**TYPE** Specifies which variant of the **RECOVER** command is to be issued. Values are:

#### **NORMAL**

Perform true recovery by restoring data from a backup taken using the **BACKUP CFSTRUCT** command and reapplying logged changes since that time. Any nonpersistent messages are discarded.

This is the default.

#### **PURGE**

Reset the structure and associated shared message data sets to an empty state. This can be used to restore a working state when no backup is available, but results in the loss of all affected messages.

## REFRESH CLUSTER:

Use the MQSC command **REFRESH CLUSTER** to discard all locally held cluster information and force it to be rebuilt. The command also processes any auto-defined channels that are in doubt. After the command completes processing, you can perform a “cold-start” on the cluster.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	CR

**z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes for REFRESH CLUSTER”
- “Parameter descriptions for REFRESH CLUSTER” on page 951

**Synonym:** REF CLUSTER

## REFRESH CLUSTER

### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.
- 2 Valid only on z/OS.

### Usage notes for REFRESH CLUSTER

1. Issuing **REFRESH CLUSTER** is disruptive to the cluster. It might make cluster objects invisible for a short time until the **REFRESH CLUSTER** processing completes. Specifically, if an application is using a queue that it opened with MQ00\_BIND\_NOT\_FIXED, it might receive the return code MQRC\_NO\_DESTINATIONS\_AVAILABLE. If an application is publishing or subscribing on a cluster topic, that topic might become temporarily unavailable. The unavailability results in a break in the publication stream until the **REFRESH CLUSTER** command completes. If the command is issued on a full repository queue manager, **REFRESH CLUSTER** might make a large volume of messages flow.
2. For large clusters, use of the **REFRESH CLUSTER** command can be disruptive to the cluster while it is in progress, and again at 27 day intervals thereafter when the cluster objects automatically send status updates to all interested queue managers. See Refreshing in a large cluster can affect performance and availability of the cluster.
3. Quiesce all publish/subscribe applications before issuing the **REFRESH CLUSTER** command, because issuing this command in a publish/subscribe cluster disrupts delivery of publications to and from other queue managers in the cluster, and might result in proxy subscriptions from other queue managers being canceled. If this happens, resynchronize the proxy subscriptions after the cluster has

refreshed, and keep all publish/subscribe applications quiesced until after the proxy subscriptions have been resynchronized. See REFRESH CLUSTER considerations for publish/subscribe clusters.

4. When the command returns control to the user, it does not signify the command has completed. Activity on SYSTEM.CLUSTER.COMMAND.QUEUE indicates the command is still processing. See also the REFRESH CLUSTER step in Checking that async commands for distributed networks have finished.
5. If cluster-sender channels are running at the time **REFRESH CLUSTER** is issued, the refresh might not complete until the channels stop and restart. To hasten completion, stop all cluster-sender channels for the cluster before you run the **REFRESH CLUSTER** command. During the processing of the **REFRESH CLUSTER** command, if the channel is not in doubt, the channel state might be recreated.
6. If you select **REPOS(YES)**, check that all cluster-sender channels in the relevant cluster are inactive or stopped before you issue the **REFRESH CLUSTER** command.

If cluster-sender channels are running at the time you run the **REFRESH CLUSTER REPOS(YES)** command, those cluster-sender channels are ended during the operation and left in an INACTIVE state after the operation completes. Alternatively, you can force the channels to stop using the STOP CHANNEL command with MODE(FORCE).

Stopping the channels ensures that the refresh can remove the channel state, and that the channel runs with the refreshed version after the refresh completes. If the state of a channel cannot be deleted, its state is not renewed after the refresh. If a channel was stopped, it does not automatically restart. The channel state cannot be deleted if the channel is in doubt, or because it is also running as part of another cluster.

If you choose the option **REPOS(YES)** on full repository queue manager, you must alter it to be a partial repository. If it is the sole working repository in the cluster, the result is that there is no full repository left in the cluster. After the queue manager is refreshed, and restored to its status of a full repository, you must refresh the other partial repositories to restore a working cluster.

If it is not the sole remaining repository, you do not need to refresh the partial repositories manually. Another working full repository in the cluster informs the other members of the cluster that the full repository running the **REFRESH CLUSTER** command resumed its role as a full repository.

7. It is not normally necessary to issue a **REFRESH CLUSTER** command except in one of the following circumstances:
  - Messages were removed from either the SYSTEM.CLUSTER.COMMAND.QUEUE, or from another a cluster transmission queue, where the destination queue is SYSTEM.CLUSTER.COMMAND.QUEUE on the queue manager in question.
  - Issuing a **REFRESH CLUSTER** command is recommended by IBM Service.
  - The CLUSRCVR channels were removed from a cluster, or their CONNAME s were altered on two or more full repository queue managers while they could not communicate.
  - The same name was used for a CLUSRCVR channel on more than one queue manager in a cluster. As a result, messages destined for one of the queue managers were delivered to another. In this case, remove the duplicates, and run a **REFRESH CLUSTER** command on the single remaining queue manager with a CLUSRCVR definition.
  - RESET CLUSTER ACTION(FORCEREMOVE) was issued in error.
  - The queue manager was restarted from an earlier point in time than it finished last time it was used; for example, by restoring backed up data.
8. Issuing **REFRESH CLUSTER** does not correct mistakes in cluster definitions, nor is it necessary to issue the command after such mistakes are corrected.
9. During **REFRESH CLUSTER** processing, the queue manager generates the message AMQ9875 followed by the message AMQ9442 or AMQ9404. The queue manager might also generate the message AMQ9420. If the cluster functionality is not affected, the message AMQ9420 can be ignored.
10. On UNIX systems, the command is valid only on AIX, HP-UX, Linux, and Solaris.
11.  On z/OS, the command fails if the channel initiator is not started.
12.  On z/OS, any errors are reported to the console on the system where the channel initiator is running. They are not reported to the system that issued the command.

## Parameter descriptions for REFRESH CLUSTER

( *generic-clustername* )

The name of the cluster to be refreshed. Alternatively *generic-clustername* can be specified as “\*”. If “\*” is specified, the queue manager is refreshed in all the clusters that it is a member of. If used with **REPOS(YES)**, this forces the queue manager to restart its search for full repositories from the information in the local CLUSSDR definitions. It restarts its search, even if the CLUSSDR definitions connect the queue manager to several clusters.

The *generic-clustername* parameter is required.

### z/OS **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. ' ' is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered. If you do so, you must be using a queue-sharing group environment and the command server must be enabled.

## **REPOS**

Specifies whether objects representing full repository cluster queue managers are also refreshed.

**NO** The queue manager retains knowledge of all cluster queue manager and cluster queues marked as locally defined. It also retains knowledge of all cluster queue managers that are marked as full repositories. In addition, if the queue manager is a full repository for the cluster, it retains knowledge of the other cluster queue managers in the cluster. Everything else is removed from the local copy of the repository and rebuilt from the other full repositories in the cluster. Cluster channels are not stopped if **REPOS(NO)** is used. A full repository uses its CLUSSDR channels to inform the rest of the cluster that it completed its refresh.

NO is the default.

**YES** Specifies that in addition to the **REPOS(NO)** behavior, objects representing full repository cluster queue managers are also refreshed. The **REPOS(YES)** option must not be used if the queue manager is itself a full repository. If it is a full repository, you must first alter it so that it is not a full repository for the cluster in question. The full repository location is recovered from the manually defined CLUSSDR definitions. After the refresh with **REPOS(YES)** is issued, the queue manager can be altered so that it is once again a full repository, if required.

z/OS On z/OS, N and Y are accepted synonyms of NO and YES.

**Related information:**

Clustering: Using REFRESH CLUSTER best practices

**REFRESH QMGR:**

Use the MQSC command REFRESH QMGR to perform special operations on queue managers.

**Using MQSC commands**

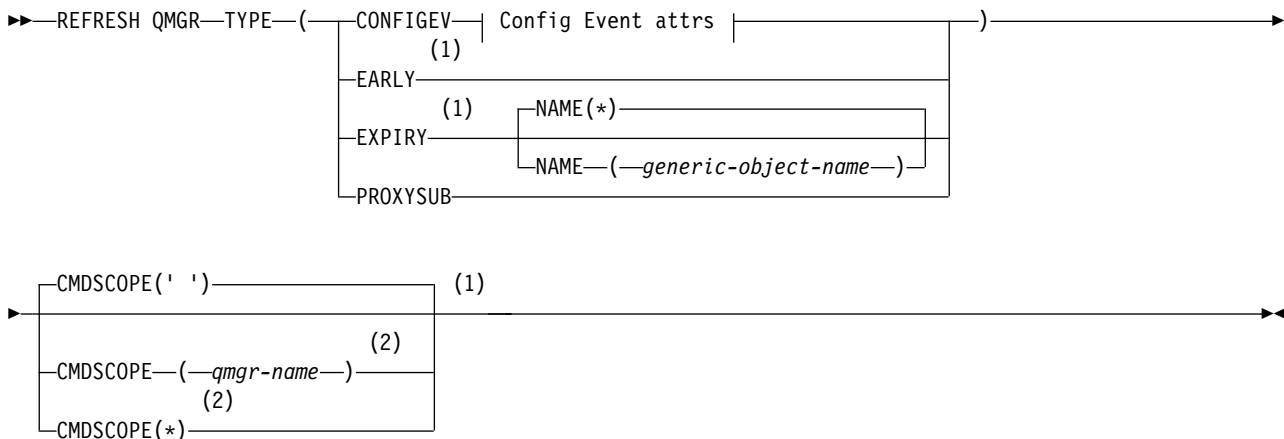

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	See "Using REFRESH QMGR on z/OS" on page 953

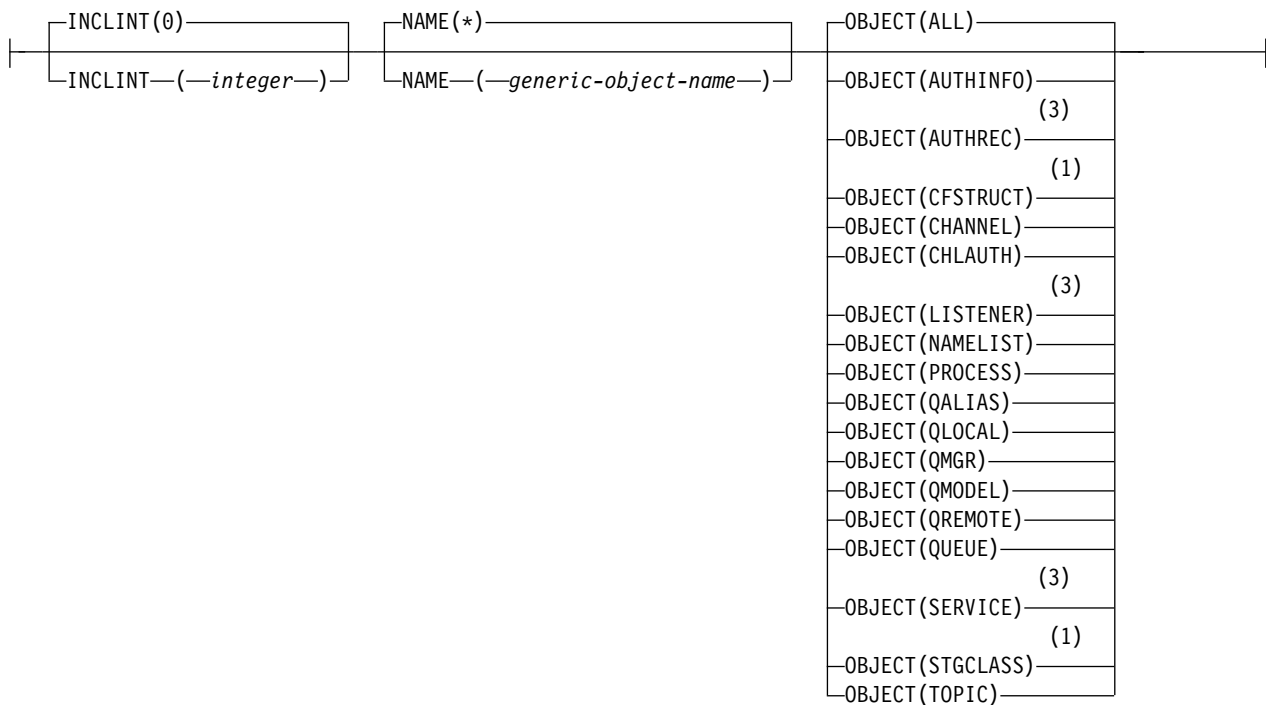

- Syntax diagram
-  "Using REFRESH QMGR on z/OS" on page 953
- "Usage Notes for REFRESH QMGR" on page 953
- "Parameter descriptions for REFRESH QMGR" on page 954

**Synonym:** None

**REFRESH QMGR**

**Config Event attr:**

**Notes:**

- 1 Valid only on z/OS.
- 2 Valid only when the queue manager is a member of a queue-sharing group.
- 3 Not valid on z/OS.

**z/OS**

**Using REFRESH QMGR on z/OS**

REFRESH QMGR can be used on z/OS. Depending on the parameters used on the command, it may be issued from various sources. For an explanation of the symbols in this table, see “Using commands on z/OS” on page 342.

Command	Command Sources	Notes
REFRESH QMGR TYPE(CONFIGEV)	2CR	
REFRESH QMGR TYPE(EARLY)	C	Queue manager must not be active.
REFRESH QMGR TYPE(EXPIRY)	2CR	
REFRESH QMGR TYPE(PROXYSUB)	2CR	CHINIT must be active to complete the command.

**Usage Notes for REFRESH QMGR**

1. Issue this command with TYPE(CONFIGEV) after setting the CONFIGEV queue manager attribute to ENABLED, to bring the queue manager configuration up to date. To ensure that complete configuration information is generated, include all objects; if you have many objects, it might be preferable to use several commands, each with a different selection of objects, but such that all are included.
2. You can also use the command with TYPE(CONFIGEV) to recover from problems such as errors on the event queue. In such cases, use appropriate selection criteria, to avoid excessive processing time and event messages generation.

3. Issue the command with TYPE(EXPIRY) at any time when you believe that a queue could contain numbers of expired messages.
4.  If TYPE(EARLY) is specified, no other keywords are allowed and the command can be issued only from the z/OS console and only if the queue manager is not active.
5. You are unlikely to use **REFRESH QMGR TYPE(PROXYSUB)** other than in exceptional circumstances. See Resynchronization of proxy subscriptions.
6. Successful completion of the **REFRESH QMGR TYPE(PROXYSUB)** command does not mean that the action completed. To check for true completion, see the REFRESH QMGR TYPE(PROXYSUB) step in Checking that async commands for distributed networks have finished.
7.  If a **REFRESH QMGR TYPE(PROXYSUB)** command is issued on z/OS when the CHINIT is not running, the command is queued up and will be processed when the CHINIT starts.
8.  Running the command REFRESH QMGR TYPE(CONFIGEV) OBJECT(ALL) includes authority records.  
You cannot specify the **INCLINT** and **NAME** parameters if you explicitly specify AUTHREC events. If you specify **OBJECT(ALL)** the **INCLINT** and **NAME** parameters are ignored.

### Parameter descriptions for REFRESH QMGR

#### **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

This parameter is not valid with TYPE(EARLY).

#### **INCLINT** (*integer*)

Specifies a value in minutes defining a period immediately before the current time, and requests that only objects that have been created or changed within that period (as defined by the ALTDATE and ALTTIME attributes) are included. The value must be in the range zero through 999 999. A value of zero means there is no time limit (this is the default).

This parameter is valid only with TYPE(CONFIGEV).

#### **NAME** (*generic-object-name*)

Requests that only objects with names that match the one specified are included. A trailing asterisk (\*) matches all object names with the specified stem followed by zero or more characters. An asterisk (\*) on its own specifies all objects (this is the default). NAME is ignored if OBJECT(QMGR) is specified.

This parameter is not valid with TYPE(EARLY).

#### **OBJECT** (*objtype*)

Requests that only objects of the specified type are included. (Synonyms for object types, such as QL, can also be specified.) The default is ALL, to include objects of every type.

This parameter is valid only with TYPE(CONFIGEV).

**TYPE** This is required. Values are:

**CONFIGEV**

Requests that the queue manager generates a configuration event message for every object that matches the selection criteria specified by the OBJECT, NAME and INCLINT parameters. Matching objects defined with QSGDISP(QMGR) or QSGDISP(COPY) are always included. Matching objects defined with QSGDISP(GROUP) or QSGDISP(SHARED) are included only if the command is being executed on the queue manager where it is entered.

**EARLY**

Requests that the subsystem function routines (generally known as early code) for the queue manager replace themselves with the corresponding routines in the linkpack area (LPA).

You need to use this command only after you install new subsystem function routines (provided as corrective maintenance or with a new version or release of IBM MQ). This command instructs the queue manager to use the new routines.

 See Task 3: Update the z/OS link list and LPA for more information about IBM MQ early code routines.

**EXPIRY**

Requests that the queue manager performs a scan to discard expired messages for every queue that matches the selection criteria specified by the NAME parameter. (The scan is performed regardless of the setting of the EXPRYINT queue manager attribute.)

**PROXYSUB**

Requests that the queue manager resynchronizes the proxy subscriptions that are held with, and on behalf of, queue managers that are connected in a hierarchy or publish/subscribe cluster.

You should only resynchronize the proxy subscriptions in exceptional circumstances. See Resynchronization of proxy subscriptions.

**REFRESH SECURITY:**

Use the MQSC command REFRESH SECURITY to perform a security refresh.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

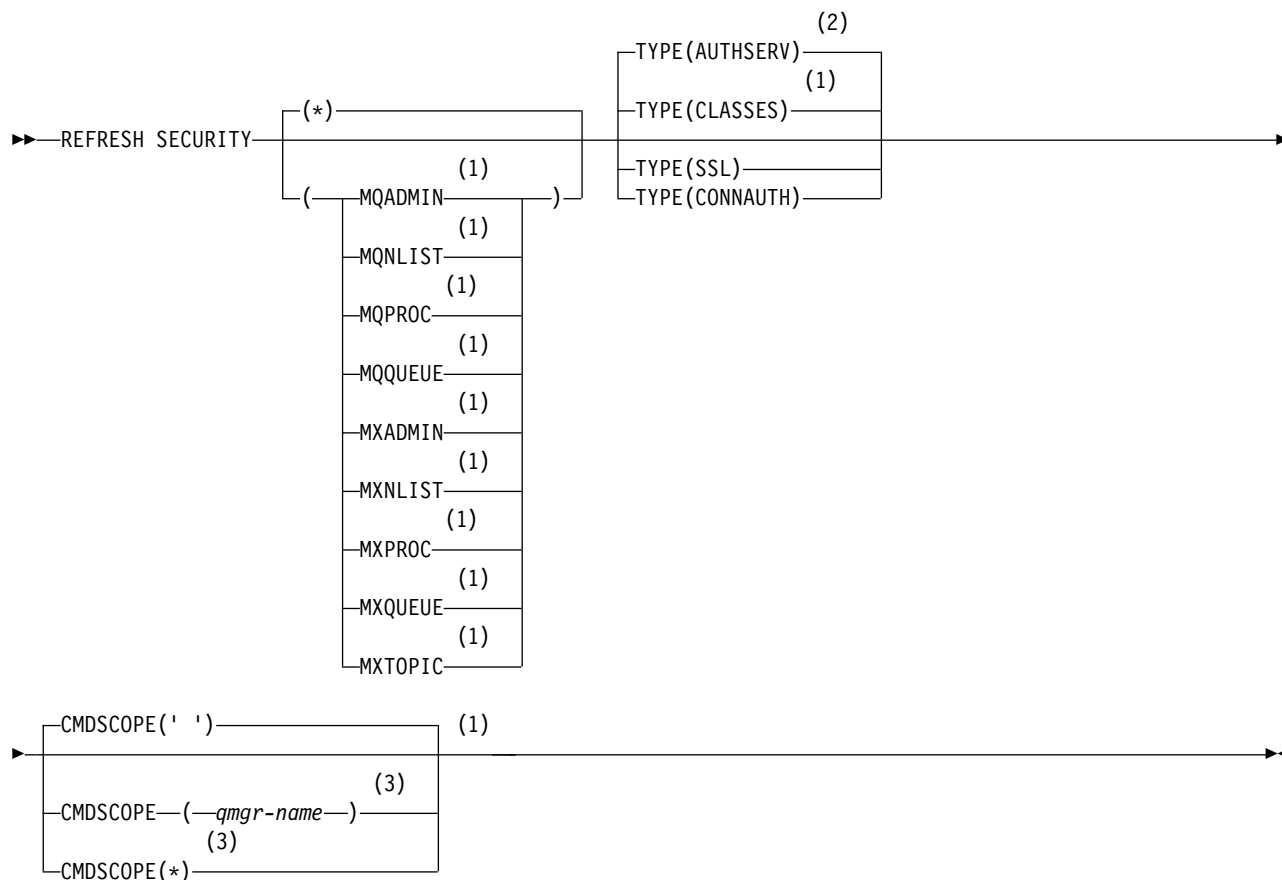

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	See “Using REFRESH SECURITY on z/OS” on page 956

- Syntax diagram
-  “Using REFRESH SECURITY on z/OS” on page 956
- “Usage notes for REFRESH SECURITY” on page 957
- “Parameter descriptions for REFRESH SECURITY” on page 958

**Synonym:** REF SEC

REBUILD SECURITY is another synonym for REFRESH SECURITY.

## REFRESH SECURITY

### Notes:

- 1 Valid only on z/OS.
- 2 Not valid on z/OS.
- 3 Valid only on IBM MQ for z/OS when the queue manager is a member of a queue-sharing group.

### z/OS

#### Using REFRESH SECURITY on z/OS

REFRESH SECURITY can be used on z/OS. Depending on the parameters used on the command, it may be issued from various sources. For an explanation of the symbols in this table, see "Using commands on z/OS" on page 342.

Command	Command Sources	Notes
REFRESH SECURITY TYPE(CLASSES)	CR	
REFRESH SECURITY TYPE(SSL)	CR	Not allowed from CSQINPT or CSQINP2. Channel initiator must be running.

### Usage notes for REFRESH SECURITY

When you issue the REFRESH SECURITY TYPE(SSL) MQSC command, all running SSL channels are stopped and restarted. Sometimes SSL channels can take a long time to shut down and this means that the refresh operation takes some time to complete. There is a time limit of 10 minutes for an SSL refresh to complete  (or 1 minute on z/OS ), so it can potentially take 10 minutes for the command to finish. This can give the appearance that the refresh operation has "frozen". The refresh operation will fail with an MQSC error message of AMQ9710 or PCF error MQRCCF\_COMMAND\_FAILED if the timeout is exceeded before all channels have stopped. This is likely to happen if the following conditions are true:

- The queue manager has many SSL channels running simultaneously when the refresh command is invoked
- The channels are handling large numbers of messages

If a refresh fails under these conditions, retry the command later when the queue manager is less busy. In the case where many channels are running, you can choose to stop some of the channels manually before invoking the REFRESH command.

When using TYPE(SSL):

1.  On z/OS, the command server and channel initiator must be running.
2.  On z/OS, IBM MQ determines whether a refresh is needed due to one, or more, of the following reasons:
  - The contents of the key repository have changed
  - The location of the LDAP server to be used for Certification Revocation Lists has changed
  - The location of the key repository has changed

If no refresh is needed, the command completes successfully and the channels are unaffected.

3.  (Platforms other than z/OS) The command updates all SSL channels regardless of whether a security refresh is needed.
4. If a refresh is to be performed, the command updates all SSL channels currently running, as follows:
  - Sender, server and cluster-sender channels using SSL are allowed to complete the current batch. In general they then run the SSL handshake again with the refreshed view of the SSL key repository. However, you must manually restart a requester-server channel on which the server definition has no CONNAME parameter.
  - All other channel types using SSL are stopped with a STOP CHANNEL MODE(FORCE) STATUS(INACTIVE) command. If the partner end of the stopped message channel has retry values defined, the channel retries and the new SSL handshake uses the refreshed view of the contents of the SSL key repository, the location of the LDAP server to be used for Certification Revocation Lists, and the location of the key repository. In the case of a server-connection channel, the client application loses its connection to the queue manager and has to reconnect in order to continue.

 When using TYPE(CLASSES):

- Classes MQADMIN, MQNLIST, MQPROC, and MQQUEUE can only hold profiles defined in uppercase.

- Classes MXADMIN, MXNLIST, MXPROC, and MQXUEUE can hold profiles defined in mixed case.
- Class MXTOPIC can be refreshed whether using uppercase or mixed case classes. Although it is a mixed case class, it is the only mixed case class that can be active with either group of classes.
- The MQCMD and MQCONN classes cannot be specified, and are not included by REFRESH SECURITY CLASS(\*).

Security information from the MQCMD and MQCONN classes is not cached in the queue manager. See Refreshing queue manager security on z/OS for further information.

#### Notes:

1. Performing a REFRESH SECURITY(\*) TYPE(CLASSES) operation is the only way to change the classes being used by your system from uppercase-only support to mixed case support.  
Do this by checking the queue manager attribute SCYCASE to see if it is set to UPPER or MIXED
2. It is your responsibility to ensure that you have copied, or defined, all the profiles you need in the appropriate classes before you carry out a REFRESH SECURITY(\*) TYPE(CLASSES) operation.
3. A refresh of an individual class is allowed only if the classes currently being used are of the same type. For example, if MQPROC is in use, you can issue a refresh for MQPROC but not MXPROC.

#### Parameter descriptions for REFRESH SECURITY

The command qualifier allows you to indicate more precise behavior for a specific TYPE value. Select from:

- \* A full refresh of the type specified is performed.  This is the default value on z/OS systems.

#### MQADMIN

Valid only if TYPE is CLASSES. Specifies that Administration type resources are to be refreshed. Valid on z/OS only.

**Note:** If, when refreshing this class, it is determined that a security switch relating to one of the other classes has been changed, a refresh for that class also takes place.

#### MQNLIST

Valid only if TYPE is CLASSES. Specifies that Namelist resources are to be refreshed. Valid on z/OS only.

#### MQPROC

Valid only if TYPE is CLASSES. Specifies that Process resources are to be refreshed. Valid on z/OS only.

#### MQQUEUE

Valid only if TYPE is CLASSES. Specifies that Queue resources are to be refreshed. Valid on z/OS only.

#### MXADMIN

Valid only if TYPE is CLASSES. Specifies that administration type resources are to be refreshed. Valid on z/OS only.

**Note:** If, when refreshing this class, it is determined that a security switch relating to one of the other classes has been changed, a refresh for that class also takes place.

#### MXNLIST

Valid only if TYPE is CLASSES. Specifies that namelist resources are to be refreshed. Valid on z/OS only.

▶ z/OS **MXPROC**

Valid only if TYPE is CLASSES. Specifies that process resources are to be refreshed. Valid on z/OS only.

▶ z/OS **MXQUEUE**

Valid only if TYPE is CLASSES. Specifies that queue resources are to be refreshed. Valid on z/OS only.

▶ z/OS **MXTOPIC**

Valid only if TYPE is CLASSES. Specifies that topic resources are to be refreshed. Valid on z/OS only.

▶ z/OS **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value ▶ z/OS for non-z/OS systems.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

**TYPE** Specifies the type of refresh that is to be performed.

▶ distributed ▶ IBM i **AUTHSERV**

The list of authorizations held internally by the authorization services component is refreshed.

This is the default value.

▶ z/OS **CLASSES**

IBM MQ in-storage ESM (external security manager, for example RACF ) profiles are refreshed. The in-storage profiles for the resources being requested are deleted. New entries are created when security checks for them are performed, and are validated when the user next requests access.

You can select specific resource classes for which to perform the security refresh.

This is valid only on z/OS where it is the default.

**CONNAUTH**

Refreshes the cached view of the configuration for connection authentication.

You must refresh the configuration before the queue manager recognizes the changes.

▶ UNIX ▶ Linux ▶ Windows ▶ IBM i On ▶ IBM i IBM i, UNIX, Linux, and Windows platforms, this is a synonym for AUTHSERV.

See Connection authentication for more information.

**SSL** Refreshes the cached view of the Secure Sockets Layer, or Transport Layer Security, key repository and allows updates to become effective on successful completion of the command. Also refreshed are the locations of:

- the LDAP servers to be used for Certified Revocation Lists
- the key repository

as well as any cryptographic hardware parameters specified through IBM MQ.

To refresh CHLAUTH use the “REFRESH QMGR” on page 952 command.

**Related information:**

**RESET CFSTRUCT:**

Use the MQSC command RESET CFSTRUCT to modify the status of a specific application structure.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			CR

▶ **z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Notes:”
- “Parameter descriptions for RESET CFSTRUCT”

**Synonym:** None.

**RESET CFSTRUCT**

▶▶—RESET CFSTRUCT—(—*structure-name*—)—ACTION—(—*FAIL*—)—▶▶

**Notes:**

1. ▶ **z/OS** Valid only when the queue manager is a member of a queue-sharing group.
2. RESET CFSTRUCT requires CFLEVEL(5)

**Parameter descriptions for RESET CFSTRUCT**

**CFSTRUCT( *structure-name* )**

Specify the name of the coupling facility application structure that you want to reset.

**ACTION( *FAIL* )**

Specify this keyword to simulate a structure failure and set the status of the application structure to FAILED

## RESET CHANNEL:

Use the MQSC command RESET CHANNEL to reset the message sequence number for an IBM MQ channel with, optionally, a specified sequence number to be used the next time that the channel is started.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

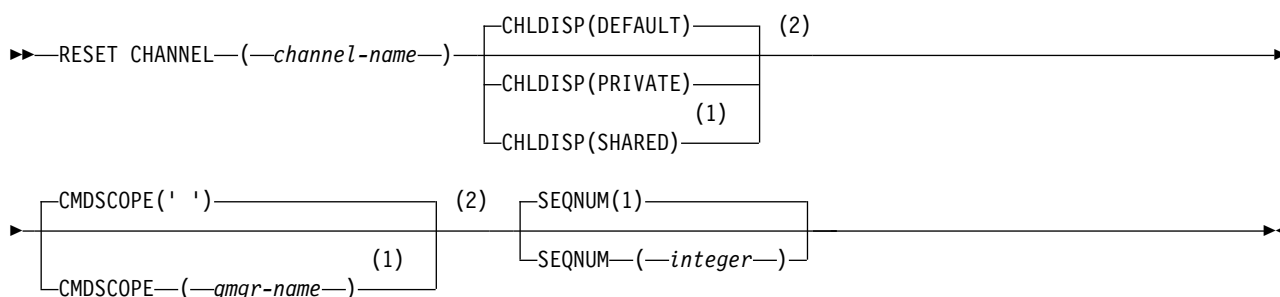

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	CR

► **z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes”
- “Parameter descriptions for RESET CHANNEL” on page 962

**Synonym:** RESET CHL

## RESET CHANNEL

### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.
- 2 Valid only on z/OS.

### Usage notes

1. ► **z/OS** On z/OS, the command server and channel initiator must be running.
2. This command can be issued to a channel of any type except SVRCONN and CLNTCONN channels, (including those that have been defined automatically). However, if it is issued to a sender or server channel, then in addition to resetting the value at the end at which the command is issued, the value at the other (receiver or requester) end is also reset to the same value the next time this channel is initiated (and resynchronized if necessary). Issuing this command on a cluster-sender channel might reset the message sequence number at either end of the channel. However, this is not significant because the sequence numbers are not checked on clustering channels.
3. If the command is issued to a receiver, requester, or cluster-receiver channel, the value at the other end is *not* reset as well; this must be done separately if necessary.

4. Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel. If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the channel that was last added to the local queue manager's repository.
5. If the message is non-persistent, and the RESET CHANNEL command is issued to the sender channel, reset data is sent and flows every time the channel starts.

### Parameter descriptions for RESET CHANNEL

(channel-name)

The name of the channel to be reset. This is required.

#### z/OS CHLDISP

This parameter applies to z/OS only and can take the values of:

- DEFAULT
- PRIVATE
- SHARED

If this parameter is omitted, then the DEFAULT value applies. This is taken from the default channel disposition attribute, DEFCDISP, of the channel object.

In conjunction with the various values of the CMDSCOPE parameter, this parameter controls two types of channel:

#### SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue-sharing group.

A sending channel is shared if its transmission queue has a disposition of SHARED.

#### PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than SHARED.

**Note:** This disposition is **not** related to the disposition set by the disposition of the queue-sharing group of the channel definition.

The combination of the CHLDISP and CMDSCOPE parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of CHLDISP and CMDSCOPE are summarized in the following table:

Table 109. CHLDISP and CMDSCOPE for RESET CHANNEL

CHLDISP	CMDSCOPE( ) or CMDSCOPE (local-qmgr)	CMDSCOPE (qmgr-name)
PRIVATE	Reset private channel on the local queue manager	Reset private channel on the named queue manager

Table 109. CHLDISP and CMDSCOPE for RESET CHANNEL (continued)

CHLDISP	CMDSCOPE( ) or CMDSCOPE (local-qmgr)	CMDSCOPE (qmgr-name)
SHARED	<p>Reset a shared channel on all active queue managers.</p> <p>This might automatically generate a command using CMDSCOPE and send it to the appropriate queue managers. If there is no definition for the channel on the queue managers to which the command is sent, or if the definition is unsuitable for the command, the action fails there.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is actually run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted

**z/OS** **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

If CHLDISP is set to SHARED, CMDSCOPE must be blank or the local queue manager.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name only if you are using a queue-sharing group environment and if the command server is enabled.

**SEQNUM( integer )**

The new message sequence number, which must be in the range 1 through 999 999 999. This is optional.

**RESET CLUSTER:**

Use the MQSC command **RESET CLUSTER** to perform special operations on clusters.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	CR

**z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes for RESET CLUSTER” on page 964
- “Parameter descriptions for RESET CLUSTER” on page 964

**Synonym:** None

## RESET CLUSTER

### Notes:

- 1 Valid only on z/OS when the queue manager is a member of a queue-sharing group.
- 2 Valid only on z/OS.

### Usage notes for RESET CLUSTER

- On UNIX systems, the command is valid only on AIX, HP-UX, Linux, and Solaris.
- **z/OS** On z/OS, the command fails if the channel initiator has not been started.
- **z/OS** On z/OS, any errors are reported to the console on the system where the channel initiator is running; they are not reported to the system that issued the command.
- To avoid any ambiguity, it is preferable to use QMID rather than QMNAME. The queue manager identifier can be found by commands such as DISPLAY QMGR and DISPLAY CLUSQMGR. If QMNAME is used, and there is more than one queue manager in the cluster with that name, the command is not actioned.
- If you use characters other than those listed in Rules for naming IBM MQ objects in your object or variable names, for example in QMID, you must enclose the name in quotation marks.
- If you remove a queue manager from a cluster using this command, you can rejoin it to the cluster by issuing a **REFRESH CLUSTER** command. Wait at least 10 seconds before issuing a **REFRESH CLUSTER** command, because the repository ignores any attempt to rejoin the cluster within 10 seconds of a **RESET CLUSTER** command. If the queue manager is in a publish/subscribe cluster, you then need to reinstate any required proxy subscriptions. See REFRESH CLUSTER considerations for publish/subscribe clusters.

**Note:** For large clusters, use of the **REFRESH CLUSTER** command can be disruptive to the cluster while it is in progress, and again at 27 day intervals thereafter when the cluster objects automatically send status updates to all interested queue managers. See Refreshing in a large cluster can affect performance and availability of the cluster.

- Successful completion of the command does not mean that the action completed. To check for true completion, see the RESET CLUSTER step in Checking that async commands for distributed networks have finished.

### Parameter descriptions for RESET CLUSTER

(*clustername*)

The name of the cluster to be reset. This is required.

### ACTION(FORCEREMOVE)

Requests that the queue manager is forcibly removed from the cluster. This might be needed to ensure correct cleanup after a queue manager has been deleted.

This action can be requested only by a repository queue manager.

**z/OS** **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

**QMID( *qmid* )**

The identifier of the queue manager to be forcibly removed.

**QMNAME( *qmname* )**

The name of the queue manager to be forcibly removed.

**QUEUES**

Specifies whether cluster queues owned by the queue manager being force removed are removed from the cluster.

**NO** Cluster queues owned by the queue manager being force removed are not removed from the cluster. This is the default.

**YES** Cluster queues owned by the queue manager being force removed are removed from the cluster in addition to the cluster queue manager itself. The cluster queues are removed even if the cluster queue manager is not visible in the cluster, perhaps because it was previously force removed without the QUEUES option.

**z/OS** On z/OS, **N** and **Y** are accepted synonyms of **NO** and **YES**.

**RESET QMGR:**

Use the MQSC command RESET QMGR as part of your backup and recovery procedures.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

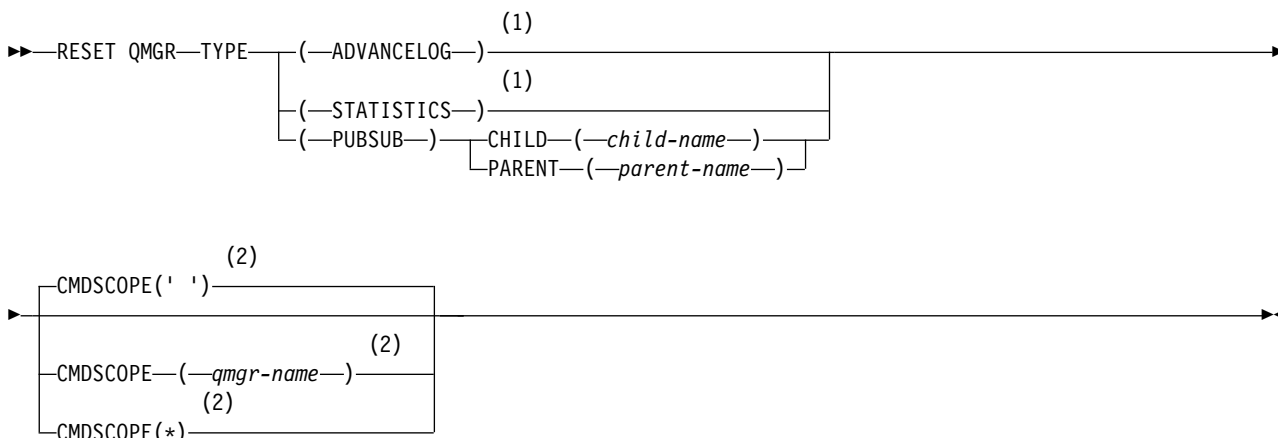

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	2CR

**z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes for RESET QMGR” on page 966
- “Parameter descriptions for RESET QMGR” on page 966

**Synonym:** None

## RESET QMGR

### Notes:

- 1 Not valid on z/OS.
- 2 Valid only on z/OS when the queue manager is a member of a queue-sharing group

### Usage notes for RESET QMGR

- You can use this command to request that the queue manager starts writing to a new log extent, making the previous log extent available for backup. See Updating a backup queue manager. Alternatively, you can use this command to request that the queue manager ends the current statistics collection period and writes the collected statistics. You can also use this command to forcibly remove a publish/subscribe hierarchical connection for which this queue manager is nominated as either the parent or the child in the hierarchical connection.
- The queue manager might refuse a request to advance the recovery log, if advancing the recovery log would cause the queue manager to become short of space in the active log.
- You are unlikely to use RESET QMGR TYPE(PUBSUB) other than in exceptional circumstances. Typically the child queue manager uses ALTER QMGR PARENT(' ') to remove the hierarchical connection.
- When you need to disconnect from a child or parent queue manager with which the queue manager has become unable to communicate, you must issue the RESET QMGR TYPE (PUBSUB) command from a queue manager. When using this command, the remote queue manager is not informed of the canceled connection. It might, therefore, be necessary to issue the ALTER QMGR PARENT(' ') command at the remote queue manager. If the child queue manager is not manually disconnected, it is forcibly disconnected and the parent status is set to REFUSED.
- If you are resetting the parent relationship, issue the ALTER QMGR PARENT(' ') command, otherwise the queue manager attempts to re-establish the connection when the publish/subscribe capability of the queue manager is later enabled.
- Successful completion of the RESET QMGR TYPE(PUBSUB) command does not mean that the action completed. To check for true completion, see the RESET QMGR TYPE(PUBSUB) step in Checking that async commands for distributed networks have finished.

### Parameter descriptions for RESET QMGR

#### TYPE

##### ADVANCELOG

Requests that the queue manager starts writing to a new log extent, making the previous log extent available for backup. See Updating a backup queue manager. This command is accepted only if the queue manager is configured to use linear logging.

## STATISTICS

Requests that the queue manager ends the current statistics collection period and writes the collected statistics.

## PUBSUB

Requests that the queue manager cancels the indicated publish/subscribe hierarchical connection. This value requires that one of the CHILD or PARENT attributes is specified:

### CHILD

The name of the child queue manager for which the hierarchical connection is to be forcibly canceled. This attribute is used only with TYPE(PUBSUB). It cannot be used together with PARENT.

### PARENT

The name of a parent queue manager for which the hierarchical connection is to be forcibly canceled. This attribute is used only with TYPE(PUBSUB). It cannot be used together with CHILD.

z/OS

## CMDSCOPE

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

CMDSCOPE must be blank, or the local queue manager, if QSGDISP is set to GROUP.

' ' The command is executed on the queue manager on which it was entered. This value is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name other than the queue manager on which it was entered, only if you are using a shared queue environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of setting this value is the same as entering the command on every queue manager in the queue-sharing group.

## RESET QSTATS: z/OS

Use the MQSC command RESET QSTATS to report performance data for a queue and then to reset that data.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			2CR

z/OS

For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- "Usage notes for RESET QSTATS" on page 968
- "Parameter descriptions for RESET QSTATS" on page 968

**Synonym:** None

**Notes:**

- 1 Valid only when the queue manager is a member of a queue-sharing group.

**Usage notes for RESET QSTATS**

1. If there is more than one queue with a name that satisfies the *generic q-name*, all those queues are reset.
2.  Issue this command from an application, and not the z/OS console or its equivalent, to ensure that the statistical information is recorded.
3. The following information is kept for all queues, both private and shared. For shared queues each queue manager keeps an independent copy of the information:

**MSGIN**

Incremented each time a message is put to the shared queue

**MSGOUT**

Incremented each time a message is removed from the shared queue

**HIQDEPTH**

Calculated by comparing the current value for HIQDEPTH held by this queue manager with the new queue depth obtained from the coupling facility during every put operation. The depth of the queue is affected by all queue managers putting messages to the queue or getting messages from it.

To retrieve the information and obtain full statistics for a shared queue, specify **CMDSCOPE(\*)** to broadcast the command to all queue managers in the queue-sharing group.

The peak queue depth approximates to the maximum of all the returned HIQDEPTH values, the total MQPUT count approximates to the sum of all the returned MSGIN values, and the total MQGET count approximates to the sum of all the returned MSGOUT values.

4. If the PERFMV attribute of the queue manager is DISABLED, the command fails.

**Parameter descriptions for RESET QSTATS**

*generic-qname*

The name of the local queue with a disposition of QMGR, COPY, or SHARED, but not GROUP, with performance data that is to be reset.

A trailing asterisk (\*) matches all queues with the specified stem followed by zero or more characters. An asterisk (\*) on its own specifies all queues.

The performance data is returned in the same format as parameters returned by DISPLAY commands. The data is:

**QSTATS**

The name of the queue

 **QSGDISP**

The disposition of the queue, that is, QMGR, COPY, or SHARED.

**RESETINT**

The number of seconds since the statistics were last reset.

## HIQDEPTH

The peak queue depth since the statistics were last reset.

## MSG SIN

The number of messages that have been added to the queue by MQPUT and MQPUT1 calls since the statistics were last reset.

The count includes messages added to the queue in units of work that have not yet been committed, but the count is not decremented if the units of work are later backed out. The maximum displayable value is 999 999 999; if the number exceeds this value, 999 999 999 is displayed.

## MSG SOUT

The number of messages removed from the queue by destructive (non-browse) MQGET calls since the statistics were last reset.

The count includes messages removed from the queue in units of work that have not yet been committed, but the count is not decremented if the units of work are subsequently backed out. The maximum displayable value is 999 999 999; if the number exceeds this value, 999 999 999 is displayed.

## z/OS CMDScope

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

## Example output

The following example, shows the output from the command on z/OS.

```
12.44.16 STC16696 CSQM201I !MQ13 CSQMDRTC RESET QSTATS DETAILS 902
902 QSTATS(CICS01.INITQ)
902 QSGDISP(QMGR)
902 RESETINT(43)
902 HIQDEPTH(0)
902 MSGSIN(0)
902 MSGSOUT(0)
902 END QSTATS DETAILS
12.44.16 STC16696 CSQM201I !MQ13 CSQMDRTC RESET QSTATS DETAILS 903
903 QSTATS(MQ13.DEAD.QUEUE)
903 QSGDISP(QMGR)
903 RESETINT(43)
903 HIQDEPTH(0)
903 MSGSIN(0)
903 MSGSOUT(0)
903 END QSTATS DETAILS
12.44.16 STC16696 CSQM201I !MQ13 CSQMDRTC RESET QSTATS DETAILS 904
904 QSTATS(SYSTEM.ADMIN.ACTIVITY.QUEUE)
904 QSGDISP(QMGR)
```

904            RESETINT(43)  
 904            HIQDEPTH(0)  
 904            MSGSIN(0)  
 904            MSGSOUT(0)

**RESET SMDS:** z/OS

Use the MQSC command RESET SMDS to modify availability or status information relating to one or more shared message data sets associated with a specific application structure.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			CR

z/OS For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Parameter descriptions for RESET SMDS”

**Synonym:**

**RESET SMDS**

**Parameter descriptions for RESET SMDS**

This command is only supported when the CFSTRUCT definition is currently using the option OFFLOAD(SMDS).

**SMDS( *qmgr-name* | \* )**

Specify the queue manager for which the shared message data set availability or status information is to be modified, or an asterisk to modify the information for all data sets associated with the specified CFSTRUCT.

**CFSTRUCT( *structure-name* )**

Specify the coupling facility application structure for which the availability or status information for one or more shared message data sets is to be modified.

**ACCESS( **ENABLED** | **DISABLED** )**

This keyword is used to enable and disable access to a shared message data set, making it available or unavailable to the queue managers in the group.

This keyword is useful when a shared message data set is required to be temporarily unavailable, for example while moving it to a different volume. In this instance, the keyword would be used to mark the data set as ACCESS(DISABLED) causing all of the queue managers to close it

normally and deallocate it. When the data set is ready to be used, it can be marked as ACCESS(ENABLED) allowing the queue managers to access it again.

#### **ENABLED**

Use the ENABLED parameter to enable access to the shared message data set after previously disabling access, or to retry access after an error has caused the availability state to be set to ACCESS(SUSPENDED).

#### **DISABLED**

Use the DISABLED parameter to indicate that the shared message data set cannot be used until the access has been changed back to ENABLED. Any queue managers currently connected to the shared message data set are disconnected from it.

#### **STATUS(FAILED | RECOVERED)**

This keyword is used to specify that a shared message data set requires recovery/repair, or to reset the STATUS of the data set from FAILED.

If you have detected that a data set is in need of repair, this keyword can be used to manually mark the data set as STATUS(FAILED). If the queue manager detects that the data set requires repair, it automatically marks it as STATUS(FAILED). Then if RECOVER CFSTRUCT is used to successfully complete a repair to the data set, the queue manager automatically marks it as STATUS(RECOVERED). If another method is used to successfully repair the data set, this keyword can be used to manually mark the data set as STATUS(RECOVERED). It is not necessary to manually alter the ACCESS, as it is automatically changed to SUSPENDED while the STATUS is FAILED and then back to ENABLED when the STATUS is set to RECOVERED.

#### **FAILED**

Use the FAILED parameter to indicate that the shared message data set needs to be recovered or repaired, and should not be used until this has been completed. This is only allowed if the current state is STATUS(ACTIVE) or STATUS(RECOVERED). If the current availability state is ACCESS(ENABLED) and is not changed on the same command, this sets ACCESS(SUSPENDED) to prevent further attempts to use the shared message data set until it has been repaired. Any queue managers currently connected to the shared message data set are forced to disconnect from it, by closing and deallocating the data set. This status may be set automatically if a permanent I/O error occurs when accessing a shared message data set or if a queue manager determines that header information in the data set is invalid or is inconsistent with the current state of the structure.

#### **RECOVERED**

Use the RECOVERED parameter to reset the state from STATUS(FAILED) if the shared message data set does not actually need to be recovered, for example if it was merely temporarily unavailable. If the current availability state (after any change specified on the same command) is ACCESS(SUSPENDED), this sets ACCESS(ENABLED) to allow the owning queue manager to open the shared message data set and perform restart processing, after which the status is changed to STATUS(ACTIVE) and other queue managers can use it again.

## RESET TPIPE: z/OS

Use the MQSC command RESET TPIPE to reset the recoverable sequence numbers for an IMS Tpipe used by the IBM MQ - IMS bridge.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

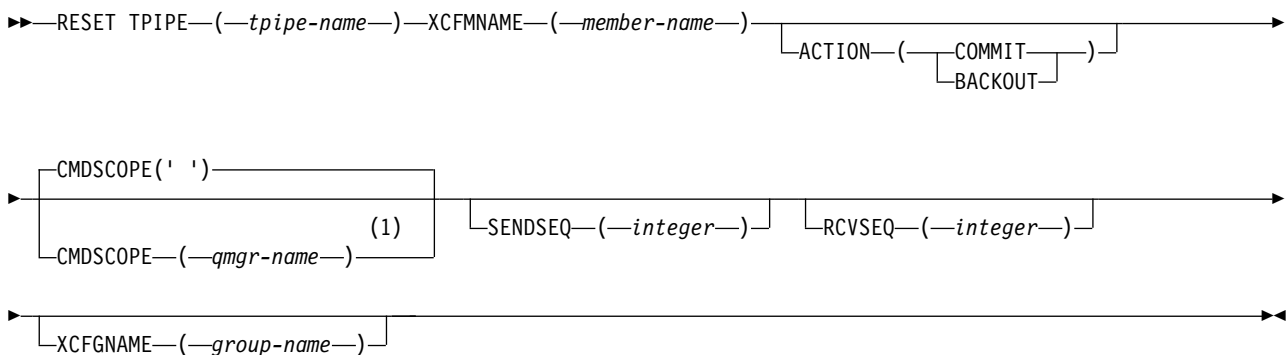

IBM i	UNIX and Linux	Windows	z/OS
			CR

z/OS For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes”
- “Parameter descriptions for RESET TPIPE”

**Synonym:** There is no synonym for this command.

### RESET TPIPE

#### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.

#### Usage notes

1. This command is used in response to the resynchronization error reported in message CSQ2020E, and initiates resynchronization of the Tpipe with IMS.
2. The command fails if the queue manager is not connected to the specified XCF member.
3. The command fails if the queue manager is connected to the specified XCF member, but the Tpipe is open.

#### Parameter descriptions for RESET TPIPE

( *tpipe-name* )

The name of the Tpipe to be reset. This is required.

#### CMDSCOPE

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

**ACTION**

Specifies whether to commit or back out any unit of recovery associated with this Tpipe. This is required if there is such a unit of recovery reported in message CSQ2020E; otherwise it is ignored.

**COMMIT**

The messages from IBM MQ are confirmed as having already transferred to IMS ; that is, they are deleted from the IBM MQ - IMS bridge queue.

**BACKOUT**

The messages from IBM MQ are backed out; that is, they are returned to the IBM MQ - IMS bridge queue.

**SENDSEQ( *integer* )**

The new recoverable sequence number to be set in the Tpipe for messages sent by IBM MQ and to be set as the partner's receive sequence number. It must be hexadecimal and can be up to 8 digits long, and can optionally be enclosed by X' '. It is optional; if omitted, the sequence number is not changed but the partner's receive sequence is set to the IBM MQ send sequence number.

**RCVSEQ( *integer* )**

The new recoverable sequence number to be set in the Tpipe for messages received by IBM MQ and to be set as the partner's send sequence number. It must be hexadecimal and can be up to 8 digits long, and can optionally be enclosed by X' '. It is optional; if omitted, the sequence number is not changed but the partner's send sequence is set to the IBM MQ receive sequence number.

**XCFGNAME( *group-name* )**

The name of the XCF group to which the Tpipe belongs. This is 1 through 8 characters long. It is optional; if omitted, the group name used is that specified in the OTMACON system parameter.

**XCFMNAME( *member-name* )**

The name of the XCF member within the group specified by XCFGNAME to which the Tpipe belongs. This is 1 through 16 characters long, and is required.

## RESOLVE CHANNEL:

Use the MQSC command RESOLVE CHANNEL to request a channel to commit or back out in-doubt messages.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

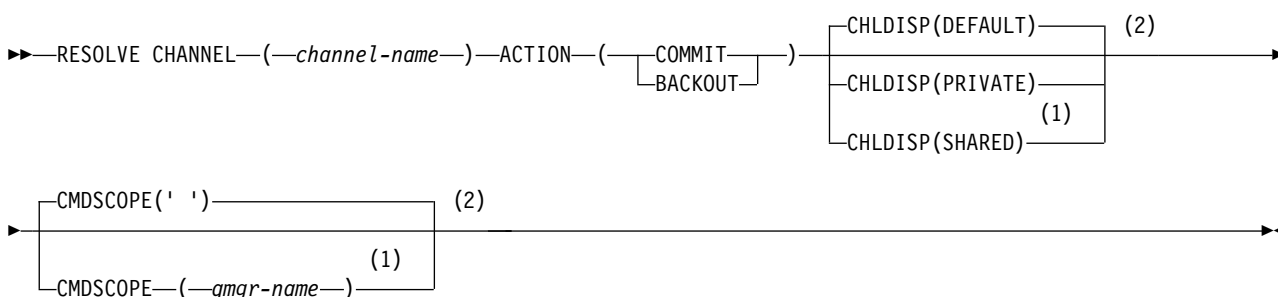

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	CR

► **z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes for RESOLVE CHANNEL”
- “Parameter descriptions for RESOLVE CHANNEL” on page 975

**Synonym:** RESOLVE CHL (RES CHL on z/OS )

## RESOLVE CHANNEL

### Notes:

- 1 Valid only on z/OS when the queue manager is a member of a queue-sharing group.
- 2 Valid only on z/OS.

### Usage notes for RESOLVE CHANNEL

1. This command is used when the other end of a link fails during the confirmation period, and for some reason it is not possible to reestablish the connection.
2. In this situation the sending end remains in doubt as to whether the messages were received. Any outstanding units of work must be resolved by being backed out or committed.
3. If the resolution specified is not the same as the resolution at the receiving end, messages can be lost or duplicated.
4. ► **z/OS** On z/OS, the command server and the channel initiator must be running.
5. This command can be used only for sender (SDR), server (SVR), and cluster-sender (CLUSSDR) channels (including those that have been defined automatically).
6. Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel. If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the channel that was last added to the local queue manager's repository.

7. If the resolution specified is not the same as the resolution at the receiving end, messages can be lost or duplicated.

### Parameter descriptions for RESOLVE CHANNEL

*(channel-name)*

The name of the channel for which in-doubt messages are to be resolved. This is required.

#### ACTION

Specifies whether to commit or back out the in-doubt messages (this is required):

#### COMMIT

The messages are committed, that is, they are deleted from the transmission queue

#### BACKOUT

The messages are backed out, that is, they are restored to the transmission queue

#### CHLDISP

This parameter applies to z/OS only and can take the values of:

- DEFAULT
- PRIVATE
- SHARED

If this parameter is omitted, then the DEFAULT value applies. This is taken from the default channel disposition attribute, DEFCDISP, of the channel object.

In conjunction with the various values of the CMDSCOPE parameter, this parameter controls two types of channel:

#### SHARED

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue-sharing group.

A sending channel is shared if its transmission queue has a disposition of SHARED.

#### PRIVATE

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than SHARED.

**Note:** This disposition is **not** related to the disposition set by the disposition of the queue-sharing group of the channel definition.

The combination of the CHLDISP and CMDSCOPE parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of CHLDISP and CMDSCOPE are summarized in the following table:

Table 110. CHLDISP and CMDSCOPE for RESOLVE CHANNEL

CHLDISP	CMDSCOPE( ) or CMDSCOPE (local-qmgr)	CMDSCOPE (qmgr-name)
PRIVATE	Resolve private channel on the local queue manager	Resolve private channel on the named queue manager
SHARED	<p>Resolve a shared channel on all active queue managers.</p> <p>This might automatically generate a command using CMDSCOPE and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is actually run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted

**z/OS** **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

If CHLDISP is set to SHARED, CMDSCOPE must be blank or the local queue manager.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name only if you are using a queue-sharing group environment and if the command server is enabled.

**RESOLVE INDOUBT:** **z/OS**

Use the MQSC command RESOLVE INDOUBT to resolve threads left in doubt because IBM MQ or a transaction manager could not resolve them automatically.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

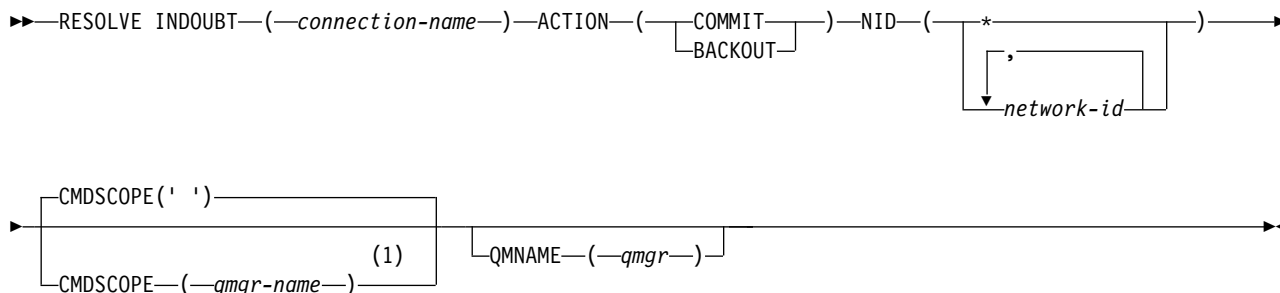

IBM i	UNIX and Linux	Windows	z/OS
			2CR

**z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes” on page 977
- “Parameter descriptions for RESOLVE INDOUBT” on page 977

Synonym: RES IND

## RESOLVE INDOUBT

### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.

### Usage notes

This command does not apply to units of recovery associated with batch or TSO applications, unless you are using the RRS adapter.

### Parameter descriptions for RESOLVE INDOUBT

(*connection-name*)

1 through 8 character connection name.

- For a CICS connection it is the CICS applid.
- For an IMS adapter connection, it is the IMS control region job name.
- For an IMS bridge connection, it is the IBM MQ queue manager name.
- For an RRS connection, it is RRSBATCH.

### ACTION

Specifies whether to commit or back out the in-doubt threads:

#### COMMIT

Commits the threads

#### BACKOUT

Backs out the threads

### CMDSCOPE

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

- ' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

**NID** Origin identifier. Specifies the thread or threads to be resolved.

( *origin-id* )

This is as returned by the DISPLAY CONN command, and is of the form *origin-node*. *origin-urid*, where:

- *origin-node* identifies the originator of the thread, except RRSBATCH where it is omitted.
- *origin-urid* is the hexadecimal number assigned to the unit of recovery by the originating system for the specific thread to be resolved.

When *origin-node* is present there must be a period (.) between it and *origin-urid*.

(\*) Resolves all threads associated with the connection.

## QMNAME

Specifies that if the designated queue manager is INACTIVE, IBM MQ should search information held in the coupling facility about units of work, performed by the indicated queue manager, that match the connection name and origin identifier.

Matching units of work are either committed or backed out according to the ACTION specified.

Only the shared portion of the unit of work are resolved by this command.

As the queue manager is necessarily inactive, local messages are unaffected and remain locked until the queue manager restarts, or after restarting, connects with the transaction manager.

Examples:

```
RESOLVE INDOUBT(CICSA) ACTION(COMMIT) NID(CICSA.ABCDEF0123456789)
RESOLVE INDOUBT(CICSA) ACTION(BACKOUT) NID(*)
```

## RESUME QMGR:

Use the MQSC command RESUME QMGR to inform other queue managers in a cluster that the local queue manager is available again for processing and can be sent messages. It reverses the action of the SUSPEND QMGR command.

## Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	See "Using RESUME QMGR on z/OS" on page 979

- Syntax diagram
-  "Using RESUME QMGR on z/OS" on page 979
- "Usage notes" on page 979
- "Parameter descriptions for RESUME QMGR" on page 979

**Synonym:** None

## RESUME QMGR

### Notes:

- 1 Valid only on z/OS.
- 2 Valid only on IBM MQ for z/OS when the queue manager is a member of a queue-sharing group.

### z/OS

#### Using RESUME QMGR on z/OS

RESUME QMGR can be used on z/OS. Depending on the parameters used on the command, it may be issued from various sources. For an explanation of the symbols in this table, see “Using commands on z/OS” on page 342.

Command	Command Sources	Notes
RESUME QMGR CLUSTER/CLUSNL	CR	Ensure the channel initiator is running
RESUME QMGR FACILITY	CR	
RESUME QMGR LOG	C	

### Usage notes

1. On UNIX systems, the command is valid only on AIX, HP-UX, Linux, and Solaris.
2. On z/OS, if you define CLUSTER or CLUSNL:
  - a. The command fails if the channel initiator has not been started.
  - b. Any errors are reported to the console on the system where the channel initiator is running; they are not reported to the system that issued the command.
3. On z/OS, you cannot issue RESUME QMGR CLUSTER (*clustername*) or RESUME QMGR FACILITY commands from CSQINP2.
4. This command, with the CLUSTER and CLUSNL parameters, is **not** available on the reduced function form of IBM MQ for z/OS supplied with WebSphere Application Server.
5. On z/OS, the SUSPEND QMGR and RESUME QMGR commands are supported through the console only. However, all the other SUSPEND and RESUME commands are supported through the console and command server.

### Parameter descriptions for RESUME QMGR

#### CLUSTER (*clustername*)

The name of the cluster for which availability is to be resumed.

#### CLUSNL (*nlname*)

The name of the namelist specifying a list of clusters for which availability is to be resumed.

#### FACILITY

Specifies the facility to which connection is to be re-established.

**Db2** Re-establishes connection to Db2.

**IMSBRIDGE**

Resumes normal IMS bridge activity.

This parameter is only valid on z/OS.

**LOG** Resumes logging and update activity for the queue manager that was suspended by a previous SUSPEND QMGR command. Valid on z/OS only. If LOG is specified, the command can be issued only from the z/OS console.

**CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

**RVERIFY SECURITY:** z/OS

Use the MQSC command RVERIFY SECURITY to set a reverification flag for all specified users. The user is reverified the next time that security is checked for that user.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			2CR

z/OS For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Parameter descriptions for RVERIFY SECURITY” on page 981

**Synonym:** REV SEC

REVERIFY SECURITY is another synonym for RVERIFY SECURITY

**RVERIFY SECURITY**

**Notes:**

- 1 Valid only when the queue manager is a member of a queue-sharing group.

**Parameter descriptions for RVERIFY SECURITY**

(*userid...*)

You must specify one or more user IDs. Each user ID specified is signed off and signed back on again the next time that a request is issued on behalf of that user that requires security checking.

**CMDSCOPE**

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

CMDSCOPE cannot be used for commands issued from the first initialization input data set CSQINP1.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

**SET ARCHIVE:** 

Use the MQSC command SET ARCHIVE to dynamically change certain archive system parameter values initially set by your system parameter module at queue manager startup.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			12CR

 For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

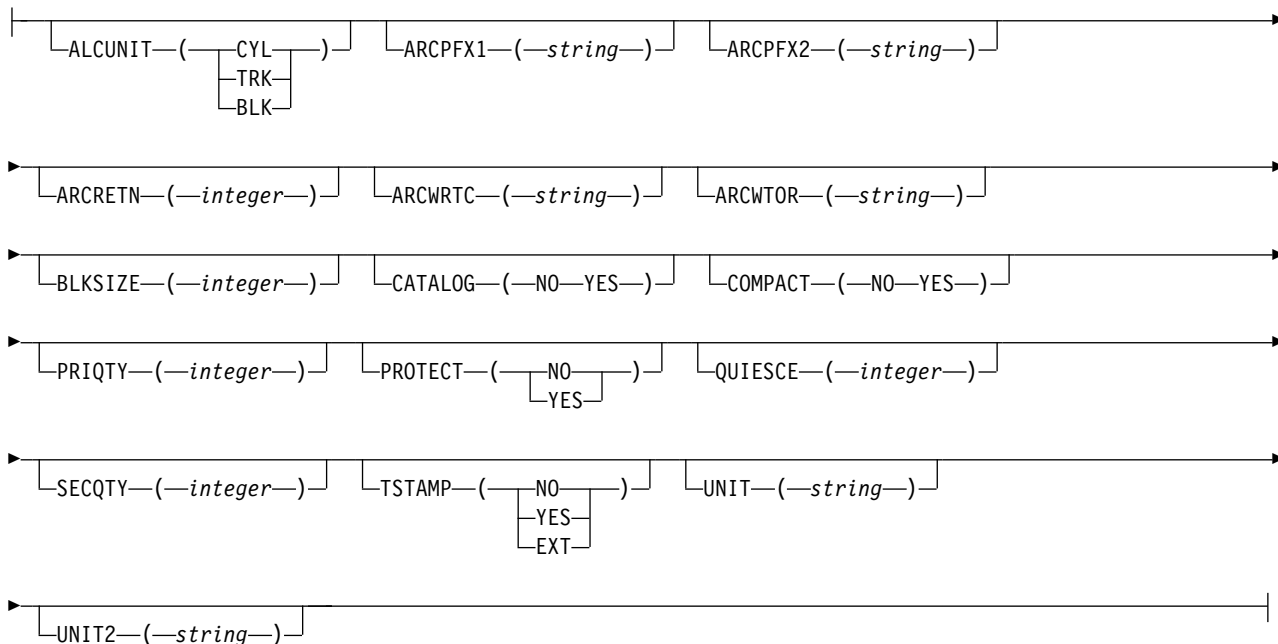

- Syntax diagram
- “Usage notes for SET ARCHIVE” on page 982
- “Parameter descriptions for SET ARCHIVE” on page 982
- “Parameter block” on page 983

**Synonym:** SET ARC

## SET ARCHIVE

### Parameter Block:

### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.

### Usage notes for SET ARCHIVE

1. The new values will be used at the next archive log offload.
2. The queue manager picks up the values in ZPARM, so the **SET ARCHIVE** values you used in the previous cycle are lost.  
To permanently change the values, either change the CSQ6SYSP parameters and regenerate the parameter module, or put the **SET ARCHIVE** commands into a data set in the CSQINP2 concatenation.

### Parameter descriptions for SET ARCHIVE

#### CMDSCOPE

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

CMDSCOPE cannot be used for commands issued from the first initialization input data set CSQINP1.

- ' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which it was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

You cannot use CMDSCOPE(*qmgr-name*) for commands issued from the first initialization input data set, CSQINP1.

- \* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

You cannot use CMDSCOPE(\*) for commands issued from CSQINP1.

## DEFAULT

Resets all the archive system parameters to the values set at queue manager startup.

## Parameter block

 For a full description of these parameters, see Using CSQ6ARVP.

Parameter block is any one or more of the following parameters that you want to change:

### ALCUNIT

Specifies the unit in which primary and secondary space allocations are made.

Specify one of:

**CYL** Cylinders

**TRK** Tracks

**BLK** Blocks

### ARCPFX1

Specifies the prefix for the first archive log data set name.

See the TSTAMP parameter for a description of how the data sets are named and for restrictions on the length of ARCPFX1.

### ARCPFX2

Specifies the prefix for the second archive log data set name.

See the TSTAMP parameter for a description of how the data sets are named and for restrictions on the length of ARCPFX2.

### ARCRETN

Specifies the retention period, in days, to be used when the archive log data set is created.

The parameter must be in the range zero - 9999.

 For more information about discarding archive log data sets, see Discarding archive log data sets.

### ARCWRTC

Specifies the list of z/OS routing codes for messages about the archive log data sets to the operator.

Specify up to 14 routing codes, each with a value in the range 1 through 16. You must specify at least one code. Separate codes in the list by commas, not by blanks.

For more information about z/OS routing codes, see the *MVS Routing and Descriptor Codes* manual.

**ARCWTOR**

Specifies whether a message is to be sent to the operator and a reply received before attempting to mount an archive log data set.

Other IBM MQ users might be forced to wait until the data set is mounted, but they are not affected while IBM MQ is waiting for the reply to the message.

Specify either:

**YES** The device needs a long time to mount archive log data sets. For example, a tape drive. (The synonym is **Y**.)

**NO** The device does not have long delays. For example, DASD. (The synonym is **N**.)

**BLKSIZE**

Specifies the block size of the archive log data set. The block size you specify must be compatible with the device type you specify in the **UNIT** parameter.

The parameter must be in the range 4 097 through 28 672. The value you specify is rounded up to a multiple of 4 096.

This parameter is ignored for data sets that are managed by the storage management subsystem (SMS).

**CATALOG**

Specifies whether archive log data sets are cataloged in the primary integrated catalog facility (ICF) catalog.

Specify either:

**NO** Archive log data sets are not cataloged. (The synonym is **N**.)

**YES** Archive log data sets are cataloged. (The synonym is **Y**.)

**COMPACT**

Specifies whether data written to archive logs is to be compacted. This option applies only to a 3480 or 3490 device that has the improved data recording capability (IDRC) feature. When this feature is turned on, hardware in the tape control unit writes data at a much higher density than normal, allowing for more data on each volume. Specify **NO** if you do not use a 3480 device with the IDRC feature or a 3490 base model, with the exception of the 3490E. Specify **YES** if you want the data to be compacted.

Specify either:

**NO** Do not compact the data sets. (The synonym is **N**.)

**YES** Compact the data sets. (The synonym is **Y**.)

**PRIQTY**

Specifies the primary space allocation for DASD data sets in ALCUNITs.

The value must be greater than zero.

This value must be sufficient for a copy of either the log data set or its corresponding BSDS, whichever is the larger.

**PROTECT**

Specifies whether archive log data sets are to be protected by discrete ESM (external security manager) profiles when the data sets are created.

Specify either:

**NO** Profiles are not created. (The synonym is **N**.)

**YES** Discrete data set profiles are created when logs are offloaded. (The synonym is **Y**.) If you specify **YES**:

- ESM protection must be active for IBM MQ.

- The user ID associated with the IBM MQ address space must have authority to create these profiles.
- The TAPEVOL class must be active if you are archiving to tape.

Otherwise, offloads will fail.

#### **QUIESCE**

Specifies the maximum time in seconds allowed for the quiesce when an ARCHIVE LOG command is issued with MODE QUIESCE specified.

The parameter must be in the range 1 through 999.

#### **SECQTY**

Specifies the secondary space allocation for DASD data sets in ALCUNITs.

The parameter must be greater than zero.

#### **TSTAMP**

Specifies whether the archive log data set name has a time stamp in it.

Specify either:

**NO** Names do not include a time stamp. (The synonym is **N**.) The archive log data sets are named:

*arcpxi.A nnnnnn*

Where *arcpxi* is the data set name prefix specified by ARCPFX1 or ARCPFX2. *arcpxi* can have up to 35 characters.

**YES** Names include a time stamp. (The synonym is **Y**.) The archive log data sets are named:

*arcpxi.cyyddd.T hhmsst.A nnnnnn*

where *c* is 'D' for the years up to and including 1999 or 'E' for the year 2000 and later, and *arcpxi* is the data set name prefix specified by ARCPFX1 or ARCPFX2. *arcpxi* can have up to 19 characters.

**EXT** Names include a time stamp. The archive log data sets are named:

*arcpxi.D yyyyddd.T hhmsst.A nnnnnn*

Where *arcpxi* is the data set name prefix specified by ARCPFX1 or ARCPFX2. *arcpxi* can have up to 17 characters.

#### **UNIT**

Specifies the device type or unit name of the device that is used to store the first copy of the archive log data set.

Specify a device type or unit name of 1 through 8 characters.

If you archive to DASD, you can specify a generic device type with a limited volume range.

#### **UNIT2**

Specifies the device type or unit name of the device that is used to store the second copy of the archive log data sets.

Specify a device type or unit name of 1 through 8 characters.

If this parameter is blank, the value set for the UNIT parameter is used.

## SET AUTHREC:

Use the MQSC command SET AUTHREC to set authority records associated with a profile name.

### Using MQSC commands

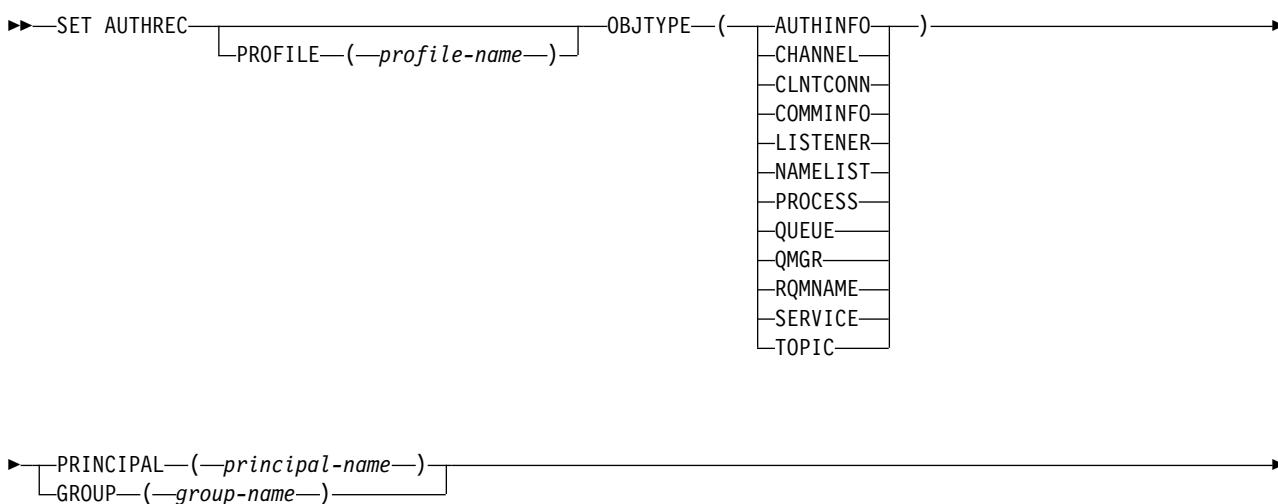

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	

- Syntax diagram
- “Parameter descriptions” on page 987
- Usage notes for SET AUTHREC

See “**setmqaut**” on page 279 for more information on the options that you can select.

## SET AUTHREC

## Parameter descriptions

### PROFILE(*profile-name*)

The name of the object or generic profile for which to display the authority records. This parameter is required unless the **OBJTYPE** parameter is QMGR, in which case it can be omitted.

See Using OAM generic profiles on UNIX, Linux, and Windows systems for more information on generic profiles and wildcard characters.

### OBJTYPE

The type of object referred to by the profile. Specify one of the following values:

#### AUTHINFO

Authentication information record

#### CHANNEL

Channel

#### CLNTCONN

Client connection channel

#### COMMINFO

Communication information object

#### LISTENER

Listener

**NAMELIST**

Namelist

**PROCESS**

Process

**QUEUE**

Queue

**QMGR**

Queue manager

**RQMNAME**

Remote queue manager

**SERVICE**

Service

**TOPIC**

Topic

**PRINCIPAL** (*principal-name*)

A principal name. This is the name of a user for whom to set authority records for the specified profile. On IBM MQ for Windows, the name of the principal can optionally include a domain name, specified in this format: user@domain.

You must specify either PRINCIPAL or GROUP.

**GROUP** (*group-name*)

A group name. This is the name of the user group for which to set authority records for the specified profile. You can specify one name only and it must be the name of an existing user group.

 For IBM MQ for Windows only, the group name can optionally include a domain name, specified in the following format:

GroupName@domain

You must specify either PRINCIPAL or GROUP.

**AUTHADD**

A list of authorizations to add in the authority records. Specify any combination of the following values:

**NONE**

No authorization

**ALTUSR**

Specify an alternative user ID on an MQI call

**BROWSE**Retrieve a message from a queue by issuing an **MQGET** call with the BROWSE option**CHG** Change the attributes of the specified object, using the appropriate command set**CLR** Clear a queue or a topic**CONNECT**Connect an application to a queue manager by issuing an **MQCONN** call**CRT** Create objects of the specified type using the appropriate command set**DLT** Delete the specified object using the appropriate command set**DSP** Display the attributes of the specified object using the appropriate command set**GET** Retrieve a message from a queue by issuing an **MQGET** call**INQ** Make an inquiry on a specific queue by issuing an **MQINQ** call

**PUT** Put a message on a specific queue by issuing an **MQPUT** call

**PASSALL**

Pass all context

**PASSID**

Pass the identity context

**SET** Set attributes on a queue by issuing an **MQSET** call

**SETALL**

Set all context on a queue

**SETID**

Set the identity context on a queue

**SUB** Create, alter, or resume a subscription to a topic using the **MQSUB** call

**RESUME**

Resume a subscription using the **MQSUB** call

**PUB** Publish a message on a topic using the **MQPUT** call

**SYSTEM**

Give authority to principals or groups, who are authorized to carry out privileged operations on the queue manager, for internal system operations.

**CTRL** Start and stop the specified channel, listener, or service, and ping the specified channel

**CTRLX**

Reset or resolve the specified channel

**ALL** Use all operations relevant to the object

all authority is equivalent to the union of the authorities `alladm`, `allmqi`, and `system` appropriate to the object type.

**ALLADM**

Perform all administration operations relevant to the object

**ALLMQI**

Use all MQI calls relevant to the object

**AUTHRMV**

A list of authorizations to remove from the authority records. Specify any combination of the following values:

**NONE**

No authorization

**ALTUSR**

Specify an alternative user ID on an MQI call

**BROWSE**

Retrieve a message from a queue by issuing an **MQGET** call with the **BROWSE** option

**CHG** Change the attributes of the specified object, using the appropriate command set

**CLR** Clear a queue or a topic

**CONNECT**

Connect an application to a queue manager by issuing an **MQCONN** call

**CRT** Create objects of the specified type using the appropriate command set

**DLT** Delete the specified object using the appropriate command set

**DSP** Display the attributes of the specified object using the appropriate command set

- GET** Retrieve a message from a queue by issuing an **MQGET** call
- INQ** Make an inquiry on a specific queue by issuing an **MQINQ** call
- PUT** Put a message on a specific queue by issuing an **MQPUT** call
- PASSALL**  
Pass all context
- PASSID**  
Pass the identity context
- SET** Set attributes on a queue by issuing an **MQSET** call
- SETALL**  
Set all context on a queue
- SETID**  
Set the identity context on a queue
- SUB** Create, alter, or resume a subscription to a topic using the **MQSUB** call
- RESUME**  
Resume a subscription using the **MQSUB** call
- PUB** Publish a message on a topic using the **MQPUT** call
- SYSTEM**  
Use queue manager for internal system operations
- CTRL** Start and stop the specified channel, listener, or service, and ping the specified channel
- CTRLX**  
Reset or resolve the specified channel
- ALL** Use all operations relevant to the object  
all authority is equivalent to the union of the authorities alladm, allmqi, and system appropriate to the object type.
- ALLADM**  
Perform all administration operations relevant to the object
- ALLMQI**  
Use all MQI calls relevant to the object

**Note:** To use SETID or SETALL authority, authorizations must be granted on both the appropriate queue object and also on the queue manager object.

**SERVCOMP(service-component)**

The name of the authorization service for which information is to be set.

If you specify this parameter, it specifies the name of the authorization service to which the authorizations apply. If you omit this parameter, the authority record is set using the registered authorization services in turn in accordance with the rules for chaining authorization services.

**Usage notes for SET AUTHREC**

The list of authorizations to add and the list of authorizations to remove must not overlap. For example, you cannot add display authority and remove display authority with the same command. This rule applies even if the authorities are expressed using different options. For example, the following command fails because DSP authority overlaps with ALLADM authority:

```
SET AUTHREC PROFILE(*) OBJTYPE(Queue) PRINCIPAL(PRINC01) AUTHADD(DSP) AUTHRMV(ALLADM)
```

The exception to this overlap behavior is with the ALL authority. The following command first adds ALL authorities then removes the SETID authority:

```
SET AUTHREC PROFILE(*) OBJTYPE(Queue) PRINCIPAL(PRINC01) AUTHADD(ALL) AUTHRMV(SETID)
```

The following command first removes ALL authorities then adds the DSP authority:

```
SET AUTHREC PROFILE(*) OBJTYPE(Queue) PRINCIPAL(PRINC01) AUTHADD(DSP) AUTHRMV(ALL)
```

Regardless of the order in which they are provided on the command, the ALL are processed first.

### SET CHLAUTH:

Use the MQSC command SET CHLAUTH to create or modify a channel authentication record.

### Using MQSC commands

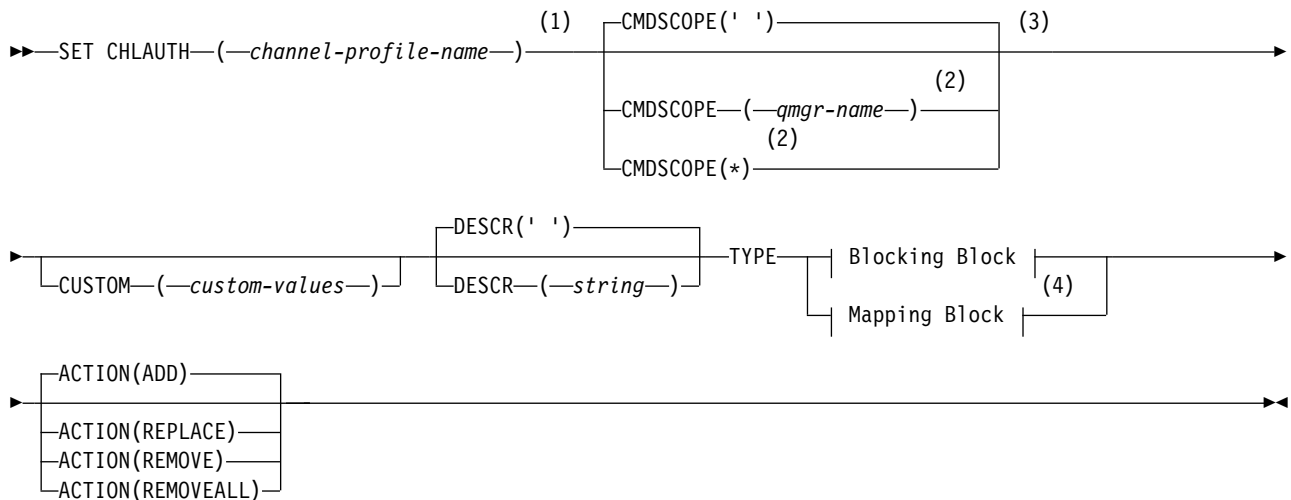

For information on how you use MQSC commands, see [Performing local administration tasks using MQSC commands](#).

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	2CR

**z/OS** For an explanation of the symbols in the z/OS column, see [Using commands on z/OS](#).

- Syntax diagram
- Usage notes
- Parameters

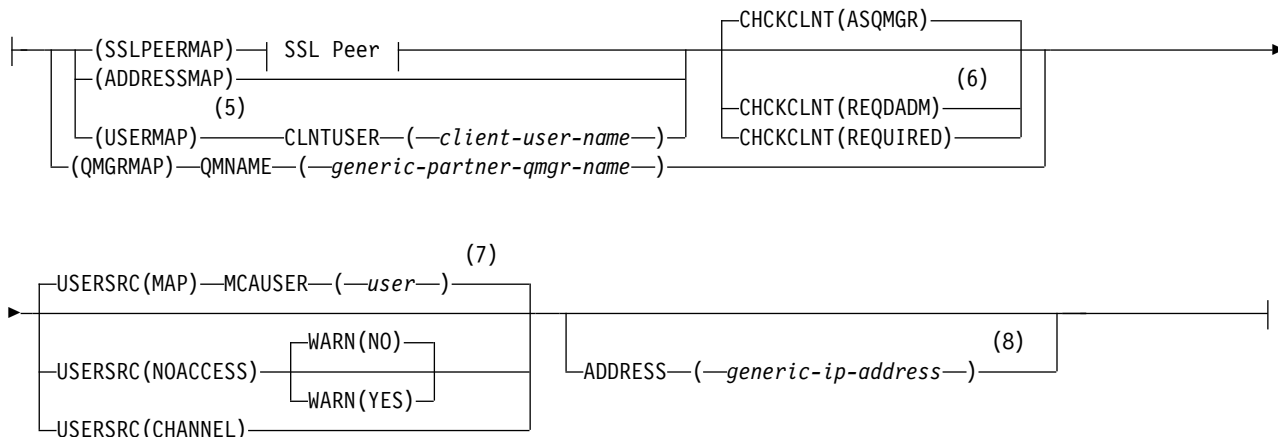

### SET CHLAUTH

## Blocking Block:

## Mapping Block:

## SSL Peer:

## Notes:

- 1 The channel profile name must be '\*' when TYPE is BLOCKADDR.
- 2 Valid only on z/OS when the queue manager is a member of a queue-sharing group.
- 3 Valid only on z/OS.
- 4 Select the appropriate value for TYPE, depending upon the option that you select from the two types of block.
- 5 USERMAP rules apply only to server connection channels.
- 6 Not valid on z/OS.
- 7 If you allow USERSRC to default to MAP, you must set a value for the parameter MCAUSER.
- 8 Mandatory when TYPE is ADDRESSMAP.

## Usage notes

The following table shows which parameters are valid for each value of **ACTION**:

Parameter	Action		
	ADD or REPLACE	REMOVE	REMOVEALL
CHLAUTH	✓	✓	✓
TYPE	✓	✓	✓
> z/OS CMDSCOPE	✓	✓	✓
ACTION	✓	✓	✓
ADDRESS	✓	✓	
ADDRLIST	✓	✓	
CHCKCLNT	✓		
CLNTUSER	✓	✓	
MCAUSER	✓		
QMNAME	✓	✓	
SSLCERTI	✓	✓	
SSLPEER	✓	✓	
USERLIST	✓	✓	
USERSRC	✓		
WARN	✓		
DESCR	✓		

Note the following:

- CHLAUTH rules can be used for any channels
- USERMAP rules are valid, only for server connection channels.
- Changes, such as mapping the MCAUSER of the channel, take effect only when starting a channel. Therefore, if a channel is already running, that channel must be stopped, and restarted, for the CHLAUTH rule changes to take effect.

### Parameters

#### *channel-profile-name*

The name of the channel or set of channels for which you are setting channel authentication configuration. You can use one or more asterisks (\*), in any position, as wildcards to specify a set of channels. If you set **TYPE** to BLOCKADDR, you must set the generic channel name to a single asterisk, which matches all channel names. On z/OS the generic-channel-name must be in quotes if it contains an asterisk.

## TYPE

The **TYPE** parameter must follow the **channel-profile-name** parameter.

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER. This parameter is required. The following values can be used:

### BLOCKUSER

This channel authentication record prevents a specified user or users from connecting. The BLOCKUSER parameter must be accompanied by a USERLIST.

### BLOCKADDR

This channel authentication record prevents connections from a specified IP address or addresses. The BLOCKADDR parameter must be accompanied by an ADDRLIST. BLOCKADDR operates at the listener before the channel name is known.

### SSLPEERMAP

This channel authentication record maps SSL or TLS Distinguished Names (DNs) to MCAUSER values. The SSLPEERMAP parameter must be accompanied by an SSLPEER.

### ADDRESSMAP

This channel authentication record maps IP addresses to MCAUSER values. The ADDRESSMAP parameter must be accompanied by an ADDRESS. ADDRESSMAP operates at the channel.

### USERMAP

This channel authentication record maps asserted user IDs to MCAUSER values. The USERMAP parameter must be accompanied by a CLNTUSER.

### QMGRMAP

This channel authentication record maps remote queue manager names to MCAUSER values. The QMGRMAP parameter must be accompanied by a QMNAME.

## ACTION

The action to perform on the channel authentication record. The following values are valid:

**ADD** Add the specified configuration to a channel authentication record. This is the default value.

For types SSLPEERMAP, ADDRESSMAP, USERMAP and QMGRMAP, if the specified configuration exists, the command fails.

For types BLOCKUSER and BLOCKADDR, the configuration is added to the list.

### REPLACE

Replace the current configuration of a channel authentication record.

For types SSLPEERMAP, ADDRESSMAP, USERMAP and QMGRMAP, if the specified configuration exists, it is replaced with the new configuration. If it does not exist it is added.

For types BLOCKUSER and BLOCKADDR, the configuration specified replaces the current list, even if the current list is empty. If you replace the current list with an empty list, this acts like REMOVEALL.

### REMOVE

Remove the specified configuration from the channel authentication records. If the configuration does not exist the command fails. If you remove the last entry from a list, this acts like REMOVEALL.

### REMOVEALL

Remove all members of the list and thus the whole record (for BLOCKADDR and BLOCKUSER ) or all previously defined mappings (for ADDRESSMAP, SSLPEERMAP, QMGRMAP and USERMAP ) from the channel authentication records. This option cannot be combined with specific values supplied in ADDRLIST, USERLIST, ADDRESS, SSLPEER, QMNAME or CLNTUSER. If the specified type has no current configuration the command still succeeds.

## ADDRESS

**Attention:** Host names can be specified in this parameter, only on queue managers that have IBM MQ Version 8.0 new functions enabled with OPMODE.

The filter to be used to compare with the IP address or hostname of the partner queue manager or client at the other end of the channel. Channel authentication records containing hostnames are only checked if the queue manager is configured to look them up with REVDNS(ENABLED). Details of the values that are allowed as hostnames are defined in the IETF documents RFC 952 and RFC 1123. Hostname matching is not case sensitive.

This parameter is mandatory with **TYPE(ADDRESSMAP)**

This parameter is also valid when **TYPE** is SSLPEERMAP, USERMAP, or QMGRMAP and **ACTION** is ADD, REPLACE, or REMOVE. You can define more than one channel authentication object with the same main identity, for example the same SSL peer name, with different addresses. However, you cannot define channel authentication records with overlapping address ranges for the same main identity. See “Generic IP addresses” on page 998 for more information about filtering IP addresses.

If the address is generic then it must be in quotes.

## ADDRLIST

A list of up to 256 generic IP addresses which are banned from accessing this queue manager on any channel. This parameter is only valid with TYPE(BLOCKADDR). See “Generic IP addresses” on page 998 for more information about filtering IP addresses.

If the address is generic then it must be in quotes.

## CHCKCLNT

Specifies whether the connection that matches this rule and is being allowed in with **USERSRC(CHANNEL)** or **USERSRC(MAP)**, must also specify a valid user ID and password. The password cannot contain single quotation marks ( ' ).

**Attention:** This parameter is valid only on queue managers that have IBM MQ Version 8.0 new functions enabled with OPMODE.

## REQDADM

A valid user ID and password are required for the connection to be allowed if you are using a privileged user ID. The password cannot contain single quotation marks ( ' ).

Any connections using a non-privileged user ID are not required to provide a user ID and password. The user id and password are checked against the user repository details provided in an authentication information object and supplied on **ALTER QMGR** in the **CONNAUTH** field. If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

 This option is not valid on z/OS platforms.

## REQUIRED

A valid user ID and password are required for the connection to be allowed. The password cannot contain single quotation marks ( ' ).

The user id and password are checked against the user repository details provided in an authentication information object and supplied on **ALTER QMGR** in the **CONNAUTH** field. If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

**ASQMGR** In order for the connection to be allowed, it must meet the connection authentication requirements defined on the queue manager.

If the **CONNAUTH** field provides an authentication information object, and the value of **CHCKCLNT** is REQUIRED, the connection fails unless a valid user ID and password are supplied. If the

**CONNAUTH** field does not provide an authentication information object, or the value of **CHCKCLNT** is not **REQUIRED**, the user ID and password are not required.

**Attention:** If you select **REQUIRED** or **REQADM**  ( on platforms other than z/OS), and you have not set the **CONNAUTH** field on the queue manager, or the value of **CHCKCLNT** is **NONE**, the connection fails. You receive message **AMQ9793**  on platforms other than z/OS, and message **CSQX793E** on z/OS.

This parameter is valid only with **TYPE(USERMAP)**, **TYPE(ADDRESSMAP)**, and **TYPE(SSLPEERMAP)** and only when **USERSRC** is not set to **NOACCESS**. It only applies to inbound connections which are **SVRCONN** channels.

Example rules that use this attribute:

- Anything in the defined network can use an asserted user ID if a valid password is supplied:

```
SET CHLAUTH('* .SVRCONN') +  
    TYPE(ADDRESSMAP) ADDRESS('192.0.2.*') +  
    USERSRC(CHANNEL) CHCKCLNT(REQUIRED)
```

- This rule ensures that SSL authentication must succeed before processing client authentication according to the policy set at the queue manager:

```
SET CHLAUTH('SSL .APP1.SVRCONN') +  
    TYPE(SSLPEERMAP) SSLPEER('CN="Steve Smith", L="BankA"') +  
    MCAUSER(SSMITH) CHCKCLNT(ASQMGR)
```

## CLNTUSER

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked.

This can be the user ID flowed from the client indicating the user ID the client side process is running under, or the user ID presented by the client on an **MQCONN** call using **MQCSP**.

The maximum length of the string is **MQ\_CLIENT\_USER\_ID\_LENGTH**.

## **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is run when the queue manager is a member of a queue-sharing group.

' ' The command is run on the queue manager on which it was entered. This is the default value.

### *qmgr-name*

The command is run on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

- \* The command is run on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect is the same as entering the command on every queue manager in the queue-sharing group.

## CUSTOM

Reserved for future use.

## DESCR

Provides descriptive information about the channel authentication record, which is displayed when you issue the **DISPLAY CHLAUTH** command. It must contain only displayable characters. The maximum length is 64 characters. In a DBCS installation, it can contain DBCS characters (subject to a maximum length of 64 bytes).

**Note:** Use characters from the coded character set identifier (CCSID) for this queue manager. Other characters might be translated incorrectly if the information is sent to another queue manager.

## MCAUSER

The user identifier to be used when the inbound connection matches the SSL or TLS DN, IP address, client asserted user ID or remote queue manager name supplied.

This parameter is mandatory with **USERSRC(MAP)** and is valid when **TYPE** is SSLPEERMAP, ADDRESSMAP, USERMAP, or QMGRMAP.

If you use lower case user IDs you must enclose them in quotation marks: For example:

```
SET CHLAUTH('SYSTEM.DEF.SVRCONN') TYPE(USERMAP) CLNTUSER(' johndoe') +
  USERSRC(MAP) MCAUSER(JOHNDOE1) +
  ADDRESS('::FFFF:9.20.4.136') +
  DESCR('Client from z/Linux machine') +
  ACTION(REPLACE)
```

This allows the lower case user ID to use channel SYSTEM.DEF.SVRCONN on IP address ::FFFF:9.20.4.136. The MCA user for the connection is JOHNDOE1.

If you display the Channel Status (CHS) of the channel, the output is MCAUSER(JOHNDOE1).

This parameter can be used only when **ACTION** is ADD or REPLACE.

## QMNAME

The name of the remote partner queue manager, or pattern that matches a set of queue manager names, to be mapped to a user ID or blocked.

This parameter is valid only with **TYPE(QMGRMAP)**.

If the queue manager name is generic then it must be in quotes.

## SSLCERTI

**Attention:** This parameter is valid only on queue managers that have IBM MQ Version 8.0 new functions enabled with OPMODE.

This parameter is additional to the **SSLPEER** parameter.

**SSLCERTI** restricts matches to being within certificates issued by a particular Certificate Authority.

A blank **SSLCERTI** acts like a wildcard, matches any Issuer Distinguished Name.

## SSLPEER

The filter to use to compare with the Subject Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel.

The **SSLPEER** filter is specified in the standard form used to specify a Distinguished Name. See IBM MQ rules for SSLPEER values for details.

The maximum length of the parameter is 1024 bytes.

## USERLIST

A list of up to 100 user IDs which are banned from use of this channel or set of channels. Use the special value \*MQADMIN to mean privileged or administrative users. The definition of this value depends on the operating system, as follows:

- On Windows, all members of the mqm group, the Administrators group and SYSTEM.
- On UNIX and Linux, all members of the mqm group.
- On IBM i, the profiles (users) qmqm and qmqmadm and all members of the qmqmadm group, and any user defined with the \*ALLOBJ special setting.
-  On z/OS, the user ID that the channel initiator, queue manager and advanced message security address spaces are running under.

For more information about privileged users, see Privileged users.

This parameter is only valid with **TYPE(BLOCKUSER)**.

## USERSRC

The source of the user ID to be used for MCAUSER at run time. The following values are valid:

**MAP** Inbound connections that match this mapping use the user ID specified in the **MCAUSER** attribute. This is the default value.

## NOACCESS

Inbound connections that match this mapping have no access to the queue manager and the channel ends immediately.

## CHANNEL

Inbound connections that match this mapping use the flowed user ID or any user defined on the channel object in the MCAUSER field.

Note that WARN and USERSRC(CHANNEL), or USERSRC(MAP) are incompatible. This is because channel access is never blocked in these cases, so there is never a reason to generate a warning.

## WARN

Indicates whether this record operates in warning mode.

**NO** This record does not operate in warning mode. Any inbound connection that matches this record is blocked. This is the default value.

**YES** This record operates in warning mode. Any inbound connection that matches this record and would therefore be blocked is allowed access. An error message is written and, if channel events are configured, a channel event message is created showing the details of what would have been blocked, see Channel Blocked. The connection is allowed to continue. An attempt is made to find another record that is set to WARN(NO) to set the credentials for the inbound channel.

## Related information:

Channel authentication records

Securing remote connectivity to the queue manager

*Generic IP addresses:*

In the various commands that create and display channel authentication records, you can specify certain parameters as either a single IP address or a pattern to match a set of IP addresses.

When you create a channel authentication record, using the MQSC command SET CHLAUTH or the PCF command Set Channel Authentication Record, you can specify a generic IP address in various contexts. You can also specify a generic IP address in the filter condition when you display a channel authentication record using the commands DISPLAY CHLAUTH or Inquire Channel Authentication Records .

You can specify the address in any of the following ways:

- a single IPv4 address, such as 192.0.2.0
- a pattern based on an IPv4 address, including an asterisk (\*) as a wildcard. The wildcard represents one or more parts of the address, depending on context. For example, the following are all valid values:
  - 192.0.2.\*
  - 192.0.\*
  - 192.0.\*.2
  - 192.\*.2
  - \*
- a pattern based on an IPv4 address, including a hyphen (-) to indicate a range, for example 192.0.2.1-8
- a pattern based on an IPv4 address, including both an asterisk and a hyphen, for example 192.0.\*.1-8

- a single IPv6 address, such as 2001:DB8:0:0:0:0:0:0
- a pattern based on an IPv6 address including an asterisk (\*) as a wildcard. The wildcard represents one or more parts of the address, depending on context. For example, the following are all valid values:
  - 2001:DB8:0:0:0:0:0:\*
  - 2001:DB8:0:0:0:\*
  - 2001:DB8:0:0:0:\*:0:1
  - 2001:\*.1
  - \*
- a pattern based on an IPv6 address, including a hyphen (-) to indicate a range, for example 2001:DB8:0:0:0:0:0:0-8
- a pattern based on an IPv6 address, including both an asterisk and a hyphen, for example 2001:DB8:0:0:0:\*:0:0-8

If your system supports both IPv4 and IPv6, you can use either address format. IBM MQ recognizes IPv4 mapped addresses in IPv6.

Certain patterns are invalid:

- A pattern cannot have fewer than the required number of parts, unless the pattern ends with a single trailing asterisk. For example 192.0.2 is invalid, but 192.0.2.\* is valid.
- A trailing asterisk must be separated from the rest of the address by the appropriate part separator (a dot (.) for IPv4, a colon (:)) for IPv6). For example, 192.0\* is not valid because the asterisk is not in a part of its own.
- A pattern may contain additional asterisks provided that no asterisk is adjacent to the trailing asterisk. For example, 192.\*.2.\* is valid, but 192.0.\*.\* is not valid.
- An IPv6 address pattern cannot contain a double colon and a trailing asterisk, because the resulting address would be ambiguous. For example, 2001::\* could expand to 2001:0000:\*, 2001:0000:0000:\* and so on

**Related information:**

Mapping an IP address to an MCAUSER user ID

**SET LOG:** z/OS

Use the MQSC command SET LOG to dynamically change certain log system parameter values that were initially set by your system parameter module at queue manager startup.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			12CR

z/OS For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes for SET LOG” on page 1000
- “Parameter descriptions for SET LOG” on page 1000
- “Parameter block” on page 1001

**Synonym:** SET LOG

## SET LOG

### Parameter Block:

### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.

### Usage notes for SET LOG

1. Any changes to WRTHRSH take immediate effect.
2. Any change to MAXARCH takes effect for the next scheduled offload (that is, not for any offload in progress at the time the command is issued).

### Parameter descriptions for SET LOG

#### CMDSCOPE

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

" The command is executed on the queue manager on which it was entered. This is the default value.

#### *qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which it was entered, only if you are using a queue-sharing group environment and if the command server is enabled. You cannot use `CMDSCOPE(qmgr-name)` for commands issued from the first initialization input data set, CSQINP1.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

You cannot use `CMDSCOPE(*)` for commands issued from CSQINP1.

#### DEFAULT

Reset all the log system parameters to the values specified at queue manager startup.

## Parameter block

► **z/OS** For a full description of these parameters, see Using CSQ6LOGP.

Parameter block is any one or more of the following parameters that you want to change:

### COMPLOG

This parameter specifies whether compression is used by the queue manager when writing log records. Any compressed records are automatically decompressed irrespective of the current COMPLOG setting.

The possible values are:

**ANY** Enable the queue manager to select the compression algorithm that gives the greatest degree of log record compression. Using this option currently results in RLE compression.

**NONE** No log data compression is used. This is the default value.

**RLE** Log data compression is performed using run-length encoding (RLE).

► **z/OS** For more details about log compression, see Log compression.

### DEALLCT

Specifies the length of time that an allocated archive read tape unit is allowed to remain unused before it is deallocated. You are recommended to specify the maximum possible values, within system constraints, for both options to achieve the optimum performance for reading archive tapes.

This, together with the MAXRTU parameter, allows IBM MQ to optimize archive log reading from tape devices.

The possible values are:

*integer*

Specifies the maximum time in minutes, in the range 0 through 1439. Zero means that a tape unit is deallocated immediately.

#### **NOLIMIT or 1440**

Indicates that the tape unit is never deallocated.

### MAXARCH

Specifies the maximum number of archive log volumes that can be recorded in the BSDS. When this number is exceeded, recording begins again at the start of the BSDS.

Use a decimal number in the range 10 through 1000.

### MAXCNOFF

Maximum number of concurrent log offload tasks.

Specify a decimal number between 1 and 31. If no value is specified the default of 31 applies.

Configure a number lower than the default if your archive logs are allocated on a tape device, and there are constraints on the number of such devices that can be concurrently allocated to the queue manager.

### MAXRTU( *integer* )

Specifies the maximum number of dedicated tape units that can be allocated to read archive log tape volumes. This overrides the value for MAXRTU set by CSQ6LOGP in the archive system parameters.

This, together with the DEALLCT parameter, allows IBM MQ to optimize archive log reading from tape devices.

#### **Note:**

1. The integer value can be in the range 1 - 99.

2. If the number specified is greater than the current specification, the maximum number of tape units allowable for reading archive logs increases.
3. If the number specified is less than the current specification, tape units that are not being used are immediately deallocated to adjust to the new value. Active, or premounted, tape units remain allocated.
4. A tape unit is a candidate for deallocation because of a lowered value only if there is no activity for the unit.
5. When you are asked to mount an archive tape and you reply CANCEL, the MAXRTU value is reset to the current number of tape units.

For example, if the current value is 10, but you reply CANCEL to the request for the seventh tape unit, the value is reset to six.

### WRTHRS

Specifies the number of 4 KB output buffers to be filled before they are written to the active log data sets.

The larger the number of buffers, the less often the write takes place, and this improves the performance of IBM MQ. The buffers might be written before this number is reached if significant events, such as a commit point, occur.

Specify the number of buffers in the range 1 through 256.

### SET POLICY:

Use the MQSC command SET POLICY to set a security policy.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

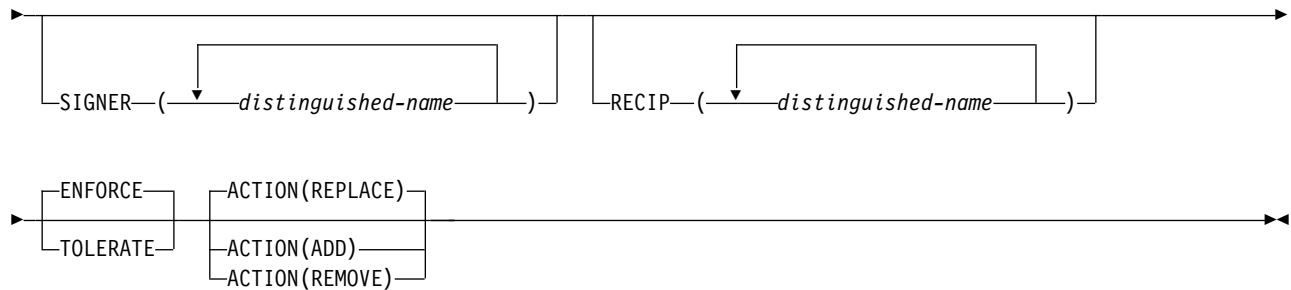

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	

- Syntax diagram
- “Parameter descriptions for SET POLICY” on page 1003

**Important:** You must have an IBM MQ Advanced Message Security (AMS) license installed to issue this command. If you attempt to issue the **SET POLICY** command without an AMS license installed, you receive message AMQ7155 - License file not found or not valid.

### SET POLICY

## Parameter descriptions for SET POLICY

*(policy-name)*

Name of the policy, required.

The policy name must match the name of the queue which is to be protected.

## SIGNALG

Specifies the digital signature algorithm from one of the following values:

- NONE
- MD5
- SHA1
- SHA256
- SHA384
- SHA512

The default value is NONE.

## ENCALG

Specifies the digital encryption algorithm from one of the following values:

- NONE
- RC2
- DES
- 3DES
- AES128
- AES256

The default value is NONE.

**RECIPIENT** *(distinguished-name)*

Specifies the message distinguished name (DN) of the recipient, that is, the certificate of a DN provided used to encrypt a given message.

### Notes:

1. The attributes names for DNs must be provided in capital letters.
2. Commas must be used as a name separator.
3. You must specify at least one recipient, if you use any encryption algorithm other than NONE.

You can specify multiple **RECIPIENT** parameters on the same policy.

**SIGNER** *(distinguished-name)*

Specifies a signature DN that is validated during the message retrieval. Only messages signed by the user, with a DN provided, are accepted during retrieval.

**Notes:**

1. The attributes name for DN's must be provided in capital letters.
2. Commas must be used as a name separator.
3. You can specify signature DN's, only if you use any signature algorithm other than NONE.

You can specify multiple **SIGNER** parameters on the same policy.

**ENFORCE**

Specifies that all messages must be protected when retrieved from the queue.

Any unprotected message encountered is moved to the SYSTEM.PROTECTION.ERROR.QUEUE.

**ENFORCE** is the default value.

**TOLERATE**

Specifies that the messages that are not protected when retrieved from the queue can ignore the policy.

**TOLERATE** is optional and exists to facilitate staged implementation, where:

- Policies have been applied to queues, but those queues might already contain unprotected messages, or
- Queues might still receive messages from remote systems that do not yet have the policy set.

**ACTION**

Specify the action for the parameters supplied, as they apply to any existing policy, using one of the following values:

**REPLACE**

Has the effect of replacing any existing policy with the parameters supplied.

**ADD** Has the effect that signers and recipients parameters have an additive effect. That is, if a signer or recipient is specified, and does not already exist in a preexisting policy, the signer or recipient value is added to the existing policy definition.

**REMOVE**

Has the opposite effect of *ADD*. That is, if any of the signer or recipient values specified exist in a preexisting policy, those values are removed from the policy definition.

*REPLACE* is the default value.

**SET SYSTEM:** z/OS

Use the MQSC command SET SYSTEM to dynamically change certain general system parameter values that were initially set from your system parameter module at queue manager startup. To permanently change these, either change the CSQ6SYSP parameters and regenerate the parameter module, or put the SET SYSTEM commands into a data set in the CSQINP2 concatenation.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			12CR

z/OS For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- "Usage notes for SET SYSTEM" on page 1005

- "Parameter descriptions for SET SYSTEM"
- "Parameter block" on page 1006

**Synonym:** None

## SET SYSTEM

### Parameter Block:

### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.

The CTHREAD, IDFORE, and IDBACK parameters are ignored in IBM WebSphere MQ Version 7.1 or later, but are still allowed for compatibility with earlier versions. Any attempt to change the value of one of these parameters sets it to a default value of 32767.

### Usage notes for SET SYSTEM

The new values take immediate effect, with the possible exception of STATIME and TRACTBL.

Changes to STATIME take effect when the current interval expires, unless the new interval is less than the unexpired portion of the current interval, in which case statistics are gathered immediately and the new interval then takes effect.

For TRACTBL, if there is any trace currently in effect, the existing trace table continues to be used, and its size is unchanged. A new global trace table is only obtained for a new START TRACE command. If a new trace table is created with insufficient storage, the old trace table continues to be used, and the message CSQW153E is displayed.

### Parameter descriptions for SET SYSTEM

#### CMDSCOPE

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

- ' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which it was entered, only if you are using a queue-sharing group environment and if the command

server is enabled. You cannot use CMDSCOPE( *qmgr-name*) for commands issued from the first initialization input data set, CSQINP1.

- \* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

You cannot use CMDSCOPE(\*) for commands issued from CSQINP1.

## DEFAULT

Resets all the general system parameters to the values set at queue manager startup.

## Parameter block

 For a full description of these parameters, see Using CSQ6SYSP.

Parameter block is any one or more of the following parameters that you want to change:

### ACELIM

Specifies the maximum size of the ACE storage pool in 1 KB blocks. The number must be in the range 0-999999. The default value of zero means no imposed constraint, beyond what is available in the system.

You should only set a value for ACELIM on queue managers that have been identified as using exorbitant quantities of ECSA storage. Limiting the ACE storage pool has the effect of limiting the number of connections in the system, and so, the amount of ECSA storage used by a queue manager.

Once the queue manager reaches the limit it is not possible for applications to obtain new connections. The lack of new connections causes failures in MQCONN processing, and applications coordinated through RRS are likely to experience failures in any IBM MQ API.

An ACE represents approximately 8% of the total ECSA required for the thread-related control blocks for a connection. So, for example, specifying ACELIM=5120 would be expected to cap the total amount of ECSA allocated by the queue manager (for thread-related control blocks) at approximately 64000K; that is 5120 multiplied by 12.5.

In order to cap the amount total amount of ECSA allocated by the queue-manager, for thread-related control blocks at 5120K, an ACELIM value of 410 is required.

You can use SMF 115 subtype 5 records, produced by statistics CLASS(3) trace, to monitor the size of the 'ACE/PEB' storage pool, and hence set an appropriate value for ACELIM.

You can obtain the total amount of ECSA storage used by the queue-manager, for control blocks, from SMF 115 subtype 7 records, written by statistics CLASS(2) trace; that is the first two elements in QSRSPHBT added together.

Note that, you should consider setting ACELIM as a mechanism to protect a z/OS image from a badly behaving queue manager, rather than as a means to control application connections to a queue manager.

### EXCLMSG

Specify a list of message identifiers to be excluded from being written to any log. Messages in this list are not sent to the z/OS console and hardcopy log. As a result using the EXCLMSG parameter to exclude messages is more efficient from a CPU perspective than using z/OS mechanisms such as the message processing facility list and should be used instead where possible. This list is dynamic and is updated using the SET SYSTEM command.

The default value is an empty list ( ).

Message identifiers are supplied without the CSQ prefix and without the action code suffix (I-D-E-A). For example, to exclude message CSQX500I, add X500 to this list. This list can contain a maximum of 16 message identifiers.

To be eligible to be included in the list, the message must be issued after normal start up of the MSTR or CHIN address spaces and begin with the one of the following characters E, H, I, J, L, M, N, P, R, T, V, W, X, Y, 2, 3, 5, 9.

Message identifiers that are issued as a result of processing commands can be added to the list, however are not excluded.

For example:

```
SET SYSTEM EXCLMSG(X511,X512)
```

suppresses the channel started and channel no longer active messages.

#### **LOGLOAD**

Specifies the number of log records that IBM MQ writes between the start of one checkpoint and the next. IBM MQ starts a new checkpoint after the number of records that you specify has been written.

Specify a value in the range 200 through 16 000 000.

#### **SERVICE**

This parameter is reserved for use by IBM.

#### **STATIME**

Specifies the interval, in minutes, between consecutive gatherings of statistics.

Specify a number in the range zero through 1440.

If you specify a value of zero, both statistics data and accounting data is collected at the SMF data collection broadcast.

#### **TRACTBL**

Specifies the default size, in 4 KB blocks, of trace table where the global trace facility stores IBM MQ trace records.

Specify a value in the range 1 through 999.

**Note:** Storage for the trace table is allocated in the ECSA. Therefore, you must select this value with care.

#### **START CHANNEL:**

Use the MQSC command `START CHANNEL` to start a channel.

#### **Using MQSC commands**

For information on how you use MQSC commands, see [Performing local administration tasks using MQSC commands](#).

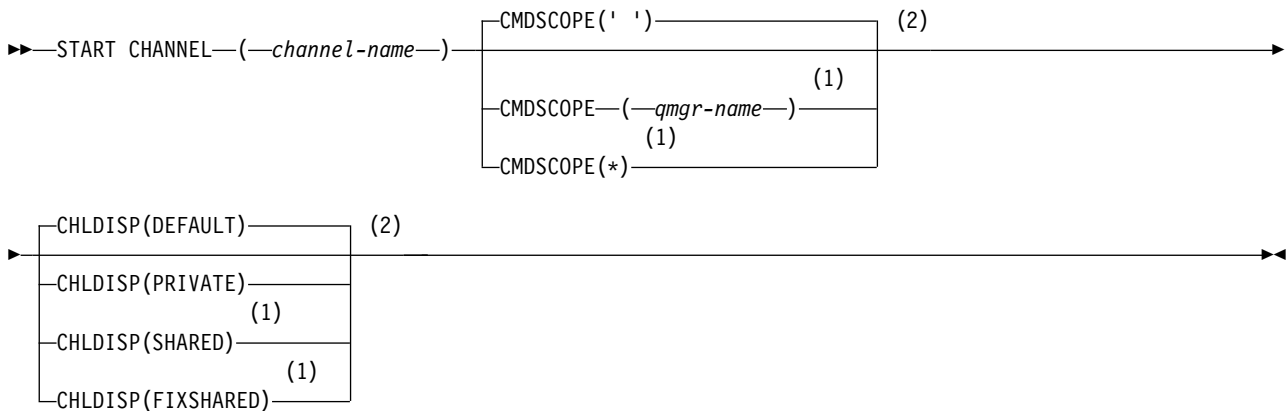

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	CR

 For an explanation of the symbols in the z/OS column, see [Using commands on z/OS](#).

- [Syntax diagram](#)
- [“Usage notes” on page 1008](#)
- [“Parameter descriptions for START CHANNEL” on page 1008](#)

**Synonym:** STA CHL

## START CHANNEL

### Notes:

- 1 Valid only on z/OS when the queue manager is a member of a queue-sharing group.
- 2 Valid only on z/OS.

### Usage notes

1. **z/OS** On z/OS, the command server and the channel initiator must be running.
2. This command can be issued to a channel of any type except CLNTCONN channels (including those that have been defined automatically). If, however, it is issued to a receiver (RCVR), server-connection (SVRCONN) or cluster-receiver (CLUSRCVR) channel, the only action is to enable the channel, not to start it.
3. Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel. If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the channel that was last added to the local queue manager's repository.

### Parameter descriptions for START CHANNEL

(channel-name)

The name of the channel definition to be started. This is required for all channel types. The name must be that of an existing channel.

#### **z/OS** CHLDISP

This parameter applies to z/OS only and can take the values of:

- DEFAULT
- PRIVATE
- SHARED
- FIXSHARED

If this parameter is omitted, then the DEFAULT value applies. This is taken from the default channel disposition attribute, DEFCDISP, of the channel object.

In conjunction with the various values of the CMDSCOPE parameter, this parameter controls two types of channel:

#### **SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue-sharing group.

A sending channel is shared if its transmission queue has a disposition of SHARED.

**PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than SHARED.

**Note:** This disposition is not related to the disposition set by the disposition of the queue-sharing group of the channel definition.

The combination of the CHLDISP and CMDSCOPE parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of CHLDISP and CMDSCOPE are summarized in the following table:

*Table 111. CHLDISP and CMDSCOPE for START CHANNEL*

CHLDISP	CMDSCOPE( ) or CMDSCOPE (local-qmgr)	CMDSCOPE (qmgr-name)	CMDSCOPE(*)
PRIVATE	Start as a private channel on the local queue manager	Start as a private channel on the named queue manager	Start as a private channel on all active queue managers
SHARED	<p>For a shared SDR, RQSTR, and SVR channel, start as a shared channel on the most suitable queue manager in the group.</p> <p>For a shared RCVR and SVRCONN channel, start the channel as a shared channel on all active queue managers.</p> <p>For a shared CLUSSDR or CLUSRCVR channel, this option is not permitted.</p> <p>This might automatically generate a command using CMDSCOPE and send it to the appropriate queue managers. If there is no definition for the channel on the queue managers to which the command is sent, or if the definition is unsuitable for the command, the action fails there.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is actually run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted

Table 111. CHLDISP and CMDSCOPE for START CHANNEL (continued)

CHLDISP	CMDSCOPE( ) or CMDSCOPE (local-qmgr)	CMDSCOPE (qmgr-name)	CMDSCOPE(*)
FIXSHARED	For a shared SDR, RQSTR, and SVR channel, with a nonblank CONNAME, start as a shared channel on the local queue manager.  For all other types, this option is not permitted.	For a shared SDR, RQSTR, and SVR with a nonblank CONNAME, start as a shared channel on the named queue manager.  For all other types, this option is not permitted.	Not permitted

Channels started with CHLDISP(FIXSHARED) are tied to the specific queue manager; if the channel initiator on that queue manager stops for any reason, the channels are not recovered by another queue manager in the group. For more information about SHARED and FIXSHARED channels, see Starting a shared channel.

**z/OS** **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

If CHLDISP is set to SHARED, CMDSCOPE must be blank or the local queue manager.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name only if you are using a queue-sharing group environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

This option is not permitted if CHLDISP is FIXSHARED.

**START CHANNEL (MQTT):**

Use the MQSC command START CHANNEL to start an IBM MQ Telemetry channel.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	AIX and Linux	Windows	z/OS
	✓	✓	

The START CHANNEL (MQTT) command is only valid for IBM MQ Telemetry channels. Supported platforms for IBM MQ Telemetry are AIX, Linux, Windows.

**Synonym:** STA CHL

## START CHANNEL

▶▶ START CHANNEL—(*channel-name*)—CHLTYPE—(MQTT)—▶▶

### Parameter descriptions for START CHANNEL

(*channel-name*)

The name of the channel definition to be started. The name must be that of an existing channel.

CHLTYPE

Channel type. The value must be MQTT.

**START CHINIT:** ▶ z/OS

Use the MQSC command START CHINIT to start a channel initiator.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			2CR

▶ z/OS For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes”
- “Parameter descriptions for START CHINIT” on page 1012

**Synonym:** STA CHI

### Syntax diagram

#### START CHINIT

▶▶ START CHINIT—[ENVPARM—(*jcl-substitution*)—]  
 [CMDSCOPE(' ')—]  
 [CMDSCOPE—(*qmgr-name*)—] (1) ▶▶

### Notes:

- 1 Valid only on z/OS when the queue manager is a member of a queue-sharing group.

### Usage notes

1. The command server must be running.
2. Although START CHINIT is permitted from CSQINP2, its processing is not complete (and the channel initiator is not available) until after CSQINP2 processing has finished. For these commands, consider using CSQINPX instead.

## Parameter descriptions for START CHINIT

### CMDSCOPE

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

### ENVPARM( *jcl-substitution* )

The parameters and values to be substituted in the JCL procedure (xxxxCHIN, where xxxx is the queue manager name) that is used to start the channel initiator address space.

*jcl-substitution*

One or more character strings of the form keyword=value enclosed in single quotation marks. If you use more than one character string, separate the strings by commas and enclose the entire list in single quotation marks, for example ENVPARM('HLQ=CSQ,VER=520').

This parameter is valid only on z/OS.

### INITQ( *string* )

The name of the initiation queue for the channel initiation process. This is the initiation queue that is specified in the definition of the transmission queue.

The initiation queue on z/OS is always SYSTEM.CHANNEL.INITQ).

### Related information:

Command resource security checking for alias queues and remote queues

### START CMDSERV:

Use the MQSC command START CMDSERV to initialize the command server.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			12C

 For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes for START CMDSERV” on page 1013

**Synonym:** STA CS

## START CMDSERV

▶—START CMDSERV—▶

### Usage notes for START CMDSERV

1. START CMDSERV starts the command server and allows it to process commands in the system-command input queue (SYSTEM.COMMAND.INPUT), mover commands, and commands using CMDSCOPE.
2. If this command is issued through the initialization files or through the operator console before work is released to the queue manager (that is, before the command server is started automatically), it overrides any earlier STOP CMDSERV command and allows the queue manager to start the command server automatically by putting it into an ENABLED state.
3. If this command is issued through the operator console while the command server is in a STOPPED or DISABLED state, it starts the command server and allows it to process commands on the system-command input queue, mover commands, and commands using CMDSCOPE immediately.
4. If the command server is in a RUNNING or WAITING state (including the case when the command is issued through the command server itself), or if the command server has been stopped automatically because the queue manager is closing down, no action is taken, the command server remains in its current state, and an error message is returned to the command originator.
5. START CMDSERV can be used to restart the command server after it has been stopped, either because of a serious error in handling command messages, or commands using the CMDSCOPE parameter.

### START LISTENER:

Use the MQSC command START LISTENER to start a channel listener.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS

▶ **z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

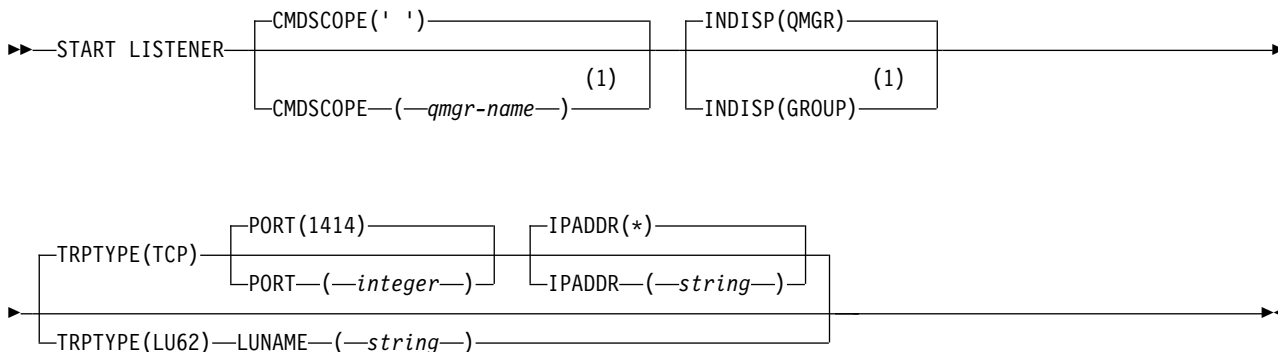

- ▶ **z/OS** Syntax diagram for IBM MQ for z/OS
- Syntax diagram for IBM MQ on other platforms
- “Usage notes” on page 1014
- “Parameter descriptions for START LISTENER” on page 1014

**Synonym:** STA LSTR

▶ **z/OS**

**IBM MQ for z/OS**

## START LISTENER

### Notes:

- 1 Valid only on z/OS when the queue manager is a member of a queue-sharing group.

## IBM MQ on other platforms

### START LISTENER

### Usage notes

1.  On z/OS:
  - a. The command server and the channel initiator must be running.
  - b. If IPADDR is not specified, the listener listens on all available IPv4 and IPv6 addresses.
  - c. For TCP/IP, it is possible to listen on multiple addresses and port combinations.
  - d. For each START LISTENER for TCP/IP request, the address and port combination is added to the list of combinations upon which the listener is currently listening.
  - e. A START LISTENER for TCP/IP request fails if it specifies the same, or a subset or superset of an existing, combination of addresses and ports upon which a TCP/IP listener is currently listening.
  - f. If you are starting a listener on a specific address to provide a secure interface with a security product, for example a firewall, it is important to ensure there is no linkage to the other non-secure interfaces in the system.  
You should disable IP forwarding and routing from other non-secure interfaces so that packets arriving at the other interface do not get passed to this specific address.  
Consult the appropriate TCP/IP documentation for information on how to do this.
2. On IBM i, UNIX systems, and Windows, this command is valid only for channels for which the transmission protocol (TRPTYPE) is TCP.

### Parameter descriptions for START LISTENER

( name )

Name of the listener to be started. If you specify this parameter, you cannot specify any other parameters.

If you do not specify a name  (on platforms other than z/OS), the SYSTEM.DEFAULT.LISTENER.TCP is started.

 This parameter is not valid on z/OS.

▶ **z/OS** **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

▶ **z/OS** **INDISP**

Specifies the disposition of the inbound transmissions that are to be handled. The possible values are:

**QMGR**

Listen for transmissions directed to the queue manager. This is the default.

**GROUP**

Listen for transmissions directed to the queue-sharing group. This is allowed only if there is a shared queue manager environment.

This parameter is valid only on z/OS.

▶ **z/OS** **IPADDR**

IP address for TCP/IP specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form. This is valid only if the transmission protocol (TRPTYPE) is TCP/IP.

This parameter is valid only on z/OS.

▶ **z/OS** **LUNAME( *string* )**

The symbolic destination name for the logical unit as specified in the APPC side information data set. (This must be the same LU that was specified for the queue manager, using the LUNAME parameter of the ALTER QMGR command.)

This parameter is valid only for channels with a transmission protocol (TRPTYPE) of LU 6.2. A START LISTENER command that specifies TRPTYPE(LU62) must also specify the LUNAME parameter.

This parameter is valid only on z/OS.

▶ **z/OS** **PORT( *port-number* )**

Port number for TCP. This is valid only if the transmission protocol (TRPTYPE) is TCP.

This parameter is valid only on z/OS.

▶ **z/OS** **TRPTYPE**

Transport type to be used. This is optional.

**TCP** TCP. This is the default if TRPTYPE is not specified.

**LU62** SNA LU 6.2.

This parameter is valid only on z/OS.

## START QMGR: z/OS

Use the MQSC command START QMGR to initialize the queue manager.

### Using MQSC commands

For information on how you use MQSC commands, see *Performing local administration tasks using MQSC commands*.

IBM i	UNIX and Linux	Windows	z/OS
			C

z/OS For an explanation of the symbols in the z/OS column, see *Using commands on z/OS*.

- Syntax diagram
- “Usage notes”
- “Parameter descriptions for START QMGR”

**Synonym:** STA QMGR

### START QMGR

#### Notes:

- 1 MSTR is accepted as a synonym for ENVPARM

#### Usage notes

When the command has been completed, the queue manager is active and available to CICS, IMS, batch, and TSO applications.

#### Parameter descriptions for START QMGR

These are optional.

##### ENVPARM( *jcl-substitution* )

The parameters and values to be substituted in the JCL procedure (xxxxMSTR, where xxxx is the queue manager name) that is used to start the queue manager address space.

##### *jcl-substitution*

One or more character strings of the form:

keyword=value

enclosed in single quotation marks. If you use more than one character string, separate the strings by commas and enclose the entire list in single quotation marks, for example ENVPARM('HLQ=CSQ,VER=520').

MSTR is accepted as a synonym for ENVPARM

**PARM( *member-name* )**

The load module that contains the queue manager initialization parameters. *member-name* is the name of a load module provided by the installation.

The default is CSQZPARM, which is provided by IBM MQ.

**START SERVICE:**

Use the MQSC command START SERVICE to start a service. The identified service definition is started within the queue manager and inherits the environment and security variables of the queue manager.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	

- Syntax diagram
- “Parameter descriptions for START SERVICE”

**Synonym:**

**START SERVICE**

▶▶—START SERVICE—(—*service-name*—)—————▶▶

**Parameter descriptions for START SERVICE**

( *service-name* )

The name of the service definition to be started. This is required. The name must that of an existing service on this queue manager.

If the service is already running, and the operating system task is active, an error is returned.

**Related information:**

Working with services

**START SMDSCONN:** ▶ z/OS

Use the MQSC command START SMDSCONN to enable a previously stopped connection from this queue manager to the specified shared message data sets, allowing them to be allocated and opened again.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			2CR

- Syntax diagram
- “Parameter descriptions for START SMDSCONN” on page 1018

Synonym:

## START SMDSCONN

### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.

### Parameter descriptions for START SMDSCONN

This command is used after connections have been put into the AVAIL(STOPPED) state by a previous STOP SMDSCONN command. It can also be used to signal to the queue manager to retry a connection which is in the AVAIL(ERROR) state after a previous error.

#### SMDSCONN(*qmgr-name* | \*)

Specify the queue manager which owns the shared message data set for which the connection is to be started or an asterisk to start connections to all shared message data sets associated with the specified structure.

#### CFSTRUCT(*structure-name*)

Specify the structure name for which shared message data set connections are to be started.

#### CMDSCOPE

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

- ' ' The command is executed on the queue manager on which it was entered. This is the default value.

#### *qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

- \* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

## START TRACE: z/OS

Use the MQSC command START TRACE to start traces.

### Using MQSC commands

For information on how you use MQSC commands, see [Performing local administration tasks using MQSC commands](#).

IBM i	UNIX and Linux	Windows	z/OS
			12CR

z/OS For an explanation of the symbols in the z/OS column, see [Using commands on z/OS](#).

- Syntax diagram
- “Usage notes” on page 1020
- “Parameter descriptions for START TRACE” on page 1020
- “Destination block” on page 1021
- “Constraint block” on page 1021

**Synonym:** STA TRACE

### START TRACE

### Destination block:

### Constraint block:

**Notes:**

- 1 Valid only when the queue manager is a member of a queue-sharing group.

**Usage notes**

When you issue this command, a trace number is returned in message number CSQW130I. You can use this trace number (TNO) in ALTER TRACE, DISPLAY TRACE, and STOP TRACE commands.

**Parameter descriptions for START TRACE**

If you do not specify a trace type to be started, the default (GLOBAL) trace is started. The types are:

**ACCTG**

Collects accounting data that can be used to charge your customers for their use of your queue manager. The synonym is A.

Class(4) statistics are supported for channel accounting, that is, SMF116 subtype 10 records.

**Note:** Accounting data can be lost if the accounting trace is started or stopped while applications are running. For information about the conditions that must be satisfied for successful collection of accounting data, see Using IBM MQ trace.

**CHINIT**

This includes data from the channel initiator. The synonym is CHI or DQM. If tracing for the channel initiator is started, it stops if the channel initiator stops.

Note that you cannot issue START TRACE(CHINIT) if the command server or the channel initiator is not running.

**GLOBAL**

This includes data from the entire queue manager except the channel initiator. The synonym is G.

**STAT**

Collects statistical data broadcast by various components of IBM MQ, at time intervals that can be chosen during installation. The synonym is S.

Class(4) statistics are supported for channel initiator statistics, that is, SMF115 subtype 231 records.

**CMDSCOPE**

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

CMDSCOPE cannot be used for commands issued from the first initialization input data set CSQINP1.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

**COMMENT( *string* )**

Specifies a comment that is reproduced in the trace output record (except in the resident trace tables). It can be used to record why the command was issued.

*string* is any character string. It must be enclosed in single quotation marks if it includes a blank, comma, or special character.

**Destination block**

**DEST** Specifies where the trace output is to be recorded. More than one value can be specified, but do not use the same value twice.

The meaning of each value is as follows:

**GTF** The z/OS Generalized Trace Facility (GTF). If used, the GTF must be started and accepting user (USR) records before the START TRACE command is issued.

**RES** A wrap-around table residing in the ECSA, or a data space for CHINIT.

**SMF** The System Management Facility (SMF). If used, the SMF must be functioning before the START TRACE command is issued. The SMF record numbers used by IBM MQ are 115 and 116. For SMF record type 115, subtypes 1, 2, and 215 are provided for the performance statistics trace.

**SRV** A serviceability routine reserved for IBM use only; not for general use.

**Note:** If your IBM support center need you to use this destination for your trace data they will supply you with module CSQWVSER. If you try to use destination SRV without CSQWVSER an error message is produced at the z/OS console when you issue the START TRACE command.

Allowed values, and the default value, depend on the type of trace started, as shown in the following table:

Table 112. Destinations allowed for each trace type

Type	GTF	RES	SMF	SRV
GLOBAL	Allowed	Default	No	Allowed
STAT	No	No	Default	Allowed
ACCTG	Allowed	No	Default	Allowed
CHINIT	No	Default	No	Allowed

**Constraint block**

The constraint block places optional constraints on the kinds of data collected by the trace. The allowed constraints depend on the type of trace started, as shown in the following table:

Table 113. Constraints allowed for each trace type

Type	CLASS	IFCID	RMID	USERID
GLOBAL	Allowed	Allowed	Allowed	Allowed
STAT	Allowed	No	No	No
ACCTG	Allowed	No	No	No
CHINIT	Allowed	Allowed	No	No

**CLASS**

Introduces a list of classes of data gathered. The classes allowed, and their meaning, depend on the type of trace started:

(\*) Starts a trace for all classes of data.

( *integer* )

Any number in the class column of the table that follows. You can use more than one of the classes that are allowed for the type of trace started. A range of classes can be specified as *m:n* (for example, CLASS(01:03)). If you do not specify a class, the default is to start class 1.

Table 114. Descriptions of trace events and classes.

Table showing the different trace events produced for the various trace classes.

Class	Description
	<b>Global trace</b>
01	Reserved for IBM service
02	User parameter error detected in a control block
03	User parameter error detected on entry to MQI
	User parameter error detected on exit from MQI
	User parameter error detected in a control block
04	Reserved for IBM service
	<b>Statistics trace</b>
01	Subsystem statistics
	Queue manager statistics
02	Queue manager storage summary statistics
03	Queue manager storage detail summary
04	Channel initiator statistics
	<b>Accounting trace</b>
01	The processor time spent processing MQI calls and a count of MQPUT, MQPUT1 and MQGET calls
03	Enhanced accounting and statistical data
04	Channel accounting data
	<b>CHINIT trace</b>
01	Reserved for IBM service
04	Reserved for IBM service

**IFCID** Reserved for IBM service.

**RMID** Introduces a list of specific resource managers for which trace information is gathered. You cannot use this option for STAT, ACCTG, or CHINIT traces.

(\*) Starts a trace for all resource managers.

This is the default.

( *integer* )

The identifying number of any resource manager in the following table. You can use up to 8 of the allowed resource manager identifiers; do not use the same one twice.

Table 115. Resource Manager identifiers that are allowed

RMID	Resource manager
1	Initialization procedures
2	Agent services management
3	Recovery management
4	Recovery log management
6	Storage management
7	Subsystem support for allied memories
8	Subsystem support for subsystem interface (SSI) functions
12	System parameter management
16	Instrumentation commands, trace, and dump services
23	General command processing
24	Message generator
26	Instrumentation accounting and statistics
148	Connection manager
163	Topic Manager
197	CF manager
199	Functional recovery
200	Security management
201	Data management
211	Lock management
212	Message management
213	Command server
215	Buffer management
242	IBM MQ IMS - bridge
245	Db2 manager

#### TDATA

Reserved for IBM service.

#### USERID

Introduces a list of specific user IDs for which trace information is gathered. You cannot use this option for STAT, ACCTG, or CHINIT traces.

(\*) Starts a trace for all user IDs. This is the default.

( *userid* )

Names a user ID. You can use up to 8 user IDs; a separate trace is started for each. The user ID is the primary authorization ID of the task, used by IBM MQ inside the queue manager. This is the userid displayed by the MQSC command DISPLAY CONN.

## STOP CHANNEL:

Use the MQSC command STOP CHANNEL to stop a channel.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

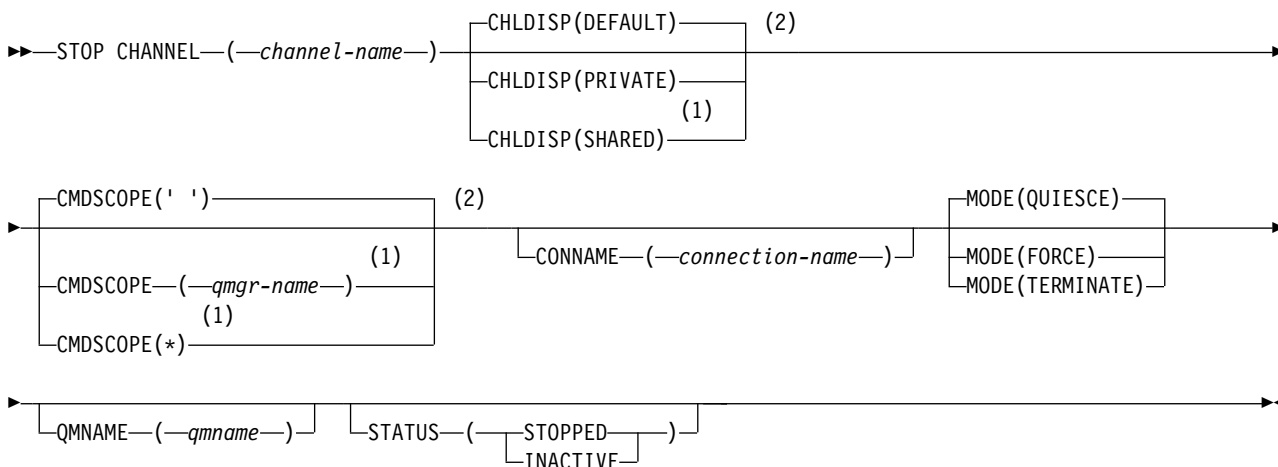

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	CR

► **z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes for STOP CHANNEL”
- “Parameter descriptions for STOP CHANNEL” on page 1025

**Synonym:** STOP CHL

## STOP CHANNEL

### Notes:

- 1 Valid only on z/OS when the queue manager is a member of a queue-sharing group.
- 2 Valid only on z/OS.

### Usage notes for STOP CHANNEL

1. If you specify either QMNAME or CONNAME, STATUS must either be INACTIVE or not specified. Do not specify a QMNAME or CONNAME and STATUS(STOPPED). It is not possible to have a channel stopped for one partner but not for others. This sort of function can be provided by a channel security exit. For more information about channel exits, see Channel exit programs.
2. ► **z/OS** On z/OS, the command server and the channel initiator must be running.
3. Any channels in STOPPED state need to be started manually; they are not started automatically. See Restarting stopped channels for information about restarting stopped channels.

4. This command can be issued to a channel of any type except CLNTCONN channels (including those that have been defined automatically).
5. Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel. If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the channel that was last added to the local queue manager repository.

### Parameter descriptions for STOP CHANNEL

*(channel-name)*

The name of the channel to be stopped. This parameter is required for all channel types.

#### **CHLDISP**

This parameter applies to z/OS only and can take the values of:

- DEFAULT
- PRIVATE
- SHARED

If this parameter is omitted, then the DEFAULT value applies. This is taken from the default channel disposition attribute, DEFCDISP, of the channel object.

In conjunction with the various values of the CMDSCOPE parameter, this parameter controls two types of channel:

#### **SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue-sharing group.

A sending channel is shared if its transmission queue has a disposition of SHARED.

#### **PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than SHARED.

**Note:** This disposition is not related to the disposition set by the disposition of the queue-sharing group of the channel definition.

The combination of the CHLDISP and CMDSCOPE parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of CHLDISP and CMDSCOPE are summarized in the following table:

Table 116. CHLDISP and CMDSCOPE for STOP CHANNEL

CHLDISP	CMDSCOPE( ) or CMDSCOPE (local-qmgr)	CMDSCOPE (qmgr-name)	CMDSCOPE(*)
PRIVATE	Stop as a private channel on the local queue manager.	Stop as a private channel on the named queue manager	Stop as a private channel on all active queue managers
SHARED	<p>For RCVR and SVRCONN channels, stop as shared channel on all active queue managers.</p> <p>For SDR, RQSTR, and SVR channels, stop as a shared channel on the queue manager where it is running. If the channel is in an inactive state (not running), or if it is in RETRY state because the channel initiator on which it was running has stopped, a STOP request for the channel is issued on the local queue manager.</p> <p>This might automatically generate a command using CMDSCOPE and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is actually run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted

**z/OS** **CMDSCOPE**

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

If CHLDISP is set to SHARED, CMDSCOPE must be blank or the local queue manager.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name only if you are using a queue-sharing group environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

**CONNNAME** (*connection-name*)

Connection name. Only channels matching the specified connection name are stopped.

When issuing the STOP CHANNEL command using a **CONNNAME** parameter, ensure that the value specified in the **CONNNAME** parameter is exactly as shown in "DISPLAY CHSTATUS" on page 761.

## MODE

Specifies whether the current batch is allowed to finish in a controlled manner. This parameter is optional.

### QUIESCE

This is the default.

Allows the current batch to finish processing on distributed platforms.

**z/OS** On z/OS, the channel stops after the current message has finished processing. (The batch is then ended and no more messages are sent, even if there are messages waiting on the transmission queue.)

For a receiving channel, if there is no batch in progress, the channel waits for either of the following to take place before it stops:

- The next batch to start
- The next heartbeat (if heartbeats are being used)

For server-connection channels, allows the current connection to end.

If you issue a `STOP CHANNEL channelname MODE (QUIESCE)` command on a server-connection channel, the IBM MQ client infrastructure becomes aware of the stop request in a timely manner. This time is dependent upon the speed of the network. If a client application is using the server-connection channel and is performing either of the following operations at the time that the command is issued, then the MQPUT or MQGET operation fails:

- An MQPUT operation with the PMO option `MQPMO_FAIL_IF QUIESCE` specified.
- An MQGET operation with the GMO option `MQGMO_FAIL_IF QUIESCE` set.

The client application receives reason code `MQRC_CONNECTION_QUIESCING`.

If a client application is using the server-connection channel and is performing either of the following operations, then the client application is allowed to complete the MQPUT or MQGET operation:

- An MQPUT operation without the PMO option `MQPMO_FAIL_IF QUIESCE` specified.
- An MQGET operation without the GMO option `MQGMO_FAIL_IF QUIESCE` set.

The next time the application tries to use the server-connection channel, it receives reason code `MQRC_CONNECTION_QUIESCING`.

If the client application is not performing an MQ API call when the server-connection channel is stopped, it becomes aware of the stop request as a result of issuing a subsequent call to IBM MQ and receives return code `MQRC_CONNECTION_QUIESCING`.

After sending the `MQRC_CONNECTION_QUIESCING` return code to the client, and allowing any outstanding MQPUT or MQGET operations to complete if necessary, the server ends the client connections for the server-connection channel.

Due to the imprecise timing of network operations, the client application should not attempt further MQ API operations.

### FORCE

For server-connection channels, breaks the current connection, returning `MQRC_CONNECTION_BROKEN`. For other channel types, terminates transmission of any current batch. This is likely to result in in-doubt situations.

**z/OS** On IBM MQ for z/OS, specifying FORCE interrupts any message reallocation in progress, which might leave `BIND_NOT_FIXED` messages partially reallocated or out of order.

### TERMINATE

**z/OS** On z/OS this is synonymous with FORCE.

On other platforms, this parameter terminates transmission of any current batch. This allows the command to actually terminate the channel thread or process.

For server-connection channels, breaks the current connection, returning MQRC\_CONNECTION\_BROKEN.

**z/OS** On IBM MQ for z/OS, specifying TERMINATE interrupts any message reallocation in progress, which might leave BIND\_NOT\_FIXED messages partially reallocated or out of order.

**QMNAME** (*qmname*)

Queue manager name. Only channels matching the specified remote queue manager are stopped.

**STATUS**

Specifies the new state of any channels stopped by this command. For details about channels in STOPPED state, especially SVRCONN channels on IBM MQ for z/OS, see Restarting stopped channels.

**STOPPED**

The channel is stopped. For a sender or server channel the transmission queue is set to GET(DISABLED) and NOTRIGGER.

This is the default if QMNAME or CONNAME are not specified.

**INACTIVE**

The channel is inactive.

This is the default if QMNAME or CONNAME are specified.

**STOP CHANNEL (MQTT):**

Use the MQSC command STOP CHANNEL to stop an IBM MQ Telemetry channel.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	AIX and Linux	Windows	z/OS
	✓	✓	

**Note:** For the telemetry server, AIX is the only supported UNIX platform.

The STOP CHANNEL (MQTT) command is only valid for IBM MQ Telemetry channels.

**Synonym:** STOP CHL

**STOP CHANNEL**

**Usage notes for STOP CHANNEL**

1. Any channels in STOPPED state need to be started manually; they are not started automatically. See Restarting stopped channels for information about restarting stopped channels.

## Parameter descriptions for STOP CHANNEL

(channel-name)

The name of the channel to be stopped. This parameter is required for all channel types including MQTT channels.

### CHLTYPE

Channel type. The value must be MQTT.

### CLIENTID (string)

Client identifier. The client identifier is a 23-byte string that identifies an IBM MQ Telemetry Transport client. When the STOP CHANNEL command specifies a CLIENTID, only the connection for the specified client identifier is stopped. If the CLIENTID is not specified, all the connections on the channel are stopped.

### STOP CHINIT: z/OS

Use the MQSC command STOP CHINIT to stop a channel initiator. The command server must be running.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			CR

z/OS For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes for STOP CHINIT”
- “Parameter descriptions for STOP CHINIT” on page 1030

**Synonym:** STOP CHI

### STOP CHINIT

#### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.

#### Usage notes for STOP CHINIT

1. When you issue the STOP CHINIT command, IBM MQ stops any channels that are running in the following way:
  - Sender and server channels are stopped using STOP CHANNEL MODE(QUIESCE) STATUS(INACTIVE)
  - All other channels are stopped using STOP CHANNEL MODE(FORCE)See “STOP CHANNEL” on page 1024 for information about what this involves.

2. You might receive communications-error messages as a result of issuing the STOP CHINIT command.

### Parameter descriptions for STOP CHINIT

#### CMDSCOPE

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

#### SHARED

Specifies whether the channel initiator should attempt to restart any active sending channels, started with CHLDISP(SHARED), that it owns on another queue manager. The possible values are:

##### RESTART

Shared sending channels are to be restarted. This is the default.

**STOP** Shared sending channels are not to be restarted, so will become inactive.

(Active channels started with CHLDISP(FIXSHARED) are not restarted, and always become inactive.)

#### STOP CMDSERV:

Use the MQSC command STOP CMDSERV to stop the command server.

#### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			12C

 For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Usage notes for STOP CMDSERV” on page 1031

**Synonym:** STOP CS

## STOP CMDSERV

▶▶—STOP CMDSERV—▶▶

### Usage notes for STOP CMDSERV

1. STOP CMDSERV stops the command server from processing commands in the system-command input queue (SYSTEM.COMMAND.INPUT), mover commands, and commands using CMDSCOPE.
2. If this command is issued through the initialization files or through the operator console before work is released to the queue manager (that is, before the command server is started automatically), it prevents the command server from starting automatically and puts it into a DISABLED state. It overrides an earlier START CMDSERV command.
3. If this command is issued through the operator console or the command server while the command server is in a RUNNING state, it stops the command server when it has finished processing its current command. When this happens, the command server enters the STOPPED state.
4. If this command is issued through the operator console while the command server is in a WAITING state, it stops the command server immediately. When this happens, the command server enters the STOPPED state.
5. If this command is issued while the command server is in a DISABLED or STOPPED state, no action is taken, the command server remains in its current state, and an error message is returned to the command originator.

### STOP CONN:

Use the MQSC command STOP CONN to break a connection between an application and the queue manager.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	

- Syntax diagram
- “Usage notes”
- “Parameter descriptions for STOP CONN” on page 1032

**Synonym:** STOP CONN

### STOP CONN

▶▶—STOP CONN—(—*connection-identifier*—)

└─EXTCONN—(—*connection-identifier*—)─▶▶

### Usage notes

There might be circumstances in which the queue manager cannot implement this command when the success of this command cannot be guaranteed.

## Parameter descriptions for STOP CONN

( *connection-identifier* )

The identifier of the connection definition for the connection to be broken.

When an application connects to IBM MQ, it is given a unique 24-byte connection identifier (ConnectionId). The value of CONN is formed by converting the last eight bytes of the ConnectionId to its 16-character hexadecimal equivalent.

## EXTCONN

The value of EXTCONN is based on the first sixteen bytes of the ConnectionId converted to its 32-character hexadecimal equivalent.

Connections are identified by a 24-byte connection identifier. The connection identifier comprises a prefix, which identifies the queue manager, and a suffix which identifies the connection to that queue manager. By default, the prefix is for the queue manager currently being administered, but you can specify a prefix explicitly by using the EXTCONN parameter. Use the CONN parameter to specify the suffix.

When connection identifiers are obtained from other sources, specify the fully qualified connection identifier (both EXTCONN and CONN) to avoid possible problems related to non-unique CONN values.

### Related reference:

“DISPLAY CONN” on page 800

Use the MQSC command DISPLAY CONN to display connection information about the applications connected to the queue manager. This is a useful command because it enables you to identify applications with long-running units of work.

## STOP LISTENER:

Use the MQSC command STOP LISTENER to stop a channel listener.

## Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS

- Syntax diagram for IBM MQ on other platforms
- ▶ **z/OS** “Usage notes” on page 1033
- “Parameter descriptions for STOP LISTENER” on page 1033

**Synonym:** STOP LSTR

▶ **z/OS**

## IBM MQ for z/OS

## STOP LISTENER

### Notes:

- 1 Valid only on IBM MQ for z/OS when the queue manager is a member of a queue-sharing group.

## IBM MQ on other platforms

### STOP LISTENER

### z/OS

#### Usage notes

On z/OS:

- The command server and the channel initiator must be running.
- If a listener is listening on multiple addresses or ports, only the address and port combinations with the address, or port, specified are stopped.
- If a listener is listening on all addresses for a particular port, a stop request for a specific IPADDR with the same port fails.
- If neither an address nor a port is specified, all addresses and ports are stopped and the listener task ends.

#### Parameter descriptions for STOP LISTENER

( *name* )

Name of the listener to be stopped. If you specify this parameter, you cannot specify any other parameters.

This parameter is required on all platforms **z/OS** other than z/OS where it is not a supported parameter.

### z/OS CMDSCOPE

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

This parameter is valid only on z/OS.

▶ **z/OS** **INDISP**

Specifies the disposition of the inbound transmissions that the listener handles. The possible values are:

**QMGR**

Handling for transmissions directed to the queue manager. This is the default.

**GROUP**

Handling for transmissions directed to the queue-sharing group. This is allowed only if there is a shared queue manager environment.

This parameter is valid only on z/OS.

▶ **z/OS** **IPADDR**

IP address for TCP/IP specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form. This is valid only if the transmission protocol (TRPTYPE) is TCP/IP.

This parameter is valid only on z/OS.

▶ **z/OS** **PORT**

The port number for TCP/IP. This is the port number on which the listener is to stop listening. This is valid only if the transmission protocol is TCP/IP.

This parameter is valid only on z/OS.

▶ **z/OS** **TRPTYPE**

Transmission protocol used. This is optional.

**TCP** TCP. This is the default if TRPTYPE is not specified.

**LU62** SNA LU 6.2.

This parameter is valid only on z/OS.

The listener stops in quiesce mode (it disregards any further requests).

**STOP QMGR:** ▶ **z/OS**

Use the MQSC command STOP QMGR to stop the queue manager.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			CR

▶ **z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- “Parameter descriptions for STOP QMGR” on page 1035

**Synonym:** There is no synonym for this command.

## STOP QMGR

### Notes:

- 1 Valid only when the queue manager is a member of a queue-sharing group.

### Parameter descriptions for STOP QMGR

The parameters are optional.

#### CMDSCOPE

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

#### *qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

#### MODE

Specifies whether programs currently being executed are allowed to finish.

#### QUIESCE

Allows programs currently being executed to finish processing. No new program is allowed to start. This is the default.

This option means that all connections to other address spaces must terminate before the queue manager stops. The system operator can determine whether any connections remain by using the DISPLAY CONN command, and can cancel remaining connections using z/OS commands.

This option deregisters IBM MQ from the z/OS automatic restart manager (ARM).

#### FORCE

Terminates programs currently being executed, including utilities. No new program is allowed to start. This option might cause in-doubt situations.

This option might not work if all the active logs are full, and log archiving has not occurred. In this situation you must issue the z/OS command CANCEL to terminate.

This option deregisters IBM MQ from the z/OS automatic restart manager (ARM).

#### RESTART

Terminates programs currently being executed, including utilities. No new program is allowed to start. This option might cause in-doubt situations.

This option might not work if all the active logs are full, and log archiving has not occurred. In this situation you must issue the z/OS command CANCEL to terminate.

This option does not deregister IBM MQ from ARM, so the queue manager is eligible for immediate automatic restart.

## STOP SERVICE:

Use the MQSC command STOP SERVICE to stop a service.

### Using MQSC commands

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	

- Syntax diagram
- “Usage notes”
- “Parameter descriptions for STOP SERVICE”

Synonym:

## STOP SERVICE

►►—STOP SERVICE—(—*service-name*—)—————►►

### Usage notes

If the service is running, it is requested to stop. This command is processed asynchronously so might return before the service has stopped.

If the service that is requested to stop has no STOP command defined, an error is returned.

### Parameter descriptions for STOP SERVICE

( *service-name* )

The name of the service definition to be stopped. This is required. The name must that of an existing service on this queue manager.

**Related reference:**

“ALTER SERVICE” on page 501

Use the MQSC command ALTER SERVICE to alter the parameters of an existing IBM MQ service definition.

“START SERVICE” on page 1017

Use the MQSC command START SERVICE to start a service. The identified service definition is started within the queue manager and inherits the environment and security variables of the queue manager.

**Related information:**

Working with services

**STOP SMDSCONN:** z/OS

Use the MQSC command STOP SMDSCONN to terminate the connection from this queue manager to one or more specified shared message data sets (causing them to be closed and deallocated) and to mark the connection as STOPPED.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

IBM i	UNIX and Linux	Windows	z/OS
			2CR

- “Syntax diagram for STOP SMDSCONN”
- “Parameter descriptions for STOP SMDSCONN”

**Syntax diagram for STOP SMDSCONN**

**Synonym:**

**Notes:**

- 1 Valid only when the queue manager is a member of a queue-sharing group.

**Parameter descriptions for STOP SMDSCONN**

**SMDSCONN**

Specify the queue manager which owns the shared message data set for which the connection is to be stopped, or an asterisk to stop connections to all shared message data sets associated with the specified structure.

**CFSTRUCT**

Specify the structure name for which shared message data set connections are to be stopped.

## CMDSCOPE

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

\* The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group. The effect of this is the same as entering the command on every queue manager in the queue-sharing group.

### STOP TRACE: z/OS

Use the MQSC command STOP TRACE to stop tracing.

#### Using MQSC commands

For information on how you use MQSC commands, see [Performing local administration tasks using MQSC commands](#).

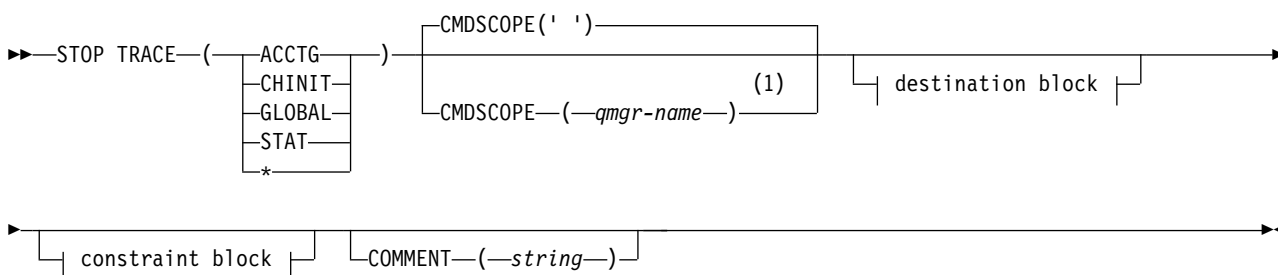

IBM i	UNIX and Linux	Windows	z/OS
			12CR

z/OS For an explanation of the symbols in the z/OS column, see [Using commands on z/OS](#).

- Syntax diagram
- "Parameter descriptions for STOP TRACE" on page 1039
- "Destination block" on page 1040
- "Constraint block" on page 1040

**Synonym:** There is no synonym for this command.

### STOP TRACE

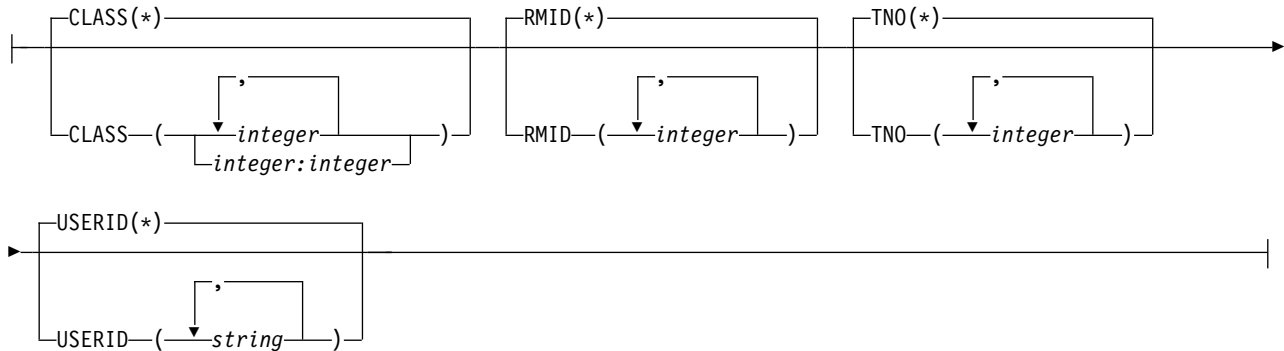

#### Destination block:

**Constraint block:**

**Notes:**

- 1 Valid only on z/OS when the queue manager is a member of a queue-sharing group.

**Parameter descriptions for STOP TRACE**

Each option that you use limits the effect of the command to active traces that were started using the same option, either explicitly or by default, with exactly the same parameter values.

You must specify a trace type or an asterisk. STOP TRACE(\*) stops all active traces.

The trace types are:

**ACCTG**

Accounting data (the synonym is A)

**Note:** Accounting data can be lost if the accounting trace is started or stopped while applications are running. For information about the conditions that must be satisfied for successful collection of accounting data, see Using IBM MQ trace.

**CHINIT**

Service data from the channel initiator. The synonym is CHI or DQM.

If the only trace running on the CHINIT is the one started automatically when the CHINIT was started, that tracing can be stopped only by explicitly stating the TNO for the default CHINIT trace (0). For example: STOP TRACE(CHINIT) TNO(0)

**GLOBAL**

Service data from the entire queue manager except for the channel initiator. The synonym is G.

**STAT** Statistical data (the synonym is S)

\* All active traces

**CMDSCOPE**

This parameter specifies how the command is executed when the queue manager is a member of a queue-sharing group.

CMDSCOPE cannot be used for commands issued from the first initialization input data set CSQINP1.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

#### **COMMENT( *string* )**

Specifies a comment that is reproduced in the trace output record (except in the resident trace tables), and can be used to record why the command was issued.

*string* is any character string. It must be enclosed in single quotation marks if it includes a blank, comma, or special character.

#### **Destination block**

**DEST** Limits the action to traces started for particular destinations. More than one value can be specified, but do not use the same value twice. If no value is specified, the list is not limited.

Possible values and their meanings are:

**GTF** The Generalized Trace Facility

**RES** A wrap-around table residing in the ECSA

**SMF** The System Management Facility

**SRV** A serviceability routine designed for problem diagnosis

#### **Constraint block**

##### **CLASS( *integer* )**

Limits the command to traces started for particular classes. See the START TRACE command for a list of allowed classes. A range of classes can be specified as *m:n* (for example, CLASS(01:03)). You cannot specify a class if you did not specify a trace type.

The default is CLASS(\*), which does not limit the command.

##### **RMID( *integer* )**

Limits the command to traces started for particular resource managers. See the START TRACE command for a list of allowed resource manager identifiers.

Do not use this option with the STAT, ACCTG, or CHINIT trace type.

The default is RMID(\*), which does not limit the command.

##### **TNO( *integer* )**

Limits the command to particular traces, identified by their trace number (0 to 32). Up to 8 trace numbers can be used. If more than one number is used, only one value for USERID can be used.

0 is the trace that the channel initiator can start automatically. Traces 1 to 32 are those for queue manager or the channel initiator that can be started automatically by the queue manager, or manually, using the START TRACE command.

The default is TNO(\*), which applies the command to all active traces with numbers 1 to 32, but **not** to the 0 trace. You can stop trace number 0 only by specifying it explicitly.

##### **USERID( *string* )**

Limits the action of the STOP TRACE to traces started for particular user ID. Up to 8 user IDs

can be used. If more than one user ID is used, only one value can be used for TNO. Do not use this option with the STAT, ACCTG, or CHINIT trace type.

The default is USERID(\*), which does not limit the command.

**SUSPEND QMGR:**

Use the MQSC command SUSPEND QMGR to advise other queue managers in a cluster to avoid sending messages to the local queue manager if possible.

**Using MQSC commands**

For information on how you use MQSC commands, see Performing local administration tasks using MQSC commands.

For further details about using the SUSPEND QMGR and RESUME QMGR commands to remove a queue manager from a cluster temporarily, see SUSPEND QMGR, RESUME QMGR and clusters.

**z/OS** On z/OS this command can also be used to suspend logging and update activity for the queue manager until a subsequent RESUME QMGR command is issued. Its action can be reversed by the RESUME QMGR command. This command does not mean that the queue manager is disabled.

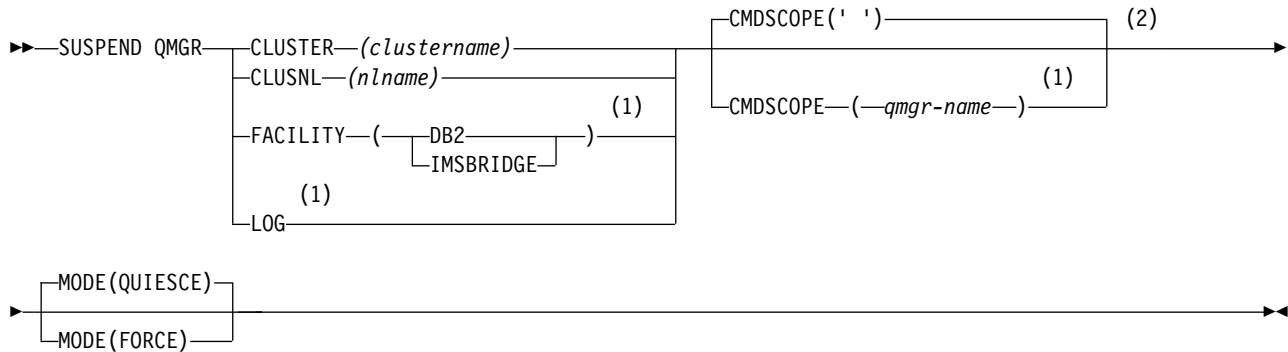

IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	See "Using SUSPEND QMGR on z/OS" on page 1042

**z/OS** For an explanation of the symbols in the z/OS column, see Using commands on z/OS.

- Syntax diagram
- **z/OS** "Using SUSPEND QMGR on z/OS" on page 1042
- **z/OS** "Usage notes" on page 1042
- "Parameter descriptions for SUSPEND QMGR" on page 1042

**Synonym:** None

**SUSPEND QMGR**

**Notes:**

- 1 Valid only on z/OS.
- 2 Valid only on IBM MQ for z/OS when the queue manager is a member of a queue-sharing group.

## Using SUSPEND QMGR on z/OS

SUSPEND QMGR can be used on z/OS. Depending on the parameters used on the command, it may be issued from various sources. For an explanation of the symbols in this table, see “Using commands on z/OS” on page 342.

Command	Command Sources	Notes
SUSPEND QMGR CLUSTER/CLUSNL	CR	Ensure the channel initiator is running
SUSPEND QMGR FACILITY	CR	
SUSPEND QMGR LOG	C	

## Usage notes

On z/OS:

- If you define CLUSTER or CLUSNL, be aware of the following behavior:
  - The command fails if the channel initiator has not been started.
  - Any errors are reported to the system console where the channel initiator is running; they are not reported to the system that issued the command.
- The SUSPEND QMGR and RESUME QMGR commands are supported through the console only. However, all the other SUSPEND and RESUME commands are supported through the console and command server.

## Parameter descriptions for SUSPEND QMGR

The SUSPEND QMGR with the CLUSTER or CLUSNL parameters to specify the cluster or clusters for which availability is suspended, how the suspension takes effect .

On z/OS, controls logging and update activity and how the command is executed when the queue manager is a member of a queue-sharing group.

You can use the SUSPEND QMGR FACILITY( Db2 ) to terminate the queue manager connection to Db2. This command might be useful if you want to apply service to Db2. Be aware, if you use this option then there is no access to Db2 resources, for example, large messages which might be offloaded to Db2 from a coupling facility.

You can use the SUSPEND QMGR FACILITY(IMSBRIDGE) to stop sending messages from the IBM MQ IMS bridge to IMS OTMA. z/OS See Controlling the IMS bridge for more information about controlling message delivery to shared and non-shared queues.

### CLUSTER (*clustname*)

The name of the cluster for which availability is to be suspended.

### CLUSNL (*nlname*)

The name of the namelist that specifies a list of clusters for which availability is to be suspended.

### FACILITY

Specifies the facility to which connection is to be terminated. The parameter must have one of the following values:

**Db2** Causes the existing connection to Db2 to be terminated. The connection is re-established when the “RESUME QMGR” on page 978 command is issued. When the Db2 connection

is SUSPENDED, any API requests which must access Db2 to complete will be suspended until the RESUME QMGR FACILITY( Db2 ) command is issued. API requests include:

- The first MQOPEN of a shared queue since the queue manager started
- MQPUT, MQPUT1 and MQGET to or from a shared queue where the message payload has been offloaded to Db2

#### z/OS IMSBRIDGE

Stops the sending of messages from IMS bridge queues to OTMA. The IMS connection is not affected. When the tasks that transmit messages to IMS have been terminated, no further messages are sent to IMS until one of the following actions happens:

- OTMA or IMS is stopped and restarted
- IBM MQ is stopped and restarted
- A "RESUME QMGR" on page 978 command is processed

Return messages from IMS OTMA to the queue manager are unaffected.

To monitor progress of the command, issue the following command and ensure that none of the queues are open:

```
DIS Q(*) CMDSCOPE(qmgr) STGCLASS(bridge_stgclass) IPPROCS
```

If any queue is open, use DISPLAY QSTATUS to verify that the MQ-IMS bridge does not have it open.

This parameter is valid only on z/OS.

#### z/OS LOG

Suspends logging and update activity for the queue manager until a subsequent RESUME request is issued. Any unwritten log buffers are externalized, a system checkpoint is taken (non-data sharing environment only), and the BSDS is updated with the high-written RBA before the update activity is suspended. A highlighted message (CSQJ372I) is issued and remains on the system console until update activity has been resumed. Valid on z/OS only. If LOG is specified, the command can be issued only from the z/OS system console.

This option is not permitted when a system quiesce is active by either the ARCHIVE LOG or STOP QMGR command.

Update activity remains suspended until a RESUME QMGR LOG or STOP QMGR command is issued.

This command must not be used during periods of high activity, or for long periods of time. Suspending update activity can cause timing-related events such as lock timeouts or IBM MQ diagnostic memory dumps when delays are detected.

#### z/OS CMDSCOPE

This parameter applies to z/OS only and specifies how the command is executed when the queue manager is a member of a queue-sharing group.

' ' The command is executed on the queue manager on which it was entered. This is the default value.

*qmgr-name*

The command is executed on the queue manager you specify, providing the queue manager is active within the queue-sharing group.

You can specify a queue manager name, other than the queue manager on which the command was entered, only if you are using a queue-sharing group environment and if the command server is enabled.

#### MODE

Specifies how the suspension of availability is to take effect:

## QUIESCE

Other queue managers in the cluster are advised to avoid sending messages to the local queue manager if possible. It does not mean that the queue manager is disabled.

## FORCE

All inbound cluster channels from other queue managers in the cluster are stopped forcibly. This occurs only if the queue manager has also been forcibly suspended from all other clusters to which the cluster receiver channel for this cluster belongs.

The MODE keyword is permitted only with CLUSTER or CLUSNL. It is not permitted with the LOG or FACILITY parameter.

### Related reference:

“RESUME QMGR” on page 978

Use the MQSC command RESUME QMGR to inform other queue managers in a cluster that the local queue manager is available again for processing and can be sent messages. It reverses the action of the SUSPEND QMGR command.

### Related information:

SUSPEND QMGR, RESUME QMGR and clusters

Use the SUSPEND QMGR and RESUME QMGR command to temporarily reduce the inbound cluster activity to this queue manager, for example, before you perform maintenance on this queue manager, and then reinstate it.

## Programmable command formats reference

Programmable Command Formats (PCFs) define command and reply messages that can be exchanged between a program and any queue manager (that supports PCFs) in a network. PCFs simplify queue manager administration and other network administration.

For an introduction to PCFs, see Introduction to Programmable Command Formats.

For the full list of PCFs, see “Definitions of the Programmable Command Formats.”

PCF commands and responses have a consistent structure including of a header and any number of parameter structures of defined types. For information about these structures, see “Structures for commands and responses” on page 1578.

For an example PCF, see “PCF example” on page 1605.

### Related concepts:

“IBM MQ Control commands” on page 178

## How the definitions are shown:

The definitions of the Programmable Command Formats (PCFs) including their commands, responses, parameters, constants, and error codes are shown in a consistent format.

For each PCF command or response, there is a description of what the command or response does, giving the command identifier in parentheses. See Constants for all values of the command identifier. Each command description starts with a table that identifies the platforms on which the command is valid. For additional, more detailed, usage notes for each command, see the corresponding command description in the Definitions of the PCFs.

IBM MQ products, other than IBM MQ for z/OS, can use the IBM MQ Administration Interface (MQAI), which provides a simplified way for applications written in the C and Visual Basic programming language to build and send PCF commands. For information about the MQAI see the second section of this topic.

## Commands

The *required parameters* and the *optional parameters* are listed. On distributed platforms, the parameters *must* occur in the order:

1. All required parameters, in the order stated, followed by
2. Optional parameters as required, in any order, unless noted in the PCF definition.

▶ **z/OS** On z/OS, the parameters can be in any order.

## Responses

The response data attribute is *always returned* whether it is requested or not. This parameter is required to identify, uniquely, the object when there is a possibility of multiple reply messages being returned.

The other attributes shown are *returned if requested* as optional parameters on the command. The response data attributes are not returned in a defined order.

## Parameters and response data

Each parameter name is followed by its structure name in parentheses (details are given in “Structures for commands and responses” on page 1578 ). The parameter identifier is given at the beginning of the description.

## Constants

For the values of constants used by PCF commands and responses see Constants.

▶ **z/OS**

## Informational messages

On z/OS, a number of command responses return a structure, MQIACF\_COMMAND\_INFO, with values that provide information about the command.

Table 117. MQIACF\_COMMAND\_INFO values

MQIACF_COMMAND_INFO value	Meaning
MQCMDI_CMDSCOPE_ACCEPTED	A command that specified <i>CommandScope</i> was entered. It has been passed to the one or more requested queue managers for processing
MQCMDI_CMDSCOPE_GENERATED	A command that specified <i>CommandScope</i> was generated in response to the command originally entered
MQCMDI_CMDSCOPE_COMPLETED	Processing for the command that specified <i>CommandScope</i> - either entered or generated by another command - has completed successfully on all requested queue managers
MQCMDI_QSG_DISP_COMPLETED	Processing for the command that refers to an object with the indicated disposition has completed successfully
MQCMDI_COMMAND_ACCEPTED	Initial processing for the command has completed successfully. The command requires further action by the channel initiator, for which a request has been queued. Messages reporting the success or otherwise of the action are sent to the command issuer later
MQCMDI_CLUSTER_REQUEST_QUEUED	Initial processing for the command has completed successfully. The command requires further action by the cluster repository manager, for which a request has been queued
MQCMDI_CHANNEL_INIT_STARTED	A Start Channel Initiator command has been issued and the channel initiator address space has been started successfully
MQCMDI_RECOVER_STARTED	The queue manager has successfully started a task to process the Recover CF Structure command for the named structure
MQCMDI_BACKUP_STARTED	The queue manager has successfully started a task to process the Backup CF Structure command for the named structure
MQCMDI_RECOVER_COMPLETED	The named CF structure has been recovered successfully. The structure is available for use again
MQCMDI_SEC_TIMER_ZERO	The Change Security command was entered with the <i>SecurityInterval</i> attribute set to 0. This means that no user timeouts occur
MQCMDI_REFRESH_CONFIGURATION	A Change Queue Manager command has been issued that enables configuration events. Event messages need to be generated to ensure that the configuration information is complete and up to date
MQCMDI_IMS_BRIDGE_SUSPENDED	The MQ-IMS bridge facility is suspended.
MQCMDI_DB2_SUSPENDED	The connection to Db2 is suspended
MQCMDI_DB2_OBSOLETE_MSGS	Obsolete Db2 messages exist in the queue-sharing group

## Error codes

► **z/OS** In z/OS, PCF commands can return MQRC reason codes instead of MQRCCF codes

MQRCCF codes are used in UNIX, Linux or Windows. At the end of most command format definitions, there is a list of error codes that might be returned by that command.

## Error codes applicable to all commands

In addition to those error codes listed under each command format, any command might return the following error codes in the response format header (descriptions of the MQRC\_\* error codes are given in the Reason codes  and IBM MQ for z/OS messages, completion, and reason codes documentation):

### *Reason (MQLONG)*

The value can be any of the following values:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

#### **MQRC\_MSG\_TOO\_BIG\_FOR\_Q**

(2030, X'7EE') Message length greater than maximum for queue.

#### **MQRC\_CONNECTION\_BROKEN**

(2009, X'7D9') Connection to queue manager lost.

#### **MQRC\_NOT\_AUTHORIZED**

(2035, X'7F3') Not authorized for access.

#### **MQRC\_SELECTOR\_ERROR**

(2067, X'813') Attribute selector not valid.

#### **MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

#### **MQRC\_UNKNOWN\_OBJECT\_NAME**

(2085, X'825') Unknown object name.

#### **MQRCCF\_ATTR\_VALUE\_ERROR**

Attribute value not valid.

#### **MQRCCF\_CFBF\_FILTER\_VAL\_LEN\_ERROR**

Filter value length not valid.

#### **MQRCCF\_CFBF\_LENGTH\_ERROR**

Structure length not valid.

#### **MQRCCF\_CFBF\_OPERATOR\_ERROR**

Operator error.

#### **MQRCCF\_CFBF\_PARM\_ID\_ERROR**

Parameter identifier not valid.

#### **MQRCCF\_CFBS\_DUPLICATE\_PARM**

Duplicate parameter.

#### **MQRCCF\_CFBS\_LENGTH\_ERROR**

Structure length not valid.

#### **MQRCCF\_CFBS\_PARM\_ID\_ERROR**

Parameter identifier not valid.

#### **MQRCCF\_CFBS\_STRING\_LENGTH\_ERROR**

String length not valid.

#### **MQRCCF\_CFGR\_LENGTH\_ERROR**

Structure length not valid.

#### **MQRCCF\_CFGR\_PARM\_COUNT\_ERROR**

Parameter count not valid.

#### **MQRCCF\_CFGR\_PARM\_ID\_ERROR**

Parameter identifier not valid.

**MQRCCF\_CFH\_COMMAND\_ERROR**  
Command identifier not valid.

**MQRCCF\_CFH\_CONTROL\_ERROR**  
Control option not valid.

**MQRCCF\_CFH\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFH\_MSG\_SEQ\_NUMBER\_ERR**  
Message sequence number not valid.

**MQRCCF\_CFH\_PARM\_COUNT\_ERROR**  
Parameter count not valid.

**MQRCCF\_CFH\_TYPE\_ERROR**  
Type not valid.

**MQRCCF\_CFH\_VERSION\_ERROR**  
Structure version number is not valid.

**MQRCCF\_CFIF\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFIF\_OPERATOR\_ERROR**  
Operator error.

**MQRCCF\_CFIF\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFIL\_COUNT\_ERROR**  
Count of parameter values not valid.

**MQRCCF\_CFIL\_DUPLICATE\_VALUE**  
Duplicate parameter.

**MQRCCF\_CFIL\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFIL\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFIN\_DUPLICATE\_PARM**  
Duplicate parameter.

**MQRCCF\_CFIN\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFIN\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFSF\_FILTER\_VAL\_LEN\_ERROR**  
Filter value length not valid.

**MQRCCF\_CFSF\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFSF\_OPERATOR\_ERROR**  
Operator error.

**MQRCCF\_CFSF\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFSL\_COUNT\_ERROR**  
Count of parameter values not valid.

**MQRCCF\_CFSL\_DUPLICATE\_PARM**  
Duplicate parameter.

**MQRCCF\_CFSL\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFSL\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFSL\_STRING\_LENGTH\_ERROR**  
String length value not valid.

**MQRCCF\_CFSL\_TOTAL\_LENGTH\_ERROR**  
Total string length error.

**MQRCCF\_CFST\_CONFLICTING\_PARM**  
Conflicting parameters.

**MQRCCF\_CFST\_DUPLICATE\_PARM**  
Duplicate parameter.

**MQRCCF\_CFST\_LENGTH\_ERROR**  
Structure length not valid.

**MQRCCF\_CFST\_PARM\_ID\_ERROR**  
Parameter identifier not valid.

**MQRCCF\_CFST\_STRING\_LENGTH\_ERROR**  
String length value not valid.

**MQRCCF\_COMMAND\_FAILED**  
Command failed.

**MQRCCF\_ENCODING\_ERROR**  
Encoding error.

**MQRCCF\_MD\_FORMAT\_ERROR**  
Format not valid.

**MQRCCF\_MSG\_SEQ\_NUMBER\_ERROR**  
Message sequence number not valid.

**MQRCCF\_MSG\_TRUNCATED**  
Message truncated.

**MQRCCF\_MSG\_LENGTH\_ERROR**  
Message length not valid.

**MQRCCF\_OBJECT\_NAME\_ERROR**  
Object name not valid.

**MQRCCF\_OBJECT\_OPEN**  
Object is open.

**MQRCCF\_PARM\_COUNT\_TOO\_BIG**  
Parameter count too large.

**MQRCCF\_PARM\_COUNT\_TOO\_SMALL**  
Parameter count too small.

**MQRCCF\_PARM\_SEQUENCE\_ERROR**  
Parameter sequence not valid.

**MQRCCF\_PARM\_SYNTAX\_ERROR**  
Syntax error found in parameter.

## **MQRCCF\_STRUCTURE\_TYPE\_ERROR**

Structure type not valid.

## **MQRCCF\_UNKNOWN\_OBJECT\_NAME**

Unknown object name.

### **PCF commands and responses in groups:**

In this product documentation, the commands and data responses are given in alphabetical order.

They can be usefully grouped as follows:

#### **Authentication Information commands**

- “Change, Copy, and Create Authentication Information Object” on page 1060
- “Delete Authentication Information Object” on page 1195
- “Inquire Authentication Information Object” on page 1218
- “Inquire Authentication Information Object Names” on page 1225

#### **Authority Record commands**

- “Delete Authority Record” on page 1196
- “Inquire Authority Records” on page 1228
- “Inquire Authority Service” on page 1234
- “Inquire Entity Authority” on page 1347
- “Set Authority Record” on page 1541

#### **z/OS**

#### **CF commands**

- “Backup CF Structure” on page 1059
- “Change, Copy, and Create CF Structure” on page 1069
- “Delete CF Structure” on page 1198
- “Inquire CF Structure” on page 1236
- “Inquire CF Structure Names” on page 1241
- “Inquire CF Structure Status” on page 1242
- “Recover CF Structure” on page 1517

#### **Channel commands**

- “Change, Copy, and Create Channel” on page 1074
- “Delete Channel” on page 1198
- “Inquire Channel” on page 1248
- **z/OS** “Inquire Channel Initiator” on page 1277
- “Inquire Channel Names” on page 1288
- “Inquire Channel Status” on page 1291
- “Ping Channel” on page 1512
- “Reset Channel” on page 1525
- “Resolve Channel” on page 1533
- “Start Channel” on page 1558
- **z/OS** “Start Channel Initiator” on page 1562
- “Stop Channel” on page 1567

-  “Stop Channel Initiator” on page 1571

### **Channel commands (MQTT)**

- “Change, Copy, and Create Channel (MQTT)” on page 1108
- “Delete Channel (MQTT)” on page 1200
- “Inquire Channel (MQTT)” on page 1257
- “Inquire Channel Status (MQTT)” on page 1304
- “Purge Channel” on page 1516
- “Start Channel (MQTT)” on page 1561
- “Stop Channel (MQTT)” on page 1570

### **Channel Authentication commands**

- “Inquire Channel Authentication Records” on page 1270
- “Set Channel Authentication Record” on page 1546

### **Channel Listener commands**

- “Change, Copy, and Create Channel Listener” on page 1114
- “Delete Channel Listener” on page 1202
- “Inquire Channel Listener” on page 1280
- “Inquire Channel Listener Status” on page 1284
- “Start Channel Listener” on page 1563
- “Stop Channel Listener” on page 1572

### **Cluster commands**

- “Inquire Cluster Queue Manager” on page 1319
- “Refresh Cluster” on page 1518
- “Reset Cluster” on page 1527
- “Resume Queue Manager Cluster” on page 1536
- “Suspend Queue Manager Cluster” on page 1577

### **Communication Information commands**

- “Change, Copy, and Create Communication Information Object” on page 1117
- “Delete Communication Information Object” on page 1202
- “Inquire Communication Information Object” on page 1332

### **Connection commands**

- “Inquire Connection” on page 1336
- “Stop Connection” on page 1574

### **Escape command**

- “Escape” on page 1212

### **Namelist commands**

- “Change, Copy, and Create Namelist” on page 1120
- “Delete Namelist” on page 1202
- “Inquire Namelist” on page 1359
- “Inquire Namelist Names” on page 1363

### Process commands

- “Change, Copy, and Create Process” on page 1123
- “Delete Process” on page 1204
- “Inquire Process” on page 1368
- “Inquire Process Names” on page 1372

### Publish/subscribe commands

- “Change, Copy, and Create Subscription” on page 1179
- “Change, Copy, and Create Topic” on page 1183
- “Clear Topic String” on page 1194
- “Delete Subscription” on page 1210
- “Delete Topic” on page 1211
- “Inquire Pub/Sub Status” on page 1374
- “Inquire Subscription” on page 1469
- “Inquire Subscription Status” on page 1477
- “Inquire Topic” on page 1485
- “Inquire Topic Names” on page 1495
- “Inquire Topic Status” on page 1498

### Queue commands

- “Change, Copy, and Create Queue” on page 1127
- “Clear Queue” on page 1192
- “Delete Queue” on page 1206
- “Inquire Queue” on page 1378
- “Inquire Queue Names” on page 1435
- “Inquire Queue Status” on page 1438
-  “Move Queue” on page 1511
- “Reset Queue Statistics” on page 1529

### Queue Manager commands

- “Change Queue Manager” on page 1145
- “Inquire Queue Manager” on page 1397
- “Inquire Queue Manager Status” on page 1431
- “Ping Queue Manager” on page 1516
- “Refresh Queue Manager” on page 1519
- “Reset Queue Manager” on page 1528
-  “Resume Queue Manager” on page 1535
-  “Suspend Queue Manager” on page 1576

### Security commands

- “Change Security” on page 1172
- “Inquire Security” on page 1450
- “Refresh Security” on page 1522
-  “Reverify Security” on page 1537

## Service commands

- “Change, Copy, and Create Service” on page 1174
- “Delete Service” on page 1208
- “Inquire Service” on page 1453
- “Inquire Service Status” on page 1456
- “Start Service” on page 1565
- “Stop Service” on page 1574

### ▶ z/OS

## SMDS commands

- “Change SMDS” on page 1173
- “Inquire SMDS” on page 1460
- “Inquire SMDS Connection” on page 1461
- “Reset SMDS” on page 1532
- “Start SMDS Connection” on page 1566
- “Stop SMDS Connection” on page 1575

### ▶ z/OS

## Storage class commands

- ▶ z/OS “Change, Copy, and Create Storage Class” on page 1176
- “Delete Storage Class” on page 1209
- “Inquire Storage Class” on page 1464
- “Inquire Storage Class Names” on page 1467

### ▶ z/OS

## System commands

- “Inquire Archive” on page 1214
- “Set Archive” on page 1537
- “Inquire Group” on page 1353
- “Inquire Log” on page 1355
- “Set Log” on page 1552
- “Inquire System” on page 1481
- “Set System” on page 1556
- “Inquire Usage” on page 1505

## Data responses to commands

- “Escape (Response)” on page 1213
- ▶ z/OS “Inquire Archive (Response)” on page 1214
- “Inquire Authentication Information Object (Response)” on page 1221
- “Inquire Authentication Information Object Names (Response)” on page 1227
- “Inquire Authority Records (Response)” on page 1231
- “Inquire Authority Service (Response)” on page 1235
- ▶ z/OS “Inquire CF Structure (Response)” on page 1237
- ▶ z/OS “Inquire CF Structure Names (Response)” on page 1241
- ▶ z/OS “Inquire CF Structure Status (Response)” on page 1243

- “Inquire Channel (Response)” on page 1259
- “Inquire Channel Authentication Records (Response)” on page 1274
- “Inquire Channel Initiator (Response)” on page 1277
- “Inquire Channel Listener (Response)” on page 1282
- “Inquire Channel Listener Status (Response)” on page 1286
- “Inquire Channel Names (Response)” on page 1290
- “Inquire Channel Status (Response)” on page 1306
- “Inquire Channel Status (Response) (MQTT)” on page 1317
- “Inquire Cluster Queue Manager (Response)” on page 1324
- “Inquire Communication Information Object (Response)” on page 1333
- “Inquire Connection (Response)” on page 1340
- “Inquire Entity Authority (Response)” on page 1350
-  “Inquire Group (Response)” on page 1353
-  “Inquire Log (Response)” on page 1356
- “Inquire Namelist (Response)” on page 1362
- “Inquire Namelist Names (Response)” on page 1365
- “Inquire Process (Response)” on page 1370
- “Inquire Process Names (Response)” on page 1373
- “Inquire Pub/Sub Status (Response)” on page 1375
- “Inquire Queue (Response)” on page 1387
- “Inquire Queue Manager (Response)” on page 1407
- “Inquire Queue Manager Status (Response)” on page 1433
- “Inquire Queue Names (Response)” on page 1437
- “Reset Queue Statistics (Response)” on page 1531
- “Inquire Queue Status (Response)” on page 1443
-  “Inquire Security (Response)” on page 1451
- “Inquire Service (Response)” on page 1454
- “Inquire Service Status (Response)” on page 1458
-  “Inquire Storage Class (Response)” on page 1466
-  “Inquire Storage Class Names (Response)” on page 1468
-  “Inquire SMDS (Response)” on page 1460
-  “Inquire SMDS Connection (Response)” on page 1462
- “Inquire Subscription (Response)” on page 1473
- “Inquire Subscription Status (Response)” on page 1479
-  “Inquire System (Response)” on page 1481
- “Inquire Topic (Response)” on page 1489
- “Inquire Topic Names (Response)” on page 1497
- “Inquire Topic Status (Response)” on page 1499
-  “Inquire Usage (Response)” on page 1506

**Backup CF Structure:** z/OS

The Backup CF Structure (MQCMD\_BACKUP\_CF\_STRUC) command initiates a CF application structure backup.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue-sharing group.

**Required parameters*****CFStrucName* (MQCFST)**

The name of the CF application structure to be backed up (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

**Optional parameters*****CommandScope* (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

***ExcludeInterval* (MQCFIN)**

Exclude interval (parameter identifier: MQIACF\_EXCLUDE\_INTERVAL).

Specifies a value in seconds that defines the length of time immediately before the current time where the backup starts. The backup excludes backing-up the last *n* seconds activity. For example, if 30 seconds is specified, the backup does not include the last 30 seconds worth of activity for this application-structure.

The value must be in the range 30 through 600. The default value is 30.

## Change, Copy, and Create Authentication Information Object:

The Change authentication information command changes attributes of an existing authentication information object. The Create and Copy authentication information commands create new authentication information objects - the Copy command uses attribute values of an existing object.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

The Change authentication information (MQCMD\_CHANGE\_AUTH\_INFO) command changes the specified attributes in an authentication information object. For any optional parameters that are omitted, the value does not change.

The Copy authentication information (MQCMD\_COPY\_AUTH\_INFO) command creates new authentication information object using, for attributes not specified in the command, the attribute values of an existing authentication information object.

The Create authentication information (MQCMD\_CREATE\_AUTH\_INFO) command creates an authentication information object. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. A system default authentication information object exists and default values are taken from it.

### Required parameters (Change authentication information)

#### *AuthInfoName* (MQCFST)

The authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

#### *AuthInfoType* (MQCFIN)

The type of authentication information object (parameter identifier: MQIA\_AUTH\_INFO\_TYPE).

The value can be:

##### **MQAIT\_CRL\_LDAP**

This defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

##### **MQAIT\_OCSP**

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

*AuthInfoType* MQAIT\_OCSP does not apply for use on IBM i or z/OS queue managers, but it can be specified on those platforms to be copied to the client channel definition table for client use.

##### **MQAIT\_IDPW\_OS**

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

##### **MQAIT\_IDPW\_LDAP**

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

**Important:** This option is not valid on z/OS.

See Security for more information.

## Required parameters (Copy authentication information)

### FromAuthInfoName (MQCFST)

The name of the authentication information object definition to be copied from (parameter identifier: MQCACF\_FROM\_AUTH\_INFO\_NAME).

**z/OS** On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToAuthInfoName* and the disposition of MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

### ToAuthInfoName (MQCFST)

The name of the authentication information object to copy to (parameter identifier: MQCACF\_TO\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

### AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA\_AUTH\_INFO\_TYPE). The value must match the *AuthInfoType* of the authentication information object from which you are copying.

The value can be:

#### MQAIT\_CRL\_LDAP

This value defines this authentication information object as specifying Certificate Revocation Lists that are held on LDAP.

#### MQAIT\_OCSP

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

#### MQAIT\_IDPW\_OS

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

#### MQAIT\_IDPW\_LDAP

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

**Important:** This option is not valid on z/OS.

See Security for more information.

## Required parameters (Create authentication information)

### AuthInfoName (MQCFST)

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

### AuthInfoType (MQCFIN)

The type of authentication information object (parameter identifier: MQIA\_AUTH\_INFO\_TYPE).

The following values are accepted:

#### MQAIT\_CRL\_LDAP

This value defines this authentication information object as specifying an LDAP server containing Certificate Revocation Lists.

## **MQAIT\_OCSP**

This value defines this authentication information object as specifying certificate revocation checking using OCSP.

An authentication information object with AuthInfoType MQAIT\_OCSP does not apply for use on IBM i or z/OS queue managers, but it can be specified on those platforms to be copied to the client channel definition table for client use.

## **MQAIT\_IDPW\_OS**

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through the operating system.

## **MQAIT\_IDPW\_LDAP**

This value defines this authentication information object as specifying certificate revocation checking using user ID and password checking through an LDAP server.

**Important:** This option is not valid on z/OS.

See Security for more information.

### **Optional parameters (Change, Copy, and Create Authentication Information Object)**

#### **AdoptContext (MQCFIN)**

Whether to use the presented credentials as the context for this application (parameter identifier MQIA\_ADOPT\_CONTEXT). This means that they are used for authorization checks, shown on administrative displays, and appear in messages.

**YES** The user ID presented in the MQCSP structure, which has been successfully validated by password, is adopted as the context to use for this application. Therefore, this user ID will be the credentials checked for authorization to use IBM MQ resources.

If the user ID presented is an LDAP user ID, and authorization checks are done using operating system user IDs, the ShortUser associated with the user entry in LDAP will be adopted as the credentials for authorization checks to be done against.

**NO** Authentication will be performed on the user ID and password presented in the MQCSP structure, but then the credentials will not be adopted for further use. Authorization will be performed using the user ID the application is running under.

This attribute is only valid for **AuthInfoType** of *MQAIT\_IDPW\_OS* and *MQAIT\_IDPW\_LDAP* .

The maximum length is MQIA\_ADOPT\_CONTEXT\_LENGTH.

#### **AuthInfoConnName (MQCFST)**

The connection name of the authentication information object (parameter identifier: MQCA\_AUTH\_INFO\_CONN\_NAME).

This parameter is relevant only when AuthInfoType is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP* , when it is required.

When used with an AuthInfoType of *MQAIT\_IDPW\_LDAP*, this can be a comma separated list of connection names.

On platforms other than z/OS, the maximum length is MQ\_AUTH\_INFO\_CONN\_NAME\_LENGTH. On z/OS, it is MQ\_LOCAL\_ADDRESS\_LENGTH.

#### **AuthInfoDesc (MQCFST)**

The description of the authentication information object (parameter identifier: MQCA\_AUTH\_INFO\_DESC).

The maximum length is MQ\_AUTH\_INFO\_DESC\_LENGTH.

### ► V 8.0.0.3 AuthenticationMethod (MQCFIN)

Authentication methods for user passwords (parameter identifier: MQIA\_AUTHENTICATION\_METHOD). Possible values are:

#### MQAUTHENTICATE\_OS

Use the traditional UNIX platforms password verification method

This is the default value.

#### MQAUTHENTICATE\_PAM

Use the Pluggable Authentication Method to authenticate the user passwords.

You can set the PAM value only on UNIX and Linux platforms.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS*, and is not valid on IBM MQ for z/OS.

### ► V 8.0.0.2 AuthorizationMethod (MQCFIN)

Authorization methods for the queue manager (parameter identifier: MQIA\_LDAP\_AUTHORMD). Possible values are:

#### MQLDAP\_AUTHORMD\_OS

Use operating system groups to determine permissions associated with a user.

This is how IBM MQ has previously worked, and is the default value.

#### MQLDAP\_AUTHORMD\_SEARCHGRP

A group entry in the LDAP repository contains an attribute listing all the users belonging to that group. Membership is indicated by the attribute defined in FindGroup. This value is typically *member* or *uniqueMember*.

#### MQLDAP\_AUTHORMD\_SEARCHUSR

A user entry in the LDAP repository contains an attribute listing all the groups to which the specified user belongs. The attribute to query is defined by the FindGroup value, typically *memberOf*.

Many LDAP servers use an attribute of the group object to determine group membership and you should, therefore, set this value to *MQLDAP\_AUTHORMD\_SEARCHGRP*.

Microsoft Active Directory typically stores group memberships as a user attribute. The IBM Tivoli Directory Server supports both methods.

In general, retrieving memberships through a user attribute will be faster than searching for groups that list the user as a member.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* ► V 8.0.0.2 , and is not applicable to Windows platforms.

### ► V 8.0.0.2 BaseDNGroup (MQCFST)

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server (parameter identifier: MQCA\_LDAP\_BASE\_DN\_GROUPS).

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* ► V 8.0.0.2 , and is not applicable to Windows platforms.

The maximum length is *MQ\_LDAP\_BASE\_DN\_LENGTH*.

### BaseDNUser (MQCFST)

In order to be able to find the short user name attribute (see *ShortUser* ) this parameter must be set with the base DN to search for users within the LDAP server (parameter identifier: MQCA\_LDAP\_BASE\_DN\_USERS).

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* and is mandatory.

The maximum length is MQ\_LDAP\_BASE\_DN\_LENGTH.

#### **Checkclient (MQCFIN)**

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS* or *MQAIT\_IDPW\_LDAP* (parameter identifier: MQIA\_CHECK\_CLIENT\_BINDING). The possible values are:

##### **MQCHK\_NONE**

Switches off checking.

##### **MQCHK\_OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

##### **MQCHK\_REQUIRED**

Requires that all applications provide a valid user ID and password.

##### **MQCHK\_REQUIRED\_ADMIN**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the OPTIONAL setting.  (This setting is not allowed on z/OS systems.)

#### **Checklocal (MQCFIN)**

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS* or *MQAIT\_IDPW\_LDAP* (parameter identifier: MQIA\_CHECK\_LOCAL\_BINDING). The possible values are:

##### **MQCHK\_NONE**

Switches off checking.

##### **MQCHK\_OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

##### **MQCHK\_REQUIRED**

Requires that all applications provide a valid user ID and password.

 If your user ID has UPDATE access to the BATCH profile in the MQCONN class, you can treat **MQCHK\_REQUIRED** as if it is **MQCHK\_OPTIONAL**. That is, you do not have to supply a password, but if you do, the password must be the correct one.

##### **MQCHK\_REQUIRED\_ADMIN**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the OPTIONAL setting.  (This setting is not allowed on z/OS systems.)

#### **ClassGroup (MQCFST)**

The LDAP object class used for group records in the LDAP repository (parameter identifier: MQCA\_LDAP\_GROUP\_OBJECT\_CLASS).

If the value is blank, groupOfNames is used.

Other commonly used values include *groupOfUniqueNames* or *group*.

The maximum length is MQ\_LDAP\_CLASS\_LENGTH.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* , and is not applicable to Windows platforms.

#### **Classuser (MQCFST)**

The LDAP object class used for user records in the LDAP repository (parameter identifier MQCA\_LDAP\_USER\_OBJECT\_CLASS).

If blank, the value defaults to *inetOrgPerson*, which is generally the value needed.

For Microsoft Active Directory, the value you require required is often *user*.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP*.

#### z/OS **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### **FailureDelay (MQCFIN)**

When a user ID and password are provided for connection authentication, and the authentication fails due to the user ID or password being incorrect, this is the delay, in seconds, before the failure is returned to the application (parameter identifier: MQIA\_AUTHENTICATION\_FAIL\_DELAY).

This can aid in avoiding busy loops from an application that simply retries, continuously, after receiving a failure.

The value must be in the range 0 - 60 seconds. The default value is 1. This parameter is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS* or *MQAIT\_IDPW\_LDAP*.

#### V 8.0.0.2 **FindGroup (MQCFST)**

Name of the attribute used within an LDAP entry to determine group membership (parameter identifier: MQCA\_LDAP\_FIND\_GROUP\_FIELD).

When *AuthorizationMethod = MQLDAP\_AUTHORMD\_SEARCHGRP*, this attribute is typically set to *member* or *uniqueMember*.

When *AuthorizationMethod = MQLDAP\_AUTHORMD\_SEARCHUSR*, this attribute is typically set to *memberOf*.

If left blank, the queue manager uses *member* or *memberOf* depending on the setting of **AuthorizationMethod**.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* **V 8.0.0.2**, and is not applicable to Windows platforms.

The maximum length is MQ\_LDAP\_FIELD\_LENGTH.

#### V 8.0.0.2 **GroupField (MQCFST)**

LDAP attribute that represents a simple name for the group (parameter identifier: MQCA\_LDAP\_GROUP\_ATTR\_FIELD).

If the value is blank, commands like *setmqaut* must use a qualified name for the group. The value can either be a full DN, or a single attribute.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* **V 8.0.0.2**, and is not applicable to Windows platforms.

The maximum length is MQ\_LDAP\_FIELD\_LENGTH.

### V 8.0.0.2 GroupNesting (MQCFIN)

Whether groups are members of other groups (parameter identifier: MQCA\_LDAP\_NESTGRP). The values can be:

#### MQLDAP\_NESTGRP\_NO

Only the initially discovered groups are considered for authorization.

#### MQLDAP\_NESTGRP\_YES

The group list is searched recursively to enumerate all the groups to which a user belongs.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* V 8.0.0.2, and is not applicable to Windows platforms.

### LDAPPassword (MQCFST)

The LDAP password (parameter identifier: MQCA\_LDAP\_PASSWORD).

This parameter is relevant only when **AuthInfoType** is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

The maximum length is MQ\_LDAP\_PASSWORD\_LENGTH.

### LDAPUserName (MQCFST)

The LDAP user name (parameter identifier: MQCA\_LDAP\_USER\_NAME).

This parameter is relevant only when **AuthInfoType** is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

On platforms other than z/OS, the maximum length is MQ\_DISTINGUISHED\_NAME\_LENGTH. On z/OS, it is MQ\_SHORT\_DNAME\_LENGTH.

### OCSPResponderURL (MQCFST)

The URL at which the OCSP responder can be contacted (parameter identifier: MQCA\_AUTH\_INFO\_OCSP\_URL).

This parameter is relevant only when **AuthInfoType** is set to *MQAIT\_OCSP*, when it is required.

This field is case-sensitive. It must start with the string `http://` in lowercase. The rest of the URL might be case sensitive, depending on the OCSP server implementation.

The maximum length is MQ\_AUTH\_INFO\_OCSP\_URL\_LENGTH.

### z/OS QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OSonly.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameter MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToAuthInfoName</i> object (for Copy) or the <i>AuthInfoName</i> object (for Create).

QSGDisposition	Change	Copy, Create
<b>MQQSGD_GROUP</b>	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE AUTHINFO(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue-sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE AUTHINFO(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
<b>MQQSGD_PRIVATE</b>	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR, or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	Not permitted.
<b>MQQSGD_Q_MGR</b>	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

#### **Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If an Authentication Information object with the same name as AuthInfoName or ToAuthInfoName exists, it specifies whether it is to be replaced. The value can be any of the following values:

#### **MQRP\_YES**

Replace existing definition

#### **MQRP\_NO**

Do not replace existing definition

#### **SecureComms (MQCFIN)**

Whether connectivity to the LDAP server should be done securely using SSL/TLS (parameter identifier MQIA\_LDAP\_SECURE\_COMM).

#### **MQSECCOMM\_YES**

Connectivity to the LDAP server is made securely using SSL/TLS.

The certificate used is the default certificate for the queue manager, named in CERTLABL on the queue manager object, or if that is blank, the one described in Digital certificate labels, understanding the requirements.

The certificate is located in the key repository specified in `SSLKEYR` on the queue manager object. A cipherspec will be negotiated that is supported by both IBM MQ and the LDAP server.

If the queue manager is configured to use `SSLFIPS(YES)` or `SUITEB` cipher specs, then this is taken account of in the connection to the LDAP server as well.

#### **MQSECCOMM\_ANON**

Connectivity to the LDAP server is made securely using SSL/TLS just as for `MQSECCOMM_YES` with one difference.

No certificate is sent to the LDAP server; the connection will be made anonymously. To use this setting, ensure that the key repository specified in `SSLKEYR`, on the queue manager object, does not contain a certificate marked as the default.

#### **MQSECCOMM\_NO**

Connectivity to the LDAP server does not use SSL/TLS.

This attribute is valid only for an **AuthInfoType** of `MQAIT_IDPW_LDAP`.

#### **ShortUser (MQCFST)**

A field in the user record to be used as a short user name in IBM MQ (parameter identifier `MQCA_LDAP_SHORT_USER_FIELD`).

This field must contain values of 12 characters or less. This short user name is used for the following purposes:

- If LDAP authentication is enabled, but LDAP authorization is not enabled, this is used as an operating system user ID for authorization checks. In this case, the attribute must represent an operating system user ID.
- If LDAP authentication and authorization are both enabled, this is used as the user ID carried with the message in order for the LDAP user name to be rediscovered when the user ID inside the message needs to be used.

For example, on another queue manager, or when writing report messages. In this case, the attribute does not need to represent an operating system user ID, but must be a unique string. An employee serial number is an example of a good attribute for this purpose.

This attribute is valid only for an **AuthInfoType** of `MQAIT_IDPW_LDAP` and is mandatory.

The maximum length is `MQ_LDAP_FIELD_LENGTH`.

#### **UserField (MQCFST)**

If the user ID provided by an application for authentication does not contain a qualifier for the field in the LDAP user record, that is, it does not contain an '=' sign, this attribute identifies the field in the LDAP user record that is used to interpret the provided user ID (parameter identifier `MQCA_LDAP_USER_ATTR_FIELD`).

This field can be blank. If this is the case, any unqualified user IDs use the `ShortUser` field to interpret the provided user ID.

The contents of this field will be concatenated with an '=' sign, together with the value provided by the application, to form the full user ID to be located in an LDAP user record. For example, the application provides a user of fred and this field has the value cn, then the LDAP repository will be searched for `cn=fred`.

The maximum length is `MQ_LDAP_FIELD_LENGTH`.

## Change, Copy, and Create CF Structure:

The Change CF Structure command changes existing CF application structures. The Copy and Create CF Structure commands create new CF application structures - the Copy command uses attribute values of an existing CF application structure.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Note:** These commands are supported only on z/OS when the queue manager is a member of a queue-sharing group.

The Change CF Structure (MQCMD\_CHANGE\_CF\_STRUC) command changes the specified attributes in a CF application structure. For any optional parameters that are omitted, the value does not change.

The Copy CF Structure (MQCMD\_COPY\_CF\_STRUC) command creates new CF application structure using, for attributes not specified in the command, the attribute values of an existing CF application structure.

The Create CF Structure (MQCMD\_CREATE\_CF\_STRUC) command creates a CF application structure. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### Required parameters (Change and Create CF Structure)

#### *CFStrucName* (MQCFST)

The name of the CF application structure with backup and recovery parameters that you want to define (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### Required parameters (Copy CF Structure)

#### *FromCFStrucName* (MQCFST)

The name of the CF application structure to be copied from (parameter identifier: MQCACF\_FROM\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

#### *ToCFStrucName* (MQCFST)

The name of the CF application structure to copy to (parameter identifier: MQCACF\_TO\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### Optional parameters (Change, Copy, and Create CF Structure)

#### *CFConlos* (MQCFIN)

CFConlos (parameter identifier: MQIA\_CF\_CFCONLOS).

Specifies the action to be taken when a queue manager loses connectivity to the CF structure. The following constant names are valid values for CFConlos:

#### **MQCFCONLOS\_ASQMGR**

The action taken is based on the setting of the CFCONLOS queue manager attribute. This value is the default for newly created CF structure objects with CFLEVEL(5).

## MQCFCONLOS\_TERMINATE

The queue manager terminates when connectivity to the structure is lost. This value is the default if the CF structure object is not at CFLEVEL(5), and for existing CF structure objects that are changed to CFLEVEL(5).

## MQCFCONLOS\_TOLERATE

The queue manager tolerates loss of connectivity to the structure without terminating.

This parameter is only valid from CFLEVEL(5).

### *CFLevel* (MQCFIN)

The functional capability level for this CF application structure (parameter identifier: MQIA\_CF\_LEVEL).

Specifies the functional capability level for the CF application structure. The value can be any of the following values:

- 1 A CF structure that can be "auto-created" by a queue manager at command level 520.
- 2 A CF structure at command level 520 that can only be created or deleted by a queue manager at command level 530 or greater.

3

A CF structure at command level 530. This *CFLevel* is required if you want to use persistent messages on shared queues, or for message grouping, or both. This level is the default *CFLevel* for queue managers at command level 600.

You can only increase the value of *CFLevel* to 3 if all the queue managers in the queue-sharing group are at command level 530 or greater - this restriction is to ensure that there are no latent command level 520 connections to queues referencing the CF structure.

You can only decrease the value of *CFLevel* from 3 if all the queues that reference the CF structure are both empty (have no messages or uncommitted activity) and closed.

4

This *CFLevel* supports all the *CFLevel* (3) functions. *CFLevel* (4) allows queues defined with CF structures at this level to have messages with a length greater than 63 KB.

Only a queue manager with a command level of 600 can connect to a CF structure at *CFLevel* (4).

You can only increase the value of *CFLevel* to 4 if all the queue managers in the queue-sharing group are at command level 600 or greater.

You can only decrease the value of *CFLevel* from 4 if all the queues that reference the CF structure are both empty (have no messages or uncommitted activity) and closed.

5

This *CFLevel* supports all the *CFLevel* (4) functions. *CFLevel* (5) allows persistent, and nonpersistent messages to be selectively stored in Db2 or shared message data sets.

Only queue managers with a command level of 710 or higher and with OPMODE set to enable IBM WebSphere MQ Version 7.1.0 new functions can connect to a CF structure at *CFLevel* (5).

Structures are required to be at CFLEVEL(5) to support toleration of loss of connectivity.

 For more information, see *Where are shared queue messages held?*

### *CFStrucDesc* (MQCFST)

The description of the CF structure (parameter identifier: MQCA\_CF\_STRUC\_DESC).

The maximum length is MQ\_CF\_STRUC\_DESC\_LENGTH.

***DSBlock (MQCFIN)***

The logical block size for shared message data sets (parameter identifier: MQIACF\_CF\_SMDS\_BLOCK\_SIZE ).

The unit in which shared message data set space is allocated to individual queues. The value can be any of the following values:

**MQDSB\_8K**

The logical block size is set to 8 K.

**MQDSB\_16K**

The logical block size is set to 16K.

**MQDSB\_32K**

The logical block size is set to 32 K.

**MQDSB\_64K**

The logical block size is set to 64 K.

**MQDSB\_128K**

The logical block size is set to 128 K.

**MQDSB\_256K**

The logical block size is set to 256 K.

**MQDSB\_512K**

The logical block size is set to 512 K.

**MQDSB\_1024K**

The logical block size is set to 1024 K.

**MQDSB\_1M**

The logical block size is set to 1 M.

Value can not be set unless CFLEVEL(5) is defined.

The default value is 256 K unless CFLEVEL is not 5. In this case a value of 0 is used.

***DSBufs (MQCFIN)***

The shared message data set buffers group (parameter identifier: MQIA\_CF\_SMDS\_BUFFERS).

Specifies the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

A value in the range 1 - 9999.

Value can not be set unless CFLEVEL(5) is defined.

***DSEXPAND (MQCFIN)***

The shared message data set expand option (parameter identifier: MQIACF\_CF\_SMDS\_EXPAND).

Specifies whether or not the queue manager should expand a shared message data set when it is nearly full, and further blocks are required in the data set. The value can be any of the following values:

**MQDSE\_YES**

The data set can be expanded.

**MQDSE\_NO**

The data set cannot be expanded.

**MQDSE\_DEFAULT**

Only returned on DISPLAY CFSTRUCT when not explicitly set

Value can not be set unless CFLEVEL(5) is defined.

### *DSGroup* (MQCFST)

The shared message data set group name (parameter identifier: MQCACF\_CF\_SMDS\_GENERIC\_NAME).

Specifies a generic data set name to be used for the group of shared message data sets associated with this CF structure.

The string must contain exactly one asterisk (\*), which will be replaced with the queue manager name of up to 4 characters.

The maximum length of this parameter is 44 characters.

Value can not be set unless CFLEVEL(5) is defined.

### *Offload* (MQCFIN)

Offload (parameter identifier: MQIA\_CF\_OFFLOAD).

Specifies the OFFLOAD option for large (>63 K) shared messages on z/OS. The value can be:

#### **MQCFOFFLD\_DB2**

Large shared messages can be stored in Db2.

#### **MQCFOFFLD\_SMDS**

Large shared messages can be stored in z/OS shared message data sets.

#### **MQCFOFFLD\_NONE**

Used when the property *Offload* has not been explicitly set.

Value can not be set unless CFLEVEL(5) is defined.

The default value is MQCFOFFLD\_NONE if not at CFLEVEL(5).

For existing CF structure objects that are changed to CFLEVEL(5) the default is MQCFOFFLD\_DB2.

For newly created CF structure objects with CFLEVEL(5) the default is MQCFOFFLD\_SMDS.

 For more information about the group of parameters (*OFFLDxSZ* and *OFFLDxTH*), see Specifying offload options for shared message data sets

### *OFFLD1SZ* (MQCFST)

The offload size property 1 (Parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE1)

Specifies the first offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 32K. This property is used with *OFFLD1TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

### *OFFLD2SZ* (MQCFST)

The offload size property 2 (Parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE2)

Specifies the second offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 4K. This property is used with *OFFLD2TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

**OFFLD3SZ (MQCFST)**

The offload size property 3 (Parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE3)

Specifies the third offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the size of the messages to be offloaded. The property is specified as a string with values in the range 0K - 64K.

The default value is 0K. This property is used with *OFFLD3TH*.

Value can not be set unless CFLEVEL(5) is defined.

The value 64K indicates that the rule is not being used.

The maximum length is 3.

**OFFLD1TH (MQCFIN)**

The offload threshold property 1 (Parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD1)

Specifies the first offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 70. This property is used with *OFFLD1SZ*.

Value can not be set unless CFLEVEL(5) is defined.

**OFFLD2TH (MQCFIN)**

The offload threshold property 2 (Parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD2)

Specifies the second offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 80. This property is used with *OFFLD2SZ*.

Value can not be set unless CFLEVEL(5) is defined.

**OFFLD3TH (MQCFIN)**

The offload threshold property 3 (Parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD3)

Specifies the third offload rule, based on upon message size and the coupling facility structure percentage use threshold. This property indicates the coupling facility structure percentage full.

The default value is 90. This property is used with *OFFLD3SZ*.

Value can not be set unless CFLEVEL(5) is defined.

**Recauto (MQCFIN)**

Recauto (parameter identifier: MQIA\_CF\_RECAUTO).

Specifies the automatic recovery action to be taken, when a queue manager detects that the structure is failed or when a queue manager loses connectivity to the structure, and no systems in the SysPlex have connectivity to the Coupling Facility that the structure is allocated in. The value can be:

**MQRECAUTO\_YES**

The structure and associated shared message data sets which also need recovery are automatically recovered. This value is the default for newly created CF structure objects with CFLEVEL(5).

**MQRECAUTO\_NO**

The structure is not automatically recovered. This value is the default if the CF structure object is not at CFLEVEL(5), and for existing CF structure objects that are changed to CFLEVEL(5).

**Recovery (MQCFIN)**

Recovery (parameter identifier: MQIA\_CF\_RECOVER).

Specifies whether CF recovery is supported for the application structure. The value can be:

**MQCFR\_YES**

Recovery is supported.

**MQCFR\_NO**

Recovery is not supported.

**Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a CF structure definition with the same name as *ToCFStrucName* exists, this value specifies whether it is to be replaced. The value can be any of the following values:**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

**Change, Copy, and Create Channel:**

The Change Channel command changes existing channel definitions. The Copy and Create Channel commands create new channel definitions - the Copy command uses attribute values of an existing channel definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

The Change Channel (MQCMD\_CHANGE\_CHANNEL) command changes the specified attributes in a channel definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel (MQCMD\_COPY\_CHANNEL) command creates new channel definition using, for attributes not specified in the command, the attribute values of an existing channel definition.

The Create Channel (MQCMD\_CREATE\_CHANNEL) command creates an IBM MQ channel definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. If a system default channel exists for the type of channel being created, the default values are taken from there.

The following table shows the parameters that are applicable to each type of channel. V8.0.0.4

Table 118. Change, Copy, Create Channel parameters

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	<span style="background-color: #cccccc; padding: 2px;">V8.0.0.4</span>

**Note:**

1. Required parameter on Change and Create Channel commands.

2. Required parameter on Copy Channel command.
3. Required parameter on Change, Create, and Copy Channel commands.
4. PUTAUT is valid for a channel type of SVRCONN on z/OS only.
5. Required parameter on Create Channel command if TrpType is TCP.
6. Required parameter on Create Channel command for a channel type of MQTT.

### Required parameters (Change, Create Channel)

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Specifies the name of the channel definition to be changed, or created

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

This parameter is required on all types of channel; on a CLUSSDR it can be different from on the other channel types. If your convention for naming channels includes the name of the queue manager, you can make a CLUSSDR definition using the +QMNAME+ construction, and IBM MQ substitutes the correct repository queue manager name in place of +QMNAME+. This facility applies to AIX, HP-UX, Linux, IBM i, Solaris, and Windows only. See Configuring a queue manager cluster for more details.

#### *ChannelType* (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

#### **MQCHT\_SENDER**

Sender.

#### **MQCHT\_SERVER**

Server.

#### **MQCHT\_RECEIVER**

Receiver.

#### **MQCHT\_REQUESTER**

Requester.

#### **MQCHT\_SVRCONN**

Server-connection (for use by clients).

#### **MQCHT\_CLNTCONN**

Client connection.

#### **MQCHT\_CLUSRCVR**

Cluster-receiver.

#### **MQCHT\_CLUSSDR**

Cluster-sender.

#### **MQCHT\_AMQP**

AMQP.

### Required parameters (Copy Channel)

#### *FromChannelName* (MQCFST)

From channel name (parameter identifier: MQCACF\_FROM\_CHANNEL\_NAME).

The name of the existing channel definition that contains values for the attributes that are not specified in this command.

► **z/OS** On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToChannelName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### *ChannelType* (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

#### **MQCHT\_SENDER**

Sender.

#### **MQCHT\_SERVER**

Server.

#### **MQCHT\_RECEIVER**

Receiver.

#### **MQCHT\_REQUESTER**

Requester.

#### **MQCHT\_SVRCONN**

Server-connection (for use by clients).

#### **MQCHT\_CLNTCONN**

Client connection.

#### **MQCHT\_CLUSRCVR**

Cluster-receiver.

#### **MQCHT\_CLUSSDR**

Cluster-sender.

#### ► **V 8.0.0.4** **MQCHT\_AMQP**

AMQP.

#### *ToChannelName* (MQCFST)

To channel name (parameter identifier: MQCACF\_TO\_CHANNEL\_NAME).

The name of the new channel definition.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

Channel names must be unique; if a channel definition with this name exists, the value of *Replace* must be MQRP\_YES. The channel type of the existing channel definition must be the same as the channel type of the new channel definition otherwise it cannot be replaced.

### Optional parameters (Change, Copy, and Create Channel)

#### ► **V 8.0.0.4**

#### *AMQPKeepAlive* (MQCFIN)

The AMQP channel keep alive interval (parameter identifier: MQIACH\_AMQP\_KEEP\_ALIVE).

The keep alive time for an AMQP channel in seconds. If the AMQP client has not sent any frames within the keep alive interval, then the connection is closed with a `amqp:resource-limit-exceeded` AMQP error condition.

This parameter is valid only for *ChannelType* values of MQCHT\_AMQP.

### ***BatchHeartbeat* (MQCFIN)**

The batch heartbeat interval (parameter identifier: MQIACH\_BATCH\_HB).

Batch heartbeating allows sender-type channels to determine whether the remote channel instance is still active, before going in-doubt. The value can be in the range 0 - 999999. A value of 0 indicates that batch heart-eating is not to be used. Batch heartbeat is measured in milliseconds.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

### ***BatchInterval* (MQCFIN)**

Batch interval (parameter identifier: MQIACH\_BATCH\_INTERVAL).

This interval is the approximate time in milliseconds that a channel keeps a batch open, if fewer than *BatchSize* messages have been transmitted in the current batch.

If *BatchInterval* is greater than zero, the batch is terminated by whichever of the following situations occurs first:

- *BatchSize* messages have been sent, or
- *BatchInterval* milliseconds have elapsed since the start of the batch.

If *BatchInterval* is zero, the batch is terminated by whichever of the following situations occurs first:

- *BatchSize* messages have been sent, or
- *BatchDataLimit* bytes have been sent, or
- the transmission queue becomes empty.

*BatchInterval* must be in the range 0 - 999999999.

This parameter applies only to channels with a *ChannelType* of: MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

### ***BatchDataLimit* (MQCFIN)**

Batch data limit (parameter identifier: MQIACH\_BATCH\_DATA\_LIMIT).

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

The value must be in the range 0 - 999999. The default value is 5000.

This parameter is supported on all platforms.

This parameter only applies to channels with a *ChannelType* of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSRCVR, or MQCHT\_CLUSSDR.

### ***BatchSize* (MQCFIN)**

Batch size (parameter identifier: MQIACH\_BATCH\_SIZE).

The maximum number of messages that must be sent through a channel before a checkpoint is taken.

The batch size which is used is the lowest of the following:

- The *BatchSize* of the sending channel
- The *BatchSize* of the receiving channel
- The maximum number of uncommitted messages at the sending queue manager
- The maximum number of uncommitted messages at the receiving queue manager

The maximum number of uncommitted messages is specified by the *MaxUncommittedMsgs* parameter of the Change Queue Manager command.

Specify a value in the range 1 - 9999.

This parameter is not valid for channels with a *ChannelType* of MQCHT\_SVRCONN or MQCHT\_CLNTCONN.

#### *CertificateLabel* (MQCFST)

Certificate label (parameter identifier: MQCA\_CERT\_LABEL).

Certificate label for this channel to use.

The label identifies which personal certificate in the key repository is sent to the remote peer. If this attribute is blank, the certificate is determined by the queue manager **CertificateLabel** parameter.

Note that inbound channels (including receiver, cluster-receiver, unqualified server, and server-connection channels) only send the configured certificate if the IBM MQ version of the remote peer fully supports certificate label configuration, and the channel is using a TLS CipherSpec.

In all other cases, the queue manager **CertificateLabel** parameter determines the certificate sent. In particular, the following only ever receive the certificate configured by the **CertificateLabel** parameter of the queue manager, regardless of the channel-specific label setting:

- All current Java and JMS clients.
- Versions of IBM MQ prior to Version 8.0.

#### *ChannelDesc* (MQCFST)

Channel description (parameter identifier: MQCACH\_DESC).

The maximum length of the string is MQ\_CHANNEL\_DESC\_LENGTH.

Use characters from the character set, identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing, to ensure that the text is translated correctly.

#### *ChannelMonitoring* (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_CHANNEL).

Specifies whether online monitoring data is to be collected and, if so, the rate at which the data is collected. The value can be any of the following values:

##### **MQMON\_OFF**

Online monitoring data collection is turned off for this channel.

##### **MQMON\_Q\_MGR**

The value of the queue manager's *ChannelMonitoring* parameter is inherited by the channel.

##### **MQMON\_LOW**

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a low rate of data collection, for this channel.

##### **MQMON\_MEDIUM**

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a moderate rate of data collection, for this channel.

##### **MQMON\_HIGH**

If the value of the queue manager's *ChannelMonitoring* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a high rate of data collection, for this channel.

#### *ChannelStatistics* (MQCFIN)

Statistics data collection (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

Specifies whether statistics data is to be collected and, if so, the rate at which the data is collected. The value can be:

## **MQMON\_OFF**

Statistics data collection is turned off for this channel.

## **MQMON\_Q\_MGR**

The value of the queue manager's *ChannelStatistics* parameter is inherited by the channel.

## **MQMON\_LOW**

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a low rate of data collection, for this channel.

## **MQMON\_MEDIUM**

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a moderate rate of data collection, for this channel.

## **MQMON\_HIGH**

If the value of the queue manager's *ChannelStatistics* parameter is not MQMON\_NONE, online monitoring data collection is turned on, with a high rate of data collection, for this channel.

 On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

### *ClientChannelWeight* (**MQCFIN**)

Client Channel Weight (parameter identifier: MQIACH\_CLIENT\_CHANNEL\_WEIGHT).

The client channel weighting attribute is used so client channel definitions can be selected at random, with the larger weightings having a higher probability of selection, when more than one suitable definition is available.

Specify a value in the range 0 - 99. The default is 0.

This parameter is only valid for channels with a *ChannelType* of MQCHT\_CLNTCONN

### *ClusterName* (**MQCFST**)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster to which the channel belongs.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

Only one of the values of *ClusterName* and *ClusterNameList* can be nonblank; the other must be blank.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

### *ClusterNameList* (**MQCFST**)

Cluster namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

The name, of the namelist, that specifies a list of clusters to which the channel belongs.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

Only one of the values of *ClusterName* and *ClusterNameList* can be nonblank; the other must be blank.

### *CLWLChannelPriority* (**MQCFIN**)

Channel priority for the purposes of cluster workload distribution (parameter identifier: MQIACH\_CLWL\_CHANNEL\_PRIORITY).

Specify a value in the range 0 - 9 where 0 is the lowest priority and 9 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

#### *CLWLChannelRank* (MQCFIN)

Channel rank for the purposes of cluster workload distribution (parameter identifier: MQIACH\_CLWL\_CHANNEL\_RANK).

Specify a value in the range 0 - 9 where 0 is the lowest priority and 9 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

#### *CLWLChannelWeight* (MQCFIN)

Channel weighting for the purposes of cluster workload distribution (parameter identifier: MQIACH\_CLWL\_CHANNEL\_WEIGHT).

Specify a weighting for the channel for use in workload management. Specify a value in the range 1 - 99 where 1 is the lowest priority and 99 is the highest.

This parameter applies only to channels with a *ChannelType* of:

- MQCHT\_CLUSSDR
- MQCHT\_CLUSRCVR

### z/OS

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *ConnectionAffinity* (MQCFIN)

Channel Affinity (parameter identifier: MQIACH\_CONNECTION\_AFFINITY)

The channel affinity attribute specifies whether client applications that connect multiple times using the same queue manager name, use the same client channel. The value can be any of the following values:

#### **MQCAFTY\_PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any zero ClientChannelWeight definitions first in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful nonzero ClientChannelWeight definitions are moved to the end of the list. Zero ClientChannelWeight definitions remain at the start of the list and are selected first for each

connection. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created. Each client process with the same host name creates the same list.

This value is the default value.

### MQCAFTY\_NONE

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process independently select an applicable definition based on the weighting with any applicable zero ClientChannelWeight definitions selected first in alphabetical order. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created.

This parameter is only valid for channels with a ChannelType of MQCHT\_CLNTCONN.

### ConnectionName (MQCFST)

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

On platforms other than z/OS, the maximum length of the string is 264. On z/OS, it is 48.

Specify *ConnectionName* as a comma-separated list of names of machines for the stated *TransportType*. Typically, only one machine name is required. You can provide multiple machine names to configure multiple connections with the same properties. The connections are tried in the order they are specified in the connection list until a connection is successfully established. If no connection is successful, the channel starts to try processing again. Connection lists are an alternative to queue manager groups to configure connections for reconnectable clients, and also to configure channel connections to multi-instance queue managers.

Specify the name of the machine as required for the stated *TransportType*:

- For MQXPT\_LU62 on IBM i, and UNIX systems, specify the name of the CPI-C communications side object. On Windows specify the CPI-C symbolic destination name.

► **z/OS** On z/OS, there are two forms in which to specify the value:

#### Logical unit name

The logical unit information for the queue manager, comprising the logical unit name, TP name, and optional mode name. This name can be specified in one of three forms:

Form	Example
luname	IGY12355
luname/TPname	IGY12345/APING
luname/TPname/modename	IGY12345/APINGD/#INTER

For the first form, the TP name and mode name must be specified for the *TpName* and *ModeName* parameters; otherwise these parameters must be blank.

**Note:** For client-connection channels, only the first form is allowed.

#### Symbolic name

The symbolic destination name for the logical unit information for the queue manager, as defined in the side information data set. The *TpName* and *ModeName* parameters must be blank.

**Note:** For cluster-receiver channels, the side information is on the other queue managers in the cluster. Alternatively, in this case it can be a name that a channel auto-definition exit can resolve into the appropriate logical unit information for the local queue manager.

The specified or implied LU name can be that of a VTAM generic resources group.

- For MQXPT\_TCP, you can specify a connection name, or a connection list, containing the host name or the network address of the remote machine. Separate connection names in a connection list with commas.

**z/OS** On z/OS, the connection name can include the IP\_name of a z/OS dynamic DNS group or a network dispatcher input port. Do not include this parameter for channels with a *ChannelType* value of MQCHT\_CLUSSDR.

On AIX, HP-UX, IBM i, Linux, Solaris, and Windows platforms, the TCP/IP connection name parameter of a cluster-receiver channel is optional. If you leave the connection name blank, IBM MQ generates a connection name for you, assuming the default port and using the current IP address of the system. You can override the default port number, but still use the current IP address of the system. For each connection name leave the IP name blank, and provide the port number in parentheses; for example:

(1415)

The generated CONNAME is always in the dotted decimal (IPv4) or hexadecimal (IPv6) form, rather than in the form of an alphanumeric DNS host name.

- For MQXPT\_NETBIOS specify the NetBIOS station name.
- For MQXPT\_SPX specify the 4 byte network address, the 6 byte node address, and the 2 byte socket number. These values must be entered in hexadecimal, with a period separating the network and node addresses. The socket number must be enclosed in brackets, for example:

0a0b0c0d.804abcde23a1(5e86)

If the socket number is omitted, the IBM MQ default value (5e86 hex) is assumed.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_REQUESTER, MQCHT\_CLNTCONN, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

**Note:** If you are using clustering between IPv6 -only and IPv4 -only queue managers, do not specify an IPv6 network address as the *ConnectionName* for cluster-receiver channels. A queue manager that is capable only of IPv4 communication is unable to start a cluster sender channel definition that specifies the *ConnectionName* in IPv6 hexadecimal form. Consider, instead, using host names in a heterogeneous IP environment.

#### **DataConversion (MQCFIN)**

Whether sender must convert application data (parameter identifier: MQIACH\_DATA\_CONVERSION).

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

The value can be any of the following values:

#### **MQCDC\_NO\_SENDER\_CONVERSION**

No conversion by sender.

#### **MQCDC\_SENDER\_CONVERSION**

Conversion by sender.

#### **DefaultChannelDisposition (MQCFIN)**

Intended disposition of the channel when activated or started (parameter identifier: MQIACH\_DEF\_CHANNEL\_DISP).

This parameter applies to z/OS only.

The value can be any of the following values:

#### **MQCHLD\_PRIVATE**

The intended use of the object is as a private channel.

This value is the default value.

## MQCHLD\_FIXSHARED

The intended use of the object is as a fixshared channel.

## MQCHLD\_SHARED

The intended use of the object is as a shared channel.

### DefReconnect (MQCFIN)

Client channel default reconnection option (parameter identifier: MQIACH\_DEF\_RECONNECT).

The default automatic client reconnection option. You can configure a IBM MQ MQI client to automatically reconnect a client application. The IBM MQ MQI client tries to reconnect to a queue manager after a connection failure. It tries to reconnect without the application client issuing an MQCONN or MQCONNX MQI call.

#### MQRCN\_NO

MQRCN\_NO is the default value.

Unless overridden by MQCONNX, the client is not reconnected automatically.

#### MQRCN\_YES

Unless overridden by MQCONNX, the client reconnects automatically.

#### MQRCN\_Q\_MGR

Unless overridden by MQCONNX, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO\_RECONNECT\_Q\_MGR.

#### MQRCN\_DISABLED

Reconnection is disabled, even if requested by the client program using the MQCONNX MQI call.

Table 119. Automatic reconnection depends on the values set in the application and in the channel definition

DefReconnect	Reconnection options set in the application			
	MQCNO_RECONNECT	MQCNO_RECONNECT_Q_MGR	MQCNO_RECONNECT_AS_D	MQCNO_RECONNECT_DISABLED
MQRCN_NO	YES	QMGR	NO	NO
MQRCN_YES	YES	QMGR	YES	NO
MQRCN_Q_MGR	YES	QMGR	QMGR	NO
MQRCN_DISABLED	NO	NO	NO	NO

This parameter is valid only for a *ChannelType* value of MQCHT\_CLNTCONN.

### DiscInterval (MQCFIN)

Disconnection interval (parameter identifier: MQIACH\_DISC\_INTERVAL).

This interval defines the maximum number of seconds that the channel waits for messages to be put on a transmission queue before terminating the channel. A value of zero causes the message channel agent to wait indefinitely.

Specify a value in the range 0 - 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER MQCHT\_SERVER, MQCHT\_SVRCONN, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

For server-connection channels using the TCP protocol, this interval is the minimum time in seconds for which the server-connection channel instance remains active without any communication from its partner client. A value of zero disables this disconnect processing. The server-connection inactivity interval only applies between MQ API calls from a client, so no client is disconnected during an extended MQGET with wait call. This attribute is ignored for server-connection channels using protocols other than TCP.

### *HeaderCompression* (MQCFIL)

Header data compression techniques supported by the channel (parameter identifier: MQIACH\_HDR\_COMPRESSION).

The list of header data compression techniques supported by the channel. For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The mutually supported compression techniques of the channel are passed to the message exit of the sending channel where the compression technique used can be altered on a per message basis. Compression alters the data passed to send and receive exits.

Specify one or more of:

#### **MQCOMPRESS\_NONE**

No header data compression is performed. This value is the default value.

#### **MQCOMPRESS\_SYSTEM**

Header data compression is performed.

### *HeartbeatInterval* (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH\_HB\_INTERVAL).

The interpretation of this parameter depends on the channel type, as follows:

- For a channel type of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_RECEIVER, MQCHT\_REQUESTER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR, this interval is the time in seconds between heartbeat flows passed from the sending MCA when there are no messages on the transmission queue. This interval gives the receiving MCA the opportunity to quiesce the channel. To be useful, *HeartbeatInterval* must be less than *DiscInterval*. However, the only check is that the value is within the permitted range.

This type of heartbeat is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Windows, and z/OS.

- For a channel type of MQCHT\_CLNTCONN or MQCHT\_SVRCONN, this interval is the time in seconds between heartbeat flows passed from the server MCA when that MCA has issued an MQGET call with the MQGMO\_WAIT option on behalf of a client application. This interval allows the server MCA to handle situations where the client connection fails during an MQGET with MQGMO\_WAIT.

This type of heartbeat is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Windows, Linux, and z/OS.

The value must be in the range 0 - 999 999. A value of 0 means that no heartbeat exchange occurs. The value that is used is the larger of the values specified at the sending side and receiving side.

### *KeepAliveInterval* (MQCFIN)

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL).

Specifies the value passed to the communications stack for KeepAlive timing for the channel.

For this attribute to be effective, TCP/IP keepalive must be enabled. On z/OS, you enable TCP/IP keepalive by issuing the Change Queue Manager command with a value of MQTCPKEEP in the *TCPKeepAlive* parameter; if the *TCPKeepAlive* queue manager parameter has a value of MQTCPKEEP\_NO, the value is ignored, and the KeepAlive facility is not used. On other platforms, TCP/IP keepalive is enabled when the KEEPALIVE=YES parameter is specified in the TCP stanza in the distributed queuing configuration file, qm.ini, or through the IBM MQ Explorer. Keepalive must also be switched on within TCP/IP itself, using the TCP profile configuration data set.

Although this parameter is available on all platforms, its setting is implemented only on z/OS. On platforms other than z/OS, you can access and modify the parameter, but it is only stored and forwarded; there is no functional implementation of the parameter. This parameter is useful in a

clustered environment where a value set in a cluster-receiver channel definition on Solaris, for example, flows to (and is implemented by) z/OS queue managers that are in, or join, the cluster.

Specify either:

*integer*

The KeepAlive interval to be used, in seconds, in the range 0 - 99 999. If you specify a value of 0, the value used is that specified by the INTERVAL statement in the TCP profile configuration data set.

### **MQKAI\_AUTO**

The KeepAlive interval is calculated based upon the negotiated heartbeat value as follows:

- If the negotiated *HeartbeatInterval* is greater than zero, KeepAlive interval is set to that value plus 60 seconds.
- If the negotiated *HeartbeatInterval* is zero, the value used is that specified by the INTERVAL statement in the TCP profile configuration data set.

On platforms other than z/OS, if you need the functionality provided by the *KeepAliveInterval* parameter, use the *HeartBeatInterval* parameter.

### **LocalAddress (MQCFST)**

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

The value that you specify depends on the transport type (*TransportType*) to be used:

#### **TCP/IP**

The value is the optional IP address and optional port or port range to be used for outbound TCP/IP communications. The format for this information is as follows:

LOCLADDR([ip-addr] [(low-port[,high-port])][, [ip-addr] [(low-port[,high-port])]])

where ip-addr is specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form, and low-port and high-port are port numbers enclosed in parentheses. All are optional.

Specify [, [ip-addr] [(low-port[,high-port])]] multiple times for each additional local address. Use multiple local addresses if you want to specify a specific subset of local network adapters. You can also use [, [ip-addr] [(low-port[,high-port])]] to represent a particular local network address on different servers that are part of a multi-instance queue manager configuration.

#### **All Others**

The value is ignored; no error is diagnosed.

Use this parameter if you want a channel to use a particular IP address, port, or port range for outbound communications. This parameter is useful when a machine is connected to multiple networks with different IP addresses.

Examples of use

Value	Meaning
9.20.4.98	Channel binds to this address locally
9.20.4.98 (1000)	Channel binds to this address and port 1000 locally
9.20.4.98 (1000,2000)	Channel binds to this address and uses a port in the range 1000 - 2000 locally
(1000)	Channel binds to port 1000 locally
(1000,2000)	Channel binds to a port in the range 1000 - 2000 locally

This parameter is valid for the following channel types:

- MQCHT\_SENDER
- MQCHT\_SERVER
- MQCHT\_REQUESTER
- MQCHT\_CLNTCONN
- MQCHT\_CLUSRCVR
- MQCHT\_CLUSSDR

**Note:**

- Do not confuse this parameter with *ConnectionName*. The *LocalAddress* parameter specifies the characteristics of the local communications; the *ConnectionName* parameter specifies how to reach a remote queue manager.

**LongRetryCount (MQCFIN)**

Long retry count (parameter identifier: MQIACH\_LONG\_RETRY).

When a sender or server channel is attempting to connect to the remote machine, and the count specified by *ShortRetryCount* has been exhausted, this count specifies the maximum number of further attempts that are made to connect to the remote machine, at intervals specified by *LongRetryInterval*.

If this count is also exhausted without success, an error is logged to the operator, and the channel is stopped. The channel must later be restarted with a command (it is not started automatically by the channel initiator), and it then makes only one attempt to connect, as it is assumed that the problem has now been cleared by the administrator. The retry sequence is not carried out again until after the channel has successfully connected.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

**LongRetryInterval (MQCFIN)**

Long timer (parameter identifier: MQIACH\_LONG\_TIMER).

Specifies the long retry wait interval for a sender or server channel that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine, after the count specified by *ShortRetryCount* has been exhausted.

The time is approximate; zero means that another connection attempt is made as soon as possible.

Specify a value in the range 0 - 999 999. Values exceeding this value are treated as 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

**MaxInstances (MQCFIN)**

**V8.0.0.4** Maximum number of simultaneous instances of a server-connection channel or an AMQP channel (parameter identifier: MQIACH\_MAX\_INSTANCES).

Specify a value in the range 0 - 999 999 999.

The default value is 999 999 999.

A value of zero indicates that no client connections are allowed on the channel.

If the value is reduced below the number of instances of the server-connection channel that are currently running, the running channels are not affected. This parameter applies even if the value is zero. However, if the value is reduced below the number of instances of the server-connection channel that are currently running, then new instances cannot be started until sufficient existing instances have ceased to run.

**V8.0.0.4** If an AMQP client attempts to connect to an AMQP channel, and the number of connected clients has reached `MaxInstances`, the channel closes the connection with a close frame. The close frame contains the following message: `amqp:resource-limit-exceeded`. If a client connects with an ID that is already connected (that is, it performs a client-takeover), and the client is permitted to take over the connection, the takeover will succeed regardless of whether the number of connected clients has reached `MaxInstances`.

**V8.0.0.4** This parameter is valid only for channels with a *ChannelType* value of `MQCHT_SVRCONN` or `MQCHT_AMQP`.

#### *MaxInstancesPerClient* (MQCFIN)

Maximum number of simultaneous instances of a server-connection channel that can be started from a single client (parameter identifier: `MQIACH_MAX_INSTS_PER_CLIENT`). In this context, connections that originate from the same remote network address are regarded as coming from the same client.

Specify a value in the range 0 - 999 999 999.

The default value is 999 999 999.

A value of zero indicates that no client connections are allowed on the channel.

If the value is reduced below the number of instances of the server-connection channel that are currently running from individual clients, the running channels are not affected. This parameter applies even if the value is zero. However, if the value is reduced below the number of instances of the server-connection channel that are currently running from individual clients, new instances from those clients cannot start until sufficient existing instances have ceased to run.

This parameter is valid only for channels with a *ChannelType* value of `MQCHT_SVRCONN`.

#### *MaxMsgLength* (MQCFIN)

Maximum message length (parameter identifier: `MQIACH_MAX_MSG_LENGTH`).

Specifies the maximum message length that can be transmitted on the channel. This value is compared with the value for the remote channel and the actual maximum is the lower of the two values.

The value zero means the maximum message length for the queue manager.

The lower limit for this parameter is 0. The maximum message length is 100 MB (104 857 600 bytes).

#### *MCAName* (MQCFST)

Message channel agent name (parameter identifier: `MQCACH_MCA_NAME`).

**Note:** An alternative way of providing a user ID for a channel to run under is to use channel authentication records. With channel authentication records, different connections can use the same channel while using different credentials. If both `MCAUSER` on the channel is set and channel authentication records are used to apply to the same channel, the channel authentication records take precedence. The `MCAUSER` on the channel definition is only used if the channel authentication record uses `USERSRC(CHANNEL)`. For more details, see Channel authentication records

This parameter is reserved, and if specified can be set only to blanks.

The maximum length of the string is `MQ_MCA_NAME_LENGTH`.

This parameter is valid only for *ChannelType* values of `MQCHT_SENDER`, `MQCHT_SERVER`, `MQCHT_REQUESTER`, `MQCHT_CLUSSDR`, or `MQCHT_CLUSRCVR`.

#### *MCAType* (MQCFIN)

Message channel agent type (parameter identifier: `MQIACH_MCA_TYPE`).

Specifies the type of the message channel agent program.

On AIX, HP-UX, IBM i, Solaris, Windows, and Linux, this parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_REQUESTER, or MQCHT\_CLUSSDR.

On z/OS, this parameter is valid only for a *ChannelType* value of MQCHT\_CLURCVR.

The value can be any of the following values:

**MQMCAT\_PROCESS**

Process.

**MQMCAT\_THREAD**

Thread.

*MCAUserIdentifier* (**MQCFST**)

Message channel agent user identifier (parameter identifier: MQCACH\_MCA\_USER\_ID).

If this parameter is nonblank, it is the user identifier which is to be used by the message channel agent for authorization to access IBM MQ resources, including (if *PutAuthority* is MQPA\_DEFAULT) authorization to put the message to the destination queue for receiver or requester channels.

If it is blank, the message channel agent uses its default user identifier.

This user identifier can be overridden by one supplied by a channel security exit.

This parameter is not valid for channels with a *ChannelType* of MQCHT\_SDR, MQCHT\_SVR, MQCHT\_CLNTCONN, MQCHT\_CLUSSDR.

The maximum length of the MCA user identifier depends on the environment in which the MCA is running. MQ\_MCA\_USER\_ID\_LENGTH gives the maximum length for the environment for which your application is running. MQ\_MAX\_MCA\_USER\_ID\_LENGTH gives the maximum for all supported environments.

On Windows, you can optionally qualify a user identifier with the domain name in the following format:

user@domain

*MessageCompression* (**MQCFIL**)

Header data compression techniques supported by the channel (parameter identifier: MQIACH\_MSG\_COMPRESSION). The list of message data compression techniques supported by the channel. For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference with the first compression technique supported by the remote end of the channel being used.

The mutually supported compression techniques of the channel are passed to the message exit of the sending channel where the compression technique used can be altered on a per message basis. Compression alters the data passed to send and receive exits.

Specify one or more of:

**MQCOMPRESS\_NONE**

No message data compression is performed. This value is the default value.

**MQCOMPRESS\_RLE**

Message data compression is performed using run-length encoding.

**MQCOMPRESS\_ZLIBFAST**

Message data compression is performed using ZLIB encoding with speed prioritized.

**MQCOMPRESS\_ZLIBHIGH**

Message data compression is performed using ZLIB encoding with compression prioritized.

**MQCOMPRESS\_ANY**

Any compression technique supported by the queue manager can be used. This value is only valid for receiver, requester, and server-connection channels.

### **ModeName (MQCFST)**

Mode name (parameter identifier: MQCACH\_MODE\_NAME).

This parameter is the LU 6.2 mode name.

The maximum length of the string is MQ\_MODE\_NAME\_LENGTH.

- On IBM i, HP Integrity NonStop Server, UNIX systems, and Windows, this parameter can be set only to blanks. The actual name is taken instead from the CPI-C Communications Side Object or (on Windows ) from the CPI-C symbolic destination name properties.

This parameter is valid only for channels with a *TransportType* of MQXPT\_LU62. It is not valid for receiver or server-connection channels.

### **MsgExit (MQCFSL)**

Message exit name (parameter identifier: MQCACH\_MSG\_EXIT\_NAME).

If a nonblank name is defined, the exit is invoked immediately after a message has been retrieved from the transmission queue. The exit is given the entire application message and message descriptor for modification.

For channels with a channel type (*ChannelType*) of MQCHT\_SVRCONN or MQCHT\_CLNTCONN, this parameter is accepted but ignored, since message exits are not invoked for such channels.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ\_TOTAL\_EXIT\_NAME\_LENGTH. An individual string must not exceed MQ\_EXIT\_NAME\_LENGTH.
- On z/OS, you can specify the names of up to eight exit programs.

### **MsgRetryCount (MQCFIN)**

Message retry count (parameter identifier: MQIACH\_MR\_COUNT).

Specifies the number of times that a failing message must be retried.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_RECEIVER, MQCHT\_REQUESTER, or MQCHT\_CLUSRCVR.

### **MsgRetryExit (MQCFST)**

Message retry exit name (parameter identifier: MQCACH\_MR\_EXIT\_NAME).

If a nonblank name is defined, the exit is invoked before performing a wait before retrying a failing message.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

This parameter is valid only for *ChannelType* values of MQCHT\_RECEIVER, MQCHT\_REQUESTER, or MQCHT\_CLUSRCVR.

**MsgRetryInterval (MQCFIN)**

Message retry interval (parameter identifier: MQIACH\_MR\_INTERVAL).

Specifies the minimum time interval in milliseconds between retries of failing messages.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_RECEIVER, MQCHT\_REQUESTER, or MQCHT\_CLUSRCVR.

**MsgRetryUserData (MQCFST)**

Message retry exit user data (parameter identifier: MQCACH\_MR\_EXIT\_USER\_DATA).

Specifies user data that is passed to the message retry exit.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

This parameter is valid only for *ChannelType* values of MQCHT\_RECEIVER, MQCHT\_REQUESTER, or MQCHT\_CLUSRCVR.

**MsgUserData (MQCFSL)**

Message exit user data (parameter identifier: MQCACH\_MSG\_EXIT\_USER\_DATA).

Specifies user data that is passed to the message exit.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

For channels with a channel type (*ChannelType*) of MQCHT\_SVRCONN or MQCHT\_CLNTCONN, this parameter is accepted but ignored, since message exits are not invoked for such channels.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *MsgExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ\_TOTAL\_EXIT\_DATA\_LENGTH. An individual string must not exceed MQ\_EXIT\_DATA\_LENGTH.
- On z/OS, you can specify up to eight strings.

**NetworkPriority (MQCFIN)**

Network priority (parameter identifier: MQIACH\_NETWORK\_PRIORITY).

The priority for the network connection. If there are multiple paths available, distributed queuing selects the path with the highest priority.

The value must be in the range 0 (lowest) - 9 (highest).

This parameter applies only to channels with a *ChannelType* of MQCHT\_CLUSRCVR

**NonPersistentMsgSpeed (MQCFIN)**

Speed at which nonpersistent messages are to be sent (parameter identifier: MQIACH\_NPM\_SPEED).

This parameter is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Windows, and Linux.

Specifying MQNPMS\_FAST means that nonpersistent messages on a channel need not wait for a syncpoint before being made available for retrieval. The advantage of this is that nonpersistent messages become available for retrieval far more quickly. The disadvantage is that because they do not wait for a syncpoint, they might be lost if there is a transmission failure.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_RECEIVER, MQCHT\_REQUESTER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR. The value can be any of the following values:

**MQNPMS\_NORMAL**

Normal speed.

**MQNPMS\_FAST**

Fast speed.

**Password (MQCFST)**

Password (parameter identifier: MQCACH\_PASSWORD).

This parameter is used by the message channel agent when attempting to initiate a secure SNA session with a remote message channel agent. On IBM i, HP Integrity NonStop Server, and UNIX systems, it is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_REQUESTER, MQCHT\_CLNTCONN, or MQCHT\_CLUSSDR. On z/OS, it is valid only for a *ChannelType* value of MQCHT\_CLNTCONN.

The maximum length of the string is MQ\_PASSWORD\_LENGTH. However, only the first 10 characters are used.

**V8.0.0.4**

**Port (MQCFIN)**

Port number (parameter identifier MQIACH\_PORT).

The port number used to connect an AMQP channel. The default port for AMQP 1.0 connections is 5672. If you are already using port 5672, you can specify a different port.

This attribute is applicable to AMQP channels.

**PropertyControl (MQCFIN)**

Property control attribute (parameter identifier MQIA\_PROPERTY\_CONTROL).

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor). The value can be any of the following values:

**MQPROP\_COMPATIBILITY**

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

This value is the default value; it allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

**MQPROP\_NONE**

All properties of the message, except those properties in the message descriptor (or extension), are removed from the message before the message is sent to the remote queue manager.

**MQPROP\_ALL**

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

This attribute is applicable to Sender, Server, Cluster Sender, and Cluster Receiver channels.

**PutAuthority (MQCFIN)**

Put authority (parameter identifier: MQIACH\_PUT\_AUTHORITY).

Specifies which user identifiers are used to establish authority to put messages to the destination queue (for messages channels) or to execute an MQI call (for MQI channels).

This parameter is valid only for channels with a *ChannelType* value of MQCHT\_RECEIVER, MQCHT\_REQUESTER, MQCHT\_CLUSRCVR, or MQCHT\_SVRCONN. The value can be any of the following values:

**MQPA\_DEFAULT**

Default user identifier is used.

▶ **z/OS** On z/OS, MQPA\_DEFAULT might involve using both the user ID received from the network and that derived from MCAUSER.

**MQPA\_CONTEXT**

The user ID from the *UserIdentifier* field of the message descriptor is used.

▶ **z/OS** On z/OS, MQPA\_CONTEXT might involve also using the user ID received from the network or that derived from MCAUSER, or both.

**MQPA\_ALTERNATE\_OR\_MCA**

The user ID from the *UserIdentifier* field of the message descriptor is used. Any user ID received from the network is not used. This value is supported only on z/OS.

**MQPA\_ONLY\_MCA**

The user ID derived from MCAUSER is used. Any user ID received from the network is not used. This value is supported only on z/OS.

**QMgrName (MQCFST)**

Queue-manager name (parameter identifier: MQCA\_Q\_MGR\_NAME).

For channels with a *ChannelType* of MQCHT\_CLNTCONN, this name is the name of a queue manager to which a client application can request connection.

For channels of other types, this parameter is not valid. The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

▶ **z/OS**

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToChannelName</i> object (for Copy) or <i>ChannelName</i> object (for Create).

QSGDisposition	Change	Copy, Create
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE CHANNEL(channel-name) CHLTYPE(type) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue-sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE CHANNEL(channel-name) CHLTYPE(type) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	<p>The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.</p>	Not permitted.
MQQSGD_Q_MGR	<p>The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.</p>	<p>The object is defined on the page set of the queue manager that executes the command. This value is the default value.</p>

### ReceiveExit (MQCFSL)

Receive exit name (parameter identifier: MQCACH\_RCV\_EXIT\_NAME).

If a nonblank name is defined, the exit is invoked before data received from the network is processed. The complete transmission buffer is passed to the exit and the contents of the buffer can be modified as required.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed MQ\_TOTAL\_EXIT\_NAME\_LENGTH. An individual string must not exceed MQ\_EXIT\_NAME\_LENGTH.

- On z/OS, you can specify the names of up to eight exit programs.

#### **ReceiveUserData (MQCFSL)**

Receive exit user data (parameter identifier: MQCACH\_RCV\_EXIT\_USER\_DATA).

Specifies user data that is passed to the receive exit.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *ReceiveExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed MQ\_TOTAL\_EXIT\_DATA\_LENGTH. An individual string must not exceed MQ\_EXIT\_DATA\_LENGTH.
- On z/OS, you can specify up to eight strings.

#### **Replace (MQCFIN)**

Replace channel definition (parameter identifier: MQIACF\_REPLACE).

The value can be any of the following values:

##### **MQRP\_YES**

Replace existing definition.

If *ChannelType* is MQCHT\_CLUSSDR, MQRP\_YES can be specified only if the channel was created manually.

##### **MQRP\_NO**

Do not replace existing definition.

#### **SecurityExit (MQCFST)**

Security exit name (parameter identifier: MQCACH\_SEC\_EXIT\_NAME).

If a nonblank name is defined, the security exit is invoked at the following times:

- Immediately after establishing a channel.  
Before any messages are transferred, the exit is enabled to instigate security flows to validate connection authorization.
- Upon receipt of a response to a security message flow.  
Any security message flows received from the remote processor on the remote machine are passed to the exit.

The exit is given the entire application message and message descriptor for modification.

The format of the string depends on the platform, as follows:

- On IBM i and UNIX systems, it is of the form  
libraryname(functionname)

**Note:** On IBM i systems, the following form is also supported for compatibility with older releases:  
progrname libname

where *progrname* occupies the first 10 characters, and *libname* the second 10 characters (both blank-padded to the right if necessary).

- On Windows, it is of the form  
dllname(functionname)

where *dllname* is specified without the suffix `.DLL`.

- On z/OS, it is a load module name, maximum length 8 characters (128 characters are allowed for exit names for client-connection channels, subject to a maximum total length of 999).

The maximum length of the exit name depends on the environment in which the exit is running. `MQ_EXIT_NAME_LENGTH` gives the maximum length for the environment in which your application is running. `MQ_MAX_EXIT_NAME_LENGTH` gives the maximum for all supported environments.

#### ***SecurityUserData* (MQCFST)**

Security exit user data (parameter identifier: `MQCACH_SEC_EXIT_USER_DATA`).

Specifies user data that is passed to the security exit.

The maximum length of the string is `MQ_EXIT_DATA_LENGTH`.

#### ***SendExit* (MQCFSL)**

Send exit name (parameter identifier: `MQCACH_SEND_EXIT_NAME`).

If a nonblank name is defined, the exit is invoked immediately before data is sent out on the network. The exit is given the complete transmission buffer before it is transmitted; the contents of the buffer can be modified as required.

The format of the string is the same as for *SecurityExit*.

The maximum length of the exit name depends on the environment in which the exit is running. `MQ_EXIT_NAME_LENGTH` gives the maximum length for the environment in which your application is running. `MQ_MAX_EXIT_NAME_LENGTH` gives the maximum for all supported environments.

You can specify a list of exit names by using an MQCFSL structure instead of an MQCFST structure.

- The exits are invoked in the order specified in the list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit names in the list (excluding trailing blanks in each name) must not exceed `MQ_TOTAL_EXIT_NAME_LENGTH`. An individual string must not exceed `MQ_EXIT_NAME_LENGTH`.
- On z/OS, you can specify the names of up to eight exit programs.

#### ***SendUserData* (MQCFSL)**

Send exit user data (parameter identifier: `MQCACH_SEND_EXIT_USER_DATA`).

Specifies user data that is passed to the send exit.

The maximum length of the string is `MQ_EXIT_DATA_LENGTH`.

You can specify a list of exit user data strings by using an MQCFSL structure instead of an MQCFST structure.

- Each exit user data string is passed to the exit at the same ordinal position in the *SendExit* list.
- A list with only one name is equivalent to specifying a single name in an MQCFST structure.
- You cannot specify both a list (MQCFSL) and a single entry (MQCFST) structure for the same channel attribute.
- The total length of all the exit user data in the list (excluding trailing blanks in each string) must not exceed `MQ_TOTAL_EXIT_DATA_LENGTH`. An individual string must not exceed `MQ_EXIT_DATA_LENGTH`.
- On z/OS, you can specify up to eight strings.

#### ***SeqNumberWrap* (MQCFIN)**

Sequence wrap number (parameter identifier: `MQIACH_SEQUENCE_NUMBER_WRAP`).

Specifies the maximum message sequence number. When the maximum is reached, sequence numbers wrap to start again at 1.

The maximum message sequence number is not negotiable; the local and remote channels must wrap at the same number.

Specify a value in the range 100 - 999 999 999.

This parameter is not valid for channels with a *ChannelType* of MQCHT\_SVRCONN or MQCHT\_CLNTCONN.

#### *SharingConversations* (MQCFIN)

Maximum number of sharing conversations (parameter identifier: MQIACH\_SHARING\_CONVERSATIONS).

Specifies the maximum number of conversations that can share a particular TCP/IP MQI channel instance (socket).

Specify a value in the range 0 - 999 999 999. The default value is 10 and the migrated value is 10.

This parameter is valid only for channels with a *ChannelType* of MQCHT\_CLNTCONN or MQCHT\_SVRCONN. It is ignored for channels with a *TransportType* other than MQXPT\_TCP.

The number of shared conversations does not contribute to the *MaxInstances* or *MaxInstancesPerClient* totals.

A value of:

- 1 Means that there is no sharing of conversations over a TCP/IP channel instance, but client heartbeating is available whether in an MQGET call or not, read ahead and client asynchronous consumption are available, and channel quiescing is more controllable.
- 0 Specifies no sharing of conversations over a TCP/IP channel instance. The channel instance runs in a mode before that of IBM WebSphere MQ Version 7.0, regarding:
  - Administrator stop-quiesce
  - Heartbeating
  - Read ahead
  - Client asynchronous consumption

#### *ShortRetryCount* (MQCFIN)

Short retry count (parameter identifier: MQIACH\_SHORT\_RETRY).

The maximum number of attempts that are made by a sender or server channel to establish a connection to the remote machine, at intervals specified by *ShortRetryInterval* before the (normally longer) *LongRetryCount* and *LongRetryInterval* are used.

Retry attempts are made if the channel fails to connect initially (whether it is started automatically by the channel initiator or by an explicit command), and also if the connection fails after the channel has successfully connected. However, if the cause of the failure is such that retry is unlikely to be successful, retries are not attempted.

Specify a value in the range 0 - 999 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

#### *ShortRetryInterval* (MQCFIN)

Short timer (parameter identifier: MQIACH\_SHORT\_TIMER).

Specifies the short retry wait interval for a sender or server channel that is started automatically by the channel initiator. It defines the interval in seconds between attempts to establish a connection to the remote machine.

The time is approximate. From IBM MQ Version 8.0, zero means that another connection attempt is made as soon as possible.

Specify a value in the range 0 - 999 999. Values exceeding this value are treated as 999 999.

This parameter is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR.

**SSLCipherSpec (MQCFST)**

CipherSpec (parameter identifier: MQCACH\_SSL\_CIPHER\_SPEC).

The length of the string is MQ\_SSL\_CIPHER\_SPEC\_LENGTH.

It is valid only for channels with a transport type (TRPTYPE) of TCP. If the TRPTYPE is not TCP, the data is ignored and no error message is issued.

The SSLCIPH values must specify the same CipherSpec on both ends of the channel.

Specify the name of the CipherSpec that you are using. Alternatively, on IBM i, and z/OS, you can specify the two-digit hexadecimal code.

The following table shows the CipherSpecs that can be used with IBM MQ SSL.

On IBM i, installation of AC3 is a prerequisite of the use of SSL.

Platform support <sup>1</sup>	CipherSpec name	Protocol used	Data integrity	Encryption algorithm	Encryption bits	FIPS <sup>2</sup>	Suite B
<ul style="list-style-type: none"> <li>&gt; Linux</li> <li>&gt; Windows</li> <li>&gt; UNIX</li> <li>&gt; z/OS</li> </ul>	TLS_RSA_WITH_AES_128_CBC_SHA	TLS 1.0	SHA-1	AES	128	Yes	No
<ul style="list-style-type: none"> <li>&gt; Linux</li> <li>&gt; Windows</li> <li>&gt; UNIX</li> <li>&gt; z/OS</li> </ul>	TLS_RSA_WITH_AES_256_CBC_SHA <sup>3</sup>	TLS 1.0	SHA-1	AES	256	Yes	No
All	ECDHE_ECDSA_AES_128_CBC_SHA256	TLS 1.2	SHA-256	AES	128	Yes	No
All	ECDHE_ECDSA_AES_256_CBC_SHA384 <sup>3</sup> on page 1101	TLS 1.2	SHA-384	AES	256	Yes	No
<b>distributed</b>	ECDHE_ECDSA_AES_128_GCM_SHA256 <sup>4</sup>	TLS 1.2	AEAD AES-128 GCM	AES	128	Yes	128 bit
<b>distributed</b>	ECDHE_ECDSA_AES_256_GCM_SHA384 <sup>3 4</sup>	TLS 1.2	AEAD AES-128 GCM	AES	256	Yes	192 bit
All	ECDHE_RSA_AES_128_CBC_SHA256	TLS 1.2	SHA-256	AES	128	Yes	No
All	ECDHE_RSA_AES_256_CBC_SHA384 <sup>3</sup> on page 1101	TLS 1.2	SHA-384	AES	256	Yes	No
<b>distributed</b>	ECDHE_RSA_AES_128_GCM_SHA256 <sup>4</sup>	TLS 1.2	AEAD AES-128 GCM	AES	128	Yes	No
<b>distributed</b>	ECDHE_RSA_AES_256_GCM_SHA384 <sup>3 4</sup>	TLS 1.2	AEAD AES-128 GCM	AES	SHA384	Yes	No
<b>IBM i</b>	ECDHE_ECDSA_RC4_128_SHA256	TLS 1.2	AEAD AES-128 GCM	AES	SHA256	Yes	No

Platform support <sup>1</sup>	CipherSpec name	Protocol used	Data integrity	Encryption algorithm	Encryption bits	FIPS <sup>2</sup>	Suite B
> IBM i	ECDHE_ECDSA_3DES_EDE_CBC_SHA256	TLS 1.2	AEAD AES-128 GCM	3DES	SHA256	Yes	No
> IBM i	ECDHE_RSA_3DES_EDE_CBC_SHA256	TLS 1.2	AEAD AES-128 GCM	3DES	SHA256	Yes	No
> IBM i	ECDHE_RSA_RC4_128_SHA256	TLS 1.2	AEAD AES-128 GCM	RSA	SHA256	Yes	No
> IBM i	ECDHE_RSA_NULL_SHA256	TLS 1.2	AEAD AES-128 GCM	RSA	SHA256	Yes	No
> IBM i	ECDHE_ECDSA_NULL_SHA256	TLS 1.2	AEAD AES-128 GCM	ECDSA	SHA256	Yes	No
> IBM i	ECDHE_ECDSA_AES_256_GCM_SHA384 <sup>4</sup>	TLS 1.2	AEAD AES-128 GCM	AES	SHA384	Yes	No
> Linux > Windows > UNIX > z/OS	TLS_RSA_WITH_AES_128_CBC_SHA256	TLS 1.2	SHA-256	AES	128	Yes	No
> Linux > Windows > UNIX > z/OS	TLS_RSA_WITH_AES_256_CBC_SHA256 <sup>3</sup>	TLS 1.2	SHA-256	AES	256	Yes	No
> distributed	TLS_RSA_WITH_AES_128_GCM_SHA256 <sup>4</sup>	TLS 1.2	AEAD AES-128 GCM	AES	128	Yes	No
> distributed	TLS_RSA_WITH_AES_256_GCM_SHA384 <sup>4</sup>	TLS 1.2	AEAD AES-128 GCM	AES	256	Yes	No

**Notes:**

1. If no specific platform is noted, the CipherSpec is available on all platforms.
2. Specifies whether the CipherSpec is FIPS-certified on a FIPS-certified platform. See Federal Information Processing Standards (FIPS) for an explanation of FIPS.
3. This CipherSpec cannot be used to secure a connection from the MQ Explorer to a queue manager unless the appropriate unrestricted policy files are applied to the JRE used by the Explorer.
4. Following a recommendation by NIST, GCM CipherSpecs now have a restriction which means that after 2022 TLS records are sent, using the same session key, the connection will be terminated with message AMQ9288.  
To prevent this error from happening: avoid using GCM Ciphers, enable secret key reset, or start your IBM MQ queue manager with the environment variable GSK\_ENFORCE\_GCM\_RESTRICTION=GSK\_FALSE set.  
**Important:** The GCM restriction is active, regardless of the FIPS mode being used.
5. The CipherSpecs listed as supported on IBM i apply to Versions 7.2 and 7.3 of IBM i.

When you request a personal certificate, you specify a key size for the public and private key pair. The key size that is used during the SSL handshake can depend on the size stored in the certificate and on the CipherSpec:

- On UNIX systems, Windows systems, and z/OS, when a CipherSpec name includes `_EXPORT`, the maximum handshake key size is 512 bits. If either of the certificates exchanged during the SSL handshake has a key size greater than 512 bits, a temporary 512-bit key is generated for use during the handshake.
- On UNIX and Windows systems, when a CipherSpec name includes `_EXPORT1024`, the handshake key size is 1024 bits.
- Otherwise the handshake key size is the size stored in the certificate.

If the `SSLCIPH` parameter is blank, no attempt is made to use SSL on the channel.

#### *SSLClientAuth* (MQCFIN)

Client authentication (parameter identifier: MQIACH\_SSL\_CLIENT\_AUTH).

The value can be any of the following values:

##### **MQSCA\_REQUIRED**

Client authentication required.

##### **MQSCA\_OPTIONAL**

Client authentication optional.

Defines whether IBM MQ requires a certificate from the SSL client.

The SSL client is the end of the message channel that initiates the connection. The SSL Server is the end of the message channel that receives the initiation flow.

The parameter is used only for channels with `SSLCIPH` specified. If `SSLCIPH` is blank, the data is ignored and no error message is issued.

#### *SSLPeerName* (MQCFST)

Peer name (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

**Note:** An alternative way of restricting connections into channels by matching against the SSL or TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different SSL or TLS Subject Distinguished Name patterns can be applied to the same channel. If both `SSLPEER` on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see Channel authentication records.

On platforms other than z/OS, the length of the string is `MQ_SSL_PEER_NAME_LENGTH`. On z/OS, it is `MQ_SSL_SHORT_PEER_NAME_LENGTH`.

Specifies the filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel. (A Distinguished Name is the identifier of the SSL certificate.) If the Distinguished Name in the certificate received from the peer does not match the `SSLPEER` filter, the channel does not start.

This parameter is optional; if it is not specified, the Distinguished Name of the peer is not checked when the channel is started. (The Distinguished Name from the certificate is still written into the `SSLPEER` definition held in memory, and passed to the security exit). If `SSLCIPH` is blank, the data is ignored and no error message is issued.

This parameter is valid for all channel types.

The `SSLPEER` value is specified in the standard form used to specify a Distinguished Name. For example: `SSLPEER('SERIALNUMBER=4C:D0:49:D5:02:5F:38,CN="H1_C_FR1",O=IBM,C=GB')`

You can use a semi-colon as a separator instead of a comma.

The possible attribute types supported are:

Attribute	Description
SERIALNUMBER	Certificate serial number
MAIL	Email address
E	Email address (Deprecated in preference to MAIL)
UID or USERID	User identifier
CN	Common Name
T	Title
OU	Organizational Unit name
DC	Domain component
O	Organization name
STREET	Street / First line of address
L	Locality name
ST (or SP or S)	State or Province name
PC	Postal code / zip code
C	Country
UNSTRUCTUREDNAME	Host name
UNSTRUCTUREDADDRESS	IP address
DNQ	Distinguished name qualifier

IBM MQ only accepts uppercase letters for the attribute types.

If any of the unsupported attribute types are specified in the SSLPEER string, an error is output either when the attribute is defined or at run time (depending on which platform you are running on), and the string is deemed not to have matched the Distinguished Name of the flowed certificate.

If the Distinguished Name of the flowed certificate contains multiple OU (organizational unit) attributes, and SSLPEER specifies these attributes to be compared, they must be defined in descending hierarchical order. For example, if the Distinguished Name of the flowed certificate contains the OUs OU=Large Unit,OU=Medium Unit,OU=Small Unit, specifying the following SSLPEER values work:

```
('OU=Large Unit,OU=Medium Unit') ('OU=*,OU=Medium Unit,OU=Small Unit') ('OU=*,OU=Medium Unit')
```

but specifying the following SSLPEER values fail:

```
('OU=Medium Unit,OU=Small Unit') ('OU=Large Unit,OU=Small Unit') ('OU=Medium Unit')
```

Any or all the attribute values can be generic, either an asterisk (\*) on its own, or a stem with initiating or trailing asterisks. This value allows the SSLPEER to match any Distinguished Name value, or any value starting with the stem for that attribute.

If an asterisk is specified at the beginning or end of any attribute value in the Distinguished Name on the certificate, you can specify \\* to check for an exact match in SSLPEER. For example, if you have an attribute of CN=Test\* in the Distinguished Name of the certificate, you can use the following command:

```
SSLPEER('CN=Test\*')
```

#### *TpName* (MQCFST)

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

This name is the LU 6.2 transaction program name.

The maximum length of the string is MQ\_TP\_NAME\_LENGTH.

- On IBM i, HP Integrity NonStop Server, UNIX systems, and Windows, this parameter can be set only to blanks. The actual name is taken instead from the CPI-C Communications Side Object or (on Windows ) from the CPI-C symbolic destination name properties.

This parameter is valid only for channels with a *TransportType* of MQXPT\_LU62. It is not valid for receiver channels.

**TPRoot (MQCFST)**

Topic root for an AMQP channel. (parameter identifier: MQCACH\_TOPIC\_ROOT).

The default value for TPRoot is SYSTEM.BASE.TOPIC. With this value, the topic string an AMQP client uses to publish or subscribe has no prefix, and the client can exchange messages with other MQ pub/sub applications. To have AMQP clients publish and subscribe under a topic prefix, first create an MQ topic object with a topic string set to the prefix you want, then set TPRoot to the name of the MQ topic object you created.

This parameter is valid only for AMQP channels.

**TransportType (MQCFIN)**

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

No check is made that the correct transport type has been specified if the channel is initiated from the other end. The value can be any of the following values:

**MQXPT\_LU62**

LU 6.2.

**MQXPT\_TCP**

TCP.

**MQXPT\_NETBIOS**

NetBIOS.

This value is supported in Windows. It also applies to z/OS for defining client-connection channels that connect to servers on the platforms supporting NetBIOS.

**MQXPT\_SPX**

SPX.

This value is supported in Windows. It also applies to z/OS for defining client-connection channels that connect to servers on the platforms supporting SPX.

**UseCltId (MQCFIN)**

Determines how authorization checks are done for AMQP channels. (parameter identifier: MQIACH\_USE\_CLIENT\_ID).

Specifies that the client ID should be used for authorization checks for an AMQP channel, instead of the MCAUSER attribute value.

This parameter is valid only for AMQP channels.

**UseDLQ (MQCFIN)**

Determines whether the dead-letter queue is used when messages cannot be delivered by channels. (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value can be any of the following values:

**MQUSEDLQ\_NO**

Messages that cannot be delivered by a channel are treated as a failure. The channel either discards the message, or the channel ends, in accordance with the NonPersistentMsgSpeed setting.

**MQUSEDLQ\_YES**

When the DEADQ queue manager attribute provides the name of a dead-letter queue, then it is used, else the behavior is as for MQUSEDLQ\_NO.

**UserIdentifier (MQCFST)**

Task user identifier (parameter identifier: MQCACH\_USER\_ID).

This parameter is used by the message channel agent when attempting to initiate a secure SNA session with a remote message channel agent. On IBM i and UNIX systems, it is valid only for *ChannelType* values of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_REQUESTER, MQCHT\_CLNTCONN, MQCHT\_CLUSSDR, or MQCHT\_CLUSRCVR. On z/OS, it is valid only for a *ChannelType* value of MQCHT\_CLNTCONN.

The maximum length of the string is MQ\_USER\_ID\_LENGTH. However, only the first 10 characters are used.

*XmitQName* (MQCFST)

Transmission queue name (parameter identifier: MQCACH\_XMIT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

A transmission queue name is required (either previously defined or specified here) if *ChannelType* is MQCHT\_SENDER or MQCHT\_SERVER. It is not valid for other channel types.

**Error codes (Change, Copy, and Create Channel)**

This command might return the following error codes in the response format header, in addition to those codes listed in “Error codes applicable to all commands” on page 1051.

*Reason* (MQLONG)

The value can be any of the following values:

**MQRCCF\_BATCH\_INT\_ERROR**

Batch interval not valid.

**MQRCCF\_BATCH\_INT\_WRONG\_TYPE**

Batch interval parameter not allowed for this channel type.

**MQRCCF\_BATCH\_SIZE\_ERROR**

Batch size not valid.

**MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

**MQRCCF\_CLUSTER\_NAME\_CONFLICT**

Cluster name conflict.

**MQRCCF\_DISC\_INT\_ERROR**

Disconnection interval not valid.

**MQRCCF\_DISC\_INT\_WRONG\_TYPE**

Disconnection interval not allowed for this channel type.

**MQRCCF\_HB\_INTERVAL\_ERROR**

Heartbeat interval not valid.

**MQRCCF\_HB\_INTERVAL\_WRONG\_TYPE**

Heartbeat interval parameter not allowed for this channel type.

**MQRCCF\_LONG\_RETRY\_ERROR**

Long retry count not valid.

**MQRCCF\_LONG\_RETRY\_WRONG\_TYPE**

Long retry parameter not allowed for this channel type.

**MQRCCF\_LONG\_TIMER\_ERROR**  
Long timer not valid.

**MQRCCF\_LONG\_TIMER\_WRONG\_TYPE**  
Long timer parameter not allowed for this channel type.

**MQRCCF\_MAX\_INSTANCES\_ERROR**  
Maximum instances value not valid.

**MQRCCF\_MAX\_INSTS\_PER\_CLNT\_ERR**  
Maximum instances per client value not valid.

**MQRCCF\_MAX\_MSG\_LENGTH\_ERROR**  
Maximum message length not valid.

**MQRCCF\_MCA\_NAME\_ERROR**  
Message channel agent name error.

**MQRCCF\_MCA\_NAME\_WRONG\_TYPE**  
Message channel agent name not allowed for this channel type.

**MQRCCF\_MCA\_TYPE\_ERROR**  
Message channel agent type not valid.

**MQRCCF\_MISSING\_CONN\_NAME**  
Connection name parameter required but missing.

**MQRCCF\_MR\_COUNT\_ERROR**  
Message retry count not valid.

**MQRCCF\_MR\_COUNT\_WRONG\_TYPE**  
Message-retry count parameter not allowed for this channel type.

**MQRCCF\_MR\_EXIT\_NAME\_ERROR**  
Channel message-retry exit name error.

**MQRCCF\_MR\_EXIT\_NAME\_WRONG\_TYPE**  
Message-retry exit parameter not allowed for this channel type.

**MQRCCF\_MR\_INTERVAL\_ERROR**  
Message retry interval not valid.

**MQRCCF\_MR\_INTERVAL\_WRONG\_TYPE**  
Message-retry interval parameter not allowed for this channel type.

**MQRCCF\_MSG\_EXIT\_NAME\_ERROR**  
Channel message exit name error.

**MQRCCF\_NET\_PRIORITY\_ERROR**  
Network priority value error.

**MQRCCF\_NET\_PRIORITY\_WRONG\_TYPE**  
Network priority attribute not allowed for this channel type.

**MQRCCF\_NPM\_SPEED\_ERROR**  
Nonpersistent message speed not valid.

**MQRCCF\_NPM\_SPEED\_WRONG\_TYPE**  
Nonpersistent message speed parameter not allowed for this channel type.

**MQRCCF\_PARM\_SEQUENCE\_ERROR**  
Parameter sequence not valid.

**MQRCCF\_PUT\_AUTH\_ERROR**  
Put authority value not valid.

**MQRCCF\_PUT\_AUTH\_WRONG\_TYPE**  
Put authority parameter not allowed for this channel type.

**MQRCCF\_RCV\_EXIT\_NAME\_ERROR**  
Channel receive exit name error.

**MQRCCF\_SEC\_EXIT\_NAME\_ERROR**  
Channel security exit name error.

**MQRCCF\_SEND\_EXIT\_NAME\_ERROR**  
Channel send exit name error.

**MQRCCF\_SEQ\_NUMBER\_WRAP\_ERROR**  
Sequence wrap number not valid.

**MQRCCF\_SHARING\_CONVS\_ERROR**  
Value given for Sharing Conversations not valid.

**MQRCCF\_SHARING\_CONVS\_TYPE**  
Sharing Conversations parameter not valid for this channel type.

**MQRCCF\_SHORT\_RETRY\_ERROR**  
Short retry count not valid.

**MQRCCF\_SHORT\_RETRY\_WRONG\_TYPE**  
Short retry parameter not allowed for this channel type.

**MQRCCF\_SHORT\_TIMER\_ERROR**  
Short timer value not valid.

**MQRCCF\_SHORT\_TIMER\_WRONG\_TYPE**  
Short timer parameter not allowed for this channel type.

**MQRCCF\_SSL\_CIPHER\_SPEC\_ERROR**  
SSL CipherSpec not valid.

**MQRCCF\_SSL\_CLIENT\_AUTH\_ERROR**  
SSL client authentication not valid.

**MQRCCF\_SSL\_PEER\_NAME\_ERROR**  
SSL peer name not valid.

**MQRCCF\_WRONG\_CHANNEL\_TYPE**  
Parameter not allowed for this channel type.

**MQRCCF\_XMIT\_PROTOCOL\_TYPE\_ERR**  
Transmission protocol type not valid.

**MQRCCF\_XMIT\_Q\_NAME\_ERROR**  
Transmission queue name error.

**MQRCCF\_XMIT\_Q\_NAME\_WRONG\_TYPE**  
Transmission queue name not allowed for this channel type.

## Change, Copy, and Create Channel (MQTT):

The Change Channel command changes existing Telemetry channel definitions. The Copy and Create Channel commands create new Telemetry channel definitions - the Copy command uses attribute values of an existing channel definition.

The Change Channel (MQCMD\_CHANGE\_CHANNEL) command changes the specified attributes in a channel definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel (MQCMD\_COPY\_CHANNEL) command creates new channel definition using, for attributes not specified in the command, the attribute values of an existing channel definition.

The Create Channel (MQCMD\_CREATE\_CHANNEL) command creates an IBM MQ channel definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager. If a system default channel exists for the type of channel being created, the default values are taken from there.

### Required parameters (Change, Create Channel)

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Specifies the name of the channel definition to be changed, or created

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

This parameter is required on all types of channel; on a CLUSSDR it can be different from on the other channel types. If your convention for naming channels includes the name of the queue manager, you can make a CLUSSDR definition using the +QMNAME+ construction, and IBM MQ substitutes the correct repository queue manager name in place of +QMNAME+. This facility applies to AIX, HP-UX, Linux, IBM i, Solaris, and Windows only. See Configuring a queue manager cluster for more details.

#### *ChannelType* (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

#### **MQCHT\_MQTT**

Telemetry.

#### *TrpType* (MQCFIN)

Transmission protocol type of the channel (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

This parameter is required for a create command in telemetry.

No check is made that the correct transport type has been specified if the channel is initiated from the other end. The value is:

#### **MQXPT\_TCP**

TCP.

#### *Port* (MQCFIN)

The port number to use if *TrpType* is set to MQXPT\_TCP. This parameter is required for a create command in telemetry, if *TrpType* is set to MQXPT\_TCP.

The value is in the range 1 - 65335.

### Required parameters (Copy Channel)

#### *ChannelType* (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

Specifies the type of the channel being changed, copied, or created. The value can be any of the following values:

**MQCHT\_MQTT**

Telemetry.

**Optional parameters (Change, Copy, and Create Channel)**

**Backlog (MQCFIN)**

The number of concurrent connection requests that the telemetry channel supports at any one time (parameter identifier: MQIACH\_BACKLOG).

The value is in the range 0 - 999999999.

**JAASConfig (MQCFST)**

The file path of the JAAS configuration (parameter identifier: MQCACH\_JAAS\_CONFIG).

The maximum length of this value is MQ\_JAAS\_CONFIG\_LENGTH.

Only one of JAASCONFIG, MCAUSER, and USECLIENTID can be specified for a telemetry channel; if none is specified, no authentication is performed. If JAASConfig is specified, the client flows a user name and password. In all other cases, the flowed user name is ignored.

**LocalAddress (MQCFST)**

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

The value that you specify depends on the transport type (*TransportType*) to be used:

**TCP/IP**

The value is the optional IP address and optional port or port range to be used for outbound TCP/IP communications. The format for this information is as follows:

[ip-addr][(low-port[,high-port])]

where ip-addr is specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric form, and low-port and high-port are port numbers enclosed in parentheses. All are optional.

**All Others**

The value is ignored; no error is diagnosed.

Use this parameter if you want a channel to use a particular IP address, port, or port range for outbound communications. This parameter is useful when a machine is connected to multiple networks with different IP addresses.

Examples of use

Value	Meaning
9.20.4.98	Channel binds to this address locally
9.20.4.98 (1000)	Channel binds to this address and port 1000 locally
9.20.4.98 (1000,2000)	Channel binds to this address and uses a port in the range 1000 - 2000 locally
(1000)	Channel binds to port 1000 locally
(1000,2000)	Channel binds to a port in the range 1000 - 2000 locally

**Note:**

- Do not confuse this parameter with *ConnectionName*. The *LocalAddress* parameter specifies the characteristics of the local communications; the *ConnectionName* parameter specifies how to reach a remote queue manager.

### *MqiachProtocol* (MQCFIL)

Client protocols supported by the MQTT channel (parameter identifier: MQIACH\_PROTOCOL).

The value can be one or more of the following values:

#### **MQPROTO\_MQTTV311**

The channel accepts connections from clients using the protocol defined by the MQTT Version 3.1.1 Oasis standard. The functionality provided by this protocol is almost identical to that provided by the pre-existing MQTTV3 protocol.

#### **MQPROTO\_MQTTV3**

The channel accepts connections from clients using the MQTT V3.1 Protocol Specification from mqtt.org.

#### **MQPROTO\_HTTP**

The channel accepts HTTP requests for pages, or WebSockets connections to IBM MQ Telemetry.

If you specify no client protocols, the channel accepts connections from clients using any of the supported protocols.

**V 8.0.0.3** If you are using IBM MQ Version 8.0.0, Fix Pack 3 or later, and your configuration includes an MQTT channel that was last modified in an earlier version of IBM MQ, you must explicitly change the protocol setting to prompt the channel to use the MQTTV311 option. This is so even if the channel does not specify any client protocols, because the specific protocols to use with the channel are stored at the time the channel is configured, and previous versions of the product have no awareness of the MQTTV311 option. To prompt a channel in this state to use the MQTTV311 option, explicitly add the option then save your changes. The channel definition is now aware of the option. If you subsequently change the settings again, and specify no client protocols, the MQTTV311 option is still included in the stored list of supported protocols.

### *SSLCipherSuite* (MQCFST)

CipherSuite (parameter identifier: MQCACH\_SSL\_CIPHER\_SUITE).

The length of the string is MQ\_SSL\_CIPHER\_SUITE\_LENGTH.

SSL CIPHER SUITE character channel parameter type.

### *SSLClientAuth* (MQCFIN)

Client authentication (parameter identifier: MQIACH\_SSL\_CLIENT\_AUTH).

The value can be any of the following values:

#### **MQSCA\_REQUIRED**

Client authentication required

#### **MQSCA\_OPTIONAL**

Client authentication is optional.

#### **MQSCA\_NEVER\_REQUIRED**

Client authentication is never required, and must not be provided.

Defines whether IBM MQ requires a certificate from the SSL client.

The SSL client is the end of the message channel that initiates the connection. The SSL Server is the end of the message channel that receives the initiation flow.

The parameter is used only for channels with SSLCIPH specified. If SSLCIPH is blank, the data is ignored and no error message is issued.

### *SSLKeyFile* (MQCFST)

The store for digital certificates and their associated private keys (parameter identifier: MQCA\_SSL\_KEY\_REPOSITORY).

If you do not specify a key file, SSL is not used.

The maximum length of this parameter is MQ\_SSL\_KEY\_REPOSITORY\_LENGTH.

**SSLPassPhrase (MQCFST)**

The password for the key repository (parameter identifier: MQCACH\_SSL\_KEY\_PASSPHRASE).

If no pass phrase is entered, then unencrypted connections must be used.

The maximum length of this parameter is MQ\_SSL\_KEY\_PASSPHRASE\_LENGTH.

**TransportType (MQCFIN)**

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

No check is made that the correct transport type has been specified if the channel is initiated from the other end. The value can be any of the following values:

**MQXPT\_LU62**

LU 6.2.

**MQXPT\_TCP**

TCP.

**MQXPT\_NETBIOS**

NetBIOS.

This value is supported in Windows.

**MQXPT\_SPX**

SPX.

This value is supported in Windows.

This parameter is required for a create command in telemetry; see TransportType for more information.

**UseClientIdentifier (MQCFIN)**

Determines whether to use the client ID of a new connection as the user ID for that connection (parameter identifier: MQIACH\_USE\_CLIENT\_ID).

The value is either:

**MQUCI\_YES**

Yes.

**MQUCI\_NO**

No.

Only one of JAASCONFIG, MCAUSER, and USECLIENTID can be specified for a telemetry channel; if none is specified, no authentication is performed. If USECLIENTID is specified, the flowed user name of the client is ignored.

**Error codes (Change, Copy, and Create Channel)**

This command might return the following error codes in the response format header, in addition to those codes listed in "Error codes applicable to all commands" on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_BATCH\_INT\_ERROR**

Batch interval not valid.

**MQRCCF\_BATCH\_INT\_WRONG\_TYPE**

Batch interval parameter not allowed for this channel type.

**MQRCCF\_BATCH\_SIZE\_ERROR**  
Batch size not valid.

**MQRCCF\_CHANNEL\_NAME\_ERROR**  
Channel name error.

**MQRCCF\_CHANNEL\_NOT\_FOUND**  
Channel not found.

**MQRCCF\_CHANNEL\_TYPE\_ERROR**  
Channel type not valid.

**MQRCCF\_CLUSTER\_NAME\_CONFLICT**  
Cluster name conflict.

**MQRCCF\_DISC\_INT\_ERROR**  
Disconnection interval not valid.

**MQRCCF\_DISC\_INT\_WRONG\_TYPE**  
Disconnection interval not allowed for this channel type.

**MQRCCF\_HB\_INTERVAL\_ERROR**  
Heartbeat interval not valid.

**MQRCCF\_HB\_INTERVAL\_WRONG\_TYPE**  
Heartbeat interval parameter not allowed for this channel type.

**MQRCCF\_LONG\_RETRY\_ERROR**  
Long retry count not valid.

**MQRCCF\_LONG\_RETRY\_WRONG\_TYPE**  
Long retry parameter not allowed for this channel type.

**MQRCCF\_LONG\_TIMER\_ERROR**  
Long timer not valid.

**MQRCCF\_LONG\_TIMER\_WRONG\_TYPE**  
Long timer parameter not allowed for this channel type.

**MQRCCF\_MAX\_INSTANCES\_ERROR**  
Maximum instances value not valid.

**MQRCCF\_MAX\_INSTS\_PER\_CLNT\_ERR**  
Maximum instances per client value not valid.

**MQRCCF\_MAX\_MSG\_LENGTH\_ERROR**  
Maximum message length not valid.

**MQRCCF\_MCA\_NAME\_ERROR**  
Message channel agent name error.

**MQRCCF\_MCA\_NAME\_WRONG\_TYPE**  
Message channel agent name not allowed for this channel type.

**MQRCCF\_MCA\_TYPE\_ERROR**  
Message channel agent type not valid.

**MQRCCF\_MISSING\_CONN\_NAME**  
Connection name parameter required but missing.

**MQRCCF\_MR\_COUNT\_ERROR**  
Message retry count not valid.

**MQRCCF\_MR\_COUNT\_WRONG\_TYPE**  
Message-retry count parameter not allowed for this channel type.

**MQRCCF\_MR\_EXIT\_NAME\_ERROR**  
Channel message-retry exit name error.

**MQRCCF\_MR\_EXIT\_NAME\_WRONG\_TYPE**  
Message-retry exit parameter not allowed for this channel type.

**MQRCCF\_MR\_INTERVAL\_ERROR**  
Message retry interval not valid.

**MQRCCF\_MR\_INTERVAL\_WRONG\_TYPE**  
Message-retry interval parameter not allowed for this channel type.

**MQRCCF\_MSG\_EXIT\_NAME\_ERROR**  
Channel message exit name error.

**MQRCCF\_NET\_PRIORITY\_ERROR**  
Network priority value error.

**MQRCCF\_NET\_PRIORITY\_WRONG\_TYPE**  
Network priority attribute not allowed for this channel type.

**MQRCCF\_NPM\_SPEED\_ERROR**  
Nonpersistent message speed not valid.

**MQRCCF\_NPM\_SPEED\_WRONG\_TYPE**  
Nonpersistent message speed parameter not allowed for this channel type.

**MQRCCF\_PARM\_SEQUENCE\_ERROR**  
Parameter sequence not valid.

**MQRCCF\_PUT\_AUTH\_ERROR**  
Put authority value not valid.

**MQRCCF\_PUT\_AUTH\_WRONG\_TYPE**  
Put authority parameter not allowed for this channel type.

**MQRCCF\_RCV\_EXIT\_NAME\_ERROR**  
Channel receive exit name error.

**MQRCCF\_SEC\_EXIT\_NAME\_ERROR**  
Channel security exit name error.

**MQRCCF\_SEND\_EXIT\_NAME\_ERROR**  
Channel send exit name error.

**MQRCCF\_SEQ\_NUMBER\_WRAP\_ERROR**  
Sequence wrap number not valid.

**MQRCCF\_SHARING\_CONVS\_ERROR**  
Value given for Sharing Conversations not valid.

**MQRCCF\_SHARING\_CONVS\_TYPE**  
Sharing Conversations parameter not valid for this channel type.

**MQRCCF\_SHORT\_RETRY\_ERROR**  
Short retry count not valid.

**MQRCCF\_SHORT\_RETRY\_WRONG\_TYPE**  
Short retry parameter not allowed for this channel type.

**MQRCCF\_SHORT\_TIMER\_ERROR**  
Short timer value not valid.

**MQRCCF\_SHORT\_TIMER\_WRONG\_TYPE**  
Short timer parameter not allowed for this channel type.

**MQRCCF\_SSL\_CIPHER\_SPEC\_ERROR**

SSL CipherSpec not valid.

**MQRCCF\_SSL\_CLIENT\_AUTH\_ERROR**

SSL client authentication not valid.

**MQRCCF\_SSL\_PEER\_NAME\_ERROR**

SSL peer name not valid.

**MQRCCF\_WRONG\_CHANNEL\_TYPE**

Parameter not allowed for this channel type.

**MQRCCF\_XMIT\_PROTOCOL\_TYPE\_ERR**

Transmission protocol type not valid.

**MQRCCF\_XMIT\_Q\_NAME\_ERROR**

Transmission queue name error.

**MQRCCF\_XMIT\_Q\_NAME\_WRONG\_TYPE**

Transmission queue name not allowed for this channel type.

**Change, Copy, and Create Channel Listener:**

The Change Channel Listener command changes existing channel listener definitions. The Copy and Create Channel Listener commands create new channel listener definitions - the Copy command uses attribute values of an existing channel listener definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

The Change Channel Listener (MQCMD\_CHANGE\_LISTENER) command changes the specified attributes of an existing IBM MQ listener definition. For any optional parameters that are omitted, the value does not change.

The Copy Channel Listener (MQCMD\_COPY\_LISTENER) command creates an IBM MQ listener definition, using, for attributes not specified in the command, the attribute values of an existing listener definition.

The Create Channel Listener (MQCMD\_CREATE\_LISTENER) command creates an IBM MQ listener definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

**Required parameters (Change and Create Channel Listener)****ListenerName (MQCFST)**

The name of the listener definition to be changed or created (parameter identifier: MQCACH\_LISTENER\_NAME).

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**TransportType (MQCFIN)**

Transmission protocol (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_TCP**

TCP.

**MQXPT\_LU62**

LU 6.2. This value is valid only on Windows.

**MQXPT\_NETBIOS**

NetBIOS. This value is valid only on Windows.

**MQXPT\_SPX**

SPX. This value is valid only on Windows.

**Required parameters (Copy Channel Listener)*****FromListenerName* (MQCFST)**

The name of the listener definition to be copied from (parameter identifier: MQCACF\_FROM\_LISTENER\_NAME).

This parameter specifies the name of the existing listener definition that contains values for the attributes not specified in this command.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

***ToListenerName* (MQCFST)**

To listener name (parameter identifier: MQCACF\_TO\_LISTENER\_NAME).

This parameter specifies the name of the new listener definition. If a listener definition with this name exists, *Replace* must be specified as MQRP\_YES.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**Optional parameters (Change, Copy, and Create Channel Listener)*****Adapter* (MQCFIN)**

Adapter number (parameter identifier: MQIACH\_ADAPTER).

The adapter number on which NetBIOS listens. This parameter is valid only on Windows.

***Backlog* (MQCFIN)**

Backlog (parameter identifier: MQIACH\_BACKLOG).

The number of concurrent connection requests that the listener supports.

***Commands* (MQCFIN)**

Adapter number (parameter identifier: MQIACH\_COMMAND\_COUNT).

The number of commands that the listener can use. This parameter is valid only on Windows.

***IPAddress* (MQCFST)**

IP address (parameter identifier: MQCACH\_IP\_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form. If you do not specify a value for this parameter, the listener listens on all configured IPv4 and IPv6 stacks.

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

***ListenerDesc* (MQCFST)**

Description of listener definition (parameter identifier: MQCACH\_LISTENER\_DESC).

This parameter is a plain-text comment that provides descriptive information about the listener definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ\_LISTENER\_DESC\_LENGTH.

***LocalName* (MQCFST)**

NetBIOS local name (parameter identifier: MQCACH\_LOCAL\_NAME).

The NetBIOS local name that the listener uses. This parameter is valid only on Windows.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

**NetbiosNames (MQCFIN)**

NetBIOS names (parameter identifier: MQIACH\_NAME\_COUNT).

The number of names that the listener supports. This parameter is valid only on Windows.

**Port (MQCFIN)**

Port number (parameter identifier: MQIACH\_PORT).

The port number for TCP/IP. This parameter is valid only if the value of *TransportType* is MQXPT\_TCP.

**Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a namelist definition with the same name as *ToListenerName* exists, this definition specifies whether it is to be replaced. The value can be:

**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

**Sessions (MQCFIN)**

NetBIOS sessions (parameter identifier: MQIACH\_SESSION\_COUNT).

The number of sessions that the listener can use. This parameter is valid only on Windows.

**Socket (MQCFIN)**

SPX socket number (parameter identifier: MQIACH\_SOCKET).

The SPX socket on which to listen. This parameter is valid only if the value of *TransportType* is MQXPT\_SPX.

**StartMode (MQCFIN)**

Service mode (parameter identifier: MQIACH\_LISTENER\_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. This value is the default value.

**MQSVC\_CONTROL\_Q\_MGR**

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The listener is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

**TPName (MQCFST)**

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The LU 6.2 transaction program name. This parameter is valid only on Windows.

The maximum length of the string is MQ\_TP\_NAME\_LENGTH

## Change, Copy, and Create Communication Information Object:

The Change Communication Information Object command changes existing communication information object definitions. The Copy and Create Communication Information Object commands create new communication information object definitions - the Copy command uses attribute values of an existing communication information object definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

The Change communication information (MQCMD\_CHANGE\_COMM\_INFO) command changes the specified attributes of an existing IBM MQ communication information object definition. For any optional parameters that are omitted, the value does not change.

The Copy communication information (MQCMD\_COPY\_COMM\_INFO) command creates an IBM MQ communication information object definition, using, for attributes not specified in the command, the attribute values of an existing communication information definition.

The Create communication information (MQCMD\_CREATE\_COMM\_INFO) command creates an IBM MQ communication information object definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### Required parameter (Change communication information)

#### *ComminfoName* (MQCFST)

The name of the communication information definition to be changed (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

### Required parameters (Copy communication information)

#### *FromComminfoName* (MQCFST)

The name of the communication information object definition to be copied from (parameter identifier: MQCACF\_FROM\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

#### *ToComminfoName* (MQCFST)

The name of the communication information definition to copy to (parameter identifier: MQCACF\_TO\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

### Required parameters (Create communication information)

#### *ComminfoName* (MQCFST)

The name of the communication information definition to be created (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

### Optional parameters (Change, Copy, and Create communication information)

#### *Bridge* (MQCFIN)

Controls whether publications from applications not using Multicast are bridged to applications using multicast (parameter identifier: MQIA\_MCAST\_BRIDGE).

Bridging does not apply to topics that are marked as **MCAST(ONLY)**. As these topics can only have multicast traffic, it is not applicable to bridge to the non-multicast publish/subscribe domain.

#### **MQMCB\_DISABLED**

Publications from applications not using multicast are not bridged to applications that do use Multicast. This is the default for IBM i.

#### **MQMCB\_ENABLED**

Publications from applications not using multicast are bridged to applications that do use Multicast. This is the default for platforms other than IBM i. This value is not valid on IBM i.

#### **CCSID (MQCFIN)**

The coded character set identifier that messages are transmitted on (parameter identifier: MQIA\_CODED\_CHAR\_SET\_ID).

Specify a value in the range 1 to 65535.

The CCSID must specify a value that is defined for use on your platform, and use a character set that is appropriate to the platform. If you use this parameter to change the CCSID, applications that are running when the change is applied continue to use the original CCSID. Because of this, you must stop and restart all running applications before you continue.

This includes the command server and channel programs. To do this, stop and restart the queue manager after making the change. The default value is ASPUB which means that the coded character set is taken from the one that is supplied in the published message.

#### **CommEvent (MQCFIN)**

Controls whether event messages are generated for multicast handles that are created using this COMMINFO object (parameter identifier: MQIA\_COMM\_EVENT).

Events are only generated if monitoring is also enabled using the *MonitorInterval* parameter.

#### **MQEVR\_DISABLED**

Publications from applications not using multicast are not bridged to applications that do use multicast. This is the default value.

#### **MQEVR\_ENABLED**

Publications from applications not using multicast are bridged to applications that do use multicast.

#### **MQEVR\_EXCEPTION**

Event messages are written if the message reliability is below the reliability threshold. The reliability threshold is set to 90 by default.

#### **Description (MQCFST)**

Plain-text comment that provides descriptive information about the communication information object (parameter identifier: MQCA\_COMM\_INFO\_DESC).

It must contain only displayable characters. The maximum length is 64 characters. In a DBCS installation, it can contain DBCS characters (subject to a maximum length of 64 bytes).

If characters are used that are not in the coded character set identifier (CCSID) for this queue manager, they might be translated incorrectly if the information is sent to another queue manager.

The maximum length is MQ\_COMM\_INFO\_DESC\_LENGTH.

#### **Encoding (MQCFIN)**

The encoding that the messages are transmitted in (parameter identifier: MQIACF\_ENCODING).

#### **MQENC\_AS\_PUBLISHED**

The encoding of the message is taken from the one that is supplied in the published message. This is the default value.

#### **MQENC\_NORMAL**

## **MQENC\_REVERSED**

## **MQENC\_S390**

## **MQENC\_TNS**

### ***GrpAddress* (MQCFST)**

The group IP address or DNS name (parameter identifier: MQCACH\_GROUP\_ADDRESS).

It is the administrator's responsibility to manage the group addresses. It is possible for all multicast clients to use the same group address for every topic; only the messages that match outstanding subscriptions on the client are delivered. Using the same group address can be inefficient because every client must examine and process every multicast packet in the network. It is more efficient to allocate different IP group addresses to different topics or sets of topics, but this requires careful management, especially if other non-MQ multicast applications are in use on the network. The default value is 239.0.0.0.

The maximum length is MQ\_GROUP\_ADDRESS\_LENGTH.

### ***MonitorInterval* (MQCFIN)**

How frequently monitoring information is updated and event messages are generated (parameter identifier: MQIA\_MONITOR\_INTERVAL).

The value is specified as a number of seconds in the range 0 to 999 999. A value of 0 indicates that no monitoring is required.

If a non-zero value is specified, monitoring is enabled. Monitoring information is updated and event messages (if enabled using *CommEvent*, are generated about the status of the multicast handles created using this communication information object.

### ***MsgHistory* (MQCFIN)**

This value is the amount of message history in kilobytes that is kept by the system to handle retransmissions in the case of NACKs (parameter identifier: MQIACH\_MSG\_HISTORY).

The value is in the range 0 to 999 999 999. A value of 0 gives the least level of reliability. The default value is 100.

### ***MulticastHeartbeat* (MQCFIN)**

The heartbeat interval is measured in milliseconds, and specifies the frequency at which the transmitter notifies any receivers that there is no further data available (parameter identifier: MQIACH\_MC\_HB\_INTERVAL).

The value is in the range 0 to 999 999. The default value is 2000 milliseconds.

### ***MulticastPropControl* (MQCFIN)**

The multicast properties control how many of the MQMD properties and user properties flow with the message (parameter identifier: MQIACH\_MULTICAST\_PROPERTIES).

#### **MQMCP\_ALL**

All user properties and all the fields of the MQMD are transported. This is the default value.

#### **MQMCP\_REPLY**

Only user properties, and MQMD fields that deal with replying to the messages, are transmitted. These properties are:

- MsgType
- MessageId
- CorrelId
- ReplyToQ
- ReplyToQmgr

#### **MQMCP\_USER**

Only the user properties are transmitted.

## MQMCP\_NONE

No user properties or MQMD fields are transmitted.

## MQMCP\_COMPAT

Properties are transmitted in a format compatible with previous MQ multicast clients.

### *NewSubHistory* (MQCFIN)

The new subscriber history controls whether a subscriber joining a publication stream receives as much data as is currently available, or receives only publications made from the time of the subscription (parameter identifier: MQIACH\_NEW\_SUBSCRIBER\_HISTORY).

## MQNSH\_NONE

A value of NONE causes the transmitter to transmit only publication made from the time of the subscription. This is the default value.

## MQNSH\_ALL

A value of ALL causes the transmitter to retransmit as much history of the topic as is known. In some circumstances, this can give a similar behavior to retained publications.

Using the value of MQNSH\_ALL might have a detrimental effect on performance if there is a large topic history because all the topic history is retransmitted.

### *PortNumber* (MQCFIN)

The port number to transmit on (parameter identifier: MQIACH\_PORT).

The default port number is 1414.

### *Type* (MQCFIN)

The type of the communications information object (parameter identifier: MQIA\_COMM\_INFO\_TYPE).

The only type supported is MQCIT\_MULTICAST.

## Change, Copy, and Create Namelist:

The Change Namelist command changes existing namelist definitions. The Copy and Create Namelist commands create new namelist definitions - the Copy command uses attribute values of an existing namelist definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

The Change Namelist (MQCMD\_CHANGE\_NAMELIST) command changes the specified attributes of an existing IBM MQ namelist definition. For any optional parameters that are omitted, the value does not change.

The Copy Namelist (MQCMD\_COPY\_NAMELIST) command creates an IBM MQ namelist definition, using, for attributes not specified in the command, the attribute values of an existing namelist definition.

The Create Namelist (MQCMD\_CREATE\_NAMELIST) command creates an IBM MQ namelist definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

## Required parameter (Change and Create Namelist)

### *NamelistName* (MQCFST)

The name of the namelist definition to be changed (parameter identifier: MQCA\_NAMELIST\_NAME).

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

### Required parameters (Copy Namelist)

#### *FromNamelistName* (MQCFST)

The name of the namelist definition to be copied from (parameter identifier: MQCACF\_FROM\_NAMELIST\_NAME).

This parameter specifies the name of the existing namelist definition that contains values for the attributes not specified in this command.

▶ **z/OS** On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToNamelistName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

#### *ToNamelistName* (MQCFST)

To namelist name (parameter identifier: MQCACF\_TO\_NAMELIST\_NAME).

This parameter specifies the name of the new namelist definition. If a namelist definition with this name exists, *Replace* must be specified as MQRP\_YES.

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

### Optional parameters (Change, Copy, and Create Namelist) ▶ **z/OS**

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *NamelistDesc* (MQCFST)

Description of namelist definition (parameter identifier: MQCA\_NAMELIST\_DESC).

This parameter is a plain-text comment that provides descriptive information about the namelist definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ\_NAMELIST\_DESC\_LENGTH.

#### ▶ **z/OS**

#### *NamelistType* (MQCFIN)

Type of names in the namelist (parameter identifier: MQIA\_NAMELIST\_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

**MQNT\_NONE**

The names are of no particular type.

**MQNT\_Q**

A namelist that holds a list of queue names.

**MQNT\_CLUSTER**

A namelist that is associated with clustering, containing a list of the cluster names.

**MQNT\_AUTH\_INFO**

The namelist is associated with SSL, and contains a list of authentication information object names.

**Names (MQCFSL)**

The names to be placed in the namelist (parameter identifier: MQCA\_NAMES).

The number of names in the list is given by the *Count* field in the MQCFSL structure. The length of each name is given by the *StringLength* field in that structure. The maximum length of a name is MQ\_OBJECT\_NAME\_LENGTH.

**z/OS**

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
<b>MQQSGD_COPY</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToNameListName</i> object (for Copy) or <i>NameListName</i> object (for Create).
<b>MQQSGD_GROUP</b>	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE NAMELIST(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This is allowed only if the queue manager is in a queue-sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE NAMELIST(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>

QSGDisposition	Change	Copy, Create
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value.

### Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a namelist definition with the same name as *ToNamelistName* exists, this definition specifies whether it is to be replaced. The value can be:

#### MQRP\_YES

Replace existing definition.

#### MQRP\_NO

Do not replace existing definition.

### Change, Copy, and Create Process:

The Change Process command changes existing process definitions. The Copy and Create Process commands create new process definitions - the Copy command uses attribute values of an existing process definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

The Change Process (MQCMD\_CHANGE\_PROCESS) command changes the specified attributes of an existing IBM MQ process definition. For any optional parameters that are omitted, the value does not change.

The Copy Process (MQCMD\_COPY\_PROCESS) command creates an IBM MQ process definition, using, for attributes not specified in the command, the attribute values of an existing process definition.

The Create Process (MQCMD\_CREATE\_PROCESS) command creates an IBM MQ process definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### Required parameters (Change and Create Process)

#### ProcessName (MQCFST)

The name of the process definition to be changed or created (parameter identifier: MQCA\_PROCESS\_NAME).

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

## Required parameters (Copy Process)

### *FromProcessName* (MQCFST)

The name of the process definition to be copied from (parameter identifier: MQCACF\_FROM\_PROCESS\_NAME).

Specifies the name of the existing process definition that contains values for the attributes not specified in this command.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToProcessName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

### *ToProcessName* (MQCFST)

To process name (parameter identifier: MQCACF\_TO\_PROCESS\_NAME).

The name of the new process definition. If a process definition with this name exists, *Replace* must be specified as MQRP\_YES.

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

## Optional parameters (Change, Copy, and Create Process)

### *ApplId* (MQCFST)

Application identifier (parameter identifier: MQCA\_APPL\_ID).

*ApplId* is the name of the application to be started. The application must be on the platform for which the command is executing. The name might typically be a fully qualified file name of an executable object. Qualifying the file name is particularly important if you have multiple IBM MQ installations, to ensure the correct version of the application is run.

The maximum length of the string is MQ\_PROCESS\_APPL\_ID\_LENGTH.

### *ApplType* (MQCFIN)

Application type (parameter identifier: MQIA\_APPL\_TYPE).

Valid application types are:

#### **MQAT\_OS400**

IBM i application.

#### **MQAT\_WINDOWS\_NT**

Windows or Windows 95, Windows 98 application.

#### **MQAT\_DOS**

DOS client application.

#### **MQAT\_WINDOWS**

Windows client application.

#### **MQAT\_UNIX**

UNIX application.

#### **MQAT\_AIX**

AIX application (same value as MQAT\_UNIX).

#### **MQAT\_CICS**

CICS transaction.

#### **MQAT\_NSK**

HP Integrity NonStop Server application.

▶ **z/OS** **MQAT\_ZOS**  
z/OS application.

**MQAT\_DEFAULT**  
Default application type.

*integer*: System-defined application type in the range zero through 65 535 or a user-defined application type in the range 65 536 through 999 999 999 (not checked).

Only specify application types (other than user-defined types) that are supported on the platform at which the command is executed:

- On IBM i: MQAT\_OS400, MQAT\_CICS, and MQAT\_DEFAULT are supported.
- On HP Integrity NonStop Server: MQAT\_NSK, MQAT\_DOS, MQAT\_WINDOWS, and MQAT\_DEFAULT are supported.
- On UNIX systems: MQAT\_UNIX, MQAT\_OS2, MQAT\_DOS, MQAT\_WINDOWS, MQAT\_CICS, and MQAT\_DEFAULT are supported.
- On Windows: MQAT\_WINDOWS\_NT, MQAT\_OS2, MQAT\_DOS, MQAT\_WINDOWS, MQAT\_CICS, and MQAT\_DEFAULT are supported.
- ▶ **z/OS** On z/OS: MQAT\_DOS, MQAT\_IMS MQAT\_MVS, MQAT\_UNIX, MQAT\_CICS, and MQAT\_DEFAULT are supported.

▶ **z/OS**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. In a shared queue environment, you can provide a different queue manager name from the one you are using to enter the command. The command server must be enabled.
- An asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### **EnvData (MQCFST)**

Environment data (parameter identifier: MQCA\_ENV\_DATA).

A character string that contains environment information pertaining to the application to be started.

The maximum length of the string is MQ\_PROCESS\_ENV\_DATA\_LENGTH.

#### **ProcessDesc (MQCFST)**

Description of process definition (parameter identifier: MQCA\_PROCESS\_DESC).

A plain-text comment that provides descriptive information about the process definition. It must contain only displayable characters.

The maximum length of the string is MQ\_PROCESS\_DESC\_LENGTH.

Use characters from the coded character set identifier (CCSID) for this queue manager. Other characters might be translated incorrectly if the information is sent to another queue manager.

▶ **z/OS**

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToProcessName</i> object (for Copy) or <i>ProcessName</i> object (for Create).
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameters QSGDISP(GROUP). On the page set of the queue manager that executes the command, only a local copy of the object is altered by this command. If the command is successful, the following command is generated.</p> <pre>DEFINE PROCESS(process-name) REPLACE QSGDISP(COPY)</pre> <p>The command is sent to all active queue managers in the queue-sharing group to attempt to refresh local copies on page set zero. The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. GROUP is allowed only if the queue manager is in a queue-sharing group. If the definition is successful, the following command is generated.</p> <pre>DEFINE PROCESS(process-name) REPLACE QSGDISP(COPY)</pre> <p>The command is sent to all active queue managers in the queue-sharing group to attempt to make or refresh local copies on page set zero. The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. MQQSGD_Q_MGR is the default value.	The object is defined on the page set of the queue manager that executes the command. MQQSGD_Q_MGR is the default value.

### Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a process definition with the same name as *ToProcessName* exists, specify whether to replace it.

The value can be any of the following values:

#### MQRP\_YES

Replace existing definition.

## MQRP\_NO

Do not replace existing definition.

### *UserData* (MQCFST)

User data (parameter identifier: MQCA\_USER\_DATA).

A character string that contains user information pertaining to the application (defined by *AppId*) that is to be started.

For Microsoft Windows, the character string must not contain double quotation marks if the process definition is going to be passed to **runmqtrm**.

The maximum length of the string is MQ\_PROCESS\_USER\_DATA\_LENGTH.

## Change, Copy, and Create Queue:

The Change Queue command MQCMD\_CHANGE\_Q changes existing queue definitions. The Copy and Create Queue commands create new queue definitions - the Copy command uses attribute values of an existing queue definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

The Change Queue command MQCMD\_CHANGE\_Q changes the specified attributes of an existing IBM MQ queue. For any optional parameters that are omitted, the value does not change.

The Copy Queue command MQCMD\_COPY\_Q creates a queue definition of the same type. For attributes not specified in the command, it uses the attribute values of an existing queue definition.

The Create Queue command MQCMD\_CREATE\_Q creates a queue definition with the specified attributes. All attributes that are not specified are set to the default value for the type of queue that is created.

## Required parameters (Change and Create Queue)

### *QName* (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

The name of the queue to be changed. The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

## Required parameters (Copy Queue)

### *FromQName* (MQCFST)

From queue name (parameter identifier: MQCACF\_FROM\_Q\_NAME).

Specifies the name of the existing queue definition.

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR, MQQSGD\_COPY, or MQQSGD\_SHARED to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToQName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### *ToQName* (MQCFST)

To queue name (parameter identifier: MQCACF\_TO\_Q\_NAME).

Specifies the name of the new queue definition.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

Queue names must be unique; if a queue definition exists with the name and type of the new queue, *Replace* must be specified as `MQRP_YES`. If a queue definition exists with the same name as and a different type from the new queue, the command fails.

### Required parameters (all commands)

#### *QType* (MQCFIN)

Queue type (parameter identifier: `MQIA_Q_TYPE`).

The value specified must match the type of the queue being changed.

The value can be any of the following values:

#### **MQQT\_ALIAS**

Alias queue definition.

#### **MQQT\_LOCAL**

Local queue.

#### **MQQT\_REMOTE**

Local definition of a remote queue.

#### **MQQT\_MODEL**

Model queue definition.

### Optional parameters (Change, Copy, and Create Queue)

#### *BackoutRequeueName* (MQCFST) - see **MQSC BOQNAME**

Excessive backout requeue name (parameter identifier: `MQCA_BACKOUT_REQ_Q_NAME`).

Specifies the name of the queue to which a message is transferred if it is backed out more times than the value of *BackoutThreshold*. The queue does not have to be a local queue.

The backout queue does not need to exist at this time but it must exist when the *BackoutThreshold* value is exceeded.

The maximum length of the string is `MQ_Q_NAME_LENGTH`.

#### *BackoutThreshold* (MQCFIN)

Backout threshold (parameter identifier: `MQIA_BACKOUT_THRESHOLD`).

The number of times a message can be backed out before it is transferred to the backout queue specified by *BackoutRequeueName*.

If the value is later reduced, messages that are already on the queue that were backed out at least as many times as the new value remain on the queue. Those messages are transferred if they are backed out again.

Specify a value in the range 0 - 999,999,999.

#### *BaseObjectName* (MQCFST)

Name of the object to which the alias resolves (parameter identifier: `MQCA_BASE_OBJECT_NAME`).

This parameter is the name of a queue or topic that is defined to the local queue manager.

The maximum length of the string is `MQ_OBJECT_NAME_LENGTH`.

#### *BaseQName* (MQCFST)

Queue name to which the alias resolves (parameter identifier: `MQCA_BASE_Q_NAME`).

This parameter is the name of a local or remote queue that is defined to the local queue manager.

The maximum length of the string is `MQ_Q_NAME_LENGTH`.

#### *CFStructure* (MQCFST)

Coupling facility structure name (parameter identifier: `MQCA_CF_STRUC_NAME`). This parameter applies to z/OS only.

Specifies the name of the coupling facility structure where you want to store messages when you use shared queues. The name:

- Cannot have more than 12 characters
- Must start with an uppercase letter (A - Z)
- Can include only the characters A - Z and 0 - 9

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

The name of the queue-sharing group to which the queue manager is connected is prefixed to the name you supply. The name of the queue-sharing group is always four characters, padded with @ symbols if necessary. For example, if you use a queue-sharing group named NY03 and you supply the name PRODUCT7, the resultant coupling facility structure name is NY03PRODUCT7. Note the administrative structure for the queue-sharing group (in this case NY03CSQ\_ADMIN) cannot be used for storing messages.

For local and model queues, the following rules apply. The rules apply if you use the Create Queue command with a value of MQRP\_YES in the *Replace* parameter. The rules also apply if you use the Change Queue command.

- On a local queue with a value of MQQSGD\_SHARED in the *QSGDisposition* parameter, *CFStructure* cannot change.

If you need to change either the *CFStructure* or *QSGDisposition* value, you must delete and redefine the queue. To preserve any of the messages on the queue you must offload the messages before you delete the queue. Reload the messages after you redefine the queue, or move the messages to another queue.

- On a model queue with a value of MQQDT\_SHARED\_DYNAMIC in the *DefinitionType* parameter, *CFStructure* cannot be blank.
- On a local queue with a value other than MQQSGD\_SHARED in the *QSGDisposition* parameter, the value of *CFStructure* does not matter. The value *CFStructure* also does not matter for a model queue with a value other than MQQDT\_SHARED\_DYNAMIC in the *DefinitionType* parameter.

For local and model queues, when you use the Create Queue command with a value of MQRP\_NO in the *Replace* parameter, the coupling facility structure:

- On a local queue with a value of MQQSGD\_SHARED in the *QSGDisposition* parameter, or a model queue with a value of MQQDT\_SHARED\_DYNAMIC in the *DefinitionType* parameter, *CFStructure* cannot be blank.
- On a local queue with a value other than MQQSGD\_SHARED in the *QSGDisposition* parameter, the value of *CFStructure* does not matter. The value *CFStructure* also does not matter for a model queue with a value other than MQQDT\_SHARED\_DYNAMIC in the *DefinitionType* parameter.

**Note:** Before you can use the queue, the structure must be defined in the coupling facility Resource Management (CFRM) policy data set.

#### *ClusterChannelName* (MQCFST)

This parameter is supported only on transmission queues.

*ClusterChannelName* is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue. (Parameter identifier: MQCA\_CLUS\_CHL\_NAME.)

You can also set the transmission queue attribute *ClusterChannelName* attribute to a cluster-sender channel manually. Messages that are destined for the queue manager connected by the cluster-sender channel are stored in the transmission queue that identifies the cluster-sender channel. They are not stored in the default cluster transmission queue. If you set the *ClusterChannelName* attribute to blanks, the channel switches to the default cluster transmission queue when the channel restarts. The default queue is either SYSTEM.CLUSTER.TRANSMIT.*ChannelName* or SYSTEM.CLUSTER.TRANSMIT.QUEUE, depending on the value of the queue manager DefClusterXmitQueueType attribute.

By specifying asterisks, “\*”, in `ClusterChannelName`, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. `ClusterChannelName` is limited to a length of 20 characters: `MQ_CHANNEL_NAME_LENGTH`.

The default queue manager configuration is for all cluster-sender channels to send messages from a single transmission queue, `SYSTEM.CLUSTER.TRANSMIT.QUEUE`. The default configuration can be changed by modified by changing the queue manager attribute, `DefClusterXmitQueueType`. The default value of the attribute is `SCTQ`. You can change the value to `CHANNEL`. If you set the `DefClusterXmitQueueType` attribute to `CHANNEL`, each cluster-sender channel defaults to using a specific cluster transmission queue, `SYSTEM.CLUSTER.TRANSMIT.ChannelName`.

#### ***ClusterName* (MQCFST)**

Cluster name (parameter identifier: `MQCA_CLUSTER_NAME`).

The name of the cluster to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are open.

Only one of the resultant values of *ClusterName* and *ClusterNameList* can be nonblank; you cannot specify a value for both.

The maximum length of the string is `MQ_CLUSTER_NAME_LENGTH`.

#### ***ClusterNameList* (MQCFST)**

Cluster namelist (parameter identifier: `MQCA_CLUSTER_NAMELIST`).

The name of the namelist, that specifies a list of clusters to which the queue belongs.

Changes to this parameter do not affect instances of the queue that are open.

Only one of the resultant values of *ClusterName* and *ClusterNameList* can be nonblank; you cannot specify a value for both.

#### ***CLWLQueuePriority* (MQCFIN)**

Cluster workload queue priority (parameter identifier: `MQIA_CLWL_Q_PRIORITY`).

Specifies the priority of the queue in cluster workload management; see *Configuring a queue manager cluster*. The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

#### ***CLWLQueueRank* (MQCFIN)**

Cluster workload queue rank (parameter identifier: `MQIA_CLWL_Q_RANK`).

Specifies the rank of the queue in cluster workload management. The value must be in the range 0 - 9, where 0 is the lowest priority and 9 is the highest.

#### ***CLWLUseQ* (MQCFIN)**

Cluster workload use remote queue (parameter identifier: `MQIA_CLWL_USEQ`).

Specifies whether remote and local queues are to be used in cluster workload distribution. The value can be any of the following values:

##### **MQCLWL\_USEQ\_AS\_Q\_MGR**

Use the value of the *CLWLUseQ* parameter on the definition of the queue manager.

##### **MQCLWL\_USEQ\_ANY**

Use remote and local queues.

##### **MQCLWL\_USEQ\_LOCAL**

Do not use remote queues.

z/OS

#### ***CommandScope* (MQCFST)**

Command scope (parameter identifier: `MQCACF_COMMAND_SCOPE`). This parameter applies to z/OS only.

Specifies how the command is run when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- Blank, or omit the parameter altogether. The command is run on the queue manager on which it was entered.
- A queue manager name. The command is run on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment. The command server must be enabled.
- An asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *Custom (MQCFST)*

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

**V8.0.0.4** This attribute contains the values of attributes, as pairs of attribute name and value, separated by at least one space. The attribute name and value pairs have the form NAME(VALUE). Single quotation marks must be escaped with another single quotation mark.

#### **CAPEXPY ( integer )**

The maximum time, expressed in tenths of a second, until a message put using an object handle, opened using this object on the resolution path, remains in the system until it becomes eligible for expiry processing.

For more information on message expiry processing, see Enforcing lower expiration times.

The value can be one of the following:

##### **integer**

The value must be in the range one through to 999 999 999.

##### **NOLIMIT**

There is no limit on the expiry time of messages put using this object. This is the default value.

Specifying a value for CAPEXPY that is not valid, does not cause the command to fail. Instead, the default value is used.

#### *DefaultPutResponse (MQCFIN)*

Default put response type definition (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

The parameter specifies the type of response to be used for put operations to the queue when an application specifies MQPMO\_RESPONSE\_AS\_Q\_DEF. The value can be any of the following values:

##### **MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

##### **MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

#### *DefBind (MQCFIN)*

Bind definition (parameter identifier: MQIA\_DEF\_BIND).

The parameter specifies the binding to be used when MQ00\_BIND\_AS\_Q\_DEF is specified on the MQOPEN call. The value can be any of the following values:

##### **MQBND\_BIND\_ON\_OPEN**

The binding is fixed by the MQOPEN call.

##### **MQBND\_BIND\_NOT\_FIXED**

The binding is not fixed.

**MQBND\_BIND\_ON\_GROUP**

Allows an application to request that a group of messages are all allocated to the same destination instance.

Changes to this parameter do not affect instances of the queue that are open.

**DefinitionType (MQCFIN)**

Queue definition type (parameter identifier: MQIA\_DEFINITION\_TYPE).

The value can be any of the following values:

**MQQDT\_PERMANENT\_DYNAMIC**

Dynamically defined permanent queue.

**MQQDT\_SHARED\_DYNAMIC**

Dynamically defined shared queue. This option is available on z/OS only.

**MQQDT\_TEMPORARY\_DYNAMIC**

Dynamically defined temporary queue.

**DefInputOpenOption (MQCFIN)**

Default input open option (parameter identifier: MQIA\_DEF\_INPUT\_OPEN\_OPTION).

Specifies the default share option for applications opening this queue for input.

The value can be any of the following values:

**MQOO\_INPUT\_EXCLUSIVE**

Open queue to get messages with exclusive access.

**MQOO\_INPUT\_SHARED**

Open queue to get messages with shared access.

**DefPersistence (MQCFIN)**

Default persistence (parameter identifier: MQIA\_DEF\_PERSISTENCE).

Specifies the default for message-persistence on the queue. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value can be any of the following values:

**MQPER\_PERSISTENT**

Message is persistent.

**MQPER\_NOT\_PERSISTENT**

Message is not persistent.

**DefPriority (MQCFIN)**

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

Specifies the default priority of messages put on the queue. The value must be in the range zero through to the maximum priority value that is supported (9).

**DefReadAhead (MQCFIN)**

Default read ahead (parameter identifier: MQIA\_DEF\_READ\_AHEAD).

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

The value can be any of the following values:

**MQREADA\_NO**

Non-persistent messages are not read ahead unless the client application is configured to request read ahead.

**MQREADA\_YES**

Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

**MQREADA\_DISABLED**

Read ahead of non-persistent messages is not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

**DistLists (MQCFIN)**

Distribution list support (parameter identifier: MQIA\_DIST\_LISTS).

Specifies whether distribution-list messages can be placed on the queue.

**Note:** This attribute is set by the sending message channel agent (MCA). The sending MCA removes messages from the queue each time it establishes a connection to a receiving MCA on a partner queue manager. The attribute is not normally set by administrators, although it can be set if the need arises.

This parameter is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Windows, and Linux.

The value can be any of the following values:

**MQDL\_SUPPORTED**

Distribution lists supported.

**MQDL\_NOT\_SUPPORTED**

Distribution lists not supported.

**Force (MQCFIN)**

Force changes (parameter identifier: MQIACF\_FORCE).

Specifies whether the command must be forced to complete when conditions are such that completing the command would affect an open queue. The conditions depend upon the type of the queue that is being changed:

**QALIAS** *BaseQName* is specified with a queue name and an application has the alias queue open.

**QLOCAL** Either of the following conditions indicates that a local queue would be affected:

- *Shareability* is specified as MQQA\_NOT\_SHAREABLE and more than one application has the local queue open for input.
- The *Usage* value is changed and one or more applications has the local queue open, or there are one or more messages on the queue. (The *Usage* value must not normally be changed while there are messages on the queue. The format of messages changes when they are put on a transmission queue.)

**QREMOTE**

Either of the following conditions indicates that a remote queue would be affected:

- If *XmitQName* is specified with a transmission-queue name, or blank, and an application has a remote queue open that would be affected by this change.
- If any of the following parameters are specified with a queue or queue-manager name, and one or more applications has a queue open that resolved through this definition as a queue-manager alias. The parameters are:
  1. *RemoteQName*
  2. *RemoteQMGrName*
  3. *XmitQName*

**QMODEL** This parameter is not valid for model queues.

**Note:** A value of MQFC\_YES is not required if this definition is in use as a reply-to queue definition only.

The value can be any of the following values:

**MQFC\_YES**

Force the change.

**MQFC\_NO**

Do not force the change.

**HardenGetBackout (MQCFIN)**

Harden the backout count, or not (parameter identifier: MQIA\_HARDEN\_GET\_BACKOUT).

Specifies whether the count of backed out messages is saved (hardened) across restarts of the message queue manager.

**Note:** IBM MQ for IBM i always hardens the count, regardless of the setting of this attribute.

The value can be any of the following values:

**MQQA\_BACKOUT\_HARDENED**

Backout count remembered.

**MQQA\_BACKOUT\_NOT\_HARDENED**

Backout count might not be remembered.

**IndexType (MQCFIN)**

Index type (parameter identifier: MQIA\_INDEX\_TYPE). This parameter applies to z/OS only.

Specifies the type of index maintained by the queue manager to expedite MQGET operations on the queue. For shared queues, the type of index determines what type of MQGET calls can be used. The value can be any of the following values:

**MQIT\_NONE**

No index.

**MQIT\_MSG\_ID**

The queue is indexed using message identifiers.

**MQIT\_CORREL\_ID**

The queue is indexed using correlation identifiers.

**MQIT\_MSG\_TOKEN**

The queue is indexed using message tokens.

**MQIT\_GROUP\_ID**

The queue is indexed using group identifiers.

Messages can be retrieved using a selection criterion only if an appropriate index type is maintained, as the following table shows:

Retrieval selection criterion	IndexType required	
	Shared queue	Other queue
None (sequential retrieval)	Any	Any
Message identifier	MQIT_MSG_ID or MQIT_NONE	Any
Correlation identifier	MQIT_CORREL_ID	Any
Message and correlation identifiers	MQIT_MSG_ID or MQIT_CORREL_ID	Any
Group identifier	MQIT_GROUP_ID	Any
Grouping	MQIT_GROUP_ID	MQIT_GROUP_ID

Retrieval selection criterion	IndexType required	
	Message token	Not allowed

#### *InhibitGet* (MQCFIN)

Get operations are allowed or inhibited (parameter identifier: MQIA\_INHIBIT\_GET).

The value can be:

##### **MQQA\_GET\_ALLOWED**

Get operations are allowed.

##### **MQQA\_GET\_INHIBITED**

Get operations are inhibited.

#### *InhibitPut* (MQCFIN)

Put operations are allowed or inhibited (parameter identifier: MQIA\_INHIBIT\_PUT).

Specifies whether messages can be put on the queue.

The value can be any of the following values:

##### **MQQA\_PUT\_ALLOWED**

Put operations are allowed.

##### **MQQA\_PUT\_INHIBITED**

Put operations are inhibited.

#### *InitiationQName* (MQCFST)

Initiation queue name (parameter identifier: MQCA\_INITIATION\_Q\_NAME).

The local queue for trigger messages relating to this queue. The initiation queue must be on the same queue manager.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### *MaxMsgLength* (MQCFIN)

Maximum message length (parameter identifier: MQIA\_MAX\_MSG\_LENGTH).

The maximum length for messages on the queue. Applications might use the value of this attribute to determine the size of buffer they need to retrieve messages from the queue. If you change this value it might cause an application to operate incorrectly.

Do not set a value that is greater than the *MaxMsgLength* attribute of a queue manager.

The lower limit for this parameter is 0. The upper limit depends on the environment:

- On AIX, HP Integrity NonStop Server, HP-UX, IBM i, Solaris, Linux, Windows, and z/OS, the maximum message length is 100 MB (104,857,600 bytes).
- On other UNIX systems, the maximum message length is 4 MB (4,194,304 bytes).

#### *MaxQDepth* (MQCFIN)

Maximum queue depth (parameter identifier: MQIA\_MAX\_Q\_DEPTH).

The maximum number of messages allowed on the queue.

**Note:** Other factors might cause the queue to be treated as full. For example, it appears to be full if there is no storage available for a message.

Specify a value greater than or equal to 0, and less than or equal to:

- 999,999,999 if the queue is on AIX, HP-UX, IBM i, Solaris, Linux, Windows, or z/OS
- 640,000 if the queue is on any other IBM MQ platform.

### *MsgDeliverySequence* (MQCFIN)

Messages are delivered in priority order or sequence (parameter identifier: MQIA\_MSG\_DELIVERY\_SEQUENCE).

The value can be any of the following values:

#### **MQMDS\_PRIORITY**

Messages are returned in priority order.

#### **MQMDS\_FIFO**

Messages are returned in FIFO order (first in, first out).

### *NonPersistentMessageClass* (MQCFIN)

The level of reliability to be assigned to non-persistent messages that are put to the queue (parameter identifier: MQIA\_NPM\_CLASS).

The value can be:

#### **MQNPM\_CLASS\_NORMAL**

Non-persistent messages persist as long as the lifetime of the queue manager session. They are discarded in the event of a queue manager restart. This value is the default value.

#### **MQNPM\_CLASS\_HIGH**

The queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages might still be lost in the event of a failure.

This parameter is valid only on local and model queues. It is not valid on z/OS.

### *ProcessName* (MQCFST)

Name of process definition for the queue (parameter identifier: MQCA\_PROCESS\_NAME).

Specifies the local name of the IBM MQ process that identifies the application to be started when a trigger event occurs.

- If the queue is a transmission queue, the process definition contains the name of the channel to be started. This parameter is optional for transmission queues on AIX, HP-UX, Linux, IBM i, Solaris, Windows, and z/OS. If you do not specify it, the channel name is taken from the value specified for the *TriggerData* parameter.
- In other environments, the process name must be nonblank for a trigger event to occur, although it can be set after creating the queue.

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

### *PropertyControl* (MQCFIN)

Property control attribute (parameter identifier: MQIA\_PROPERTY\_CONTROL).

Specifies how message properties are handled when messages are retrieved from queues using the MQGET call with the MQGMO\_PROPERTIES\_AS\_Q\_DEF option. The value can be any of the following values:

#### **MQPROP\_COMPATIBILITY**

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

This value is the default value. It allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

#### **MQPROP\_NONE**

All properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor, or extension, are not removed.

#### **MQPROP\_ALL**

All properties of the message are included with the message when it is sent to the remote

queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

#### **MQPROP\_FORCE\_MQRFH2**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

A valid message handle supplied in the `MsgHandle` field of the `MQGMO` structure on the `MQGET` call is ignored. Properties of the message are not accessible using the message handle.

#### **MQPROP\_V6COMPAT**

Any application MQRFH2 header is received as it was sent. Any properties set using `MQSETMP` must be retrieved using `MQINQMP`. They are not added to the MQRFH2 created by the application. Properties that were set in the MQRFH2 header by the sending application cannot be retrieved using `MQINQMP`.

This parameter is applicable to Local, Alias, and Model queues.

#### ***QDepthHighEvent* (MQCFIN)**

Controls whether Queue Depth High events are generated (parameter identifier: `MQIA_Q_DEPTH_HIGH_EVENT`).

A Queue Depth High event indicates that an application put a message on a queue. This event caused the number of messages on the queue to become greater than or equal to the queue depth high threshold. See the *QDepthHighLimit* parameter.

**Note:** The value of this attribute can change implicitly; see “Definitions of the Programmable Command Formats” on page 1044.

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

#### ***QDepthHighLimit* (MQCFIN)**

High limit for queue depth (parameter identifier: `MQIA_Q_DEPTH_HIGH_LIMIT`).

The threshold against which the queue depth is compared to generate a Queue Depth High event.

This event indicates that an application put a message to a queue. This event caused the number of messages on the queue to become greater than or equal to the queue depth high threshold. See the *QDepthHighEvent* parameter.

The value is expressed as a percentage of the maximum queue depth, *MaxQDepth*. It must be greater than or equal to 0 and less than or equal to 100.

#### ***QDepthLowEvent* (MQCFIN)**

Controls whether Queue Depth Low events are generated (parameter identifier: `MQIA_Q_DEPTH_LOW_EVENT`).

A Queue Depth Low event indicates that an application retrieved a message from a queue. This event caused the number of messages on the queue to become less than or equal to the queue depth low threshold. See the *QDepthLowLimit* parameter.

**Note:** The value of this attribute can change implicitly. See “Definitions of the Programmable Command Formats” on page 1044.

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

***QDepthLowLimit* (MQCFIN)**

Low limit for queue depth (parameter identifier: MQIA\_Q\_DEPTH\_LOW\_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth Low event.

This event indicates that an application retrieved a message from a queue. This event caused the number of messages on the queue to become less than or equal to the queue depth low threshold. See the *QDepthLowEvent* parameter.

Specify the value as a percentage of the maximum queue depth (*MaxQDepth* attribute), in the range 0 through 100.

***QDepthMaxEvent* (MQCFIN)**

Controls whether Queue Full events are generated (parameter identifier: MQIA\_Q\_DEPTH\_MAX\_EVENT).

A Queue Full event indicates that an MQPUT call to a queue was rejected because the queue is full. That is, the queue depth reached its maximum value.

**Note:** The value of this attribute can change implicitly; see “Definitions of the Programmable Command Formats” on page 1044.

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

***QDesc* (MQCFST)**

Queue description (parameter identifier: MQCA\_Q\_DESC).

Text that briefly describes the object.

The maximum length of the string is MQ\_Q\_DESC\_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing. This choice ensures that the text is translated correctly if it is sent to another queue manager.

***QServiceInterval* (MQCFIN)**

Target for queue service interval (parameter identifier: MQIA\_Q\_SERVICE\_INTERVAL).

The service interval used for comparison to generate Queue Service Interval High and Queue Service Interval OK events. See the *QServiceIntervalEvent* parameter.

Specify a value in the range 0 through 999 999 999 milliseconds.

***QServiceIntervalEvent* (MQCFIN)**

Controls whether Service Interval High or Service Interval OK events are generated (parameter identifier: MQIA\_Q\_SERVICE\_INTERVAL\_EVENT).

A Queue Service Interval High event is generated when a check indicates that no messages were retrieved from, or put to, the queue for at least the time indicated by the *QServiceInterval* attribute.

A Queue Service Interval OK event is generated when a check indicates that a message was retrieved from the queue within the time indicated by the *QServiceInterval* attribute.

**Note:** The value of this attribute can change implicitly; see “Definitions of the Programmable Command Formats” on page 1044.

The value can be any of the following values:

**MQQSIE\_HIGH**

Queue Service Interval High events enabled.

- Queue Service Interval High events are enabled and
- Queue Service Interval OK events are disabled.

**MQQSIE\_OK**

Queue Service Interval OK events enabled.

- Queue Service Interval High events are disabled and
- Queue Service Interval OK events are enabled.

**MQQSIE\_NONE**

No queue service interval events enabled.

- Queue Service Interval High events are disabled and
- Queue Service Interval OK events are also disabled.

**z/OS QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP ). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToQName</i> object (for Copy) or the <i>QName</i> object (for Create). For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.
MQQSGD_GROUP	The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.  If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to attempt to refresh local copies on page set zero: DEFINE QUEUE(q-name) REPLACE QSGDISP(COPY)  The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.	The object definition resides in the shared repository. This value is allowed only in a shared queue manager environment.  If the definition is successful, the following MQSC command is generated and sent to all active queue managers to attempt to make or refresh local copies on page set zero: DEFINE QUEUE(q-name) REPLACE QSGDISP(COPY)  The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.

QSGDisposition	Change	Copy, Create
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value. For local queues, messages are stored on the page sets of each queue manager and are available only through that queue manager.
MQQSGD_SHARED	This value applies only to local queues. The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD_SHARED. Any object residing on the page set of the queue manager that executes the command, or any object defined by a command using the parameter MQQSGD_GROUP, is not affected by this command.	This option applies only to local queues. The object is defined in the shared repository. Messages are stored in the coupling facility and are available to any queue manager in the queue-sharing group. You can specify MQQSGD_SHARED only if: <ul style="list-style-type: none"> <li>• <i>CFStructure</i> is nonblank</li> <li>• <i>IndexType</i> is not MQIT_MSG_TOKEN</li> <li>• The queue is not one of the following: <ul style="list-style-type: none"> <li>– SYSTEM.CHANNEL.INITQ</li> <li>– SYSTEM.COMMAND.INPUT</li> </ul> </li> </ul>

#### *QueueAccounting* (MQCFIN)

Controls the collection of accounting data (parameter identifier: MQIA\_ACCOUNTING\_Q).

The value can be:

##### **MQMON\_Q\_MGR**

The collection of accounting data for the queue is performed based upon the setting of the *QueueAccounting* parameter on the queue manager.

##### **MQMON\_OFF**

Accounting data collection is disabled for the queue.

##### **MQMON\_ON**

If the value of the queue manager's *QueueAccounting* parameter is not MQMON\_NONE, accounting data collection is enabled for the queue.

#### *QueueMonitoring* (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_Q).

Specifies whether online monitoring data is to be collected and, if so, the rate at which the data is collected. The value can be any of the following values:

##### **MQMON\_OFF**

Online monitoring data collection is turned off for this queue.

##### **MQMON\_Q\_MGR**

The value of the queue manager's *QueueMonitoring* parameter is inherited by the queue.

##### **MQMON\_LOW**

If the value of the queue manager *QueueMonitoring* parameter is not MQMON\_NONE, online monitoring data collection is turned on. The rate of data collection is low for this queue.

##### **MQMON\_MEDIUM**

If the value of the queue manager *QueueMonitoring* parameter is not MQMON\_NONE, online monitoring data collection is turned on. The rate of data collection is moderate for this queue.

##### **MQMON\_HIGH**

If the value of the queue manager *QueueMonitoring* parameter is not MQMON\_NONE, online monitoring data collection is turned on. The rate of data collection is high for this queue.

### *QueueStatistics* (MQCFIN)

Statistics data collection (parameter identifier: MQIA\_STATISTICS\_Q).

Specifies whether statistics data collection is enabled. The value can be any of the following values:

#### **MQMON\_Q\_MGR**

The value of the queue manager's *QueueStatistics* parameter is inherited by the queue.

#### **MQMON\_OFF**

Statistics data collection is disabled

#### **MQMON\_ON**

If the value of the queue manager's *QueueStatistics* parameter is not MQMON\_NONE, statistics data collection is enabled

This parameter is valid only on IBM i, UNIX systems, and Windows.

### *RemoteQMGrName* (MQCFST)

Name of remote queue manager (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

If an application opens the local definition of a remote queue, *RemoteQMGrName* must not be blank or the name of the queue manager the application is connected to. If *XmitQName* is blank there must be a local queue called *RemoteQMGrName*. That queue is used as the transmission queue.

If this definition is used for a queue-manager alias, *RemoteQMGrName* is the name of the queue manager. The queue manager name can be the name of the connected queue manager. If *XmitQName* is blank, when the queue is opened there must be a local queue called *RemoteQMGrName*. That queue is used as the transmission queue.

If this definition is used for a reply-to queue alias, *RemoteQMGrName* is the name of the queue manager that is to be the reply-to queue manager.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### *RemoteQName* (MQCFST)

Name of remote queue as known locally on the remote queue manager (parameter identifier: MQCA\_REMOTE\_Q\_NAME).

If this definition is used for a local definition of a remote queue, *RemoteQName* must not be blank when the open occurs.

If this definition is used for a queue-manager alias definition, *RemoteQName* must be blank when the open occurs.

If this definition is used for a reply-to queue alias, this name is the name of the queue that is to be the reply-to queue.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### *Replace* (MQCFIN)

Replace attributes (parameter identifier: MQIACF\_REPLACE). This parameter is not valid on a Change Queue command.

If the object exists, the effect is like issuing the Change Queue command. It is like a Change Queue command without the MQFC\_YES option on the *Force* parameter, and with all of the other attributes specified. In particular, note that any messages which are on the existing queue are retained.

The Change Queue command without MQFC\_YES on the *Force* parameter, and the Create Queue command with MQRP\_YES on the *Replace* parameter, are different. The difference is that the Change Queue command does not change unspecified attributes. Create Queue with MQRP\_YES sets all the attributes. If you use MQRP\_YES, unspecified attributes are taken from the default definition, and the attributes of the object being replaced, if one exists, are ignored.)

The command fails if both of the following are true:

- The command sets attributes that would require the use of MQFC\_YES on the *Force* parameter if you were using the Change Queue command
- The object is open

The Change Queue command with MQFC\_YES on the *Force* parameter succeeds in this situation.

If MQSCO\_CELL is specified on the *Scope* parameter on UNIX systems, and there is already a queue with the same name in the cell directory, the command fails. The command fails even if MQRP\_YES is specified.

The value can be any of the following values:

**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

**RetentionInterval (MQCFIN)**

Retention interval (parameter identifier: MQIA\_RETENTION\_INTERVAL).

The number of hours for which the queue might be needed, based on the date and time when the queue was created.

This information is available to a housekeeping application or an operator and can be used to determine when a queue is no longer required. The queue manager does not delete queues nor does it prevent queues from being deleted if their retention interval is not expired. It is the responsibility of the user to take any required action.

Specify a value in the range 0 - 999,999,999.

**Scope (MQCFIN)**

Scope of the queue definition (parameter identifier: MQIA\_SCOPE).

Specifies whether the scope of the queue definition extends beyond the queue manager which owns the queue. It does so if the queue name is contained in a cell directory, so that it is known to all the queue managers within the cell.

If this attribute is changed from MQSCO\_CELL to MQSCO\_Q\_MGR, the entry for the queue is deleted from the cell directory.

Model and dynamic queues cannot be changed to have cell scope.

If it is changed from MQSCO\_Q\_MGR to MQSCO\_CELL, an entry for the queue is created in the cell directory. If there is already a queue with the same name in the cell directory, the command fails. The command also fails if no name service supporting a cell directory is configured.

The value can be:

**MQSCO\_Q\_MGR**

Queue-manager scope.

**MQSCO\_CELL**

Cell scope.

This value is not supported on IBM i.

This parameter is not available on z/OS.

**Shareability (MQCFIN)**

The queue can be shared, or not (parameter identifier: MQIA\_SHAREABILITY).

Specifies whether multiple instances of applications can open this queue for input.

The value can be any of the following values:

**MQQA\_SHAREABLE**

Queue is shareable.

**MQQA\_NOT\_SHAREABLE**

Queue is not shareable.

**z/OS StorageClass (MQCFST)**

Storage class (parameter identifier: MQCA\_STORAGE\_CLASS). This parameter applies to z/OS only.

Specifies the name of the storage class.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

**TargetType (MQCFIN)**

Target type (parameter identifier: MQIA\_BASE\_TYPE).

Specifies the type of object to which the alias resolves.

The value can be any of the following values:

**MQOT\_Q** The object is a queue.

**MQOT\_TOPIC**

The object is a topic.

**TriggerControl (MQCFIN)**

Trigger control (parameter identifier: MQIA\_TRIGGER\_CONTROL).

Specifies whether trigger messages are written to the initiation queue.

The value can be:

**MQTC\_OFF**

Trigger messages not required.

**MQTC\_ON**

Trigger messages required.

**TriggerData (MQCFST)**

Trigger data (parameter identifier: MQCA\_TRIGGER\_DATA).

Specifies user data that the queue manager includes in the trigger message. This data is made available to the monitoring application that processes the initiation queue and to the application that is started by the monitor.

The maximum length of the string is MQ\_TRIGGER\_DATA\_LENGTH.

**TriggerDepth (MQCFIN)**

Trigger depth (parameter identifier: MQIA\_TRIGGER\_DEPTH).

Specifies (when *TriggerType* is MQTT\_DEPTH) the number of messages that initiates a trigger message to the initiation queue. The value must be in the range 1 through 999△999△999.

**TriggerMsgPriority (MQCFIN)**

Threshold message priority for triggers (parameter identifier: MQIA\_TRIGGER\_MSG\_PRIORITY).

Specifies the minimum priority that a message must have before it can cause, or be counted for, a trigger event. The value must be in the range of priority values that is supported (0 through 9).

**TriggerType (MQCFIN)**

Trigger type (parameter identifier: MQIA\_TRIGGER\_TYPE).

Specifies the condition that initiates a trigger event. When the condition is true, a trigger message is sent to the initiation queue.

The value can be any of the following values:

**MQTT\_NONE**  
No trigger messages.

**MQTT EVERY**  
Trigger message for every message.

**MQTT\_FIRST**  
Trigger message when queue depth goes from 0 to 1.

**MQTT\_DEPTH**  
Trigger message when depth threshold exceeded.

**Usage (MQCFIN)**

Usage (parameter identifier: MQIA\_USAGE).

Specifies whether the queue is for normal usage or for transmitting messages to a remote message queue manager.

The value can be any of the following values:

**MQUS\_NORMAL**  
Normal usage.

**MQUS\_TRANSMISSION**  
Transmission queue.

**XmitQName (MQCFST)**

Transmission queue name (parameter identifier: MQCA\_XMIT\_Q\_NAME).

Specifies the local name of the transmission queue to be used for messages destined for either a remote queue or for a queue-manager alias definition.

If *XmitQName* is blank, a queue with the same name as *RemoteQMGrName* is used as the transmission queue.

This attribute is ignored if the definition is being used as a queue-manager alias and *RemoteQMGrName* is the name of the connected queue manager.

It is also ignored if the definition is used as a reply-to queue alias definition.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Error codes (Change, Copy, and Create Queue)**

This command might return the following errors in the response format header, in addition to the values shown on in "Error codes applicable to all commands" on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CELL\_DIR\_NOT\_AVAILABLE**  
Cell directory is not available.

**MQRCCF\_CLUSTER\_NAME\_CONFLICT**  
Cluster name conflict.

**MQRCCF\_CLUSTER\_Q\_USAGE\_ERROR**  
Cluster usage conflict.

**MQRCCF\_DYNAMIC\_Q\_SCOPE\_ERROR**  
Dynamic queue scope error.

**MQRCCF\_FORCE\_VALUE\_ERROR**  
Force value not valid.

**MQRCCF\_Q\_ALREADY\_IN\_CELL**  
Queue exists in cell.

**MQRCCF\_Q\_TYPE\_ERROR**  
Queue type not valid.

### Change Queue Manager:

The Change Queue Manager ( MQCMD\_CHANGE\_Q\_MGR) command changes the specified attributes of the queue manager.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

For any optional parameters that are omitted, the value does not change.

**Required parameters:**  
None

### Optional parameters (Change Queue Manager)

#### *AccountingConnOverride* (MQCFIN)

Specifies whether applications can override the settings of the *QueueAccounting* and *MQIAccounting* queue manager parameters (parameter identifier: MQIA\_ACCOUNTING\_CONN\_OVERRIDE).

The value can be any of the following values:

#### **MQMON\_DISABLED**

Applications cannot override the settings of the *QueueAccounting* and *MQIAccounting* parameters.

This value is the initial default value for the queue manager.

#### **MQMON\_ENABLED**

Applications can override the settings of the *QueueAccounting* and *MQIAccounting* parameters by using the options field of the MQCNO structure of the MQCONN API call.

This parameter is valid only on IBM i, UNIX, Linux, and Windows systems.

#### *AccountingInterval* (MQCFIN)

The time interval, in seconds, at which intermediate accounting records are written (parameter identifier: MQIA\_ACCOUNTING\_INTERVAL).

Specify a value in the range 1 - 604,000.

This parameter is valid only on IBM i, UNIX, Linux, and Windows systems.

#### *ActivityRecording* (MQCFIN)

Specifies whether activity reports can be generated (parameter identifier: MQIA\_ACTIVITY\_RECORDING).

The value can be:

#### **MQRECORDING\_DISABLED**

Activity reports cannot be generated.

#### **MQRECORDING\_MSG**

Activity reports can be generated and sent to the reply queue specified by the originator in the message causing the report.

#### **MQRECORDING\_Q**

Activity reports can be generated and sent to SYSTEM.ADMIN.ACTIVITY.QUEUE.

► **z/OS** *AdoptNewMCACheck* (**MQCFIN**)

The elements checked to determine whether an MCA must be adopted (restarted) when a new inbound channel is detected. It must be adopted (restarted) if it has the same name as a currently active MCA (parameter identifier: MQIA\_ADOPTNEWMCA\_CHECK).

The value can be:

**MQADOPT\_CHECK\_Q\_MGR\_NAME**

Check the queue manager name.

**MQADOPT\_CHECK\_NET\_ADDR**

Check the network address.

**MQADOPT\_CHECK\_ALL**

Check the queue manager name and network address. Perform this check to prevent your channels from being inadvertently shut down. This value is the initial default value of the queue manager.

**MQADOPT\_CHECK\_NONE**

Do not check any elements.

This parameter applies to z/OS only.

► **z/OS** *AdoptNewMCAType* (**MQCFIN**)

Adoption of orphaned channel instances (parameter identifier: MQIA\_ADOPTNEWMCA\_TYPE).

Specify whether an orphaned MCA instance is to be adopted when a new inbound channel request is detected matching the *AdoptNewMCACheck* parameters.

The value can be:

**MQADOPT\_TYPE\_NO**

Do not adopt orphaned channel instances.

**MQADOPT\_TYPE\_ALL**

Adopt all channel types. This value is the initial default value of the queue manager.

This parameter applies to z/OS only.

*AuthorityEvent* (**MQCFIN**)

Controls whether authorization (Not Authorized) events are generated (parameter identifier: MQIA\_AUTHORITY\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled. This value is not permitted on z/OS.

*BridgeEvent* (**MQCFIN**)

Controls whether IMS bridge events are generated (parameter identifier: MQIA\_BRIDGE\_EVENT). This parameter applies to z/OS only.

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled. This value is the default value.

**MQEVR\_ENABLED**

Event reporting enabled. This value is not supported on z/OS.

*CertificateLabel* (**MQCFST**)

Specifies the certificate label for this queue manager to use. The label identifies which personal certificate in the key repository has been selected (parameter identifier: MQCA\_CERT\_LABEL).

The default and migrated queue manager values are:

- **z/OS** On z/OS: *ibmWebSphereMQXXXX* where *XXXX* is the queue manager name.
- On IBM i:
  - If you specified `SSLKEYR(*SYSTEM)`, the value is blank.  
Note that it is forbidden to use a nonblank queue manager `CERTLABL` with `SSLKEYR(*SYSTEM)`. Attempting to do so results in an `MQRCCF_Q_MGR_ATTR_CONFLICT` error.
  - Otherwise, *ibmwebspheremqxxxx* where *xxxx* is the queue manager name folded to lower case.
- On UNIX and Linux and Windows, *ibmwebspheremqxxxx* where *xxxx* is the queue manager name folded to lower case.

### *CertificateValPolicy* (MQCFIN)

Specifies which SSL/TLS certificate validation policy is used to validate digital certificates received from remote partner systems (parameter identifier: `MQIA_CERT_VAL_POLICY`).

This attribute can be used to control how strictly the certificate chain validation conforms to industry security standards. For more information, see *Certificate validation policies in IBM MQ*.

The value can be any of the following values:

#### **MQ\_CERT\_VAL\_POLICY\_ANY**

Apply each of the certificate validation policies supported by the secure sockets library and accept the certificate chain if any of the policies considers the certificate chain valid. This setting can be used for maximum backwards compatibility with older digital certificates which do not comply with the modern certificate standards.

#### **MQ\_CERT\_VAL\_POLICY\_RFC5280**

Apply only the RFC 5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

This parameter is only valid on UNIX, Linux, and Windows and can be used only on a queue manager with a command level of 711, or higher.

Changes to **CertificateValPolicy** become effective either:

- When a new channel process is started.
- For channels that run as threads of the channel initiator, when the channel initiator is restarted.
- For channels that run as threads of the listener, when the listener is restarted.
- For channels that run as threads of a process pooling process, when the process pooling process is started or restarted and first runs an SSL channel. If the process pooling process has already run an SSL channel, and you want the change to become effective immediately, run the MQSC command **REFRESH SECURITY TYPE(SSL)**. The process pooling process is `amqrmppa` on UNIX, Linux, and Windows systems.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued.

### **z/OS** *CFConlos* (MQCFIN)

Specifies the action to be taken when the queue manager loses connectivity to the administration structure, or any CF structure with `CFConlos` set to `ASQMGR` (parameter identifier: `MQIA_QMGR_CFCONLOS`).

The value can be:

#### **MQCFCONLOS\_TERMINATE**

The queue manager terminates when connectivity to CF structures is lost.

#### **MQCFCONLOS\_TOLERATE**

The queue manager tolerates loss of connectivity to CF structures without terminating.

This parameter applies to z/OS only.

You can select MQCFCONLOS\_TOLERATE only if all the queue managers in the queue-sharing group are at command level 710 or greater and have OPMODE set to NEWFUNC.

#### ***ChannelAutoDef* (MQCFIN)**

Controls whether receiver and server-connection channels can be auto-defined (parameter identifier: MQIA\_CHANNEL\_AUTO\_DEF).

Auto-definition for cluster-sender channels is always enabled.

This parameter is supported in the following environments: IBM i, UNIX, Linux, and Windows systems.

The value can be:

#### **MQCHAD\_DISABLED**

Channel auto-definition disabled.

#### **MQCHAD\_ENABLED**

Channel auto-definition enabled.

#### ***ChannelAutoDefEvent* (MQCFIN)**

Controls whether channel auto-definition events are generated (parameter identifier: MQIA\_CHANNEL\_AUTO\_DEF\_EVENT), when a receiver, server-connection, or cluster-sender channel is auto-defined.

This parameter is supported in the following environments: IBM i, UNIX, Linux, and Windows systems.

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

#### ***ChannelAutoDefExit* (MQCFIN)**

Channel auto-definition exit name (parameter identifier: MQCA\_CHANNEL\_AUTO\_DEF\_EXIT).

This exit is invoked when an inbound request for an undefined channel is received, if:

1. The channel is a cluster-sender, or
2. Channel auto-definition is enabled (see *ChannelAutoDef*).

This exit is also invoked when a cluster-receiver channel is started.

The format of the name is the same as for the *SecurityExit* parameter described in “Change, Copy, and Create Channel” on page 1074.

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

This parameter is supported in the following environments: IBM i, z/OS, UNIX, Linux, and Windows. On z/OS, it applies only to cluster-sender and cluster-receiver channels.

#### ***ChannelAuthenticationRecords* (MQCFIN)**

Controls whether channel authentication records are used. Channel authentication records can still be set and displayed regardless of the value of this attribute. (parameter identifier: MQIA\_CHLAUTH\_RECORDS).

The value can be:

#### **MQCHLA\_DISABLED**

Channel authentication records are not checked.

**MQCHLA\_ENABLED**

Channel authentication records are checked.

**ChannelEvent (MQCFIN)**

Controls whether channel events are generated (parameter identifier: MQIA\_CHANNEL\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**MQEVR\_EXCEPTION**

Reporting of exception channel events enabled.

**ChannelInitiatorControl (MQCFIN)**

Specifies whether the channel initiator is to be started when the queue manager starts (parameter identifier: MQIA\_CHINIT\_CONTROL).

The value can be:

**MQSVC\_CONTROL\_MANUAL**

The channel initiator is not to be started automatically.

**MQSVC\_CONTROL\_Q\_MGR**

The channel initiator is to be started automatically when the queue manager starts.

This parameter is valid only on IBM i, UNIX, Linux, and Windows systems.

**ChannelMonitoring (MQCFIN)**

Default setting for online monitoring for channels (parameter identifier: MQIA\_MONITORING\_CHANNEL).

The value can be:

**MQMON\_NONE**

Online monitoring data collection is turned off for channels regardless of the setting of their *ChannelMonitoring* parameter.

**MQMON\_OFF**

Online monitoring data collection is turned off for channels specifying a value of MQMON\_Q\_MGR in their *ChannelMonitoring* parameter. This value is the initial default value of the queue manager.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their *ChannelMonitoring* parameter.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their *ChannelMonitoring* parameter.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their *ChannelMonitoring* parameter.

**ChannelStatistics (MQCFIN)**

Controls whether statistics data is to be collected for channels (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

The value can be:

**MQMON\_NONE**

Statistics data collection is turned off for channels regardless of the setting of their *ChannelStatistics* parameter. This value is the initial default value of the queue manager.

**MQMON\_OFF**

Statistics data collection is turned off for channels specifying a value of MQMON\_Q\_MGR in their *ChannelStatistics* parameter.

**MQMON\_LOW**

Statistics data collection is turned on, with a low ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their *ChannelStatistics* parameter.

**MQMON\_MEDIUM**

Statistics data collection is turned on, with a moderate ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their *ChannelStatistics* parameter.

**MQMON\_HIGH**

Statistics data collection is turned on, with a high ratio of data collection, for channels specifying a value of MQMON\_Q\_MGR in their *ChannelStatistics* parameter.

On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

▶ **z/OS** *ChinitAdapters* (MQCFIN)

Number of adapter subtasks (parameter identifier: MQIA\_CHINIT\_ADAPTERS).

The number of adapter subtasks to use for processing IBM MQ calls. This parameter applies to z/OS only.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 8.

▶ **z/OS** *ChinitDispatchers* (MQCFIN)

Number of dispatchers (parameter identifier: MQIA\_CHINIT\_DISPATCHERS).

The number of dispatchers to use for the channel initiator. This parameter applies to z/OS only.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 5.

▶ **z/OS** *ChinitServiceParm* (MQCFIN)

Reserved for use by IBM (parameter identifier: MQCA\_CHINIT\_SERVICE\_PARM).

This parameter applies to z/OS only.

▶ **z/OS** *ChinitTraceAutoStart* (MQCFIN)

Specifies whether the channel initiator trace must start automatically (parameter identifier: MQIA\_CHINIT\_TRACE\_AUTO\_START).

The value can be:

**MQTRAXSTR\_YES**

Channel initiator trace is to start automatically.

**MQTRAXSTR\_NO**

Channel initiator trace is not to start automatically. This value is the initial default value of the queue manager.

This parameter applies to z/OS only.

▶ **z/OS** *ChinitTraceTableSize* (MQCFIN)

The size, in megabytes, of the trace data space of the channel initiator (parameter identifier: MQIA\_CHINIT\_TRACE\_TABLE\_SIZE).

Specify a value in the range 2 - 2048. The initial default value of the queue manager is 2.

This parameter applies to z/OS only.

*ClusterSenderMonitoringDefault* (MQCFIN)

Default setting for online monitoring for automatically defined cluster-sender channels (parameter identifier: MQIA\_MONITORING\_AUTO\_CLUSSDR).

Specifies the value to be used for the *ChannelMonitoring* attribute of automatically defined cluster-sender channels. The value can be any of the following values:

**MQMON\_Q\_MGR**

Collection of online monitoring data is inherited from the setting of the queue manager's *ChannelMonitoring* parameter. This value is the initial default value of the queue manager.

**MQMON\_OFF**

Monitoring for the channel is switched off.

**MQMON\_LOW**

Unless *ChannelMonitoring* is MQMON\_NONE, this value specifies a low rate of data collection with a minimal effect on system performance. The data collected is not likely to be the most current.

**MQMON\_MEDIUM**

Unless *ChannelMonitoring* is MQMON\_NONE, this value specifies a moderate rate of data collection with limited effect on system performance.

**MQMON\_HIGH**

Unless *ChannelMonitoring* is MQMON\_NONE, this value specifies a high rate of data collection with a likely effect on system performance. The data collected is the most current available.

▶ **z/OS** On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

**ClusterSenderStatistics (MQCFIN)**

Controls whether statistics data is to be collected for auto-defined cluster-sender channels (parameter identifier: MQIA\_STATISTICS\_AUTO\_CLUSSDR).

The value can be:

**MQMON\_Q\_MGR**

Collection of statistics data is inherited from the setting of the queue manager's *ChannelStatistics* parameter. This value is the initial default value of the queue manager.

**MQMON\_OFF**

Statistics data collection for the channel is switched off.

**MQMON\_LOW**

Unless *ChannelStatistics* is MQMON\_NONE, this value specifies a low rate of data collection with a minimal effect on system performance.

**MQMON\_MEDIUM**

Unless *ChannelStatistics* is MQMON\_NONE, this value specifies a moderate rate of data collection.

**MQMON\_HIGH**

Unless *ChannelStatistics* is MQMON\_NONE, this value specifies a high rate of data collection.

▶ **z/OS** On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

**ClusterWorkLoadData (MQCFST)**

Cluster workload exit data (parameter identifier: MQCA\_CLUSTER\_WORKLOAD\_DATA).

This parameter is passed to the cluster workload exit when it is called.

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

**ClusterWorkLoadExit (MQCFST)**

Cluster workload exit name (parameter identifier: MQCA\_CLUSTER\_WORKLOAD\_EXIT).

If a nonblank name is defined this exit is invoked when a message is put to a cluster queue.

The format of the name is the same as for the *SecurityExit* parameter described in “Change, Copy, and Create Channel” on page 1074.

The maximum length of the exit name depends on the environment in which the exit is running. `MQ_EXIT_NAME_LENGTH` gives the maximum length for the environment in which your application is running. `MQ_MAX_EXIT_NAME_LENGTH` gives the maximum for all supported environments.

***ClusterWorkLoadLength (MQCFIN)***

Cluster workload length (parameter identifier: `MQIA_CLUSTER_WORKLOAD_LENGTH`).

The maximum length of the message passed to the cluster workload exit.

The value of this attribute must be in the range 0 - 999,999 999.

***CLWLMRUChannels (MQCFIN)***

Cluster workload most recently used (MRU) channels (parameter identifier: `MQIA_CLWL_MRU_CHANNELS`).

The maximum number of active most recently used outbound channels.

Specify a value in the range 1 - 999,999 999.

***CLWLUseQ (MQCFIN)***

Use of remote queue (parameter identifier: `MQIA_CLWL_USEQ`).

Specifies whether a cluster queue manager is to use remote puts to other queues defined in other queue managers within the cluster during workload management.

Specify either:

**`MQCLWL_USEQ_ANY`**

Use remote queues.

**`MQCLWL_USEQ_LOCAL`**

Do not use remote queues.

***CodedCharSetId (MQCFIN)***

Queue manager coded character set identifier (parameter identifier: `MQIA_CODED_CHAR_SET_ID`).

The coded character set identifier (CCSID) for the queue manager. The CCSID is the identifier used with all character string fields defined by the application programming interface (API). If the CCSID in a message descriptor is set to the value `MQCCSI_Q_MGR`, it applies to the character data written into the body of a message. Data is written using `MQPUT` or `MQPUT1`. Character data is identified by the format specified for the message.

Specify a value in the range 1 - 65,535.

The CCSID must specify a value that is defined for use on the platform and use an appropriate character set. The character set must be:

- EBCDIC on IBM i
- ASCII or ASCII-related on other platforms

Stop and restart the queue manager after execution of this command so that all processes reflect the changed CCSID of the queue manager.

This parameter is not supported on z/OS.

***CommandEvent (MQCFIN)***

Controls whether command events are generated (parameter identifier: `MQIA_COMMAND_EVENT`).

The value can be any of the following values:

**`MQEVR_DISABLED`**

Event reporting disabled.

**`MQEVR_ENABLED`**

Event reporting enabled.

**MQEVR\_NO\_DISPLAY**

Event reporting enabled for all successful commands except Inquire commands.

**z/OS** *CommandScope* (**MQCFIN**)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment. The command server must be enabled.
- An asterisk "\*". The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

*CommandServerControl* (**MQCFIN**)

Specifies whether the command server is to be started when the queue manager starts (parameter identifier: MQIA\_CMD\_SERVER\_CONTROL).

The value can be:

**MQSVC\_CONTROL\_MANUAL**

The command server is not to be started automatically.

**MQSVC\_CONTROL\_Q\_MGR**

The command server is to be started automatically when the queue manager starts.

This parameter is valid only on IBM i, UNIX, Linux, and Windows systems.

*ConfigurationEvent* (**MQCFIN**)

Controls whether configuration events are generated (parameter identifier: MQIA\_CONFIGURATION\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

*ConnAuth* (**MQCFST**)

The name of an authentication information object that is used to provide the location of user ID and password authentication (parameter identifier: MQCA\_CONN\_AUTH).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH. Only authentication information objects with type IDPWOS or IDPWLDAP can be specified; other types result in an error message when the OAM (on UNIX, Linux, and Windows platforms) or the security component (on z/OS platforms) reads the configuration.

*Custom* (**MQCFST**)

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name and value pairs have the form NAME(VALUE). Single quotation marks must be escaped with another single quotation mark.

This description is updated when features using this attribute are introduced. Currently there are no possible values for *Custom*.

The maximum length of the string is MQ\_CUSTOM\_LENGTH.

#### **DeadLetterQName (MQCFIN)**

Dead letter (undelivered message) queue name (parameter identifier: MQCA\_DEAD\_LETTER\_Q\_NAME).

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination. The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### **DefClusterXmitQueueType (MQCFIN)**

The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels. (Parameter identifier: MQIA\_DEF\_CLUSTER\_XMIT\_Q\_TYPE.)

The values of DefClusterXmitQueueType are MQCLXQ\_SCTQ or MQCLXQ\_CHANNEL.

#### **MQCLXQ\_SCTQ**

All cluster-sender channels send messages from SYSTEM.CLUSTER.TRANSMIT.QUEUE. The correIID of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined. This behavior is implicit in versions of IBM WebSphere MQ, earlier than Version 7.5. In earlier versions, the queue manager attribute DefClusterXmitQueueType was not present.

#### **MQCLXQ\_CHANNEL**

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE.

#### **DefXmitQName (MQCFST)**

Default transmission queue name (parameter identifier: MQCA\_DEF\_XMIT\_Q\_NAME).

This parameter is the name of the default transmission queue that is used for the transmission of messages to remote queue managers. It is selected if there is no other indication of which transmission queue to use.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### **DNSGroup (MQCFST)**

DNS group name (parameter identifier: MQCA\_DNS\_GROUP).

This parameter is no longer used. Refer to WLM/DNS no longer supported. This parameter applies to z/OS only.

The maximum length of the string is MQ\_DNS\_GROUP\_NAME\_LENGTH.

#### **z/OS DNSWLM (MQCFIN)**

WLM/DNS Control: (parameter identifier: MQIA\_DNS\_WLM).

This parameter is no longer used. Refer to WLM/DNS no longer supported.

The value can be any of the following values:

#### **MQDNSWLM\_NO**

This is the only value supported by the queue manager.

This parameter applies to z/OS only.

#### **z/OS ExpiryInterval (MQCFIN)**

Interval between scans for expired messages (parameter identifier: MQIA\_EXPIRY\_INTERVAL). This parameter applies to z/OS only.

Specifies the frequency with which the queue manager scans the queues looking for expired messages. Specify a time interval in seconds in the range 1 - 99,999,999, or the following special value:

**MQEXPI\_OFF**

No scans for expired messages.

The minimum scan interval used is 5 seconds, even if you specify a lower value.

*EncryptionPolicySuiteB (MQCFIL)*

Specifies whether Suite B-compliant cryptography is used and what level of strength is employed (parameter identifier MQIA\_SUITE\_B\_STRENGTH).

The value can be one or more of:

**MQ\_SUITE\_B\_NONE**

Suite B-compliant cryptography is not used.

**MQ\_SUITE\_B\_128\_BIT**

Suite B 128-bit strength security is used.

**MQ\_SUITE\_B\_192\_BIT**

Suite B 192-bit strength security is used.

If invalid lists are specified, such as MQ\_SUITE\_B\_NONE with MQ\_SUITE\_B\_128\_BIT, the error MQRCCF\_SUITE\_B\_ERROR is issued.

*Force (MQCFIN)*

Force changes (parameter identifier: MQIACF\_FORCE).

Specifies whether the command is forced to complete if both of the following are true:

- *DefXmitQName* is specified, and
- An application has a remote queue open, the resolution for which is affected by this change.

▶ **z/OS** *GroupUR (MQCFIN)*

Controls whether CICS and XA client applications can establish transactions with a GROUP unit of recovery disposition.

This attribute is only valid on z/OS and can be enabled only when the queue manager is a member of a queue-sharing group.

The value can be:

**MQGUR\_DISABLED**

CICS and XA client applications must connect using a queue manager name.

**MQGUR\_ENABLED**

CICS and XA client applications can establish transactions with a group unit of recovery disposition by specifying a QSG name when they connect.

▶ **z/OS** See Unit of recovery disposition in a queue-sharing group.

▶ **z/OS** *IGQPutAuthority (MQCFIN)*

Command scope (parameter identifier: MQIA\_IGQ\_PUT\_AUTHORITY). This parameter is valid only on z/OS when the queue manager is a member of a queue-sharing group.

Specifies the type of authority checking and, therefore, the user IDs to be used by the IGQ agent (IGQA). This parameter establishes the authority to put messages to a destination queue. The value can be any of the following values:

**MQIGQA\_DEFAULT**

Default user identifier is used.

The user identifier used for authorization is the value of the *UserIdentifier* field. The *UserIdentifier* field is in the separate MQMD that is associated with the message when the message is on the shared transmission queue. This value is the user identifier of the program that placed the message on the shared transmission queue. It is typically the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is checked.

#### **MQIGQPA\_CONTEXT**

Context user identifier is used.

The user identifier used for authorization is the value of the *UserIdentifier* field. The *UserIdentifier* field is in the separate MQMD that is associated with the message when the message is on the shared transmission queue. This value is the user identifier of the program that placed the message on the shared transmission queue. It is typically the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is checked.. The value of the *UserIdentifier* field in the embedded MQMD is also checked. The latter user identifier is typically the user identifier of the application that originated the message.

#### **MQIGQPA\_ONLY\_IGQ**

Only the IGQ user identifier is used.

The user identifier used for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, this user identifier is used for all checks.

#### **MQIGQPA\_ALTERNATE\_OR\_IGQ**

Alternate user identifier or IGQ-agent user identifier is used.

The user identifier used for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the value of the *UserIdentifier* field in the embedded MQMD is also checked. The latter user identifier is typically the user identifier of the application that originated the message.

#### **z/OS *IGQUserId* (MQCFST)**

Intra-group queuing agent user identifier (parameter identifier: MQCA\_IGQ\_USER\_ID). This parameter is valid only on z/OS when the queue manager is a member of a queue-sharing group.

Specifies the user identifier that is associated with the local intra-group queuing agent. This identifier is one of the user identifiers that might be checked for authorization when the IGQ agent puts messages on local queues. The actual user identifiers checked depend on the setting of the *IGQPutAuthority* attribute, and on external security options.

The maximum length is MQ\_USER\_ID\_LENGTH.

#### ***InhibitEvent* (MQCFIN)**

Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated (parameter identifier: MQIA\_INHIBIT\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

▶ **z/OS** *IntraGroupQueuing* (MQCFIN)

Command scope (parameter identifier: MQIA\_INTRA\_GROUP\_QUEUING). This parameter is valid only on z/OS when the queue manager is a member of a queue-sharing group.

Specifies whether intra-group queuing is used. The value can be any of the following values:

**MQIGQ\_DISABLED**

Intra-group queuing disabled.

**MQIGQ\_ENABLED**

Intra-group queuing enabled.

*IPAddressVersion* (MQCFIN)

IP address version selector (parameter identifier: MQIA\_IP\_ADDRESS\_VERSION).

Specifies which IP address version, either IPv4 or IPv6, is used. The value can be:

**MQIPADDR\_IPv4**

IPv4 is used.

**MQIPADDR\_IPv6**

IPv6 is used.

This parameter is only relevant for systems that run both IPv4 and IPv6. It affects only channels defined as having a *TransportType* of MQXPY\_TCP when one of the following conditions is true:

- The channel attribute *ConnectionName* is a host name that resolves to both an IPv4 and IPv6 address and its *LocalAddress* parameter is not specified.
- The channel attributes *ConnectionName* and *LocalAddress* are both host names that resolve to both IPv4 and IPv6 addresses.

▶ **z/OS** *ListenerTimer* (MQCFIN)

Listener restart interval (parameter identifier: MQIA\_LISTENER\_TIMER).

The time interval, in seconds, between attempts by IBM MQ to restart the listener after an APPC or TCP/IP failure. This parameter applies to z/OS only.

Specify a value in the range 5 - 9,999. The initial default value of the queue manager is 60.

*LocalEvent* (MQCFIN)

Controls whether local error events are generated (parameter identifier: MQIA\_LOCAL\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

*LoggerEvent* (MQCFIN)

Controls whether recovery log events are generated (parameter identifier: MQIA\_LOGGER\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled. This value is valid only on queue managers that use linear logging.

This parameter is valid only on IBM i, UNIX, Linux, and Windows systems.

▶ **z/OS** *LUGroupName* (MQCFST)

Generic LU name for the LU 6.2 listener (parameter identifier: MQCA\_LU\_GROUP\_NAME).

The generic LU name to be used by the LU 6.2 listener that handles inbound transmissions for the queue-sharing group.

This parameter applies to z/OS only.

The maximum length of the string is MQ\_LU\_NAME\_LENGTH.

▶ **z/OS** *LUName* (**MQCFST**)

LU name to use for outbound LU 6.2 transmissions (parameter identifier: MQCA\_LU\_NAME).

The name of the LU to use for outbound LU 6.2 transmissions. Set this parameter to be the same as the name of the LU to be used by the listener for inbound transmissions.

This parameter applies to z/OS only.

The maximum length of the string is MQ\_LU\_NAME\_LENGTH.

▶ **z/OS** *LU62ARMSuffix* (**MQCFST**)

APPCPM suffix (parameter identifier: MQCA\_LU62\_ARM\_SUFFIX).

The suffix of the APPCPM member of SYS1.PARMLIB. This suffix nominates the LUADD for this channel initiator.

This parameter applies to z/OS only.

The maximum length of the string is MQ\_ARM\_SUFFIX\_LENGTH.

▶ **z/OS** *LU62Channels* (**MQCFIN**)

Maximum number of LU 6.2 channels (parameter identifier: MQIA\_LU62\_CHANNELS).

The maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol.

This parameter applies to z/OS only.

Specify a value in the range 0 - 9999. The initial default value of the queue manager is 200.

▶ **z/OS** *MaxActiveChannels* (**MQCFIN**)

Maximum number of active channels (parameter identifier: MQIA\_ACTIVE\_CHANNELS ).

The maximum number of channels that can be *active* at any time.

This parameter applies to z/OS only.

Sharing conversations do not contribute to the total for this parameter.

Specify a value in the range 1 - 9999. The initial default value of the queue manager is 200.

▶ **z/OS** *MaxChannels* (**MQCFIN**)

Maximum number of current channels (parameter identifier: MQIA\_MAX\_CHANNELS).

The maximum number of channels that can be *current* (including server-connection channels with connected clients).

This parameter applies to z/OS only.

Sharing conversations do not contribute to the total for this parameter.

Specify a value in the range 1 - 9999.

*MaxHandles* (**MQCFIN**)

Maximum number of handles (parameter identifier: MQIA\_MAX\_HANDLES).

The maximum number of handles that any one connection can have open at the same time.

Specify a value in the range 0 - 999,999,999.

*MaxMsgLength* (**MQCFIN**)

Maximum message length (parameter identifier: MQIA\_MAX\_MSG\_LENGTH).

Specifies the maximum length of messages allowed on queues on the queue manager. No message that is larger than either the queue attribute *MaxMsgLength* or the queue manager attribute *MaxMsgLength* can be put on a queue.

If you reduce the maximum message length for the queue manager, you must also reduce the maximum message length of the `SYSTEM.DEFAULT.LOCAL.QUEUE` definition, and your other queues. Reduce the definitions on the queues to less than or equal to the limit of the queue manager. If you do not reduce the message lengths appropriately, and applications inquire only the value of the queue attribute *MaxMsgLength*, they might not work correctly.

The lower limit for this parameter is 32 KB (32,768 bytes). The upper limit is 100 MB (104,857,600 bytes). This parameter is not valid on z/OS.

#### *MaxPropertiesLength* (MQCFIN)

Maximum property length (parameter identifier: MQIA\_MAX\_PROPERTIES\_LENGTH).

Specifies the maximum length of the properties, including both the property name in bytes and the size of the property value in bytes.

Specify a value in the range 0 - 100 MB (104,857,600 bytes), or the special value:

#### **MQPROP\_UNRESTRICTED\_LENGTH**

The size of the properties is restricted only by the upper limit.

#### *MaxUncommittedMsgs* (MQCFIN)

Maximum uncommitted messages (parameter identifier: MQIA\_MAX\_UNCOMMITTED\_MSGS).

Specifies the maximum number of uncommitted messages. The maximum number of uncommitted messages under any sync point is the sum of the following messages:

- The number of messages that can be retrieved.

- The number of messages that can be put.

- The number of trigger messages generated within this unit of work.

The limit does not apply to messages that are retrieved or put outside sync point.

Specify a value in the range 1 - 10,000.

#### *MQIAccounting* (MQCFIN)

Controls whether accounting information for MQI data is to be collected (parameter identifier: MQIA\_ACCOUNTING\_MQI).

The value can be:

#### **MQMON\_OFF**

MQI accounting data collection is disabled. This value is the initial default value of the queue manager.

#### **MQMON\_ON**

MQI accounting data collection is enabled.

This parameter is valid only on IBM i, UNIX, Linux, and Windows systems.

#### *MQIStatistics* (MQCFIN)

Controls whether statistics monitoring data is to be collected for the queue manager (parameter identifier: MQIA\_STATISTICS\_MQI).

The value can be:

#### **MQMON\_OFF**

Data collection for MQI statistics is disabled. This value is the initial default value of the queue manager.

#### **MQMON\_ON**

Data collection for MQI statistics is enabled.

This parameter is valid only on IBM i, UNIX, Linux, and Windows systems.

#### *MsgMarkBrowseInterval* (MQCFIN)

Mark-browse interval (parameter identifier: MQIA\_MSG\_MARK\_BROWSE\_INTERVAL).

Specifies the time interval in milliseconds after which the queue manager can automatically unmark messages.

Specify a value in the range 0 - 999,999,999, or the special value MQMMBI\_UNLIMITED.

A value of 0 causes the queue manager to unmark messages immediately.

MQMMBI\_UNLIMITED indicates that the queue manager does not automatically unmark messages.

#### ▶ z/OS *OutboundPortMax* (MQCFIN)

The maximum value in the range for the binding of outgoing channels (parameter identifier: MQIA\_OUTBOUND\_PORT\_MAX).

The maximum value in the range of port numbers to be used when binding outgoing channels. This parameter applies to z/OS only.

Specify a value in the range 0 - 65,535. The initial default value of the queue manager is zero.

Specify a corresponding value for *OutboundPortMin* and ensure that the value of *OutboundPortMax* is greater than or equal to the value of *OutboundPortMin*.

#### ▶ z/OS *OutboundPortMin* (MQCFIN)

The minimum value in the range for the binding of outgoing channels (parameter identifier: MQIA\_OUTBOUND\_PORT\_MIN).

The minimum value in the range of port numbers to be used when binding outgoing channels. This parameter applies to z/OS only.

Specify a value in the range 0 - 65,535. The initial default value of the queue manager is zero.

Specify a corresponding value for *OutboundPortMax* and ensure that the value of *OutboundPortMin* is less than or equal to the value of *OutboundPortMax*.

#### *Parent* (MQCFST)

The name of the queue manager to which this queue manager is to connect hierarchically as its child (parameter identifier: MQCA\_PARENT).

A blank value indicates that this queue manager has no parent queue manager. If there is an existing parent queue manager it is disconnected. This value is the initial default value of the queue manager.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

#### **Note:**

- The use of IBM MQ hierarchical connections requires that the queue manager attribute PSMODE is set to MQPSM\_ENABLED.
- The value of *Parent* can be set to a blank value if PSMODE is set to MQPSM\_DISABLED.
- Before connecting to a queue manager hierarchically as its child, channels in both directions must exist between the parent queue manager and child queue manager.
- If a parent is defined, the **Change Queue Manager** command disconnects from the original parent and sends a connection flow to the new parent queue manager.
- Successful completion of the command does not mean that the action completed or that it is going to complete successfully. Use the **Inquire Pub/Sub Status** command to track the status of the requested parent relationship.

#### *PerformanceEvent* (MQCFIN)

Controls whether performance-related events are generated (parameter identifier: MQIA\_PERFORMANCE\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

*PubSubClus* (**MQCFIN**)

Controls whether the queue manager participates in publish/subscribe clustering (parameter identifier: MQIA\_PUBSUB\_CLUSTER).

The value can be:

**MQPSCLUS\_ENABLED**

The creating or receipt of clustered topic definitions and cluster subscriptions is permitted.

**Note:** The introduction of a clustered topic into a large IBM MQ cluster can cause a degradation in performance. This degradation occurs because all partial repositories are notified of all the other members of the cluster. Unexpected subscriptions might be created at all other nodes; for example, where proxysub(FORCE) is specified. Large numbers of channels might be started from a queue manager; for example, on resync after a queue manager failure.

**MQPSCLUS\_DISABLED**

The creating or receipt of clustered topic definitions and cluster subscriptions is inhibited. The creations or receipts are recorded as warnings in the queue manager error logs.

*PubSubMaxMsgRetryCount* (**MQCFIN**)

The number of attempts to reprocess a message when processing a failed command message under sync point (parameter identifier: MQIA\_PUBSUB\_MAXMSG\_RETRY\_COUNT).

The value can be:

**0 to 999 999 999**

The initial value is 5.

*PubSubMode* (**MQCFIN**)

Specifies whether the publish/subscribe engine and the queued publish/subscribe interface are running. The publish/subscribe engine enables applications to publish or subscribe by using the application programming interface. The publish/subscribe interface monitors the queues used the queued publish/subscribe interface (parameter identifier: MQIA\_PUBSUB\_MODE).

The value can be:

**MQPSM\_COMPAT**

The publish/subscribe engine is running. It is therefore possible to publish or subscribe by using the application programming interface. The queued publish/subscribe interface is not running. Therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. MQPSM\_COMPAT is used for compatibility with versions of WebSphere Message Broker (now known as IBM Integration Bus ) prior to version 7 that use this queue manager.

**MQPSM\_DISABLED**

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

**MQPSM\_ENABLED**

The publish/subscribe engine and the queued publish/subscribe interface are running. It is

therefore possible to publish or subscribe by using the application programming interface and the queues that are monitored by the queued publish/subscribe interface. This value is the initial default value of the queue manager.

*PubSubNPInputMsg* (**MQCFIN**)

Whether to discard (or keep) an undelivered input message (parameter identifier: MQIA\_PUBSUB\_NP\_MSG).

The value can be:

**MQUNDELIVERED\_DISCARD**

Non-persistent input messages are discarded if they cannot be processed.

**MQUNDELIVERED\_KEEP**

Non-persistent input messages are not discarded if they cannot be processed. In this situation, the queued publish/subscribe interface continues to try the process again at appropriate intervals and does not continue processing subsequent messages.

*PubSubNPResponse* (**MQCFIN**)

Controls the behavior of undelivered response messages (parameter identifier: MQIA\_PUBSUB\_NP\_RESP).

The value can be:

**MQUNDELIVERED\_NORMAL**

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If they cannot be placed on the dead letter queue they are discarded.

**MQUNDELIVERED\_SAFE**

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be sent and cannot be placed on the dead letter queue the queued publish/subscribe interface rolls back the current operation. The operation is tried again at appropriate intervals and does not continue processing subsequent messages.

**MQUNDELIVERED\_DISCARD**

Non-persistent responses that are not placed on the reply queue are discarded.

**MQUNDELIVERED\_KEEP**

Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface backs out the current operation and then try it again at appropriate intervals.

*PubSubSyncPoint* (**MQCFIN**)

Whether only persistent (or all) messages must be processed under sync point (parameter identifier: MQIA\_PUBSUB\_SYNC\_PT).

The value can be:

**MQSYNCPOINT\_IFPER**

This value makes the queued publish/subscribe interface receive non-persistent messages outside sync point. If the interface receives a publication outside sync point, the interface forwards the publication to subscribers known to it outside sync point.

**MQSYNCPOINT\_YES**

This value makes the queued publish/subscribe interface receive all messages under sync point.

*QMgrDesc* (**MQCFST**)

Queue manager description (parameter identifier: MQCA\_Q\_MGR\_DESC).

This parameter is text that briefly describes the object.

The maximum length of the string is MQ\_Q\_MGR\_DESC\_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the queue manager on which the command is executing. Using this character set ensures that the text is translated correctly.

z/OS **QSGCertificateLabel (MQCFST)**

Specifies the certificate label for the queue sharing group to use (parameter identifier: MQCA\_QSG\_CERT\_LABEL).

This parameter takes precedence over CERTLABL in the event that the queue manager is a member of a QSG.

**QueueAccounting (MQCFIN)**

Controls the collection of accounting (thread-level and queue-level accounting) data for queues (parameter identifier: MQIA\_ACCOUNTING\_Q).

The value can be:

**MQMON\_NONE**

Accounting data collection for queues is disabled. This value must not be overridden by the value of the *QueueAccounting* parameter on the queue.

**MQMON\_OFF**

Accounting data collection is disabled for queues specifying a value of MQMON\_Q\_MGR in the *QueueAccounting* parameter.

**MQMON\_ON**

Accounting data collection is enabled for queues specifying a value of MQMON\_Q\_MGR in the *QueueAccounting* parameter.

**QueueMonitoring (MQCFIN)**

Default setting for online monitoring for queues (parameter identifier: MQIA\_MONITORING\_Q).

If the *QueueMonitoring* queue attribute is set to MQMON\_Q\_MGR, this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

**MQMON\_OFF**

Online monitoring data collection is turned off. This value is the initial default value of the queue manager.

**MQMON\_NONE**

Online monitoring data collection is turned off for queues regardless of the setting of their *QueueMonitoring* attribute.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low ratio of data collection.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate ratio of data collection.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high ratio of data collection.

**QueueStatistics (MQCFIN)**

Controls whether statistics data is to be collected for queues (parameter identifier: MQIA\_STATISTICS\_Q).

The value can be:

**MQMON\_NONE**

Statistics data collection is turned off for queues regardless of the setting of their *QueueStatistics* parameter. This value is the initial default value of the queue manager.

**MQMON\_OFF**

Statistics data collection is turned off for queues specifying a value of MQMON\_Q\_MGR in their *QueueStatistics* parameter.

## MQMON\_ON

Statistics data collection is turned on for queues specifying a value of MQMON\_Q\_MGR in their *QueueStatistics* parameter.

This parameter is valid only on IBM i, UNIX, Linux, and Windows systems.

### z/OS *ReceiveTimeout* (MQCFIN)

How long a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA\_RECEIVE\_TIMEOUT).

The approximate length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state.

This parameter applies to z/OS only. It applies to message channels, and not to MQI channels. This number can be qualified as follows:

- This number is a multiplier to be applied to the negotiated *HeartBeatInterval* value to determine how long a channel is to wait. Set *ReceiveTimeoutType* to MQRCVTIME\_MULTIPLY. Specify a value of zero or in the range 2 - 99. If you specify zero, the channel waits indefinitely to receive data from its partner.
- This number is a value, in seconds, to be added to the negotiated *HeartBeatInterval* value to determine how long a channel is to wait. Set *ReceiveTimeoutType* to MQRCVTIME\_ADD. Specify a value in the range 1 - 999,999.
- This number is a value, in seconds, that the channel is to wait, set *ReceiveTimeoutType* to MQRCVTIME\_EQUAL. Specify a value in the range 0 - 999,999. If you specify 0, the channel waits indefinitely to receive data from its partner.

The initial default value of the queue manager is zero.

### z/OS *ReceiveTimeoutMin* (MQCFIN)

The minimum length of time that a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA\_RECEIVE\_TIMEOUT\_MIN).

The minimum length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. This parameter applies to z/OS only.

Specify a value in the range 0 - 999,999.

### z/OS *ReceiveTimeoutType* (MQCFIN)

The qualifier to apply to *ReceiveTimeout* (parameter identifier: MQIA\_RECEIVE\_TIMEOUT\_TYPE).

The qualifier to apply to *ReceiveTimeoutType* to calculate how long a TCP/IP channel waits to receive data, including heartbeats, from its partner. It waits to receive data before returning to the inactive state. This parameter applies to z/OS only.

The value can be any of the following values:

#### MQRCVTIME\_MULTIPLY

The *ReceiveTimeout* value is a multiplier to be applied to the negotiated value of *HeartbeatInterval* to determine how long a channel waits. This value is the initial default value of the queue manager.

#### MQRCVTIME\_ADD

*ReceiveTimeout* is a value, in seconds, to be added to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

#### MQRCVTIME\_EQUAL

*ReceiveTimeout* is a value, in seconds, representing how long a channel waits.

### *RemoteEvent* (MQCFIN)

Controls whether remote error events are generated (parameter identifier: MQIA\_REMOTE\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**RepositoryName (MQCFST)**

Cluster name (parameter identifier: MQCA\_REPOSITORY\_NAME).

The name of a cluster for which this queue manager provides a repository manager service.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

No more than one of the resultant values of *RepositoryName* can be nonblank.

**RepositoryNameList (MQCFST)**

Repository namelist (parameter identifier: MQCA\_REPOSITORY\_NAMELIST).

The name, of a namelist of clusters, for which this queue manager provides a repository manager service.

This queue manager does not have a full repository, but can be a client of other repository services that are defined in the cluster, if

- Both *RepositoryName* and *RepositoryNameList* are blank, or
- *RepositoryName* is blank and the namelist specified by *RepositoryNameList* is empty.

No more than one of the resultant values of *RepositoryNameList* can be nonblank.

**RevDns (MQCFIN)**

Whether reverse lookup of the host name from a Domain Name Server is carried out. (parameter identifier: MQIA\_REVERSE\_DNS\_LOOKUP).

This attribute has an effect only on channels using a transport type (TRPTYPE) of TCP.

The value can be:

**MQRDNS\_DISABLED**

DNS host names are not reverse looked-up for the IP addresses of inbound channels. With this setting any CHLAUTH rules using host names are not matched.

**MQRDNS\_ENABLED**

DNS host names are reverse looked-up for the IP addresses of inbound channels when this information is required. This setting is required for matching against CHLAUTH rules that contain host names, and for writing out error messages.

**z/OS SecurityCase (MQCFIN)**

Security case supported (parameter identifier: MQIA\_SECURITY\_CASE).

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only. The value is activated when a Refresh Security command is run with *SecurityType* (MQSECTYPE\_CLASSES) specified. This parameter is valid only on z/OS.

The value can be:

**MQSCYC\_UPPER**

Security profile names must be in uppercase.

**MQSCYC\_MIXED**

Security profile names can be in uppercase or in mixed case.

**z/OS SharedQMgrName (MQCFIN)**

Shared-queue queue manager name (parameter identifier: MQIA\_SHARED\_Q\_Q\_MGR\_NAME ).

A queue manager makes an MQOPEN call for a shared queue. The queue manager that is specified in the *ObjectQmgrName* parameter of the MQOPEN call is in the same queue-sharing group as the

processing queue manager. The `SQQMNAME` attribute specifies whether the *ObjectQmgrName* is used or whether the processing queue manager opens the shared queue directly. This parameter is valid only on z/OS.

The value can be any of the following values:

**MQSQQM\_USE**

*ObjectQmgrName* is used and the appropriate transmission queue is opened.

**MQSQQM\_IGNORE**

The processing queue manager opens the shared queue directly. This value can reduce the traffic in your queue manager network.

**SSLCRLNameList (MQCFST)**

The SSL namelist (parameter identifier: `MQCA_SSL_CRL_NAMELIST`).

The length of the string is `MQ_NAMELIST_NAME_LENGTH`.

Indicates the name of a namelist of authentication information objects which are used to provide certificate revocation locations to allow enhanced TLS/SSL certificate checking.

If *SSLCRLNameList* is blank, certificate revocation checking is not invoked.

Changes to *SSLCRLNameList*, or to the names in a previously specified namelist, or to previously referenced authentication information objects become effective:

- On IBM i, UNIX, Linux, and Windows systems when a new channel process is started.
- For channels that run as threads of the channel initiator on IBM i, UNIX, Linux, and Windows systems, when the channel initiator is restarted.
- For channels that run as threads of the listener on IBM i, UNIX, Linux, and Windows systems, when the listener is restarted.
- On z/OS, when the channel initiator is restarted.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued.
- On IBM i queue managers, this parameter is ignored. However, it is used to determine which authentication information objects are written to the `AMQCLCHL.TAB` file.

Only authentication information objects with types of `LDAPCRL` or `OCSP` are allowed in the namelist referred to by *SSLCRLNameList* (`MQCFST`). Any other type results in an error message when the list is processed and is subsequently ignored.

**SSLCryptoHardware (MQCFST)**

The SSL cryptographic hardware (parameter identifier: `MQCA_SSL_CRYPTO_HARDWARE`).

The length of the string is `MQ_SSL_CRYPTO_HARDWARE_LENGTH`.

Sets the name of the parameter string required to configure the cryptographic hardware present on the system.

This parameter is supported on UNIX, Linux, and Windows systems only.

All supported cryptographic hardware supports the PKCS #11 interface. Specify a string of the following format:

```
GSK_PKCS11= <the PKCS #11 driver path and file name> >; <the PKCS #11 token label> ;  
<the PKCS #11 token password>;<symmetric cipher setting> ;
```

The PKCS #11 driver path is an absolute path to the shared library providing support for the PKCS #11 card. The PKCS #11 driver file name is the name of the shared library. An example of the value required for the PKCS #11 driver path and file name is `/usr/lib/pkcs11/PKCS11_API.so`

To access symmetric cipher operations through GSKit, specify the symmetric cipher setting parameter. The value of this parameter is either:

**SYMMETRIC\_CIPHER\_OFF**

Do not access symmetric cipher operations.

**SYMMETRIC\_CIPHER\_ON**

Access symmetric cipher operations.

If the symmetric cipher setting is not specified, this value has the same effect as specifying SYMMETRIC\_CIPHER\_OFF.

The maximum length of the string is 256 characters. The default value is blank.

If you specify a string in the wrong format, you get an error.

When the *SSLCryptoHardware* (MQCFST) value is changed, the cryptographic hardware parameters specified become the ones used for new SSL connection environments. The new information becomes effective:

- When a new channel process is started.
- For channels that run as threads of the channel initiator, when the channel initiator is restarted.
- For channels that run as threads of the listener, when the listener is restarted.
- When a Refresh Security command is issued to refresh the contents of the SSL key repository.

**SSLEvent (MQCFIN)**

Controls whether SSL events are generated (parameter identifier: MQIA\_SSL\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**SSLFipsRequired (MQCFIN)**

SSLFIPS specifies whether only FIPS-certified algorithms are to be used if cryptography is carried out in IBM MQ, rather than in cryptographic hardware (parameter identifier: MQIA\_SSL\_FIPS\_REQUIRED).

If cryptographic hardware is configured, the cryptographic modules used are those modules provided by the hardware product. These modules might, or might not, be FIPS-certified to a particular level depending on the hardware product in use. This parameter applies to z/OS, UNIX, Linux, and Windows platforms only.

The value can be any of the following values:

**MQSSL\_FIPS\_NO**

IBM MQ provides an implementation of SSL cryptography which supplies some FIPS-certified modules on some platforms. If you set *SSLFipsRequired* to MQSSL\_FIPS\_NO, any CipherSpec supported on a particular platform can be used. This value is the initial default value of the queue manager.

If the queue manager runs without using cryptographic hardware, refer to the CipherSpecs listed in Specifying CipherSpecs employing FIPS 140-2 certified cryptography:

**MQSSL\_FIPS\_YES**

Specifies that only FIPS-certified algorithms are to be used in the CipherSpecs allowed on all SSL connections from and to this queue manager.

For a listing of appropriate FIPS 140-2 certified CipherSpecs; see Specifying CipherSpecs.

Changes to SSLFIPS become effective either:

- On UNIX, Linux, and Windows systems, when a new channel process is started.
- For channels that run as threads of the channel initiator on UNIX, Linux, and Windows systems, when the channel initiator is restarted.
- For channels that run as threads of the listener on UNIX, Linux, and Windows systems, when the listener is restarted.

- For channels that run as threads of a process pooling process, when the process pooling process is started or restarted and first runs an SSL channel. If the process pooling process has already run an SSL channel, and you want the change to become effective immediately, run the MQSC command **REFRESH SECURITY TYPE(SSL)**. The process pooling process is **amqrmppa** on UNIX, Linux, and Windows systems.
- On z/OS, when the channel initiator is restarted.
- When a **REFRESH SECURITY TYPE(SSL)** command is issued, except on z/OS.

#### **SSLKeyRepository (MQCFST)**

The SSL key repository (parameter identifier: MQCA\_SSL\_KEY\_REPOSITORY).

The length of the string is MQ\_SSL\_KEY\_REPOSITORY\_LENGTH.

Indicates the name of the Secure Sockets Layer key repository.

The format of the name depends on the environment:

- On z/OS, it is the name of a key ring.
- On IBM i, it is of the form *pathname/keyfile*, where *keyfile* is specified without the suffix ( *.kdb* ), and identifies a GSKit key database file. The default value is /QIBM/UserData/ICSS/Cert/Server/Default.

If you specify \*SYSTEM, IBM MQ uses the system certificate store as the key repository for the queue manager. As a result, the queue manager is registered as a server application in Digital Certificate Manager (DCM). You can assign any server/client certificate in the system store to this application.

If you change the SSLKEYR parameter to a value other than \*SYSTEM, IBM MQ unregisters the queue manager as an application with DCM.

- On UNIX, it is of the form *pathname/keyfile* and on Windows *pathname\keyfile*, where *keyfile* is specified without the suffix ( *.kdb* ), and identifies a GSKit key database file. The default value for UNIX platforms is /var/mqm/qmgrs/QMGR/ssl/key, and on Windows it is C:\Program Files\IBM\WebSphere MQ\qmgrs\QMGR\ssl\key, where QMGR is replaced by the queue manager name (on UNIX, Linux, and Windows).

On IBM i, UNIX, Linux, and Windows systems, the syntax of this parameter is validated to ensure that it contains a valid, absolute, directory path.

If SSLKEYR is blank, or is a value that does not correspond to a key ring or key database file, channels using SSL fail to start.

Changes to SSLKeyRepository become effective:

- On IBM i, UNIX, Linux, and Windows platforms, when a new channel process is started.
- For channels that run as threads of the channel initiator on IBM i, UNIX, Linux, and Windows platforms, when the channel initiator is restarted.
- For channels that run as threads of the listener on IBM i, UNIX, Linux, and Windows platforms, when the listener is restarted.
- On z/OS, when the channel initiator is restarted.

#### **SSLKeyResetCount (MQCFIN)**

SSL key reset count (parameter identifier: MQIA\_SSL\_RESET\_COUNT).

Specifies when SSL channel MCAs that initiate communication reset the secret key used for encryption on the channel. The value of this parameter represents the total number of unencrypted bytes that are sent and received on the channel before the secret key is renegotiated. This number of bytes includes control information sent by the MCA.

The secret key is renegotiated when (whichever occurs first):

- The total number of unencrypted bytes sent and received by the initiating channel MCA exceeds the specified value, or,
- If channel heartbeats are enabled, before data is sent or received following a channel heartbeat.

Specify a value in the range 0 - 999,999,999. A value of zero, the initial default value of the queue manager, signifies that secret keys are never renegotiated. If you specify an SSL/TLS secret key reset count between 1 byte through 32 KB, SSL/TLS channels use a secret key reset count of 32Kb. This count is to avoid the performance effect of excessive key resets which would occur for small SSL/TLS secret key reset values.

#### **SSLTasks (MQCFIN)**

Number of server subtasks to use for processing SSL calls (parameter identifier: MQIA\_SSL\_TASKS). This parameter applies to z/OS only.

The number of server subtasks to use for processing SSL calls. To use SSL channels, you must have at least two of these tasks running.

Specify a value in the range 0 - 9999. However, to avoid problems with storage allocation, do not set this parameter to a value greater than 50.

#### **StartStopEvent (MQCFIN)**

Controls whether start and stop events are generated (parameter identifier: MQIA\_START\_STOP\_EVENT).

The value can be:

##### **MQEVR\_DISABLED**

Event reporting disabled.

##### **MQEVR\_ENABLED**

Event reporting enabled.

#### **StatisticsInterval (MQCFIN)**

The time interval, in seconds, at which statistics monitoring data is written to the monitoring queue (parameter identifier: MQIA\_STATISTICS\_INTERVAL).

Specify a value in the range 1 - 604,000.

This parameter is valid only on IBM i, UNIX, Linux, and Windows.

#### **z/OS TCPChannels (MQCFIN)**

The maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol (parameter identifier: MQIA\_TCP\_CHANNELS).

Specify a value in the range 0 - 9999. The initial default value of the queue manager is 200.

Sharing conversations do not contribute to the total for this parameter.

This parameter applies to z/OS only.

#### **z/OS TCPKeepAlive (MQCFIN)**

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of a connection is still available (parameter identifier: MQIA\_TCP\_KEEP\_ALIVE).

The value can be:

##### **MQTCPKEEP\_YES**

The TCP KEEPALIVE facility is to be used as specified in the TCP profile configuration data set. The interval is specified in the *KeepAliveInterval* channel attribute.

##### **MQTCPKEEP\_NO**

The TCP KEEPALIVE facility is not to be used. This value is the initial default value of the queue manager.

This parameter applies to z/OS only.

#### **z/OS TCPName (MQCFST)**

The name of the TCP/IP system that you are using (parameter identifier: MQIA\_TCP\_NAME).

The maximum length of the string is MQ\_TCP\_NAME\_LENGTH.

This parameter applies to z/OS only.

► **z/OS** *TCPStackType* (**MQCFIN**)

Specifies whether the channel initiator can use only the TCP/IP address space specified in *TCPName*, or can optionally bind to any selected TCP/IP address (parameter identifier: MQIA\_TCP\_STACK\_TYPE).

The value can be:

**MQTCPSTACK\_SINGLE**

The channel initiator uses the TCP/IP address space that is specified in *TCPName*. This value is the initial default value of the queue manager.

**MQTCPSTACK\_MULTIPLE**

The channel initiator can use any TCP/IP address space available to it. It defaults to the one specified in *TCPName* if no other is specified for a channel or listener.

This parameter applies to z/OS only.

*TraceRouteRecording* (**MQCFIN**)

Specifies whether trace-route information can be recorded and a reply message generated (parameter identifier: MQIA\_TRACE\_ROUTE\_RECORDING).

The value can be:

**MQRECORDING\_DISABLED**

Trace-route information cannot be recorded.

**MQRECORDING\_MSG**

Trace-route information can be recorded and replies sent to the destination specified by the originator of the message causing the trace-route record.

**MQRECORDING\_Q**

Trace-route information can be recorded and replies sent to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE.

If participation in route tracing is enabled using this queue manager attribute, the value of the attribute is only important if a reply is generated. Route tracing is enabled by not setting *TraceRouteRecording* to MQRECORDING\_DISABLED. The reply must go either to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE, or to the destination specified by the message itself. Provided the attribute is not disabled then messages not yet at the final destination might have information added to them. For more information about trace-route records, see Controlling trace-route messaging.

*TreeLifeTime* (**MQCFIN**)

The lifetime, in seconds, of non-administrative topics (parameter identifier: MQIA\_TREE\_LIFE\_TIME).

Non-administrative topics are those topics created when an application publishes to, or subscribes as, a topic string that does not exist as an administrative node. When this non-administrative node no longer has any active subscriptions, this parameter determines how long the queue manager waits before removing that node. Only non-administrative topics that are in use by a durable subscription remain after the queue manager is recycled.

Specify a value in the range 0 - 604,000. A value of 0 means that non-administrative topics are not removed by the queue manager. The initial default value of the queue manager is 1800.

*TriggerInterval* (**MQCFIN**)

Trigger interval (parameter identifier: MQIA\_TRIGGER\_INTERVAL).

Specifies the trigger time interval, expressed in milliseconds, for use only with queues where *TriggerType* has a value of MQTT\_FIRST.

In this case, trigger messages are normally generated only when a suitable message arrives on the queue, and the queue was previously empty. Under certain circumstances, however, an additional trigger message can be generated with MQTT\_FIRST triggering, even if the queue was not empty. These additional trigger messages are not generated more often than every *TriggerInterval* milliseconds.

Specify a value in the range 0 - 999,999,999.

### Error codes (Change Queue Manager)

This command might return the following errors in the response format header, in addition to the values shown on page "Error codes applicable to all commands" on page 1051.

#### Reason (MQLONG)

The value can be any of the following values:

**MQRCCF\_CERT\_LABEL\_NOT\_ALLOWED**

Certificate label error.

**MQRCCF\_CHAD\_ERROR**

Channel automatic definition error.

**MQRCCF\_CHAD\_EVENT\_ERROR**

Channel automatic definition event error.

**MQRCCF\_CHAD\_EVENT\_WRONG\_TYPE**

Channel automatic definition event parameter not allowed for this channel type.

**MQRCCF\_CHAD\_EXIT\_ERROR**

Channel automatic definition exit name error.

**MQRCCF\_CHAD\_EXIT\_WRONG\_TYPE**

Channel automatic definition exit parameter not allowed for this channel type.

**MQRCCF\_CHAD\_WRONG\_TYPE**

Channel automatic definition parameter not allowed for this channel type.

**MQRCCF\_FORCE\_VALUE\_ERROR**

Force value not valid.

**MQRCCF\_PATH\_NOT\_VALID**

Path not valid.

**MQRCCF\_PWD\_LENGTH\_ERROR**

Password length error.

**MQRCCF\_PSCLUS\_DISABLED\_TOPDEF**

Administrator or application attempted to define a cluster topic when **PubSubClub** is set to MQPSCLUS\_DISABLED.

**MQRCCF\_PSCLUS\_TOPIC\_EXSITS**

Administrator tried to set **PubSubClub** to MQPSCLUS\_DISABLED when a cluster topic definition exists.

 **MQRCCF\_Q\_MGR\_ATTR\_CONFLICT**

Queue manager attribute error. A possible cause is that you attempted to specify SSLKEYR(\*SYSTEM) with a nonblank queue manager CERTLABEL.

**MQRCCF\_Q\_MGR\_CCSID\_ERROR**

Coded character set value not valid.

**MQRCCF\_REPOS\_NAME\_CONFLICT**

Repository names not valid.

**MQRCCF\_UNKNOWN\_Q\_MGR**

Queue manager not known.

**MQRCCF\_WRONG\_CHANNEL\_TYPE**

Channel type error.

### Required parameters

*None*

### Optional parameters

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *SecurityInterval* (MQCFIN)

Timeout check interval (parameter identifier: MQIACF\_SECURITY\_INTERVAL).

Specifies the interval between checks for user IDs and associated resources to determine whether the *SecurityTimeout* has occurred. The value specifies a number of minutes in the range zero through 10080 (one week). If *SecurityInterval* is specified as zero, no user timeouts occur. If *SecurityInterval* is specified as nonzero, the user ID times out at a time between *SecurityTimeout* and *SecurityTimeout* plus *SecurityInterval*.

#### *SecurityTimeout* (MQCFIN)

Security information timeout (parameter identifier: MQIACF\_SECURITY\_TIMEOUT).

Specifies how long security information about an unused user ID and associated resources is retained by IBM MQ. The value specifies a number of minutes in the range zero through 10080 (one week). If *SecurityTimeout* is specified as zero, and *SecurityInterval* is nonzero, all such information is discarded by the queue manager every *SecurityInterval* number of minutes.

## Change SMDS:

The Change SMDS (MQCMD\_CHANGE\_SMDS) command changes the attributes of shared message data set.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

The Change SMDS (MQCMD\_CHANGE\_SMDS) command changes the current shared message data set options for the specified queue manager and CF structure.

### **SMDS (MQCFST)**

Specifies the queue manager for which the shared message data set properties are to be changed, or an asterisk to change the properties for all shared message data sets associated with the specified CFSTRUCT.

### **CFStrucName (MQCFST)**

The name of the CF application structure with SMDS parameters that you want to change (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### **Optional parameters**

#### **DSBufs (MQCFIN)**

The shared message data set buffers group (parameter identifier: MQIA\_CF\_SMDS\_BUFFERS).

Specifies the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

A value in the range 1 - 9999 or MQDSB\_DEFAULT.

When DEFAULT is used any previous value is overridden and the DSBUFS value from the CFSTRUCT definition is used. The size of each buffer is equal to the logical block size.

Value can not be set unless CFLEVEL(5) is defined.

#### **DSEXPA ND (MQCFIN)**

The shared message data set expand option (parameter identifier: MQIACF\_CF\_SMDS\_EXPAND).

Specifies whether or not the queue manager should expand a shared message data set when it is nearly full, and further blocks are required in the data set. The value can be any of the following values:

#### **MQDSE\_YES**

The data set can be expanded.

#### **MQDSE\_NO**

The data set cannot be expanded.

#### **MQDSE\_DEFAULT**

Only returned on DISPLAY CFSTRUCT when not explicitly set

Value can not be set unless CFLEVEL(5) is defined.

## Change, Copy, and Create Service:

The Change Service command changes existing service definitions. The Copy and Create service commands create new service definitions - the Copy command uses attribute values of an existing service definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

The Change Service (MQCMD\_CHANGE\_SERVICE) command changes the specified attributes of an existing IBM MQ service definition. For any optional parameters that are omitted, the value does not change.

The Copy Service (MQCMD\_COPY\_SERVICE) command creates an IBM MQ service definition, using, for attributes not specified in the command, the attribute values of an existing service definition.

The Create Service (MQCMD\_CREATE\_SERVICE) command creates an IBM MQ service definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### Required parameter (Change and Create Service)

#### *ServiceName* (MQCFST)

The name of the service definition to be changed or created (parameter identifier: MQCA\_SERVICE\_NAME).

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### Required parameters (Copy Service)

#### *FromServiceName* (MQCFST)

The name of the service definition to be copied from (parameter identifier: MQCACF\_FROM\_SERVICE\_NAME).

This parameter specifies the name of the existing service definition that contains values for the attributes not specified in this command.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

#### *ToServiceName* (MQCFST)

To service name (parameter identifier: MQCACF\_TO\_SERVICE\_NAME).

This parameter specifies the name of the new service definition. If a service definition with this name exists, *Replace* must be specified as MQRP\_YES.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### Optional parameters (Change, Copy, and Create Service)

#### *Replace* (MQCFIN)

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a namelist definition with the same name as *ToServiceName* exists, this specifies parameter whether it is to be replaced. The value can be:

#### **MQRP\_YES**

Replace existing definition.

#### **MQRP\_NO**

Do not replace existing definition.

*ServiceDesc* (**MQCFST**)

Description of service definition (parameter identifier: MQCA\_SERVICE\_DESC).

This parameter is a plain-text comment that provides descriptive information about the service definition. It must contain only displayable characters.

If characters are used that are not in the coded character set identifier (CCSID) for the queue manager on which the command is executing, they might be translated incorrectly.

The maximum length of the string is MQ\_SERVICE\_DESC\_LENGTH.

*ServiceType* (**MQCFIN**)

The mode in which the service is to run (parameter identifier: MQIA\_SERVICE\_TYPE).

Specify either:

**MQSVC\_TYPE\_SERVER**

Only one instance of the service can be executed at a time, with the status of the service made available by the Inquire Service Status command.

**MQSVC\_TYPE\_COMMAND**

Multiple instances of the service can be started.

*StartArguments* (**MQCFST**)

Arguments to be passed to the program on startup (parameter identifier: MQCA\_SERVICE\_START\_ARGS).

Specify each argument within the string as you would on a command line, with a space to separate each argument to the program.

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

*StartCommand* (**MQCFST**)

Service program name (parameter identifier: MQCA\_SERVICE\_START\_COMMAND).

Specifies the name of the program which is to run. You must specify a fully qualified path name to the executable program.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

*StartMode* (**MQCFIN**)

Service mode (parameter identifier: MQIA\_SERVICE\_CONTROL).

Specifies how the service is to be started and stopped. The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The service is not to be started automatically or stopped automatically. It is to be controlled by user command. This value is the default value.

**MQSVC\_CONTROL\_Q\_MGR**

The service being defined is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The service is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

*StderrDestination* (**MQCFST**)

Specifies the path to a file to which the standard error (stderr) of the service program must be redirected (parameter identifier: MQCA\_STDERR\_DESTINATION).

If the file does not exist when the service program is started, the file is created.

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

### *StdoutDestination* (MQCFST)

Specifies the path to a file to which the standard output (stdout) of the service program must be redirected (parameter identifier: MQCA\_STDOUT\_DESTINATION).

If the file does not exist when the service program is started, the file is created.

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

### *StopArguments* (MQCFST)

Specifies the arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA\_SERVICE\_STOP\_ARGS).

Specify each argument within the string as you would on a command line, with a space to separate each argument to the program.

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

### *StopCommand* (MQCFST)

Service program stop command (parameter identifier: MQCA\_SERVICE\_STOP\_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop. You must specify a fully qualified path name to the executable program.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

## Change, Copy, and Create Storage Class:

The Change Storage Class command changes existing storage class definitions. The Copy and Create Storage Class commands create new storage class definitions - the Copy command uses attribute values of an existing storage class definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

The Change Storage Class (MQCMD\_CHANGE\_STG\_CLASS) command changes the characteristics of a storage class. For any optional parameters that are omitted, the value does not change.

The Copy Storage Class (MQCMD\_COPY\_STG\_CLASS) command creates a storage class to page set mapping using, for attributes not specified in the command, the attribute values of an existing storage class.

The Create Storage Class (MQCMD\_CREATE\_STG\_CLASS) command creates a storage class to page set mapping. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### Required parameter (Change and Create Storage Class)

#### *StorageClassName* (MQCFST)

The name of the storage class to be changed or created (parameter identifier: MQCA\_STORAGE\_CLASS).

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

### Required parameters (Copy Storage Class)

#### *FromStorageClassName* (MQCFST)

The name of the storage class to be copied from (parameter identifier: MQCACF\_FROM\_STORAGE\_CLASS).

On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToStorageClassName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

*ToStorageClassName* **(MQCFST)**

The name of the storage class to copy to (parameter identifier: MQCACF\_TO\_STORAGE\_CLASS).

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

**Optional parameters (Change, Copy, and Create Storage Class)**

*CommandScope* **(MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

*PageSetId* **(MQCFIN)**

Page set identifier that the storage class is to be associated with (parameter identifier: MQIA\_PAGESET\_ID).

Specify a string of two numeric characters in the range 00 through 99.

If you do not specify this parameter, the default is taken from the default storage class SYSTEMST.

No check is made that the page set has been defined; an error is raised only if you try to put a message to a queue that specifies this storage class (MQRC\_PAGESET\_ERROR).

*PassTicketApplication* **(MQCFST)**

Pass ticket application (parameter identifier: MQCA\_PASS\_TICKET\_APPL).

The application name that is passed to RACF when authenticating the passticket specified in the MQIIH header.

The maximum length is MQ\_PASS\_TICKET\_APPL\_LENGTH.

*QSGDisposition* **(MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
MQQSGD_COPY	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command using the MQQSGD_GROUP object of the same name as the <i>ToStorageClassName</i> object (for Copy) or the <i>StorageClassName</i> object (for Create).
MQQSGD_GROUP	<p>The object definition resides in the shared repository. The object was defined using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to attempt to refresh local copies on page set zero:</p> <pre>DEFINE STGCLASS(storage-class) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This parameter is allowed only if the queue manager is in a queue-sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to attempt to make or refresh local copies on page set zero:</p> <pre>DEFINE STGCLASS(storage-class) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
MQQSGD_PRIVATE	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.
MQQSGD_Q_MGR	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value.

#### Replace (MQCFIN)

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a storage class definition with the same name as *ToStorageClassName* exists, this parameter specifies whether it is to be replaced. The value can be:

#### MQRP\_YES

Replace existing definition.

#### MQRP\_NO

Do not replace existing definition.

#### StorageClassDesc (MQCFST)

The description of the storage class (parameter identifier: MQCA\_STORAGE\_CLASS\_DESC).

The maximum length is MQ\_STORAGE\_CLASS\_DESC\_LENGTH.

**XCFGroupName (MQCFST)**

XCF group name (parameter identifier: MQCA\_XCF\_GROUP\_NAME).

If you are using the IMS bridge, this parameter is the name of the XCF group to which the IMS system belongs.

The maximum length is MQ\_XCF\_GROUP\_NAME\_LENGTH.

**XCFMemberName (MQCFST)**

XCF member name (parameter identifier: MQCA\_XCF\_MEMBER\_NAME).

If you are using the IMS bridge, this parameter is the XCF member name of the IMS system within the XCF group specified in *XCFGroupName*.

The maximum length is MQ\_XCF\_MEMBER\_NAME\_LENGTH.

**Change, Copy, and Create Subscription:**

The Change Subscription command changes existing subscription definitions. The Copy and Create Subscription commands create new subscription definitions - the Copy command uses attribute values of an existing subscription definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

The Change Subscription (MQCMD\_CHANGE\_SUBSCRIPTION) command changes the specified attributes of an existing IBM MQ subscription. For any optional parameters that are omitted, the value does not change.

The Copy Subscription (MQCMD\_COPY\_SUBSCRIPTION) command creates an IBM MQ subscription, using, for attributes not specified in the command, the attribute values of an existing subscription.

The Create Subscription (MQCMD\_CREATE\_SUBSCRIPTION) command creates an IBM MQ administrative subscription so that existing applications can participate in publish/subscribe application.

**Required parameters (Change Subscription)****SubName (MQCFST)**

The name of the subscription definition to be changed (parameter identifier: MQCACF\_SUB\_NAME).

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

or

**SubId (MQCFBS)**

The unique identifier of the subscription definition to be changed (parameter identifier: MQBACF\_SUB\_ID).

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

**Required parameters (Copy Subscription)****ToSubscriptionName (MQCFBS)**

The name of the subscription to copy to (parameter identifier: MQCACF\_TO\_SUB\_NAME).

The maximum length of the string is MQ\_SUBSCRIPTION\_NAME\_LENGTH.

You require at least one of *FromSubscriptionName* or *SubId*.

### *FromSubscriptionName* (MQCFST)

The name of the subscription definition to be copied from (parameter identifier: MQCACF\_FROM\_SUB\_NAME).

▶ **z/OS** On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToSubscriptionName* and the disposition MQQSGD\_GROUP is used.

The maximum length of the string is MQ\_SUBSCRIPTION\_NAME\_LENGTH.

### *SubId* (MQCFBS)

The unique identifier of the subscription definition to be changed (parameter identifier: MQBACF\_SUB\_ID).

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

## Required parameters (Create Subscription)

You must provide the *SubName*.

### *SubName* (MQCFST)

The name of the subscription definition to be changed (parameter identifier: MQCACF\_SUB\_NAME).

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

You require at least one of *TopicObject* or *TopicString*.

### *TopicObject* (MQCFST)

The name of a previously defined topic object from which is obtained the topic name for the subscription (parameter identifier: MQCA\_TOPIC\_NAME). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

### *TopicString* (MQCFST)

The resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING).

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

## Optional parameters (Change, Copy, and Create Subscription) ▶ **z/OS**

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- a queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### *Destination* (MQCFST)

Destination (parameter identifier: MQCACF\_DESTINATION).

Specifies the name of the alias, local, remote, or cluster queue to which messages for this subscription are put.

This parameter is mandatory if *DestinationClass* is set to MQDC\_PROVIDED, but is not applicable if *DestinationClass* is set to MQDC\_MANAGED.

***DestinationClass* (MQCFIN)**

Destination class (parameter identifier: MQIACF\_DESTINATION\_CLASS).

Specifies whether the destination is managed.

Specify either:

**MQDC\_MANAGED**

The destination is managed.

**MQDC\_PROVIDED**

The destination queue is as specified in the *Destination* field.

Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

***DestinationCorrelId* (MQCFBS)**

Destination correlation identifier (parameter identifier: MQBACF\_DESTINATION\_CORREL\_ID).

Provides a correlation identifier that is placed in the *CorrelId* field of the message descriptor for all the messages sent to this subscription.

The maximum length is MQ\_CORREL\_ID\_LENGTH.

***DestinationQueueManager* (MQCFST)**

Destination queue manager (parameter identifier: MQCACF\_DESTINATION\_Q\_MGR).

Specifies the name of the destination queue manager, either local or remote, to which messages for the subscription are forwarded.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

***Expiry* (MQCFIN)**

The time, in tenths of a second, at which a subscription expires after its creation date and time (parameter identifier: MQIACF\_EXPIRY).

The default value of unlimited means that the subscription never expires.

After a subscription has expired it becomes eligible to be discarded by the queue manager and receives no further publications.

***PublishedAccountingToken* (MQCFBS)**

Value of the accounting token used in the *AccountingToken* field of the message descriptor (parameter identifier: MQBACF\_ACCOUNTING\_TOKEN).

The maximum length of the string is MQ\_ACCOUNTING\_TOKEN\_LENGTH.

***PublishedApplicationIdentifier* (MQCFST)**

Value of the application identity data used in the *ApplIdentityData* field of the message descriptor (parameter identifier: MQCACF\_APPL\_IDENTITY\_DATA).

The maximum length of the string is MQ\_APPL\_IDENTITY\_DATA\_LENGTH.

***PublishPriority* (MQCFIN)**

The priority of the message sent to this subscription (parameter identifier: MQIACF\_PUB\_PRIORITY).

The value can be:

**MQPRI\_PRIORITY\_AS\_PUBLISHED**

Priority of messages sent to this subscription is taken from the priority supplied to the published message. This value is the supplied default value.

**MQPRI\_PRIORITY\_AS\_QDEF**

Priority of messages sent to this subscription is determined by the default priority of the queue defined as a destination.

**0-9** An integer value providing an explicit priority for messages sent to this subscription.

***PublishSubscribeProperties (MQCFIN)***

Specifies how publish/subscribe related message properties are added to messages sent to this subscription (parameter identifier: MQIACF\_PUBSUB\_PROPERTIES).

The value can be:

**MQSPROP\_COMPAT**

If the original publication is a PCF message, then the publish/subscribe properties are added as PCF attributes. Otherwise, publish/subscribe properties are added within an MQRFH version 1 header. This method is compatible with applications coded for use with previous versions of IBM MQ.

**MQSPROP\_NONE**

Do not add publish/subscribe properties to the messages. This value is the supplied default value.

**MQSPROP\_RFH2**

Publish/subscribe properties are added within an MQRFH version 2 header. This method is compatible with applications coded for use with WebSphere Message Broker.

***Selector (MQCFST)***

Specifies the selector applied to messages published to the topic (parameter identifier: MQCACF\_SUB\_SELECTOR). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

Only those messages that satisfy the selection criteria are put to the destination specified by this subscription.

The maximum length of the string is MQ\_SELECTOR\_LENGTH.

***SubscriptionLevel (MQCFIN)***

The level within the subscription interception hierarchy at which this subscription is made (parameter identifier: MQIACF\_SUB\_LEVEL). To ensure that an intercepting application receives messages before any other subscribers, make sure that it has the highest subscription level of all subscribers.

The value can be:

**0 - 9** An integer in the range 0-9. The default value is 1. Subscribers with a subscription level of 9 intercept publications before they reach subscribers with lower subscription levels.

***SubscriptionScope (MQCFIN)***

Determines whether this subscription is passed to other queue managers in the network (parameter identifier: MQIACF\_SUBSCRIPTION\_SCOPE). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

**MQTSCOPE\_ALL**

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy. This value is the supplied default value.

**MQTSCOPE\_QMGR**

The subscription only forwards messages published on the topic within this queue manager.

***SubscriptionUser (MQCFST)***

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF\_SUB\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

**TopicString (MQCFST)**

The resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

**Userdata (MQCFST)**

User data (parameter identifier: MQCACF\_SUB\_USER\_DATA).

Specifies the user data associated with the subscription

The maximum length of the string is MQ\_USER\_DATA\_LENGTH.

**VariableUser (MQCFST)**

Specifies whether a user other than the one who created the subscription, that is, the user shown in *SubscriptionUser* can take over the ownership of the subscription (parameter identifier: MQIACF\_VARIABLE\_USER\_ID).

The value can be:

**MQVU\_ANY\_USER**

Any user can take over the ownership. This value is the supplied default value.

**MQVU\_FIXED\_USER**

No other user can take over the ownership.

**WildcardSchema (MQCFIN)**

Specifies the schema to be used when interpreting any wildcard characters contained in the *TopicString* (parameter identifier: MQIACF\_WILDCARD\_SCHEMA). Although the parameter is accepted, the value specified cannot be different from the original value for Change Subscription.

The value can be:

**MQWS\_CHAR**

Wildcard characters represent portions of strings for compatibility with IBM MQ V6.0 broker.

**MQWS\_TOPIC**

Wildcard characters represent portions of the topic hierarchy for compatibility with WebSphere Message Broker. This value is the supplied default value.

**Change, Copy, and Create Topic:**

The Change Topic command changes existing topic definitions. The Copy and Create Topic commands create new topic definitions - the Copy command uses attribute values of an existing topic definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

The Change Topic (MQCMD\_CHANGE\_TOPIC) command changes the specified attributes of an existing IBM MQ administrative topic definition. For any optional parameters that are omitted, the value does not change.

The Copy Topic (MQCMD\_COPY\_TOPIC) command creates an IBM MQ administrative topic definition by using, for attributes not specified in the command, the attribute values of an existing topic definition.

The Create Topic (MQCMD\_CREATE\_TOPIC) command creates an IBM MQ administrative topic definition. Any attributes that are not defined explicitly are set to the default values on the destination queue manager.

### Required parameter (Change Topic)

#### *TopicName* (MQCFST)

The name of the administrative topic definition to be changed (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

### Required parameters (Copy Topic)

#### *FromTopicName* (MQCFST)

The name of the administrative topic object definition to be copied from (parameter identifier: MQCACF\_FROM\_TOPIC\_NAME).

 On z/OS, the queue manager searches for an object with the name you specify and a disposition of MQQSGD\_Q\_MGR or MQQSGD\_COPY to copy from. This parameter is ignored if a value of MQQSGD\_COPY is specified for *QSGDisposition*. In this case, an object with the name specified by *ToTopicName* and the disposition MQQSGD\_GROUP is searched for to copy from.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

#### *TopicString* (MQCFST)

The topic string (parameter identifier: MQCA\_TOPIC\_STRING). This string uses the forward slash (/) character as a delimiter for elements within the topic tree.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

#### *ToTopicName* (MQCFST)

The name of the administrative topic definition to copy to (parameter identifier: MQCACF\_TO\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

### Required parameters (Create Topic)

#### *TopicName* (MQCFST)

The name of the administrative topic definition to be created (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

#### *TopicString* (MQCFST)

The topic string (parameter identifier: MQCA\_TOPIC\_STRING).

This parameter is required and cannot contain the empty string. The "/" character within this string has a special meaning. It delimits the elements in the topic tree. A topic string can start with the "/" character but is not required to. A string starting with the "/" character is not the same as a string that does not start with the "/" character. A topic string cannot end with the "/" character.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

### Optional parameters (Change, Copy, and Create Topic)

#### *ClusterName* (MQCFST)

The name of the cluster to which this topic belongs. (parameter identifier: MQCA\_CLUSTER\_NAME). The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see Distributed publish/subscribe networks.

The value can be any of the following values:

**Blank** If no topic object above this topic in the topic tree has set this parameter to a cluster name,

then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

**String** The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if `PublicationScope` or `SubscriptionScope` are set to `MQSCOPE_ALL`, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

#### *ClusterPubRoute* (**MQCFIN**)

The routing behavior of publications between queue managers in a cluster (parameter identifier: `MQIA_CLUSTER_PUB_ROUTE`).

The value can be any of the following values:

#### **MQCLROUTE\_DIRECT**

When you configure a direct routed clustered topic on a queue manager, all queue managers in the cluster become aware of all other queue managers in the cluster. When performing publish and subscribe operations, each queue manager can connect direct to any other queue manager in the cluster.

#### **MQCLROUTE\_TOPIC\_HOST**

When you use topic host routing, all queue managers in the cluster become aware of the cluster queue managers that host the routed topic definition (that is, the queue managers on which you have defined the topic object). When performing publish and subscribe operations, queue managers in the cluster connect only to these topic host queue managers, and not directly to each other. The topic host queue managers are responsible for routing publications from queue managers on which publications are published to queue managers with matching subscriptions.

After a topic object has been clustered (through setting the **CLUSTER** property) you cannot change the value of the **CLROUTE** property. The object must be un-clustered (**CLUSTER** set to ' ') before you can change the value. Un-clustering a topic converts the topic definition to a local topic, which results in a period during which publications are not delivered to subscriptions on remote queue managers; this should be considered when performing this change. See The effect of defining a non-cluster topic with the same name as a cluster topic from another queue manager. If you try to change the value of the **CLROUTE** property while it is clustered, the system generates an `MQRCCF_CLROUTE_NOT_ALTERABLE` exception.

See also Routing for publish/subscribe clusters: Notes on behavior and Designing publish/subscribe clusters.

#### *CommandScope* (**MQCFST**)

Command scope (parameter identifier: `MQCACF_COMMAND_SCOPE`). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *CommunicationInformation (MQCFST)*

The Multicast communication information object (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

#### *Custom (MQCFST)*

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

**V8.0.0.4** This attribute contains the values of attributes, as pairs of attribute name and value, separated by at least one space. The attribute name and value pairs have the form NAME(VALUE). Single quotation marks must be escaped with another single quotation mark.

#### **CAPEXPY ( integer )**

The maximum time, expressed in tenths of a second, until a message published to a topic which inherits properties from this object, remains in the system until it becomes eligible for expiry processing.

For more information on message expiry processing, see Enforcing lower expiration times.

The value can be one of the following:

##### **integer**

The value must be in the range one through to 999 999 999.

##### **NOLIMIT**

There is no limit on the expiry time of messages put using this object.

##### **ASPARENT**

The maximum message expiry time is based on the setting of the closest parent administrative topic object in the topic tree. This is the default value.

Specifying a value for CAPEXPY that is not valid, does not cause the command to fail. Instead,, the default value is used.

#### *DefPersistence (MQCFIN)*

Default persistence (parameter identifier: MQIA\_TOPIC\_DEF\_PERSISTENCE).

Specifies the default for message-persistence of messages published to the topic. Message persistence determines whether messages are preserved across restarts of the queue manager.

The value can be any of the following values:

##### **MQPER\_PERSISTENCE\_AS\_PARENT**

The default persistence is based on the setting of the closest parent administrative topic object in the topic tree.

##### **MQPER\_PERSISTENT**

Message is persistent.

##### **MQPER\_NOT\_PERSISTENT**

Message is not persistent.

#### *DefPriority (MQCFIN)*

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

Specifies the default priority of messages published to the topic.

Specify either:

*integer*

The default priority to be used, in the range zero through to the maximum priority value that is supported (9).

**MQPRI\_PRIORITY\_AS\_PARENT**

The default priority is based on the setting of the closest parent administrative topic object in the topic tree.

*DefPutResponse* (**MQCFIN**)

Default put response (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

The value can be:

**MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

**MQPRT\_RESPONSE\_AS\_PARENT**

The default put response is based on the setting of the closest parent administrative topic object in the topic tree.

**MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

*DurableModelQName* (**MQCFST**)

Name of the model queue to be used for durable subscriptions (parameter identifier: MQCA\_MODEL\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

*DurableSubscriptions* (**MQCFIN**)

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA\_DURABLE\_SUB).

The value can be:

**MQSUB\_DURABLE\_AS\_PARENT**

Whether durable subscriptions are permitted is based on the setting of the closest parent administrative topic object in the topic tree.

**MQSUB\_DURABLE\_ALLOWED**

Durable subscriptions are permitted.

**MQSUB\_DURABLE\_INHIBITED**

Durable subscriptions are not permitted.

*InhibitPublications* (**MQCFIN**)

Whether publications are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_PUB).

The value can be:

**MQTA\_PUB\_AS\_PARENT**

Whether messages can be published to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQTA\_PUB\_INHIBITED**

Publications are inhibited for this topic.

**MQTA\_PUB\_ALLOWED**

Publications are allowed for this topic.

*InhibitSubscriptions* (**MQCFIN**)

Whether subscriptions are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_SUB).

The value can be:

**MQTA\_SUB\_AS\_PARENT**

Whether applications can subscribe to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQTA\_SUB\_INHIBITED**

Subscriptions are inhibited for this topic.

**MQTA\_SUB\_ALLOWED**

Subscriptions are allowed for this topic.

***Multicast (MQCFIN)***

Whether multicast is allowable in the topic tree (parameter identifier: MQIA\_MULTICAST).

The value can be:

**MQMC\_AS\_PARENT**

Whether multicast is allowed on this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQMC\_ENABLED**

Multicast is allowed on this topic.

**MQMC\_DISABLED**

Multicast is not allowed on this topic.

**MQMC\_ONLY**

Only subscriptions and publications made using multicast are allowed on this topic.

***NonDurableModelQName (MQCFST)***

Name of the model queue to be used for non-durable subscriptions (parameter identifier: MQCA\_MODEL\_NON\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

***NonPersistentMsgDelivery (MQCFIN)***

The delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA\_NPM\_DELIVERY).

The value can be:

**MQDLV\_AS\_PARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**MQDLV\_ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_DUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_AVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

***PersistentMsgDelivery (MQCFIN)***

The delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA\_PM\_DELIVERY).

The value can be:

### **MQDLV\_AS\_PARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

### **MQDLV\_ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

### **MQDLV\_ALL\_DUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

### **MQDLV\_ALL\_AVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

### *ProxySubscriptions* (**MQCFIN**)

Whether a proxy subscription is to be sent for this topic to directly connected queue managers, even if no local subscriptions exist (parameter identifier: MQIA\_PROXY\_SUB).

The value can be:

### **MQTA\_PROXY\_SUB\_FORCE**

A proxy subscription is sent to connected queue managers even if no local subscriptions exist.

**Note:** The proxy subscription is sent when this value is set on Create or Change of the topic.

### **MQTA\_PROXY\_SUB\_FIRSTUSE**

For each unique topic string at or below this topic object, a proxy subscription is asynchronously sent to all neighboring queue managers in the following scenarios:

- When a local subscription is created.
- When a proxy subscription is received that must be propagated to further directly connected queue managers.

This value is the default value for this parameter if no value is specified.

### *PublicationScope* (**MQCFIN**)

Whether this queue manager propagates publications for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_PUB\_SCOPE).

The value can be:

### **MQSCOPE\_AS\_PARENT**

Whether this queue manager propagates publications, for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This value is the default value for this parameter if no value is specified.

### **MQSCOPE\_QMGR**

Publications for this topic are not propagated to other queue managers.

### **MQSCOPE\_ALL**

Publications for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

**Note:** This behavior can be over-ridden on a publication-by-publication basis, by using MQPMO\_SCOPE\_QMGR on the Put Message Options.

**z/OS QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

QSGDisposition	Change	Copy, Create
<b>MQQSGD_COPY</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined by using a command that had the parameter MQQSGD_COPY. Any object residing in the shared repository, or any object defined by using a command that had the parameters MQQSGD_Q_MGR, is not affected by this command.	The object is defined on the page set of the queue manager that executes the command by using the MQQSGD_GROUP object of the same name as the <i>ToTopicName</i> object (for Copy) or <i>TopicName</i> object (for Create).
<b>MQQSGD_GROUP</b>	<p>The object definition resides in the shared repository. The object was defined by using a command that had the parameter MQQSGD_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.</p> <p>If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group so that they refresh local copies on page set zero:</p> <pre>DEFINE TOPIC(name) REPLACE QSGDISP(COPY)</pre> <p>The Change for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>	<p>The object definition resides in the shared repository. This definition is allowed only if the queue manager is in a queue-sharing group.</p> <p>If the definition is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group so that they make or refresh local copies on page set zero:</p> <pre>DEFINE TOPIC(name) REPLACE QSGDISP(COPY)</pre> <p>The Copy or Create for the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.</p>
<b>MQQSGD_PRIVATE</b>	The object resides on the page set of the queue manager that executes the command, and was defined with MQQSGD_Q_MGR or MQQSGD_COPY. Any object residing in the shared repository is unaffected.	Not permitted.
<b>MQQSGD_Q_MGR</b>	The object definition resides on the page set of the queue manager that executes the command. The object was defined using a command that had the parameter MQQSGD_Q_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command. This value is the default value.	The object is defined on the page set of the queue manager that executes the command. This value is the default value.

**Replace (MQCFIN)**

Replace attributes (parameter identifier: MQIACF\_REPLACE).

If a topic definition with the same name as *ToTopicName* exists, this parameter specifies whether it is to be replaced. The value can be as follows:

**MQRP\_YES**

Replace existing definition.

**MQRP\_NO**

Do not replace existing definition.

**SubscriptionScope (MQCFIN)**

Whether this queue manager propagates subscriptions for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_SUB\_SCOPE).

The value can be:

**MQSCOPE\_AS\_PARENT**

Whether this queue manager propagates subscriptions, for this topic, to queue managers as part of a hierarchy or as part of a publish/subscribe-cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

This value is the default value for this parameter if no value is specified.

**MQSCOPE\_QMGR**

Subscriptions for this topic are not propagated to other queue managers.

**MQSCOPE\_ALL**

Subscriptions for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

**Note:** This behavior can be over-ridden on a subscription-by-subscription basis, by using MQSO\_SCOPE\_QMGR on the Subscription Descriptor or SUBSCOPE(QMGR) on DEFINE SUB.

**TopicDesc (MQCFST)**

Topic description (parameter identifier: MQCA\_TOPIC\_DESC).

Text that briefly describes the object

The maximum length is MQ\_TOPIC\_DESC\_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the message queue manager on which the command is executing to ensure that the text is translated correctly if it is sent to another queue manager.

**TopicType (MQCFIN)**

Topic type (parameter identifier: MQIA\_TOPIC\_TYPE).

The value specified must match the type of the topic being changed. The value can be:

**MQTOPT\_LOCAL**

Local topic object

**UseDLQ (MQCFIN)**

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value can be any of the following values:

**MQUSEDLQ\_AS\_PARENT**

Determines whether to use the dead-letter queue using the setting of the closest administrative topic object in the topic tree. This value is the default supplied with IBM MQ, but your installation might have changed it.

**MQUSEDLQ\_NO**

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message. The MQPUT of an application to a topic fails in accordance with the settings of MQIA\_NPM\_DELIVERY and MQIA\_PM\_DELIVERY.

## MQUSEDLQ\_YES

If the DEADQ queue manager attribute provides the name of a dead-letter queue then it is used, otherwise the behavior is as for MQUSEDLQ\_NO.

## *WildcardOperation* (MQCFIN)

Behavior of subscriptions including wildcards made to this topic (parameter identifier: MQIA\_WILDCARD\_OPERATION).

The value can be:

### MQTA\_PASSTHRU

A less specific wildcard subscription is a subscription made by using wildcard topic names that are less specific than the topic string at this topic object. MQTA\_PASSTHRU lets less specific wildcard subscriptions receive publications made to this topic and to topic strings more specific than this topic. This value is the default supplied with IBM MQ.

### MQTA\_BLOCK

A less specific wildcard subscription is a subscription made by using wildcard topic names that are less specific than the topic string at this topic object. MQTA\_BLOCK stops less specific wildcard subscriptions receiving publications made to this topic or to topic strings more specific than this topic.

This value of this attribute is used when subscriptions are defined. If you alter this attribute, the set of topics covered by existing subscriptions is not affected by the modification. This value applies also, if the topology is changed when topic objects are created or deleted; the set of topics matching subscriptions created following the modification of the *WildcardOperation* attribute is created by using the modified topology. If you want to force the matching set of topics to be re-evaluated for existing subscriptions, you must restart the queue manager.

## Clear Queue:

The Clear Queue (MQCMD\_CLEAR\_Q) command deletes all the messages from a local queue.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

The command fails if the queue contains uncommitted messages.

## Required parameters

### *QName* (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

The name of the local queue to be cleared. The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Note:** The target queue must be type local.

### ▶ z/OS

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### ***QSGDisposition* (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_PRIVATE**

Clear the private queue named in *QName*. The queue is private if it was created using a command with the attributes MQQSGD\_PRIVATE or MQQSGD\_Q\_MGR. This value is the default value.

#### **MQQSGD\_SHARED**

Clear the shared queue named in *QName*. The queue is shared if it was created using a command with the attribute MQQSGD\_SHARED. This value applies only to local queues.

#### **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown on page “Error codes applicable to all commands” on page 1051.

#### ***Reason* (MQLONG)**

The value can be any of the following values:

#### **MQRC\_Q\_NOT\_EMPTY**

(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

This reason occurs only if there are uncommitted updates.

#### **MQRCCF\_Q\_WRONG\_TYPE**

Action not valid for the queue of specified type.

## Clear Topic String:

The Clear Topic String (MQCMD\_CLEAR\_TOPIC\_STRING) command clears the retained message which is stored for the specified topic.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

## Required parameters

### *TopicString* (MQCFST)

Topic String (parameter identifier: MQCA\_TOPIC\_STRING).

The topic string to be cleared The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

### *ClearType* (MQCFIN)

Clear type (parameter identifier: MQIACF\_CLEAR\_TYPE).

Specifies the type of clear command being issued. The value must be:

MQCLRT\_RETAINED Remove the retained publication from the specified topic string.

## Optional parameters

### *Scope* (MQCFIN)

Scope of clearance (parameter identifier: MQIACF\_CLEAR\_SCOPE).

Whether the topic string is to be cleared locally or globally. The value can be:

#### **MQCLRS\_LOCAL**

The retained message is removed from the specified topic string at the local queue manager only.

### ▶ z/OS

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Delete Authentication Information Object:

The Delete authentication information (MQCMD\_DELETE\_AUTH\_INFO) command deletes the specified authentication information object.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

## Required parameters

### *AuthInfoName* (MQCFST)

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

### ▶ z/OS

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_COPY**

The object definition resides on the page set of the queue manager which executes this command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object in the shared repository, or any object defined by a command using the parameter MQQSGD\_Q\_MGR, is not affected by this command.

#### **MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to delete local copies on page set zero:

```
DELETE AUTHINFO(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

### **Delete Authority Record:**

The Delete Authority Record (MQCMD\_DELETE\_AUTH\_REC) command deletes an authority record. The authorizations associated with the profile no longer apply to IBM MQ objects with names that match the profile name specified.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

### **Required parameters**

#### *ObjectType* (MQCFIN)

The type of object for which to delete authorizations (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be any of the following values:

#### **MQOT\_AUTH\_INFO**

Authentication information.

#### **MQOT\_CHANNEL**

Channel object.

#### **MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

#### **MQOT\_COMM\_INFO**

Communication information object

#### **MQOT\_LISTENER**

Listener object.

#### **MQOT\_NAMELIST**

Namelist.

#### **MQOT\_PROCESS**

Process.

#### **MQOT\_Q**

Queue, or queues, that match the object name parameter.

#### **MQOT\_Q\_MGR**

Queue manager.

#### **MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

#### **MQOT\_SERVICE**

Service object.

## **MQOT\_TOPIC**

Topic object.

### ***ProfileName* (MQCFST)**

Name of the profile to be deleted (parameter identifier: MQCACF\_AUTH\_PROFILE\_NAME).

If you have defined a generic profile then you can specify it here, using wildcard characters to specify a named generic profile to be removed. If you specify an explicit profile name, the object must exist.

The maximum length of the string is MQ\_AUTH\_PROFILE\_NAME\_LENGTH.

### **Optional parameters**

#### ***GroupNames* (MQCFSL)**

Group names (parameter identifier: MQCACF\_GROUP\_ENTITY\_NAMES).

The names of groups having a profile deleted. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ\_ENTITY\_NAME\_LENGTH.

#### ***PrincipalNames* (MQCFSL)**

Principal names (parameter identifier: MQCACF\_PRINCIPAL\_ENTITY\_NAMES).

The names of principals having a profile deleted. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ\_ENTITY\_NAME\_LENGTH.

### **Error codes (Delete Authority Record)**

This command might return the following error codes in the response format header, in addition to the values shown on page "Error codes applicable to all commands" on page 1051.

#### ***Reason* (MQLONG)**

The value can be any of the following values:

##### **MQRC\_OBJECT\_TYPE\_ERROR**

Invalid object type.

##### **MQRC\_UNKNOWN\_ENTITY**

Userid not authorized, or unknown.

##### **MQRCCF\_ENTITY\_NAME\_MISSING**

Entity name missing.

##### **MQRCCF\_OBJECT\_TYPE\_MISSING**

Object type missing.

##### **MQRCCF\_PROFILE\_NAME\_ERROR**

Invalid profile name.

## Delete CF Structure:

The Delete CF Structure (MQCMD\_DELETE\_CF\_STRUC) command deletes an existing CF application structure definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue-sharing group.

### Required parameters

#### *CFStrucName* (MQCFST)

CF structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The CF application structure definition to be deleted. The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

### Delete Channel:

The Delete Channel (MQCMD\_DELETE\_CHANNEL) command deletes the specified channel definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### Required parameters

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel definition to be deleted. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### Optional parameters

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

#### *ChannelType* (MQCFIN)

The type of channel (parameter identifier: MQIACH\_CHANNEL\_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when deleting a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT\_MQTT**.

#### *ChannelTable* (MQCFIN)

Channel table (parameter identifier: MQIACH\_CHANNEL\_TABLE).

Specifies the ownership of the channel definition table that contains the specified channel definition.

The value can be any of the following values:

#### **MQCHTAB\_Q\_MGR**

Queue-manager table.

MQCHTAB\_Q\_MGR is the default. This table contains channel definitions for channels of all types except MQCHT\_CLNTCONN.

### **MQCHTAB\_CLNTCONN**

Client-connection table.

This table only contains channel definitions for channels of type MQCHT\_CLNTCONN.

This parameter is not applicable to IBM MQ Telemetry.

#### **z/OS** *CommandScope* (**MQCFST**)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### **z/OS** *QSGDisposition* (**MQCFIN**)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined by a command using the parameter MQQSGD\_Q\_MGR, is not affected by this command.

#### **MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameters MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to delete local copies on page set zero:

```
DELETE CHANNEL(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

#### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

This command might return the following error codes in the response format header, in addition to the values shown on page “Error codes applicable to all commands” on page 1051.

### Error codes

#### *Reason (MQLONG)*

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

#### **MQRCCF\_CHANNEL\_TABLE\_ERROR**

Channel table value not valid.

### Delete Channel (MQTT):

The Delete Telemetry Channel (MQCMD\_DELETE\_CHANNEL) command deletes the specified channel definition.

### Required parameters

#### *ChannelName (MQCFST)*

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel definition to be deleted. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### *ChannelType (MQCFIN)*

The type of channel (parameter identifier: MQIACH\_CHANNEL\_TYPE). Required when deleting a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT\_MQTT**.

### Optional parameters

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

#### *ChannelTable (MQCFIN)*

Channel table (parameter identifier: MQIACH\_CHANNEL\_TABLE).

Specifies the ownership of the channel definition table that contains the specified channel definition.

The value can be any of the following values:

#### **MQHTAB\_Q\_MGR**

Queue-manager table.

MQHTAB\_Q\_MGR is the default. This table contains channel definitions for channels of all types except MQCHT\_CLNTCONN.

#### **MQHTAB\_CLNTCONN**

Client-connection table.

This table only contains channel definitions for channels of type MQCHT\_CLNTCONN.

This parameter is not applicable to IBM MQ Telemetry.

#### *CommandScope (MQCFST)*

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined by a command using the parameter MQQSGD\_Q\_MGR, is not affected by this command.

#### **MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameters MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to delete local copies on page set zero:

```
DELETE CHANNEL(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

#### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

This command might return the following error codes in the response format header, in addition to the values shown on page “Error codes applicable to all commands” on page 1051.

#### **Error codes**

##### *Reason* (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

#### **MQRCCF\_CHANNEL\_TABLE\_ERROR**

Channel table value not valid.

## Delete Channel Listener:

The Delete Channel Listener (MQCMD\_DELETE\_LISTENER) command deletes an existing channel listener definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux systems	Windows	z/OS
	✓	✓	✓	

### Required parameters

#### *ListenerName* (MQCFST)

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME).

This parameter is the name of the listener definition to be deleted. The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

## Delete Communication Information Object:

The Delete Communication Information Object (MQCMD\_DELETE\_COMM\_INFO) command deletes the specified communication information object.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

### Required parameter

#### *CommInfoName* (MQCFST)

The name of the communication information definition to be deleted (parameter identifier: MQCA\_COMM\_INFO\_NAME).

## Delete Namelist:

The Delete Namelist (MQCMD\_DELETE\_NAMELIST) command deletes an existing namelist definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### Required parameters

#### *NamelistName* (MQCFST)

Namelist name (parameter identifier: MQCA\_NAMELIST\_NAME).

This parameter is the name of the namelist definition to be deleted. The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

#### z/OS

### Optional parameters

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *QSGDisposition* (**MQCFIN**)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

#### **MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to delete local copies on page set zero:  
DELETE NAMLIST(name) QSGDISP(COPY)

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

#### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

## Delete Policy:

The Delete Policy (MQCMD\_DELETE\_PROT\_POLICY) command deletes a security policy.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

## Required parameters

### *Policy-name* (MQCFST)

The name of the security policy to be deleted (parameter identifier: MQCA\_POLICY\_NAME).

The name of the policy, or policies, to delete are the same as the name of the queue, or queues, that the policies control.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

## Error codes (Delete Security Policy)

This command might return the following error codes in the response format header, in addition to the values shown on page “Error codes applicable to all commands” on page 1051.

### *Reason* (MQLONG)

The value can be any of the following values:

#### **MQRC\_OBJECT\_TYPE\_ERROR**

Invalid object type.

#### **MQRCCF\_POLICY\_NAME\_ERROR**

Invalid policy name.

## Delete Process:

The Delete Process (MQCMD\_DELETE\_PROCESS) command deletes an existing process definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

## Required parameters

### *ProcessName* (MQCFST)

Process name (parameter identifier: MQCA\_PROCESS\_NAME).

The process definition to be deleted. The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

### ▶ z/OS

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *QSGDisposition* (**MQCFIN**)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

#### **MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to delete local copies on page set zero:

```
DELETE PROCESS(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

#### **MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

## Delete Queue:

The Delete Queue (MQCMD\_DELETE\_Q) command deletes a queue.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### Required parameters

#### *QName* (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

The name of the queue to be deleted.

If the *Scope* attribute of the queue is MQSCO\_CELL, the entry for the queue is deleted from the cell directory.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### Optional parameters

#### *Authrec* (MQCFIN)

Authrec (parameter identifier: MQIACF\_REMOVE\_AUTHREC).

Specifies whether the associated authority record is also deleted.

This parameter does not apply to z/OS.

The value can be any of the following values:

#### **MQRAR\_YES**

The authority record associated with the object is deleted. This is the default.

#### **MQRAR\_NO**

The authority record associated with the object is not deleted.

#### ▶ z/OS

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *Purge* (MQCFIN)

Purge queue (parameter identifier: MQIACF\_PURGE).

If there are messages on the queue MQPO\_YES must be specified, otherwise the command fails. If this parameter is not present the queue is not purged.

Valid only for queue of type local.

The value can be any of the following values:

**MQPO\_YES**

Purge the queue.

**MQPO\_NO**

Do not purge the queue.

**z/OS**

***QSGDisposition* (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

**MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the deletion is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to delete local copies on page set zero:

```
DELETE queue(q-name) QSGDISP(COPY)
```

or, for a local queue only:

```
DELETE QLOCAL(q-name) NOPURGE QSGDISP(COPY)
```

The deletion of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

**Note:** You always get the NOPURGE option even if you specify MQPO\_YES for *Purge*. To delete messages on local copies of the queues, you must explicitly issue, for each copy, the Delete Queue command with a *QSGDisposition* value of MQQSGD\_COPY and a *Purge* value of MQPO\_YES.

**MQQSGD\_Q\_MGR**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

**MQQSGD\_SHARED**

Valid only for queue of type local.

The object resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_SHARED. Any object residing on the page set of the queue manager that executes the command, or any object defined by a command using the parameter MQQSGD\_GROUP, is not affected by this command.

**QType (MQCFIN)**

Queue type (parameter identifier: MQIA\_Q\_TYPE).

If this parameter is present, the queue must be of the specified type.

The value can be:

**MQQT\_ALIAS**

Alias queue definition.

**MQQT\_LOCAL**

Local queue.

**MQQT\_REMOTE**

Local definition of a remote queue.

**MQQT\_MODEL**

Model queue definition.

**Error codes (Delete Queue)**

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRC\_Q\_NOT\_EMPTY**

(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

**Delete Service:**

The Delete Service (MQCMD\_DELETE\_SERVICE) command deletes an existing service definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux systems	Windows	z/OS
	✓	✓	✓	

**Required parameters**

**ServiceName (MQCFST)**

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

This parameter is the name of the service definition to be deleted.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

**Delete Storage Class:** z/OS

The Delete Storage Class (MQCMD\_DELETE\_STG\_CLASS) command deletes an existing storage class definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Required parameters**

**StorageClassName (MQCFST)**

Storage class name (parameter identifier: MQCA\_STORAGE\_CLASS).

The storage class definition to be deleted. The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

**Optional parameters**

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_COPY**

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

**MQQSGD\_GROUP**

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the command is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to delete local copies on page set zero:

```
DELETE STGCLASS(name) QSGDISP(COPY)
```

The deletion of the group object takes effect regardless of whether the generated command with QSGDISP(COPY) fails.

### MQQSGD\_Q\_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

### Delete Subscription:

The Delete Subscription (MQCMD\_DELETE\_SUBSCRIPTION) command deletes a subscription.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### Required parameters

#### *SubName* (MQCFST)

Subscription name (parameter identifier: MQCACF\_SUB\_NAME).

Specifies the unique subscription name. The subscription name, if provided, must be fully specified; a wildcard is not acceptable.

The subscription name must refer to a durable subscription.

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be deleted.

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

#### *SubId* (MQCFBS)

Subscription identifier (parameter identifier: MQBACF\_SUB\_ID).

Specifies the unique internal subscription identifier.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

### Optional parameters

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter on which to filter.

### Delete Topic:

The Delete Topic (MQCMD\_DELETE\_TOPIC) command deletes the specified administrative topic object.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### Required parameters

#### *TopicName* (MQCFST)

The name of the administrative topic definition to be deleted (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

### Optional parameters

#### *Authrec* (MQCFIN)

Authrec (parameter identifier: MQIACF\_REMOVE\_AUTHREC).

Specifies whether the associated authority record is also deleted.

This parameter does not apply to z/OS.

The value can be any of the following values:

#### **MQRAR\_YES**

The authority record associated with the object is deleted. This is the default.

#### **MQRAR\_NO**

The authority record associated with the object is not deleted.

#### ▶ z/OS *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### ▶ z/OS

#### *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object to which you are applying the command (that is, where it is defined and how it behaves). The value can be any of the following values:

### MQQSGD\_COPY

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_COPY. Any object residing in the shared repository, or any object defined using a command that had the parameters MQQSGD\_Q\_MGR, is not affected by this command.

### MQQSGD\_GROUP

The object definition resides in the shared repository. The object was defined by a command using the parameter MQQSGD\_GROUP. Any object residing on the page set of the queue manager that executes the command (except a local copy of the object) is not affected by this command.

If the deletion is successful, the following MQSC command is generated and sent to all active queue managers in the queue-sharing group to make, or delete, local copies on page set zero:  
DELETE TOPIC(name) QSGDISP(COPY)

The deletion of the group object takes effect even if the generated command with QSGDISP(COPY) fails.

### MQQSGD\_Q\_MGR

The object definition resides on the page set of the queue manager that executes the command. The object was defined by a command using the parameter MQQSGD\_Q\_MGR. Any object residing in the shared repository, or any local copy of such an object, is not affected by this command.

MQQSGD\_Q\_MGR is the default value.

### Escape:

The Escape (MQCMD\_ESCAPE) command conveys any IBM MQ command (MQSC) to a remote queue manager.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	

Use the Escape command when the queue manager (or application) sending the command does not support the particular IBM MQ command, and so does not recognize it and cannot construct the required PCF command.

The Escape command can also be used to send a command for which no Programmable Command Format has been defined.

The only type of command that can be carried is one that is identified as an MQSC, that is recognized at the receiving queue manager.

### Required parameters

#### EscapeType (MQCFIN)

Escape type (parameter identifier: MQIACF\_ESCAPE\_TYPE).

The only value supported is:

#### MQET\_MQSC

IBM MQ command.

#### EscapeText (MQCFST)

Escape text (parameter identifier: MQCACF\_ESCAPE\_TEXT).

A string to hold a command. The length of the string is limited only by the size of the message.

### Error codes

This command might return the following error code in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

#### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_ESCAPE\_TYPE\_ERROR**

Escape type not valid.

### Escape (Response):

The response to the Escape (MQCMD\_ESCAPE) command consists of the response header followed by two parameter structures, one containing the escape type, and the other containing the text response. More than one such message might be issued, depending upon the command contained in the Escape request.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	

The *Command* field in the response header MQCFH contains the MQCMD\_\* command identifier of the text command contained in the *EscapeText* parameter in the original Escape command. For example, if *EscapeText* in the original Escape command specified PING QMGR, *Command* in the response has the value MQCMD\_PING\_Q\_MGR.

If it is possible to determine the outcome of the command, the *CompCode* in the response header identifies whether the command was successful. The success or otherwise can therefore be determined without the recipient of the response having to parse the text of the response.

If it is not possible to determine the outcome of the command, *CompCode* in the response header has the value MQCC\_UNKNOWN, and *Reason* is MQRC\_NONE.

### Parameters

#### EscapeType (MQCFIN)

Escape type (parameter identifier: MQIACF\_ESCAPE\_TYPE).

The only value supported is:

#### **MQET\_MQSC**

IBM MQ command.

#### EscapeText (MQCFST)

Escape text (parameter identifier: MQCACF\_ESCAPE\_TEXT).

A string holding the response to the original command.

**Inquire Archive:** 

The Inquire Archive (MQCMD\_INQUIRE\_ARCHIVE) command returns archive system parameters and information.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**Inquire Archive (Response):** 

The response to the Inquire Archive (MQCMD\_INQUIRE\_ARCHIVE) command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of *ParameterType*.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Always returned:**

*ParameterType* Specifies the type of archive information being returned. The value can be any of the following values:

**MQSYSP\_TYPE\_INITIAL**

The initial settings of the archive parameters.

**MQSYSP\_TYPE\_SET**

The settings of the archive parameters if they have been altered since their initial setting.

**MQSYSP\_TYPE\_ARCHIVE\_TAPE**

Parameters relating to the tape unit (if in use). There is one such message per tape unit in use for archive logging.

**Returned if *ParameterType* is MQSYSP\_TYPE\_INITIAL (one message is returned):**

*AllocPrimary, AllocSecondary, AllocUnits, ArchivePrefix1, ArchivePrefix2, ArchiveRetention, ArchiveUnit1, ArchiveUnit2, ArchiveWTOR, BlockSize, Catalog, Compact, Protect, QuiesceInterval, RoutingCode, TimeStampFormat*

**Returned if *ParameterType* is MQSYSP\_TYPE\_SET and any value is set (one message is returned):**

*AllocPrimary, AllocSecondary, AllocUnits, ArchivePrefix1, ArchivePrefix2, ArchiveRetention, ArchiveUnit1, ArchiveUnit2, ArchiveWTOR, BlockSize, Catalog, Compact, Protect, QuiesceInterval, RoutingCode, TimeStampFormat*

**Returned if *ParameterType* is MQSYSP\_TYPE\_ARCHIVE\_TAPE (one message is returned for each tape unit in use for archive logging):**

*DataSetName, LogCorrelId, UnitAddress, UnitStatus, UnitVolser*

### **Response data - archive parameter information**

#### ***AllocPrimary* (MQCFIN)**

Primary space allocation for DASD data sets (parameter identifier: MQIACF\_SYSP\_ALLOC\_PRIMARY).

Specifies the primary space allocation for DASD data sets in the units specified in the *AllocUnits* parameter.

#### ***AllocSecondary* (MQCFIN)**

Secondary space allocation for DASD data sets (parameter identifier: MQIACF\_SYSP\_ALLOC\_SECONDARY).

Specifies the secondary space allocation for DASD data sets in the units specified in the *AllocUnits* parameter.

#### ***AllocUnits* (MQCFIN)**

Allocation unit (parameter identifier: MQIACF\_SYSP\_ALLOC\_UNIT).

Specifies the unit in which primary and secondary space allocations are made. The value can be any of the following values:

**MQSYSP\_ALLOC\_BLK**

Blocks.

**MQSYSP\_ALLOC\_TRK**

Tracks.

**MQSYSP\_ALLOC\_CYL**

Cylinders.

#### ***ArchivePrefix1* (MQCFST)**

Prefix for the first archive log data set name (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_PFX1).

The maximum length of the string is MQ\_ARCHIVE\_PFX\_LENGTH.

#### ***ArchivePrefix2* (MQCFST)**

Prefix for the second archive log data set name (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_PFX2).

The maximum length of the string is MQ\_ARCHIVE\_PFX\_LENGTH.

#### ***ArchiveRetention* (MQCFIN)**

Archive retention period (parameter identifier: MQIACF\_SYSP\_ARCHIVE\_RETAIN).

Specifies the retention period, in days, to be used when the archive log data set is created.

#### ***ArchiveUnit1* (MQCFST)**

Specifies the device type or unit name of the device that is used to store the first copy of the archive log data set (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_UNIT1).

The maximum length of the string is MQ\_ARCHIVE\_UNIT\_LENGTH.

#### ***ArchiveUnit2* (MQCFST)**

Specifies the device type or unit name of the device that is used to store the second copy of the archive log data set (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_UNIT2).

The maximum length of the string is MQ\_ARCHIVE\_UNIT\_LENGTH.

**ArchiveWTOR (MQCFIN)**

Specifies whether a message is to be sent to the operator and a reply is received before attempting to mount an archive log data set (parameter identifier: MQIACF\_SYSP\_ARCHIVE\_WTOR).

The value can be:

**MQSYSP\_YES**

A message is to be sent and a reply received before an attempt to mount an archive log data set.

**MQSYSP\_NO**

A message is not to be sent and a reply received before an attempt to mount an archive log data set.

**BlockSize (MQCFIN)**

Block size of the archive log data set (parameter identifier: MQIACF\_SYSP\_BLOCK\_SIZE).

**Catalog (MQCFIN)**

Specifies whether archive log data sets are cataloged in the primary integrated catalog facility (parameter identifier: MQIACF\_SYSP\_CATALOG).

The value can be:

**MQSYSP\_YES**

Archive log data sets are cataloged.

**MQSYSP\_NO**

Archive log data sets are not cataloged.

**Compact (MQCFIN)**

Specifies whether data written to archive logs is to be compacted (parameter identifier: MQIACF\_SYSP\_COMPACT).

The value can be any of the following values:

**MQSYSP\_YES**

Data is to be compacted.

**MQSYSP\_NO**

Data is not to be compacted.

**Protect (MQCFIN)**

Protection by external security manager (ESM) (parameter identifier: MQIACF\_SYSP\_PROTECT).

Specifies whether archive log data sets are protected by ESM profiles when the data sets are created.

The value can be any of the following values:

**MQSYSP\_YES**

Data set profiles are created when logs are offloaded.

**MQSYSP\_NO**

Profiles are not created.

**QuiesceInterval (MQCFIN)**

Maximum time allowed for the quiesce (parameter identifier: MQIACF\_SYSP\_QUIESCE\_INTERVAL).

Specifies the maximum time, in seconds, allowed for the quiesce.

**RoutingCode (MQCFIL)**

z/OS routing code list (parameter identifier: MQIACF\_SYSP\_ROUTING\_CODE).

Specifies the list of z/OS routing codes for messages about the archive log data sets to the operator. There can be 1 - 14 entries in the list.

*TimeStampFormat* (**MQCFIN**)

Time stamp included (parameter identifier: MQIACF\_SYSP\_TIMESTAMP).

Specifies whether the archive log data set name has a time stamp in it.

The value can be:

**MQSYSP\_YES**

Names include a time stamp.

**MQSYSP\_NO**

Names do not include a time stamp.

**MQSYSP\_EXTENDED**

Names include a time stamp.

**Response data - tape unit status information**

*DataSetName* (**MQCFST**)

Data set name (parameter identifier: MQCACF\_DATA\_SET\_NAME).

Specifies the data set name on the tape volume that is being processed, or was last processed.

The maximum length of the string is MQ\_DATA\_SET\_NAME\_LENGTH.

*LogCorrelId* (**MQCFST**)

Correlation identifier (parameter identifier: MQCACF\_SYSP\_LOG\_CORREL\_ID).

Specifies the correlation ID associated with the user of the tape being processed. This parameter is blank if there is no current user.

The maximum length of the string is MQ\_LOG\_CORREL\_ID\_LENGTH.

*UnitAddress* (**MQCFIN**)

Tape unit address: MQIACF\_SYSP\_UNIT\_ADDRESS).

Specifies the physical address of the tape unit allocated to read the archive log.

*UnitStatus* (**MQCFIN**)

Status if the tape unit: MQIACF\_SYSP\_UNIT\_STATUS).

The value can be:

**MQSYSP\_STATUS\_BUSY**

The tape unit is busy, actively processing an archive log data set.

**MQSYSP\_STATUS\_PREMOUNT**

The tape unit is active and allocated for premounting.

**MQSYSP\_STATUS\_AVAILABLE**

The tape unit is available, inactive, and waiting for work.

**MQSYSP\_STATUS\_UNKNOWN**

The tape unit status is unknown.

*UnitVolser* (**MQCFST**)

The volume serial number of the tape that is mounted (parameter identifier: MQCACF\_SYSP\_UNIT\_VOLSER).

The maximum length of the string is MQ\_VOLSER\_LENGTH.

## Inquire Authentication Information Object:

The Inquire authentication information object (MQCMD\_INQUIRE\_AUTH\_INFO) command inquires about the attributes of authentication information objects.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

## Required parameters

### *AuthInfoName* (MQCFST)

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

Specifies the name of the authentication information object about which information is to be returned.

Generic authentication information object names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all authentication information objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

## Optional parameters

### *AuthInfoAttrs* (MQCFIL)

Authentication information object attributes (parameter identifier: MQIACF\_AUTH\_INFO\_ATTRS).

The attribute list can specify the following value - the default value if the parameter is not specified):

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQIA\_ADOPT\_CONTEXT**

Adopt the presented credentials as the context for the application.

#### **MQCA\_ALTERATION\_DATE**

Date on which the definition was last altered.

#### **MQCA\_ALTERATION\_TIME**

Time at which the definition was last altered.

#### **MQCA\_AUTH\_INFO\_DESC**

Description of the authentication information object.

#### **MQCA\_AUTH\_INFO\_NAME**

Name of the authentication information object.

#### **MQIA\_AUTH\_INFO\_TYPE**

Type of authentication information object.

#### **MQCA\_AUTH\_INFO\_CONN\_NAME**

Connection name of the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT\_CRL\_LDAP or MQAIT\_IDPW\_LDAP.

#### **MQIA\_AUTHENTICATION\_FAIL\_DELAY**

Delay in seconds before an authentication failure is returned to an application.

**MQIA\_AUTHENTICATION\_METHOD**

Authentication method for user passwords.

**MQIA\_CHECK\_CLIENT\_BINDING**

Authentication requirements for client applications.

**MQIA\_CHECK\_LOCAL\_BINDING**

Authentication requirements for locally bound applications.

**MQIA\_LDAP\_AUTHORMD**

Authorization method for the queue manager.

**MQCA\_LDAP\_BASE\_DN\_GROUPS**

The base Distinguished Name for groups in the LDAP server.

**MQCA\_LDAP\_BASE\_DN\_USERS**

The base Distinguished Name for users in the LDAP server.

**MQCA\_LDAP\_FIND\_GROUP\_FIELD**

Name of the attribute used within an LDAP entry to determine group membership.

**MQCA\_LDAP\_GROUP\_ATTR\_FIELD**

LDAP attribute that represents a simple name for the group.

**MQCA\_LDAP\_GROUP\_OBJECT\_CLASS**

The LDAP object class used for group records in the LDAP repository.

**MQIA\_LDAP\_NESTGRP**

Whether LDAP groups are checked for membership of other groups.

**MQCA\_LDAP\_PASSWORD**

LDAP password in the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT\_CRL\_LDAP or MQAIT\_IDPW\_LDAP.

**MQIA\_LDAP\_SECURE\_COMM**

Whether connectivity to the LDAP server should be done securely using TLS.

**MQCA\_LDAP\_SHORT\_USER\_FIELD**

The field in the LDAP user record to be used as a short user name in IBM MQ.

**MQCA\_LDAP\_USER\_ATTR\_FIELD**

The field in the LDAP user record to be used to interpret the user ID provided by an application, if the user ID does not contain a qualifier.

**MQCA\_LDAP\_USER\_NAME**

LDAP user name in the authentication information object.

This attribute is relevant only when **AuthInfoType** is set to MQAIT\_CRL\_LDAP or MQAIT\_IDPW\_LDAP.

**MQCA\_LDAP\_USER\_OBJECT\_CLASS**

The LDAP object class used for user records in the LDAP repository.

**MQCA\_AUTH\_INFO\_OCSP\_URL**

The URL of the OCSP responder used to check for certificate revocation.

**AuthInfoType (MQCFIN)**

Type of authentication information object. The following values are accepted:

**MQAIT\_CRL\_LDAP**

Authentication information objects specifying Certificate Revocation Lists held on LDAP servers.

## MQAIT\_OCSP

Authentication information objects specifying certificate revocation checking using OCSP.

## MQAIT\_IDPW\_OS

Authentication information objects specifying certificate revocation checking using user ID and password checking through the operating system.

## MQAIT\_IDPW\_LDAP

Authentication information objects specifying certificate revocation checking using user ID and password checking through an LDAP server.

## MQAIT\_ALL

Authentication information objects of any type.

z/OS

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use **CommandScope** as a parameter to filter on.

### IntegerFilterCommand (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in **AuthInfoAttrs**, except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

z/OS

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### MQQSGD\_LIVE

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. This value is the default value if the parameter is not specified.

#### MQQSGD\_ALL

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. This value is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use **QSGDisposition** as a parameter to filter on.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in **AuthInfoAttrs**, except MQCA\_AUTH\_INFO\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. For information about using this filter condition, see “MQCFSF - PCF string filter parameter” on page 1595.

If you specify a string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter.

**Inquire Authentication Information Object (Response):**

The response of the Inquire authentication information (MQCMD\_INQUIRE\_AUTH\_INFO) command consists of the response header followed by the *AuthInfoName* structure (and on z/OS only, the *QSGDisposition* structure), and the requested combination of attribute parameter structures (where applicable).

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

**Always returned:**

*AuthInfoName* , *QSGDisposition*

**Returned if requested:**

*AdoptContext, AlterationDate, AlterationTime, AuthInfoConnName, BaseDNGroup, BaseDNUser, AuthInfoType, CheckClient, CheckLocal, ClassUser, FailureDelay, LDAPPassword, LDAPUserName, OCSPResponderURL, SecureComms, ShortUser, UserField*

**Response data**

**AdoptContext**

Whether to use the presented credentials as the context for this application.

**AlterationDate (MQCFST)**

Alteration date of the authentication information object, in the form yyyy-mm-dd (parameter identifier: MQCA\_ALTERATION\_DATE).

**AlterationTime (MQCFST)**

Alteration time of the authentication information object, in the form hh.mm.ss (parameter identifier: MQCA\_ALTERATION\_TIME).

**AuthInfoConnName (MQCFST)**

The connection name of the authentication information object (parameter identifier: MQCA\_AUTH\_INFO\_CONN\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_CONN\_NAME\_LENGTH. On z/OS, it is MQ\_LOCAL\_ADDRESS\_LENGTH.

This parameter is relevant only when AuthInfoType is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

**AuthInfoDesc (MQCFST)**

The description of the authentication information object (parameter identifier: MQCA\_AUTH\_INFO\_DESC).

The maximum length is MQ\_AUTH\_INFO\_DESC\_LENGTH.

**AuthInfoName (MQCFST)**

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

**AuthInfoType (MQCFIN)**

The type of authentication information object (parameter identifier: MQIA\_AUTH\_INFO\_TYPE).

The value can be:

**MQAIT\_CRL\_LDAP**

This authentication information object specifies Certificate Revocation Lists that are held on LDAP servers.

**MQAIT\_OCSP**

This authentication information object specifies certificate revocation checking using OCSP.

**MQAIT\_IDPW\_OS**

This authentication information object specifies certificate revocation checking using user ID and password checking through the operating system.

**MQAIT\_IDPW\_LDAP**

This authentication information object specifies certificate revocation checking using user ID and password checking through an LDAP server.

See Security for more information.

**V 8.0.0.3 AuthenticationMethod (MQCFIN)**

Authentication methods for user passwords (parameter identifier: MQIA\_AUTHENTICATION\_METHOD). Possible values are:

**MQAUTHENTICATE\_OS**

Use the traditional UNIX platforms password verification method.

**MQAUTHENTICATE\_PAM**

Use the Pluggable Authentication Method to authenticate the user passwords.

You can set the PAM value only on UNIX and Linux platforms.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS*, and is not valid on IBM MQ for z/OS.

**V 8.0.0.2 AuthorizationMethod (MQCFIN)**

Authorization methods for the queue manager (parameter identifier MQIA\_LDAP\_AUTHORMD). Possible values are:

**MQLDAP\_AUTHORMD\_OS**

Use operating system groups to determine permissions associated with a user.

### **MQLDAP\_AUTHORMD\_SEARCHGRP**

A group entry in the LDAP repository contains an attribute listing all the users belonging to that group.

### **MQLDAP\_AUTHORMD\_SEARCHUSER**

A user entry in the LDAP repository contains an attribute listing all the groups to which the specified user belongs.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* , and is not applicable to Windows platforms.

### **BaseDNGroup (MQCFST)**

In order to be able to find group names, this parameter must be set with the base DN to search for groups in the LDAP server (parameter identifier *MQCA\_LDAP\_BASE\_DN\_GROUPS*).

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* , and is not applicable to Windows platforms.

The maximum length of the string is *MQ\_LDAP\_BASE\_DN\_LENGTH*.

### **BaseDNUser (MQCFST)**

In order to be able to find the short user name attribute (see *ShortUser*) this parameter must be set with the base DN to search for users within the LDAP server.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* and is mandatory (parameter identifier *MQ\_LDAP\_BASE\_DN\_USERS*).

The maximum length is *MQ\_LDAP\_BASE\_DN\_LENGTH*.

### **Checklocal or Checkclient (MQCFIN)**

These attributes are valid only for an **AuthInfoType** of *MQAIT\_IDPW\_OS* or *MQAIT\_IDPW\_LDAP* (parameter identifier *MQIA\_CHECK\_LOCAL\_BINDING* or *MQIA\_CHECK\_CLIENT\_BINDING*). The possible values are:

#### **MQCHK\_NONE**

Switches off checking.

#### **MQCHK\_OPTIONAL**

Ensures that if a user ID and password are provided by an application, they are a valid pair, but that it is not mandatory to provide them. This option might be useful during migration, for example.

#### **MQCHK\_REQUIRED**

Requires that all applications provide a valid user ID and password.

#### **MQCHK\_REQUIRED\_ADMIN**

Privileged users must supply a valid user ID and password, but non-privileged users are treated as with the *OPTIONAL* setting. See also the following note.  (This setting is not allowed on z/OS systems.)

### **ClassGroup (MQCFST)**

The LDAP object class used for group records in the LDAP repository (parameter identifier *MQCA\_LDAP\_GROUP\_OBJECT\_CLASS*).

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* , and is not applicable to Windows platforms.

### **Classuser (MQCFST)**

The LDAP object class used for user records in the LDAP repository (parameter identifier *MQCA\_LDAP\_USER\_OBJECT\_CLASS*).

The maximum length is *MQ\_LDAP\_CLASS\_LENGTH*.

### **FailureDelay (MQCFIN)**

The failure delay (parameter identifier MQIA\_AUTHENTICATION\_FAIL\_DELAY) when an authentication fails due to the user ID or password being incorrect, in seconds, before the failure is returned to the application.

#### **V 8.0.0.2 FindGroup (MQCFST)**

Name of the attribute used within an LDAP entry to determine group membership (parameter identifier MQCA\_LDAP\_FIND\_GROUP\_FIELD).

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* **V 8.0.0.2**, and is not applicable to Windows platforms.

The maximum length of the string is MQ\_LDAP\_FIELD\_LENGTH.

#### **V 8.0.0.2 GroupField (MQCFST)**

LDAP attribute that represents a simple name for the group (parameter identifier MQCA\_LDAP\_GROUP\_ATTR\_FIELD).

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* **V 8.0.0.2**, and is not applicable to Windows platforms.

The maximum length of the string is MQ\_LDAP\_FIELD\_LENGTH.

#### **V 8.0.0.2 GroupNesting (MQCFIN)**

Whether groups are members of other groups (parameter identifier MQIA\_LDAP\_USE\_NESTED\_GROUPS). The values can be:

##### **MQLDAP\_NESTGRP\_NO**

Only the initially discovered groups are considered for authorization.

##### **MQLDAP\_NESTGRP\_YES**

The group list is searched recursively to enumerate all the groups to which a user belongs.

This attribute is valid only for an **AuthInfoType** of *MQAIT\_IDPW\_LDAP* **V 8.0.0.2**, and is not applicable to Windows platforms.

### **LDAPPassword (MQCFST)**

The LDAP password (parameter identifier: MQCA\_LDAP\_PASSWORD).

The maximum length is MQ\_LDAP\_PASSWORD\_LENGTH.

This parameter is relevant only when AuthInfoType is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

### **LDAPUserName (MQCFST)**

The LDAP user name (parameter identifier: MQCA\_LDAP\_USER\_NAME).

The Distinguished Name of the user who is binding to the directory.

The maximum length is MQ\_DISTINGUISHED\_NAME\_LENGTH. On z/OS, it is MQ\_SHORT\_DNAME\_LENGTH.

This parameter is relevant only when AuthInfoType is set to *MQAIT\_CRL\_LDAP* or *MQAIT\_IDPW\_LDAP*.

### **OCSPResponderURL (MQCFST)**

The URL of the OCSP responder used to check for certificate revocation.

#### **z/OS QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**SecureComms (MQCFIN)**

Whether connectivity to the LDAP server should be done securely using SSL/TLS (parameter identifier MQIA\_LDAP\_SECURE\_COMM).

The maximum length is MQ\_LDAP\_SECURE\_COMM\_LENGTH.

**ShortUser (MQCFST)**

A field in the user record to be used as a short user name in IBM MQ (parameter identifier MQCA\_LDAP\_SHORT\_USER\_FIELD)..

The maximum length is MQ\_LDAP\_FIELD\_LENGTH.

**UserField (MQCFST)**

Identifies the field in the LDAP user record that is used to interpret the provided user ID, only if the user ID does not contain a qualifier (parameter identifier MQCA\_LDAP\_USER\_ATTR\_FIELD).

The maximum length is MQ\_LDAP\_FIELD\_LENGTH.

**Inquire Authentication Information Object Names:**

The Inquire authentication information names (MQCMD\_INQUIRE\_AUTH\_INFO\_NAMES) command asks for a list of authentication information names that match the generic authentication information name specified.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

**Required parameters****AuthInfoName (MQCFST)**

Authentication information object name (parameter identifier: MQCA\_AUTH\_INFO\_NAME).

Specifies the name of the authentication information object about which information is to be returned.

Generic authentication information object names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all authentication information objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_AUTH\_INFO\_NAME\_LENGTH.

**Optional parameters****AuthInfoType (MQCFIN)**

Type of authentication information object. The following values are accepted:

**MQAIT\_CRL\_LDAP**

Authentication information objects specifying Certificate Revocation Lists held on LDAP servers.

**MQAIT\_OCSP**

Authentication information objects specifying certificate revocation checking using OCSP.

## MQAIT\_ALL

Authentication information objects of any type. MQAIT\_ALL is the default value

z/OS

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

z/OS

### QSGDisposition (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### MQQSGD\_LIVE

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### MQQSGD\_ALL

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

#### MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

#### MQQSGD\_PRIVATE

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

## Inquire Authentication Information Object Names (Response):

The response to the inquire authentication information names (MQCMD\_INQUIRE\_AUTH\_INFO\_NAMES) command consists of the response header followed by a parameter structure giving zero or more names that match the specified authentication information name.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

▶ **z/OS** Additionally, on z/OS only, a parameter structure, *QSGDispositions* (with the same number of entries as the *AuthInfoNames* structure), is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *AuthInfoNames* structure.

### Always returned:

*AuthInfoNames* ▶ **z/OS** , *QSGDispositions*

### Returned if requested:

None

### Response data

#### *AuthInfoNames* (MQCFSL)

List of authentication information object names (parameter identifier: MQCACF\_AUTH\_INFO\_NAMES).

▶ **z/OS**

#### *QSGDispositions* (MQCFIL)

List of QSG dispositions (parameter identifier: MQIACF\_QSG\_DISPS).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

#### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

#### MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP.

#### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

## Inquire Authority Records:

The Inquire Authority Records (MQCMD\_INQUIRE\_AUTH\_RECS) command retrieves authority records associated with a profile name.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

## Required parameters

### Options (MQCFIN)

Options to control the set of authority records that is returned (parameter identifier: MQIACF\_AUTH\_OPTIONS).

This parameter is required and you must include one of the following two values:

#### MQAUTHOPT\_NAME\_ALL\_MATCHING

Return all profiles the names of which match the specified *ProfileName*. This means that a *ProfileName* of ABCD results in the profiles ABCD, ABC\*, and AB\* being returned (if ABC\* and AB\* have been defined as profiles).

#### MQAUTHOPT\_NAME\_EXPLICIT

Return only those profiles the names of which exactly match the *ProfileName*. No matching generic profiles are returned unless the *ProfileName* is, itself, a generic profile. You cannot specify this value and MQAUTHOPT\_ENTITY\_SET.

and one of the following two values:

#### MQAUTHOPT\_ENTITY\_EXPLICIT

Return all profiles the entity fields of which match the specified *EntityName*. No profiles are returned for any group in which *EntityName* is a member; only the profile defined for the specified *EntityName*.

#### MQAUTHOPT\_ENTITY\_SET

Return the profile the entity field of which matches the specified *EntityName* and the profiles pertaining to any groups in which *EntityName* is a member that contribute to the cumulative authority for the specified entity. You cannot specify this value and MQAUTHOPT\_NAME\_EXPLICIT.

You can also optionally specify:

#### MQAUTHOPT\_NAME\_AS\_WILDCARD

Interpret *ProfileName* as a filter on the profile name of the authority records. If you do not specify this attribute and *ProfileName* contains wildcard characters, it is interpreted as a generic profile and only those authority records where the generic profile names match the value of *ProfileName* are returned.

You cannot specify MQAUTHOPT\_NAME\_AS\_WILDCARD if you also specify MQAUTHOPT\_ENTITY\_SET.

### ProfileName (MQCFST)

Profile name (parameter identifier: MQCACF\_AUTH\_PROFILE\_NAME).

This parameter is the name of the profile for which to retrieve authorizations. Generic profile names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all profiles having names that start with the selected character string. An asterisk on its own matches all possible names.

If you have defined a generic profile, you can return information about it by not setting `MQAUTHOPT_NAME_AS_WILDCARD` in *Options*.

If you set *Options* to `MQAUTHOPT_NAME_AS_WILDCARD`, the only valid value for *ProfileName* is a single asterisk (\*). This means that all authority records that satisfy the values specified in the other parameters are returned.

Do not specify *ProfileName* if the value of *ObjectType* is `MQOT_Q_MGR`.

The profile name is always returned regardless of the attributes requested.

The maximum length of the string is `MQ_AUTH_PROFILE_NAME_LENGTH`.

#### *ObjectType* (MQCFIN)

The type of object referred to by the profile (parameter identifier: `MQIACF_OBJECT_TYPE`).

The value can be any of the following values:

#### **MQOT\_ALL**

All object types. `MQOT_ALL` is the default if you do not specify a value for *ObjectType*.

#### **MQOT\_AUTH\_INFO**

Authentication information.

#### **MQOT\_CHANNEL**

Channel object.

#### **MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

#### **MQOT\_COMM\_INFO**

Communication information object

#### **MQOT\_LISTENER**

Listener object.

#### **MQOT\_NAMELIST**

Namelist.

#### **MQOT\_PROCESS**

Process.

#### **MQOT\_Q**

Queue, or queues, that match the object name parameter.

#### **MQOT\_Q\_MGR**

Queue manager.

#### **MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

#### **MQOT\_SERVICE**

Service object.

#### **MQOT\_TOPIC**

Topic object.

### Optional parameters

#### *EntityName* (MQCFST)

Entity name (parameter identifier: `MQCACF_ENTITY_NAME`).

Depending on the value of *EntityType*, this parameter is either:

- A principal name. This name is the name of a user for whom to retrieve authorizations to the specified object. On IBM MQ for Windows, the name of the principal can optionally include a domain name, specified in this format: `user@domain`.

- A group name. This name is the name of the user group on which to make the inquiry. You can specify one name only and this name must be the name of an existing user group.  
For IBM MQ for Windows only, the group name can optionally include a domain name, specified in the following formats:

```
GroupName@domain
domain\GroupName
```

The maximum length of the string is MQ\_ENTITY\_NAME\_LENGTH.

#### *EntityType* (MQCFIN)

Entity type (parameter identifier: MQIACF\_ENTITY\_TYPE).

The value can be:

#### **MQZAET\_GROUP**

The value of the *EntityName* parameter refers to a group name.

#### **MQZAET\_PRINCIPAL**

The value of the *EntityName* parameter refers to a principal name.

#### *ProfileAttrs* (MQCFIL)

Profile attributes (parameter identifier: MQIACF\_AUTH\_PROFILE\_ATTRS).

The attribute list might specify the following value on its own - the default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCACF\_ENTITY\_NAME**

Entity name.

#### **MQIACF\_AUTHORIZATION\_LIST**

Authorization list.

#### **MQIACF\_ENTITY\_TYPE**

Entity type.

**Note:** If an entity is specified by using the parameters MQCACF\_ENTITY\_NAME and MQIACF\_ENTITY\_TYPE, then all the required parameters must be passed in first.

#### *ServiceComponent* (MQCFST)

Service component (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service from which to retrieve authorization.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ\_SERVICE\_COMPONENT\_LENGTH.

### **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

#### *Reason* (MQLONG)

The value can be any of the following values:

#### **MQRC\_OBJECT\_TYPE\_ERROR**

Invalid object type.

**MQRC\_UNKNOWN\_ENTITY**  
User ID not authorized, or unknown.

**MQRCCF\_CFST\_CONFLICTING\_PARM**  
Conflicting parameters.

**MQRCCF\_PROFILE\_NAME\_ERROR**  
Invalid profile name.

**MQRCCF\_ENTITY\_NAME\_MISSING**  
Entity name missing.

**MQRCCF\_OBJECT\_TYPE\_MISSING**  
Object type missing.

**MQRCCF\_PROFILE\_NAME\_MISSING**  
Profile name missing.

### Inquire Authority Records (Response):

The response to the Inquire Authority Records (MQCMD\_INQUIRE\_AUTH\_RECS) command consists of the response header followed by the *QMgrName*, *Options*, *ProfileName*, and *ObjectType* structures and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

One PCF message is returned for each authority record that is found the profile name of which matches the options specified in the Inquire Authority Records request.

#### Always returned:

*ObjectType, Options, ProfileName, QMgrName*

#### Returned if requested:

*AuthorizationList, EntityName, EntityType*

### Response data

#### *AuthorizationList* (MQCFIL)

Authorization list (parameter identifier: MQIACF\_AUTHORIZATION\_LIST).

This list can contain zero or more authorization values. Each returned authorization value means that any user ID in the specified group or principal has the authority to perform the operation defined by that value. The value can be any of the following values:

**MQAUTH\_NONE**  
The entity has authority set to 'none'.

**MQAUTH\_ALT\_USER\_AUTHORITY**  
Specify an alternate user ID on an MQI call.

**MQAUTH\_BROWSE**  
Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

**MQAUTH\_CHANGE**  
Change the attributes of the specified object, using the appropriate command set.

**MQAUTH\_CLEAR**  
Clear a queue.

**MQAUTH\_CONNECT**  
Connect the application to the specified queue manager by issuing an MQCONN call.

**MQAUTH\_CREATE**  
Create objects of the specified type using the appropriate command set.

**MQAUTH\_DELETE**  
Delete the specified object using the appropriate command set.

**MQAUTH\_DISPLAY**  
Display the attributes of the specified object using the appropriate command set.

**MQAUTH\_INPUT**  
Retrieve a message from a queue by issuing an MQGET call.

**MQAUTH\_INQUIRE**  
Make an inquiry on a specific queue by issuing an MQINQ call.

**MQAUTH\_OUTPUT**  
Put a message on a specific queue by issuing an MQPUT call.

**MQAUTH\_PASS\_ALL\_CONTEXT**  
Pass all context.

**MQAUTH\_PASS\_IDENTITY\_CONTEXT**  
Pass the identity context.

**MQAUTH\_SET**  
Set attributes on a queue from the MQI by issuing an MQSET call.

**MQAUTH\_SET\_ALL\_CONTEXT**  
Set all context on a queue.

**MQAUTH\_SET\_IDENTITY\_CONTEXT**  
Set the identity context on a queue.

**MQAUTH\_CONTROL**  
For listeners and services, start and stop the specified channel, listener, or service.  
For channels, start, stop, and ping the specified channel.  
For topics, define, alter, or delete subscriptions.

**MQAUTH\_CONTROL\_EXTENDED**  
Reset or resolve the specified channel.

**MQAUTH\_PUBLISH**  
Publish to the specified topic.

**MQAUTH\_SUBSCRIBE**  
Subscribe to the specified topic.

**MQAUTH\_RESUME**  
Resume a subscription to the specified topic.

**MQAUTH\_SYSTEM**  
Use queue manager for internal system operations.

**MQAUTH\_ALL**  
Use all operations applicable to the object.

**MQAUTH\_ALL\_ADMIN**  
Use all operations applicable to the object.

**MQAUTH\_ALL\_MQI**  
Use all MQI calls applicable to the object.

Use the *Count* field in the MQCFIL structure to determine how many values are returned.

**EntityName (MQCFST)**

Entity name (parameter identifier: MQCACF\_ENTITY\_NAME).

This parameter can either be a principal name or a group name.

The maximum length of the string is MQ\_ENTITY\_NAME\_LENGTH.

**EntityType (MQCFIN)**

Entity type (parameter identifier: MQIACF\_ENTITY\_TYPE).

The value can be:

**MQZAET\_GROUP**

The value of the *EntityName* parameter refers to a group name.

**MQZAET\_PRINCIPAL**

The value of the *EntityName* parameter refers to a principal name.

**MQZAET\_UNKNOWN**

On Windows, an authority record still exists from a previous queue manager which did not originally contain entity type information.

**ObjectType (MQCFIN)**

Object type (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be:

**MQOT\_AUTH\_INFO**

Authentication information.

**MQOT\_CHANNEL**

Channel object.

**MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

**MQOT\_COMM\_INFO**

Communication information object

**MQOT\_LISTENER**

Listener object.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process.

**MQOT\_Q**

Queue, or queues, that match the object name parameter.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

**MQOT\_SERVICE**

Service object.

**MQOT\_TOPIC**

Topic object.

### Options (MQCFIN)

Options used to indicate the level of information that is returned (parameter identifier: MQIACF\_AUTH\_OPTIONS).

### ProfileName (MQCFST)

Profile name (parameter identifier: MQCACF\_AUTH\_PROFILE\_NAME).

The maximum length of the string is MQ\_AUTH\_PROFILE\_NAME\_LENGTH.

### QMgrName (MQCFST)

Name of the queue manager on which the Inquire command is issued (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

## Inquire Authority Service:

The Inquire Authority Service (MQCMD\_INQUIRE\_AUTH\_SERVICE) command retrieves information about the level of function supported by installed authority managers.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

## Required parameters

### AuthServiceAttrs (MQCFIL)

Authority service attributes (parameter identifier: MQIACF\_AUTH\_SERVICE\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

#### MQIACF\_ALL

All attributes.

or a combination of the following:

#### MQIACF\_INTERFACE\_VERSION

Current interface version of the authority service.

#### MQIACF\_USER\_ID\_SUPPORT

Whether the authority service supports user IDs.

## Optional parameters

### ServiceComponent (MQCFST)

Name of authorization service (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

The name of the authorization service which is to handle the Inquire Authority Service command.

If this parameter is omitted, or specified as a blank or null string, the inquire function is called in each installed authorization service in reverse order to the order in which the services have been installed, until all authorization services have been called or until one returns a value of MQZCI\_STOP in the Continuation field.

The maximum length of the string is MQ\_SERVICE\_COMPONENT\_LENGTH.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRC\_SELECTOR\_ERROR**

Attribute selector not valid.

**MQRC\_UNKNOWN\_COMPONENT\_NAME**

Unknown service component name.

**Inquire Authority Service (Response):**

The response to the Inquire Authority Service (MQCMD\_INQUIRE\_AUTH\_SERVICE) command consists of the response header followed by the *ServiceComponent* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

**Always returned:**

*ServiceComponent*

**Returned if requested:**

*InterfaceVersion, UserIDSupport*

**Response data**

***InterfaceVersion* (MQCFIN)**

Interface version (parameter identifier: MQIACF\_INTERFACE\_VERSION).

This parameter is the current interface version of the OAM.

***ServiceComponent* (MQCFSL)**

Name of authorization service (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

If you included a specific value for *ServiceComponent* on the Inquire Authority Service command, this field contains the name of the authorization service that handled the command. If you did not include a specific value for *ServiceComponent* on the Inquire Authority Service command, the list contains the names of all the installed authorization services.

If there is no OAM or if the OAM requested in the *ServiceComponent* does not exist this field is blank.

The maximum length of each element in the list is MQ\_SERVICE\_COMPONENT\_LENGTH.

***UserIDSupport* (MQCFIN)**

User ID support (parameter identifier: MQIACF\_USER\_ID\_SUPPORT).

The value can be:

**MQUIDSUPP\_YES**

The authority service supports user IDs.

**MQUIDSUPP\_NO**

The authority service does not support user IDs.

## Inquire CF Structure: z/OS

The Inquire CF Structure (MQCMD\_INQUIRE\_CF\_STRUC) command returns information about the attributes of one or more CF application structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue-sharing group.

### Required parameters

#### *CFStrucName* (MQCFST)

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

Specifies the name of the CF application structure about which information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

### Optional parameters

#### *CFStrucAttrs* (MQCFIL)

CF application structure attributes (parameter identifier: MQIACF\_CF\_STRUC\_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCA\_ALTERATION\_DATE**

The date on which the definition was last altered.

#### **MQCA\_ALTERATION\_TIME**

The time at which the definition was last altered.

#### **MQIA\_CF\_CFCNLOS**

The action to be taken when the queue manager loses connectivity to the CF application structure.

#### **MQIA\_CF\_LEVEL**

Functional capability level for the CF application structure.

#### **MQIA\_CF\_OFFLOAD**

The shared message data set OFFLOAD property for the CF application structure.

#### **MQIA\_CF\_RECOVER**

Whether CF recovery for the application structure is supported.

#### **MQIA\_CF\_RECAUTO**

Whether automatic recovery action is taken when a structure is failed or when a queue manager loses connectivity to the structure and no systems in the SysPlex have connectivity to the Coupling Facility the structure is located in.

**MQIACF\_CF\_SMDS\_BLOCK\_SIZE**

The shared message data set DSGROUP property for the CF application structure.

**MQIA\_CF\_SMDS\_BUFFERS**

The shared message data set DSGROUP property for the CF application structure.

**MQIACF\_CF\_SMDS\_EXPAND**

The shared message data set DSEXPAND property for the CF application structure.

**MQCACF\_CF\_SMDS\_GENERIC\_NAME**

The shared message data set DSBUFS property for the CF application structure.

**MQCA\_CF\_STRUC\_DESC**

Description of CF application structure.

**MQCA\_CF\_STRUC\_NAME**

Name of CF application structure.

**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *CFStrucAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *CFStrucAttrs* except MQCA\_CF\_STRUC\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

**Inquire CF Structure (Response):** z/OS

The response to the Inquire CF Structure (MQCMD\_INQUIRE\_CF\_STRUC) command consists of the response header followed by the *CFStrucName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

If a generic CF application structure name was specified, one such message is generated for each CF application structure found.

**Always returned:**

*CFStrucName*

**Returned if requested:**

*AlterationDate, AlterationTime, CFConlos, CFLevel, CFStrucDesc, DSBLOCK, DSBUFS, DSEXPAND, DSGROUP, OFFLD1SZ, OFFLD12SZ, OFFLD3SZ, OFFLD1TH, OFFLD2TH, OFFLD3TH, Offload, RCVDATE, RCVTIME, Recauto, Recovery*

## Response data

### *AlterationDate* (MQCFST)

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date on which the definition was last altered, in the form yyyy-mm-dd.

The maximum length of the string is MQ\_DATE\_LENGTH.

### *AlterationTime* (MQCFST)

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time at which the definition was last altered, in the form hh.mm.ss.

The maximum length of the string is MQ\_TIME\_LENGTH.

### *CFConlos* (MQCFIN)

The CFConlos property (parameter identifier: MQIA\_CF\_CFCONLOS).

Specifies the action to be taken when a queue manager loses connectivity to the CF structure. The value can be any of the following values:

#### **MQCFCONLOS\_TERMINATE**

The queue manager will terminate when connectivity to the structure is lost.

#### **MQCFCONLOS\_TOLERATE**

The queue manager will tolerate loss of connectivity to the structure without terminating.

#### **MQCFCONLOS\_ASQMGR**

The action taken is based on the setting of the CFCONLOS queue manager attribute

This parameter is only valid from CFLEVEL(5).

### *CFLevel* (MQCFIN)

The functional capability level for this CF application structure (parameter identifier: MQIA\_CF\_LEVEL).

Specifies the functional capability level for the CF application structure. The value can be any of the following values:

- 1 A CF structure that can be "auto-created" by a queue manager at command level 520.
- 2 A CF structure at command level 520 that can only be created or deleted by a queue manager at command level 530 or greater. This level is the default *CFLevel* for queue managers at command level 530 or greater.
- 3 A CF structure at command level 530. This *CFLevel* is required if you want to use persistent messages on shared queues, or for message grouping, or both.
- 4 A CF structure at command level 600. This *CFLevel* can be used for persistent messages or for messages longer than 64 512 bytes.
- 5 A CF structure at command level 710. This *CFLevel* supports shared message data sets (SMDS) and Db2 for offloading messages.  
Structures are required to be at CFLEVEL(5) to support toleration of loss of connectivity.

### *CFStrucDesc* (MQCFST)

The description of the CF structure (parameter identifier: MQCA\_CF\_STRUC\_DESC).

The maximum length is MQ\_CF\_STRUC\_DESC\_LENGTH.

**CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

**DSBLOCK (MQCFIN)**

The CF DSBLOCK property (parameter identifier: MQIACF\_CF\_SMDS\_BLOCK\_SIZE).

The returned value is one of the following constants: MQDSB\_8K, MQDSB\_16K, MQDSB\_32K, MQDSB\_64K, MQDSB\_128K, MQDSB\_256K, MQDSB\_512K, MQDSB\_1024K, MQDSB\_1M.

**DSBUFS (MQCFIN)**

The CF DSBUFS property (parameter identifier: MQIA\_CF\_SMDS\_BUFFERS).

The returned value is in the range 0 - 9999.

The value is the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

**DSEXPAND (MQCFIN)**

The CF DSEXPAND property (parameter identifier: MQIACF\_CF\_SMDS\_EXPAND).

**MQDSE\_YES**

The data set can be expanded.

**MQDSE\_NO**

The data set cannot be expanded.

**MQDSE\_DEFAULT**

Only returned on Inquire CF Struct when not explicitly set

**DSGROUP (MQCFST)**

The CF DSGROUP property (parameter identifier: MQCACF\_CF\_SMDS\_GENERIC\_NAME).

The returned value is a string containing a generic data set name used for the group of shared message data sets associated with this CF structure.

**OFFLD1SZ (MQCFST)**

The CF OFFLD1SZ property (parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE1).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

The maximum length is 3.

**OFFLD2SZ (MQCFST)**

The CF OFFLD2SZ property (parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE2).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

The maximum length is 3.

**OFFLD3SZ (MQCFST)**

The CF OFFLD3SZ property (parameter identifier: MQCACF\_CF\_OFFLOAD\_SIZE3).

The returned value is a string in the range 0K - 64K.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

The maximum length is 3.

**OFFLD1TH (MQCFIN)**

The CF OFFLD1TH property (parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD1).

The returned value is in the range 0 - 100.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

**OFFLD2TH (MQCFIN)**

The CF OFFLD2TH property (parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD2).

The returned value is in the range 0 - 100.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

**OFFLD3TH (MQCFIN)**

The CF OFFLD3TH property (parameter identifier: MQIA\_CF\_OFFLOAD\_THRESHOLD3).

The returned value is in the range 0 - 100.

Returned if the MQIACF\_ALL or MQIA\_CF\_OFFLOAD parameters are specified.

**Offload (MQCFIN)**

The CF OFFLOAD property (parameter identifier: MQIA\_CF\_OFFLOAD).

The returned values can be:

**MQCFOFFLD\_DB2**

Large shared messages can be stored in Db2.

**MQCFOFFLD\_SMDS**

Large shared messages can be stored in z/OS shared message data sets.

**MQCFOFFLD\_NONE**

Used when the property *Offload* has not been explicitly set.

**RCVDATE (MQCFST)**

The recovery start date (parameter identifier: MQCACF\_RECOVERY\_DATE).

If recovery is currently enabled for the data set, this indicates the date when it was activated, in the form yyyy-mm-dd. If recovery is not enabled, this is displayed as RCVDATE().

**RCVTIME (MQCFST)**

The recovery start time (parameter identifier: MQCACF\_RECOVERY\_TIME).

If recovery is currently enabled for the data set, this indicates the time when it was activated, in the form hh.mm.ss. If recovery is not enabled, this is displayed as RCVTIME().

**Recauto (MQCFIN)**

Recauto (parameter identifier: MQIA\_CF\_RECAUTO).

Indicates whether automatic recovery action is taken when a queue manager detects that the structure is failed, or when a queue manager loses connectivity to the structure and no systems in the SysPlex have connectivity to the Coupling Facility that the structure is allocated in. The value can be:

**MQRECAUTO\_YES**

The structure and associated shared message data sets which also need recovery will be automatically recovered.

**MQRECAUTO\_NO**

The structure will not be automatically recovered.

**Recovery (MQCFIN)**

Recovery (parameter identifier: MQIA\_CF\_RECOVER).

Specifies whether CF recovery is supported for the application structure. The value can be:

**MQCFR\_YES**

Recovery is supported.

**MQCFR\_NO**

Recovery is not supported.

**Inquire CF Structure Names:** z/OS

The Inquire CF Structure Names (MQCMD\_INQUIRE\_CF\_STRUC\_NAMES) command inquires for a list of CF application structure names that match the generic CF structure name specified.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue-sharing group.

**Required parameters***CFStrucName* (MQCFST)

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

Specifies the name of the CF application structure about which information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

**Inquire CF Structure Names (Response):** z/OS

The response to the Inquire CF Structure Names (MQCMD\_INQUIRE\_CF\_STRUC\_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified CF application structure name.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Always returned:**

*CFStrucNames*

**Returned if requested:**

None

**Response data***CFStrucNames* (MQCFSL)

List of CF application structure names (parameter identifier: MQCACF\_CF\_STRUC\_NAMES).

## Inquire CF Structure Status:

The Inquire CF Structure Status (MQCMD\_INQUIRE\_CF\_STRUC\_STATUS) command inquires about the status of a CF application structure.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue-sharing group.

### Required parameters

#### *CFStrucName* (MQCFST)

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

Specifies the name of the CF application structure for which status information is to be returned.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all CF application structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

### Optional parameters

#### *CFStatusType* (MQCFIN)

Status information type (parameter identifier: MQIACF\_CF\_STATUS\_TYPE).

Specifies the type of status information you want to be returned. You can specify one of the following:

#### **MQIACF\_CF\_STATUS\_SUMMARY**

Summary status information for the CF application structure.

MQIACF\_CF\_STATUS\_SUMMARY is the default.

#### **MQIACF\_CF\_STATUS\_CONNECT**

Connection status information for each CF application structure for each active queue manager.

#### **MQIACF\_CF\_STATUS\_BACKUP**

Backup status information for each CF application structure.

#### **MQIACF\_CF\_STATUS\_SMDS**

Shared message data set information for each CF application structure.

#### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter in the response data except MQIACF\_CF\_STATUS\_TYPE. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

#### *StringFilterCommand* (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter in the

response data except MQCA\_CF\_STRUC\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

**Inquire CF Structure Status (Response):** z/OS

The response to the Inquire CF Structure Status (MQCMD\_INQUIRE\_CF\_STRUC\_STATUS) command consists of the response header followed by the *CFStrucName* and *CFStatusType* structures and a set of attribute parameter structures determined by the value of *CFStatusType* in the Inquire command.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Always returned:**

*CFStrucName*, *CFStatusType*.

*CFStatusType* specifies the type of status information being returned. The value can be any of the following values:

**MQIACF\_CF\_STATUS\_SUMMARY**

Summary status information for the CF application structure. This is the default.

**MQIACF\_CF\_STATUS\_CONNECT**

Connection status information for each CF application structure for each active queue manager.

**MQIACF\_CF\_STATUS\_BACKUP**

Backup status information for each CF application structure.

**MQIACF\_CF\_STATUS\_SMDS**

Shared message data set information for each CF application structure.

**Returned if *CFStatusType* is MQIACF\_CF\_STATUS\_SUMMARY:**

*CFStrucStatus*, *CFStrucType*, *EntriesMax*, *EntriesUsed*, *FailDate*, *FailTime*, *OffLdUse*, *SizeMax*, *SizeUsed*

**Returned if *CFStatusType* is MQIACF\_CF\_STATUS\_CONNECT:**

*CFStrucStatus*, *FailDate*, *FailTime*, *QMgrName*, *SysName*

**Returned if *CFStatusType* is MQIACF\_CF\_STATUS\_BACKUP:**

*BackupDate*, *BackupEndRBA*, *BackupSize*, *BackupStartRBA*, *BackupTime*, *CFStrucStatus*, *FailDate*, *FailTime*, *LogQMgrNames*, *QmgrName*

**Returned if *CFStatusType* is MQIACF\_CF\_STATUS\_SMDS:**

*Access*, *FailDate*, *FailTime*, *RcvDate*, *RcvTime*, *CFStrucStatus*

**Response data**

**Access (MQCFIN)**

Availability of the shared message data set (parameter identifier: MQIACF\_CF\_STRUC\_ACCESS).

**MQCFACCESS\_ENABLED**

The shared message data set is either available for use, or is to be enabled after previously being disabled, or access to the shared message data set is to be retried following an error.

**MQCFACCESS\_SUSPENDED**

The shared message data set is unavailable because of an error.

## **MQCFACCESS\_DISABLED**

The shared message data set is either disabled, or is to be set as disabled.

### **BackupDate (MQCFST)**

The date, in the form yyyy-mm-dd, on which the last successful backup was taken for this CF application structure (parameter identifier: MQCACF\_BACKUP\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

### **BackupEndRBA (MQCFST)**

The backup data set end RBA for the end of the last successful backup taken for this CF application structure (parameter identifier: MQCACF\_CF\_STRUC\_BACKUP\_END).

The maximum length of the string is MQ\_RBA\_LENGTH.

### **BackupSize (MQCFIN)**

The size, in megabytes, of the last successful backup taken for this CF application structure (parameter identifier: MQIACF\_CF\_STRUC\_BACKUP\_SIZE).

### **BackupStartRBA (MQCFST)**

The backup data set start RBA for the start of the last successful backup taken for this CF application structure (parameter identifier: MQCACF\_CF\_STRUC\_BACKUP\_START).

The maximum length of the string is MQ\_RBA\_LENGTH.

### **BackupTime (MQCFST)**

The end time, in the form hh.mm.ss, of the last successful backup taken for this CF application structure (parameter identifier: MQCACF\_BACKUP\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

### **CFStatusType (MQCFIN)**

Status information type (parameter identifier: MQIACF\_CF\_STATUS\_TYPE).

Specifies the type of status information being returned. The value can be any of the following values:

#### **MQIACF\_CF\_STATUS\_SUMMARY**

Summary status information for the CF application structure.  
MQIACF\_CF\_STATUS\_SUMMARY is the default.

#### **MQIACF\_CF\_STATUS\_CONNECT**

Connection status information for each CF application structure for each active queue manager.

#### **MQIACF\_CF\_STATUS\_BACKUP**

Back up status information for each CF application structure.

#### **MQIACF\_CF\_STATUS\_SMDS**

Shared message data set information for each CF application structure.

### **CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

### **CFStrucStatus (MQCFIN)**

CF Structure status (parameter identifier: MQIACF\_CF\_STRUC\_STATUS).

The status of the CF application structure.

If *CFStatusType* is MQIACF\_CF\_STATUS\_SUMMARY, the value can be:

#### **MQCFSTATUS\_ACTIVE**

The structure is active.

#### **MQCFSTATUS\_FAILED**

The structure has failed.

**MQCFSTATUS\_NOT\_FOUND**

The structure is not allocated in the CF, but has been defined to Db2.

**MQCFSTATUS\_IN\_BACKUP**

The structure is in the process of being backed up.

**MQCFSTATUS\_IN\_RECOVER**

The structure is in the process of being recovered.

**MQCFSTATUS\_UNKNOWN**

The status of the CF structure is unknown because, for example, Db2 might be unavailable.

If *CFStatusType* is MQIACF\_CF\_STATUS\_CONNECT, the value can be:

**MQCFSTATUS\_ACTIVE**

The structure is connected to this queue manager.

**MQCFSTATUS\_FAILED**

The queue manager connection to this structure has failed.

**MQCFSTATUS\_NONE**

The structure has never been connected to this queue manager.

If *CFStatusType* is MQIACF\_CF\_STATUS\_BACKUP, the value can be:

**MQCFSTATUS\_ACTIVE**

The structure is active.

**MQCFSTATUS\_FAILED**

The structure has failed.

**MQCFSTATUS\_NONE**

The structure has never been backed up.

**MQCFSTATUS\_IN\_BACKUP**

The structure is in the process of being backed up.

**MQCFSTATUS\_IN\_RECOVER**

The structure is in the process of being recovered.

If *CFStatusType* is MQIACF\_CF\_STATUS\_SMDS, the value can be:

**MQCFSTATUS\_ACTIVE**

The shared message data set is available for normal use

**MQCFSTATUS\_FAILED**

The shared message data set is in an unusable state and probably requires recovery.

**MQCFSTATUS\_IN\_RECOVER**

The shared message data set is in the process of being recovered (by way of a RECOVER CFSTRUCT command).

**MQCFSTATUS\_NOT\_FOUND**

The data set has never been used, or the attempt to open it for the first time failed.

**MQCFSTATUS\_RECOVERED**

The data set has been recovered or otherwise repaired, and is ready for use again, but requires some restart processing the next time it is opened. This restart processing ensures that obsolete references to any deleted messages have been removed from the coupling facility structure before the data set is made available again. The restart processing also rebuilds the data set space map.

**MQCFSTATUS\_EMPTY**

The data set contains no messages. The data set is put into this state if it is closed normally by the owning queue manager at a time when it does not contain any messages. It can also be put into EMPTY state when the previous data set contents are to be discarded because the

application structure has been emptied (using **RECOVER CFSTRUCT** with TYPE PURGE or, for a nonrecoverable structure only, by deleting the previous instance of the structure). The next time the data set is opened by its owning queue manager, the space map is reset to empty, and the status is changed to ACTIVE. As the previous data set contents are no longer required, a data set in this state can be replaced with a newly allocated data set, for example to change the space allocation or move it to another volume.

#### **MQCFSTATUS\_NEW**

The data set is being opened and initialized for the first time, ready to be made active.

#### **CFStrucType (MQCFIN)**

CF Structure type (parameter identifier: MQIACF\_CF\_STRUC\_TYPE).

The value can be:

#### **MQCFTYPE\_ADMIN**

MQCFTYPE\_ADMIN is the CF administration structure.

#### **MQCFTYPE\_APPL**

MQCFTYPE\_APPL is a CF application structure.

#### **EntriesMax (MQCFIN)**

Number of CF list entries defined for this CF application structure (parameter identifier: MQIACF\_CF\_STRUC\_ENTRIES\_MAX).

#### **EntriesUsed (MQCFIN)**

Number of CF list entries defined for this CF application structure that are in use (parameter identifier: MQIACF\_CF\_STRUC\_ENTRIES\_USED).

#### **FailDate (MQCFST)**

The date, in the form yyyy-mm-dd, on which this CF application structure failed (parameter identifier: MQCACF\_FAIL\_DATE).

If *CFStatusType* is MQIACF\_CF\_STATUS\_CONNECT, it is the date on which the queue manager lost connectivity to this application structure. For the other values of *CFStatusType*, it is the date on which this CF application structure failed. This parameter is only applicable when *CFStrucStatus* is MQCFSTATUS\_FAILED or MQCFSTATUS\_IN\_RECOVER.

The maximum length of the string is MQ\_DATE\_LENGTH.

#### **FailTime (MQCFST)**

The time, in the form hh.mm.ss, that this CF application structure failed (parameter identifier: MQCACF\_FAIL\_TIME).

If *CFStatusType* is MQIACF\_CF\_STATUS\_CONNECT, it is the time that the queue manager lost connectivity to this application structure. For the other values of *CFStatusType*, it is the time that this CF application structure failed. This parameter is only applicable when *CFStrucStatus* is MQCFSTATUS\_FAILED or MQCFSTATUS\_IN\_RECOVER.

The maximum length of the string is MQ\_TIME\_LENGTH.

#### **LogQMgrNames (MQCFSL)**

A list of queue managers, the logs of which are required to perform a recovery (parameter identifier: MQCACF\_CF\_STRUC\_LOG\_Q\_MGRS).

The maximum length of each name is MQ\_Q\_MGR\_NAME\_LENGTH.

#### **OffLdUse (MQCFIN)**

Offload usage (parameter identifier: MQIA\_CF\_OFFLDUSE).

Indicates whether any offloaded large message data might currently exist in shared message data sets, Db2, or both. The value can be any of the following values:

#### **MQCFOFFLD\_DB2**

Large shared messages are stored in Db2.

**MQCFOFFLD\_SMDS**

Large shared messages are stored in z/OS shared message data sets.

**MQCFOFFLD\_NONE**

Use on DISPLAY CFSTRUCT when the property has not been explicitly set.

**MQCFOFFLD\_BOTH**

There might be large shared messages stored in both Db2, and shared message data sets.

Value cannot be set unless CFLEVEL(5) is defined.

**QMgrName (MQCFST)**

Queue manager name (parameter identifier: MQCA\_Q\_MGR\_NAME).

This parameter is the name of the queue manager. If *CFStatusType* is MQIACF\_CF\_STATUS\_BACKUP, it is the name of the queue manager that took the last successful backup.

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

**RcvDate (MQCFST)**

The recovery start date (parameter identifier: MQCACF\_RECOVERY\_DATE).

If recovery is currently enabled for the data set, this indicates the date when it was activated, in the form yyyy-mm-dd.

**RcvTime (MQCFST)**

The recovery start time (parameter identifier: MQCACF\_RECOVERY\_TIME).

If recovery is currently enabled for the data set, this indicates the time when it was activated, in the form hh.mm.ss.

**SizeMax (MQCFIN)**

Size of the CF application structure (parameter identifier: MQIACF\_CF\_STRUC\_SIZE\_MAX).

This parameter is the size, in kilobytes, of the CF application structure.

**SizeUsed (MQCFIN)**

Percentage of the CF application structure that is in use (parameter identifier: MQIACF\_CF\_STRUC\_SIZE\_USED).

This parameter is the percentage of the size of the CF application structure that is in use.

**SysName (MQCFST)**

Queue manager name (parameter identifier: MQCACF\_SYSTEM\_NAME).

This parameter is the name of the z/OS image of the queue manager that last connected to the CF application structure.

The maximum length is MQ\_SYSTEM\_NAME\_LENGTH.

**SizeMax (MQCFIN)**

Size of the CF application structure (parameter identifier: MQIACF\_CF\_STRUC\_SIZE\_MAX).

This parameter is the size, in kilobytes, of the CF application structure.

## Inquire Channel:

The Inquire Channel (MQCMD\_INQUIRE\_CHANNEL) command inquires about the attributes of IBM MQ channel definitions.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

## Required parameters

### ChannelName (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all channels having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

## Optional parameters

### ChannelAttrs (MQCFIL)

Channel attributes (parameter identifier: MQIACF\_CHANNEL\_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

#### MQIACF\_ALL

All attributes.

or a combination of the parameters in the following table: **V 8.0.0.4**

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	<b>V 8.0.0.4</b>
<b>MQCA_ALTERATION_DATE</b> Date on which the definition was last altered	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQCA_ALTERATION_TIME</b> Time at which the definition was last altered	✓	✓	✓	✓	✓	✓	✓	✓	✓

<b>MQIACH_DISC_INTERVAL</b> Disconnection interval	✓	✓				✓	✓	✓	

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	
<b>MQIACH_HB_INTERVAL</b> Heartbeat interval (seconds)	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQIACH_HDR_COMPRESSION</b> List of header data compression techniques supported by the channel	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQIACH_KEEP_ALIVE_INTERVAL</b> KeepAlive interval	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQIACH_LONG_RETRY</b> Long retry count	✓	✓					✓	✓	
<b>MQIACH_LONG_TIMER</b> Long timer	✓	✓					✓	✓	
<b>MQIACH_MAX_INSTANCES</b> Maximum number of simultaneous instances of a server-connection channel that can be started.						✓			✓
<b>MQIACH_MAX_INSTS_PER_CLIENT</b> Maximum number of simultaneous instances of a server-connection channel that can be started from a single client.						✓			
<b>MQIACH_MAX_MSG_LENGTH</b> Maximum message length	✓	✓	✓	✓	✓	✓	✓	✓	✓
<b>MQIACH_MCA_TYPE</b> MCA type	✓	✓		✓			✓	✓	
<b>MQIACH_MR_COUNT</b> Message retry count			✓	✓				✓	
<b>MQIACH_MSG_COMPRESSION</b> List of message data compression techniques supported by the channel	✓	✓	✓	✓	✓	✓	✓	✓	
<b>MQIACH_MR_INTERVAL</b> Message retry interval (milliseconds)			✓	✓				✓	

Parameter	Sender	Server	Receiver	Requester	Client conn	Server conn	Cluster sender	Cluster receiver	AMQP V8.0.0.4
<b>MQIACH_NPM_SPEED</b> Speed of nonpersistent messages	✓	✓	✓	✓			✓	✓	
<b>MQIACH_PORT</b> AMQP port number									✓
<b>MQIACH_PUT_AUTHORITY</b> Put authority			✓	✓		✓		✓	
<b>MQIACH_RESET_REQUESTED</b> Sequence number of outstanding request when a RESET CHANNEL command is used	✓	✓	✓	✓			✓	✓	
<b>MQIACH_SEQUENCE_NUMBER_WRAP</b> Sequence number wrap	✓	✓	✓	✓			✓	✓	
<b>MQIACH_SHARING_CONVERSATIONS</b> Value of Sharing Conversations						✓			
<b>MQIACH_SHORT_RETRY</b> Short retry count	✓	✓					✓	✓	
<b>MQIACH_SHORT_TIMER</b> Short timer	✓	✓					✓	✓	
<b>MQIACH_SSL_CLIENT_AUTH</b> SSL client authentication	✓	✓	✓	✓		✓		✓	✓
<b>MQIACH_USE_CLIENT_ID</b> Specify that the client ID is used for authorization checks for an AMQP channel									✓
<b>MQIACH_XMIT_PROTOCOL_TYPE</b> Transport (transmission protocol) type	✓	✓	✓	✓	✓	✓	✓	✓	

**Note:**

- Only one of the following parameters can be specified:
  - MQCACH\_JAAS\_CONFIG
  - MQCACH\_MCA\_USER\_ID
  - MQIACH\_USE\_CLIENT\_ID

If none of these parameters are specified, no authentication is performed. If MQCACH\_JAAS\_CONFIG is specified, the client flows a user name and password, in all other cases the flowed user name is ignored.

**CertificateLabel (MQCFST)**

Certificate label (parameter identifier: MQCA\_CERT\_LABEL).

Specifies the certificate label in use.

The maximum length is MQ\_CERT\_LABEL\_LENGTH.

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

If this parameter is present, eligible channels are limited to the specified type. Any attribute selector specified in the *ChannelAttrs* list which is only valid for channels of a different type or types is ignored; no error is raised.

If this parameter is not present (or if MQCHT\_ALL is specified), channels of all types other than MQCHT\_MQTT are eligible. Each attribute specified must be a valid channel attribute selector (that is, it must be one from the following list), but it might not be applicable to all (or any) of the channels returned. Channel attribute selectors that are valid but not applicable to the channel are ignored, no error messages occur, and no attribute is returned.

The value can be:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**

Cluster-receiver.

**MQCHT\_CLUSSDR**

Cluster-sender.

**V8.0.0.4 MQCHT\_AMQP**

AMQP channel.

**MQCHT\_MQTT**

Telemetry channel.

**MQCHT\_ALL**

All types other than MQCHT\_MQTT.

The default value if this parameter is not specified is MQCHT\_ALL.

**Note:** If this parameter is present, it must occur immediately after the *ChannelName* parameter on platforms other than z/OS otherwise resulting in a MQRCCF\_MSG\_LENGTH\_ERROR error message.

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### ▶ z/OS

### *DefaultChannelDisposition* (MQCFIN)

Default channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP).

This parameter is not allowed for client-connection (CLNTCONN) channels.

This parameter applies to z/OS only.

Specifies the disposition of the channels for which information is to be returned. If this parameter is not present (or if MQCHLD\_ALL is specified), channels of all channel dispositions are eligible. The value can be any of the following values:

#### **MQCHLD\_ALL**

Returns requested information for all eligible channels.

#### **MQCHLD\_PRIVATE**

Returns requested information for PRIVATE channels.

#### **MQCHLD\_SHARED**

Returns requested information for channels with channel disposition that is defined as either MQCHLD\_SHARED or MQCHLD\_FIXSHARED.

### *DefReconnect* (MQCFIN)

Client channel default reconnection option (parameter identifier: MQIACH\_DEF\_RECONNECT).

The default automatic client reconnection option. You can configure a IBM MQ MQI client to automatically reconnect a client application. The IBM MQ MQI client tries to reconnect to a queue manager after a connection failure. It tries to reconnect without the application client issuing an MQCONN or MQCONNX MQI call.

### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ChannelAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter for channel type, you cannot also specify the *ChannelType* parameter.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

### ▶ z/OS

### *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

### *StringFilterCommand* (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ChannelAttrs* except MQCACH\_CHANNEL\_NAME and MQCACH\_MCA\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFSF - PCF string filter parameter" on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

### **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

#### *Reason* (MQLONG)

The value can be any of the following values:

##### **MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

##### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

##### **MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

## Inquire Channel (MQTT):

The Inquire Channel (MQCMD\_INQUIRE\_CHANNEL) command inquires about the attributes of IBM MQ channel definitions.

### Required parameters

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all channels having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### *ChannelType* (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

If this parameter is present, eligible channels are limited to the specified type. Any attribute selector specified in the *ChannelAttrs* list which is only valid for channels of a different type or types is ignored; no error is raised.

If this parameter is not present (or if MQCHT\_ALL is specified), channels of all types are eligible. Each attribute specified must be a valid channel attribute selector (that is, it must be one from the following list), but it might not be applicable to all (or any) of the channels returned. Channel attribute selectors that are valid but not applicable to the channel are ignored, no error messages occur, and no attribute is returned.

The value must be:

#### **MQCHT\_MQTT**

Telemetry channel.

### Optional parameters

#### *ChannelAttrs* (MQCFIL)

Channel attributes (parameter identifier: MQIACF\_CHANNEL\_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following parameters:

#### **MQCA\_SSL\_KEY\_REPOSITORY**

SSL Key Repository

#### **MQCACH\_CHANNEL\_NAME**

Channel name. You cannot use this attribute as a filter keyword.

#### **MQCACH\_JAAS\_CONFIG**

The file path of the JAAS configuration

#### **MQCACH\_LOCAL\_ADDRESS**

Local communications address for the channel

#### **MQCACH\_MCA\_USER\_ID**

MCA user identifier.

#### **MQCACH\_SSL\_CIPHER\_SPEC**

SSL cipher spec.

**MQCACH\_SSL\_KEY\_PASSPHRASE**

SSL key passphrase.

**MQIACH\_BACKLOG**

The number of concurrent connection requests that the channel supports.

**MQIACH\_CHANNEL\_TYPE**

Channel type

**MQIACH\_PORT**

Port number to use when *TransportType* is set to TCP.

**MQIACH\_SSL\_CLIENT\_AUTH**

SSL client authentication.

**MQIACH\_USE\_CLIENT\_ID**

Specify whether to use the *clientID* of a new connection as the *userID* for that connection

**MQIACH\_XMIT\_PROTOCOL\_TYPE**

Transport (transmission protocol) type

**Note:**

1. Only one of the following parameters can be specified:

- MQCACH\_JAAS\_CONFIG
- MQCACH\_MCA\_USER\_ID
- MQIACH\_USE\_CLIENT\_ID

If none of these parameters are specified, no authentication is performed. If MQCACH\_JAAS\_CONFIG is specified, the client flows a user name and password, in all other cases the flowed user name is ignored.

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHANNEL\_TYPE\_ERROR**

Channel type not valid.

## Inquire Channel (Response):

The response to the Inquire Channel (MQCMD\_INQUIRE\_CHANNEL) command consists of the response header followed by the *ChannelName* and *ChannelType* structures (and on z/OS only, the *DefaultChannelDisposition*, and *QSGDisposition* structure), and the requested combination of attribute parameter structures (where applicable).

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

If a generic channel name was specified, one such message is generated for each channel found.

### Always returned:

*ChannelName*, *ChannelType*, z/OS *DefaultChannelDisposition*, z/OS *QSGDisposition*

### Returned if requested:

*AlterationDate*, *AlterationTime*, *BatchDataLimit*, *BatchHeartbeat*, *BatchInterval*, *BatchSize*, *Certificatelabel*, *ChannelDesc*, *ChannelMonitoring*, *ChannelStartTime*, *ChannelStartDate*, *ChannelStatistics*, *ClientChannelWeight*, *ClientIdentifier*, *ClusterName*, *ClusterNameList*, *CLWLChannelPriority*, *CLWLChannelRank*, *CLWLChannelWeight*, *ConnectionAffinity*, *ConnectionName*, *DataConversion*, *DefReconnect*, *DiscInterval*, *HeaderCompression*, *HeartbeatInterval*, *InDoubtInbound*, *InDoubtOutbound*, *KeepAliveInterval*, *LastMsgTime*, *LocalAddress*, *LongRetryCount*, *LongRetryInterval*, *MaxMsgLength*, *MCAName*, *MCAType*, *MCAUserIdentifier*, *MessageCompression*, *ModeName*, *MsgExit*, *MsgRetryCount*, *MsgRetryExit*, *MsgRetryInterval*, *MsgRetryUserData*, *MsgsReceived*, *MsgsSent*, *MsgUserData*, *NetworkPriority*, *NonPersistentMsgSpeed*, *Password*, *PendingOutbound*, *PropertyControl*, *PutAuthority*, *QMGrName*, *ReceiveExit*, *ReceiveUserData*, *ResetSeq*, *SecurityExit*, *SecurityUserData*, *SendExit*, *SendUserData*, *SeqNumberWrap*, *SharingConversations*, *ShortRetryCount*, *ShortRetryInterval*, *SSLCipherSpec*, *SSLCipherSuite*, *SSLClientAuth*, *SSLPeerName*, *TpName*, *TransportType*, *UseDLQ*, *UserIdentifier*, *XmitQName*

### Response data

#### *AlterationDate* (MQCFST)

Alteration date, in the form yyyy-mm-dd (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered.

#### *AlterationTime* (MQCFST)

Alteration time, in the form hh.mm.ss (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered.

#### *BatchDataLimit* (MQCFIN)

Batch data limit (parameter identifier: MQIACH\_BATCH\_DATA\_LIMIT).

The limit, in kilobytes, of the amount of data that can be sent through a channel before taking a sync point. A sync point is taken after the message that caused the limit to be reached has flowed across the channel. A value of zero in this attribute means that no data limit is applied to batches over this channel.

This parameter only applies to channels with a *ChannelType* of MQCHT\_SENDER, MQCHT\_SERVER, MQCHT\_CLUSRCVR, or MQCHT\_CLUSSDR.

#### *BatchHeartbeat* (MQCFIN)

The value being used for the batch heartbeating (parameter identifier: MQIACH\_BATCH\_HB).

The value can be 0 - 999999. A value of 0 indicates that heartbeating is not in use.

**BatchInterval (MQCFIN)**

Batch interval (parameter identifier: MQIACH\_BATCH\_INTERVAL).

**BatchSize (MQCFIN)**

Batch size (parameter identifier: MQIACH\_BATCH\_SIZE).

**CertificateLabel (MQCFST)**

Certificate label (parameter identifier: MQCA\_CERT\_LABEL).

Specifies the certificate label in use.

The maximum length is MQ\_CERT\_LABEL\_LENGTH.

**ChannelDesc (MQCFST)**

Channel description (parameter identifier: MQCACH\_DESC).

The maximum length of the string is MQ\_CHANNEL\_DESC\_LENGTH.

**ChannelMonitoring (MQCFIN)**

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_CHANNEL).

The value can be any of the following values:

**MQMON\_OFF**

Online monitoring data collection is turned off for this channel.

**MQMON\_Q\_MGR**

The value of the queue manager's *ChannelMonitoring* parameter is inherited by the channel.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's *ChannelMonitoring* parameter is MQMON\_NONE.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's *ChannelMonitoring* parameter is MQMON\_NONE.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's *ChannelMonitoring* parameter is MQMON\_NONE.

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**ChannelStartDate (MQCFST)**

The date that the channel started (parameter identifier: MQCACH\_CHANNEL\_START\_DATE). The length is specified by the value MQ\_DATE\_LENGTH.

**ChannelStartTime (MQCFST)**

The time that the channel started (parameter identifier: MQCACH\_CHANNEL\_START\_TIME). The length is specified by the value MQ\_TIME\_LENGTH.

**ChannelStatistics (MQCFIN)**

Statistics data collection (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

The value can be any of the following values:

**MQMON\_OFF**

Statistics data collection is turned off for this channel.

**MQMON\_Q\_MGR**

The value of the queue manager's *ChannelStatistics* parameter is inherited by the channel.

**MQMON\_LOW**

Statistics data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's *ChannelStatistics* parameter is MQMON\_NONE.

**MQMON\_MEDIUM**

Statistics data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's *ChannelStatistics* parameter is MQMON\_NONE.

**MQMON\_HIGH**

Statistics data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's *ChannelStatistics* parameter is MQMON\_NONE.

 On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value can be any of the following values:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**

Cluster-receiver.

**MQCHT\_CLUSSDR**

Cluster-sender.

**MQCHT\_MQTT**

Telemetry channel.

**ClientChannelWeight (MQCFIN)**

Client Channel Weight (parameter identifier: MQIACH\_CLIENT\_CHANNEL\_WEIGHT).

The client channel weighting attribute is used so client channel definitions can be selected at random, with the larger weightings having a higher probability of selection, when more than one suitable definition is available.

The value can be 0 - 99. The default is 0.

This parameter is only valid for channels with a ChannelType of MQCHT\_CLNTCONN

**ClientIdentifier (MQCFST)**

the clientId of the client (parameter identifier: MQCACH\_CLIENT\_ID).

**ClusterName (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

**ClusterNameList (MQCFST)**

Cluster namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

*CLWLChannelPriority* (**MQCFIN**)

Channel priority (parameter identifier: MQIACH\_CLWL\_CHANNEL\_PRIORITY).

*CLWLChannelRank* (**MQCFIN**)

Channel rank (parameter identifier: MQIACH\_CLWL\_CHANNEL\_RANK).

*CLWLChannelWeight* (**MQCFIN**)

Channel weighting (parameter identifier: MQIACH\_CLWL\_CHANNEL\_WEIGHT).

*ConnectionAffinity* (**MQCFIN**)

Channel Affinity (parameter identifier: MQIACH\_CONNECTION\_AFFINITY)

The channel affinity attribute specifies whether client applications that connect multiple times using the same queue manager name, use the same client channel. The value can be any of the following values:

**MQCAFTY\_PREFERRED**

The first connection in a process reading a client channel definition table (CCDT) creates a list of applicable definitions based on the weighting with any zero ClientChannelWeight definitions first in alphabetical order. Each connection in the process attempts to connect using the first definition in the list. If a connection is unsuccessful the next definition is used. Unsuccessful nonzero ClientChannelWeight definitions are moved to the end of the list. Zero ClientChannelWeight definitions remain at the start of the list and are selected first for each connection. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created. Each client process with the same host name creates the same list.

MQCAFTY\_PREFERRED is the default value.

**MQCAFTY\_NONE**

The first connection in a process reading a CCDT creates a list of applicable definitions. All connections in a process independently select an applicable definition based on the weighting with any applicable zero ClientChannelWeight definitions selected first in alphabetical order. For C, C++ and .NET (including fully managed .NET) clients the list is updated if the CCDT has been modified since the list was created.

This parameter is only valid for channels with a ChannelType of MQCHT\_CLNTCONN.

*ConnectionName* (**MQCFST**)

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH. On z/OS, it is MQ\_LOCAL\_ADDRESS\_LENGTH.

The *ConnectionName* is a comma-separated list.

*DataConversion* (**MQCFIN**)

Whether sender must convert application data (parameter identifier: MQIACH\_DATA\_CONVERSION).

The value can be:

**MQCDC\_NO\_SENDER\_CONVERSION**

No conversion by sender.

**MQCDC\_SENDER\_CONVERSION**

Conversion by sender.

 *DefaultChannelDisposition* (**MQCFIN**)

Default channel disposition (parameter identifier: MQIACH\_DEF\_CHANNEL\_DISP).

This parameter applies to z/OS only.

Specifies the intended disposition of the channel when active. The value can be any of the following values:

**MQCHLD\_PRIVATE**

The intended use of the object is as a private channel.

**MQCHLD\_FIXSHARED**

The intended use of the object is as a shared channel linked to a specific queue manager.

**MQCHLD\_SHARED**

The intended use of the object is as a shared channel.

*DiscInterval* (**MQCFIN**)

Disconnection interval (parameter identifier: MQIACH\_DISC\_INTERVAL).

*DefReconnect* (**MQCFIN**)

Client channel default reconnection option (parameter identifier: MQIACH\_DEF\_RECONNECT).

The returned values can be:

**MQRCN\_NO**

MQRCN\_NO is the default value.

Unless overridden by MQCONNX, the client is not reconnected automatically.

**MQRCN\_YES**

Unless overridden by MQCONNX, the client reconnects automatically.

**MQRCN\_Q\_MGR**

Unless overridden by MQCONNX, the client reconnects automatically, but only to the same queue manager. The QMGR option has the same effect as MQCNO\_RECONNECT\_Q\_MGR.

**MQRCN\_DISABLED**

Reconnection is disabled, even if requested by the client program using the MQCONNX MQI call.

*HeaderCompression* (**MQCFIL**)

Header data compression techniques supported by the channel (parameter identifier: MQIACH\_HDR\_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of

**MQCOMPRESS\_NONE**

No header data compression is performed.

**MQCOMPRESS\_SYSTEM**

Header data compression is performed.

*HeartbeatInterval* (**MQCFIN**)

Heartbeat interval (parameter identifier: MQIACH\_HB\_INTERVAL).

*InDoubtInbound* (**MQCFIN**)

Number of inbound messages to the client that are in doubt (Parameter identifier: MQIACH\_IN\_DOUBT\_IN).

*InDoubtOutbound* (**MQCFIN**)

Number of outbound messages from the client that are in doubt (Parameter identifier: MQIACH\_IN\_DOUBT\_OUT).

*KeepAliveInterval* (**MQCFIN**)

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL).

*LastMsgTime* (**MQCFST**)

The time that the last message was sent or received (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

*LocalAddress* (**MQCFST**)

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

*LongRetryCount* (**MQCFIN**)

Long retry count (parameter identifier: MQIACH\_LONG\_RETRY).

*LongRetryInterval* (**MQCFIN**)

Long timer (parameter identifier: MQIACH\_LONG\_TIMER).

*MaxInstances* (**MQCFIN**)

Maximum number of simultaneous instances of a server-connection channel (parameter identifier: MQIACH\_MAX\_INSTANCES).

This parameter is returned only for server-connection channels in response to an Inquire Channel call with ChannelAttrs including MQIACF\_ALL or MQIACH\_MAX\_INSTANCES.

*MaxInstancesPerClient* (**MQCFIN**)

Maximum number of simultaneous instances of a server-connection channel that can be started from a single client (parameter identifier: MQIACH\_MAX\_INSTS\_PER\_CLIENT).

This parameter is returned only for server-connection channels in response to an Inquire Channel call with ChannelAttrs including MQIACF\_ALL or MQIACH\_MAX\_INSTS\_PER\_CLIENT.

*MaxMsgLength* (**MQCFIN**)

Maximum message length (parameter identifier: MQIACH\_MAX\_MSG\_LENGTH).

*MCAName* (**MQCFST**)

Message channel agent name (parameter identifier: MQCACH\_MCA\_NAME).

The maximum length of the string is MQ\_MCA\_NAME\_LENGTH.

*MCAType* (**MQCFIN**)

Message channel agent type (parameter identifier: MQIACH\_MCA\_TYPE).

The value can be any of the following values:

**MQMCAT\_PROCESS**

Process.

**MQMCAT\_THREAD**

Thread ( Windows only).

*MCAUserIdentifier* (**MQCFST**)

Message channel agent user identifier (parameter identifier: MQCACH\_MCA\_USER\_ID).

**Note:** An alternative way of providing a user ID for a channel to run under is to use channel authentication records. With channel authentication records, different connections can use the same channel while using different credentials. If both MCAUSER on the channel is set and channel authentication records are used to apply to the same channel, the channel authentication records take precedence. The MCAUSER on the channel definition is only used if the channel authentication record uses USERSRC(CHANNEL). For more details, see Channel authentication records

The maximum length of the MCA user identifier depends on the environment in which the MCA is running. MQ\_MCA\_USER\_ID\_LENGTH gives the maximum length for the environment for which your application is running. MQ\_MAX\_MCA\_USER\_ID\_LENGTH gives the maximum for all supported environments.

On Windows, the user identifier might be qualified with the domain name in the following format:

user@domain

*MessageCompression* (**MQCFIL**)

Message data compression techniques supported by the channel (parameter identifier:

MQIACH\_MSG\_COMPRESSION). For sender, server, cluster-sender, cluster-receiver, and client-connection channels, the values specified are in order of preference.

The value can be one, or more, of:

**MQCOMPRESS\_NONE**

No message data compression is performed.

**MQCOMPRESS\_RLE**

Message data compression is performed using run-length encoding.

**MQCOMPRESS\_ZLIBFAST**

Message data compression is performed using ZLIB encoding with speed prioritized.

**MQCOMPRESS\_ZLIBHIGH**

Message data compression is performed using ZLIB encoding with compression prioritized.

**MQCOMPRESS\_ANY**

Any compression technique supported by the queue manager can be used.  
MQCOMPRESS\_ANY is only valid for receiver, requester, and server-connection channels.

*ModeName* (**MQCFST**)

Mode name (parameter identifier: MQCACH\_MODE\_NAME).

The maximum length of the string is MQ\_MODE\_NAME\_LENGTH.

*MsgExit* (**MQCFST**)

Message exit name (parameter identifier: MQCACH\_MSG\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

In the following environments, if more than one message exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure: IBM i, Windows, UNIX and Linux. An MQCFSL structure is always used on z/OS.

*MsgsReceived* (**MQCFIN64**)

The number of messages received by the client since it last connected (parameter identifier: MQIACH\_MSGS\_RECEIVED / MQIACH\_MSGS\_RCVD).

*MsgRetryCount* (**MQCFIN**)

Message retry count (parameter identifier: MQIACH\_MR\_COUNT).

*MsgRetryExit* (**MQCFST**)

Message retry exit name (parameter identifier: MQCACH\_MR\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

*MsgRetryInterval* (**MQCFIN**)

Message retry interval (parameter identifier: MQIACH\_MR\_INTERVAL).

*MsgRetryUserData* (**MQCFST**)

Message retry exit user data (parameter identifier: MQCACH\_MR\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

*MsgsSent* (**MQCFIN64**)

The number of messages sent by the client since it last connected (parameter identifier: MQIACH\_MSGS\_SENT).

### *MsgUserData* (MQCFST)

Message exit user data (parameter identifier: MQCACH\_MSG\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

In the following environments, if more than one message exit user data string has been defined for the channel, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure: IBM i, Windows, UNIX and Linux. An MQCFSL structure is always used on z/OS.

### *NetworkPriority* (MQCFIN)

Network priority (parameter identifier: MQIACH\_NETWORK\_PRIORITY).

### *NonPersistentMsgSpeed* (MQCFIN)

Speed at which non-persistent messages are to be sent (parameter identifier: MQIACH\_NPM\_SPEED).

The value can be:

**MQNPMS\_NORMAL**

Normal speed.

**MQNPMS\_FAST**

Fast speed.

### *Password* (MQCFST)

Password (parameter identifier: MQCACH\_PASSWORD).

If a nonblank password is defined, it is returned as asterisks. Otherwise, it is returned as blanks.

The maximum length of the string is MQ\_PASSWORD\_LENGTH. However, only the first 10 characters are used.

### *PropertyControl* (MQCFIN)

Property control attribute (parameter identifier MQIA\_PROPERTY\_CONTROL).

Specifies what happens to properties of messages when the message is about to be sent to a V6 or prior queue manager (a queue manager that does not understand the concept of a property descriptor). The value can be any of the following values:

**MQPROP\_COMPATIBILITY**

Message properties	Result
The message contains a property with a prefix of <b>mcd.</b> , <b>jms.</b> , <b>usr.</b> or <b>mnext.</b>	All optional message properties (where the <b>Support</b> value is MQPD_SUPPORT_OPTIONAL), except those properties in the message descriptor or extension, are placed in one or more MQRFH2 headers in the message data before the message is sent to the remote queue manager.
The message does not contain a property with a prefix of <b>mcd.</b> , <b>jms.</b> , <b>usr.</b> or <b>mnext.</b>	All message properties, except those properties in the message descriptor or extension, are removed from the message before the message is sent to the remote queue manager.
The message contains a property where the <b>Support</b> field of the property descriptor is not set to MQPD_SUPPORT_OPTIONAL	The message is rejected with reason MQRC_UNSUPPORTED_PROPERTY and treated in accordance with its report options.
The message contains one or more properties where the <b>Support</b> field of the property descriptor is set to MQPD_SUPPORT_OPTIONAL but other fields of the property descriptor are set to non-default values	The properties with non-default values are removed from the message before the message is sent to the remote queue manager.
The MQRFH2 folder that would contain the message property needs to be assigned with the <i>content='properties'</i> attribute	The properties are removed to prevent MQRFH2 headers with unsupported syntax flowing to a V6 or prior queue manager.

### **MQPROP\_NONE**

All properties of the message, except those properties in the message descriptor or extension, are removed from the message before the message is sent to the remote queue manager.

If the message contains a property where the **Support** field of the property descriptor is not set to MQPD\_SUPPORT\_OPTIONAL then the message is rejected with reason MQRC\_UNSUPPORTED\_PROPERTY and treated in accordance with its report options.

### **MQPROP\_ALL**

All properties of the message are included with the message when it is sent to the remote queue manager. The properties, except those properties in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data.

This attribute is applicable to Sender, Server, Cluster Sender, and Cluster Receiver channels.

### *PutAuthority* (**MQCFIN**)

Put authority (parameter identifier: MQIACH\_PUT\_AUTHORITY).

The value can be any of the following values:

#### **MQPA\_DEFAULT**

Default user identifier is used.

#### **MQPA\_CONTEXT**

Context user identifier is used.

### *QMgrName* (**MQCFST**)

Queue manager name (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### *QSGDisposition* (**MQCFIN**)

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

### *ReceiveExit* (**MQCFST**)

Receive exit name (parameter identifier: MQCACH\_RCV\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

In the following environments, if more than one receive exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure: IBM i, Windows, UNIX and Linux. An MQCFSL structure is always used on z/OS.

### *ReceiveUserData* (**MQCFST**)

Receive exit user data (parameter identifier: MQCACH\_RCV\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

In the following environments, if more than one receive exit user data string has been defined for the channel, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure: IBM i, Windows, UNIX and Linux. An MQCFSL structure is always used on z/OS.

#### ***ResetSeq (MQCFIN)***

Pending reset sequence number (parameter identifier: MQIACH\_RESET\_REQUESTED).

This is the sequence number from an outstanding request and it indicates a user Reset Channel command request is outstanding.

A value of zero indicates that there is no outstanding Reset Channel. The value can be in the range 1 - 999999999.

Possible return values include MQCHRR\_RESET\_NOT\_REQUESTED.

This parameter is not applicable on z/OS.

#### ***SecurityExit (MQCFST)***

Security exit name (parameter identifier: MQCACH\_SEC\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

#### ***SecurityUserData (MQCFST)***

Security exit user data (parameter identifier: MQCACH\_SEC\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

#### ***SendExit (MQCFST)***

Send exit name (parameter identifier: MQCACH\_SEND\_EXIT\_NAME).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

In the following environments, if more than one send exit has been defined for the channel, the list of names is returned in an MQCFSL structure instead of an MQCFST structure: IBM i, Windows, UNIX and Linux. An MQCFSL structure is always used on z/OS.

#### ***SendUserData (MQCFST)***

Send exit user data (parameter identifier: MQCACH\_SEND\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

In the following environments, if more than one send exit user data string has been defined for the channel, the list of strings is returned in an MQCFSL structure instead of an MQCFST structure: IBM i, Windows, UNIX and Linux. An MQCFSL structure is always used on z/OS.

#### ***SeqNumberWrap (MQCFIN)***

Sequence wrap number (parameter identifier: MQIACH\_SEQUENCE\_NUMBER\_WRAP).

#### ***SharingConversations (MQCFIN)***

Number of sharing conversations (parameter identifier: MQIACH\_SHARING\_CONVERSATIONS).

This parameter is returned only for TCP/IP client-connection and server-connection channels.

#### ***ShortRetryCount (MQCFIN)***

Short retry count (parameter identifier: MQIACH\_SHORT\_RETRY).

#### ***ShortRetryInterval (MQCFIN)***

Short timer (parameter identifier: MQIACH\_SHORT\_TIMER).

*SSLCipherSpec* (**MQCFST**)

CipherSpec (parameter identifier: MQCACH\_SSL\_CIPHER\_SPEC).

The length of the string is MQ\_SSL\_CIPHER\_SPEC\_LENGTH.

*SSLCipherSuite* (**MQCFST**)

CipherSuite (parameter identifier: MQCACH\_SSL\_CIPHER\_SUITE).

The length of the string is MQ\_SSL\_CIPHER\_SUITE\_LENGTH.

*SSLClientAuth* (**MQCFIN**)

Client authentication (parameter identifier: MQIACH\_SSL\_CLIENT\_AUTH).

The value can be

**MQSCA\_REQUIRED**

Client authentication required

**MQSCA\_OPTIONAL**

Client authentication is optional.

The following value is also valid for Channels of type MQCHT\_MQTT:

**MQSCA\_NEVER\_REQUIRED**

Client authentication is never required, and must not be provided.

Defines whether IBM MQ requires a certificate from the SSL client.

*SSLPeerName* (**MQCFST**)

Peer name (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

**Note:** An alternative way of restricting connections into channels by matching against the SSL or TLS Subject Distinguished Name, is to use channel authentication records. With channel authentication records, different SSL or TLS Subject Distinguished Name patterns can be applied to the same channel. If both SSLPEER on the channel and a channel authentication record are used to apply to the same channel, the inbound certificate must match both patterns in order to connect. For more information, see Channel authentication records.

The length of the string is MQ\_SSL\_PEER\_NAME\_LENGTH. On z/OS, it is MQ\_SSL\_SHORT\_PEER\_NAME\_LENGTH.

Specifies the filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel. (A Distinguished Name is the identifier of the SSL certificate.) If the Distinguished Name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

*TpName* (**MQCFST**)

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The maximum length of the string is MQ\_TP\_NAME\_LENGTH.

*TransportType* (**MQCFIN**)

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value might be:

**MQXPT\_LU62**

LU 6.2.

**MQXPT\_TCP**

TCP.

**MQXPT\_NETBIOS**

NetBIOS.

**MQXPT\_SPX**  
SPX.

**MQXPT\_DECNET**  
DECnet.

**UseDLQ (MQCFIN)**

Whether the dead-letter queue (or undelivered message queue) should be used when messages cannot be delivered by channels (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value might be:

**MQUSEDLQ\_NO**

Messages that cannot be delivered by a channel will be treated as a failure and either the channel will discard them, or the channel will end, in accordance with the setting of NPMSPEED.

**MQUSEDLQ\_YES**

If the queue manager DEADQ attribute provides the name of a dead-letter queue then it will be used, otherwise the behavior will be as for MQUSEDLQ\_NO.

**UserIdentifier (MQCFST)**

Task user identifier (parameter identifier: MQCACH\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH. However, only the first 10 characters are used.

**XmitQName (MQCFST)**

Transmission queue name (parameter identifier: MQCACH\_XMIT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Inquire Channel Authentication Records:**

The Inquire Channel Authentication Records (MQCMD\_INQUIRE\_CHLAUTH\_RECS) command retrieves the allowed partner details and mappings to MCAUSER for a channel or set of channels.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	2CR

**Required parameters**

**generic-channel-name (MQCFST)**

The name of the channel or set of channels on which you are inquiring (parameter identifier: MQCACH\_CHANNEL\_NAME).

You can use the asterisk (\*) as a wildcard to specify a set of channels, unless you set Match to MQMATCH\_RUNCHECK. If you set Type to BLOCKADDR, you must set the generic channel name to a single asterisk, which matches all channel names.

**Optional parameters**

**Address (MQCFST)**

The IP address to be mapped (parameter identifier: MQCACH\_CONNECTION\_NAME).

This parameter is valid only when **Match** is MQMATCH\_RUNCHECK and must not be generic.

### *ByteStringFilterCommand* (MQCFBF)

Byte string filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFBF - PCF byte string filter parameter” on page 1583 for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the **IntegerFilterCommand** parameter, or a string filter using the **StringFilterCommand** parameter.

### *ChannelAuthAttrs* (MQCFIL)

Authority record attributes (parameter identifier: MQIACF\_CHLAUTH\_ATTRS).

You can specify the following value in the attribute list on its own. This is the default value if the parameter is not specified.

#### **MQIACF\_ALL**

All attributes.

If MQIACF\_ALL is not specified, specify a combination of the following values:

#### **MQCA\_ALTERATION\_DATE**

Alteration Date.

#### **MQCA\_ALTERATION\_TIME**

Alteration Time.

#### **MQCA\_CHLAUTH\_DESC**

Description.

#### **MQCA\_CUSTOM**

Custom.

#### **MQCACH\_CONNECTION\_NAME**

IP address filter.

#### **MQCACH\_MCA\_USER\_ID**

MCA User ID mapped on the record.

#### **MQIACH\_USER\_SOURCE**

The source of the user ID for this record.

#### **MQIACH\_WARNING**

Warning mode.

### *CheckClient* (MQCFIN)

The user ID and password requirements for the client connection to be successful. The following values are valid:

#### **MQCHK\_REQUIRED\_ADMIN**

A valid user ID and password are required for the connection to be allowed if you are using a privileged user ID.

Any connections using a non-privileged user ID are not required to provide a user ID and password.

The user ID and password are checked against the user repository details provided in an authentication information object, and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

This option is not valid on z/OS platforms.

#### **MQCHK\_REQUIRED**

A valid user ID and password are required for the connection to be allowed.

The user id and password are checked against the user repository details provided in an authentication information object and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

### MQCHK\_AS\_Q\_MGR

In order for the connection to be allowed, it must meet the connection authentication requirements defined on the queue manager.

If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is REQUIRED, the connection fails unless a valid user ID and password are supplied.

If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not REQUIRED, the user ID and password are not required.

**Attention:** If you select REQUIRED or REQADM  ( on platforms other than z/OS), and you have not set the CONNAUTH field on the queue manager, or the value of CHCKCLNT is NONE, the connection fails. You receive message AMQ9793  on platforms other than z/OS, and message CSQX793E on z/OS.

### *ClntUser* (MQCFST)

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH\_CLIENT\_USER\_ID).

This can be the user ID flowed from the client indicating the user ID the client side process is running under, or the user ID presented by the client on an MQCONN call using MQCSP.

This parameter is valid only with TYPE(USERMAP) and when **Match** is MQMATCH\_RUNCHECK.

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which the command was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or a string filter using the **StringFilterCommand** parameter.

### *Match* (MQCFIN)

Indicates the type of matching to be applied (parameter identifier MQIACH\_MATCH). You can specify any one of the following values:

#### MQMATCH\_RUNCHECK

A specific match is made against the supplied channel name and optionally supplied **Address**, **SSLPeer**, **QMName**, and **ClntUser** attributes to find the channel authentication record that will be

matched by the channel at runtime if it connects into this queue manager. If the record discovered has **Warn** set to MQWARN\_YES, a second record might also be displayed to show the actual record the channel will use at runtime. The channel name supplied in this case cannot be generic. This option must be combined with **Type** MQCAUT\_ALL.

#### **MQMATCH\_EXACT**

Return only those records which exactly match the channel profile name supplied. If there are no asterisks in the channel profile name, this option returns the same output as MQMATCH\_GENERIC.

#### **MQMATCH\_GENERIC**

Any asterisks in the channel profile name are treated as wild cards. If there are no asterisks in the channel profile name, this returns the same output as MQMATCH\_EXACT. For example, a profile of ABC\* could result in records for ABC, ABC\*, and ABCD being returned.

#### **MQMATCH\_ALL**

Return all possible records that match the channel profile name supplied. If the channel name is generic in this case, all records that match the channel name are returned even if more specific matches exist. For example, a profile of SYSTEM\*.SVRCONN could result in records for SYSTEM.\*, SYSTEM.DEF.\*, SYSTEM.DEF.SVRCONN, and SYSTEM.ADMIN.SVRCONN being returned.

#### *QMName* (MQCFST)

The name of the remote partner queue manager to be matched (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

This parameter is valid only when **Match** is MQMATCH\_RUNCHECK. The value cannot be generic.

#### *SSLCertIssuer* (MQCFST)

This parameter is additional to the **SSLPeer** parameter.

**SSLCertIssuer** restricts matches to being within certificates issued by a particular Certificate Authority.

#### *SSLPeer* (MQCFST)

The Distinguished Name of the certificate to be matched (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

This parameter is valid only when **Match** is MQMATCH\_RUNCHECK.

The **SSLPeer** value is specified in the standard form used to specify a Distinguished Name and cannot be a generic value.

The maximum length of the parameter is MQ\_SSL\_PEER\_NAME\_LENGTH .

#### *StringFilterCommand* (MQCFSF)

String filter command descriptor. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the **ByteStringFilterCommand** parameter or an integer filter using the **IntegerFilterCommand** parameter.

#### *Type* (MQCFIN)

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF\_CHLAUTH\_TYPE). The following values are valid:

#### **MQCAUT\_BLOCKUSER**

This channel authentication record prevents a specified user or users from connecting.

#### **MQCAUT\_BLOCKADDR**

This channel authentication record prevents connections from a specified IP address or addresses.

**MQCAUT\_SSLPEERMAP**

This channel authentication record maps SSL Distinguished Names (DNs) to MCAUSER values.

**MQCAUT\_ADDRESSMAP**

This channel authentication record maps IP addresses to MCAUSER values.

**MQCAUT\_USERMAP**

This channel authentication record maps asserted user IDs to MCAUSER values.

**MQCAUT\_QMGRMAP**

This channel authentication record maps remote queue manager names to MCAUSER values.

**MQCAUT\_ALL**

Inquire on all types of record. This is the default value.

**Related information:**

Channel authentication records

**Inquire Channel Authentication Records (Response):**

The response to the Inquire Channel Authentication Records (MQCMD\_INQUIRE\_CHLAUTH\_RECS) command consists of the response header followed by the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	2CR

**Always returned:**

*ChlAuth, Type, Warn (yes)*

**Always returned if type is MQCAUT\_BLOCKUSER:**

*UserList*

**Always returned if type is MQCAUT\_BLOCKADDR:**

*AddrList*

**Always returned if type is MQCAUT\_SSLPEERMAP:**

*Address (unless blanks), MCAUser (unless blanks), SSLCertIssuer, SSLPeer, UserSrc*

**Always returned if type is MQCAUT\_ADDRESSMAP:**

*Address (unless blanks), MCAUser (unless blanks), UserSrc*

**Always returned if type is MQCAUT\_USERMAP:**

*Address (unless blanks), CintUser, MCAUser (unless blanks), UserSrc*

**Always returned if type is MQCAUT\_QMGRMAP:**

*Address (unless blanks), MCAUser (unless blanks), QMName, UserSrc*

**Returned if requested:**

*Address, AlterationDate, AlterationTime, Custom, Description, MCAUser, SSLPeer, UserSrc, Warn*

**Response data****AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

**AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

**Address (MQCFST)**

The filter used to compare with the IP address, or host name, of the partner queue manager or client at the other end of the channel (parameter identifier: MQCACH\_CONNECTION\_NAME).

**AddrList (MQCFSL)**

A list of up to 100 IP address patterns which are banned from accessing this queue manager on any channel (parameter identifier: MQCACH\_CONNECTION\_NAME\_LIST).

**Chlauth (MQCFST)**

The name of the channel, or pattern that matches a set of channels, to which the channel authentication record applies (parameter identifier: MQCACH\_CHANNEL\_NAME).

**CheckClient (MQCFIN)**

The user ID and password requirements for the client connection to be successful (parameter identifier: MQIA\_CHECK\_CLIENT\_BINDING).

**ClntUser (MQCFST)**

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH\_CLIENT\_USER\_ID).

**Description (MQCFST)**

Descriptive information about the channel authentication record (parameter identifier: MQCA\_CHLAUTH\_DESC).

**MCAUser (MQCFST)**

The user identifier to be used when the inbound connection matches the SSL DN, IP address, client asserted user ID or remote queue manager name supplied (parameter identifier: MQCACH\_MCA\_USER\_ID).

**QMName (MQCFST)**

The name of the remote partner queue manager to be mapped to a user ID, allowed through unchanged, or blocked (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

**SSLCertIssuer (MQCFST)**

This parameter is additional to the **SSLPeer** parameter.

**SSLCertIssuer** restricts matches to being within certificates issued by a particular Certificate Authority (parameter identifier: MQCA\_SSL\_CERT\_ISSUER\_NAME).

**SSLPeer (MQCFST)**

The filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

**Type (MQCFIN)**

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF\_CHLAUTH\_TYPE). The following values can be returned:

**MQCAUT\_BLOCKUSER**

This channel authentication record prevents a specified user or users from connecting.

**MQCAUT\_BLOCKADDR**

This channel authentication record prevents connections from a specified IP address or addresses.

**MQCAUT\_SSLPEERMAP**

This channel authentication record maps SSL Distinguished Names (DNs) to MCAUSER values.

**MQCAUT\_ADDRESSMAP**

This channel authentication record maps IP addresses to MCAUSER values.

## **MQCAUT\_USERMAP**

This channel authentication record maps asserted user IDs to MCAUSER values.

## **MQCAUT\_QMGRMAP**

This channel authentication record maps remote queue manager names to MCAUSER values.

### *UserList* (**MQCFSL**)

A list of up to 100 user IDs which are banned from use of this channel or set of channels (parameter identifier: MQCACH\_MCA\_USER\_ID\_LIST). Use the special value \*MQADMIN to mean privileged or administrative users. The definition of this value depends on the operating system, as follows:

- On Windows, all members of the mqm group, the Administrators group and SYSTEM.
- On UNIX and Linux, all members of the mqm group.
- On IBM i, the profiles (users) qmqm and qmqmadm and all members of the qmqmadm group, and any user defined with the \*ALLOBJ special setting.
- On z/OS, the user ID that the channel initiator, queue manager and advanced message security address spaces are running under.

### *UserSrc* (**MQCFIN**)

The source of the user ID to be used for MCAUSER at run time (parameter identifier: MQIACH\_USER\_SOURCE).

The following values can be returned:

#### **MQUSRC\_MAP**

Inbound connections that match this mapping use the user ID specified in the **MCAUser** attribute.

#### **MQUSRC\_NOACCESS**

Inbound connections that match this mapping have no access to the queue manager and the channel ends immediately.

#### **MQUSRC\_CHANNEL**

Inbound connections that match this mapping use the flowed user ID or any user defined on the channel object in the MCAUSER field.

### *Warn* (**MQCFIN**)

Indicates whether this record operates in warning mode (parameter identifier: MQIACH\_WARNING).

#### **MQWARN\_NO**

This record does not operate in warning mode. Any inbound connection that matches this record is blocked. This is the default value.

#### **MQWARN\_YES**

This record operates in warning mode. Any inbound connection that matches this record and would therefore be blocked is allowed access. An error message is written and, if events are configured, an event message is created showing the details of what would have been blocked. The connection is allowed to continue.

**Inquire Channel Initiator:** z/OS

The Inquire Channel Initiator (MQCMD\_INQUIRE\_CHANNEL\_INIT) command returns information about the channel initiator.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**Inquire Channel Initiator (Response):** z/OS

The response to the Inquire Channel Initiator (MQCMD\_INQUIRE\_CHANNEL\_INIT) command consists of one response with a series of attribute parameter structures showing the status of the channel initiator (shown by the *ChannelInitiatorStatus* parameter), and one response for each listener (shown by the *ListenerStatus* parameter).

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Always returned (one message with channel initiator information):**

*ActiveChannels, ActiveChannelsMax, ActiveChannelsPaused, ActiveChannelsRetrying, ActiveChannelsStarted, ActiveChannelsStopped, AdaptersMax, AdaptersStarted, ChannelInitiatorStatus, CurrentChannels, CurrentChannelsLU62, CurrentChannelsMax, CurrentChannelsTCP, DispatchersMax, DispatchersStarted, SSLTasksStarted, TCPName*

**Always returned (one message for each listener):**

*InboundDisposition, ListenerStatus, TransportType*

**Returned if applicable for the listener:**

*IPAddress, LUName, Port*

**Response data - channel initiator information****ActiveChannels (MQCFIN)**

The number of active channel connections (parameter identifier: MQIACH\_ACTIVE\_CHL).

**ActiveChannelsMax (MQCFIN)**

The requested number of active channel connections (parameter identifier: MQIACH\_ACTIVE\_CHL\_MAX).

**ActiveChannelsPaused (MQCFIN)**

The number of active channel connections that have paused, waiting to become active, because the limit for active channels has been reached (parameter identifier: MQIACH\_ACTIVE\_CHL\_PAUSED).

**ActiveChannelsRetrying (MQCFIN)**

The number of active channel connections that are attempting to reconnect following a temporary error (parameter identifier: MQIACH\_ACTIVE\_CHL\_RETRY).

**ActiveChannelsStarted (MQCFIN)**

The number of active channel connections that have started (parameter identifier: MQIACH\_ACTIVE\_CHL\_STARTED).

**ActiveChannelsStopped (MQCFIN)**

The number of active channel connections that have stopped, requiring manual intervention (parameter identifier: MQIACH\_ACTIVE\_CHL\_STOPPED).

**AdaptersMax (MQCFIN)**

The requested number of adapter subtasks (parameter identifier: MQIACH\_ADAPS\_MAX).

**AdaptersStarted (MQCFIN)**

The number of active adapter subtasks (parameter identifier: MQIACH\_ADAPS\_STARTED).

**ChannelInitiatorStatus (MQCFIN)**

Status of the channel initiator (parameter identifier: MQIACF\_CHINIT\_STATUS).

The value can be:

**MQSVC\_STATUS\_STOPPED**

The channel initiator is not running.

**MQSVC\_STATUS\_RUNNING**

The channel initiator is fully initialized and is running.

**CurrentChannels (MQCFIN)**

The number of current channel connections (parameter identifier: MQIACH\_CURRENT\_CHL).

**CurrentChannelsLU62 (MQCFIN)**

The number of current LU 6.2 channel connections (parameter identifier: MQIACH\_CURRENT\_CHL\_LU62).

**CurrentChannelsMax (MQCFIN)**

The requested number of channel connections (parameter identifier: MQIACH\_CURRENT\_CHL\_MAX).

**CurrentChannelsTCP (MQCFIN)**

The number of current TCP/IP channel connections (parameter identifier: MQIACH\_CURRENT\_CHL\_TCP).

**DispatchersMax (MQCFIN)**

The requested number of dispatchers (parameter identifier: MQIACH\_DISPS\_MAX).

**DispatchersStarted (MQCFIN)**

The number of active dispatchers (parameter identifier: MQIACH\_DISPS\_STARTED).

**SSLTasksMax (MQCFIN)**

The requested number of SSL server subtasks (parameter identifier: MQIACH\_SSLTASKS\_MAX).

**SSLTasksStarted (MQCFIN)**

The number of active SSL server subtasks (parameter identifier: MQIACH\_SSLTASKS\_STARTED).

*TCPName* (**MQCFST**)

TCP system name (parameter identifier: MQCACH\_TCP\_NAME).

The maximum length is MQ\_TCP\_NAME\_LENGTH.

**Response data - listener information**

*InboundDisposition* (**MQCFIN**)

Inbound transmission disposition (parameter identifier: MQIACH\_INBOUND\_DISP).

Specifies the disposition of the inbound transmissions that the listener handles. The value can be any of the following values:

**MQINBD\_Q\_MGR**

Handling for transmissions directed to the queue manager. MQINBD\_Q\_MGR is the default.

**MQINBD\_GROUP**

Handling for transmissions directed to the queue-sharing group. MQINBD\_GROUP is permitted only if there is a shared queue manager environment.

*IPAddress* (**MQCFST**)

IP address on which the listener listens (parameter identifier: MQCACH\_IP\_ADDRESS).

*ListenerStatus* (**MQCFIN**)

Listener status (parameter identifier: MQIACH\_LISTENER\_STATUS).

The value can be:

**MQSVC\_STATUS\_RUNNING**

The listener has started.

**MQSVC\_STATUS\_STOPPED**

The listener has stopped.

**MQSVC\_STATUS\_RETRYING**

The listener is trying again.

*LUName* (**MQCFST**)

LU name on which the listener listens (parameter identifier: MQCACH\_LU\_NAME).

The maximum length is MQ\_LU\_NAME\_LENGTH.

*Port* (**MQCFIN**)

Port number on which the listener listens (parameter identifier: MQIACH\_PORT\_NUMBER).

*TransportType* (**MQCFIN**)

Transmission protocol type that the listener is using (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_LU62**

LU62.

**MQXPT\_TCP**

TCP.

## Inquire Channel Listener:

The Inquire Channel Listener (MQCMD\_INQUIRE\_LISTENER) command inquires about the attributes of existing IBM MQ listeners.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

## Required parameters

### *ListenerName* (MQCFST)

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME).

This parameter is the name of the listener with attributes that are required. Generic listener names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all listeners having names that start with the selected character string. An asterisk on its own matches all possible names.

The listener name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

## Optional parameters

### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ListenerAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

### *ListenerAttrs* (MQCFIL)

Listener attributes (parameter identifier: MQIACF\_LISTENER\_ATTRS).

The attribute list might specify the following value on its own- default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCA\_ALTERATION\_DATE**

Date on which the definition was last altered.

#### **MQCA\_ALTERATION\_TIME**

Time at which the definition was last altered.

#### **MQCACH\_IP\_ADDRESS**

IP address for the listener.

#### **MQCACH\_LISTENER\_DESC**

Description of listener definition.

#### **MQCACH\_LISTENER\_NAME**

Name of listener definition.

**MQCACH\_LOCAL\_NAME**

NetBIOS local name that the listener uses. MQCACH\_LOCAL\_NAME is valid only on Windows.

**MQCACH\_TP\_NAME**

The LU 6.2 transaction program name. MQCACH\_TP\_NAME is valid only on Windows.

**MQIACH\_ADAPTER**

Adapter number on which NetBIOS listens. MQIACH\_ADAPTER is valid only on Windows.

**MQIACH\_BACKLOG**

Number of concurrent connection requests that the listener supports.

**MQIACH\_COMMAND\_COUNT**

Number of commands that the listener can use. MQIACH\_COMMAND\_COUNT is valid only on Windows.

**MQIACH\_LISTENER\_CONTROL**

Specifies when the queue manager starts and stops the listener.

**MQIACH\_NAME\_COUNT**

Number of names that the listener can use. MQIACH\_NAME\_COUNT is valid only on Windows.

**MQIACH\_PORT**

Port number.

**MQIACH\_SESSION\_COUNT**

Number of sessions that the listener can use. MQIACH\_SESSION\_COUNT is valid only on Windows.

**MQIACH\_SOCKET**

SPX socket on which to listen. MQIACH\_SOCKET is valid only on Windows.

***StringFilterCommand (MQCFSF)***

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ListenerAttrs* except MQCACH\_LISTENER\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

***TransportType (MQCFIN)***

Transport protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

If you specify this parameter, information is returned relating only to those listeners defined with the specified transport protocol type. If you specify an attribute in the *ListenerAttrs* list which is valid only for listeners of a different transport protocol type, it is ignored and no error is raised. If you specify this parameter, it must occur immediately after the *ListenerName* parameter.

If you do not specify this parameter, or if you specify it with a value of MQXPT\_ALL, information about all listeners is returned. Valid attributes in the *ListenerAttrs* list which are not applicable to the listener are ignored, and no error messages are issued. The value can be any of the following values:

**MQXPT\_ALL**

All transport types.

**MQXPT\_LU62**

SNA LU 6.2. MQXPT\_LU62 is valid only on Windows.

**MQXPT\_NETBIOS**

NetBIOS. MQXPT\_NETBIOS is valid only on Windows.

## MQXPT\_SPX

SPX. MQXPT\_SPX is valid only on Windows.

## MQXPT\_TCP

Transmission Control Protocol/Internet Protocol (TCP/IP).

### Inquire Channel Listener (Response):

The response to the Inquire Channel Listener (MQCMD\_INQUIRE\_LISTENER) command consists of the response header followed by the *ListenerName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

If a generic listener name was specified, one such message is generated for each listener found.

#### Always returned:

*ListenerName*

#### Returned if requested:

*Adapter, AlterationDate, AlterationTime, Backlog, Commands, IPAddress, ListenerDesc, LocalName, NetbiosNames, Port, Sessions, Socket, StartMode, TPname, TransportType*

#### Response data

##### *AlterationDate* (MQCFST)

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date, in the form yyyy-mm-dd, on which the information was last altered.

##### *AlterationTime* (MQCFST)

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time, in the form hh.mm.ss, at which the information was last altered.

##### *Adapter* (MQCFIN)

Adapter number (parameter identifier: MQIACH\_ADAPTER).

The adapter number on which NetBIOS listens. This parameter is valid only on Windows.

##### *Backlog* (MQCFIN)

Backlog (parameter identifier: MQIACH\_BACKLOG).

The number of concurrent connection requests that the listener supports.

##### *Commands* (MQCFIN)

Adapter number (parameter identifier: MQIACH\_COMMAND\_COUNT).

The number of commands that the listener can use. This parameter is valid only on Windows.

##### *IPAddress* (MQCFST)

IP address (parameter identifier: MQCACH\_IP\_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

##### *ListenerDesc* (MQCFST)

Description of listener definition (parameter identifier: MQCACH\_LISTENER\_DESC).

The maximum length of the string is MQ\_LISTENER\_DESC\_LENGTH.

**ListenerName (MQCFST)**

Name of listener definition (parameter identifier: MQCACH\_LISTENER\_NAME).

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**LocalName (MQCFST)**

NetBIOS local name (parameter identifier: MQCACH\_LOCAL\_NAME).

The NetBIOS local name that the listener uses. This parameter is valid only on Windows.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

**NetbiosNames (MQCFIN)**

NetBIOS names (parameter identifier: MQIACH\_NAME\_COUNT).

The number of names that the listener supports. This parameter is valid only on Windows.

**Port (MQCFIN)**

Port number (parameter identifier: MQIACH\_PORT).

The port number for TCP/IP. This parameter is valid only if the value of *TransportType* is MQXPT\_TCP.

**Sessions (MQCFIN)**

NetBIOS sessions (parameter identifier: MQIACH\_SESSION\_COUNT).

The number of sessions that the listener can use. This parameter is valid only on Windows.

**Socket (MQCFIN)**

SPX socket number (parameter identifier: MQIACH\_SOCKET).

The SPX socket on which to listen. This parameter is valid only if the value of *TransportType* is MQXPT\_SPX.

**StartMode (MQCFIN)**

Service mode (parameter identifier: MQIACH\_LISTENER\_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. MQSVC\_CONTROL\_MANUAL is the default value.

**MQSVC\_CONTROL\_Q\_MGR**

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The listener is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

**TPName (MQCFST)**

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The LU 6.2 transaction program name. This parameter is valid only on Windows.

The maximum length of the string is MQ\_TP\_NAME\_LENGTH

**TransportType (MQCFIN)**

Transmission protocol (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_TCP**

TCP.

## MQXPT\_LU62

LU 6.2. MQXPT\_LU62 is valid only on Windows.

## MQXPT\_NETBIOS

NetBIOS. MQXPT\_NETBIOS is valid only on Windows.

## MQXPT\_SPX

SPX. MQXPT\_SPX is valid only on Windows.

### Inquire Channel Listener Status:

The Inquire Channel Listener Status (MQCMD\_INQUIRE\_LISTENER\_STATUS) command inquires about the status of one or more IBM MQ listener instances.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

You must specify the name of a listener for which you want to receive status information. You can specify a listener by using either a specific listener name or a generic listener name. By using a generic listener name, you can display either:

- Status information for all listener definitions, by using a single asterisk (\*), or
- Status information for one or more listeners that match the specified name.

### Required parameters

#### *ListenerName* (MQCFST)

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME).

Generic listener names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all listeners having names that start with the selected character string. An asterisk on its own matches all possible names.

The listener name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

### Optional parameters

#### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ListenerStatusAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFIF - PCF integer filter parameter" on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

#### *ListenerStatusAttrs* (MQCFIL)

Listener status attributes (parameter identifier: MQIACF\_LISTENER\_STATUS\_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

#### MQIACF\_ALL

All attributes.

or a combination of the following:

**MQCACH\_IP\_ADDRESS**

IP address of the listener.

**MQCACH\_LISTENER\_DESC**

Description of listener definition.

**MQCACH\_LISTENER\_NAME**

Name of listener definition.

**MQCACH\_LISTENER\_START\_DATE**

The date on which the listener was started.

**MQCACH\_LISTENER\_START\_TIME**

The time at which the listener was started.

**MQCACH\_LOCAL\_NAME**

NetBIOS local name that the listener uses. MQCACH\_LOCAL\_NAME is valid only on Windows.

**MQCACH\_TP\_NAME**

LU6.2 transaction program name. MQCACH\_TP\_NAME is valid only on Windows.

**MQIACH\_PROCESS\_ID**

Operating system process identifier associated with the listener.

**MQIACH\_ADAPTER**

Adapter number on which NetBIOS listens. MQIACH\_ADAPTER is valid only on Windows.

**MQIACH\_BACKLOG**

Number of concurrent connection requests that the listener supports.

**MQIACH\_COMMAND\_COUNT**

Number of commands that the listener can use. MQIACH\_COMMAND\_COUNT is valid only on Windows.

**MQIACH\_LISTENER\_CONTROL**

How the listener is to be started and stopped.

**MQIACH\_LISTENER\_STATUS**

Status of the listener.

**MQIACH\_NAME\_COUNT**

Number of names that the listener can use. MQIACH\_NAME\_COUNT is valid only on Windows.

**MQIACH\_PORT**

Port number for TCP/IP.

**MQIACH\_SESSION\_COUNT**

Number of sessions that the listener can use. MQIACH\_SESSION\_COUNT is valid only on Windows.

**MQIACH\_SOCKET**

SPX socket. MQIACH\_SOCKET is valid only on Windows.

**MQIACH\_XMIT\_PROTOCOL\_TYPE**

Transport type.

***StringFilterCommand (MQCFSF)***

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ListenerStatusAttrs* except MQCACH\_LISTENER\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFSF - PCF string filter parameter" on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

### Error code

This command might return the following error code in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

#### Reason (MQLONG)

The value can be any of the following values:

#### MQRCCF\_LSTR\_STATUS\_NOT\_FOUND

Listener status not found.

### Inquire Channel Listener Status (Response):

The response to the Inquire Channel Listener Status (MQCMD\_INQUIRE\_LISTENER\_STATUS) command consists of the response header followed by the *ListenerName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

If a generic listener name was specified, one such message is generated for each listener found.

#### Always returned:

*ListenerName*

#### Returned if requested:

*Adapter, Backlog, ChannelCount, Commands, IPAddress, ListenerDesc, LocalName, NetbiosNames, Port, ProcessId, Sessions, Socket, StartDate, StartMode, StartTime, Status, TPname, TransportType*

### Response data

#### Adapter (MQCFIN)

Adapter number (parameter identifier: MQIACH\_ADAPTER).

The adapter number on which NetBIOS listens.

#### Backlog (MQCFIN)

Backlog (parameter identifier: MQIACH\_BACKLOG).

The number of concurrent connection requests that the listener supports.

#### Commands (MQCFIN)

Adapter number (parameter identifier: MQIACH\_COMMAND\_COUNT).

The number of commands that the listener can use.

#### IPAddress (MQCFST)

IP address (parameter identifier: MQCACH\_IP\_ADDRESS).

IP address for the listener specified in IPv4 dotted decimal, IPv6 hexadecimal notation, or alphanumeric host name form.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

#### ListenerDesc (MQCFST)

Description of listener definition (parameter identifier: MQCACH\_LISTENER\_DESC).

The maximum length of the string is MQ\_LISTENER\_DESC\_LENGTH.

**ListenerName (MQCFST)**

Name of listener definition (parameter identifier: MQCACH\_LISTENER\_NAME).

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

**LocalName (MQCFST)**

NetBIOS local name (parameter identifier: MQCACH\_LOCAL\_NAME).

The NetBIOS local name that the listener uses.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH

**NetbiosNames (MQCFIN)**

NetBIOS names (parameter identifier: MQIACH\_NAME\_COUNT).

The number of names that the listener supports.

**Port (MQCFIN)**

Port number (parameter identifier: MQIACH\_PORT).

The port number for TCP/IP.

**ProcessId (MQCFIN)**

Process identifier (parameter identifier: MQIACF\_PROCESS\_ID).

The operating system process identifier associated with the listener.

**Sessions (MQCFIN)**

NetBIOS sessions (parameter identifier: MQIACH\_SESSION\_COUNT).

The number of sessions that the listener can use.

**Socket (MQCFIN)**

SPX socket number (parameter identifier: MQIACH\_SOCKET).

The SPX socket on which the listener is to listen.

**StartDate (MQCFST)**

Start date (parameter identifier: MQCACH\_LISTENER\_START\_DATE).

The date, in the form yyyy-mm-dd, on which the listener was started.

The maximum length of the string is MQ\_DATE\_LENGTH

**StartMode (MQCFIN)**

Service mode (parameter identifier: MQIACH\_LISTENER\_CONTROL).

Specifies how the listener is to be started and stopped. The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The listener is not to be started automatically or stopped automatically. It is to be controlled by user command. MQSVC\_CONTROL\_MANUAL is the default value.

**MQSVC\_CONTROL\_Q\_MGR**

The listener being defined is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The listener is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

**StartTime (MQCFST)**

Start date (parameter identifier: MQCACH\_LISTENER\_START\_TIME).

The time, in the form hh.mm.ss, at which the listener was started.

The maximum length of the string is MQ\_TIME\_LENGTH

**Status (MQCFIN)**

Listener status (parameter identifier: MQIACH\_LISTENER\_STATUS).

The status of the listener. The value can be any of the following values:

**MQSVC\_STATUS\_STARTING**

The listener is in the process of initializing.

**MQSVC\_STATUS\_RUNNING**

The listener is running.

**MQSVC\_STATUS\_STOPPING**

The listener is stopping.

**TPName (MQCFST)**

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The LU 6.2 transaction program name.

The maximum length of the string is MQ\_TP\_NAME\_LENGTH

**TransportType (MQCFIN)**

Transmission protocol (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_TCP**

TCP.

**MQXPT\_LU62**

LU 6.2. MQXPT\_LU62 is valid only on Windows.

**MQXPT\_NETBIOS**

NetBIOS. MQXPT\_NETBIOS is valid only on Windows.

**MQXPT\_SPX**

SPX. MQXPT\_SPX is valid only on Windows.

**Inquire Channel Names:**

The Inquire Channel Names (MQCMD\_INQUIRE\_CHANNEL\_NAMES) command inquires a list of IBM MQ channel names that match the generic channel name, and the optional channel type specified.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

**Required parameters**

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**Optional parameters**

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

If present, this parameter limits the channel names returned to channels of the specified type.

The value can be any of the following values:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**

Cluster-receiver.

**MQCHT\_CLUSSDR**

Cluster-sender.

**MQCHT\_ALL**

All types.

The default value if this parameter is not specified is **MQCHT\_ALL**, which means that channels of all types except **MQCHT\_CLNTCONN** are eligible.

z/OS

#### *CommandScope* (**MQCFST**)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

z/OS

#### *QSGDisposition* (**MQCFIN**)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

### MQQSGD\_LIVE

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

### MQQSGD\_ALL

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

### MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

### MQQSGD\_PRIVATE

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

### Error code

This command might return the following error code in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

#### Reason (MQLONG)

The value can be any of the following values:

#### MQRCCF\_CHANNEL\_NAME\_ERROR

Channel name error.

#### MQRCCF\_CHANNEL\_TYPE\_ERROR

Channel type not valid.

### Inquire Channel Names (Response):

The response to the Inquire Channel Names (MQCMD\_INQUIRE\_CHANNEL\_NAMES) command consists of one response per client connection channel (except for SYSTEM.DEF.CLNTCONN), and a final message with all the remaining channels.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

#### Always returned:

*ChannelNames, ChannelTypes*

#### Returned if requested:

None

On z/OS only, one additional parameter structure (with the same number of entries as the *ChannelNames* structure), is returned. Each entry in the structure, *QSGDispositions*, indicates the disposition of the object with the corresponding entry in the *ChannelNames* structure.

### Response data

#### *ChannelNames* (MQCFSL)

List of channel names (parameter identifier: MQCACH\_CHANNEL\_NAMES).

#### *ChannelTypes* (MQCFIL)

List of channel types (parameter identifier: MQIACH\_CHANNEL\_TYPES). Possible values for fields in this structure are those values permitted for the *ChannelType* parameter, except MQCHT\_ALL.

#### z/OS

#### *QSGDispositions* (MQCFIL)

List of QSG dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter is valid only on z/OS. The value can be:

##### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

##### MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

##### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

### Inquire Channel Status:

The Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) command inquires about the status of one or more channel instances.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

You must also specify whether you want:

- The status data (of current channels only), or
- The saved status data of all channels, or
- On z/OS only, the short status data of the channel.

Status for all channels that meet the selection criteria is returned, whether the channels were defined manually or automatically.

### Selection

The way to make a selection, is to use one of the following four options:

- **XmitQname** (MQCACH\_XMIT\_Q\_NAME)

- **ConnectionName** (MQCACH\_CONNECTION\_NAME)
-  **ChannelDisposition** (MQIACH\_CHANNEL\_DISP)
- **ChannelInstanceType** (MQIACH\_CHANNEL\_INSTANCE\_TYPE)

 This command includes a check on the current depth of the transmission queue for the channel, if the channel is a CLUSSDR channel. To issue this command, you must be authorized to inquire the queue depth, and to do this requires *+inq* authority on the transmission queue. Note that another name for this authority is MQZAO\_INQUIRE.

 Without this authority this command runs without error, but a value of zero is output for the **MsgsAvailable** parameter of the “Inquire Channel Status (Response)” on page 1306 command. If you have the correct authority, the command provides the correct value for **MsgsAvailable**.

There are three classes of data available for channel status. These classes are **saved**, **current**, and **short**. The status fields available for saved data are a subset of the fields available for current data and are called **common** status fields. Although the common data *fields* are the same, the data *values* might be different for saved and current status. The rest of the fields available for current data are called **current-only** status fields.

- **Saved** data consists of the common status fields. This data is reset at the following times:
  - For all channels:
    - When the channel enters or leaves STOPPED or RETRY state
  - For a sending channel:
    - Before requesting confirmation that a batch of messages has been received
    - When confirmation has been received
  - For a receiving channel:
    - Just before confirming that a batch of messages has been received
  - For a server connection channel:
    - No data is saved

Therefore, a channel which has never been current does not have any saved status.

- **Current** data consists of the common status fields and current-only status fields. The data fields are continually updated as messages are sent or received.
- **Short** data consists of the queue manager name that owns the channel instance. This class of data is available only on z/OS.

This method of operation has the following consequences:

- An inactive channel might not have any saved status if it has never been current or has not yet reached a point where saved status is reset.
- The “common” data fields might have different values for saved and current status.
- A current channel always has current status and might have saved status.

Channels can be current or inactive:

#### Current channels

These are channels that have been started, or on which a client has connected, and that have not finished or disconnected normally. They might not yet have reached the point of transferring messages, or data, or even of establishing contact with the partner. Current channels have **current** status and can also have **saved** or **short** status.

The term **Active** is used to describe the set of current channels which are not stopped.

#### Inactive channels

These are channels that have either not been started or on which a client has not connected, or

that have finished or disconnected normally. (If a channel is stopped, it is not yet considered to have finished normally and is, therefore, still current.) Inactive channels have either **saved** status or no status at all.

There can be more than one instance of a receiver, requester, cluster-sender, cluster-receiver, or server-connection channel current at the same time (the requester is acting as a receiver). This situation occurs if several senders, at different queue managers, each initiate a session with this receiver, using the same channel name. For channels of other types, there can only be one instance current at any time.

For all channel types, however, there can be more than one set of saved status information available for a particular channel name. At most one of these sets relates to a current instance of the channel, the rest relate to previously current instances. Multiple instances arise if different transmission queue names or connection names have been used with the same channel. This situation can happen in the following cases:

- At a sender or server:
  - If the same channel has been connected to by different requesters (servers only),
  - If the transmission queue name has been changed in the definition, or
  - If the connection name has been changed in the definition.
- At a receiver or requester:
  - If the same channel has been connected to by different senders or servers, or
  - If the connection name has been changed in the definition (for requester channels initiating connection).

The number of sets returned for a particular channel can be limited by using the *XmitQName*, *ConnectionName* and *ChannelInstanceType* parameters.

## Required parameters

### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

## Optional parameters

### *ChannelDisposition* (MQCFIN)

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels for which information is to be returned. The value can be any of the following values:

#### **MQCHLD\_ALL**

Returns requested status information for private channels.

In a shared queue environment where the command is being executed on the queue manager where it was issued, or if *ChannelInstanceType* has a value of MQOT\_CURRENT\_CHANNEL, this option also displays the requested status information for shared channels.

#### **MQCHLD\_PRIVATE**

Returns requested status information for private channels.

## MQCHLD\_SHARED

Returns requested status information for shared channels.

The status information that is returned for various combinations of *ChannelDisposition*, *CommandScope*, and status type, is summarized in Table 120, Table 121, and Table 122 on page 1295.

Table 120. *ChannelDisposition* and *CommandScope* for *Inquire Channel Status, Current*

<i>ChannelDisposition</i>	<i>CommandScope</i> <b>blank or local queue manager</b>	<i>CommandScope</i> ( <i>qmgr-name</i> )	<i>CommandScope</i> (*)
MQCHLD_PRIVATE	Common and current-only status for current private channels on the local queue manager	Common and current-only status for current private channels on the named queue manager	Common and current-only status for current private channels on all queue managers
MQCHLD_SHARED	Common and current-only status for current shared channels on the local queue manager	Common and current-only status for current shared channels on the named queue manager	Common and current-only status for current shared channels on all queue managers
MQCHLD_ALL	Common and current-only status for current private and shared channels on the local queue manager	Common and current-only status for current private and shared channels on the named queue manager	Common and current-only status for current private and shared channels on all active queue managers

Table 121. *ChannelDisposition* and *CommandScope* for *Inquire Channel Status, Short*

<i>ChannelDisposition</i>	<i>CommandScope</i> <b>blank or local queue manager</b>	<i>CommandScope</i> ( <i>qmgr-name</i> )	<i>CommandScope</i> (*)
MQCHLD_PRIVATE	<i>ChannelStatus</i> and short status for current private channels on the local queue manager	<i>ChannelStatus</i> and short status for current private channels on the named queue manager	<i>ChannelStatus</i> and short status for current private channels on all active queue managers
MQCHLD_SHARED	<i>ChannelStatus</i> and short status for current shared channels on all active queue managers in the queue-sharing group	Not permitted	Not permitted
MQCHLD_ALL	<i>ChannelStatus</i> and short status for current private channels on the local queue manager and current shared channels in the queue-sharing group( 1 )	<i>ChannelStatus</i> and short status for current private channels on the named queue manager	<i>ChannelStatus</i> and short status for current private, and shared, channels on all active queue managers in the queue-sharing group( 1 )

### Note:

1. In this case you get two separate sets of responses to the command on the queue manager where it was entered; one for MQCHLD\_PRIVATE and one for MQCHLD\_SHARED.

Table 122. ChannelDisposition and CommandScope for Inquire Channel Status, Saved

ChannelDisposition	CommandScope blank or local queue manager	CommandScope (qmgr-name)	CommandScope (*)
MQCHLD_PRIVATE	Common status for saved private channels on the local queue manager	Common status for saved private channels on the named queue manager	Common status for saved private channels on all active queue managers
MQCHLD_SHARED	Common status for saved shared channels on all active queue managers in the queue-sharing group	Not permitted	Not permitted
MQCHLD_ALL	Common status for saved private channels on the local queue manager and saved shared channels in the queue-sharing group	Common status for saved private channels on the named queue manager	Common status for saved private, and shared, channels on all active queue managers in the queue-sharing group

You cannot use this parameter as a filter keyword.

#### ChannelInstanceAttrs (MQCFIL)

Channel instance attributes (parameter identifier: MQIACH\_CHANNEL\_INSTANCE\_ATTRS).

The *ChannelInstanceAttrs* parameter names the list of attributes to be returned. This parameter does not provide any way to select, based upon the value of the items in that list of attributes.

If status information is requested which is not relevant for the particular channel type, it is not an error. Similarly, it is not an error to request status information that is applicable only to active channels for saved channel instances. In both of these cases, no structure is returned in the response for the information concerned.

For a saved channel instance, the MQCACH\_CURRENT\_LUWID, MQIACH\_CURRENT\_MSGS, and MQIACH\_CURRENT\_SEQ\_NUMBER attributes have meaningful information only if the channel instance is in doubt. However, the attribute values are still returned when requested, even if the channel instance is not in-doubt.

The attribute list might specify the following value on its own:

#### MQIACF\_ALL

All attributes.

MQIACF\_ALL is the default value used if the parameter is not specified or it can specify a combination of the following:

- Relevant for common status:

The following information applies to all sets of channel status, whether the set is current.

#### MQCACH\_CHANNEL\_NAME

Channel name.

#### MQCACH\_CONNECTION\_NAME

Connection name.

#### MQCACH\_CURRENT\_LUWID

Logical unit of work identifier for current batch.

#### MQCACH\_LAST\_LUWID

Logical unit of work identifier for last committed batch.

#### MQCACH\_XMIT\_Q\_NAME

Transmission queue name.

#### MQIACH\_CHANNEL\_INSTANCE\_TYPE

Channel instance type.

**MQIACH\_CHANNEL\_TYPE**

Channel type.

**MQIACH\_CURRENT\_MSGS**

Number of messages sent or received in current batch.

**MQIACH\_CURRENT\_SEQ\_NUMBER**

Sequence number of last message sent or received.

**MQIACH\_INDOUBT\_STATUS**

Whether the channel is currently in-doubt.

**MQIACH\_LAST\_SEQ\_NUMBER**

Sequence number of last message in last committed batch.

MQCACH\_CURRENT\_LUWID, MQCACH\_LAST\_LUWID, MQIACH\_CURRENT\_MSGS, MQIACH\_CURRENT\_SEQ\_NUMBER, MQIACH\_INDOUBT\_STATUS and MQIACH\_LAST\_SEQ\_NUMBER do not apply to server-connection channels, and no values are returned. If specified on the command, they are ignored.

- Relevant for current-only status:

The following information applies only to current channel instances. The information applies to all channel types, except where stated.

**MQCA\_Q\_MGR\_NAME**

Name of the queue manager that owns the channel instance. This parameter is valid only on z/OS.

**MQCA\_REMOTE\_Q\_MGR\_NAME**

Queue manager name, or queue-sharing group name of the remote system. The remote queue manager name is always returned regardless of the instance attributes requested.

**MQCACH\_CHANNEL\_START\_DATE**

Date channel was started.

**MQCACH\_CHANNEL\_START\_TIME**

Time channel was started.

**MQCACH\_LAST\_MSG\_DATE**

Date last message was sent, or MQI call was handled.

**MQCACH\_LAST\_MSG\_TIME**

Time last message was sent, or MQI call was handled.

**MQCACH\_LOCAL\_ADDRESS**

Local communications address for the channel.

**MQCACH\_MCA\_JOB\_NAME**

Name of MCA job.

This parameter is not valid on z/OS.

You cannot use MQCACH\_MCA\_JOB\_NAME as a parameter to filter on.

**MQCACH\_MCA\_USER\_ID**

The user ID used by the MCA.

**MQCACH\_REMOTE\_APPL\_TAG**

Remote partner application name. MQCACH\_REMOTE\_APPL\_TAG is the name of the client application at the remote end of the channel. This parameter applies only to server-connection channels.

**MQCACH\_REMOTE\_PRODUCT**

Remote partner product identifier. This is the product identifier of the IBM MQ code running at the remote end of the channel.

**MQCACH\_REMOTE\_VERSION**

Remote partner version. This is the version of the IBM MQ code running at the remote end of the channel.

**MQCACH\_SSL\_SHORT\_PEER\_NAME**

SSL short peer name.

**MQCACH\_SSL\_CERT\_ISSUER\_NAME**

The full Distinguished Name of the issuer of the remote certificate.

**z/OS MQCACH\_SSL\_CERT\_USER\_ID**

User ID associated with the remote certificate; valid on z/OS only.

**V8.0.0.4 MQCACH\_TOPIC\_ROOT**

Topic root for AMQP channel.

**MQIA\_MONITORING\_CHANNEL**

The level of monitoring data collection.

**z/OS MQIA\_STATISTICS\_CHANNEL**

The level of statistics data collection; valid on z/OS only.

**MQIACF\_MONITORING**

All channel status monitoring attributes. These attributes are:

**MQIA\_MONITORING\_CHANNEL**

The level of monitoring data collection.

**MQIACH\_BATCH\_SIZE\_INDICATOR**

Batch size.

**MQIACH\_COMPRESSION\_RATE**

The compression rate achieved displayed to the nearest percentage.

**MQIACH\_COMPRESSION\_TIME**

The amount of time per message, displayed in microseconds, spent during compression or decompression.

**MQIACH\_EXIT\_TIME\_INDICATOR**

Exit time.

**MQIACH\_NETWORK\_TIME\_INDICATOR**

Network time.

**MQIACH\_XMITQ\_MSGS\_AVAILABLE**

Number of messages available to the channel on the transmission queue.

**MQIACH\_XMITQ\_TIME\_INDICATOR**

Time on transmission queue.

You cannot use MQIACF\_MONITORING as a parameter to filter on.

**MQIACH\_BATCH\_SIZE\_INDICATOR**

Batch size.

You cannot use MQIACH\_BATCH\_SIZE\_INDICATOR as a parameter to filter on.

**MQIACH\_BATCHES**

Number of completed batches.

**MQIACH\_BUFFERS\_RCVD**

Number of buffers received.

**MQIACH\_BUFFERS\_SENT**

Number of buffers sent.

**MQIACH\_BYTES\_RCVD**

Number of bytes received.

**MQIACH\_BYTES\_SENT**

Number of bytes sent.

**MQIACH\_CHANNEL\_SUBSTATE**

The channel substate.

**MQIACH\_COMPRESSION\_RATE**

The compression rate achieved displayed to the nearest percentage.

You cannot use MQIACH\_COMPRESSION\_RATE as a parameter to filter on.

**MQIACH\_COMPRESSION\_TIME**

The amount of time per message, displayed in microseconds, spent during compression or decompression.

You cannot use MQIACH\_COMPRESSION\_TIME as a parameter to filter on.

**MQIACH\_CURRENT\_SHARING\_CONVS**

Requests information about the current number of conversations on this channel instance.

This attribute applies only to TCP/IP server-connection channels.

**MQIACH\_EXIT\_TIME\_INDICATOR**

Exit time.

You cannot use MQIACH\_EXIT\_TIME\_INDICATOR as a parameter to filter on.

**MQIACH\_HDR\_COMPRESSION**

Technique used to compress the header data sent by the channel.

**MQIACH\_KEEP\_ALIVE\_INTERVAL**

The KeepAlive interval in use for this session. This parameter is significant only for z/OS.

**MQIACH\_LONG\_RETRIES\_LEFT**

Number of long retry attempts remaining.

**MQIACH\_MAX\_MSG\_LENGTH**

Maximum message length. MQIACH\_MAX\_MSG\_LENGTH is valid only on z/OS.

**MQIACH\_MAX\_SHARING\_CONVS**

Requests information about the maximum number of conversations on this channel instance.

This attribute applies only to TCP/IP server-connection channels.

**MQIACH\_MCA\_STATUS**

MCA status.

You cannot use MQIACH\_MCA\_STATUS as a parameter to filter on.

**MQIACH\_MSG\_COMPRESSION**

Technique used to compress the message data sent by the channel.

**MQIACH\_MSGS**

Number of messages sent or received, or number of MQI calls handled.

**MQIACH\_NETWORK\_TIME\_INDICATOR**

Network time.

You cannot use MQIACH\_NETWORK\_TIME\_INDICATOR as a parameter on which to filter.

**MQIACH\_SECURITY\_PROTOCOL**

Security protocol currently in use.

This parameter does not apply to client-connection channels.

This parameter does not apply to z/OS.

**MQIACH\_SHORT\_RETRIES\_LEFT**

Number of short retry attempts remaining.

**MQIACH\_SSL\_KEY\_RESETS**

Number of successful SSL key resets.

**MQIACH\_SSL\_RESET\_DATE**

Date of previous successful SSL secret key reset.

**MQIACH\_SSL\_RESET\_TIME**

Time of previous successful SSL secret key reset.

**MQIACH\_STOP\_REQUESTED**

Whether user stop request has been received.

**MQIACH\_XMITQ\_MSGS\_AVAILABLE**

Number of messages available to the channel on the transmission queue.

**MQIACH\_XMITQ\_TIME\_INDICATOR**

Time on transmission queue.

You cannot use MQIACH\_XMITQ\_TIME\_INDICATOR as a parameter to filter on.

The following value is supported on all platforms:

**MQIACH\_BATCH\_SIZE**

Batch size.

The following value is supported on all platforms:

**MQIACH\_HB\_INTERVAL**

Heartbeat interval (seconds).

**MQIACH\_NPM\_SPEED**

Speed of nonpersistent messages.

The following attributes do not apply to server-connection channels, and no values are returned. If specified on the command they are ignored:

- MQIACH\_BATCH\_SIZE\_INDICATOR
- MQIACH\_BATCH\_SIZE
- MQIACH\_BATCHES
- MQIACH\_LONG\_RETRIES\_LEFT
- MQIACH\_NETWORK\_TIME
- MQIACH\_NPM\_SPEED
- MQCA\_REMOTE\_Q\_MGR\_NAME
- MQIACH\_SHORT\_RETRIES\_LEFT
- MQIACH\_XMITQ\_MSGS\_AVAILABLE
- MQIACH\_XMITQ\_TIME\_INDICATOR

The following attributes apply only to server-connection channels. If specified on the command for other types of channel the attribute is ignored and no value is returned:

- MQIACH\_CURRENT\_SHARING\_CONVS
- MQIACH\_MAX\_SHARING\_CONVS

-  Relevant for short status:

The following parameter applies to current channels on z/OS:

**MQCACH\_Q\_MGR\_NAME**

Name of the queue manager that owns the channel instance.

### *ChannelInstanceType* (MQCFIN)

Channel instance type (parameter identifier: MQIACH\_CHANNEL\_INSTANCE\_TYPE).

It is always returned regardless of the channel instance attributes requested.

The value can be:

#### **MQOT\_CURRENT\_CHANNEL**

The channel status.

MQOT\_CURRENT\_CHANNEL is the default, and indicates that only current status information for active channels is to be returned.

Both common status information and active-only status information can be requested for current channels.

#### **MQOT\_SAVED\_CHANNEL**

Saved channel status.

Specify MQOT\_SAVED\_CHANNEL to cause saved status information for both active and inactive channels to be returned.

Only common status information can be returned. Active-only status information is not returned for active channels if this keyword is specified.

#### **MQOT\_SHORT\_CHANNEL**

Short channel status (valid on z/OS only).

Specify MQOT\_SHORT\_CHANNEL to cause short status information for current channels to be returned.

Other common status and current-only status information are not returned for current channels if this keyword is specified.

You cannot use MQIACH\_CHANNEL\_INSTANCE\_TYPE as a parameter to filter on.

#### 

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### *ConnectionName* (MQCFST)

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

If this parameter is present, eligible channel instances are limited to those using this connection name. If it is not specified, eligible channel instances are not limited in this way.

The connection name is always returned, regardless of the instance attributes requested.

The value returned for *ConnectionName* might not be the same as in the channel definition, and might differ between the current channel status and the saved channel status. (Using *ConnectionName* for limiting the number of sets of status is therefore not recommended.)

For example, when using TCP, if *ConnectionName* in the channel definition:

- Is blank or is in *host name* format, the channel status value has the resolved IP address.
- Includes the port number, the current channel status value includes the port number (except on z/OS ), but the saved channel status value does not.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

#### **IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ChannelInstanceAttrs* except MQIACF\_ALL and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

#### **StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ChannelInstanceAttrs* except MQCACH\_CHANNEL\_NAME and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter for *ConnectionName* or *XmitQName*, you cannot also specify the *ConnectionName* or *XmitQName* parameter.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

#### **XmitQName (MQCFST)**

Transmission queue name (parameter identifier: MQCACH\_XMIT\_Q\_NAME).

If this parameter is present, eligible channel instances are limited to those using this transmission queue. If it is not specified, eligible channel instances are not limited in this way.

The transmission queue name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **Error code**

This command might return the following error code in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

#### **Reason (MQLONG)**

The value can be any of the following values:

##### **MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

##### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

##### **MQRCCF\_CHL\_INST\_TYPE\_ERROR**

Channel instance type not valid.

##### **MQRCCF\_CHL\_STATUS\_NOT\_FOUND**

Channel status not found.

##### **MQRCCF\_XMIT\_Q\_NAME\_ERROR**

Transmission queue name error.

## Inquire Channel Status (AMQP): V8.0.0.4

The Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) (AMQP) command inquires about the status of one or more AMQP channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

If the **ClientIdentifier** parameter is not specified, the output of the **Inquire Channel Status** command is a summary of statuses of all clients connected to the channel. One PCF response message is returned per channel.

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter may be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned (within the limits of **MaxResponses** and **ResponseRestartPoint** if they are set).

### Required parameters

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects which have names that start with the selected character string. An asterisk on its own matches all possible names.

This parameter is allowed for only when the **ResponseType** parameter is set to MQRESP\_TOTAL.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### *ChannelType* (MQCFIN)

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value must be:

**MQCHT\_AMQP**  
AMQP

### Optional parameters

#### *ClientIdentifier* (MQCFST)

The ClientId of the client (parameter identifier: MQCACH\_CLIENT\_ID).

#### *MaxResponses* (MQCFIN)

The maximum number of clients to return status for.

#### *ResponseRestartPoint* (MQCFIN)

The first client to return status for. The combination of this parameter with **MaxResponses** enables the range of clients to be specified.

### Summary mode

If you do not specify a **ClientIdentifier** parameter, the following fields are returned:

#### **CHANNEL**

The channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

**CHLTYPE**

The channel type of AMQP (parameter identifier: MQIACH\_CHANNEL\_TYPE).

**CONNECTIONS**

The number of connections described in the summary (parameter identifier: MQIACF\_CONNECTION\_COUNT).

**STATUS**

The current status of the client (parameter identifier: MQIACH\_CHANNEL\_STATUS).

**Client details mode**

If you specify a **ClientIdentifier** parameter, the following fields are returned:

**STATUS**

The current status of the client (parameter identifier: MQIACH\_CHANNEL\_STATUS).

**CONNAME**

The name of the remote connection (ip address) (parameter identifier: MQCACH\_CONNECTION\_NAME).

**AMQPKA**

The keep alive interval of the client (parameter identifier: MQIACH\_AMQP\_KEEP\_ALIVE).

**MCANAME**

Message channel agent name (parameter identifier: MQCACH\_MCA\_USER\_ID).

**MSGSENT**

Number of messages sent by the client since it last connected (parameter identifier: MQIACH\_MSGS\_SENT).

**MSGRCVD**

Number of messages received by the client since it last connected (parameter identifier: MQIACH\_MSGS\_RECEIVED / MQIACH\_MSGS\_RCVD).

**LMSGDATE**

Date last message was received or sent (parameter identifier: MQCACH\_LAST\_MSG\_DATE).

**LMSGTIME**

Time last message was received or sent (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

**CHLSDATE**

Date channel started (parameter identifier: MQCACH\_CHANNEL\_START\_DATE).

**CHLSTIME**

Time channel was started (parameter identifier: MQCACH\_CHANNEL\_START\_TIME).

**Error code**

This command might return the following error code in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHL\_INST\_TYPE\_ERROR**

Channel instance type not valid.

## **MQRCCF\_CHL\_STATUS\_NOT\_FOUND**

Channel status not found.

## **MQRCCF\_XMIT\_Q\_NAME\_ERROR**

Transmission queue name error.

### **Inquire Channel Status (MQTT):**

The Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) (MQTT) command inquires about the status of one or more Telemetry channel instances.

You must specify the name of the channel for which you want to inquire status information. This name can be a specific channel name or a generic channel name. By using a generic channel name, you can inquire either:

- Status information for all channels, or
- Status information for one or more channels that match the specified name.

**Note:** The **Inquire Channel Status** command for IBM MQ Telemetry has the potential to return a far larger number of responses than if the command was run for an IBM MQ channel. For this reason, the IBM MQ Telemetry server does not return more responses than fit on the reply-to queue. The number of responses is limited to the value of MAXDEPTH parameter of the SYSTEM.MQSC.REPLY.QUEUE queue. When an IBM MQ Telemetry command is truncated by the IBM MQ Telemetry server, the AMQ8492 message is displayed specifying how many responses are returned based on the size of MAXDEPTH.

If the **ClientIdentifier** parameter is not specified, the output of the **Inquire Channel Status** command is a summary of statuses of all clients connected to the channel. One PCF response message is returned per channel.

If the **ClientIdentifier** parameter is specified, separate PCF response messages are returned for each client connection. The **ClientIdentifier** parameter may be a wildcard, in which the status for all clients that match the **ClientIdentifier** string is returned (within the limits of **MaxResponses** and **ResponseRestartPoint** if they are set).

### **Required parameters**

#### **ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Generic channel names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects which have names that start with the selected character string. An asterisk on its own matches all possible names.

This parameter is allowed for only when the **ResponseType** parameter is set to MQRESP\_TOTAL.

The channel name is always returned, regardless of the instance attributes requested.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### **ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value must be:

#### **MQCHT\_MQTT**

Telemetry.

### **Optional parameters**

#### **ClientIdentifier (MQCFST)**

The ClientId of the client (parameter identifier: MQCACH\_CLIENT\_ID).

### *MaxResponses* (MQCFIN)

The maximum number of clients to return status for (parameter identifier: MQIA\_MAX\_RESPONSES).

This parameter is only allowed when the **ClientIdentifier** parameter is specified.

### *ResponseRestartPoint* (MQCFIN)

The first client to return status for (parameter identifier: MQIA\_RESPONSE\_RESTART\_POINT). The combination of this parameter with **MaxResponses** enables the range of clients to be specified.

This parameter is only allowed when the **ClientIdentifier** parameter is specified.

## Client details mode

### STATUS

The current status of the client (parameter identifier: MQIACH\_CHANNEL\_STATUS).

### CONNAME

The name of the remote connection (ip address) (parameter identifier: MQCACH\_CONNECTION\_NAME).

### KAINT

The keep alive interval of the client (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL).

### MCANAME

Message channel agent name (parameter identifier: MQCACH\_MCA\_USER\_ID).

### MSGSNT

Number of messages sent by the client since it last connected (parameter identifier: MQIACH\_MSGS\_SENT).

### MSGRCVD

Number of messages received by the client since it last connected (parameter identifier: MQIACH\_MSGS\_RECEIVED / MQIACH\_MSGS\_RCVD).

### INDOUBTIN

Number of in doubt, inbound messages to the client (parameter identifier: MQIACH\_IN\_DOUBT\_IN).

### INDOUBTOUT

Number of in doubt, outbound messages to the client (parameter identifier: MQIACH\_IN\_DOUBT\_OUT).

### PENDING

Number of outbound pending messages (parameter identifier: MQIACH\_PENDING\_OUT).

### LMSGDATE

Date last message was received or sent (parameter identifier: MQCACH\_LAST\_MSG\_DATE).

### LMSGTIME

Time last message was received or sent (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

### CHLSDATE

Date channel started (parameter identifier: MQCACH\_CHANNEL\_START\_DATE).

### CHLSTIME

Time channel was started (parameter identifier: MQCACH\_CHANNEL\_START\_TIME).

## Error code

This command might return the following error code in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHANNEL\_NAME\_ERROR**

Channel name error.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_CHL\_INST\_TYPE\_ERROR**

Channel instance type not valid.

**MQRCCF\_CHL\_STATUS\_NOT\_FOUND**

Channel status not found.

**MQRCCF\_XMIT\_Q\_NAME\_ERROR**

Transmission queue name error.

**Inquire Channel Status (Response):**

The response to the Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) command consists of the response header followed by several structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

These structures are

- The *ChannelName* structure,
-  The *ChannelDisposition* structure (on z/OS only),
- The *ChannelInstanceType* structure
- The *ChannelStatus* structure (except on z/OS channels whose *ChannelInstanceType* parameter has a value of MQOT\_SAVED\_CHANNEL).
- The *ChannelType* structure
- The *ConnectionName* structure
- The *RemoteApplTag* structure
- The *RemoteQMGrName* structure
- The *StopRequested* structure
- The *XmitQName* structure

which are then followed by the requested combination of status attribute parameter structures. One such message is generated for each channel instance found that matches the criteria specified on the command.

 On z/OS, if the value for any of these parameters exceeds 999999999, it is returned as 999999999:

- *Batches*
- *BuffersReceived*
- *BuffersSent*
- *BytesReceived*
- *BytesSent*
- *CompressionTime*
- *CurrentMsgs*

- *ExitTime*
- *Msgs*
- *NetTime*
- *SSLKeyResets*
- *XQTime*

**Always returned:**

 *ChannelDisposition, ChannelInstanceType, ChannelName, ChannelStatus, ChannelType, ConnectionName, RemoteApplTag, RemoteQMGrName, StopRequested, SubState, XmitQName*

**Returned if requested:**

*Batches, BatchSize, BatchSizeIndicator, BuffersReceived, BuffersSent, BytesReceived, BytesSent, ChannelMonitoring, ChannelStartDate, ChannelStartTime, ClientIdentifier, CompressionRate, CompressionTime, CurrentLUWID, CurrentMsgs, CurrentSequenceNumber, CurrentSharingConversations, ExitTime, HeaderCompression, HeartbeatInterval, InDoubtInbound, InDoubtStatus, InDoubtOutbound, KeepAliveInterval, LastLUWID, LastMsgDate, LastMsgTime, LastSequenceNumber, LocalAddress, LongRetriesLeft, MaxMsgLength, MaxSharingConversations, MCAJobName, MCAStatus, MCAUserIdentifier, MessageCompression, Msgs, MsgsAvailable, MsgsReceived, MsgsSent, NetTime, NonPersistentMsgSpeed, PendingOutbound, QMGrName, ResponseType, RemoteVersion, RemoteProduct, ShortRetriesLeft, SSLCertRemoteIssuerName, SSLCertUserId, SSLKeyResetDate, SSLKeyResets, SSLKeyResetTime, SSLShortPeerName, XQTime*

**Response data**

*Batches* **(MQCFIN)**

Number of completed batches (parameter identifier: MQIACH\_BATCHES).

*BatchSize* **(MQCFIN)**

Negotiated batch size (parameter identifier: MQIACH\_BATCH\_SIZE).

*BatchSizeIndicator* **(MQCFIL)**

Indicator of the number of messages in a batch (parameter identifier: MQIACH\_BATCH\_SIZE\_INDICATOR). Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

*BuffersReceived* **(MQCFIN)**

Number of buffers received (parameter identifier: MQIACH\_BUFFERS\_RCVD).

*BuffersSent* **(MQCFIN)**

Number of buffers sent (parameter identifier: MQIACH\_BUFFERS\_SENT).

*BytesReceived* **(MQCFIN)**

Number of bytes received (parameter identifier: MQIACH\_BYTES\_RCVD).

*BytesSent* **(MQCFIN)**

Number of bytes sent (parameter identifier: MQIACH\_BYTES\_SENT).

*ChannelDisposition* **(MQCFIN)**

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter is valid only on z/OS.

The value can be any of the following values:

**MQCHLD\_PRIVATE**

Status information for a private channel.

**MQCHLD\_SHARED**

Status information for a shared channel.

**MQCHLD\_FIXSHARED**

Status information for a shared channel, tied to a specific queue manager.

**ChannelInstanceType (MQCFIN)**

Channel instance type (parameter identifier: MQIACH\_CHANNEL\_INSTANCE\_TYPE).

The value can be any of the following values:

**MQOT\_CURRENT\_CHANNEL**

Current channel status.

**MQOT\_SAVED\_CHANNEL**

Saved channel status.

**z/OS MQOT\_SHORT\_CHANNEL**

Short channel status, only on z/OS.

**ChannelMonitoring (MQCFIN)**

Current level of monitoring data collection for the channel (parameter identifier: MQIA\_MONITORING\_CHANNEL).

The value can be any of the following values:

**MQMON\_OFF**

Monitoring for the channel is switched off.

**MQMON\_LOW**

Low rate of data collection.

**MQMON\_MEDIUM**

Medium rate of data collection.

**MQMON\_HIGH**

High rate of data collection.

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**ChannelStartDate (MQCFST)**

Date channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH\_CHANNEL\_START\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

**ChannelStartTime (MQCFST)**

Time channel started, in the form hh.mm.ss (parameter identifier: MQCACH\_CHANNEL\_START\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

**z/OS ChannelStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for channels (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

The value can be:

**MQMON\_OFF**

Statistics data collection is turned off.

**MQMON\_LOW**

Statistics data collection is turned on, with a low ratio of data collection.

**MQMON\_MEDIUM**

Statistics data collection is turned on, with a moderate ratio of data collection.

**MQMON\_HIGH**

Statistics data collection is turned on, with a high ratio of data collection.

This parameter is valid only on z/OS.

**ChannelStatus (MQCFIN)**

Channel status (parameter identifier: MQIACH\_CHANNEL\_STATUS).

Channel status has the following values defined:

**MQCHS\_BINDING**

Channel is negotiating with the partner.

**MQCHS\_STARTING**

Channel is waiting to become active.

**MQCHS\_RUNNING**

Channel is transferring or waiting for messages.

**MQCHS\_PAUSED**

Channel is paused.

**MQCHS\_STOPPING**

Channel is in process of stopping.

**MQCHS\_RETRYING**

Channel is reattempting to establish connection.

**MQCHS\_STOPPED**

Channel is stopped.

**MQCHS\_REQUESTING**

Requester channel is requesting connection.

**MQCHS\_SWITCHING**

Channel is switching transmission queues.

**MQCHS\_INITIALIZING**

Channel is initializing.

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value can be any of the following values:

**MQCHT\_SENDER**

Sender.

**MQCHT\_SERVER**

Server.

**MQCHT\_RECEIVER**

Receiver.

**MQCHT\_REQUESTER**

Requester.

**MQCHT\_SVRCONN**

Server-connection (for use by clients).

**MQCHT\_CLNTCONN**

Client connection.

**MQCHT\_CLUSRCVR**  
Cluster-receiver.

**MQCHT\_CLUSSDR**  
Cluster-sender.

**CompressionRate (MQCFIL)**

The compression rate achieved displayed to the nearest percentage (parameter identifier: MQIACH\_COMPRESSION\_RATE). Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

**CompressionTime (MQCFIL)**

The amount of time per message, displayed in microseconds, spent during compression or decompression (parameter identifier: MQIACH\_COMPRESSION\_TIME). Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

**ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_SHORT\_CONN\_NAME\_LENGTH.

**CurrentLUWID (MQCFST)**

Logical unit of work identifier for in-doubt batch (parameter identifier: MQCACH\_CURRENT\_LUWID).

The logical unit of work identifier associated with the current batch, for a sending or a receiving channel.

For a sending channel, when the channel is in-doubt it is the LUWID of the in-doubt batch.

It is updated with the LUWID of the next batch when it is known.

The maximum length is MQ\_LUWID\_LENGTH.

**CurrentMsgs (MQCFIN)**

Number of messages in-doubt (parameter identifier: MQIACH\_CURRENT\_MSGS).

For a sending channel, this parameter is the number of messages that have been sent in the current batch. It is incremented as each message is sent, and when the channel becomes in-doubt it is the number of messages that are in-doubt.

For a receiving channel, it is the number of messages that have been received in the current batch. It is incremented as each message is received.

The value is reset to zero, for both sending and receiving channels, when the batch is committed.

**CurrentSequenceNumber (MQCFIN)**

Sequence number of last message in in-doubt batch (parameter identifier: MQIACH\_CURRENT\_SEQ\_NUMBER).

For a sending channel, this parameter is the message sequence number of the last message sent. It is updated as each message is sent, and when the channel becomes in-doubt it is the message sequence number of the last message in the in-doubt batch.

For a receiving channel, it is the message sequence number of the last message that was received. It is updated as each message is received.

### *CurrentSharingConversations* (MQCFIN)

Number of conversations currently active on this channel instance (parameter identifier: MQIACH\_CURRENT\_SHARING\_CONVS).

This parameter is returned only for TCP/IP server-connection channels.

A value of zero indicates that the channel instance is running in a mode before IBM WebSphere MQ Version 7.0, regarding:

- Administrator stop-quietse
- Heartbeating
- Read ahead
- Client asynchronous consumption

### *ExitTime* (MQCFIL)

Indicator of the time taken executing user exits per message (parameter identifier: MQIACH\_EXIT\_TIME\_INDICATOR). Amount of time, in microseconds, spent processing user exits per message. Where more than one exit is executed per message, the value is the sum of all the user exit times for a single message. Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

### *HeaderCompression* (MQCFIL)

Whether the header data sent by the channel is compressed (parameter identifier: MQIACH\_HDR\_COMPRESSION). Two values are returned:

- The default header data compression value negotiated for this channel.
- The header data compression value used for the last message sent. The header data compression value can be altered in a sending channels message exit. If no message has been sent, the second value is MQCOMPRESS\_NOT\_AVAILABLE.

The values can be:

#### **MQCOMPRESS\_NONE**

No header data compression is performed. MQCOMPRESS\_NONE is the default value.

#### **MQCOMPRESS\_SYSTEM**

Header data compression is performed.

#### **MQCOMPRESS\_NOT\_AVAILABLE**

No message has been sent by the channel.

### *HeartbeatInterval* (MQCFIN)

Heartbeat interval (parameter identifier: MQIACH\_HB\_INTERVAL).

### *InDoubtStatus* (MQCFIN)

Whether the channel is currently in doubt (parameter identifier: MQIACH\_INDOUBT\_STATUS).

A sending channel is only in doubt while the sending Message Channel Agent is waiting for an acknowledgment that a batch of messages, which it has sent, has been successfully received. It is not in doubt at all other times, including the period during which messages are being sent, but before an acknowledgment has been requested.

A receiving channel is never in doubt.

The value can be any of the following values:

#### **MQCHIDS\_NOT\_INDOUBT**

Channel is not in-doubt.

#### **MQCHIDS\_INDOUBT**

Channel is in-doubt.

**KeepAliveInterval (MQCFIN)**

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL). This parameter is valid only on z/OS.

**LastLUWID (MQCFST)**

Logical unit of work identifier for last committed batch (parameter identifier: MQCACH\_LAST\_LUWID).

The maximum length is MQ\_LUWID\_LENGTH.

**LastMsgDate (MQCFST)**

Date last message was sent, or MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH\_LAST\_MSG\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

**LastMsgTime (MQCFST)**

Time last message was sent, or MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

**LastSequenceNumber (MQCFIN)**

Sequence number of last message in last committed batch (parameter identifier: MQIACH\_LAST\_SEQ\_NUMBER).

**LocalAddress (MQCFST)**

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

**LongRetriesLeft (MQCFIN)**

Number of long retry attempts remaining (parameter identifier: MQIACH\_LONG\_RETRIES\_LEFT).

**MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIACH\_MAX\_MSG\_LENGTH). This parameter is valid only on z/OS.

**MaxSharingConversations (MQCFIN)**

Maximum number of conversations permitted on this channel instance. (parameter identifier: MQIACH\_MAX\_SHARING\_CONVS)

This parameter is returned only for TCP/IP server-connection channels.

A value of zero indicates that the channel instance is running in a mode before IBM WebSphere MQ Version 7.0, regarding:

- Administrator stop-quiet
- Heartbeating
- Read ahead
- Client asynchronous consumption

**MCAJobName (MQCFST)**

Name of MCA job (parameter identifier: MQCACH\_MCA\_JOB\_NAME).

The maximum length of the string is MQ\_MCA\_JOB\_NAME\_LENGTH.

**MCAStatus (MQCFIN)**

MCA status (parameter identifier: MQIACH\_MCA\_STATUS).

The value can be any of the following values:

**MQMCAS\_STOPPED**

Message channel agent stopped.

**MQMCAS\_RUNNING**

Message channel agent running.

**MCAUserIdentifier (MQCFST)**

The user ID used by the MCA (parameter identifier: MQCACH\_MCA\_USER\_ID).

This parameter applies only to server-connection, receiver, requester, and cluster-receiver channels.

The maximum length of the string is MQ\_MCA\_USER\_ID\_LENGTH.

**MessageCompression (MQCFIL)**

Whether the header data sent by the channel is compressed (parameter identifier: MQIACH\_MSG\_COMPRESSION). Two values are returned:

- The default message data compression value negotiated for this channel.
- The message data compression value used for the last message sent. The message data compression value can be altered in a sending channels message exit. If no message has been sent, the second value is MQCOMPRESS\_NOT\_AVAILABLE.

The values can be:

**MQCOMPRESS\_NONE**

No message data compression is performed. MQCOMPRESS\_NONE is the default value.

**MQCOMPRESS\_RLE**

Message data compression is performed using run-length encoding.

**MQCOMPRESS\_ZLIBFAST**

Message data compression is performed using ZLIB encoding with speed prioritized.

**MQCOMPRESS\_ZLIBHIGH**

Message data compression is performed using ZLIB encoding with compression prioritized.

**MQCOMPRESS\_NOT\_AVAILABLE**

No message has been sent by the channel.

**Msgs (MQCFIN)**

Number of messages sent or received, or number of MQI calls handled (parameter identifier: MQIACH\_MSGS).

**MsgsAvailable (MQCFIN)**

Number of messages available (parameter identifier: MQIACH\_XMITQ\_MSGS\_AVAILABLE).

Number of messages queued on the transmission queue available to the channel for MQGETs.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

This parameter applies to cluster sender channels only.

**NetTime (MQCFIL)**

Indicator of the time of a network operation (parameter identifier:

MQIACH\_NETWORK\_TIME\_INDICATOR). Amount of time, in microseconds, to send a request to the remote end of the channel and receive a response. This time only measures the network time for such an operation. Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

**NonPersistentMsgSpeed (MQCFIN)**

Speed at which nonpersistent messages are to be sent (parameter identifier: MQIACH\_NPM\_SPEED).

The value can be any of the following values:

**MQNPMS\_NORMAL**

Normal speed.

## MQNPMS\_FAST

Fast speed.

### *QMgrName* (MQCFST)

Name of the queue manager that owns the channel instance (parameter identifier: MQCA\_Q\_MGR\_NAME). This parameter is valid only on z/OS.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### *RemoteApplTag* (MQCFST)

The remote partner application name. This parameter is the name of the client application at the remote end of the channel. This parameter applies only to server-connection channels (parameter identifier: MQCACH\_REMOTE\_APPL\_TAG).

### *RemoteProduct* (MQCFST)

The remote partner product identifier. This parameter is the product identifier of the IBM MQ code running at the remote end of the channel (parameter identifier: MQCACH\_REMOTE\_PRODUCT).

The possible values are shown in the following table:

Table 123. Product Identifier values

Product Identifier	Description
MQMM	Queue Manager (non z/OS Platform)
MQMV	Queue Manager on z/OS
MQCC	IBM MQ C client
MQNM	IBM MQ .NET fully managed client
MQJB	IBM MQ Classes for JAVA
MQJM	IBM MQ Classes for JMS (normal mode)
MQJN	IBM MQ Classes for JMS (migration mode)
MQJU	Common Java interface to the MQI
MQXC	XMS client C/C++ (normal mode)
MQXD	XMS client C/C++ (migration mode)
MQXN	XMS client .NET (normal mode)
MQXM	XMS client .NET (migration mode)
MQXU	IBM MQ .NET XMS client (unmanaged/XA)
MQNU	IBM MQ .NET unmanaged client

### *RemoteVersion* (MQCFST)

The remote partner version. This parameter is the version of the IBM MQ code running at the remote end of the channel (parameter identifier: MQCACH\_REMOTE\_VERSION).

The remote version is displayed as **VVRRMMFF**, where

**VV** Version

**RR** Release

**MM** Maintenance level

**FF** Fix level

### *RemoteQMgrName* (MQCFST)

Name of the remote queue manager, or queue-sharing group (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

### *ShortRetriesLeft* (MQCFIN)

Number of short retry attempts remaining (parameter identifier: MQIACH\_SHORT\_RETRIES\_LEFT).

*SecurityProtocol* (**MQCFIN**)

Security protocol currently in use (parameter identifier: MQIACH\_SECURITY\_PROTOCOL).

This parameter does not apply to client-connection channels.

The possible values are:

**MQSECPROT\_NONE**

No security protocol

**MQSECPROT\_SSLV30**

SSL version 3.0

**MQSECPROT\_TLSV10**

TLS version 1.0

**MQSECPROT\_TLSV12**

TLS version 1.2

This parameter is not available on z/OS.

*SSLCertRemoteIssuerName* (**MQCFST**)

The full Distinguished Name of the issuer of the remote certificate. The issuer is the certificate authority that issued the certificate (parameter identifier: MQCACH\_SSL\_CERT\_ISSUER\_NAME).

The maximum length of the string is MQ\_SHORT\_DNAME\_LENGTH.

*SSLCertUserId* (**MQCFST**)

The local user ID associated with the remote certificate (parameter identifier: MQCACH\_SSL\_CERT\_USER\_ID).

This parameter is valid only on z/OS.

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

*SSLKeyResetDate* (**MQCFST**)

Date of the previous successful SSL secret key reset, in the form yyyy-mm-dd (parameter identifier: MQCACH\_SSL\_KEY\_RESET\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

*SSLKeyResets* (**MQCFIN**)

SSL secret key resets (parameter identifier: MQIACH\_SSL\_KEY\_RESETS).

The number of successful SSL secret key resets that have occurred for this channel instance since the channel started. If SSL secret key negotiation is enabled, the count is incremented whenever a secret key reset is performed.

*SSLKeyResetTime* (**MQCFST**)

Time of the previous successful SSL secret key reset, in the form hh.mm.ss (parameter identifier: MQCACH\_SSL\_KEY\_RESET\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

*SSLShortPeerName* (**MQCFST**)

Distinguished Name of the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH\_SSL\_SHORT\_PEER\_NAME).

The maximum length is MQ\_SHORT\_DNAME\_LENGTH. This limit might mean that exceptionally long Distinguished Names are truncated.

*StopRequested* (**MQCFIN**)

Whether user stop request is outstanding (parameter identifier: MQIACH\_STOP\_REQUESTED).

The value can be any of the following values:

**MQCHSR\_STOP\_NOT\_REQUESTED**  
User stop request has not been received.

**MQCHSR\_STOP\_REQUESTED**  
User stop request has been received.

**SubState (MQCFIN)**

Current action being performed by the channel (parameter identifier: MQIACH\_CHANNEL\_SUBSTATE).

The value can be any of the following values:

**MQCHSSTATE\_CHADEXIT**  
Running channel auto-definition exit.

**MQCHSSTATE\_COMPRESSING**  
Compressing or decompressing data.

**MQCHSSTATE\_END\_OF\_BATCH**  
End of batch processing.

**MQCHSSTATE\_HANDSHAKING**  
SSL handshaking.

**MQCHSSTATE\_HEARTBEATING**  
Heartbeating with partner.

**MQCHSSTATE\_IN\_MQGET**  
Performing MQGET.

**MQCHSSTATE\_IN\_MQI\_CALL**  
Executing an IBM MQ API call, other than an MQPUT or MQGET.

**MQCHSSTATE\_IN\_MQPUT**  
Performing MQPUT.

**MQCHSSTATE\_MREXIT**  
Running retry exit.

**MQCHSSTATE\_MSGEXIT**  
Running message exit.

**MQCHSSTATE\_NAME\_SERVER**  
Name server request.

**MQCHSSTATE\_NET\_CONNECTING**  
Network connect.

**MQCHSSTATE\_OTHER**  
Undefined state.

**MQCHSSTATE\_RCVEXIT**  
Running receive exit.

**MQCHSSTATE\_RECEIVING**  
Network receive.

**MQCHSSTATE\_RESYNCHING**  
Resynching with partner.

**MQCHSSTATE\_SCYEXIT**  
Running security exit.

**MQCHSSTATE\_SENDEXIT**  
Running send exit.

## **MQCHSSTATE\_SENDING**

Network send.

## **MQCHSSTATE\_SERIALIZING**

Serialized on queue manager access.

### ***XmitQName* (MQCFST)**

Transmission queue name (parameter identifier: MQCACH\_XMIT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### ***XQTime* (MQCFIL)**

Transmission queue time indicator (parameter identifier: MQIACH\_XMITQ\_TIME\_INDICATOR). The time, in microseconds, that messages remained on the transmission queue before being retrieved. The time is measured from when the message is put onto the transmission queue until it is retrieved to be sent on the channel and, therefore, includes any interval caused by a delay in the putting application.

Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned.

## **Inquire Channel Status (Response) (MQTT):**

The response to the Inquire Channel Status (MQCMD\_INQUIRE\_CHANNEL\_STATUS) command consists of the response header followed by the *ChannelName* structure and the requested combination of attribute parameter structures.

One PCF response message is generated for each channel instance found that matches the criteria that are specified on the command.

If the ClientIdentifier parameter is not specified, the output of the Inquire Channel Status command is a summary of statuses of all clients that are connected to the channel. One PCF response message is returned per channel.

### **Always returned:**

*ChannelName, ChannelStatus, ChannelType, Connections,*

If the ClientIdentifier parameter is specified, separate PCF response messages are returned for each client connection. The ClientIdentifier parameter might be a wildcard, in which the status for all clients that match the ClientIdentifier string is returned (within the limits of MaxResponses and ResponseRestartPoint if they are set).

### **Always returned:**

*ChannelName, ChannelStatus, ChannelType, ClientId*

### **Returned if requested:**

*ChannelStatusDate, ChannelStatusTime, ClientUser, InDoubtInput, InDoubtOutput, KeepAliveInterval, LastMessageSentDate, LastMessageSentTime, MCAUser, MessagesReceived, MessagesSent, PendingOutbound, Protocol*

## **Response data**

### ***ChannelName* (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### ***ChannelStartDate* (MQCFST)**

Date on which the channel started, in the form yyyy-mm-dd (parameter identifier: MQCACH\_CHANNEL\_START\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

**ChannelStartTime (MQCFST)**

Time at which the channel started, in the form hh.mm.ss (parameter identifier: MQCACH\_CHANNEL\_START\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

**ChannelStatus (MQCFIN)**

Channel status (parameter identifier: MQIACH\_CHANNEL\_STATUS).

The value can be:

**MQCHS\_DISCONNECTED**

Channel is disconnected.

**MQCHS\_RUNNING**

Channel is transferring or waiting for messages.

**ChannelType (MQCFIN)**

Channel type (parameter identifier: MQIACH\_CHANNEL\_TYPE).

The value must be:

**MQCHT\_MQTT**

Telemetry.

**ClientUser (MQCFST)**

ClientID of the client (parameter identifier: MQCACH\_CLIENT\_USER\_ID).

The maximum length of the string is MQ\_CLIENT\_USER\_ID\_LENGTH.

**ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

**Connections (MQCFIN)**

Current number of MQTT connections connected to this channel (parameter identifier: MQIACF\_NAME\_LENGTH).

**InDoubtInput (MQCFIN)**

The number of inbound messages to the client that are in doubt (parameter identifier: MQIACH\_IN\_DOUBT\_IN).

**InDoubtOutput (MQCFIN)**

The number of outbound messages from the client that are in doubt (parameter identifier: MQIACH\_IN\_DOUBT\_OUT).

**KeepAliveInterval (MQCFIN)**

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL).

The interval in milliseconds after which the client is disconnected because of inactivity. If the MQXR service does not receive any communication from the client within the keep alive interval, it disconnects from the client. This interval is calculated based on the MQTT keep alive time sent by the client when it connects. The maximum size is MQ\_MQTT\_MAX\_KEEP\_ALIVE.

**LastMsgDate (MQCFST)**

Date on which the last message was sent, or the MQI call was handled, in the form yyyy-mm-dd (parameter identifier: MQCACH\_LAST\_MSG\_DATE).

The maximum length of the string is MQ\_CHANNEL\_DATE\_LENGTH.

**LastMsgTime (MQCFST)**

Time at which the last message was sent, or the MQI call was handled, in the form hh.mm.ss (parameter identifier: MQCACH\_LAST\_MSG\_TIME).

The maximum length of the string is MQ\_CHANNEL\_TIME\_LENGTH.

**MCAUser (MQCFST)**

Message channel agent user identifier (parameter identifier: MQCACH\_MCA\_USER\_ID).

The maximum length of the MCA user identifier is MQ\_MCA\_USER\_ID\_LENGTH.

**MsgsReceived (MQCFIN64)**

Number of messages received by the client since it last connected (parameter identifier: MQIACH\_MSGS\_RECEIVED / MQIACH\_MSGS\_RCVD).

**MsgsSent (MQCFIN64)**

Number of messages sent by the client since it last connected (parameter identifier: MQIACH\_MSGS\_SENT).

**PendingOutbound (MQCFIN)**

The number of outbound messages pending (parameter identifier: MQIACH\_PENDING\_OUT).

**Protocol (MQCFST)**

MQTT protocol supported by this channel (parameter identifier: MQIACH\_PROTOCOL).

Specify one or both of the following options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

MQTTv3 (constant: MQPROTO\_MQTTV3)

HTTP (constant: MQPROTO\_HTTP)

**Inquire Cluster Queue Manager:**

The Inquire Cluster Queue Manager (MQCMD\_INQUIRE\_CLUSTER\_Q\_MGR) command inquires about the attributes of IBM MQ queue managers in a cluster.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

**Required parameters**

**ClusterQMgrName (MQCFST)**

Queue manager name (parameter identifier: MQCA\_CLUSTER\_Q\_MGR\_NAME).

Generic queue manager names are supported. A generic name is a character string followed by an asterisk "\*", for example ABC\*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue manager name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**Optional parameters**

**Channel (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

Specifies that eligible cluster queue managers are limited to those having the specified channel name.

Generic channel names are supported. A generic name is a character string followed by an asterisk "\*", for example ABC\*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

If you do not specify a value for this parameter, channel information about *all* queue managers in the cluster is returned.

**ClusterName (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

Specifies that eligible cluster queue managers are limited to those having the specified cluster name.

Generic cluster names are supported. A generic name is a character string followed by an asterisk "\*", for example ABC\*. It selects all queue managers having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

If you do not specify a value for this parameter, cluster information about *all* queue managers inquired is returned.

**ClusterQMgrAttrs (MQCFIL)**

Attributes (parameter identifier: MQIACF\_CLUSTER\_Q\_MGR\_ATTRS).

Some parameters are relevant only for cluster channels of a particular type or types. Attributes that are not relevant for a particular type of channel cause no output, and do not cause an error. To check which attributes apply to which channel types; see Channel attributes and channel types.

The attribute list might specify the following value on its own. If the parameter is not specified, a default value is used.

**MQIACF\_ALL**

All attributes.

Alternative, supply a combination of the following values:

**MQCA\_ALTERATION\_DATE**

The date on which the information was last altered.

**MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

**MQCA\_CLUSTER\_DATE**

The date on which the information became available to the local queue manager.

**MQCA\_CLUSTER\_NAME**

The name of the cluster to which the channel belongs.

**MQCA\_CLUSTER\_Q\_MGR\_NAME**

The name of the cluster to which the channel belongs.

**MQCA\_CLUSTER\_TIME**

The time at which the information became available to the local queue manager.

**MQCA\_Q\_MGR\_IDENTIFIER**

The unique identifier of the queue manager.

**MQCA\_VERSION**

The version of the IBM MQ installation that the cluster queue manager is associated with.

**MQCA\_XMIT\_Q\_NAME**

The cluster transmission queue used by the queue manager.

**MQCACH\_CONNECTION\_NAME**

Connection name.

**MQCACH\_DESCRIPTION**

Description.

**MQCACH\_LOCAL\_ADDRESS**

Local communications address for the channel.

**MQCACH\_MCA\_NAME**  
Message channel agent name.  
You cannot use MQCACH\_MCA\_NAME as a parameter to filter on.

**MQCACH\_MCA\_USER\_ID**  
MCA user identifier.

**MQCACH\_MODE\_NAME**  
Mode name.

**MQCACH\_MR\_EXIT\_NAME**  
Message-retry exit name.

**MQCACH\_MR\_EXIT\_USER\_DATA**  
Message-retry exit user data.

**MQCACH\_MSG\_EXIT\_NAME**  
Message exit name.

**MQCACH\_MSG\_EXIT\_USER\_DATA**  
Message exit user data.

**MQCACH\_PASSWORD**  
Password.  
This parameter is not valid on z/OS.

**MQCACH\_RCV\_EXIT\_NAME**  
Receive exit name.

**MQCACH\_RCV\_EXIT\_USER\_DATA**  
Receive exit user data.

**MQCACH\_SEC\_EXIT\_NAME**  
Security exit name.

**MQCACH\_SEC\_EXIT\_USER\_DATA**  
Security exit user data.

**MQCACH\_SEND\_EXIT\_NAME**  
Send exit name.

**MQCACH\_SEND\_EXIT\_USER\_DATA**  
Send exit user data.

**MQCACH\_SSL\_CIPHER\_SPEC**  
SSL cipher spec.

**MQIACH\_SSL\_CLIENT\_AUTH**  
SSL client authentication.

**MQCACH\_SSL\_PEER\_NAME**  
SSL peer name.

**MQCACH\_TP\_NAME**  
Transaction program name.

**MQCACH\_USER\_ID**  
User identifier.  
This parameter is not valid on z/OS.

**MQIA\_MONITORING\_CHANNEL**  
Online monitoring data collection.

**MQIA\_USE\_DEAD\_LETTER\_Q**  
Determines whether the dead-letter queue is used when messages cannot be delivered by channels.

**MQIACF\_Q\_MGR\_DEFINITION\_TYPE**  
How the cluster queue manager was defined.

**MQIACF\_Q\_MGR\_TYPE**  
The function of the queue manager in the cluster.

**MQIACF\_SUSPEND**  
Specifies whether the queue manager is suspended from the cluster.

**MQIACH\_BATCH\_HB**  
The value being used for the batch heartbeat.

**MQIACH\_BATCH\_INTERVAL**  
Batch wait interval (seconds).

**MQIACH\_BATCH\_DATA\_LIMIT**  
Batch data limit (kilobytes).

**MQIACH\_BATCH\_SIZE**  
Batch size.

**MQIACH\_CHANNEL\_STATUS**  
Channel status.

**MQIACH\_CLWL\_CHANNEL\_PRIORITY**  
Cluster workload channel priority.

**MQIACH\_CLWL\_CHANNEL\_RANK**  
Cluster workload channel rank.

**MQIACH\_CLWL\_CHANNEL\_WEIGHT**  
Cluster workload channel weight.

**MQIACH\_DATA\_CONVERSION**  
Specifies whether sender must convert application data.

**MQIACH\_DISC\_INTERVAL**  
Disconnection interval.

**MQIACH\_HB\_INTERVAL**  
Heartbeat interval (seconds).

**MQIACH\_HDR\_COMPRESSION**  
The list of header data compression techniques supported by the channel.

**MQIACH\_KEEP\_ALIVE\_INTERVAL**  
KeepAlive interval (valid on z/OS only).

**MQIACH\_LONG\_RETRY**  
Count of long duration attempts.

**MQIACH\_LONG\_TIMER**  
Long duration timer.

**MQIACH\_MAX\_MSG\_LENGTH**  
Maximum message length.

**MQIACH\_MCA\_TYPE**  
MCA type.

**MQIACH\_MR\_COUNT**  
Count of send message attempts.

**MQIACH\_MR\_INTERVAL**

Interval between attempting to resend a message in milliseconds.

**MQIACH\_MSG\_COMPRESSION**

List of message data compression techniques supported by the channel.

**MQIACH\_NETWORK\_PRIORITY**

Network priority.

**MQIACH\_NPM\_SPEED**

Speed of nonpersistent messages.

**MQIACH\_PUT\_AUTHORITY**

Put authority.

**MQIACH\_SEQUENCE\_NUMBER\_WRAP**

Sequence number wrap.

**MQIACH\_SHORT\_RETRY**

Count of short duration attempts.

**MQIACH\_SHORT\_TIMER**

Short duration timer.

**MQIACH\_XMIT\_PROTOCOL\_TYPE**

Transmission protocol type.

► z/OS

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment. The command server must be enabled.
- An asterisk "\*". The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ClusterQMGrAttrs* except MQIACF\_ALL and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFIF - PCF integer filter parameter" on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ClusterQMGrAttrs* except MQCA\_CLUSTER\_Q\_MGR\_NAME and others as noted. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFSF - PCF string filter parameter" on page 1595 for information about using this filter condition.

If you specify a string filter for *Channel* or *ClusterName*, you cannot also specify the *Channel* or *ClusterName* parameter.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

### Inquire Cluster Queue Manager (Response):

The response to the Inquire Cluster Queue Manager (MQCMD\_INQUIRE\_CLUSTER\_Q\_MGR) command consists of three parts. The response header is followed by the *QMgrName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### Always returned:

*ChannelName, ClusterName, QMgrName,*

### Returned if requested:

*AlterationDate, AlterationTime, BatchHeartbeat, BatchInterval, BatchSize, ChannelDesc, ChannelMonitoring, ChannelStatus, ClusterDate, ClusterInfo, ClusterTime, CLWLChannelPriority, CLWLChannelRank, CLWLChannelWeight, ConnectionName, DataConversion, DiscInterval, HeaderCompression, HeartbeatInterval, z/OS KeepAliveInterval, LocalAddress, LongRetryCount, LongRetryInterval, MaxMsgLength, MCAName, MCAType, MCAUserIdentifier, MessageCompression, ModeName, MsgExit, MsgRetryCount, MsgRetryExit, MsgRetryInterval, MsgRetryUserData, MsgUserData, NetworkPriority, NonPersistentMsgSpeed, Password, PutAuthority, QMgrDefinitionType, QMgrIdentifier, QMgrType, ReceiveExit, ReceiveUserData, SecurityExit, SecurityUserData, SendExit, SendUserData, SeqNumberWrap, ShortRetryCount, ShortRetryInterval, SSLCipherSpec, SSLClientAuth, SSLPeerName, Suspend, TpName, TransmissionQName, TransportType, UseDLQ, UserIdentifier, Version*

### Response data

#### *AlterationDate* (MQCFST)

Alteration date, in the form yyyy-mm-dd (parameter identifier: MQCA\_ALTERATION\_DATE).

The date at which the information was last altered.

#### *AlterationTime* (MQCFST)

Alteration time, in the form hh.mm.ss (parameter identifier: MQCA\_ALTERATION\_TIME).

The time at which the information was last altered.

#### *BatchHeartbeat* (MQCFIN)

The value being used for the batch heartbeat (parameter identifier: MQIACH\_BATCH\_HB).

The value can be 0 - 999,999. A value of 0 indicates that the batch heartbeat is not being used.

#### *BatchInterval* (MQCFIN)

Batch interval (parameter identifier: MQIACH\_BATCH\_INTERVAL).

#### *BatchSize* (MQCFIN)

Batch size (parameter identifier: MQIACH\_BATCH\_SIZE).

#### *ChannelDesc* (MQCFST)

Channel description (parameter identifier: MQCACH\_DESC).

The maximum length of the string is MQ\_CHANNEL\_DESC\_LENGTH.

### *ChannelMonitoring* (MQCFIN)

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_CHANNEL).

The value can be:

#### **MQMON\_OFF**

Online monitoring data collection is turned off for this channel.

#### **MQMON\_Q\_MGR**

The value of the queue manager's *ChannelMonitoring* parameter is inherited by the channel. MQMON\_Q\_MGR is the default value.

#### **MQMON\_LOW**

Online monitoring data collection is turned on, with a low rate of data collection, for this channel unless the queue manager's *ChannelMonitoring* parameter is MQMON\_NONE.

#### **MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate rate of data collection, for this channel unless the queue manager's *ChannelMonitoring* parameter is MQMON\_NONE.

#### **MQMON\_HIGH**

Online monitoring data collection is turned on, with a high rate of data collection, for this channel unless the queue manager's *ChannelMonitoring* parameter is MQMON\_NONE.

### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### *ChannelStatus* (MQCFIN)

Channel status (parameter identifier: MQIACH\_CHANNEL\_STATUS).

The value can be:

#### **MQCHS\_BINDING**

Channel is negotiating with the partner.

#### **MQCHS\_INACTIVE**

Channel is not active.

#### **MQCHS\_STARTING**

Channel is waiting to become active.

#### **MQCHS\_RUNNING**

Channel is transferring or waiting for messages.

#### **MQCHS\_PAUSED**

Channel is paused.

#### **MQCHS\_STOPPING**

Channel is in process of stopping.

#### **MQCHS\_RETRYING**

Channel is reattempting to establish connection.

#### **MQCHS\_STOPPED**

Channel is stopped.

#### **MQCHS\_REQUESTING**

Requester channel is requesting connection.

#### **MQCHS\_INITIALIZING**

Channel is initializing.

This parameter is returned if the channel is a cluster-sender channel ( CLUSSDR ) only.

*ClusterDate* (**MQCFST**)

Cluster date, in the form yyyy-mm-dd (parameter identifier: MQCA\_CLUSTER\_DATE).

The date at which the information became available to the local queue manager.

*ClusterInfo* (**MQCFIN**)

Cluster information (parameter identifier: MQIACF\_CLUSTER\_INFO).

The cluster information available to the local queue manager.

*ClusterName* (**MQCFST**)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

*ClusterTime* (**MQCFST**)

Cluster time, in the form hh.mm.ss (parameter identifier: MQCA\_CLUSTER\_TIME).

The time at which the information became available to the local queue manager.

*CLWLChannelPriority* (**MQCFIN**)

Channel priority (parameter identifier: MQIACH\_CLWL\_CHANNEL\_PRIORITY).

*CLWLChannelRank* (**MQCFIN**)

Channel rank (parameter identifier: MQIACH\_CLWL\_CHANNEL\_RANK).

*CLWLChannelWeight* (**MQCFIN**)

Channel weighting (parameter identifier: MQIACH\_CLWL\_CHANNEL\_WEIGHT).

*ConnectionName* (**MQCFST**)

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH. On z/OS, it is MQ\_LOCAL\_ADDRESS\_LENGTH.

*DataConversion* (**MQCFIN**)

Specifies whether sender must convert application data (parameter identifier: MQIACH\_DATA\_CONVERSION).

The value can be:

**MQCDC\_NO\_SENDER\_CONVERSION**

No conversion by sender.

**MQCDC\_SENDER\_CONVERSION**

Conversion by sender.

*DiscInterval* (**MQCFIN**)

Disconnection interval (parameter identifier: MQIACH\_DISC\_INTERVAL).

*HeaderCompression* (**MQCFIL**)

Header data compression techniques supported by the channel (parameter identifier: MQIACH\_HDR\_COMPRESSION). The values specified are in order of preference.

The value can be one, or more, of

**MQCOMPRESS\_NONE**

No header data compression is performed.

**MQCOMPRESS\_SYSTEM**

Header data compression is performed.

*HeartbeatInterval* (**MQCFIN**)

Heartbeat interval (parameter identifier: MQIACH\_HB\_INTERVAL).

▶ z/OS

*KeepAliveInterval* (**MQCFIN**)

KeepAlive interval (parameter identifier: MQIACH\_KEEP\_ALIVE\_INTERVAL). This parameter applies to z/OS only.

*LocalAddress* (**MQCFST**)

Local communications address for the channel (parameter identifier: MQCACH\_LOCAL\_ADDRESS).

The maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

*LongRetryCount* (**MQCFIN**)

Long retry count (parameter identifier: MQIACH\_LONG\_RETRY).

*LongRetryInterval* (**MQCFIN**)

Long timer (parameter identifier: MQIACH\_LONG\_TIMER).

*MaxMsgLength* (**MQCFIN**)

Maximum message length (parameter identifier: MQIACH\_MAX\_MSG\_LENGTH).

*MCAName* (**MQCFST**)

Message channel agent name (parameter identifier: MQCACH\_MCA\_NAME).

The maximum length of the string is MQ\_MCA\_NAME\_LENGTH.

*MCAType* (**MQCFIN**)

Message channel agent type (parameter identifier: MQIACH\_MCA\_TYPE).

The value can be:

**MQMCAT\_PROCESS**

Process.

**MQMCAT\_THREAD**

Thread ( Windows only).

*MCAUserIdentifier* (**MQCFST**)

Message channel agent user identifier (parameter identifier: MQCACH\_MCA\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

*MessageCompression* (**MQCFIL**)

Message data compression techniques supported by the channel (parameter identifier: MQIACH\_MSG\_COMPRESSION). The values specified are in order of preference.

The value can be one, or more, of:

**MQCOMPRESS\_NONE**

No message data compression is performed.

**MQCOMPRESS\_RLE**

Message data compression is performed using run-length encoding.

**MQCOMPRESS\_ZLIBFAST**

Message data compression is performed using ZLIB encoding with speed prioritized.

**MQCOMPRESS\_ZLIBHIGH**

Message data compression is performed using ZLIB encoding with compression prioritized.

*ModeName* (**MQCFST**)

Mode name (parameter identifier: MQCACH\_MODE\_NAME).

The maximum length of the string is MQ\_MODE\_NAME\_LENGTH.

*MsgExit* (**MQCFST**)

Message exit name (parameter identifier: MQCACH\_MSG\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

In the following environments more than one message exit can be defined for a channel. If more than one message exit is defined, the list of names is returned in an MQCFSL structure instead of an (MQCFST) structure. The environments are: AIX, HP-UX, IBM i, Solaris, Linux, and Windows. An MQCFSL structure is always used on z/OS.

***MsgRetryCount* (MQCFIN)**

Message retry count (parameter identifier: MQIACH\_MR\_COUNT).

***MsgRetryExit* (MQCFST)**

Message retry exit name (parameter identifier: MQCACH\_MR\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

***MsgRetryInterval* (MQCFIN)**

Message retry interval (parameter identifier: MQIACH\_MR\_INTERVAL).

***MsgRetryUserData* (MQCFST)**

Message retry exit user data (parameter identifier: MQCACH\_MR\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

***MsgUserData* (MQCFST)**

Message exit user data (parameter identifier: MQCACH\_MSG\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

In the following environments, more than one message exit user data string can be defined for a channel. If more than one string is defined, the list of strings is returned in an MQCFSL structure instead of an (MQCFST) structure. The environments are: AIX, HP-UX, IBM i, Solaris, Linux, and Windows. An MQCFSL structure is always used on z/OS.

***NetworkPriority* (MQCFIN)**

Network priority (parameter identifier: MQIACH\_NETWORK\_PRIORITY).

***NonPersistentMsgSpeed* (MQCFIN)**

Speed at which non-persistent messages are to be sent (parameter identifier: MQIACH\_NPM\_SPEED).

The value can be:

**MQNPMS\_NORMAL**

Normal speed.

**MQNPMS\_FAST**

Fast speed.

***Password* (MQCFST)**

Password (parameter identifier: MQCACH\_PASSWORD). This parameter is not available on z/OS.

If a nonblank password is defined, it is returned as asterisks. Otherwise, it is returned as blanks.

The maximum length of the string is MQ\_PASSWORD\_LENGTH. However, only the first 10 characters are used.

***PutAuthority* (MQCFIN)**

Put authority (parameter identifier: MQIACH\_PUT\_AUTHORITY).

The value can be:

**MQPA\_DEFAULT**

Default user identifier is used.

**MQPA\_CONTEXT**

Context user identifier is used.

**MQPA\_ALTERNATE\_OR\_MCA**

The user identifier from the *UserIdentifier* field of the message descriptor is used. Any user ID received from the network is not used. This value is valid only on z/OS.

**MQPA\_ONLY\_MCA**

The default user identifier is used. Any user ID received from the network is not used. This value is valid only on z/OS.

*QMgrDefinitionType* (**MQCFIN**)

Queue manager definition type (parameter identifier: MQIACF\_Q\_MGR\_DEFINITION\_TYPE).

The value can be:

**MQQMDT\_EXPLICIT\_CLUSTER\_SENDER**

A cluster-sender channel from an explicit definition.

**MQQMDT\_AUTO\_CLUSTER\_SENDER**

A cluster-sender channel by auto-definition.

**MQQMDT\_CLUSTER\_RECEIVER**

A cluster-receiver channel.

**MQQMDT\_AUTO\_EXP\_CLUSTER\_SENDER**

A cluster-sender channel, both from an explicit definition and by auto-definition.

*QMgrIdentifier* (**MQCFST**)

Queue manager identifier (parameter identifier: MQCA\_Q\_MGR\_IDENTIFIER).

The unique identifier of the queue manager.

*QMgrName* (**MQCFST**)

Queue manager name (parameter identifier: MQCA\_CLUSTER\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

*QMgrType* (**MQCFIN**)

Queue manager type (parameter identifier: MQIACF\_Q\_MGR\_TYPE).

The value can be:

**MQQMT\_NORMAL**

A normal queue manager.

**MQQMT\_REPOSITORY**

A repository queue manager.

*ReceiveExit* (**MQCFST**)

Receive exit name (parameter identifier: MQCACH\_RCV\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

In the following environments, more than one receive exit can be defined for a channel. If more than one receive exit is defined, the list of names is returned in an MQCFSL structure instead of an (MQCFST) structure. The environments are: AIX, HP-UX, IBM i, Solaris, Linux, and Windows. An MQCFSL structure is always used on z/OS.

*ReceiveUserData* (**MQCFST**)

Receive exit user data (parameter identifier: MQCACH\_RCV\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

In the following environments, more than one receive exit user data string can be defined for the channel. If more than one string is defined, the list of strings is returned in an MQCFSL structure instead of an (MQCFST) structure. The environments are: AIX, HP-UX, IBM i, Solaris, Linux, and Windows. An MQCFSL structure is always used on z/OS.

*SecurityExit* (**MQCFST**)

Security exit name (parameter identifier: MQCACH\_SEC\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

*SecurityUserData* (**MQCFST**)

Security exit user data (parameter identifier: MQCACH\_SEC\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

### *SendExit* (MQCFST)

Send exit name (parameter identifier: MQCACH\_SEND\_EXIT\_NAME).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

In the following environments, more than one send exit can be defined for a channel. If more than one send exit is defined, the list of names is returned in an MQCFSL structure instead of an (MQCFST) structure. The environments are: AIX, HP-UX, IBM i, Solaris, Linux, and Windows. An MQCFSL structure is always used on z/OS.

### *SendUserData* (MQCFST)

Send exit user data (parameter identifier: MQCACH\_SEND\_EXIT\_USER\_DATA).

The maximum length of the string is MQ\_EXIT\_DATA\_LENGTH.

In the following environments, more than one send exit user data string can be defined for the channel. If more than one string is defined, the list of strings is returned in an MQCFSL structure instead of an (MQCFST) structure. The environments are: AIX, HP-UX, IBM i, Solaris, Linux, and Windows. An MQCFSL structure is always used on z/OS.

### *SeqNumberWrap* (MQCFIN)

Sequence wrap number (parameter identifier: MQIACH\_SEQUENCE\_NUMBER\_WRAP).

### *ShortRetryCount* (MQCFIN)

Short retry count (parameter identifier: MQIACH\_SHORT\_RETRY).

### *ShortRetryInterval* (MQCFIN)

Short timer (parameter identifier: MQIACH\_SHORT\_TIMER).

### *SSLCipherSpec* (MQCFST)

CipherSpec (parameter identifier: MQCACH\_SSL\_CIPHER\_SPEC).

The length of the string is MQ\_SSL\_CIPHER\_SPEC\_LENGTH.

### *SSLClientAuth* (MQCFIN)

Client authentication (parameter identifier: MQIACH\_SSL\_CLIENT\_AUTH).

The value can be:

#### **MQSCA\_REQUIRED**

Client authentication required

#### **MQSCA\_OPTIONAL**

Client authentication is optional.

Defines whether IBM MQ requires a certificate from the SSL client.

### *SSLPeerName* (MQCFST)

Peer name (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

The length of the string is MQ\_SSL\_PEER\_NAME\_LENGTH. On z/OS, it is MQ\_SHORT\_PEER\_NAME\_LENGTH.

Specifies the filter to use to compare with the distinguished name of the certificate from the peer queue manager or client at the other end of the channel. (A distinguished name is the identifier of the SSL certificate.) If the distinguished name in the certificate received from the peer does not match the SSLPEER filter, the channel does not start.

### *Suspend* (MQCFIN)

Specifies whether the queue manager is suspended (parameter identifier: MQIACF\_SUSPEND).

The value can be:

#### **MQSUS\_NO**

The queue manager is not suspended from the cluster.

#### **MQSUS\_YES**

The queue manager is suspended from the cluster.

***TpName* (MQCFST)**

Transaction program name (parameter identifier: MQCACH\_TP\_NAME).

The maximum length of the string is MQ\_TP\_NAME\_LENGTH.

***TransmissionQName* (MQCFST)**

Transmission queue name (parameter identifier: MQCA\_XMIT\_Q\_NAME). The cluster transmission queue used by the queue manager.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

***TransportType* (MQCFIN)**

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_LU62**

LU 6.2.

**MQXPT\_TCP**

TCP.

**MQXPT\_NETBIOS**

NetBIOS.

**MQXPT\_SPX**

SPX.

**MQXPT\_DECNET**

DECnet.

***UseDLQ* (MQCFIN)**

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

***UserIdentifier* (MQCFST)**

Task user identifier (parameter identifier: MQCACH\_USER\_ID). This parameter is not available on z/OS.

The maximum length of the string is MQ\_USER\_ID\_LENGTH. However, only the first 10 characters are used.

***Version* (MQCFST)**

The version of the IBM MQ installation that the cluster queue manager is associated with. (parameter identifier: MQCA\_VERSION). The version has the format VVRRMMFF:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

## Inquire Communication Information Object:

The Inquire Communication Information Object (MQCMD\_INQUIRE\_COMM\_INFO) command inquires about the attributes of existing IBM MQ communication information objects.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

### Required parameters:

*ComminfoName*

### Optional parameters:

*ComminfoAttrs, IntegerFilterCommand, StringFilterCommand*

### Required parameters

#### *ComminfoName* (MQCFST)

The name of the communication information definition about which information is to be returned (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The communication information name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

### Optional parameters

#### *ComminfoAttrs* (MQCFIL)

Comminfo attributes (parameter identifier: MQIACF\_COMM\_INFO\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQIA\_CODED\_CHAR\_SET\_ID**

CCSID for transmitted messages.

#### **MQIA\_COMM\_EVENT**

Comminfo event control.

#### **MQIA\_MCAST\_BRIDGE**

Multicast bridging.

#### **MQIA\_MONITOR\_INTERVAL**

Frequency of update for monitoring information.

#### **MQIACF\_ENCODING**

Encoding for transmitted messages.

#### **MQIACH\_MC\_HB\_INTERVAL**

Multicast heartbeat interval.

#### **MQIACH\_MSG\_HISTORY**

Amount of message history being kept.

#### **MQIACH\_MULTICAST\_PROPERTIES**

Multicast properties control.

**MQIACH\_NEW\_SUBSCRIBER\_HISTORY**

New subscriber history.

**MQIACH\_PORT**

Port Number.

**MQCA\_ALTERATION\_DATE**

The date on which the information was last altered.

**MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

**MQCA\_COMM\_INFO\_DESC**

CommInfo description.

**MQCA\_COMM\_INFO\_TYPE**

CommInfo type

**MQCACH\_GROUP\_ADDRESS**

Group Address.

***IntegerFilterCommand (MQCFIF)***

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *CommInfoAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter for *CommInfoType* (MQIA\_COMM\_INFO\_TYPE), you cannot also specify the *CommInfoType* parameter.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

***StringFilterCommand (MQCFSF)***

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *CommInfoAttrs* except MQCA\_COMM\_INFO\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

**Inquire Communication Information Object (Response):**

The response to the Inquire Communication Information Object (MQCMD\_INQUIRE\_COMM\_INFO) command consists of the response header followed by the *CommInfoName* structure, and the requested combination of attribute parameter structures (where applicable).

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

If a generic communication information name was specified, one such message is generated for each object found.

**Always returned:***CommInfoName*

**Returned if requested:**

*AlterationDate, AlterationTime, Bridge, CCSID, CommEvent, Description, Encoding, GrpAddress, MonitorInterval, MulticastHeartbeat, MulticastPropControl, MsgHistory, NewSubHistory, PortNumber, Type*

**Response data*****AlterationDate (MQCFST)***

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

***AlterationTime (MQCFST)***

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

***Bridge (MQCFIN)***

Multicast Bridging (parameter identifier: MQIA\_MCAST\_BRIDGE).

Controls whether publications from applications not using Multicast are bridged to applications using multicast.

***CCSID (MQCFIN)***

CCSID that messages are transmitted in (parameter identifier: MQIA\_CODED\_CHAR\_SET\_ID).

The coded character set identifier that messages are transmitted in.

***CommEvent (MQCFIN)***

Event Control (parameter identifier: MQIA\_COMM\_EVENT).

Controls whether event messages are generated for multicast handles that are created using this COMMINFO object. The value can be:

***MQEVR\_DISABLED***

Event reporting disabled.

***MQEVR\_ENABLED***

Event reporting enabled.

***MQEVR\_EXCEPTION***

Reporting of events for message reliability below the reliability threshold enabled.

***CommInfoName (MQCFST)***

The name of the communication information definition (parameter identifier: MQCA\_COMM\_INFO\_NAME).

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

***Description (MQCFST)***

Description of the communication information definition (parameter identifier: MQCA\_COMM\_INFO\_DESC).

The maximum length of the string is MQ\_COMM\_INFO\_DESC\_LENGTH.

***Encoding (MQCFIN)***

Encoding that messages are transmitted in (parameter identifier: MQIACF\_ENCODING).

The encoding that messages are transmitted in. The value can be any of the following values:

***MQENC\_AS\_PUBLISHED***

Encoding taken from published message.

***MQENC\_NORMAL******MQENC\_REVERSED***

**MQENC\_S390**

**MQENC\_TNS**

*GrpAddress* (**MQCFST**)

The group IP address or DNS name (parameter identifier: MQCACH\_GROUP\_ADDRESS).

The maximum length of the string is MQ\_GROUP\_ADDRESS\_LENGTH.

*MonitorInterval* (**MQCFIN**)

Frequency of monitoring (parameter identifier: MQIA\_MONITOR\_INTERVAL).

How frequently, in seconds, monitoring information is updated and event messages are generated.

*MulticastHeartbeat* (**MQCFIN**)

Heartbeat Interval for multicast (parameter identifier: MQIACH\_MC\_HB\_INTERVAL).

The heartbeat interval, in milliseconds, for multicast transmitters.

*MulticastPropControl* (**MQCFIN**)

Multicast property control (parameter identifier: MQIACH\_MULTICAST\_PROPERTIES).

Control which MQMD properties and user properties flow with the message. The value can be any of the following values:

**MQMCP\_ALL**

All MQMD and user properties.

**MQMAP\_REPLY**

Properties related to replying to messages.

**MQMAP\_USER**

Only user properties.

**MQMAP\_NONE**

No MQMD or user properties.

**MQMAP\_COMPAT**

Properties are transmitted in a format compatible with previous Multicast clients.

*MsgHistory* (**MQCFIN**)

Message History (parameter identifier: MQIACH\_MSG\_HISTORY).

The amount of message history, in kilobytes, that is kept by the system to handle retransmissions in the case of NACKS.

*NewSubHistory* (**MQCFIN**)

New Subscriber History (parameter identifier: MQIACH\_NEW\_SUBSCRIBER\_HISTORY).

Controls how much historical data a new subscriber receives. The value can be any of the following values:

**MQNSH\_NONE**

Only publications from the time of the subscription are sent.

**MQNSH\_ALL**

As much history as is known is retransmitted.

*PortNumber* (**MQCFIN**)

Port Number (parameter identifier: MQIACH\_PORT).

The port number to transmit on.

*Type* (**MQCFIN**)

The type of the communications information definition (parameter identifier: MQIA\_COMM\_INFO\_TYPE).

The value can be:

## MQCIT\_MULTICAST

Multicast.

### Inquire Connection:

The Inquire connection (MQCMD\_INQUIRE\_CONNECTION) command inquires about the applications which are connected to the queue manager, the status of any transactions that those applications are running, and the objects which the application has open.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### Required parameters

#### *ConnectionId* (MQCFBS)

Connection identifier (parameter identifier: MQBACF\_CONNECTION\_ID).

This parameter is the unique connection identifier associated with an application that is connected to the queue manager. Specify either this parameter **or** *GenericConnectionId*.

All connections are assigned a unique identifier by the queue manager regardless of how the connection is established.

If you need to specify a generic connection identifier, use the *GenericConnectionId* parameter instead.

The length of the string is MQ\_CONNECTION\_ID\_LENGTH.

#### *GenericConnectionId* (MQCFBS)

Generic specification of a connection identifier (parameter identifier: MQBACF\_GENERIC\_CONNECTION\_ID).

Specify either this parameter **or** *ConnectionId*.

If you specify a byte string of zero length, or one which contains only null bytes, information about all connection identifiers is returned. This value is the only value permitted for *GenericConnectionId*.

The length of the string is MQ\_CONNECTION\_ID\_LENGTH.

### Optional parameters

#### *ByteStringFilterCommand* (MQCFBF)

Byte string filter command descriptor. The parameter identifier must be MQBACF\_EXTERNAL\_UOW\_ID, MQBACF\_ORIGIN\_UOW\_ID, or MQBACF\_Q\_MGR\_UOW\_ID. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFBF - PCF byte string filter parameter” on page 1583 for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter, or a string filter using the *StringFilterCommand* parameter.

#### ▶ z/OS

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

#### **ConnectionAttrs (MQCFIL)**

Connection attributes (parameter identifier: MQIACF\_CONNECTION\_ATTRS).

The attribute list can specify the following value on its own - default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes of the selected *ConnInfoType*.

or, if you select a value of MQIACF\_CONN\_INFO\_CONN for *ConnInfoType*, a combination of the following:

#### **MQBACF\_CONNECTION\_ID**

Connection identifier.

#### **MQBACF\_EXTERNAL\_UOW\_ID**

External unit of recovery identifier associated with the connection.

#### **MQBACF\_ORIGIN\_UOW\_ID**

Unit of recovery identifier assigned by the originator (valid on z/OS only).

#### **MQBACF\_Q\_MGR\_UOW\_ID**

Unit of recovery identifier assigned by the queue manager.

#### **MQCACF\_APPL\_TAG**

Name of an application that is connected to the queue manager.

#### **MQCACF\_ASID**

The 4-character address-space identifier of the application identified in MQCACF\_APPL\_TAG (valid on z/OS only).

#### **MQCACF\_ORIGIN\_NAME**

Originator of the unit of recovery (valid on z/OS only).

#### **MQCACF\_PSB\_NAME**

The 8-character name of the program specification block (PSB) associated with the running IMS transaction (valid on z/OS only).

#### **MQCACF\_PST\_ID**

The 4-character IMS program specification table (PST) region identifier for the connected IMS region (valid on z/OS only).

#### **MQCACF\_TASK\_NUMBER**

A 7-digit CICS task number (valid on z/OS only).

#### **MQCACF\_TRANSACTION\_ID**

A 4-character CICS transaction identifier (valid on z/OS only).

#### **MQCACF\_UOW\_LOG\_EXTENT\_NAME**

Name of the first extent required to recover the transaction.  
MQCACF\_UOW\_LOG\_EXTENT\_NAME is not valid on z/OS.

**MQCACF\_UOW\_LOG\_START\_DATE**

Date on which the transaction associated with the current connection first wrote to the log.

**MQCACF\_UOW\_LOG\_START\_TIME**

Time at which the transaction associated with the current connection first wrote to the log.

**MQCACF\_UOW\_START\_DATE**

Date on which the transaction associated with the current connection was started.

**MQCACF\_UOW\_START\_TIME**

Time at which the transaction associated with the current connection was started.

**MQCACF\_USER\_IDENTIFIER**

User identifier of the application that is connected to the queue manager.

**MQCACH\_CHANNEL\_NAME**

Name of the channel associated with the connected application.

**MQCACH\_CONNECTION\_NAME**

Connection name of the channel associated with the application.

**MQIA\_APPL\_TYPE**

Type of the application that is connected to the queue manager.

**MQIACF\_CONNECT\_OPTIONS**

Connect options currently in force for this application connection.

You cannot use the value MQCNO\_STANDARD\_BINDING as a filter value.

**MQIACF\_PROCESS\_ID**

Process identifier of the application that is currently connected to the queue manager.

This parameter is not valid on z/OS.

**MQIACF\_THREAD\_ID**

Thread identifier of the application that is currently connected to the queue manager.

This parameter is not valid on z/OS.

**MQIACF\_UOW\_STATE**

State of the unit of work.

**MQIACF\_UOW\_TYPE**

Type of external unit of recovery identifier as understood by the queue manager.

or, if you select a value of MQIACF\_CONN\_INFO\_HANDLE for *ConnInfoType*, a combination of the following:

**MQCACF\_OBJECT\_NAME**

Name of each object that the connection has open.

**MQCACH\_CONNECTION\_NAME**

Connection name of the channel associated with the application.

**MQIA\_QSG\_DISP**

Disposition of the object (valid on z/OS only).

You cannot use MQIA\_QSG\_DISP as a parameter to filter on.

**MQIA\_READ\_AHEAD**

The read ahead connection status.

**MQIA\_UR\_DISP**

The unit of recovery disposition associated with the connection (valid on z/OS only).

**MQIACF\_HANDLE\_STATE**

Whether an API call is in progress.

**MQIACF\_OBJECT\_TYPE**

Type of each object that the connection has open.

**MQIACF\_OPEN\_OPTIONS**

Options used by the connection to open each object.

or, if you select a value of MQIACF\_CONN\_INFO\_ALL for *ConnInfoType*, any of the previous values.

**ConnInfoType (MQCFIN)**

Type of connection information to be returned (parameter identifier: MQIACF\_CONN\_INFO\_TYPE).

The value can be any of the following values:

**MQIACF\_CONN\_INFO\_CONN**

Connection information. On z/OS, MQIACF\_CONN\_INFO\_CONN includes threads which might be logically or actually disassociated from a connection, together with those threads that are in-doubt and for which external intervention is needed to resolve them.

MQIACF\_CONN\_INFO\_CONN is the default value used if the parameter is not specified.

**MQIACF\_CONN\_INFO\_HANDLE**

Information pertaining only to those objects opened by the specified connection.

**MQIACF\_CONN\_INFO\_ALL**

Connection information and information about those objects that the connection has open.

You cannot use *ConnInfoType* as a parameter to filter on.

**IntegerFilterCommand (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ConnectionAttrs* except as noted and MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. You cannot use the value MQCNO\_STANDARD\_BINDING on the MQIACF\_CONNECT\_OPTIONS parameter with either the MQCFOP\_CONTAINS or MQCFOP\_EXCLUDES operator. See "MQCFIF - PCF integer filter parameter" on page 1588 for information about using this filter condition.

If you filter on MQIACF\_CONNECT\_OPTIONS or MQIACF\_OPEN\_OPTIONS, in each case the filter value must have only 1 bit set.

If you specify an integer filter, you cannot also specify a byte string filter using the *ByteStringFilterCommand* parameter or a string filter using the *StringFilterCommand* parameter.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ConnectionAttrs*. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFSF - PCF string filter parameter" on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the *ByteStringFilterCommand* parameter or an integer filter using the *IntegerFilterCommand* parameter.

**URDisposition (MQCFIN)**

The unit of recovery disposition associated with the connection (parameter identifier: MQI\_UR\_DISP). This parameter is valid only on z/OS.

The value can be any of the following values:

**MQQSGD\_ALL**

Specifies that all connections must be returned.

**MQQSGD\_GROUP**

Specifies that only connections with a GROUP unit of recovery disposition must be returned.

**MQQSGD\_Q\_MGR**

Specifies that only connections with a QMGR unit of recovery disposition must be returned.

## Error code

This command might return the following error code in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

### Reason (MQLONG)

The value can be any of the following values:

**MQRCCF\_CONNECTION\_ID\_ERROR**  
Connection identifier not valid.

## Inquire Connection (Response):

The response to the Inquire Connection (MQCMD\_INQUIRE\_CONNECTION) command consists of the response header followed by the *ConnectionId* structure and a set of attribute parameter structures determined by the value of *ConnInfoType* in the Inquire command.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

If the value of *ConnInfoType* was MQIACF\_CONN\_INFO\_ALL, there is one message for each connection found with MQIACF\_CONN\_INFO\_CONN, and *n* more messages per connection with MQIACF\_CONN\_INFO\_HANDLE (where *n* is the number of objects that the connection has open).

### Always returned:

*ConnectionId, ConnInfoType*

### Always returned if *ConnInfoType* is MQIACF\_CONN\_INFO\_HANDLE:

*ObjectName, ObjectType, z/OS QSGDisposition*

### Returned if requested and *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN:

*ApplDesc, ApplTag, ApplType, z/OS ASID, AsynchronousState, ChannelName, ConnectionName, ConnectionOptions, z/OS OriginName, z/OS OriginUOWId, z/OS ProcessId, PSBName, z/OS PSTId, QMgrUOWId, StartUOWLogExtent, TaskNumber, ThreadId, z/OS TransactionId, UOWIdentifier, UOWLogStartDate, UOWLogStartTime, UOWStartDate, UOWStartTime, UOWState, UOWType, z/OS URDisposition, UserId*

### Returned if requested and *ConnInfoType* is MQIACF\_CONN\_INFO\_HANDLE:

*AsynchronousState, Destination, DestinationQueueManager, HandleState, OpenOptions, ReadAhead, SubscriptionID, SubscriptionName, TopicString*

## Response data

### *ApplDesc* (MQCFST)

Application description (parameter identifier: MQCACF\_APPL\_DESC).

The maximum length is MQ\_APPL\_DESC\_LENGTH.

### *ApplTag* (MQCFST)

Application tag (parameter identifier: MQCACF\_APPL\_TAG).

The maximum length is MQ\_APPL\_TAG\_LENGTH.

### *ApplType* (MQCFIN)

Application type (parameter identifier: MQIA\_APPL\_TYPE).

The value can be any of the following values:

**MQAT\_QMGR**

Queue manager process.

**MQAT\_CHANNEL\_INITIATOR**

Channel initiator.

**MQAT\_USER**

User application.

**MQAT\_BATCH**

Application using a batch connection (only on z/OS ).

**MQAT\_RRS\_BATCH**

RRS-coordinated application using a batch connection (only on z/OS ).

**MQAT\_CICS**

CICS transaction (only on z/OS ).

**MQAT\_IMS**

IMS transaction (only on z/OS ).

**MQAT\_SYSTEM\_EXTENSION**

Application performing an extension of function that is provided by the queue manager.

**z/OS****ASID (MQCFST)**

Address space identifier (parameter identifier: MQCACF\_ASID).

The four character address-space identifier of the application identified by *ApplTag*. It distinguishes duplicate values of *ApplTag*.

This parameter is valid only on z/OS.

The length of the string is MQ\_ASID\_LENGTH.

**AsynchronousState (MQCFIN)**

The state of asynchronous consumption on this handle (parameter identifier: MQIACF\_ASYNC\_STATE).

The value can be:

**MQAS\_NONE**

If *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN, an MQCTL call has not been issued against the handle. Asynchronous message consumption cannot currently proceed on this connection. If *ConnInfoType* is MQIACF\_CONN\_INFO\_HANDLE, an MQCB call has not been issued against this handle, so no asynchronous message consumption is configured on this handle.

**MQAS\_SUSPENDED**

The asynchronous consumption callback has been suspended so that asynchronous message consumption cannot currently proceed on this handle. This situation can be either because an MQCB or MQCTL call with *Operation* MQOP\_SUSPEND has been issued against this object handle by the application, or because it has been suspended by the system. If it has been suspended by the system, as part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This reason code is reported in the *Reason* field in the MQCBC structure passed to the callback. In order for asynchronous message consumption to proceed, the application must issue an MQCB or MQCTL call with *Operation* MQOP\_RESUME. This reason code can be returned if *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN or MQIACF\_CONN\_INFO\_HANDLE.

**MQAS\_SUSPENDED\_TEMPORARY**

The asynchronous consumption callback has been temporarily suspended by the system so

that asynchronous message consumption cannot currently proceed on this object handle. As part of the process of suspending asynchronous message consumption, the callback function is called with the reason code that describes the problem resulting in suspension. MQAS\_SUSPENDED\_TEMPORARY is reported in the *Reason* field in the MQCBC structure passed to the callback. The callback function is called again when asynchronous message consumption is resumed by the system when the temporary condition has been resolved. MQAS\_SUSPENDED\_TEMPORARY is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_HANDLE.

#### **MQAS\_STARTED**

An MQCTL call with *Operation* MQOP\_START has been issued against the connection handle so that asynchronous message consumption can proceed on this connection. MQAS\_STARTED is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN.

#### **MQAS\_START\_WAIT**

An MQCTL call with *Operation* MQOP\_START\_WAIT has been issued against the connection handle so that asynchronous message consumption can proceed on this connection. MQAS\_START\_WAIT is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN.

#### **MQAS\_STOPPED**

An MQCTL call with *Operation* MQOP\_STOP has been issued against the connection handle so that asynchronous message consumption cannot currently proceed on this connection. MQAS\_STOPPED is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_CONN.

#### **MQAS\_ACTIVE**

An MQCB call has set up a function to call back to process messages asynchronously and the connection handle has been started so that asynchronous message consumption can proceed. MQAS\_ACTIVE is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_HANDLE.

#### **MQAS\_INACTIVE**

An MQCB call has set up a function to call back to process messages asynchronously but the connection handle has not yet been started, or has been stopped or suspended, so that asynchronous message consumption cannot currently proceed. MQAS\_INACTIVE is returned only if *ConnInfoType* is MQIACF\_CONN\_INFO\_HANDLE.

#### **ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### **ConnectionId (MQCFBS)**

Connection identifier (parameter identifier: MQBACF\_CONNECTION\_ID).

The length of the string is MQ\_CONNECTION\_ID\_LENGTH.

#### **ConnectionName (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

#### **ConnectionOptions (MQCFIL)**

Connect options currently in force for the connection (parameter identifier: MQIACF\_CONNECT\_OPTIONS).

#### **ConnInfoType (MQCFIN)**

Type of information returned (parameter identifier: MQIACF\_CONN\_INFO\_TYPE).

The value can be any of the following values:

#### **MQIACF\_CONN\_INFO\_CONN**

Generic information for the specified connection.

#### **MQIACF\_CONN\_INFO\_HANDLE**

Information pertinent only to those objects opened by the specified connection.

**Destination (MQCFST)**

The destination queue for messages published to this subscription (parameter identifier MQCACF\_DESTINATION).

This parameter is relevant only for handles of subscriptions to topics.

**DestinationQueueManager (MQCFST)**

The destination queue manager for messages published to this subscription (parameter identifier MQCACF\_DESTINATION\_Q\_MGR).

This parameter is relevant only for handles of subscriptions to topics. If *Destination* is a queue hosted on the local queue manager, this parameter contains the local queue manager name. If *Destination* is a queue hosted on a remote queue manager, this parameter contains the name of the remote queue manager.

**HandleState (MQCFIN)**

State of the handle (parameter identifier: MQIACF\_HANDLE\_STATE).

The value can be any of the following values:

**MQHSTATE\_ACTIVE**

An API call from this connection is currently in progress for this object. If the object is a queue, this condition can arise when an MQGET WAIT call is in progress.

If there is an MQGET SIGNAL outstanding, then this situation does not mean, by itself, that the handle is active.

**MQHSTATE\_INACTIVE**

No API call from this connection is currently in progress for this object. If the object is a queue, this condition can arise when no MQGET WAIT call is in progress.

**ObjectName (MQCFST)**

Object name (parameter identifier: MQCACF\_OBJECT\_NAME).

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

**ObjectType (MQCFIN)**

Object type (parameter identifier: MQIACF\_OBJECT\_TYPE).

If this parameter is a handle of a subscription to a topic, the SUBID parameter identifies the subscription and can be used with the Inquire Subscription command to find all the details about the subscription.

The value can be any of the following values:

**MQOT\_Q**

Queue.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_CHANNEL**

Channel.

**MQOT\_AUTH\_INFO**

Authentication information object.

**MQOT\_TOPIC**

Topic.

### *OpenOptions* (MQCFIN)

Open options currently in force for the object for connection (parameter identifier: MQIACF\_OPEN\_OPTIONS).

This parameter is not relevant for a subscription. Use the SUBID field of the DISPLAY SUB command to find all the details about the subscription.

▶ z/OS

### *OriginName* (MQCFST)

Origin name (parameter identifier: MQCACF\_ORIGIN\_NAME).

Identifies the originator of the unit of recovery, except where *ApplType* is MQAT\_RRS\_BATCH when it is omitted.

This parameter is valid only on z/OS.

The length of the string is MQ\_ORIGIN\_NAME\_LENGTH.

▶ z/OS

### *OriginUOWId* (MQCFBS)

Origin UOW identifier (parameter identifier: MQBACF\_ORIGIN\_UOW\_ID).

The unit of recovery identifier assigned by the originator. It is an 8-byte value.

This parameter is valid only on z/OS.

The length of the string is MQ\_UOW\_ID\_LENGTH.

▶ z/OS

### *ProcessId* (MQCFIN)

Process identifier (parameter identifier: MQIACF\_PROCESS\_ID).

### *PSBName* (MQCFST)

Program specification block name (parameter identifier: MQCACF\_PSB\_NAME).

The 8-character name of the program specification block (PSB) associated with the running IMS transaction.

This parameter is valid only on z/OS.

The length of the string is MQ\_PSB\_NAME\_LENGTH.

▶ z/OS

### *PSTId* (MQCFST)

Program specification table identifier (parameter identifier: MQCACF\_PST\_ID).

The 4-character IMS program specification table (PST) region identifier for the connected IMS region.

This parameter is valid only on z/OS.

The length of the string is MQ\_PST\_ID\_LENGTH.

### *QMgrUOWId* (MQCFBS)

Unit of recovery identifier assigned by the queue manager (parameter identifier: MQBACF\_Q\_MGR\_UOW\_ID).

On z/OS platforms, this parameter is returned as an 8-byte RBA. On platforms other than z/OS, this parameter is an 8-byte transaction identifier.

The maximum length of the string is MQ\_UOW\_ID\_LENGTH.

**QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

**ReadAhead (MQCFIN)**

The read ahead connection status (parameter identifier: MQIA\_READ\_AHEAD).

The value can be any of the following values:

**MQREADA\_NO**

Read ahead for browsing messages, or of non-persistent messages is not enabled for the object that the connection has open.

**MQREADA\_YES**

Read ahead for browsing messages, or of non-persistent messages is enabled for the object that the connection has open and is being used efficiently.

**MQREADA\_BACKLOG**

Read ahead for browsing messages, or of non-persistent messages is enabled for this object. Read ahead is not being used efficiently because the client has been sent many messages which are not being consumed.

**MQREADA\_INHIBITED**

Read ahead was requested by the application but has been inhibited because of incompatible options specified on the first MQGET call.

**StartUOWLogExtent (MQCFST)**

Name of the first extent needed to recover the transaction (parameter identifier: MQCACF\_UOW\_LOG\_EXTENT\_NAME).

The 8-character name of the program specification block (PSB) associated with the running IMS transaction.

This parameter is not valid on z/OS.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

**SubscriptionID (MQCFBS)**

The internal, all time unique identifier of the subscription (parameter identifier MQBACF\_SUB\_ID).

This parameter is relevant only for handles of subscriptions to topics.

Not all subscriptions can be seen using Inquire Connection; only those subscriptions that have current handles open to the subscriptions can be seen. Use the Inquire Subscription command to see all subscriptions.

**SubscriptionName (MQCFST)**

The unique subscription name of the application associated with the handle (parameter identifier MQCACF\_SUB\_NAME).

This parameter is relevant only for handles of subscriptions to topics. Not all subscriptions have a subscription name.

**ThreadId (MQCFIN)**

Thread identifier (parameter identifier: MQIACF\_THREAD\_ID).

**TopicString (MQCFST)**

Resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING).

This parameter is relevant for handles with an ObjectType of MQOT\_TOPIC. For any other object type, this parameter is blank.

▶ z/OS

**TransactionId (MQCFST)**

Transaction identifier (parameter identifier: MQCACF\_TRANSACTION\_ID).

The 4-character CICS transaction identifier.

This parameter is valid only on z/OS.

The maximum length of the string is MQ\_TRANSACTION\_ID\_LENGTH.

**UOWIdentifier (MQCFBS)**

External unit of recovery identifier associated with the connection (parameter identifier: MQBACF\_EXTERNAL UOW\_ID).

This parameter is the recovery identifier for the unit of recovery. The value of *UOWType* determines its format.

The maximum length of the byte string is MQ\_UOW\_ID\_LENGTH.

**UOWLogStartDate (MQCFST)**

Logged unit of work start date, in the form yyyy-mm-dd (parameter identifier: MQCACF\_UOW\_LOG\_START\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**UOWLogStartTime (MQCFST)**

Logged unit of work start time, in the form hh.mm.ss (parameter identifier: MQCACF\_UOW\_LOG\_START\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**UOWStartDate (MQCFST)**

Unit of work creation date (parameter identifier: MQCACF\_UOW\_START\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**UOWStartTime (MQCFST)**

Unit of work creation time (parameter identifier: MQCACF\_UOW\_START\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**UOWState (MQCFIN)**

State of the unit of work (parameter identifier: MQIACF\_UOW\_STATE).

The value can be any of the following values:

**MQUOWST\_NONE**

There is no unit of work.

**MQUOWST\_ACTIVE**

The unit of work is active.

**MQUOWST\_PREPARED**

The unit of work is in the process of being committed.

**MQUOWST\_UNRESOLVED**

The unit of work is in the second phase of a two-phase commit operation. IBM MQ holds

resources on behalf of the unit of work and external intervention is required to resolve it. It might be as simple as starting the recovery coordinator (such as CICS, IMS, or RRS) or it might involve a more complex operation such as using the RESOLVE INDOUBT command. This value can occur only on z/OS.

**UOWType (MQCFIN)**

Type of external unit of recovery identifier as perceived by the queue manager (parameter identifier: MQIACF\_UOW\_TYPE).

The value can be any of the following values:

**MQUOWT\_Q\_MGR**

**MQUOWT\_CICS**

**MQUOWT\_RRS**

**MQUOWT\_IMS**

**MQUOWT\_XA**

**z/OS**

**URDisposition (MQCFIN)**

The unit of recovery disposition associated with the connection.

This parameter is valid only on z/OS.

The value can be:

**MQQSGD\_GROUP**

This connection has a GROUP unit of recovery disposition.

**MQQSGD\_Q\_MGR**

This connection has a QMGR unit of recovery disposition.

**UserId (MQCFST)**

User identifier (parameter identifier: MQCACF\_USER\_IDENTIFIER).

The maximum length of the string is MQ\_MAX\_USER\_ID\_LENGTH.

**Inquire Entity Authority:**

The Inquire Entity Authority (MQCMD\_INQUIRE\_ENTITY\_AUTH) command inquires about authorizations of an entity to a specified object.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

**Required parameters**

**EntityName (MQCFST)**

Entity name (parameter identifier: MQCACF\_ENTITY\_NAME).

Depending on the value of *EntityType*, this parameter is either:

- A principal name. This name is the name of a user for whom to retrieve authorizations to the specified object. On IBM MQ for Windows, the name of the principal can optionally include a domain name, specified in this format: user@domain.
- A group name. This name is the name of the user group on which to make the inquiry. You can specify one name only and this name must be the name of an existing user group.

For IBM MQ for Windows only, the group name can optionally include a domain name, specified in the following formats:

GroupName@domain  
domain\GroupName

The maximum length of the string is MQ\_ENTITY\_NAME\_LENGTH.

**EntityType (MQCFIN)**

Entity type (parameter identifier: MQIACF\_ENTITY\_TYPE).

The value can be:

**MQZAET\_GROUP**

The value of the *EntityName* parameter refers to a group name.

**MQZAET\_PRINCIPAL**

The value of the *EntityName* parameter refers to a principal name.

**ObjectType (MQCFIN)**

The type of object referred to by the profile (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be any of the following values:

**MQOT\_AUTH\_INFO**

Authentication information.

**MQOT\_CHANNEL**

Channel object.

**MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

**MQOT\_COMM\_INFO**

Communication information object

**MQOT\_LISTENER**

Listener object.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process.

**MQOT\_Q**

Queue, or queues, that match the object name parameter.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

**MQOT\_SERVICE**

Service object.

**MQOT\_TOPIC**

Topic object.

**Options (MQCFIN)**

Options to control the set of authority records that is returned (parameter identifier: MQIACF\_AUTH\_OPTIONS).

This parameter is required and you must set it to the value MQAUTHOPT\_CUMULATIVE. It returns a set of authorities representing the cumulative authority that an entity has to a specified object.

If a user ID is a member of more than one group, this command displays the combined authorizations of all groups.

### Optional parameters

#### *ObjectName* (MQCFST)

Object name (parameter identifier: MQCACF\_OBJECT\_NAME).

The name of the queue manager, queue, process definition, or generic profile on which to make the inquiry.

You must include a parameter if the *ObjectType* is not MQOT\_Q\_MGR. If you do not include this parameter, it is assumed that you are making an inquiry on the queue manager.

You cannot specify a generic object name although you can specify the name of a generic profile.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

#### *ProfileAttrs* (MQCFIL)

Profile attributes (parameter identifier: MQIACF\_AUTH\_PROFILE\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

##### **MQIACF\_ALL**

All attributes.

or a combination of the following:

##### **MQCACF\_ENTITY\_NAME**

Entity name.

##### **MQIACF\_AUTHORIZATION\_LIST**

Authorization list.

##### **MQIACF\_ENTITY\_TYPE**

Entity type.

##### **MQIACF\_OBJECT\_TYPE**

Object type.

#### *ServiceComponent* (MQCFST)

Service component (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service to which the authorizations apply.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ\_SERVICE\_COMPONENT\_LENGTH.

### Error codes

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

#### *Reason* (MQLONG)

The value can be any of the following values:

##### **MQRC\_UNKNOWN\_ENTITY**

User ID not authorized, or unknown.

##### **MQRCCF\_OBJECT\_TYPE\_MISSING**

Object type missing.

## Inquire Entity Authority (Response):

Each response to the Inquire Entity Authority (MQCMD\_INQUIRE\_AUTH\_RECS) command consists of the response header followed by the *QMgrName*, *Options*, and *ObjectName* structures and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

### Always returned:

*ObjectName, Options, QMgrName*

### Returned if requested:

*AuthorizationList, EntityName, EntityType, ObjectType*

### Response data

#### *AuthorizationList* (MQCFIL)

Authorization list(parameter identifier: MQIACF\_AUTHORIZATION\_LIST).

This list can contain zero or more authorization values. Each returned authorization value means that any user ID in the specified group or principal has the authority to perform the operation defined by that value. The value can be any of the following values:

#### **MQAUTH\_NONE**

The entity has authority set to 'none'.

#### **MQAUTH\_ALT\_USER\_AUTHORITY**

Specify an alternate user ID on an MQI call.

#### **MQAUTH\_BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

#### **MQAUTH\_CHANGE**

Change the attributes of the specified object, using the appropriate command set.

#### **MQAUTH\_CLEAR**

Clear a queue.

#### **MQAUTH\_CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

#### **MQAUTH\_CREATE**

Create objects of the specified type using the appropriate command set.

#### **MQAUTH\_DELETE**

Delete the specified object using the appropriate command set.

#### **MQAUTH\_DISPLAY**

Display the attributes of the specified object using the appropriate command set.

#### **MQAUTH\_INPUT**

Retrieve a message from a queue by issuing an MQGET call.

#### **MQAUTH\_INQUIRE**

Make an inquiry on a specific queue by issuing an MQINQ call.

#### **MQAUTH\_OUTPUT**

Put a message on a specific queue by issuing an MQPUT call.

#### **MQAUTH\_PASS\_ALL\_CONTEXT**

Pass all context.

**MQAUTH\_PASS\_IDENTITY\_CONTEXT**

Pass the identity context.

**MQAUTH\_SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

**MQAUTH\_SET\_ALL\_CONTEXT**

Set all context on a queue.

**MQAUTH\_SET\_IDENTITY\_CONTEXT**

Set the identity context on a queue.

**MQAUTH\_CONTROL**

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

**MQAUTH\_CONTROL\_EXTENDED**

Reset or resolve the specified channel.

**MQAUTH\_PUBLISH**

Publish to the specified topic.

**MQAUTH\_SUBSCRIBE**

Subscribe to the specified topic.

**MQAUTH\_RESUME**

Resume a subscription to the specified topic.

**MQAUTH\_SYSTEM**

Use queue manager for internal system operations.

**MQAUTH\_ALL**

Use all operations applicable to the object.

**MQAUTH\_ALL\_ADMIN**

Use all administration operations applicable to the object.

**MQAUTH\_ALL\_MQI**

Use all MQI calls applicable to the object.

Use the *Count* field in the MQCFIL structure to determine how many values are returned.

***EntityName* (MQCFST)**

Entity name (parameter identifier: MQCACF\_ENTITY\_NAME).

This parameter can either be a principal name or a group name.

The maximum length of the string is MQ\_ENTITY\_NAME\_LENGTH.

***EntityType* (MQCFIN)**

Entity type (parameter identifier: MQIACF\_ENTITY\_TYPE).

The value can be:

**MQZAET\_GROUP**

The value of the *EntityName* parameter refers to a group name.

**MQZAET\_PRINCIPAL**

The value of the *EntityName* parameter refers to a principal name.

**MQZAET\_UNKNOWN**

On Windows, an authority record still exists from a previous queue manager which did not originally contain entity type information.

*ObjectName* (**MQCFST**)

Object name (parameter identifier: MQCACF\_OBJECT\_NAME).

The name of the queue manager, queue, process definition, or generic profile on which the inquiry is made.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

*ObjectType* (**MQCFIN**)

Object type (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be:

**MQOT\_AUTH\_INFO**

Authentication information.

**MQOT\_CHANNEL**

Channel object.

**MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

**MQOT\_COMM\_INFO**

Communication information object

**MQOT\_LISTENER**

Listener object.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process.

**MQOT\_Q**

Queue, or queues, that match the object name parameter.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

**MQOT\_SERVICE**

Service object.

*QMgrName* (**MQCFST**)

Name of the queue manager on which the Inquire command is issued (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**Inquire Group:** z/OS

The Inquire Group (MQCMD\_INQUIRE\_QSG) command inquires about the queue-sharing group to which the queue manager is connected.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Note:** This command is supported only on z/OS when the queue manager is a member of a queue-sharing group.

**Optional parameters***ObsoleteDB2Msgs* (MQCFIN)

Whether to look for obsolete Db2 messages (parameter identifier: MQIACF\_OBSOLETE\_MSGS).

The value can be any of the following values:

**MQOM\_NO**

Obsolete messages in Db2 are not looked for. MQOM\_NO is the default value used if the parameter is not specified.

**MQOM\_YES**

Obsolete messages in Db2 are looked for and messages containing information about any found are returned.

**Inquire Group (Response):** z/OS

The response to the Inquire Group (MQCMD\_INQUIRE\_QSG) command consists of the response header followed by the *QMgrName* structure and a number of other parameter structures. One such message is generated for each queue manager in the queue-sharing group.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

If there are any obsolete Db2 messages, and that information is requested, one message, identified by a value of MQCMDI\_DB2\_OBSOLETE\_MSGS in the *CommandInformation* parameter, is returned for each such message.

**Always returned for the queue manager:**

*CommandLevel, DB2ConnectStatus, DB2Name, QmgrCPF, QMgrName, QmgrNumber, QMgrStatus, QSGName*

**Always returned for obsolete Db2 messages:**

*CommandInformation, CFMsgIdentifier*

**Response data relating to the queue manager***CommandLevel* (MQCFIN)

Command level supported by the queue manager (parameter identifier: MQIA\_COMMAND\_LEVEL).

The value can be any of the following values:

**MQCMDL\_LEVEL\_520**

Level 520 of system control commands.

**MQCMDL\_LEVEL\_530**

Level 530 of system control commands.

**MQCMDL\_LEVEL\_531**

Level 531 of system control commands.

**MQCMDL\_LEVEL\_600**

Level 600 of system control commands.

**MQCMDL\_LEVEL\_700**

Level 700 of system control commands.

**MQCMDL\_LEVEL\_701**

Level 701 of system control commands.

**MQCMDL\_LEVEL\_750**

Level 750 of system control commands.

**MQCMDL\_LEVEL\_800**

Level 800 of system control commands.

**V 8.0.0.2 MQCMDL\_LEVEL\_801**

Level 801 of system control commands.

**Attention:** MQCMDL\_LEVEL\_801 applies only to UNIX platforms, when you install IBM MQ Version 8.0.0, Fix Pack 2.

**DB2ConnectStatus (MQCFIN)**

The current status of the connection to Db2 (parameter identifier: MQIACF\_DB2\_CONN\_STATUS).

The current status of the queue manager. The value can be any of the following values:

**MQQSGS\_ACTIVE**

The queue manager is running and is connected to Db2.

**MQQSGS\_INACTIVE**

The queue manager is not running and is not connected to Db2.

**MQQSGS\_FAILED**

The queue manager is running but not connected because Db2 has terminated abnormally.

**MQQSGS\_PENDING**

The queue manager is running but not connected because Db2 has terminated normally.

**MQQSGS\_UNKNOWN**

The status cannot be determined.

**DB2Name (MQCFST)**

The name of the Db2 subsystem or group to which the queue manager is to connect (parameter identifier: MQCACF\_DB2\_NAME).

The maximum length is MQ\_Q\_MGR\_CPF\_LENGTH.

**QMgrCPF (MQCFST)**

The command prefix of the queue manager (parameter identifier: MQCA\_Q\_MGR\_CPF).

The maximum length is MQ\_Q\_MGR\_CPF\_LENGTH.

**QMgrName (MQCFST)**

Name of the queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

**QmgrNumber (MQCFIN)**

The number, generated internally, of the queue manager in the group.(parameter identifier: MQIACF\_Q\_MGR\_NUMBER).

**QMgrStatus (MQCFIN)**

Recovery (parameter identifier: MQIACF\_Q\_MGR\_STATUS).

The current status of the queue manager. The value can be any of the following values:

**MQQSGS\_ACTIVE**

The queue manager is running.

**MQQSGS\_INACTIVE**

The queue manager is not running, having terminated normally.

**MQQSGS\_FAILED**

The queue manager is not running, having terminated abnormally.

**MQQSGS\_CREATED**

The queue manager has been defined to the group, but has not yet been started.

**MQQSGS\_UNKNOWN**

The status cannot be determined.

**QSGName (MQCFST)**

The name of the queue sharing group (parameter identifier: MQCA\_QSG\_NAME).

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**Response data relating to obsolete Db2 messages**

**CFMsgIdentifier (MQCFBS)**

CF list entry identifier (parameter identifier: MQBACF\_CF\_LEID).

The maximum length is MQ\_CF\_LEID\_LENGTH.

**CommandInformation (MQCFIN)**

Command information (parameter identifier: MQIACF\_COMMAND\_INFO). This indicates whether queue managers in the group contain obsolete messages. The value is MQCMDI\_DB2\_OBSOLETE\_MSGS.

**Inquire Log:** 

The Inquire Log (MQCMD\_INQUIRE\_LOG) command returns log system parameters and information.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Optional parameters**

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**Inquire Log (Response):** z/OS

The response to the Inquire Log (MQCMD\_INQUIRE\_LOG) command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of *ParameterType*.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Always returned:**

*ParameterType*. Specifies the type of archive information being returned. The value can be any of the following values:

**MQSYSP\_TYPE\_INITIAL**

The initial settings of the log parameters.

**MQSYSP\_TYPE\_SET**

The settings of the log parameters if they have been altered since their initial setting.

**MQSYSP\_TYPE\_LOG\_COPY**

Information relating to the active log copy.

**MQSYSP\_TYPE\_LOG\_STATUS**

Information relating to the status of the logs.

**Returned if *ParameterType* is MQSYSP\_TYPE\_INITIAL (one message is returned):**

*DeallocateInterval, DualArchive, DualActive, DualBSDS, InputBufferSize, LogArchive, LogCompression, MaxArchiveLog, MaxConcurrentOffloads, MaxReadTapeUnits, OutputBufferCount, OutputBufferSize*

**Returned if *ParameterType* is MQSYSP\_TYPE\_SET and any value is set (one message is returned):**

*DeallocateInterval, DualArchive, DualActive, DualBSDS, InputBufferSize, LogArchive, MaxArchiveLog, MaxConcurrentOffloads, MaxReadTapeUnits, OutputBufferCount, OutputBufferSize*

**Returned if *ParameterType* is MQSYSP\_TYPE\_LOG\_COPY (one message is returned for each log copy):** *DataSetName, LogCopyNumber, LogUsed*

**Returned if *ParameterType* is MQSYSP\_TYPE\_LOG\_STATUS (one message is returned):**

*FullLogs, LogCompression, LogRBA, LogSuspend, OffloadStatus, QMgrStartDate, QMgrStartRBA, QMgrStartTime, TotalLogs*

**Response data - log parameter information**

***DeallocateInterval* (MQCFIN)**

Deallocation interval (parameter identifier: MQIACF\_SYSP\_DEALLOC\_INTERVAL).

Specifies the length of time, in minutes, that an allocated archive read tape unit is allowed to remain unused before it is deallocated. The value can be in the range zero through 1440. If it is zero, the tape unit is deallocated immediately. If it is 1440, the tape unit is never deallocated.

***DualActive* (MQCFIN)**

Specifies whether dual logging is being used (parameter identifier: MQIACF\_SYSP\_DUAL\_ACTIVE).

The value can be any of the following values:

**MQSYSP\_YES**

Dual logging is being used.

**MQSYSP\_NO**

Dual logging is not being used.

**DualArchive (MQCFIN)**

Specifies whether dual archive logging is being used (parameter identifier: MQIACF\_SYSP\_DUAL\_ARCHIVE).

The value can be any of the following values:

**MQSYSP\_YES**

Dual archive logging is being used.

**MQSYSP\_NO**

Dual archive logging is not being used.

**DualBSDS (MQCFIN)**

Specifies whether dual BSDS is being used (parameter identifier: MQIACF\_SYSP\_DUAL\_BSDS).

The value can be any of the following values:

**MQSYSP\_YES**

Dual BSDS is being used.

**MQSYSP\_NO**

Dual BSDS is not being used.

**InputBufferSize (MQCFIN)**

Specifies the size of input buffer storage for active and archive log data sets (parameter identifier: MQIACF\_SYSP\_IN\_BUFFER\_SIZE).

**LogArchive (MQCFIN)**

Specifies whether archiving is on or off (parameter identifier: MQIACF\_SYSP\_ARCHIVE).

The value can be any of the following values:

**MQSYSP\_YES**

Archiving is on.

**MQSYSP\_NO**

Archiving is off.

**LogCompression (MQCFIN)**

Specifies which log compression parameter is used (parameter identifier: MQIACF\_LOG\_COMPRESSION).

The value can be any of the following values:

**MQCOMPRESS\_NONE**

No log compression is performed.

**MQCOMPRESS\_RLE**

Run-length encoding compression is performed.

**MQCOMPRESS\_ANY**

Enable the queue manager to select the compression algorithm that gives the greatest degree of log record compression. Using this option currently results in RLE compression.

**MaxArchiveLog (MQCFIN)**

Specifies the maximum number of archive log volumes that can be recorded in the BSDS (parameter identifier: MQIACF\_SYSP\_MAX\_ARCHIVE).

**MaxConcurrentOffloads (MQCFIN)**

Specifies the maximum number of concurrent log offload tasks (parameter identifier: MQIACF\_SYSP\_MAX\_CONC\_OFFLOADS).

*MaxReadTapeUnits* (MQCFIN)

Specifies the maximum number of dedicated tape units that can be allocated to read archive log tape volumes (parameter identifier: MQIACF\_SYSP\_MAX\_READ\_TAPES).

*OutputBufferCount* (MQCFIN)

Specifies the number of output buffers to be filled before they are written to the active log data sets (parameter identifier: MQIACF\_SYSP\_OUT\_BUFFER\_COUNT).

*OutputBufferSize* (MQCFIN)

Specifies the size of output buffer storage for active and archive log data sets (parameter identifier: MQIACF\_SYSP\_OUT\_BUFFER\_SIZE).

**Response data - to log status information**

*DataSetName* (MQCFST)

The data set name of the active log data set (parameter identifier: MQCACF\_DATA\_SET\_NAME).

If the copy is not currently active, this parameter is returned as blank.

The maximum length of the string is MQ\_DATA\_DATA\_SET\_NAME\_LENGTH.

*FullLogs* (MQCFIN)

The total number of full active log data sets that have not yet been archived (parameter identifier: MQIACF\_SYSP\_FULL\_LOGS).

*LogCompression* (MQCFIN)

Specifies the current log compression option (parameter identifier: MQIACF\_LOG\_COMPRESSION).

The value can be any of the following values:

**MQCOMPRESS\_NONE**

Log compression is not enabled.

**MQCOMPRESS\_RLE**

Run-length encoding log compression is enabled.

**MQCOMPRESS\_ANY**

Any compression algorithm supported by the queue manager is enabled.

*LogCopyNumber* (MQCFIN)

Copy number (parameter identifier: MQIACF\_SYSP\_LOG\_COPY).

*LogRBA* (MQCFST)

The RBA of the most recently written log record (parameter identifier: MQCACF\_SYSP\_LOG\_RBA).

The maximum length of the string is MQ\_RBA\_LENGTH.

*LogSuspend* (MQCFIN)

Specifies whether logging is suspended (parameter identifier: MQIACF\_SYSP\_LOG\_SUSPEND).

The value can be any of the following values:

**MQSYSP\_YES**

Logging is suspended.

**MQSYSP\_NO**

Logging is not suspended.

*LogUsed* (MQCFIN)

The percentage of the active log data set that has been used (parameter identifier: MQIACF\_SYSP\_LOG\_USED).

*OffloadStatus* (MQCFIN)

Specifies the status of the offload task (parameter identifier: MQIACF\_SYSP\_OFFLOAD\_STATUS).

The value can be any of the following values:

**MQSYSP\_STATUS\_ALLOCATING\_ARCHIVE**

The offload task is busy, allocating the archive data set.  
MQSYSP\_STATUS\_ALLOCATING\_ARCHIVE could indicate that a tape mount request is pending.

**MQSYSP\_STATUS\_COPYING\_BSDS**

The offload task is busy, copying the BSDS data set.

**MQSYSP\_STATUS\_COPYING\_LOG**

The offload task is busy, copying the active log data set.

**MQSYSP\_STATUS\_BUSY**

The offload task is busy with other processing.

**MQSYSP\_STATUS\_AVAILABLE**

The offload task is waiting for work.

**QMgrStartDate (MQCFST)**

The date on which the queue manager was started, in the form yyyy-mm-dd (parameter identifier: MQCACF\_SYSP\_Q\_MGR\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**QMgrStartRBA (MQCFST)**

The RBA from which logging began when the queue manager was started (parameter identifier: MQCACF\_SYSP\_Q\_MGR\_RBA).

The maximum length of the string is MQ\_RBA\_LENGTH.

**QMgrStartTime (MQCFST)**

The time that the queue manager was started, in the form hh.mm.ss (parameter identifier: MQCACF\_SYSP\_Q\_MGR\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**TotalLogs (MQCFIN)**

The total number of active log data sets (parameter identifier: MQIACF\_SYSP\_TOTAL\_LOGS).

**Inquire Namelist:**

The Inquire Namelist (MQCMD\_INQUIRE\_NAMELIST) command inquires about the attributes of existing IBM MQ namelists.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

**Required parameters:**

*NamelistName*

**Optional parameters:**

▶ **z/OS** *CommandScope*, *IntegerFilterCommand*, *NamelistAttrs*, ▶ **z/OS** *QSGDisposition*, *StringFilterCommand*

**Required parameters****NamelistName (MQCFST)**

Namelist name (parameter identifier: MQCA\_NAMELIST\_NAME).

This parameter is the name of the namelist with attributes that are required. Generic namelist names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all namelists having names that start with the selected character string. An asterisk on its own matches all possible names.

The namelist name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

### Optional parameters

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

#### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *NamelistAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter for *NamelistType* (MQIA\_NAMELIST\_TYPE), you cannot also specify the *NamelistType* parameter.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

#### *NamelistAttrs* (MQCFIL)

Namelist attributes (parameter identifier: MQIACF\_NAMELIST\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

**MQIACF\_ALL**  
All attributes.

or a combination of the following:

**MQCA\_NAMELIST\_NAME**  
Name of namelist object.

**MQCA\_NAMELIST\_DESC**  
Namelist description.

**MQCA\_NAMES**  
Names in the namelist.

**MQCA\_ALTERATION\_DATE**

The date on which the information was last altered.

**MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

**MQIA\_NAME\_COUNT**

Number of names in the namelist.

**MQIA\_NAMELIST\_TYPE**

Namelist type (valid only on z/OS )

***NamelistType (MQCFIN)***

Namelist attributes (parameter identifier: MQIA\_NAMELIST\_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

**MQNT\_NONE**

The names are of no particular type.

**MQNT\_Q**

A namelist that holds a list of queue names.

**MQNT\_CLUSTER**

A namelist that is associated with clustering, containing a list of the cluster names.

**MQNT\_AUTH\_INFO**

The namelist is associated with SSL, and contains a list of authentication information object names.

**z/OS*****QSGDisposition (MQCFIN)***

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

**MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

## MQQSGD\_PRIVATE

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

### *StringFilterCommand* (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *NamelistAttrs* except MQCA\_NAMELIST\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

### Inquire Namelist (Response):

The response to the Inquire Namelist (MQCMD\_INQUIRE\_NAMELIST) command consists of the response header followed by the *NamelistName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

If a generic namelist name was specified, one such message is generated for each namelist found.

#### Always returned:

*NamelistName*,  *QSGDisposition*

#### Returned if requested:

*AlterationDate*, *AlterationTime*, *NameCount*, *NamelistDesc*,  *NamelistType*, *Names*

#### Response data

##### *AlterationDate* (MQCFST)

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

##### *AlterationTime* (MQCFST)

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

##### *NameCount* (MQCFIN)

Number of names in the namelist (parameter identifier: MQIA\_NAME\_COUNT).

The number of names contained in the namelist.

##### *NamelistDesc* (MQCFST)

Description of namelist definition (parameter identifier: MQCA\_NAMELIST\_DESC).

The maximum length of the string is MQ\_NAMELIST\_DESC\_LENGTH.

##### *NamelistName* (MQCFST)

The name of the namelist definition (parameter identifier: MQCA\_NAMELIST\_NAME).

The maximum length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

 z/OS

### *NamelistType* (MQCFIN)

Type of names in the namelist (parameter identifier: MQIA\_NAMELIST\_TYPE). This parameter applies to z/OS only.

Specifies the type of names in the namelist. The value can be any of the following values:

#### **MQNT\_NONE**

The names are of no particular type.

#### **MQNT\_Q**

A namelist that holds a list of queue names.

#### **MQNT\_CLUSTER**

A namelist that is associated with clustering, containing a list of the cluster names.

#### **MQNT\_AUTH\_INFO**

The namelist is associated with SSL, and contains a list of authentication information object names.

### *Names* (MQCFSL)

A list of the names contained in the namelist (parameter identifier: MQCA\_NAMES).

The number of names in the list is given by the *Count* field in the MQCFSL structure. The length of each name is given by the *StringLength* field in that structure. The maximum length of a name is MQ\_OBJECT\_NAME\_LENGTH.

### z/OS

### *QSGDisposition* (MQCFIN)

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter applies only to z/OS. The value can be any of the following values:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

### **Inquire Namelist Names:**

The Inquire Namelist Names (MQCMD\_INQUIRE\_NAMELIST\_NAMES) command inquires for a list of namelist names that match the generic namelist name specified.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### **Required parameters**

### *NamelistName* (MQCFST)

Name of namelist (parameter identifier: MQCA\_NAMELIST\_NAME).

Generic namelist names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

### Inquire Namelist Names (Response):

The response to the Inquire Namelist Names (MQCMD\_INQUIRE\_NAMELIST\_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified namelist name.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

#### ▶ z/OS

Additionally, on z/OS only, the *QSGDispositions* structure (with the same number of entries as the *NamelistNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *NamelistNames* structure.

#### Always returned:

*NamelistNames*, ▶ z/OS *QSGDispositions*

#### Returned if requested:

None

#### Response data

##### *NamelistNames* (MQCFSL)

List of namelist names (parameter identifier: MQCACF\_NAMELIST\_NAMES).

#### ▶ z/OS

##### *QSGDispositions* (MQCFIL)

List of QSG dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter is valid only on z/OS. Possible values for fields in this structure are:

##### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

##### MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

##### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

## Inquire Policy:

The Inquire Policy (MQCMD\_INQUIRE\_PROT\_POLICY) command inquires about the policy, or policies, set on a queue.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

## Required parameters

### *generic-policy-name* (MQCFST)

Policy name (parameter identifier: MQCA\_POLICY\_NAME).

This parameter is the name of the policy with attributes that are required. Generic policy names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all policies having names that start with the selected character string. An asterisk on its own matches all possible names.

The policy name is always returned regardless of the attributes requested.

The name of the policy, or policies (or part of the policy name or names) to inquire are the same as the name of the queue, or queues, that the policies control.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

## Optional parameters

### *PolicyAttrs* (MQCFIL)

Policy attributes (parameter identifier: MQIACF\_POLICY\_ATTRS).

The attribute list might specify the following value on its own- default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCA\_POLICY\_NAME**

Name of the policy.

#### **MQIA\_SIGNATURE\_ALGORITHM**

The digital signature algorithm.

#### **MQIA\_ENCRYPTION\_ALGORITHM**

The encryption algorithm.

#### **MQCA\_SIGNER\_DN**

The distinguished name of an authorized signer, or signers.

#### **MQCA\_RECIPIENT\_DN**

The distinguished name of an intended recipient, or recipients.

#### **MQIA\_TOLERATE\_UNPROTECTED**

Whether the policy is enforced or unprotected messages tolerated.

#### **MQIACF\_ACTION**

The action taken on the command with regards to signer and recipient parameters.

## Inquire Policy (Response):

The response to the Inquire Policy (MQCMD\_INQUIRE\_PROT\_POLICY) command consists of the response header followed by the *PolicyName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

If a generic security policy name was specified, one such message is generated for each policy found.

### Always returned:

*PolicyName*

The name of the policy, or policies (or part of the policy name or names) to inquire are the same as the name of the queue, or queues, that the policies control.

### Returned if requested:

*Action, EncAlg, Enforce and Tolerate, Recipient, SignAlg, Signer*

### Response data

#### *Action* (MQCFIL)

Action (parameter identifier: MQIACF\_ACTION).

The action taken on the command with regards to signer and recipient parameters.

#### *EncAlg* (MQCFIL)

Encryption algorithm (parameter identifier: MQIA\_ENCRYPTION\_ALGORITHM).

The encryption algorithm specified.

#### *Enforce and Tolerate* (MQCFST)

Indicates whether the security policy should be enforced or whether unprotected messages are tolerated (parameter identifier: MQIA\_TOLERATE\_UNPROTECTED).

#### *Recipient* (MQCFIL)

Specifies the distinguished name of the intended recipient (parameter identifier: MQCA\_RECIPIENT\_DN)

This parameter can be specified multiple times.

The maximum length of the string is MQ\_DISTINGUISHED\_NAME\_LENGTH.

#### *SignAlg* (MQCFIL)

Specifies the digital signature algorithm (parameter identifier: MQIA\_SIGNATURE\_ALGORITHM).

#### *Signer* (MQCFST)

Specifies the distinguished name of an authorized signer (parameter identifier: MQCA\_SIGNER\_DN)

This parameter can be specified multiple times.

The maximum length of the string is MQ\_DISTINGUISHED\_NAME\_LENGTH.

## Inquire Process:

The Inquire Process (MQCMD\_INQUIRE\_PROCESS) command inquires about the attributes of existing IBM MQ processes.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

## Required parameters

### *ProcessName* (MQCFST)

Process name (parameter identifier: MQCA\_PROCESS\_NAME).

Generic process names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all processes having names that start with the selected character string. An asterisk on its own matches all possible names.

The process name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

## Optional parameters z/OS

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ProcessAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFIF - PCF integer filter parameter" on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

### *ProcessAttrs* (MQCFIL)

Process attributes (parameter identifier: MQIACF\_PROCESS\_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQCA\_ALTERATION\_DATE**

The date at which the information was last altered.

**MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

**MQCA\_APPL\_ID**

Application identifier.

**MQCA\_ENV\_DATA**

Environment data.

**MQCA\_PROCESS\_DESC**

Description of process definition.

**MQCA\_PROCESS\_NAME**

Name of process definition.

**MQCA\_USER\_DATA**

User data.

**MQIA\_APPL\_TYPE**

Application type.

z/OS

*QSGDisposition* (**MQCFIN**)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

**MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

### *StringFilterCommand* (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ProcessAttrs* except MQCA\_PROCESS\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

### Inquire Process (Response):

The response to the Inquire Process (MQCMD\_INQUIRE\_PROCESS) command consists of the response header followed by the *ProcessName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux systems	Windows	z/OS
✓	✓	✓	✓	✓

If a generic process name was specified, one such message is generated for each process found.

#### Always returned:

*ProcessName*,  *QSGDisposition*

#### Returned if requested:

*AlterationDate*, *AlterationTime*, *ApplId*, *ApplType*, *EnvData*, *ProcessDesc*, *UserData*

#### Response data

##### *AlterationDate* (MQCFST)

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

##### *AlterationTime* (MQCFST)

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

##### *ApplId* (MQCFST)

Application identifier (parameter identifier: MQCA\_APPL\_ID).

The maximum length of the string is MQ\_PROCESS\_APPL\_ID\_LENGTH.

##### *ApplType* (MQCFIN)

Application type (parameter identifier: MQIA\_APPL\_TYPE).

The value can be:

##### MQAT\_AIX

AIX application (same value as MQAT\_UNIX)

##### MQAT\_CICS

CICS transaction

##### MQAT\_DOS

DOS client application

##### MQAT\_MVS

z/OS application

**MQAT\_OS400**

IBM i application

**MQAT\_QMGR**

Queue manager

**MQAT\_UNIX**

UNIX application

**MQAT\_WINDOWS**

16-bit Windows application

**MQAT\_WINDOWS\_NT**

32-bit Windows application

*integer*

System-defined application type in the range zero through 65 535 or a user-defined application type in the range 65 536 through 999 999 999

**EnvData (MQCFST)**

Environment data (parameter identifier: MQCA\_ENV\_DATA).

The maximum length of the string is MQ\_PROCESS\_ENV\_DATA\_LENGTH.

**ProcessDesc (MQCFST)**

Description of process definition (parameter identifier: MQCA\_PROCESS\_DESC).

The maximum length of the string is MQ\_PROCESS\_DESC\_LENGTH.

**ProcessName (MQCFST)**

The name of the process definition (parameter identifier: MQCA\_PROCESS\_NAME).

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

 z/OS

**QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**UserData (MQCFST)**

User data (parameter identifier: MQCA\_USER\_DATA).

The maximum length of the string is MQ\_PROCESS\_USER\_DATA\_LENGTH.

## Inquire Process Names:

The Inquire Process Names (MQCMD\_INQUIRE\_PROCESS\_NAMES) command inquires for a list of process names that match the generic process name specified.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

## Required parameters

### *ProcessName* (MQCFST)

Name of process-definition for queue (parameter identifier: MQCA\_PROCESS\_NAME).

Generic process names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

### ▶ z/OS

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

**Inquire Process Names (Response):**

The response to the Inquire Process Names (MQCMD\_INQUIRE\_PROCESS\_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified process name.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

Additionally, on z/OS only, a parameter structure, *QSGDispositions* (with the same number of entries as the *ProcessNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *ProcessNames* structure.

This response is not supported on Windows.

**Always returned:**

*ProcessNames, QSGDispositions*

**Returned if requested:**

None

**Response data*****ProcessNames* (MQCFSL)**

List of process names (parameter identifier: MQCACF\_PROCESS\_NAMES).

***QSGDispositions* (MQCFIL)**

List of QSG dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter applies only to z/OS. Possible values for fields in this structure are:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

## Inquire Pub/Sub Status:

The Inquire Pub/Sub Status (MQCMD\_INQUIRE\_PUBSUB\_STATUS) command inquires about the status of publish/subscribe connections.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

## Optional parameters

### ▶ z/OS *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

#### **blank (or omit the parameter altogether)**

The command is executed on the queue manager on which it was entered.

#### **a queue manager name**

The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

#### **an asterisk (\*)**

The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use CommandScope as a parameter to filter on.

### *PubSubStatusAttrs* (MQCFIL)

Publish/subscribe status attributes (parameter identifier: MQIACF\_PUBSUB\_STATUS\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQIA\_SUB\_COUNT**

The total number of subscriptions against the local tree.

#### **MQIA\_TOPIC\_NODE\_COUNT**

The total number of topic nodes in the local tree.

#### **MQIACF\_PUBSUB\_STATUS**

Hierarchy status.

#### **MQIACF\_PS\_STATUS\_TYPE**

Hierarchy type.

### *Type* (MQCFIN)

Type (parameter identifier: MQIACF\_PS\_STATUS\_TYPE).

The type can specify one of the following:

**MQPSST\_ALL**

Return status of both parent and child connections. MQPSST\_ALL is the default value if the parameter is not specified.

**MQPSST\_LOCAL**

Return local status information.

**MQPSST\_PARENT**

Return status of the parent connection.

**MQPSST\_CHILD**

Return status of the child connections.

**Inquire Pub/Sub Status (Response):**

The response to the Inquire publish/subscribe Status (MQCMD\_INQUIRE\_PUBSUB\_STATUS) command consists of the response header followed by the attribute structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	2CR

A group of parameters is returned containing the following attributes: *Type*, *QueueManagerName*, *Status*, *SubCount*, and *TopicNodeCount*.

**Always returned:**

*QueueManagerName*, *Status*, *Type*, *SubCount*, and *TopicNodeCount*.

**Returned if requested:**

*None*

**Response data**

*QueueManagerName* (MQCFST)

Either the name of the local queue manager when TYPE is LOCAL, or the name of the hierarchically connected queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

*Type* (MQCFIN)

Type of status that is being returned (parameter identifier: MQIACF\_PS\_STATUS\_TYPE).

The value can be:

**MQPSST\_CHILD**

Publish/subscribe status for a child hierarchical connection.

**MQPSST\_LOCAL**

Publish/subscribe status for the local queue manager.

**MQPSST\_PARENT**

Publish/subscribe status for the parent hierarchical connection.

*Status* (MQCFIN)

The status of the publish/subscribe engine or the hierarchical connection (parameter identifier: MQIACF\_PUBSUB\_STATUS).

When TYPE is LOCAL the following values can be returned:

**MQPS\_STATUS\_ACTIVE**

The publish/subscribe engine and the queued publish/subscribe interface are running. It is

therefore possible to publish or subscribe using the application programming interface and the queues that are monitored by the queued publish/subscribe interface appropriately.

#### **MQPS\_STATUS\_COMPAT**

The publish/subscribe engine is running. It is therefore possible to publish or subscribe using the application programming interface. The queued publish/subscribe interface is not running. Therefore, any message that is put to the queues monitored by the queued publish/subscribe interface is not acted upon by IBM MQ.

#### **MQPS\_STATUS\_ERROR**

The publish/subscribe engine has failed. Check your error logs to determine the reason for the failure.

#### **MQPS\_STATUS\_INACTIVE**

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface is not acted upon by IBM MQ.

If inactive and you want to start the publish/subscribe engine, on the Change Queue Manager command set PubSubMode to **MQPSM\_ENABLED**.

#### **MQPS\_STATUS\_STARTING**

The publish/subscribe engine is initializing and is not yet operational.

#### **MQPS\_STATUS\_STOPPING**

The publish/subscribe engine is stopping.

When TYPE is PARENT, the following values can be returned:

#### **MQPS\_STATUS\_ACTIVE**

The connection with the parent queue manager is active.

#### **MQPS\_STATUS\_ERROR**

This queue manager is unable to initialize a connection with the parent queue manager because of a configuration error.

A message is produced in the queue manager logs to indicate the specific error. If you receive error message AMQ5821 or on z/OS systems CSQT821E, possible causes include:

- Transmit queue is full
- Transmit queue put disabled

If you receive error message AMQ5814 or on z/OS systems CSQT814E, take the following actions:

- Check that the parent queue manager is correctly specified.
- Ensure that broker is able to resolve the queue manager name of the parent broker.

To resolve the queue manager name, at least one of the following resources must be configured:

- A transmission queue with the same name as the parent queue manager name.
- A queue manager alias definition with the same name as the parent queue manager name.
- A cluster with the parent queue manager a member of the same cluster as this queue manager.
- A cluster queue manager alias definition with the same name as the parent queue manager name.
- A default transmission queue.

After you have set up the configuration correctly, modify the parent queue manager name to blank. Then set with the parent queue manager name.

### **MQPS\_STATUS\_REFUSED**

The connection has been refused by the parent queue manager.

This situation might be caused by the parent queue manager already having another child queue manager of the same name as this queue manager.

Alternatively, the parent queue manager has used the RESET QMGR TYPE(PUBSUB) CHILD command to remove this queue manager as one of its children.

### **MQPS\_STATUS\_STARTING**

The queue manager is attempting to request that another queue manager is its parent.

If the parent status remains in starting status without progressing to active status, take the following actions:

- Check that the sender channel to parent queue manager is running
- Check that the receiver channel from parent queue manager is running

### **MQPS\_STATUS\_STOPPING**

The queue manager is disconnecting from its parent.

If the parent status remains in stopping status, take the following actions:

- Check that the sender channel to parent queue manager is running
- Check that the receiver channel from parent queue manager is running

When TYPE is CHILD, the following values can be returned:

### **MQPS\_STATUS\_ACTIVE**

The connection with the parent queue manager is active.

### **MQPS\_STATUS\_ERROR**

This queue manager is unable to initialize a connection with the parent queue manager because of a configuration error.

A message is produced in the queue manager logs to indicate the specific error. If you receive error message AMQ5821 or on z/OS systems CSQT821E, possible causes include:

- Transmit queue is full
- Transmit queue put disabled

If you receive error message AMQ5814 or on z/OS systems CSQT814E, take the following actions:

- Check that the child queue manager is correctly specified.
- Ensure that broker is able to resolve the queue manager name of the child broker.

To resolve the queue manager name, at least one of the following resources must be configured:

- A transmission queue with the same name as the child queue manager name.
- A queue manager alias definition with the same name as the child queue manager name.
- A cluster with the child queue manager a member of the same cluster as this queue manager.
- A cluster queue manager alias definition with the same name as the child queue manager name.
- A default transmission queue.

After you have set up the configuration correctly, modify the child queue manager name to blank. Then set with the child queue manager name.

### **MQPS\_STATUS\_STARTING**

The queue manager is attempting to request that another queue manager is its parent.

If the child status remains in starting status without progressing to active status, take the following actions:

- Check that the sender channel to child queue manager is running
- Check that the receiver channel from child queue manager is running

### **MQPS\_STATUS\_STOPPING**

The queue manager is disconnecting from its parent.

If the child status remains in stopping status, take the following actions:

- Check that the sender channel to child queue manager is running
- Check that the receiver channel from child queue manager is running

### **SubCount (MQCFIN)**

When *Type* is MQPSST\_LOCAL, the total number of subscriptions against the local tree is returned. When *Type* is MQPSST\_CHILD or MQPSST\_PARENT, queue manager relations are not inquired and the value MQPSCT\_NONE is returned. (parameter identifier: MQIA\_SUB\_COUNT).

### **TopicNodeCount (MQCFIN)**

When *Type* is MQPSST\_LOCAL, the total number of topic nodes in the local tree is returned. When *Type* is MQPSST\_CHILD or MQPSST\_PARENT, queue manager relations are not inquired and the value MQPSCT\_NONE is returned. (parameter identifier: MQIA\_TOPIC\_NODE\_COUNT).

### **Inquire Queue:**

Use the Inquire Queue command MQCMD\_INQUIRE\_Q to query the attributes of IBM MQ queues.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### **Required parameters**

#### **QName (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk \* ; for example ABC\*. It selects all queues having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **Optional parameters** z/OS

#### **CFStructure (MQCFST)**

CF structure (parameter identifier: MQCA\_CF\_STRUC\_NAME). Specifies the name of the CF structure. This parameter is valid only on z/OS.

This parameter specifies that eligible queues are limited to those having the specified *CFStructure* value. If this parameter is not specified, then all queues are eligible.

Generic CF structure names are supported. A generic name is a character string followed by an asterisk \* ; for example ABC\*. It selects all CF structures having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

#### **ClusterInfo (MQCFIN)**

Cluster information (parameter identifier: MQIACF\_CLUSTER\_INFO).

This parameter requests that cluster information about these queues and other queues in the repository that match the selection criteria is displayed. The cluster information is displayed in addition to information about attributes of queues defined on this queue manager.

In this case, there might be multiple queues with the same name displayed. The cluster information is shown with a queue type of MQQT\_CLUSTER.

You can set this parameter to any integer value, the value used does not affect the response to the command.

The cluster information is obtained locally from the queue manager.

#### ***ClusterName* (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

This parameter specifies that eligible queues are limited to those having the specified *ClusterName* value. If this parameter is not specified, then all queues are eligible.

Generic cluster names are supported. A generic name is a character string followed by an asterisk \* ; for example ABC\*. It selects all clusters having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

#### ***ClusterNameList* (MQCFST)**

Cluster namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

This parameter specifies that eligible queues are limited to those having the specified *ClusterNameList* value. If this parameter is not specified, then all queues are eligible.

Generic cluster namelists are supported. A generic name is a character string followed by an asterisk \* ; for example ABC\*. It selects all cluster namelists having names that start with the selected character string. An asterisk on its own matches all possible names.

### **z/OS**

#### ***CommandScope* (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment. The command server must be enabled.
- An asterisk "\*". The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

#### ***IntegerFilterCommand* (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *QAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFIF - PCF integer filter parameter" on page 1588 for information about using this filter condition.

If you specify an integer filter for *Qtype* or *PageSetID*, you cannot also specify the *Qtype* or *PageSetID* parameter.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

z/OS

**PageSetID (MQCFIN)**

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID). This parameter applies to z/OS only.

This parameter specifies that eligible queues are limited to those having the specified *PageSetID* value. If this parameter is not specified, then all queues are eligible.

**QAttr (MQCFIL)**

Queue attributes (parameter identifier: MQIACF\_Q\_ATTRS).

The attribute list might specify the following value on its own. If the parameter is not specified, this value is the default:

**MQIACF\_ALL**

All attributes.

You can also specify a combination of the parameters in the following table:

Table 124. Inquire Queue command, queue attributes

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQCA_ALTERATION_DATE The date on which the information was last altered	✓	✓	✓	✓	✓
MQCA_ALTERATION_TIME The time at which the information was last altered	✓	✓	✓	✓	✓
MQCA_BACKOUT_REQ_Q_NAME Excessive backout requeue name	✓	✓			
MQCA_BASE_NAME Name of queue that alias resolves to			✓		
MQCA_CF_STRUC_NAME Coupling facility structure name. This attribute is valid on z/OS only	✓	✓			
MQCA_CLUS_CHL_NAME The generic name of the cluster-sender channels that use this queue as a transmission queue.	✓	✓			
MQCA_CLUSTER_DATE Date when the definition became available to the local queue manager					✓
MQCA_CLUSTER_NAME Cluster name	✓		✓	✓	✓
MQCA_CLUSTER_NAMELIST Cluster namelist	✓		✓	✓	

Table 124. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQCA_CLUSTER_Q_MGR_NAME Queue manager name that hosts the queue					✓
MQCA_CLUSTER_TIME Time when the definition became available to the local queue manager					✓
MQCA_CREATION_DATE Queue creation date	✓	✓			
MQCA_CREATION_TIME Queue creation time	✓	✓			
MQCA_CUSTOM The custom attribute for new features	✓	✓	✓	✓	✓
MQCA_INITIATION_Q_NAME Initiation queue name	✓	✓			
MQCA_PROCESS_NAME Name of process definition	✓	✓			
MQCA_Q_DESC Queue description	✓	✓	✓	✓	✓
MQCA_Q_MGR_IDENTIFIER Internally generated queue manager name					✓
MQCA_Q_NAME Queue name	✓	✓	✓	✓	✓
MQCA_REMOTE_Q_MGR_NAME Name of remote queue manager				✓	
MQCA_REMOTE_Q_NAME Name of remote queue as known locally on the remote queue manager				✓	
 MQCA_STORAGE_CLASS Storage class. MQCA_STORAGE_CLASS is valid on z/OS only	✓	✓			
MQCA_TPIPE_NAME The <b>TPIPE</b> name used for communication with OTMA using the IBM MQ IMS bridge	✓				
MQCA_TRIGGER_DATA Trigger data	✓	✓			

Table 124. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQCA_XMIT_Q_NAME Transmission queue name				✓	
MQIA_ACCOUNTING_Q Accounting data collection	✓	✓			
MQIA_BACKOUT_THRESHOLD Backout threshold	✓	✓			
MQIA_BASE_TYPE Type of object	✓	✓	✓	✓	✓
MQIA_CLUSTER_Q_TYPE Cluster queue type					✓
MQIA_CLWL_Q_PRIORITY Cluster workload queue priority	✓		✓	✓	✓
MQIA_CLWL_Q_RANK Cluster workload queue rank	✓		✓	✓	✓
MQIA_CLWL_USEQ Cluster workload use remote setting	✓				
MQIA_CURRENT_Q_DEPTH Number of messages on queue	✓				
MQIA_DEF_BIND Default binding	✓		✓	✓	✓
MQIA_DEF_INPUT_OPEN_OPTION Default open-for-input option	✓	✓			
MQIA_DEF_PERSISTENCE Default message persistence	✓	✓	✓	✓	✓
MQIA_DEF_PRIORITY Default message priority	✓	✓	✓	✓	✓
MQIA_DEF_PUT_RESPONSE_TYPE Default put response type	✓	✓	✓	✓	✓
MQIA_DEF_READ_AHEAD Default put response type	✓	✓	✓	✓	✓
MQIA_DEFINITION_TYPE Queue definition type	✓	✓			
MQIA_DIST_LISTS Distribution list support. MQIA_DIST_LISTS is not valid on z/OS	✓	✓			

Table 124. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_HARDEN_GET_BACKOUT Whether to harden backout count	✓	✓			
MQIA_INDEX_TYPE Index type. This attribute is valid on z/OS only.	✓	✓			
MQIA_INHIBIT_GET Whether get operations are allowed	✓	✓	✓		
MQIA_INHIBIT_PUT Whether put operations are allowed	✓	✓	✓	✓	✓
MQIA_MAX_MSG_LENGTH Maximum message length	✓	✓			
MQIA_MAX_Q_DEPTH Maximum number of messages allowed on queue	✓	✓			
MQIA_MONITORING_Q Online monitoring data collection	✓	✓			
MQIA_MSG_DELIVERY_SEQUENCE Whether message priority is relevant	✓	✓			
MQIA_NPM_CLASS Level of reliability assigned to non-persistent messages that are put to the queue	✓	✓			
MQIA_OPEN_INPUT_COUNT Number of MQOPEN calls that have the queue open for input	✓				
MQIA_OPEN_OUTPUT_COUNT Number of MQOPEN calls that have the queue open for output	✓				
 MQIA_PAGESET_ID Page set identifier	✓				
MQIA_PROPERTY_CONTROL Property control attribute	✓	✓	✓		
MQIA_Q_DEPTH_HIGH_EVENT Control attribute for queue depth high events.  You cannot use MQIA_Q_DEPTH_HIGH_EVENT as a filter attribute.	✓	✓			

Table 124. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_Q_DEPTH_HIGH_LIMIT High limit for queue depth	✓	✓			
MQIA_Q_DEPTH_LOW_EVENT Control attribute for queue depth low events. You cannot use MQIA_Q_DEPTH_LOW_EVENT as a filter attribute.	✓	✓			
MQIA_Q_DEPTH_LOW_LIMIT Low limit for queue depth	✓	✓			
MQIA_Q_DEPTH_MAX_EVENT Control attribute for queue depth max events	✓	✓			
MQIA_Q_SERVICE_INTERVAL Limit for queue service interval	✓	✓			
MQIA_Q_SERVICE_INTERVAL_EVENT Control attribute for queue service interval events	✓	✓			
MQIA_Q_TYPE Queue type	✓	✓	✓	✓	✓
MQIA_RETENTION_INTERVAL Queue retention interval	✓	✓			
MQIA_SCOPE Queue definition scope. MQIA_SCOPE is not valid on z/OS or IBM i	✓		✓	✓	
MQIA_SHAREABILITY Whether queue can be shared	✓	✓			
MQIA_STATISTICS_Q Statistics data collection. MQIA_STATISTICS_Q is valid only on AIX, HP-UX, Linux, IBM i, Solaris, and Windows.	✓	✓			
MQIA_TRIGGER_CONTROL Trigger control	✓	✓			
MQIA_TRIGGER_DEPTH Trigger depth	✓	✓			
MQIA_TRIGGER_MSG_PRIORITY Threshold message priority for triggers	✓	✓			

Table 124. Inquire Queue command, queue attributes (continued)

	Local queue	Model queue	Alias queue	Remote queue	Cluster queue
MQIA_TRIGGER_MTYPE Trigger type	✓	✓			
MQIA_USAGE Usage	✓	✓			

**z/OS** *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP ). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned. The meaning of “the disposition of an object” is where the object is defined and how it behaves. The value can be any of the following values:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. In a shared queue manager environment, if the command is run on the queue manager where it was issued, MQQSGD\_LIVE also returns information for objects defined with MQQSGD\_SHARED. MQQSGD\_LIVE is the default value if the parameter is not specified.

**MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

In a shared queue manager environment, if the command is run on the queue manager where it was issued, MQQSGD\_ALL also displays information for objects defined with MQQSGD\_GROUP or MQQSGD\_SHARED.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names, with different dispositions.

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED. MQQSGD\_SHARED is permitted only in a shared queue environment.

You cannot use *QSGDisposition* as a parameter to filter on.

**QType** (MQCFIN)

Queue type (parameter identifier: MQIA\_Q\_TYPE).

If this parameter is present, eligible queues are limited to the specified type. Any attribute selector specified in the *QAttrs* list which is valid only for queues of a different type or types is ignored; no error is raised.

If this parameter is not present, or if `MQQT_ALL` is specified, queues of all types are eligible. Each attribute specified must be a valid queue attribute selector. The attribute can apply to some of the queues returned. It does not have to apply to all the queues. Queue attribute selectors that are valid but not applicable to the queue are ignored, no error messages occur and no attribute is returned. The following lists contains the value of all valid queue attribute selectors:

**MQQT\_ALL**

All queue types.

**MQQT\_LOCAL**

Local queue.

**MQQT\_ALIAS**

Alias queue definition.

**MQQT\_REMOTE**

Local definition of a remote queue.

**MQQT\_CLUSTER**

Cluster queue.

**MQQT\_MODEL**

Model queue definition.

**Note:** On platforms other than z/OS, if this parameter is present, it must occur immediately after the *QName* parameter.

▶ **z/OS** *StorageClass* (**MQCFST**)

Storage class (parameter identifier: `MQCA_STORAGE_CLASS`). Specifies the name of the storage class. This parameter is valid only on z/OS.

This parameter specifies that eligible queues are limited to those having the specified *StorageClass* value. If this parameter is not specified, then all queues are eligible.

Generic names are supported. A generic name is a character string followed by an asterisk \* ; for example `ABC*`. It selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is `MQ_STORAGE_CLASS_LENGTH`.

*StringFilterCommand* (**MQCFSF**)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *QAttrs* except `MQCA_Q_NAME`. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter for *ClusterName*, *ClusterNameList*, *StorageClass*, or *CFStructure*, you cannot also specify that as a parameter.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

**Error codes**

This command might return the following error code in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

*Reason* (**MQLONG**)

The value can be any of the following values:

**MQRCCF\_Q\_TYPE\_ERROR**

Queue type not valid.

## Inquire Queue (Response):

The response to the Inquire Queue command MQCMD\_INQUIRE\_Q consists of the response header followed by the *QName* structure. On z/OS only, response includes the *QSGDisposition* structure, and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

If a generic queue name was specified, or cluster queues requested, by setting either MQQT\_CLUSTER or MQIACF\_CLUSTER\_INFO, one message is generated for each queue found.

### Always returned:

*QName, QSGDisposition, QType*

### Returned if requested:

*AlterationDate, AlterationTime, BackoutRequeueName, BackoutThreshold, BaseQName, CFStructure, ClusterChannelName, ClusterDate, ClusterName, ClusterNameList, ClusterQType, ClusterTime, CLWLQueuePriority, CLWLQueueRank, CLWLUseQ, CreationDate, CreationTime, CurrentQDepth, Custom, DefaultPutResponse, DefBind, DefinitionType, DefInputOpenOption, DefPersistence, DefPriority, DefReadAhead, DistLists, HardenGetBackout, IndexType, InhibitGet, InhibitPut, InitiationQName, MaxMsgLength, MaxQDepth, MsgDeliverySequence, NonPersistentMessageClass, OpenInputCount, OpenOutputCount, PageSetID, ProcessName, PropertyControl, QDepthHighEvent, QDepthHighLimit, QDepthLowEvent, QDepthLowLimit, QDepthMaxEvent, QDesc, QMgrIdentifier, QMgrName, QServiceInterval, QServiceIntervalEvent, QueueAccounting, QueueMonitoring, QueueStatistics, RemoteQMgrName, RemoteQName, RetentionInterval, Scope, Shareability, StorageClass, TpipeNames, TriggerControl, TriggerData, TriggerDepth, TriggerMsgPriority, TriggerType, Usage, XmitQName*

### Response data

#### *AlterationDate* (MQCFST)

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

#### *AlterationTime* (MQCFST)

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

#### *BackoutRequeueName* (MQCFST)

Excessive backout requeue name (parameter identifier: MQCA\_BACKOUT\_REQ\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### *BackoutThreshold* (MQCFIN)

Backout threshold (parameter identifier: MQIA\_BACKOUT\_THRESHOLD).

#### *BaseQName* (MQCFST)

Queue name to which the alias resolves (parameter identifier: MQCA\_BASE\_Q\_NAME).

The name of a queue that is defined to the local queue manager.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### *CFStructure* (MQCFST)

Coupling facility structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME). This parameter applies to z/OS only.

Specifies the name of the coupling facility structure where you want to store messages when you use shared queues.

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

**ClusterChannelName (MQCFST)**

Cluster-sender channel name (parameter identifier: MQCA\_CLUS\_CHL\_NAME).

ClusterChannelName is the generic name of the cluster-sender channels that use this queue as a transmission queue.

The maximum length of the channel name is: MQ\_CHANNEL\_NAME\_LENGTH.

**ClusterDate (MQCFST)**

Cluster date (parameter identifier: MQCA\_CLUSTER\_DATE).

The date on which the information became available to the local queue manager, in the form yyyy-mm-dd.

**ClusterName (MQCFST)**

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

**ClusterNameList (MQCFST)**

Cluster namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

**ClusterQType (MQCFIN)**

Cluster queue type (parameter identifier: MQIA\_CLUSTER\_Q\_TYPE).

The value can be:

**MQCQT\_LOCAL\_Q**

The cluster queue represents a local queue.

**MQCQT\_ALIAS\_Q**

The cluster queue represents an alias queue.

**MQCQT\_REMOTE\_Q**

The cluster queue represents a remote queue.

**MQCQT\_Q\_MGR\_ALIAS**

The cluster queue represents a queue manager alias.

**ClusterTime (MQCFST)**

Cluster time (parameter identifier: MQCA\_CLUSTER\_TIME).

The time at which the information became available to the local queue manager, in the form hh.mm.ss.

**CLWLQueuePriority (MQCFIN)**

Cluster workload queue priority (parameter identifier: MQIA\_CLWL\_Q\_PRIORITY).

Priority of the queue in cluster workload management. The value is in the range zero through 9, where zero is the lowest priority and 9 is the highest.

**CLWLQueueRank (MQCFIN)**

Cluster workload queue rank (parameter identifier: MQIA\_CLWL\_Q\_RANK).

Rank of the queue in cluster workload management. The value is in the range zero through 9, where zero is the lowest rank and 9 is the highest.

**CLWLUseQ (MQCFIN)**

Cluster workload queue rank (parameter identifier: MQIA\_CLWL\_USEQ).

The value can be:

**MQCLWL\_USEQ\_AS\_Q\_MGR**

Use the value of the *CLWLUseQ* parameter on the queue manager's definition.

**MQCLWL\_USEQ\_ANY**

Use remote and local queues.

**MQCLWL\_USEQ\_LOCAL**

Do not use remote queues.

**CreationDate (MQCFST)**

Queue creation date, in the form yyyy-mm-dd (parameter identifier: MQCA\_CREATION\_DATE).

The maximum length of the string is MQ\_CREATION\_DATE\_LENGTH.

**CreationTime (MQCFST)**

Creation time, in the form hh.mm.ss (parameter identifier: MQCA\_CREATION\_TIME).

The maximum length of the string is MQ\_CREATION\_TIME\_LENGTH.

**CurrentQDepth (MQCFIN)**

Current queue depth (parameter identifier: MQIA\_CURRENT\_Q\_DEPTH).

**Custom (MQCFST)**

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are named. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name and value pairs have the form NAME(VALUE).

This description is updated when features using this attribute are introduced.

**DefaultPutResponse (MQCFIN)**

Default put response type definition (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

The parameter specifies the type of response to be used for put operations to the queue when an application specifies MQPMO\_RESPONSE\_AS\_Q\_DEF. The value can be any of the following values:

**MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

**MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

**DefBind (MQCFIN)**

Default binding (parameter identifier: MQIA\_DEF\_BIND).

The value can be:

**MQBND\_BIND\_ON\_OPEN**

Binding fixed by MQOPEN call.

**MQBND\_BIND\_NOT\_FIXED**

Binding not fixed.

**MQBND\_BIND\_ON\_GROUP**

Allows an application to request that a group of messages are all allocated to the same destination instance.

**DefinitionType (MQCFIN)**

Queue definition type (parameter identifier: MQIA\_DEFINITION\_TYPE).

The value can be:

**MQQDT\_PREDEFINED**

Predefined permanent queue.

**MQQDT\_PERMANENT\_DYNAMIC**

Dynamically defined permanent queue.

**MQQDT\_SHARED\_DYNAMIC**

Dynamically defined shared queue. This option is available on z/OS only.

**MQQDT\_TEMPORARY\_DYNAMIC**

Dynamically defined temporary queue.

**DefInputOpenOption (MQCFIN)**

Default input open option for defining whether queues can be shared (parameter identifier: MQIA\_DEF\_INPUT\_OPEN\_OPTION).

The value can be:

**MQOO\_INPUT\_EXCLUSIVE**

Open queue to get messages with exclusive access.

**MQOO\_INPUT\_SHARED**

Open queue to get messages with shared access.

**DefPersistence (MQCFIN)**

Default persistence (parameter identifier: MQIA\_DEF\_PERSISTENCE).

The value can be:

**MQPER\_PERSISTENT**

Message is persistent.

**MQPER\_NOT\_PERSISTENT**

Message is not persistent.

**DefPriority (MQCFIN)**

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

**DefReadAhead (MQCFIN)**

Default read ahead (parameter identifier: MQIA\_DEF\_READ\_AHEAD).

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

The value can be any of the following values:

**MQREADA\_NO**

Non-persistent messages are not sent ahead to the client before an application requests them. A maximum of one non-persistent message can be lost if the client ends abnormally.

**MQREADA\_YES**

Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

**MQREADA\_DISABLED**

Read ahead of non-persistent messages is not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

**DistLists (MQCFIN)**

Distribution list support (parameter identifier: MQIA\_DIST\_LISTS).

The value can be:

**MQDL\_SUPPORTED**

Distribution lists supported.

**MQDL\_NOT\_SUPPORTED**

Distribution lists not supported.

This parameter is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Windows, and Linux.

*HardenGetBackout* (MQCFIN)

Harden backout, or not: (parameter identifier: MQIA\_HARDEN\_GET\_BACKOUT).

The value can be:

**MQQA\_BACKOUT\_HARDENED**

Backout count remembered.

**MQQA\_BACKOUT\_NOT\_HARDENED**

Backout count may not be remembered.

*IndexType* (MQCFIN)

Index type (parameter identifier: MQIA\_INDEX\_TYPE). This parameter applies to z/OS only.

Specifies the type of index maintained by the queue manager to expedite MQGET operations on the queue. The value can be any of the following values:

**MQIT\_NONE**

No index.

**MQIT\_MSG\_ID**

The queue is indexed using message identifiers.

**MQIT\_CORREL\_ID**

The queue is indexed using correlation identifiers.

**MQIT\_MSG\_TOKEN**

The queue is indexed using message tokens.

**MQIT\_GROUP\_ID**

The queue is indexed using group identifiers.

*InhibitGet* (MQCFIN)

Get operations are allowed or inhibited: (parameter identifier: MQIA\_INHIBIT\_GET).

The value can be:

**MQQA\_GET\_ALLOWED**

Get operations are allowed.

**MQQA\_GET\_INHIBITED**

Get operations are inhibited.

*InhibitPut* (MQCFIN)

Put operations are allowed or inhibited: (parameter identifier: MQIA\_INHIBIT\_PUT).

The value can be:

**MQQA\_PUT\_ALLOWED**

Put operations are allowed.

**MQQA\_PUT\_INHIBITED**

Put operations are inhibited.

*InitiationQName* (MQCFST)

Initiation queue name (parameter identifier: MQCA\_INITIATION\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

*MaxMsgLength* (MQCFIN)

Maximum message length (parameter identifier: MQIA\_MAX\_MSG\_LENGTH).

*MaxQDepth* (MQCFIN)

Maximum queue depth (parameter identifier: MQIA\_MAX\_Q\_DEPTH).

*MsgDeliverySequence* (MQCFIN)

Messages ordered by priority or sequence: (parameter identifier: MQIA\_MSG\_DELIVERY\_SEQUENCE).

The value can be:

**MQMDS\_PRIORITY**

Messages are returned in priority order.

**MQMDS\_FIFO**

Messages are returned in FIFO order (first in, first out).

*NonPersistentMessageClass* (**MQCFIN**)

The level of reliability assigned to non-persistent messages that are put to the queue (parameter identifier: MQIA\_NPM\_CLASS).

Specifies the circumstances under which non-persistent messages put to the queue may be lost. The value can be any of the following values:

**MQNPM\_CLASS\_NORMAL**

Non-persistent messages are limited to the lifetime of the queue manager session. They are discarded in the event of a queue manager restart. MQNPM\_CLASS\_NORMAL is the default value.

**MQNPM\_CLASS\_HIGH**

The queue manager attempts to retain non-persistent messages for the lifetime of the queue. Non-persistent messages may still be lost in the event of a failure.

*OpenInputCount* (**MQCFIN**)

Number of MQOPEN calls that have the queue open for input (parameter identifier: MQIA\_OPEN\_INPUT\_COUNT).

*OpenOutputCount* (**MQCFIN**)

Number of MQOPEN calls that have the queue open for output (parameter identifier: MQIA\_OPEN\_OUTPUT\_COUNT).

*PageSetID* (**MQCFIN**)

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID).

Specifies the identifier of the page set on which the queue resides.

This parameter applies to z/OS only when the queue is actively associated with a page set.

*ProcessName* (**MQCFST**)

Name of process definition for queue (parameter identifier: MQCA\_PROCESS\_NAME).

The maximum length of the string is MQ\_PROCESS\_NAME\_LENGTH.

*PropertyControl* (**MQCFIN**)

Property control attribute (parameter identifier MQIA\_PROPERTY\_CONTROL).

Specifies how message properties are handled for messages that are retrieved from queues using the MQGET call with the MQGMO\_PROPERTIES\_AS\_Q\_DEF option. The value can be any of the following values:

**MQPROP\_COMPATIBILITY**

If the message contains a property with a prefix of **mcd.**, **jms.**, **usr.** or **mqext.**, all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except properties contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

MQPROP\_COMPATIBILITY is the default value. It allows applications which expect JMS-related properties to be in an MQRFH2 header in the message data to continue to work unmodified.

**MQPROP\_NONE**

All properties of the message are removed from the message before the message is sent to the remote queue manager. Properties in the message descriptor (or extension) are not removed.

**MQPROP\_ALL**

All properties of the message are included with the message when it is sent to the remote

queue manager. The properties are placed in one or more MQRFH2 headers in the message data. Properties in the message descriptor (or extension) are not placed in MQRFH2 headers.

**MQPROP\_FORCE\_MQRFH2**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle.

A valid message handle supplied in the `MsgHandle` field of the MQGMO structure on the MQGET call is ignored. Properties of the message are not accessible via the message handle.

This parameter is applicable to local, alias, and model queues.

*QDepthHighEvent* (**MQCFIN**)

Controls whether Queue Depth High events are generated (parameter identifier: MQIA\_Q\_DEPTH\_HIGH\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

*QDepthHighLimit* (**MQCFIN**)

High limit for queue depth (parameter identifier: MQIA\_Q\_DEPTH\_HIGH\_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth High event.

*QDepthLowEvent* (**MQCFIN**)

Controls whether Queue Depth Low events are generated (parameter identifier: MQIA\_Q\_DEPTH\_LOW\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

*QDepthLowLimit* (**MQCFIN**)

Low limit for queue depth (parameter identifier: MQIA\_Q\_DEPTH\_LOW\_LIMIT).

The threshold against which the queue depth is compared to generate a Queue Depth Low event.

*QDepthMaxEvent* (**MQCFIN**)

Controls whether Queue Full events are generated (parameter identifier: MQIA\_Q\_DEPTH\_MAX\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

*QDesc* (**MQCFST**)

Queue description (parameter identifier: MQCA\_Q\_DESC).

The maximum length of the string is MQ\_Q\_DESC\_LENGTH.

*QMgrIdentifier* (**MQCFST**)

Queue manager identifier (parameter identifier: MQCA\_Q\_MGR\_IDENTIFIER).

The unique identifier of the queue manager.

***QMgrName* (MQCFST)**

Name of local queue manager (parameter identifier: MQCA\_CLUSTER\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

***QName* (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

***QServiceInterval* (MQCFIN)**

Target for queue service interval (parameter identifier: MQIA\_Q\_SERVICE\_INTERVAL).

The service interval used for comparison to generate Queue Service Interval High and Queue Service Interval OK events.

***QServiceIntervalEvent* (MQCFIN)**

Controls whether Service Interval High or Service Interval OK events are generated (parameter identifier: MQIA\_Q\_SERVICE\_INTERVAL\_EVENT).

The value can be:

**MQQSIE\_HIGH**

Queue Service Interval High events enabled.

**MQQSIE\_OK**

Queue Service Interval OK events enabled.

**MQQSIE\_NONE**

No queue service interval events enabled.

***QSGDisposition* (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). *QSGDisposition* is valid only on z/OS. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

***QType* (MQCFIN)**

Queue type (parameter identifier: MQIA\_Q\_TYPE).

The value can be:

**MQQT\_ALIAS**

Alias queue definition.

**MQQT\_CLUSTER**

Cluster queue definition.

**MQQT\_LOCAL**

Local queue.

**MQQT\_REMOTE**

Local definition of a remote queue.

**MQQT\_MODEL**

Model queue definition.

**QueueAccounting (MQCFIN)**

Controls the collection of accounting (thread-level and queue-level accounting) data (parameter identifier: MQIA\_ACCOUNTING\_Q).

The value can be:

**MQMON\_Q\_MGR**

The collection of accounting data for the queue is performed based upon the setting of the *QueueAccounting* parameter on the queue manager.

**MQMON\_OFF**

Do not collect accounting data for the queue.

**MQMON\_ON**

Collect accounting data for the queue.

**QueueMonitoring (MQCFIN)**

Online monitoring data collection (parameter identifier: MQIA\_MONITORING\_Q).

The value can be:

**MQMON\_OFF**

Online monitoring data collection is turned off for this queue.

**MQMON\_Q\_MGR**

The value of the queue manager's *QueueMonitoring* parameter is inherited by the queue.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON\_NONE.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON\_NONE.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high rate of data collection, for this queue unless *QueueMonitoring* for the queue manager is MQMON\_NONE.

**QueueStatistics (MQCFIN)**

Controls the collection of statistics data (parameter identifier: MQIA\_STATISTICS\_Q).

The value can be:

**MQMON\_Q\_MGR**

The collection of statistics data for the queue is performed based upon the setting of the *QueueStatistics* parameter on the queue manager.

**MQMON\_OFF**

Do not collect statistics data for the queue.

**MQMON\_ON**

Collect statistics data for the queue unless *QueueStatistics* for the queue manager is MQMON\_NONE.

This parameter is valid only on IBM i, UNIX systems, and Windows.

**RemoteQMgrName (MQCFST)**

Name of remote queue manager (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**RemoteQName (MQCFST)**

Name of remote queue as known locally on the remote queue manager (parameter identifier: MQCA\_REMOTE\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**RetentionInterval (MQCFIN)**

Retention interval (parameter identifier: MQIA\_RETENTION\_INTERVAL).

**Scope (MQCFIN)**

Scope of the queue definition (parameter identifier: MQIA\_SCOPE).

The value can be:

**MQSCO\_Q\_MGR**

Queue-manager scope.

**MQSCO\_CELL**

Cell scope.

This parameter is not valid on IBM i or z/OS.

**Shareability (MQCFIN)**

The queue can be shared, or not: (parameter identifier: MQIA\_SHAREABILITY).

The value can be:

**MQQA\_SHAREABLE**

Queue is shareable.

**MQQA\_NOT\_SHAREABLE**

Queue is not shareable.

**StorageClass (MQCFST)**

Storage class (parameter identifier: MQCA\_STORAGE\_CLASS). This parameter applies to z/OS only.

Specifies the name of the storage class.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

**TpipeNames (MQCFSL)**

TPIPE names (parameter identifier: MQCA\_TPIPE\_NAME). This parameter applies to local queues on z/OS only.

Specifies the TPIPE names used for communication with OTMA via the IBM MQ IMS bridge, if the bridge is active.

The maximum length of the string is MQ\_TPIPE\_NAME\_LENGTH.

**TriggerControl (MQCFIN)**

Trigger control (parameter identifier: MQIA\_TRIGGER\_CONTROL).

The value can be:

**MQTC\_OFF**

Trigger messages not required.

**MQTC\_ON**

Trigger messages required.

**TriggerData (MQCFST)**

Trigger data (parameter identifier: MQCA\_TRIGGER\_DATA).

The maximum length of the string is MQ\_TRIGGER\_DATA\_LENGTH.

**TriggerDepth (MQCFIN)**

Trigger depth (parameter identifier: MQIA\_TRIGGER\_DEPTH).

### *TriggerMsgPriority* (MQCFIN)

Threshold message priority for triggers (parameter identifier: MQIA\_TRIGGER\_MSG\_PRIORITY).

### *TriggerType* (MQCFIN)

Trigger type (parameter identifier: MQIA\_TRIGGER\_TYPE).

The value can be:

#### **MQTT\_NONE**

No trigger messages.

#### **MQTT\_FIRST**

Trigger message when queue depth goes from 0 to 1.

#### **MQTT\_EVERY**

Trigger message for every message.

#### **MQTT\_DEPTH**

Trigger message when depth threshold exceeded.

### *Usage* (MQCFIN)

Usage (parameter identifier: MQIA\_USAGE).

The value can be:

#### **MQUS\_NORMAL**

Normal usage.

#### **MQUS\_TRANSMISSION**

Transmission queue.

### *XmitQName* (MQCFST)

Transmission queue name (parameter identifier: MQCA\_XMIT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

## **Inquire Queue Manager:**

The Inquire Queue Manager ( **MQCMD\_INQUIRE\_Q\_MGR** ) command inquires about the attributes of a queue manager.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

## **Optional parameters**

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following values:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment. The command server must be enabled.
- An asterisk “\*”. The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

**QMGrAttrs (MQCFIL)**

Queue manager attributes (parameter identifier: MQIACF\_Q\_MGR\_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

**MQIACF\_ALL**

All attributes.

Or a combination of the following values:

**MQCA\_ALTERATION\_DATE**

Date at which the definition was last altered.

**MQCA\_ALTERATION\_TIME**

Time at which the definition was last altered.

**MQCA\_CERT\_LABEL**

Queue manager certificate label.

**MQCA\_CHANNEL\_AUTO\_DEF\_EXIT**

Automatic channel definition exit name. MQCA\_CHANNEL\_AUTO\_DEF\_EXIT is not valid on z/OS.

**MQCA\_CLUSTER\_WORKLOAD\_DATA**

Data passed to the cluster workload exit.

**MQCA\_CLUSTER\_WORKLOAD\_EXIT**

Name of the cluster workload exit.

**MQCA\_COMMAND\_INPUT\_Q\_NAME**

System command input queue name.

**MQCA\_CONN\_AUTH**

Name of the authentication information object that is used to provide the location of user ID and password authentication.

**MQCA\_CUSTOM**

The custom attribute for new features.

**MQCA\_DEAD\_LETTER\_Q\_NAME**

Name of dead-letter queue.

**MQCA\_DEF\_XMIT\_Q\_NAME**

Default transmission queue name.

**MQCA\_DNS\_GROUP**

The name of the group that the TCP listener handling inbound transmissions for the queue-sharing group must join when using Workload Manager for Dynamic Domain Name Services support (DDNS). MQCA\_DNS\_GROUP is valid on z/OS only.

**MQCA\_IGQ\_USER\_ID**

Intra-group queuing user identifier. This parameter is valid on z/OS only.

**MQCA\_LU\_GROUP\_NAME**

Generic LU name for the LU 6.2 listener. MQCA\_LU\_GROUP\_NAME is valid on z/OS only.

**MQCA\_LU\_NAME**

LU name to use for outbound LU 6.2 transmissions. MQCA\_LU\_NAME is valid on z/OS only.

**MQCA\_LU62\_ARM\_SUFFIX**

APPCPM suffix. MQCA\_LU62\_ARM\_SUFFIX is valid on z/OS only.

**MQCA\_PARENT**

The name of the hierarchically connected queue manager that is nominated as the parent of this queue manager.

**MQCA\_Q\_MGR\_DESC**

Queue manager description.

**MQCA\_Q\_MGR\_IDENTIFIER**

Internally generated unique queue manager name.

**MQCA\_Q\_MGR\_NAME**

Name of local queue manager.

**MQCA\_QSG\_CERT\_LABEL**

Queue sharing group certificate label. This parameter attribute is valid on z/OS only.

**MQCA\_QSG\_NAME**

Queue sharing group name. This parameter attribute is valid on z/OS only.

**MQCA\_REPOSITORY\_NAME**

Cluster name for the queue manager repository.

**MQCA\_REPOSITORY\_NAMELIST**

Name of the list of clusters for which the queue manager is providing a repository manager service.

**MQCA\_SSL\_CRL\_NAMELIST**

SSL certificate revocation location namelist.

**MQCA\_SSL\_CRYPTO\_HARDWARE**

Parameters to configure the SSL cryptographic hardware. This parameter is supported on UNIX, Linux, and Windows platforms only.

**MQCA\_SSL\_KEY\_REPOSITORY**

Location and name of the SSL key repository.

**MQCA\_TCP\_NAME**

Name of the TCP/IP system that you are using. MQCA\_TCP\_NAME is valid on z/OS only.

**MQCA\_VERSION**

The version of the IBM MQ installation, the queue manager is associated with. The version has the format VVRRMMFF:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

**MQIA\_ACCOUNTING\_CONN\_OVERRIDE**

Specifies whether the settings of the *MQIAccounting* and *QueueAccounting* queue manager parameters can be overridden. MQIA\_ACCOUNTING\_CONN\_OVERRIDE is valid only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

**MQIA\_ACCOUNTING\_INTERVAL**

Intermediate accounting data collection interval. MQIA\_ACCOUNTING\_INTERVAL is valid only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

**MQIA\_ACCOUNTING\_MQI**

Specifies whether accounting information is to be collected for MQI data.

MQIA\_ACCOUNTING\_MQI is valid only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

**MQIA\_ACCOUNTING\_Q**

Accounting data collection for queues.

**MQIA\_ACTIVE\_CHANNELS**

Maximum number of channels that can be active at any time. MQIA\_ACTIVE\_CHANNELS is valid on z/OS only.

**MQIA\_ACTIVITY\_CONN\_OVERRIDE**

Specifies whether the value of application activity trace can be overridden.

**MQIA\_ACTIVITY\_RECORDING**

Specifies whether activity reports can be generated.

**MQIA\_ACTIVITY\_TRACE**

Specifies whether application activity trace reports can be generated.

**MQIA\_ADOPTNEWMCA\_CHECK**

Elements checked to determine whether an MCA must be adopted when a new inbound channel is detected with the same name as an MCA that is already active.

MQIA\_ADOPTNEWMCA\_CHECK is valid on z/OS only.

**MQIA\_ADOPTNEWMCA\_TYPE**

Specifies whether an orphaned instance of an MCA must be restarted automatically when a new inbound channel request matching the *AdoptNewMCACheck* parameter is detected.

MQIA\_ADOPTNEWMCA\_TYPE is valid on z/OS only.

**MQIA\_AUTHORITY\_EVENT**

Control attribute for authority events.

**MQIA\_BRIDGE\_EVENT**

Control attribute for IMS bridge events. MQIA\_BRIDGE\_EVENT is valid only on z/OS.

**MQIA\_CERT\_VAL\_POLICY**

Specifies which SSL/TLS certificate validation policy is used to validate digital certificates received from remote partner systems. This attribute controls how strictly the certificate chain validation conforms to industry security standards. MQIA\_CERT\_VAL\_POLICY is valid on only UNIX, Linux, and Windows. For more information, see Certificate validation policies in IBM MQ.

**MQIA\_CHANNEL\_AUTO\_DEF**

Control attribute for automatic channel definition. MQIA\_CHANNEL\_AUTO\_DEF is not valid on z/OS.

**MQIA\_CHANNEL\_AUTO\_DEF\_EVENT**

Control attribute for automatic channel definition events. MQIA\_CHANNEL\_AUTO\_DEF\_EVENT is not valid on z/OS.

**MQIA\_CHANNEL\_EVENT**

Control attribute for channel events.

**MQIA\_CHINIT\_ADAPTERS**

Number of adapter subtasks to use for processing IBM MQ calls. MQIA\_CHINIT\_ADAPTERS is valid on z/OS only.

**MQIA\_CHINIT\_CONTROL**

Start channel initiator automatically when queue manager starts.

**MQIA\_CHINIT\_DISPATCHERS**

Number of dispatchers to use for the channel initiator. MQIA\_CHINIT\_DISPATCHERS is valid on z/OS only.

**MQIA\_CHINIT\_SERVICE\_PARM**

Reserved for use by IBM. MQIA\_CHINIT\_SERVICE\_PARM is valid only on z/OS.

**MQIA\_CHINIT\_TRACE\_AUTO\_START**

Specifies whether the channel initiator trace must start automatically.

MQIA\_CHINIT\_TRACE\_AUTO\_START is valid on z/OS only.

**MQIA\_CHINIT\_TRACE\_TABLE\_SIZE**  
Size, in megabytes, of the trace data space of the channel initiator.  
MQIA\_CHINIT\_TRACE\_TABLE\_SIZE is valid on z/OS only.

**MQIA\_CHLAUTH\_RECORDS**  
Control attribute for checking of channel authentication records.

**MQIA\_CLUSTER\_WORKLOAD\_LENGTH**  
Maximum length of the message passed to the cluster workload exit.

**MQIA\_CLWL\_MRU\_CHANNELS**  
Cluster workload most recently used channels.

**MQIA\_CLWL\_USEQ**  
Cluster workload remote queue use.

**MQIA\_CMD\_SERVER\_CONTROL**  
Start command server automatically when queue manager starts.

**MQIA\_CODED\_CHAR\_SET\_ID**  
Coded character set identifier.

**MQIA\_COMMAND\_EVENT**  
Control attribute for command events.

**MQIA\_COMMAND\_LEVEL**  
Command level supported by queue manager.

**MQIA\_CONFIGURATION\_EVENT**  
Control attribute for configuration events.

**MQIA\_CPI\_LEVEL**  
Reserved for use by IBM.

**MQIA\_DEF\_CLUSTER\_XMIT\_Q\_TYPE**  
Default transmission queue type to be used for cluster-sender channels.

**MQIA\_DIST\_LISTS**  
Distribution list support. This parameter is not valid on z/OS.

**MQIA\_DNS\_WLM**  
Specifies whether the TCP listener that handles inbound transmissions for the queue-sharing group must register with Workload Manager (WLM) for DDNS. MQIA\_DNS\_WLM is valid on z/OS only.

**MQIA\_EXPIRY\_INTERVAL**  
Expiry interval. This parameter is valid on z/OS only.

**MQIA\_GROUP\_UR**  
Control attribute for whether transactional applications can connect with a GROUP unit of recovery disposition. This parameter is valid only on z/OS.

**MQIA\_IGQ\_PUT\_AUTHORITY**  
Intra-group queuing put authority. This parameter is valid on z/OS only.

**MQIA\_INHIBIT\_EVENT**  
Control attribute for inhibit events.

**MQIA\_INTRA\_GROUP\_queuing**  
Intra-group queuing support. This parameter is valid on z/OS only.

**MQIA\_IP\_ADDRESS\_VERSION**  
IP address version selector.

**MQIA\_LISTENER\_TIMER**  
Listener restart interval. MQIA\_LISTENER\_TIMER is valid on z/OS only.

**MQIA\_LOCAL\_EVENT**  
Control attribute for local events.

**MQIA\_LOGGER\_EVENT**  
Control attribute for recovery log events.

**MQIA\_LU62\_CHANNELS**  
Maximum number of LU 6.2 channels. MQIA\_LU62\_CHANNELS is valid on z/OS only.

**MQIA\_MSG\_MARK\_BROWSE\_INTERVAL**  
Interval for which messages that were browsed, remain marked.

**MQIA\_MAX\_CHANNELS**  
Maximum number of channels that can be current. MQIA\_MAX\_CHANNELS is valid on z/OS only.

**MQIA\_MAX\_HANDLES**  
Maximum number of handles.

**MQIA\_MAX\_MSG\_LENGTH**  
Maximum message length.

**MQIA\_MAX\_PRIORITY**  
Maximum priority.

**MQIA\_MAX\_PROPERTIES\_LENGTH**  
Maximum properties length.

**MQIA\_MAX\_UNCOMMITTED\_MSGS**  
Maximum number of uncommitted messages within a unit of work.

**MQIA\_MONITORING\_AUTO\_CLUSSDR**  
Default value of the *ChannelMonitoring* attribute of automatically defined cluster-sender channels.

**MQIA\_MONITORING\_CHANNEL**  
Specifies whether channel monitoring is enabled.

**MQIA\_MONITORING\_Q**  
Specifies whether queue monitoring is enabled.

**MQIA\_OUTBOUND\_PORT\_MAX**  
Maximum value in the range for the binding of outgoing channels. MQIA\_OUTBOUND\_PORT\_MAX is valid on z/OS only.

**MQIA\_OUTBOUND\_PORT\_MIN**  
Minimum value in the range for the binding of outgoing channels. MQIA\_OUTBOUND\_PORT\_MIN is valid on z/OS only.

**MQIA\_PERFORMANCE\_EVENT**  
Control attribute for performance events.

**MQIA\_PLATFORM**  
Platform on which the queue manager resides.

**MQIA\_PUBSUB\_CLUSTER**  
Controls whether this queue manager participates in the publish/subscribe clustering.

**MQIA\_PUBSUB\_MAXMSG\_RETRY\_COUNT**  
The number of retries when processing (under sync point) a failed command message

**MQIA\_PUBSUB\_MODE**  
Inquires if the publish/subscribe engine and the queued publish/subscribe interface are running, which allow applications to publish/subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface.

- MQIA\_PUBSUB\_NP\_MSG**  
Specifies whether to discard (or keep) an undelivered input message.
- MQIA\_PUBSUB\_NP\_RESP**  
The behavior of undelivered response messages.
- MQIA\_PUBSUB\_SYNC\_PT**  
Specifies whether only persistent (or all) messages must be processed under sync point.
- MQIA\_QMGR\_CFCONLOS**  
Specifies action to be taken when the queue manager loses connectivity to the administration structure, or any CF structure with CFCONLOS set to ASQMGR. MQIA\_QMGR\_CFCONLOS is valid on z/OS only.
- MQIA\_RECEIVE\_TIMEOUT**  
How long a TCP/IP channel waits to receive data from its partner. MQIA\_RECEIVE\_TIMEOUT is valid on z/OS only.
- MQIA\_RECEIVE\_TIMEOUT\_MIN**  
Minimum length of time that a TCP/IP channel waits to receive data from its partner . MQIA\_RECEIVE\_TIMEOUT\_MIN is valid on z/OS only.
- MQIA\_RECEIVE\_TIMEOUT\_TYPE**  
Qualifier to apply to the *ReceiveTimeout* parameter. MQIA\_RECEIVE\_TIMEOUT\_TYPE is valid on z/OS only.
- MQIA\_REMOTE\_EVENT**  
Control attribute for remote events.
- MQIA\_SECURITY\_CASE**  
Specifies whether the queue manager supports security profile names either in mixed case, or in uppercase only. MQIA\_SECURITY\_CASE is valid on z/OS only.
- MQIA\_SHARED\_Q\_Q\_MGR\_NAME**  
When a queue manager makes an MQOPEN call for a shared queue and the queue manager that is specified in the *ObjectQmgrName* parameter of the MQOPEN call is in the same queue-sharing group as the processing queue manager, the SQQMNAME attribute specifies whether the *ObjectQmgrName* is used or whether the processing queue manager opens the shared queue directly. MQIA\_SHARED\_Q\_Q\_MGR\_NAME is valid on z/OS only.
- MQIA\_SSL\_EVENT**  
Control attribute for SSL events.
- MQIA\_SSL\_FIPS\_REQUIRED**  
Specifies whether only FIPS-certified algorithms are to be used if cryptography is executed in IBM MQ rather than in the cryptographic hardware itself.
- MQIA\_SSL\_RESET\_COUNT**  
SSL key reset count.
- MQIA\_SSL\_TASKS**  
SSL tasks. This parameter is valid on z/OS only.
- MQIA\_START\_STOP\_EVENT**  
Control attribute for start stop events.
- MQIA\_STATISTICS\_AUTO\_CLUSSDR**  
Specifies whether statistics data is to be collected for auto-defined cluster-sender channels and, if so, the rate of data collection. .
- MQIA\_STATISTICS\_CHANNEL**  
Specifies whether statistics monitoring data is to be collected for channels and, if so, the rate of data collection.

**MQIA\_STATISTICS\_INTERVAL**

Statistics data collection interval. MQIA\_STATISTICS\_INTERVAL is valid only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

**MQIA\_STATISTICS\_MQI**

Specifies whether statistics monitoring data is to be collected for the queue manager. MQIA\_STATISTICS\_MQI is valid only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

**MQIA\_STATISTICS\_Q**

Specifies whether statistics monitoring data is to be collected for queues. MQIA\_STATISTICS\_Q is valid only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

**MQIA\_SUITE\_B\_STRENGTH**

Specifies whether Suite B-compliant cryptography is used and the level of strength employed. For more information about Suite B configuration and its effect on SSL and TLS channels, see NSA Suite B Cryptography in IBM MQ .

**MQIA\_SYNCPOINT**

Sync point availability.

**MQIA\_TCP\_CHANNELS**

Maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol This is valid on z/OS only.

**MQIA\_TCP\_KEEP\_ALIVE**

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of a connection is still available. MQIA\_TCP\_KEEP\_ALIVE is valid on z/OS only.

**MQIA\_TCP\_STACK\_TYPE**

Specifies whether the channel initiator can use only the TCP/IP address space specified in the *TCPName* parameter, or can optionally bind to any selected TCP/IP address. MQIA\_TCP\_STACK\_TYPE is valid on z/OS only.

**MQIA\_TRACE\_ROUTE\_RECORDING**

Specifies whether trace-route information can be recorded and reply messages generated.

**MQIA\_TREE\_LIFE\_TIME**

The lifetime of non-administrative topics.

**MQIA\_TRIGGER\_INTERVAL**

Trigger interval.

**MQIA\_XR\_CAPABILITY**

Specifies whether telemetry commands are supported.

**MQIACF\_Q\_MGR\_CLUSTER**

All clustering attributes. These attributes are:

- MQCA\_CLUSTER\_WORKLOAD\_DATA
- MQCA\_CLUSTER\_WORKLOAD\_EXIT
- MQCA\_CHANNEL\_AUTO\_DEF\_EXIT
- MQCA\_REPOSITORY\_NAME
- MQCA\_REPOSITORY\_NAMELIST
- MQIA\_CLUSTER\_WORKLOAD\_LENGTH
- MQIA\_CLWL\_MRU\_CHANNELS
- MQIA\_CLWL\_USEQ
- MQIA\_MONITORING\_AUTO\_CLUSSDR
- MQCA\_Q\_MGR\_IDENTIFIER

**MQIACF\_Q\_MGR\_DQM**

All distributed queuing attributes. These attributes are:

- MQCA\_CERT\_LABEL
- MQCA\_CHANNEL\_AUTO\_DEF\_EXIT
- MQCA\_CHANNEL\_AUTO\_DEF\_EXIT
- MQCA\_DEAD\_LETTER\_Q\_NAME
- MQCA\_DEF\_XMIT\_Q\_NAME
- MQCA\_DNS\_GROUP
- MQCA\_IGQ\_USER\_ID
- MQCA\_LU\_GROUP\_NAME
- MQCA\_LU\_NAME
- MQCA\_LU62\_ARM\_SUFFIX
- MQCA\_Q\_MGR\_IDENTIFIER
- MQCA\_QSG\_CERT\_LABEL
- MQCA\_SSL\_CRL\_NAMELIST
- MQCA\_SSL\_CRYPTO\_HARDWARE
- MQCA\_SSL\_KEY\_REPOSITORY
- MQCA\_TCP\_NAME
- MQIA\_ACTIVE\_CHANNELS
- MQIA\_ADOPTNEWMCA\_CHECK
- MQIA\_ADOPTNEWMCA\_TYPE
- MQIA\_CERT\_VAL\_POLICY
- MQIA\_CHANNEL\_AUTO\_DEF
- MQIA\_CHANNEL\_AUTO\_DEF\_EVENT
- MQIA\_CHANNEL\_EVENT
- MQIA\_CHINIT\_ADAPTERS
- MQIA\_CHINIT\_CONTROL
- MQIA\_CHINIT\_DISPATCHERS
- MQIA\_CHINIT\_SERVICE\_PARM
- MQIA\_CHINIT\_TRACE\_AUTO\_START
- MQIA\_CHINIT\_TRACE\_TABLE\_SIZE
- MQIA\_CHLAUTH\_RECORDS
- MQIA\_INTRA\_GROUP\_queuing
- MQIA\_IGQ\_PUT\_AUTHORITY
- MQIA\_IP\_ADDRESS\_VERSION
- MQIA\_LISTENER\_TIMER
- MQIA\_LU62\_CHANNELS
- MQIA\_MAX\_CHANNELS
- MQIA\_MONITORING\_CHANNEL
- MQIA\_OUTBOUND\_PORT\_MAX
- MQIA\_OUTBOUND\_PORT\_MIN
- MQIA\_RECEIVE\_TIMEOUT
- MQIA\_RECEIVE\_TIMEOUT\_MIN
- MQIA\_RECEIVE\_TIMEOUT\_TYPE
- MQIA\_SSL\_EVENT
- MQIA\_SSL\_FIPS\_REQUIRED
- MQIA\_SSL\_RESET\_COUNT

- MQIA\_SSL\_TASKS
- MQIA\_STATISTICS\_AUTO\_CLUSSDR
- MQIA\_TCP\_CHANNELS
- MQIA\_TCP\_KEEP\_ALIVE
- MQIA\_TCP\_STACK\_TYPE

#### **MQIACF\_Q\_MGR\_EVENT**

All event control attributes. These attributes are:

- MQIA\_AUTHORITY\_EVENT
- MQIA\_BRIDGE\_EVENT
- MQIA\_CHANNEL\_EVENT
- MQIA\_COMMAND\_EVENT
- MQIA\_CONFIGURATION\_EVENT
- MQIA\_INHIBIT\_EVENT
- MQIA\_LOCAL\_EVENT
- MQIA\_LOGGER\_EVENT
- MQIA\_PERFORMANCE\_EVENT
- MQIA\_REMOTE\_EVENT
- MQIA\_SSL\_EVENT
- MQIA\_START\_STOP\_EVENT

#### **MQIACF\_Q\_MGR\_PUBSUB**

All queue manager publish/subscribe attributes. These attributes are:

- MQCA\_PARENT
- MQIA\_PUBSUB\_MAXMSG\_RETRY\_COUNT
- MQIA\_PUBSUB\_MODE
- MQIA\_PUBSUB\_NP\_MSG
- MQIA\_PUBSUB\_NP\_RESP
- MQIA\_PUBSUB\_SYNC\_PT
- MQIA\_TREE\_LIFE\_TIME

#### **MQIACF\_Q\_MGR\_SYSTEM**

All queue manager system attributes. These attributes are:

- MQCA\_COMMAND\_INPUT\_Q\_NAME
- MQCA\_CUSTOM
- MQCA\_DEAD\_LETTER\_Q\_NAME
- MQCA\_Q\_MGR\_NAME
- MQCA\_QSG\_NAME
- MQCA\_VERSION
- MQIA\_ACCOUNTING\_CONN\_OVERRIDE
- MQIA\_ACCOUNTING\_INTERVAL
- MQIA\_ACCOUNTING\_Q
- MQIA\_ACTIVITY\_CONN\_OVERRIDE
- MQIA\_ACTIVITY\_RECORDING
- MQIA\_ACTIVITY\_TRACE
- MQCA\_ALTERATION\_DATE
- MQCA\_ALTERATION\_TIME
- MQIA\_CMD\_SERVER\_CONTROL

- MQIA\_CODED\_CHAR\_SET\_ID
- MQIA\_COMMAND\_LEVEL
- MQIA\_CPI\_LEVEL
- MQIA\_DIST\_LISTS
- MQIA\_EXPIRY\_INTERVAL
- MQIA\_MAX\_HANDLES
- MQIA\_MAX\_MSG\_LENGTH
- MQIA\_MAX\_PRIORITY
- MQIA\_MAX\_PROPERTIES\_LENGTH
- MQIA\_MAX\_UNCOMMITTED\_MSGS
- MQIA\_MONITORING\_Q
- MQIA\_PLATFORM
- MQIA\_SHARED\_Q\_Q\_MGR\_NAME
- MQIA\_STATISTICS\_INTERVAL
- MQIA\_STATISTICS\_MQI
- MQIA\_STATISTICS\_Q
- MQIA\_SYNCPOINT
- MQIA\_TRACE\_ROUTE\_RECORDING
- MQIA\_TRIGGER\_INTERVAL
- MQIA\_XR\_CAPABILITY

### Inquire Queue Manager (Response):

The response to the Inquire Queue Manager (MQCMD\_INQUIRE\_Q\_MGR) command consists of the response header followed by the *QMGrName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### Always returned:

*QMGrName*

### Returned if requested:

## Response data

### *AccountingConnOverride* (MQCFIN)

Specifies whether applications can override the settings of the *QueueAccounting* and *MQIAccounting* queue manager parameters (parameter identifier: MQIA\_ACCOUNTING\_CONN\_OVERRIDE).

The value can be any of the following values:

#### **MQMON\_DISABLED**

Applications cannot override the settings of the *QueueAccounting* and *MQIAccounting* parameters.

#### **MQMON\_ENABLED**

Applications can override the settings of the *QueueAccounting* and *MQIAccounting* parameters by using the options field of the MQCNO structure of the MQCONN API call.

This parameter applies only to AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

### *AccountingInterval* (MQCFIN)

The time interval, in seconds, at which intermediate accounting records are written (parameter identifier: MQIA\_ACCOUNTING\_INTERVAL).

It is a value in the range 1 through 604 000.

This parameter applies only to AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

### *ActivityConnOverride* (MQCFIN)

Specifies whether applications can override the setting of the ACTVTRC value in the queue manager attribute (parameter identifier: MQIA\_ACTIVITY\_CONN\_OVERRIDE).

The value can be any of the following values:

#### **MQMON\_DISABLED**

Applications cannot override the setting of the ACTVTRC queue manager attribute using the Options field in the MQCNO structure on the MQCONN call. This is the default value.

#### **MQMON\_ENABLED**

Applications can override the ACTVTRC queue manager attribute using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This parameter applies only to IBM i, Unix systems, and Windows.

### *ActivityRecording* (MQCFIN)

Whether activity reports can be generated (parameter identifier: MQIA\_ACTIVITY\_RECORDING).

The value can be:

**MQRECORDING\_DISABLED**

Activity reports cannot be generated.

**MQRECORDING\_MSG**

Activity reports can be generated and sent to the destination specified by the originator of the message causing the report.

**MQRECORDING\_Q**

Activity reports can be generated and sent to SYSTEM.ADMIN.ACTIVITY.QUEUE.

**ActivityTrace (MQCFIN)**

Whether activity reports can be generated (parameter identifier: MQIA\_ACTIVITY\_TRACE).

The value can be:

**MQMON\_OFF**

Do not collect IBM MQ MQI application activity trace. This is the default value.

If you set the queue manager attribute ACTVCON0 to ENABLED, this value might be overridden for individual connections using the Options field in the MQCNO structure.

**MQMON\_ON**

Collect IBM MQ MQI application activity trace.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This parameter applies only to IBM i, Unix systems, and Windows.

**z/OS AdoptNewMCACheck (MQCFIN)**

The elements checked to determine whether an MCA must be adopted (restarted) when a new inbound channel is detected. It is adopted if it has the same name as a currently active MCA (parameter identifier: MQIA\_ADOPTNEWMCA\_CHECK).

The value can be:

**MQADOPT\_CHECK\_Q\_MGR\_NAME**

Check the queue manager name.

**MQADOPT\_CHECK\_NET\_ADDR**

Check the network address.

**MQADOPT\_CHECK\_ALL**

Check the queue manager name and network address.

**MQADOPT\_CHECK\_NONE**

Do not check any elements.

This parameter is valid only on z/OS.

**z/OS AdoptNewMCAType (MQCFIL)**

Adoption of orphaned channel instances (parameter identifier: MQIA\_ADOPTNEWMCA\_TYPE).

The value can be:

**MQADOPT\_TYPE\_NO**

Do not adopt orphaned channel instances.

**MQADOPT\_TYPE\_ALL**

Adopt all channel types.

This parameter is valid only on z/OS.

**AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date, in the form yyyy-mm-dd, on which the information was last altered.

**AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time, in the form hh.mm.ss, at which the information was last altered.

**AuthorityEvent (MQCFIN)**

Controls whether authorization (Not Authorized) events are generated (parameter identifier: MQIA\_AUTHORITY\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**z/OS** **BridgeEvent (MQCFIN)**

Controls whether IMS bridge events are generated (parameter identifier: MQIA\_BRIDGE\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

This parameter is valid only on z/OS.

**CertificateLabel (MQCFST)**

Certificate label for this queue manager to use. The label identifies which personal certificate in the key repository has been selected.

The maximum length of the string is MQ\_CERT\_LABEL\_LENGTH.

**CertificateValPolicy (MQCFIN)**

Specifies which SSL/TLS certificate validation policy is used to validate digital certificates received from remote partner systems (parameter identifier: MQIA\_CERT\_VAL\_POLICY).

This attribute can be used to control how strictly the certificate chain validation conforms to industry security standards. This parameter is only valid on UNIX, Linux, and Windows. For more information, see Certificate validation policies in IBM MQ.

The value can be any of the following values:

**MQ\_CERT\_VAL\_POLICY\_ANY**

Apply each of the certificate validation policies supported by the secure sockets library and accept the certificate chain if any of the policies considers the certificate chain valid. This setting can be used for maximum backwards compatibility with older digital certificates which do not comply with the modern certificate standards.

**MQ\_CERT\_VAL\_POLICY\_RFC5280**

Apply only the RFC 5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

**z/OS** **CFConlos (MQCFIN)**

Specifies the action to be taken when the queue manager loses connectivity to the administration structure, or any CF structures with CFCONLOS set to ASQMGR (parameter identifier: MQIA\_QMGR\_CFCONLOS).

The value can be:

**MQCFCONLOS\_TERMINATE**

The queue manager terminates when connectivity to CF structures is lost.

**MQCFCONLOS\_TOLERATE**

The queue manager tolerates loss of connectivity to CF structures without terminating.

This parameter is valid only on z/OS.

*ChannelAutoDef* (**MQCFIN**)

Controls whether receiver and server-connection channels can be auto-defined (parameter identifier: MQIA\_CHANNEL\_AUTO\_DEF).

The value can be:

**MQCHAD\_DISABLED**

Channel auto-definition disabled.

**MQCHAD\_ENABLED**

Channel auto-definition enabled.

*ChannelAutoDefEvent* (**MQCFIN**)

Controls whether channel auto-definition events are generated (parameter identifier: MQIA\_CHANNEL\_AUTO\_DEF\_EVENT), when a receiver, server-connection, or cluster-sender channel is auto-defined.

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

*ChannelAutoDefExit* (**MQCFST**)

Channel auto-definition exit name (parameter identifier: MQCA\_CHANNEL\_AUTO\_DEF\_EXIT).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

*ChannelAuthenticationRecords* (**MQCFIN**)

Controls whether channel authentication records are checked (parameter identifier: MQIA\_CHLAUTH\_RECORDS).

The value can be:

**MQCHLA\_DISABLED**

Channel authentication records are not checked.

**MQCHLA\_ENABLED**

Channel authentication records are checked.

*ChannelEvent* (**MQCFIN**)

Controls whether channel events are generated (parameter identifier: MQIA\_CHANNEL\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**MQEVR\_EXCEPTION**

Reporting of exception channel events enabled.

### *ChannelInitiatorControl* (MQCFIN)

Start the channel initiator during queue manager start (parameter identifier: MQIA\_CHINIT\_CONTROL). This parameter is not available on z/OS.

The value can be:

#### **MQSVC\_CONTROL\_MANUAL**

The channel initiator is not to be started automatically when the queue manager starts.

#### **MQSVC\_CONTROL\_Q\_MGR**

The channel initiator is to be started automatically when the queue manager starts.

### *ChannelMonitoring* (MQCFIN)

Default setting for online monitoring for channels (parameter identifier: MQIA\_MONITORING\_CHANNEL).

If the *ChannelMonitoring* channel attribute is set to `MQMON_Q_MGR`, this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

#### **MQMON\_OFF**

Online monitoring data collection is turned off.

#### **MQMON\_NONE**

Online monitoring data collection is turned off for channels regardless of the setting of their *ChannelMonitoring* attribute.

#### **MQMON\_LOW**

Online monitoring data collection is turned on, with a low ratio of data collection.

#### **MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate ratio of data collection.

#### **MQMON\_HIGH**

Online monitoring data collection is turned on, with a high ratio of data collection.

### ▶ z/OS *ChannelStatistics* (MQCFIN)

Specifies whether statistics data is to be collected for channels (parameter identifier: MQIA\_STATISTICS\_CHANNEL).

The value can be:

#### **MQMON\_OFF**

Statistics data collection is turned off.

#### **MQMON\_LOW**

Statistics data collection is turned on, with a low ratio of data collection.

#### **MQMON\_MEDIUM**

Statistics data collection is turned on, with a moderate ratio of data collection.

#### **MQMON\_HIGH**

Statistics data collection is turned on, with a high ratio of data collection.

This parameter is valid only on z/OS.

### ▶ z/OS *ChinitAdapters* (MQCFIN)

Number of adapter subtasks (parameter identifier: MQIA\_CHINIT\_ADAPTERS).

The number of adapter subtasks to use for processing IBM MQ calls. This parameter is valid only on z/OS.

### ▶ z/OS *ChinitDispatchers* (MQCFIN)

Number of dispatchers (parameter identifier: MQIA\_CHINIT\_DISPATCHERS).

The number of dispatchers to use for the channel initiator. This parameter is valid only on z/OS.

▶ **z/OS** *ChinitServiceParm* (**MQCFST**)

Reserved for use by IBM (parameter identifier: MQCA\_CHINIT\_SERVICE\_PARM).

▶ **z/OS** *ChinitTraceAutoStart* (**MQCFIN**)

Specifies whether the channel initiator trace must start automatically (parameter identifier: MQIA\_CHINIT\_TRACE\_AUTO\_START).

The value can be:

**MQTRAXSTR\_YES**

Channel initiator trace is to start automatically.

**MQTRAXSTR\_NO**

Channel initiator trace is not to start automatically.

This parameter is valid only on z/OS.

▶ **z/OS** *ChinitTraceTableSize* (**MQCFIN**)

The size, in megabytes, of the trace data space of the channel initiator (parameter identifier: MQIA\_CHINIT\_TRACE\_TABLE\_SIZE).

This parameter is valid only on z/OS.

*ClusterSenderMonitoringDefault* (**MQCFIN**)

Setting for online monitoring for automatically defined cluster-sender channels (parameter identifier: MQIA\_MONITORING\_AUTO\_CLUSSDR).

The value can be:

**MQMON\_Q\_MGR**

Collection of online monitoring data is inherited from the setting of the queue manager's *ChannelMonitoring* parameter.

**MQMON\_OFF**

Monitoring for the channel is switched off.

**MQMON\_LOW**

Specifies a low rate of data collection with a minimal effect on system performance unless *ChannelMonitoring* for the queue manager is MQMON\_NONE. The data collected is not likely to be the most current.

**MQMON\_MEDIUM**

Specifies a moderate rate of data collection with limited effect on system performance unless *ChannelMonitoring* for the queue manager is MQMON\_NONE.

**MQMON\_HIGH**

Specifies a high rate of data collection with a likely effect on system performance unless *ChannelMonitoring* for the queue manager is MQMON\_NONE. The data collected is the most current available.

▶ **z/OS** On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

*ClusterSenderStatistics* (**MQCFIN**)

Specifies whether statistics data is to be collected for auto-defined cluster-sender channels (parameter identifier: MQIA\_STATISTICS\_AUTO\_CLUSSDR).

The value can be:

**MQMON\_Q\_MGR**

Collection of statistics data is inherited from the setting of the queue manager's *ChannelStatistics* parameter.

**MQMON\_OFF**

Statistics data collection for the channel is switched off.

**MQMON\_LOW**

Specifies a low rate of data collection with a minimal effect on system performance.

**MQMON\_MEDIUM**

Specifies a moderate rate of data collection.

**MQMON\_HIGH**

Specifies a high rate of data collection.

 On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

**ClusterWorkLoadData (MQCFST)**

Data passed to the cluster workload exit (parameter identifier: MQCA\_CLUSTER\_WORKLOAD\_DATA).

**ClusterWorkLoadExit (MQCFST)**

Name of the cluster workload exit (parameter identifier: MQCA\_CLUSTER\_WORKLOAD\_EXIT).

The maximum length of the exit name depends on the environment in which the exit is running. MQ\_EXIT\_NAME\_LENGTH gives the maximum length for the environment in which your application is running. MQ\_MAX\_EXIT\_NAME\_LENGTH gives the maximum for all supported environments.

**ClusterWorkLoadLength (MQCFIN)**

Cluster workload length (parameter identifier: MQIA\_CLUSTER\_WORKLOAD\_LENGTH).

The maximum length of the message passed to the cluster workload exit.

**CLWLMRUChannels (MQCFIN)**

Cluster workload most recently used (MRU) channels (parameter identifier: MQIA\_CLWL\_MRU\_CHANNELS).

The maximum number of active most recently used outbound channels.

**CLWLUseQ (MQCFIN)**

Use of remote queue (parameter identifier: MQIA\_CLWL\_USEQ).

Specifies whether a cluster queue manager is to use remote puts to other queues defined in other queue managers within the cluster during workload management.

The value can be any of the following values:

**MQCLWL\_USEQ\_ANY**

Use remote queues.

**MQCLWL\_USEQ\_LOCAL**

Do not use remote queues.

**CodedCharSetId (MQCFIN)**

Coded character set identifier (parameter identifier: MQIA\_CODED\_CHAR\_SET\_ID).

**CommandEvent (MQCFIN)**

Controls whether command events are generated (parameter identifier: MQIA\_COMMAND\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**MQEVR\_NODISPLAY**

Event reporting enabled for all successful commands except Inquire commands.

*CommandInputQName* (**MQCFST**)

Command input queue name (parameter identifier: MQCA\_COMMAND\_INPUT\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

*CommandLevel* (**MQCFIN**)

Command level supported by queue manager (parameter identifier: MQIA\_COMMAND\_LEVEL).

The value can be:

**MQCMDL\_LEVEL\_1**

Level 1 of system control commands.

This value is returned by the following platforms:

- MQSeries for AIX V2.2
- MQSeries for OS/400:
  - V2R3
  - V3R1
  - V3R6
- MQSeries for Windows V2.0

**MQCMDL\_LEVEL\_101**

MQSeries for Windows V2.0.1

**MQCMDL\_LEVEL\_110**

MQSeries for Windows V2.1

**MQCMDL\_LEVEL\_200**

MQSeries for Windows NT V2.0

**MQCMDL\_LEVEL\_220**

Level 220 of system control commands.

This value is returned by the following platforms:

- MQSeries for AT&T GIS UNIX V2.2
- MQSeries for SINIX and DC/OSx V2.2
- MQSeries for Compaq NonStop Kernel V2.2.0.1

**MQCMDL\_LEVEL\_221**

Level 221 of system control commands.

This value is returned by the following platforms:

- MQSeries for AIX Version 2.2.1
- MQSeries for DIGITAL UNIX (Compaq Tru64 UNIX ) V2.2.1

**MQCMDL\_LEVEL\_320**

MQSeries for OS/400 V3R2 and V3R7

**MQCMDL\_LEVEL\_420**

MQSeries for AS/400 V4R2 and R2.1

**MQCMDL\_LEVEL\_500**

Level 500 of system control commands.

This value is returned by the following platforms:

- MQSeries for AIX V5.0
- MQSeries for HP-UX V5.0
- MQSeries for Solaris V5.0
- MQSeries for Windows NT V5.0

**MQCMDL\_LEVEL\_510**

Level 510 of system control commands.

This value is returned by the following platforms:

- MQSeries for AIX V5.1
- MQSeries for AS/400 V5.1
- MQSeries for HP-UX V5.1
- MQSeries for Compaq Tru64 UNIX, V5.1
- IBM WebSphere MQ for HP Integrity NonStop Server V5.3
- MQSeries for Solaris V5.1
- MQSeries for Windows NT V5.1

**MQCMDL\_LEVEL\_520**

Level 520 of system control commands.

This value is returned by the following platforms:

- MQSeries for AIX V5.2
- MQSeries for AS/400 V5.2
- MQSeries for HP-UX V5.2
- MQSeries for Linux V5.2
- MQSeries for Solaris V5.2
- MQSeries for Windows NT V5.2
- MQSeries for Windows 2000 V5.2

**MQCMDL\_LEVEL\_530**

Level 530 of system control commands.

This value is returned by the following platforms:

- IBM WebSphere MQ for AIX, V5.3
- IBM WebSphere MQ for IBM i, V5.3
- IBM WebSphere MQ for HP-UX, V5.3
- IBM WebSphere MQ for Linux, V5.3
- IBM WebSphere MQ for Sun Solaris, Version 5.3
- IBM WebSphere MQ for Windows NT and Windows 2000, Version 5.3

**MQCMDL\_LEVEL\_531**

Level 531 of system control commands.

**MQCMDL\_LEVEL\_600**

Level 600 of system control commands.

**MQCMDL\_LEVEL\_700**

Level 700 of system control commands.

**MQCMDL\_LEVEL\_701**

Level 701 of system control commands.

**MQCMDL\_LEVEL\_710**

Level 710 of system control commands.

**MQCMDL\_LEVEL\_750**

Level 750 of system control commands.

This value is returned by the following platforms:

- IBM WebSphere MQ for AIX, V7.5
- IBM WebSphere MQ for HP-UX, V7.5

- IBM WebSphere MQ for Linux, V7.5
- IBM WebSphere MQ for Solaris, V7.5
- IBM WebSphere MQ for Windows V7.5

#### **MQCMDL\_LEVEL\_800**

Level 800 of system control commands.

This value is returned by the following platforms:

- IBM MQ for AIX, V8.0
- IBM MQ for HP-UX, V8.0
- IBM MQ for Linux, V8.0
- IBM MQ for Solaris, V8.0
- IBM MQ for Windows V8.0
- IBM MQ for Windows V8.0

#### **MQCMDL\_LEVEL\_801**

Level 801 of system control commands.

This value is returned by the following platforms:

- IBM MQ for AIX, V8.0.0.2
- IBM MQ for HP-UX, V8.0.0.2
- IBM MQ for Linux, V8.0.0.2
- IBM MQ for Solaris, V8.0.0.2

The set of system control commands that corresponds to a particular value of the *CommandLevel* attribute varies. It varies according to the value of the *Platform* attribute; both must be used to decide which system control commands are supported.

#### **CommandServerControl (MQCFIN)**

Start the command server during queue manager start (parameter identifier: MQIA\_CMD\_SERVER\_CONTROL). This parameter is not available on z/OS.

The value can be:

#### **MQSVC\_CONTROL\_MANUAL**

The command server is not to be started automatically when the queue manager starts.

#### **MQSVC\_CONTROL\_Q\_MGR**

The command server is to be started automatically when the queue manager starts.

#### **ConfigurationEvent (MQCFIN)**

Controls whether configuration events are generated (parameter identifier: MQIA\_CONFIGURATION\_EVENT).

The value can be:

#### **MQEVR\_DISABLED**

Event reporting disabled.

#### **MQEVR\_ENABLED**

Event reporting enabled.

#### **ConnAuth (MQCFST)**

Name of the authentication information object that is used to provide the location of user ID and password authentication (parameter identifier: MQCA\_CONN\_AUTH).

#### **CreationDate (MQCFST)**

Queue creation date, in the form yyyy-mm-dd (parameter identifier: MQCA\_CREATION\_DATE). The maximum length of the string is MQ\_CREATION\_DATE\_LENGTH.

### *CreationTime* (MQCFST)

Creation time, in the form hh.mm.ss (parameter identifier: MQCA\_CREATION\_TIME).  
The maximum length of the string is MQ\_CREATION\_TIME\_LENGTH.

### *Custom* (MQCFST)

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes are introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name and value pairs have the form NAME(VALUE).

This description is updated when features using this attribute are introduced.

### *DeadLetterQName* (MQCFST)

Dead letter (undelivered message) queue name (parameter identifier: MQCA\_DEAD\_LETTER\_Q\_NAME).

Specifies the name of the local queue that is to be used for undelivered messages. Messages are put on this queue if they cannot be routed to their correct destination.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### *DefClusterXmitQueueType* (MQCFIN)

The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels. (Parameter identifier: MQIA\_DEF\_CLUSTER\_XMIT\_Q\_TYPE.)

The values of DefClusterXmitQueueType are MQCLXQ\_SCTQ or MQCLXQ\_CHANNEL.

#### **MQCLXQ\_SCTQ**

All cluster-sender channels send messages from SYSTEM.CLUSTER.TRANSMIT.QUEUE. The correID of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined. This behavior is implicit in versions of IBM WebSphere MQ, earlier than Version 7.5. In earlier versions, the queue manager attribute DefClusterXmitQueueType was not present.

#### **MQCLXQ\_CHANNEL**

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE.

### *DefXmitQName* (MQCFST)

Default transmission queue name (parameter identifier: MQCA\_DEF\_XMIT\_Q\_NAME).

The default transmission queue is used for the transmission of messages to remote queue managers. It is used if there is no other indication of which transmission queue to use.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### *DistLists* (MQCFIN)

Distribution list support (parameter identifier: MQIA\_DIST\_LISTS).

The value can be:

#### **MQDL\_SUPPORTED**

Distribution lists supported.

#### **MQDL\_NOT\_SUPPORTED**

Distribution lists not supported.

### *DNSGroup* (MQCFST)

DNS group name (parameter identifier: MQCA\_DNS\_GROUP).

This parameter is no longer used. Refer to WLM/DNS no longer supported.

This parameter is valid only on z/OS.

► **z/OS** *DNSWLM* (**MQCFIN**)

WLM/DNS Control: (parameter identifier: MQIA\_DNS\_WLM).

This parameter is no longer used. Refer to WLM/DNS no longer supported.

The value can be any of the following values:

**MQDNSWLM\_NO**

MQDNSWLM\_NO is the only value supported by the queue manager.

This parameter is valid only on z/OS.

*EncryptionPolicySuiteB* (**MQCFIL**)

Specifies whether Suite B-compliant cryptography is used and what level of strength is employed (parameter identifier: MQIA\_SUITE\_B\_STRENGTH). For more information about Suite B configuration and its effect on SSL and TLS channels, see NSA Suite B Cryptography in IBM MQ .

The value can be one, or more, of:

**MQ\_SUITE\_B\_NONE**

Suite B-compliant cryptography is not used.

**MQ\_SUITE\_B\_128\_BIT**

Suite B 128-bit strength security is used.

**MQ\_SUITE\_B\_192\_BIT**

Suite B 192-bit strength security is used.

**MQ\_SUITE\_B\_128\_BIT, MQ\_SUITE\_B\_192\_BIT**

Suite B 128-bit and Suite B 192-bit strength security is used.

► **z/OS** *ExpiryInterval* (**MQCFIN**)

Interval between scans for expired messages (parameter identifier: MQIA\_EXPIRY\_INTERVAL).

Specifies the frequency with which the queue manager scans the queues looking for expired messages. This parameter is a time interval in seconds in the range 1 through 99 999 999, or the following special value:

**MQEXPI\_OFF**

No scans for expired messages.

This parameter is valid only on z/OS.

► **z/OS** *GroupUR* (**MQCFIN**)

Identifies whether XA client applications can establish transactions with a GROUP unit of recovery disposition.

The value can be:

**MQGUR\_DISABLED**

XA client applications must connect using a queue manager name.

**MQGUR\_ENABLED**

XA client applications can establish transactions with a group unit of recovery disposition by specifying a QSG name when they connect.

This parameter is valid only on z/OS.

► **z/OS** *IGQPutAuthority* (**MQCFIN**)

Type of authority checking used by the intra-group queuing agent (parameter identifier: MQIA\_IGQ\_PUT\_AUTHORITY).

The attribute indicates the type of authority checking that is performed by the local intra-group queuing agent (IGQ agent). The checking is performed when the IGQ agent removes a message from the shared transmission queue and places the message on a local queue. The value can be any of the following values:

**MQIGQPA\_DEFAULT**

Default user identifier is used.

**MQIGQPA\_CONTEXT**

Context user identifier is used.

**MQIGQPA\_ONLY\_IGQ**

Only the IGQ user identifier is used.

**MQIGQPA\_ALTERNATE\_OR\_IGQ**

Alternate user identifier or IGQ-agent user identifier is used.

This parameter is valid only on z/OS.

▶ **z/OS** *IGQUserId* (**MQCFST**)

User identifier used by the intra-group queuing agent (parameter identifier: MQCA\_IGQ\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH. This parameter is valid only on z/OS.

*InhibitEvent* (**MQCFIN**)

Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated (parameter identifier: MQIA\_INHIBIT\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

▶ **z/OS** *IntraGroupqueuing* (**MQCFIN**)

Specifies whether intra-group queuing is used (parameter identifier: MQIA\_INTRA\_GROUP\_queuing).

The value can be:

**MQIGQ\_DISABLED**

Intra-group queuing is disabled. All messages destined for other queue managers in the queue-sharing group are transmitted using conventional channels.

**MQIGQ\_ENABLED**

Intra-group queuing is enabled.

This parameter is valid only on z/OS.

*IPAddressVersion* (**MQCFIN**)

IP address version selector (parameter identifier: MQIA\_IP\_ADDRESS\_VERSION).

Specifies which IP address version, either IPv4 or IPv6, is used. The value can be:

**MQIPADDR\_IPv4**

IPv4 is used.

**MQIPADDR\_IPv6**

IPv6 is used.

*ListenerTimer* (**MQCFIN**)

Listener restart interval (parameter identifier: MQIA\_LISTENER\_TIMER).

The time interval, in seconds, between attempts by IBM MQ to restart the listener after an APPC or TCP/IP failure.

▶ **z/OS** *LocalEvent* (**MQCFIN**)

Controls whether local error events are generated (parameter identifier: MQIA\_LOCAL\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

This parameter is valid only on z/OS.

*LoggerEvent* (**MQCFIN**)

Controls whether recovery log events are generated (parameter identifier: MQIA\_LOGGER\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

This parameter applies only to AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

▶ **z/OS** *LUGroupName* (**MQCFST**)

Generic LU name for the LU 6.2 listener (parameter identifier: MQCA\_LU\_GROUP\_NAME).

The generic LU name to be used by the LU 6.2 listener that handles inbound transmissions for the queue-sharing group. This parameter is valid only on z/OS.

▶ **z/OS** *LUName* (**MQCFST**)

LU name to use for outbound LU 6.2 transmissions (parameter identifier: MQCA\_LU\_NAME).

The name of the LU to use for outbound LU 6.2 transmissions. This parameter is valid only on z/OS.

▶ **z/OS** *LU62ARMSuffix* (**MQCFST**)

APPCPM suffix (parameter identifier: MQCA\_LU62\_ARM\_SUFFIX).

The suffix of the APPCPM member of SYS1.PARMLIB. This suffix nominates the LUADD for this channel initiator. This parameter is valid only on z/OS.

▶ **z/OS** *LU62Channels* (**MQCFIN**)

Maximum number of LU 6.2 channels (parameter identifier: MQIA\_LU62\_CHANNELS).

The maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol. This parameter is valid only on z/OS.

▶ **z/OS** *MaxActiveChannels* (**MQCFIN**)

Maximum number of channels (parameter identifier: MQIA\_ACTIVE\_CHANNELS).

The maximum number of channels that can be active at any time. This parameter is valid only on z/OS.

▶ **z/OS** *MaxChannels* (**MQCFIN**)

Maximum number of current channels (parameter identifier: MQIA\_MAX\_CHANNELS).

The maximum number of channels that can be current (including server-connection channels with connected clients). This parameter is valid only on z/OS.

*MaxHandles* (**MQCFIN**)

Maximum number of handles (parameter identifier: MQIA\_MAX\_HANDLES).

Specifies the maximum number of handles that any one connection can have open at the same time.

**MaxMsgLength (MQCFIN)**

Maximum message length (parameter identifier: MQIA\_MAX\_MSG\_LENGTH).

**MaxPriority (MQCFIN)**

Maximum priority (parameter identifier: MQIA\_MAX\_PRIORITY).

**MaxPropertiesLength (MQCFIN)**

Maximum properties length (parameter identifier: MQIA\_MAX\_PROPERTIES\_LENGTH).

**MaxUncommittedMsgs (MQCFIN)**

Maximum number of uncommitted messages within a unit of work (parameter identifier: MQIA\_MAX\_UNCOMMITTED\_MSGS).

This number is the sum of the following number of messages under any one sync point. :

- The number of messages that can be retrieved, plus
- The number of messages that can be put on a queue, plus
- Any trigger messages generated within this unit of work

The limit does not apply to messages that are retrieved or put outside sync point.

**MQIAccounting (MQCFIN)**

Specifies whether accounting information for MQI data is to be collected (parameter identifier: MQIA\_ACCOUNTING\_MQI).

The value can be:

**MQMON\_OFF**

MQI accounting data collection is disabled.

**MQMON\_ON**

MQI accounting data collection is enabled.

This parameter applies only to AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

**MQIStatistics (MQCFIN)**

Specifies whether statistics monitoring data is to be collected for the queue manager (parameter identifier: MQIA\_STATISTICS\_MQI).

The value can be:

**MQMON\_OFF**

Data collection for MQI statistics is disabled. MQMON\_OFF is the initial default value of the queue manager.

**MQMON\_ON**

Data collection for MQI statistics is enabled.

This parameter applies only to AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

**MsgMarkBrowseInterval (MQCFIN)**

Mark-browse interval (parameter identifier: MQIA\_MSG\_MARK\_BROWSE\_INTERVAL).

The time interval in milliseconds after which the queue manager can automatically unmark messages.

**z/OS OutboundPortMax (MQCFIN)**

The maximum value in the range for the binding of outgoing channels (parameter identifier: MQIA\_OUTBOUND\_PORT\_MAX).

The maximum value in the range of port numbers to be used when binding outgoing channels. This parameter is valid only on z/OS.

**z/OS OutboundPortMin (MQCFIN)**

The minimum value in the range for the binding of outgoing channels (parameter identifier: MQIA\_OUTBOUND\_PORT\_MIN).

The minimum value in the range of port numbers to be used when binding outgoing channels. This parameter is valid only on z/OS.

**Parent (MQCFST)**

The name of the hierarchically connected queue manager nominated as the parent of this queue manager (parameter identifier: MQCA\_PARENT).

**PerformanceEvent (MQCFIN)**

Controls whether performance-related events are generated (parameter identifier: MQIA\_PERFORMANCE\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**Platform (MQCFIN)**

Platform on which the queue manager resides (parameter identifier: MQIA\_PLATFORM).

The value can be:

**MQPL\_AIX**

AIX (same value as MQPL\_UNIX).

**V 8.0.0.2 MQPL\_APPLIANCE**

IBM MQ Appliance

**MQPL\_NSK**

HP Integrity NonStop Server.

**MQPL\_OS400**

IBM i.

**MQPL\_UNIX**

UNIX systems.

**MQPL\_WINDOWS\_NT**

Windows.

**MQPL\_ZOS**

z/OS

**PubSubClus (MQCFIN)**

Controls whether the queue manager participates in publish/subscribe clustering (parameter identifier: MQIA\_PUBSUB\_CLUSTER).

The value can be:

**MQPSCLUS\_ENABLED**

The creating or receipt of clustered topic definitions and cluster subscriptions is permitted.

**Note:** The introduction of a clustered topic into a large IBM MQ cluster can cause a degradation in performance. This degradation occurs because all partial repositories are notified of all the other members of the cluster. Unexpected subscriptions might be created at all other nodes; for example, where proxysub(FORCE) is specified. Large numbers of channels might be started from a queue manager; for example, on resync after a queue manager failure.

**MQPSCLUS\_DISABLED**

The creating or receipt of clustered topic definitions and cluster subscriptions is inhibited. The creations or receipts are recorded as warnings in the queue manager error logs.

*PubSubMaxMsgRetryCount* (MQCFIN)

The number of attempts to reprocess a failed command message under sync point (parameter identifier: MQIA\_PUBSUB\_MAXMSG\_RETRY\_COUNT).

*PubSubMode* (MQCFIN)

Specifies whether the publish/subscribe engine and the queued publish/subscribe interface are running. The publish/subscribe engine enables applications to publish or subscribe by using the application programming interface. The publish/subscribe interface monitors the queues used the queued publish/subscribe interface (parameter identifier: MQIA\_PUBSUB\_MODE).

The values can be as follows:

**MQPSM\_COMPAT**

The publish/subscribe engine is running. It is therefore possible to publish or subscribe by using the application programming interface. The queued publish/subscribe interface is not running. Therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. MQPSM\_COMPAT is used for compatibility with versions of WebSphere Message Broker (now known as IBM Integration Bus ) prior to version 7 that use this queue manager.

**MQPSM\_DISABLED**

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish or subscribe by using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

**MQPSM\_ENABLED**

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish or subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface. MQPSM\_ENABLED is the initial default value of the queue manager.

*PubSubNPInputMsg* (MQCFIN)

Specifies whether to discard or keep an undelivered input message (parameter identifier: MQIA\_PUBSUB\_NP\_MSG).

The values can be as follows:

**MQUNDELIVERED\_DISCARD**

Non-persistent input messages can be discarded if they cannot be processed. MQUNDELIVERED\_DISCARD is the default value.

**MQUNDELIVERED\_KEEP**

Non-persistent input messages are not discarded if they cannot be processed. The queued publish/subscribe interface continues to try the process again at appropriate intervals. It does not continue processing subsequent messages.

*PubSubNPResponse* (MQCFIN)

Controls the behavior of undelivered response messages (parameter identifier: MQIA\_PUBSUB\_NP\_RESP).

The values can be as follows:

**MQUNDELIVERED\_NORMAL**

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If they cannot be placed on the dead letter queue, they are discarded.

**MQUNDELIVERED\_SAFE**

Non-persistent responses that cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be sent and cannot be placed on the dead letter queue the queued publish/subscribe interface rolls back the current operation. The operation is tried again at appropriate intervals and does not continue processing subsequent messages.

**MQUNDELIVERED\_DISCARD**

Non-persistent responses that cannot be placed on the reply queue are discarded. MQUNDELIVERED\_DISCARD is the default value for new queue managers.

**MQUNDELIVERED\_KEEP**

Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface backs out the current operation and then tries it again at appropriate intervals.

**PubSubSyncPoint (MQCFIN)**

Specifies whether only persistent messages or all messages are processed under sync point (parameter identifier: MQIA\_PUBSUB\_SYNC\_PT).

The values can be as follows:

**MQSYNCPOINT\_IFPER**

This makes the queued publish/subscribe interface receive non-persistent messages outside sync point. If the daemon receives a publication outside sync point, the daemon forwards the publication to subscribers known to it outside sync point. MQSYNCPOINT\_IFPER is the default value.

**MQSYNCPOINT\_YES**

MQSYNCPOINT\_YES makes the queued publish/subscribe interface receive all messages under sync point.

**QMgrDesc (MQCFST)**

Queue manager description (parameter identifier: MQCA\_Q\_MGR\_DESC).

This parameter is text that briefly describes the object.

The maximum length of the string is MQ\_Q\_MGR\_DESC\_LENGTH.

Use characters from the character set identified by the coded character set identifier (CCSID) for the queue manager on which the command is executing. Using this character set ensures that the text is translated correctly.

**QMgrIdentifier (MQCFST)**

Queue manager identifier (parameter identifier: MQCA\_Q\_MGR\_IDENTIFIER).

The unique identifier of the queue manager.

**QMgrName (MQCFST)**

Name of local queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**z/OS QSGCertificateLabel (MQCFST)**

Certificate label for this queue sharing group to use. The label identifies which personal certificate in the key repository has been selected.

The maximum length of the string is MQ\_QSG\_CERT\_LABEL\_LENGTH. This parameter is valid only on z/OS.

**z/OS QSGName (MQCFST)**

Queue sharing group name (parameter identifier: MQCA\_QSG\_NAME).

The maximum length of the string is MQ\_QSG\_NAME\_LENGTH. This parameter is valid only on z/OS.

**QueueAccounting (MQCFIN)**

Collection of accounting (thread-level and queue-level accounting) data for queues (parameter identifier: MQIA\_ACCOUNTING\_Q).

The value can be:

**MQMON\_NONE**

Accounting data collection for queues is disabled.

**MQMON\_OFF**

Accounting data collection is disabled for queues specifying a value of MQMON\_Q\_MGR in the *QueueAccounting* parameter.

**MQMON\_ON**

Accounting data collection is enabled for queues specifying a value of MQMON\_Q\_MGR in the *QueueAccounting* parameter.

**QueueMonitoring (MQCFIN)**

Default setting for online monitoring for queues (parameter identifier: MQIA\_MONITORING\_Q).

If the *QueueMonitoring* queue attribute is set to MQMON\_Q\_MGR, this attribute specifies the value which is assumed by the channel. The value can be any of the following values:

**MQMON\_OFF**

Online monitoring data collection is turned off.

**MQMON\_NONE**

Online monitoring data collection is turned off for queues regardless of the setting of their *QueueMonitoring* attribute.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low ratio of data collection.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate ratio of data collection.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high ratio of data collection.

**QueueStatistics (MQCFIN)**

Specifies whether statistics data is to be collected for queues (parameter identifier: MQIA\_STATISTICS\_Q).

The value can be:

**MQMON\_NONE**

Statistics data collection is turned off for queues regardless of the setting of their *QueueStatistics* parameter.

**MQMON\_OFF**

Statistics data collection is turned off for queues specifying a value of MQMON\_Q\_MGR in their *QueueStatistics* parameter.

**MQMON\_ON**

Statistics data collection is turned on for queues specifying a value of MQMON\_Q\_MGR in their *QueueStatistics* parameter.

This parameter is valid only on AIX, HP-UX, Linux, IBM i, Solaris, and Windows.

**z/OS ReceiveTimeout (MQCFIN)**

How long a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA\_RECEIVE\_TIMEOUT).

The length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state.

This parameter is valid only on z/OS.

▶ **z/OS** *ReceiveTimeoutMin* (MQCFIN)

The minimum length of time that a TCP/IP channel waits to receive data from its partner (parameter identifier: MQIA\_RECEIVE\_TIMEOUT\_MIN).

The minimum length of time that a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. This parameter is valid only on z/OS.

▶ **z/OS** *ReceiveTimeoutType* (MQCFIN)

The qualifier to apply to *ReceiveTimeout* (parameter identifier: MQIA\_RECEIVE\_TIMEOUT\_TYPE).

The qualifier to apply to *ReceiveTimeoutType* to calculate how long a TCP/IP channel waits to receive data from its partner. The wait includes heartbeats. If the wait interval expires the channel returns to the inactive state. This parameter is valid only on z/OS.

The value can be:

**MQRCVTIME\_MULTIPLY**

The *ReceiveTimeout* value is a multiplier to be applied to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

**MQRCVTIME\_ADD**

*ReceiveTimeout* is a value, in seconds, to be added to the negotiated value of *HeartbeatInterval* to determine how long a channel waits.

**MQRCVTIME\_EQUAL**

*ReceiveTimeout* is a value, in seconds, representing how long a channel waits.

*RemoteEvent* (MQCFIN)

Controls whether remote error events are generated (parameter identifier: MQIA\_REMOTE\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

*RepositoryName* (MQCFST)

Repository name (parameter identifier: MQCA\_REPOSITORY\_NAME).

The name of a cluster for which this queue manager is to provide a repository service.

*RepositoryNameList* (MQCFST)

Repository name list (parameter identifier: MQCA\_REPOSITORY\_NAMELIST).

The name of a list of clusters for which this queue manager is to provide a repository service.

*RevDns* (MQCFIN)

Whether reverse lookup of the host name from a Domain Name Server is carried out. (parameter identifier: MQIA\_REVERSE\_DNS\_LOOKUP).

This attribute has an effect only on channels using a transport type (TRPTYPE) of TCP.

The value can be:

**MQRDNS\_DISABLED**

DNS host names are not reverse looked-up for the IP addresses of inbound channels. With this setting any CHLAUTH rules using host names are not matched.

**MQRDNS\_ENABLED**

DNS host names are reverse looked-up for the IP addresses of inbound channels when this information is required. This setting is required for matching against CHLAUTH rules that contain host names, and for writing out error messages.

▶ **z/OS** *SecurityCase* (**MQCFIN**)

Security case supported (parameter identifier: MQIA\_SECURITY\_CASE).

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only. The value is activated when a Refresh Security command is run with *SecurityType*(MQSECTYPE\_CLASSES) specified.

The value can be:

**MQSCYC\_UPPER**

Security profile names must be in uppercase.

**MQSCYC\_MIXED**

Security profile names can be in uppercase or in mixed case.

This parameter is valid only on z/OS.

▶ **z/OS** *SharedQMgrName* (**MQCFIN**)

Shared-queue queue manager name (parameter identifier: MQIA\_SHARED\_Q\_Q\_MGR\_NAME ).

A queue manager makes an MQOPEN call for a shared queue. The queue manager that is specified in the *ObjectQmgrName* parameter of the MQOPEN call is in the same queue-sharing group as the processing queue manager. The SQQMNAME attribute specifies whether the *ObjectQmgrName* is used or whether the processing queue manager opens the shared queue directly.

The value can be any of the following values:

**MQSQQM\_USE**

*ObjectQmgrName* is used and the appropriate transmission queue is opened.

**MQSQQM\_IGNORE**

The processing queue manager opens the shared queue directly.

This parameter is valid only on z/OS.

*Splcap* (**MQCFIN**)

If the IBM MQ AMS component is installed for the version of IBM MQ that the queue manager is running under, the attribute has a value YES (MQCAP\_SUPPORTED). If the IBM MQ AMS component is not installed, the value is NO (MQCAP\_NOT\_SUPPORTED) (parameter identifier: MQIA\_PROT\_POLICY\_CAPABILITY).

The value can be one of the following values:

**MQCAP\_SUPPORTED**

If the IBM MQ AMS component is installed for the version of IBM MQ that the queue manager is running under.

**MQCAP\_NOT\_SUPPORTED**

If the IBM MQ AMS component is not installed.

*SSLCRLNamelist* (**MQCFST**)

The SSL certificate revocation location namelist (parameter identifier: MQCA\_SSL\_CRL\_NAMELIST).

The length of the string is MQ\_NAMELIST\_NAME\_LENGTH.

Indicates the name of a namelist of authentication information objects to be used for certificate revocation checking by the queue manager.

Only authentication information objects with types of LDAPCRL or OCSP are allowed in the namelist referred to by *SSLCRLNamelist* (MQCFST). Any other type results in an error message when the list is processed and is subsequently ignored.

*SSLCryptoHardware* (**MQCFST**)

Parameters to configure the SSL cryptographic hardware (parameter identifier: MQCA\_SSL\_CRYPTO\_HARDWARE).

The length of the string is MQ\_SSL\_CRYPTO\_HARDWARE\_LENGTH.

Sets the name of the parameter string required to configure the cryptographic hardware present on the system.

This parameter is supported on AIX, HP-UX, Solaris, Linux, and Windows only.

**SSLEvent (MQCFIN)**

Controls whether SSL events are generated (parameter identifier: MQIA\_SSL\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**SSLFipsRequired (MQCFIN)**

Controls whether only FIPS-certified algorithms are to be used if cryptography is executed in IBM MQ itself (parameter identifier: MQIA\_SSL\_FIPS\_REQUIRED). This parameter is valid only on Windows Linux UNIX and z/OS platforms.

The value can be:

**MQSSL\_FIPS\_NO**

Any supported CipherSpec can be used.

**MQSSL\_FIPS\_YES**

Only FIPS-certified cryptographic algorithms are to be used if cryptography is executed in IBM MQ rather than cryptographic hardware.

**SSLKeyRepository (MQCFST)**

Location and name of the SSL key repository (parameter identifier: MQCA\_SSL\_KEY\_REPOSITORY).

The length of the string is MQ\_SSL\_KEY\_REPOSITORY\_LENGTH.

Indicates the name of the Secure Sockets Layer key repository.

The format of the name depends on the environment.

**SSLKeyResetCount (MQCFIN)**

SSL key reset count (parameter identifier: MQIA\_SSL\_RESET\_COUNT).

The number of unencrypted bytes that initiating SSL channel MCAs send or receive before renegotiating the secret key.

**z/OS SSLTasks (MQCFIN)**

Number of server subtasks used for processing SSL calls (parameter identifier: MQIA\_SSL\_TASKS).

The number of server subtasks used for processing SSL calls. This parameter is valid only on z/OS.

**StartStopEvent (MQCFIN)**

Controls whether start and stop events are generated (parameter identifier: MQIA\_START\_STOP\_EVENT).

The value can be:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

**StatisticsInterval (MQCFIN)**

The time interval, in seconds, at which statistics monitoring data is written to the monitoring queue (parameter identifier: MQIA\_STATISTICS\_INTERVAL).

This parameter is valid only on AIX, HP-UX, Linux, IBM i, Solaris, and Windows.

### *SyncPoint* (MQCFIN)

Sync point availability (parameter identifier: MQIA\_SYNCPOINT).

The value can be:

#### **MQSP\_AVAILABLE**

Units of work and sync pointing available.

#### **MQSP\_NOT\_AVAILABLE**

Units of work and sync pointing not available.

### ▶ *z/OS* **TCPChannels** (MQCFIN)

The maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol (parameter identifier: MQIA\_TCP\_CHANNELS).

This parameter is valid only on z/OS.

### ▶ *z/OS* **TCPKeepAlive** (MQCFIN)

Specifies whether the TCP KEEPALIVE facility is to be used to check whether the other end of the connection is still available (parameter identifier: MQIA\_TCP\_KEEP\_ALIVE).

The value can be:

#### **MQTCPKEEP\_YES**

The TCP KEEPALIVE facility is to be used as specified in the TCP profile configuration data set. The interval is specified in the *KeepAliveInterval* channel attribute.

#### **MQTCPKEEP\_NO**

The TCP KEEPALIVE facility is not to be used.

This parameter is valid only on z/OS.

### ▶ *z/OS* **TCPName** (MQCFST)

The name of the TCP/IP system that you are using (parameter identifier: MQIA\_TCP\_NAME).

This parameter is valid only on z/OS.

### *TCPStackType* (MQCFIN)

Specifies whether the channel initiator can use only the TCP/IP address space specified in *TCPName*, or can optionally bind to any selected TCP/IP address (parameter identifier: MQIA\_TCP\_STACK\_TYPE).

The value can be:

#### **MQTCPSTACK\_SINGLE**

The channel initiator can use only the TCP/IP address space specified in *TCPName*.

#### **MQTCPSTACK\_MULTIPLE**

The channel initiator can use any TCP/IP address space available to it.

This parameter is valid only on z/OS.

### *TraceRouteRecording* (MQCFIN)

Specifies whether trace-route information can be recorded and a reply message generated (parameter identifier: MQIA\_TRACE\_ROUTE\_RECORDING).

The value can be:

#### **MQRECORDING\_DISABLED**

Trace-route information cannot be recorded.

#### **MQRECORDING\_MSG**

Trace-route information can be recorded and sent to the destination specified by the originator of the message causing the trace route record.

#### **MQRECORDING\_Q**

Trace-route information can be recorded and sent to SYSTEM.ADMIN.TRACE.ROUTE.QUEUE.

### *TreeLifeTime* (MQCFIN)

The lifetime in seconds of non-administrative topics (parameter identifier: MQIA\_TREE\_LIFE\_TIME).

Non-administrative topics are those topics created when an application publishes to, or subscribes on, a topic string that does not exist as an administrative node. When this non-administrative node no longer has any active subscriptions, this parameter determines how long the queue manager waits before removing that node. Only non-administrative topics that are in use by a durable subscription remain after the queue manager it recycled.

The value can be in the range 0 - 604,000. A value of 0 means that non-administrative topics are not removed by the queue manager. The initial default value of the queue manager is 1800.

### *TriggerInterval* (MQCFIN)

Trigger interval (parameter identifier: MQIA\_TRIGGER\_INTERVAL).

Specifies the trigger time interval, expressed in milliseconds, for use only with queues where *TriggerType* has a value of MQTT\_FIRST.

### *Version* (MQCFST)

The version of the IBM MQ code (parameter identifier: MQCA\_VERSION).

The version of the IBM MQ code is shown as VVRRMMFF:

VV: Version

RR: Release

MM: Maintenance level

FF: Fix level

### *XrCapability* (MQCFIN)

Specifies whether the IBM MQ Telemetry capability and commands are supported by the queue manager where *XrCapability* has a value of MQCAP\_SUPPORTED or MQCAP\_NOT\_SUPPORTED (parameter identifier: MQIA\_XR\_CAPABILITY).

This parameter applies only to IBM i, Unix systems, and Windows.

#### **Related information:**

Specifying that only FIPS-certified CipherSpecs are used at run time on the MQI client  
Federal Information Processing Standards (FIPS) for UNIX, Linux and Windows

#### **Inquire Queue Manager Status:**

The Inquire Queue Manager Status (MQCMD\_INQUIRE\_Q\_MGR\_STATUS) command inquires about the status of the local queue manager.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

#### **Optional parameters**

### *QMStatusAttrs* (MQCFIL)

Queue manager status attributes (parameter identifier: MQIACF\_Q\_MGR\_STATUS\_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQCA\_Q\_MGR\_NAME**

Name of the local queue manager.

**MQCA\_INSTALLATION\_DESC**

Description of the installation associated with the queue manager. This parameter is not valid on IBM i.

**MQCA\_INSTALLATION\_NAME**

Name of the installation associated with the queue manager. This parameter is not valid on IBM i.

**MQCA\_INSTALLATION\_PATH**

Path of the installation associated with the queue manager. This parameter is not valid on IBM i.

**MQCACF\_CURRENT\_LOG\_EXTENT\_NAME**

Name of the log extent currently being written to by the logger.

MQCACF\_CURRENT\_LOG\_EXTENT\_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF\_CURRENT\_LOG\_EXTENT\_NAME is blank.

**MQCACF\_LOG\_PATH**

Location of the recovery log extents.

**MQCACF\_MEDIA\_LOG\_EXTENT\_NAME**

Name of the earliest log extent required to perform media recovery.

MQCACF\_MEDIA\_LOG\_EXTENT\_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF\_MEDIA\_LOG\_EXTENT\_NAME is blank.

**MQCACF\_RESTART\_LOG\_EXTENT\_NAME**

Name of the earliest log extent required to perform restart recovery.

MQCACF\_RESTART\_LOG\_EXTENT\_NAME is available only on queue managers using linear logging. On other queue managers, MQCACF\_RESTART\_LOG\_EXTENT\_NAME is blank.

**MQCACF\_Q\_MGR\_START\_DATE**

The date on which the queue manager was started (in the form yyyy-mm-dd). The length of this attribute is given by MQ\_DATE\_LENGTH.

**MQCACF\_Q\_MGR\_START\_TIME**

The time at which the queue manager was started (in the form hh.mm.ss). The length of this attribute is given by MQ\_TIME\_LENGTH.

**MQIACF\_CHINIT\_STATUS**

Current status of the channel initiator.

**MQIACF\_LDAP\_CONNECTION\_STATUS**

Current status of the connection to the LDAP server.

**MQIACF\_CMD\_SERVER\_STATUS**

Current status of the command server.

**MQIACF\_CONNECTION\_COUNT**

Current number of connections to the queue manager.

**MQIACF\_Q\_MGR\_STATUS**

Current status of the queue manager.

### Inquire Queue Manager Status (Response):

The response to the Inquire Queue Manager Status (MQCMD\_INQUIRE\_Q\_MGR\_STATUS) command consists of the response header followed by the *QMgrName* and *QMgrStatus* structures and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

#### Always returned:

*QMgrName, QMgrStatus*

#### Returned if requested:

*ChannelInitiatorStatus, CommandServerStatus, ConnectionCount, CurrentLog, InstallationDesc, InstallationName, InstallationPath, LDAPConnectionStatus, LogPath, MediaRecoveryLog, RestartRecoveryLog, StartDate, StartTime*

#### Response data

##### *ChannelInitiatorStatus* (MQCFIN)

Status of the channel initiator reading SYSTEM.CHANNEL.INITQ (parameter identifier: MQIACF\_CHINIT\_STATUS).

The value can be:

##### **MQSVC\_STATUS\_STOPPED**

The channel initiator is not running.

##### **MQSVC\_STATUS\_STARTING**

The channel initiator is in the process of initializing.

##### **MQSVC\_STATUS\_RUNNING**

The channel initiator is fully initialized and is running.

##### **MQSVC\_STATUS\_STOPPING**

The channel initiator is stopping.

##### *CommandServerStatus* (MQCFIN)

Status of the command server (parameter identifier: MQIACF\_CMD\_SERVER\_STATUS).

The value can be:

##### **MQSVC\_STATUS\_STARTING**

The command server is in the process of initializing.

##### **MQSVC\_STATUS\_RUNNING**

The command server is fully initialized and is running.

##### **MQSVC\_STATUS\_STOPPING**

The command server is stopping.

##### *ConnectionCount* (MQCFIN)

Connection count (parameter identifier: MQIACF\_CONNECTION\_COUNT).

The current number of connections to the queue manager.

##### *CurrentLog* (MQCFST)

Log extent name (parameter identifier: MQCACF\_CURRENT\_LOG\_EXTENT\_NAME).

The name of the log extent that was being written to at the time of the Inquire command. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

**InstallationDesc (MQCFST)**

Installation Description (parameter identifier: MQCA\_INSTALLATION\_DESC)

The installation description for this queue manager. Not valid on IBM i.

**InstallationName (MQCFST)**

Installation Name (parameter identifier: MQCA\_INSTALLATION\_NAME)

The installation name for this queue manager. Not valid on IBM i.

**InstallationPath (MQCFST)**

Installation Path (parameter identifier: MQCA\_INSTALLATION\_PATH)

The installation path for this queue manager. Not valid on IBM i.

**LDAPConnectionStatus (MQCFIN)**

Current status of the queue manager's connection to the LDAP server (parameter identifier: MQIACF\_LDAP\_CONNECTION\_STATUS).

The value can be:

**MQLDAPC\_CONNECTED**

The queue manager currently has a connection to the LDAP server.

**MQLDAPC\_ERROR**

The queue manager attempted to make a connection to the LDAP server and failed.

**MQLDAPC\_INACTIVE**

The queue manager is not configured to use an LDAP server or has not yet made a connection to the LDAP server.

**LogPath (MQCFST)**

Location of the recovery log extents (parameter identifier: MQCACF\_LOG\_PATH).

This parameter identifies the directory where log files are created by the queue manager.

The maximum length of the string is MQ\_LOG\_PATH\_LENGTH.

**MediaRecoveryLog (MQCFST)**

Name of the oldest log extent required by the queue manager to perform media recovery (parameter identifier: MQCACF\_MEDIA\_LOG\_EXTENT\_NAME). This parameter is available only on queue managers using linear logging. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

**QMgrName (MQCFST)**

Name of the local queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**QMgrStatus (MQCFIN)**

Current execution status of the queue manager (parameter identifier: MQIACF\_Q\_MGR\_STATUS).

The value can be:

**MQQMSTA\_STARTING**

The queue manager is initializing.

**MQQMSTA\_RUNNING**

The queue manager is fully initialized and is running.

**MQQMSTA QUIESCING**

The queue manager is quiescing.

### *RestartRecoveryLog* (MQCFST)

Name of the oldest log extent required by the queue manager to perform restart recovery (parameter identifier: MQCACF\_RESTART\_LOG\_EXTENT\_NAME).

This parameter is available only on queue managers using linear logging. If the queue manager is using circular logging, this parameter is blank.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

### *StartDate* (MQCFST)

Date when this queue manager was started (in the form yyyy-mm-dd) (parameter identifier: MQCACF\_Q\_MGR\_START\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

### *StartTime* (MQCFST)

Time when this queue manager was started (in the form hh:mm:ss) (parameter identifier: MQCACF\_Q\_MGR\_START\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

### **Inquire Queue Names:**

The Inquire Queue Names (MQCMD\_INQUIRE\_Q\_NAMES) command inquires a list of queue names that match the generic queue name, and the optional queue type specified.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### **Required parameters**

#### *QName* (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_Q\_LENGTH.

### **Optional parameters** z/OS

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

**MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED. MQQSGD\_SHARED is permitted only in a shared queue environment.

**QType (MQCFIN)**

Queue type (parameter identifier: MQIA\_Q\_TYPE).

If present, this parameter limits the queue names returned to queues of the specified type. If this parameter is not present, queues of all types are eligible. The value can be any of the following values:

**MQQT\_ALL**

All queue types.

**MQQT\_LOCAL**

Local queue.

**MQQT\_ALIAS**

Alias queue definition.

**MQQT\_REMOTE**

Local definition of a remote queue.

**MQQT\_MODEL**

Model queue definition.

The default value if this parameter is not specified is MQQT\_ALL.

## Inquire Queue Names (Response):

The response to the Inquire Queue Names (MQCMD\_INQUIRE\_Q\_NAMES) command consists of the response header followed by a single parameter structure giving zero or more names that match the specified queue name. The response header is followed by the *QTypes* structure, with the same number of entries as the *QNames* structure. Each entry gives the type of the queue with the corresponding entry in the *QNames* structure.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### z/OS

Additionally, on z/OS only, the *QSGDispositions* parameter structure (with the same number of entries as the *QNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *QNames* structure.

#### Always returned:

*QNames*, **z/OS** *QSGDispositions*, *QTypes*

#### Returned if requested:

None

#### Response data

##### *QNames* (MQCFSL)

List of queue names (parameter identifier: MQCACF\_Q\_NAMES).

### z/OS

##### *QSGDispositions* (MQCFIL)

List of QSG dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter is valid on z/OS only. Possible values for fields in this structure are:

###### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

###### MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP.

###### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

###### MQQSGD\_SHARED

The object is defined as MQQSGD\_SHARED.

##### *QTypes* (MQCFIL)

List of queue types (parameter identifier: MQIACF\_Q\_TYPES). Possible values for fields in this structure are:

###### MQQT\_ALIAS

Alias queue definition.

###### MQQT\_LOCAL

Local queue.

###### MQQT\_REMOTE

Local definition of a remote queue.

## MQQT\_MODEL

Model queue definition.

### Inquire Queue Status:

The Inquire Queue Status (MQCMD\_INQUIRE\_Q\_STATUS) command inquires about the status of a local IBM MQ queue. You must specify the name of a local queue for which you want to receive status information.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### Required parameters

#### *QName* (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

Generic queue names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all queues having names that start with the selected character string. An asterisk on its own matches all possible names.

The queue name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### Optional parameters (Inquire Queue Status)

#### *ByteStringFilterCommand* (MQCFBF)

Byte string filter command descriptor. The parameter identifier must be MQBACF\_EXTERNAL\_UOW\_ID or MQBACF\_Q\_MGR\_UOW\_ID. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFBF - PCF byte string filter parameter” on page 1583 for information about using this filter condition.

If you specify a byte string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter, or a string filter using the *StringFilterCommand* parameter.

#### ▶ z/OS

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is initiated when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is initiated on the queue manager on which it was entered.
- Queue manager name. The command is initiated on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be initiated.
- An asterisk (\*). The command is initiated on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *QStatusAttrs* except MQIACF\_ALL, MQIACF\_MONITORING, and MQIACF\_Q\_TIME\_INDICATOR. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a byte string filter using the *ByteStringFilterCommand* parameter or a string filter using the *StringFilterCommand* parameter.

### *OpenType* (MQCFIN)

Queue status open type (parameter identifier: MQIACF\_OPEN\_TYPE).

It is always returned, regardless of the queue instance attributes requested.

The value can be:

#### **MQQSOT\_ALL**

Selects status for queues that are open with any type of access.

#### **MQQSOT\_INPUT**

Selects status for queues that are open for input.

#### **MQQSOT\_OUTPUT**

Selects status for queues that are open for output.

The default value if this parameter is not specified is MQQSOT\_ALL.

Filtering is not supported for this parameter.

### z/OS

### *QSGDisposition* (MQCFIN)

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid only on z/OS. The value can be any of the following values:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

You cannot use *QSGDisposition* as a parameter to filter on.

### *QStatusAttrs* (MQCFIL)

Queue status attributes (parameter identifier: MQIACF\_Q\_STATUS\_ATTRS).

The attribute list can specify the following value on its own - default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

Where *StatusType* is MQIACF\_Q\_STATUS:

#### **MQCA\_Q\_NAME**

Queue name.

#### **MQCACF\_LAST\_GET\_DATE**

Date of the last message successfully destructively read from the queue.

**MQCACF\_LAST\_GET\_TIME**

Time of the last message successfully destructively read from the queue.

**MQCACF\_LAST\_PUT\_DATE**

Date of the last message successfully put to the queue.

**MQCACF\_LAST\_PUT\_TIME**

Time of the last message successfully put to the queue.

**MQCACF\_MEDIA\_LOG\_EXTENT\_NAME**

Identity of the oldest log extent required to perform media recovery of the queue.

On IBM i, this parameter identifies the name of the oldest journal receiver require to perform media recovery of the queue.

**MQIA\_CURRENT\_Q\_DEPTH**

The current number of messages on the queue.

**MQIA\_MONITORING\_Q**

Current level of monitoring data collection.

**MQIA\_OPEN\_INPUT\_COUNT**

The number of handles that are currently open for input for the queue.

MQIA\_OPEN\_INPUT\_COUNT does not include handles that are open for browse.

**MQIA\_OPEN\_OUTPUT\_COUNT**

The number of handles that are currently open for output for the queue.

**MQIACF\_HANDLE\_STATE**

Whether an API call is in progress.

**MQIACF\_MONITORING**

All the queue status monitoring attributes. These attributes are:

- MQCACF\_LAST\_GET\_DATE
- MQCACF\_LAST\_GET\_TIME
- MQCACF\_LAST\_PUT\_DATE
- MQCACF\_LAST\_PUT\_TIME
- MQIA\_MONITORING\_Q
- MQIACF\_OLDEST\_MSG\_AGE
- MQIACF\_Q\_TIME\_INDICATOR

Filtering is not supported for this parameter.

**MQIACF\_OLDEST\_MSG\_AGE**

Age of oldest message on the queue.

**MQIACF\_Q\_TIME\_INDICATOR**

Indicator of the time that messages remain on the queue.

**MQIACF\_UNCOMMITTED\_MSGS**

The number of uncommitted messages on the queue.

Where *StatusType* is MQIACF\_Q\_HANDLE:

**MQBACF\_EXTERNAL\_UOW\_ID**

Unit of recovery identifier assigned by the queue manager.

**MQBACF\_Q\_MGR\_UOW\_ID**

External unit of recovery identifier associated with the connection.

**MQCA\_Q\_NAME**

Queue name.

**MQCACF\_APPL\_TAG**

This parameter is a string containing the tag of the application connected to the queue manager.

**MQCACF\_ASID**

Address-space identifier of the application identified by *ApplTag*. This parameter is valid on z/OS only.

**MQCACF\_PSB\_NAME**

Name of the program specification block (PSB) associated with the running IMS transaction. This parameter is valid on z/OS only.

**MQCACF\_PSTID**

Identifier of the IMS program specification table (PST) for the connected IMS region. This parameter is valid on z/OS only.

**MQCACF\_TASK\_NUMBER**

CICS task number. This parameter is valid on z/OS only.

**MQCACF\_TRANSACTION\_ID**

CICS transaction identifier. This parameter is valid on z/OS only.

**MQCACF\_USER\_IDENTIFIER**

The user name of the application that has opened the specified queue.

**MQCACH\_CHANNEL\_NAME**

The name of the channel that has the queue open, if any.

**MQCACH\_CONNECTION\_NAME**

The connection name of the channel that has the queue open, if any.

**MQIA\_APPL\_TYPE**

The type of application that has the queue open.

**MQIACF\_OPEN\_BROWSE**

Open browse.

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_INPUT\_TYPE**

Open input type.

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_INQUIRE**

Open inquire.

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_OPTIONS**

The options used to open the queue.

If this parameter is requested, the following parameter structures are also returned:

- *OpenBrowse*
- *OpenInputType*
- *OpenInquire*
- *OpenOutput*
- *OpenSet*

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_OUTPUT**

Open output.

Filtering is not supported for this parameter.

**MQIACF\_OPEN\_SET**

Open set.

Filtering is not supported for this parameter.

**MQIACF\_PROCESS\_ID**

The process identifier of the application that has opened the specified queue.

**MQIACF\_ASYNC\_STATE****MQIACF\_THREAD\_ID**

The thread identifier of the application that has opened the specified queue.

**MQIACF\_UOW\_TYPE**

Type of external unit of recovery identifier as seen by the queue manager.

**StatusType (MQCFIN)**

Queue status type (parameter identifier: MQIACF\_Q\_STATUS\_TYPE).

Specifies the type of status information required.

The value can be any of the following values:

**MQIACF\_Q\_STATUS**

Selects status information relating to queues.

**MQIACF\_Q\_HANDLE**

Selects status information relating to the handles that are accessing the queues.

The default value, if this parameter is not specified, is MQIACF\_Q\_STATUS.

You cannot use *StatusType* as a parameter to filter on.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *QStatusAttrs* except MQCA\_Q\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFSF - PCF string filter parameter" on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify a byte string filter using the *ByteStringFilterCommand* parameter or an integer filter using the *IntegerFilterCommand* parameter.

**Error codes**

This command might return the following error code in the response format header "Error codes applicable to all commands" on page 1051 along with any additional pertinent values.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_Q\_TYPE\_ERROR**

Queue type not valid.

## Inquire Queue Status (Response):

The response to the Inquire Queue Status (MQCMD\_INQUIRE\_Q\_STATUS) command consists of the response header followed by the *QName* structure and a set of attribute parameter structures determined by the value of *StatusType* in the Inquire command.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### Always returned:

*QName*,  *QSGDisposition*, *StatusType*

Possible values of *StatusType* are:

#### **MQIACF\_Q\_STATUS**

Returns status information relating to queues.

#### **MQIACF\_Q\_HANDLE**

Returns status information relating to the handles that are accessing the queues.

### Returned if requested and *StatusType* is **MQIACF\_Q\_STATUS**:

*CurrentQDepth*, *LastGetDate*, *LastGetTime*, *LastPutDate*, *LastPutTime*, *MediaRecoveryLogExtent*, *OldestMsgAge*, *OnQTime*, *OpenInputCount*, *OpenOutputCount*, *QueueMonitoring*, *UncommittedMsgs*

### Returned if requested and *StatusType* is **MQIACF\_Q\_HANDLE**:

*ApplDesc*, *ApplTag*, *ApplType*,  *ASId*, *AsynchronousState*, *ChannelName*, *ConnectionName*,  
 *ExternalUOWId*, *HandleState*, *OpenOptions*, *ProcessId*,  *PSBName*,  
 *PSTId*, *QMgrUOWId*,  *TaskNumber*, *ThreadId*,  *TransactionId*,  
*UOWIdentifier*, *UOWType*, *UserIdentifier*

### Response data if *StatusType* is **MQIACF\_Q\_STATUS**

#### *CurrentQDepth* (MQCFIN)

Current queue depth (parameter identifier: MQIA\_CURRENT\_Q\_DEPTH).

#### *LastGetDate* (MQCFST)

Date on which the last message was destructively read from the queue (parameter identifier: MQCACF\_LAST\_GET\_DATE).

The date, in the form yyyy-mm-dd, on which the last message was successfully read from the queue. The date is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ\_DATE\_LENGTH.

#### *LastGetTime* (MQCFST)

Time at which the last message was destructively read from the queue (parameter identifier: MQCACF\_LAST\_GET\_TIME).

The time, in the form hh.mm.ss, at which the last message was successfully read from the queue. The time is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ\_TIME\_LENGTH.

#### *LastPutDate* (MQCFST)

Date on which the last message was successfully put to the queue (parameter identifier: MQCACF\_LAST\_PUT\_DATE).

The date, in the form yyyy-mm-dd, on which the last message was successfully put to the queue. The date is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ\_DATE\_LENGTH.

**LastPutTime (MQCFST)**

Time at which the last message was successfully put to the queue (parameter identifier: MQCACF\_LAST\_PUT\_TIME).

The time, in the form hh.mm.ss, at which the last message was successfully put to the queue. The time is returned in the time zone in which the queue manager is running.

The maximum length of the string is MQ\_TIME\_LENGTH.

**MediaRecoveryLogExtent (MQCFST)**

Name of the oldest log extent required to perform media recovery of the queue (parameter identifier: MQCACF\_MEDIA\_LOG\_EXTENT\_NAME).

On IBM i, this parameter identifies the name of the oldest journal receiver required to perform media recovery of the queue.

The name returned is of the form Snnnnnnn.LOG and is not a fully qualified path name. The use of this parameter provides the ability for the name to be easily correlated with the messages issued, following an **rcdmqimg** command to identify those queues causing the media recovery LSN not to move forwards.

This parameter is valid on AIX, HP-UX, Linux, IBM i, Solaris, and Windows.

The maximum length of the string is MQ\_LOG\_EXTENT\_NAME\_LENGTH.

**OldestMsgAge (MQCFIN)**

Age of the oldest message (parameter identifier: MQIACF\_OLDEST\_MSG\_AGE). Age, in seconds, of the oldest message on the queue.

If the value is unavailable, MQMON\_NOT\_AVAILABLE is returned. If the queue is empty, 0 is returned. If the value exceeds 999 999 999, it is returned as 999 999 999.

**OnQTime (MQCFIL)**

Indicator of the time that messages remain on the queue (parameter identifier: MQIACF\_Q\_TIME\_INDICATOR). Amount of time, in microseconds, that a message spent on the queue. Two values are returned:

- A value based on recent activity over a short period.
- A value based on activity over a longer period.

Where no measurement is available, the value MQMON\_NOT\_AVAILABLE is returned. If the value exceeds 999 999 999, it is returned as 999 999 999.

**OpenInputCount (MQCFIN)**

Open input count (parameter identifier: MQIA\_OPEN\_INPUT\_COUNT).

**OpenOutputCount (MQCFIN)**

Open output count (parameter identifier: MQIA\_OPEN\_OUTPUT\_COUNT).

**QName (MQCFST)**

Queue name (parameter identifier: MQCA\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**z/OS**

**QSGDisposition (MQCFIN)**

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Returns the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

**QueueMonitoring (MQCFIN)**

Current level of monitoring data collection for the queue (parameter identifier: MQIA\_MONITORING\_Q). The value can be any of the following values:

**MQMON\_OFF**

Monitoring for the queue is switched off.

**MQMON\_LOW**

Low rate of data collection.

**MQMON\_MEDIUM**

Medium rate of data collection.

**MQMON\_HIGH**

High rate of data collection.

**StatusType (MQCFST)**

Queue status type (parameter identifier: MQIACF\_Q\_STATUS\_TYPE).

Specifies the type of status information.

**UncommittedMsgs (MQCFIN)**

The number of uncommitted changes (puts and gets) pending for the queue (parameter identifier: MQIACF\_UNCOMMITTED\_MSGS). The value can be any of the following values:

**MQQSUM\_YES**

On z/OS, there are one or more uncommitted changes pending.

**MQQSUM\_NO**

There are no uncommitted changes pending.

**n** On platforms other than z/OS, an integer value indicating how many uncommitted changes are pending.

**Response data if StatusType is MQIACF\_Q\_HANDLE****ApplDesc (MQCFST)**

Application description (parameter identifier: MQCACF\_APPL\_DESC).

The maximum length is MQ\_APPL\_DESC\_LENGTH.

**ApplTag (MQCFST)**

Open application tag (parameter identifier: MQCACF\_APPL\_TAG).

The maximum length of the string is MQ\_APPL\_TAG\_LENGTH.

**ApplType (MQCFIN)**

Open application type (parameter identifier: MQIA\_APPL\_TYPE).

The value can be any of the following values:

**MQAT\_QMGR**

A queue manager process.

**MQAT\_CHANNEL\_INITIATOR**

The channel initiator.

**MQAT\_USER**

A user application.

**MQAT\_BATCH**

Application using a batch connection. MQAT\_BATCH applies only to z/OS.

**MQAT\_RRS\_BATCH**

RRS-coordinated application using a batch connection. MQAT\_RRS\_BATCH applies only to z/OS.

**MQAT\_CICS**

A CICS transaction. MQAT\_CICS applies only to z/OS.

**MQAT\_IMS**

An IMS transaction. MQAT\_IMS applies only to z/OS.

**MQAT\_SYSTEM\_EXTENSION**

Application performing an extension of function that is provided by the queue manager.

**z/OS****ASId (MQCFST)**

Address-space identifier (parameter identifier: MQCACF\_ASID).

The 4-character address-space identifier of the application identified by *ApplTag*. It distinguishes duplicate values of *ApplTag*. This parameter applies only to z/OS.

The length of the string is MQ\_ASID\_LENGTH.

**AsynchronousState (MQCFIN)**

The state of the asynchronous consumer on this queue (parameter identifier: MQIACF\_ASYNC\_STATE).

The value can be any of the following values:

**MQAS\_ACTIVE**

An MQCB call has set up a function to call back to process messages asynchronously and the connection handle has been started so that asynchronous message consumption can proceed.

**MQAS\_INACTIVE**

An MQCB call has set up a function to call back to process messages asynchronously but the connection handle has not yet been started, or has been stopped or suspended, so that asynchronous message consumption cannot currently proceed.

**MQAS\_SUSPENDED**

The asynchronous consumption callback has been suspended so that asynchronous message consumption cannot currently proceed on this handle. This situation can be either because an MQCB or MQCTL call with *Operation* MQOP\_SUSPEND has been issued against this object handle by the application, or because it has been suspended by the system. If it has been suspended by the system, as part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This situation is reported in the *Reason* field in the MQCBC structure passed to the callback. In order for asynchronous message consumption to proceed, the application must issue an MQCB or MQCTL call with *Operation* MQOP\_RESUME.

**MQAS\_SUSPENDED\_TEMPORARY**

The asynchronous consumption callback has been temporarily suspended by the system so that asynchronous message consumption cannot currently proceed on this object handle. As part of the process of suspending asynchronous message consumption the callback function is called with the reason code that describes the problem resulting in suspension. This situation is reported in the *Reason* field in the MQCBC structure passed to the callback. The callback function is called again when asynchronous message consumption is resumed by the system after the temporary condition has been resolved.

**MQAS\_NONE**

An MQCB call has not been issued against this handle, so no asynchronous message consumption is configured on this handle.

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**Connname (MQCFST)**

Connection name (parameter identifier: MQCACH\_CONNECTION\_NAME).

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

**z/OS****ExternalUOWId (MQCFBS)**

RRS unit-of-recovery identifier (parameter identifier: MQBACF\_EXTERNAL\_UOW\_ID).

The RRS unit-of-recovery identifier associated with the handle. This parameter is valid only on z/OS only.

The length of the string is MQ\_EXTERNAL\_UOW\_ID\_LENGTH.

**HandleState (MQCFIN)**

State of the handle (parameter identifier: MQIACF\_HANDLE\_STATE).

The value can be any of the following values:

**MQHSTATE\_ACTIVE**

An API call from a connection is currently in progress for this object. For a queue, this condition can arise when an MQGET WAIT call is in progress.

If there is an MQGET SIGNAL outstanding, it does not mean, by itself, that the handle is active.

**MQHSTATE\_INACTIVE**

No API call from a connection is currently in progress for this object. For a queue, this condition can arise when no MQGET WAIT call is in progress.

**OpenBrowse (MQCFIN)**

Open browse (parameter identifier: MQIACF\_OPEN\_BROWSE).

The value can be any of the following values:

**MQQSO\_YES**

The queue is open for browsing.

**MQQSO\_NO**

The queue is not open for browsing.

**OpenInputType (MQCFIN)**

Open input type (parameter identifier: MQIACF\_OPEN\_INPUT\_TYPE).

The value can be any of the following values:

**MQQSO\_NO**

The queue is not open for inputting.

**MQQSO\_SHARED**

The queue is open for shared input.

**MQQSO\_EXCLUSIVE**

The queue is open for exclusive input.

**OpenInquire (MQCFIN)**

Open inquire (parameter identifier: MQIACF\_OPEN\_INQUIRE).

The value can be any of the following values:

**MQQSO\_YES**

The queue is open for inquiring.

**MQQSO\_NO**

The queue is not open for inquiring.

*OpenOptions* (**MQCFIN**)

Open options currently in force for the queue (parameter identifier: MQIACF\_OPEN\_OPTIONS).

*OpenOutput* (**MQCFIN**)

Open output (parameter identifier: MQIACF\_OPEN\_OUTPUT).

The value can be any of the following values:

**MQQSO\_YES**

The queue is open for output.

**MQQSO\_NO**

The queue is not open for output.

*OpenSet* (**MQCFIN**)

Open set (parameter identifier: MQIACF\_OPEN\_SET).

The value can be any of the following values:

**MQQSO\_YES**

The queue is open for setting.

**MQQSO\_NO**

The queue is not open for setting.

*ProcessId* (**MQCFIN**)

Open application process ID (parameter identifier: MQIACF\_PROCESS\_ID).

▶ z/OS

*PSBName* (**MQCFST**)

Program specification block (PSB) name (parameter identifier: MQCACF\_PSB\_NAME).

The 8-character name of the PSB associated with the running IMS transaction. This parameter is valid on z/OS only.

The length of the string is MQ\_PSB\_NAME\_LENGTH.

▶ z/OS

*PSTId* (**MQCFST**)

Program specification table (PST) identifier (parameter identifier: MQCACF\_PST\_ID).

The 4-character identifier of the PST region identifier for the connected IMS region. This parameter is valid on z/OS only.

The length of the string is MQ\_PST\_ID\_LENGTH.

*QMgrUOWId* (**MQCFBS**)

The unit of recovery assigned by the queue manager (parameter identifier: MQBACF\_Q\_MGR\_UOW\_ID).

On z/OS, this parameter is an 8-byte log RBA, displayed as 16 hexadecimal characters. On platforms other than z/OS, this parameter is an 8-byte transaction identifier, displayed as 16 hexadecimal characters.

The maximum length of the string is MQ\_UOW\_ID\_LENGTH.

### *QName* (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### ▶ z/OS

### *QSGDisposition* (MQCFIN)

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Returns the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED.

### *StatusType* (MQCFST)

Queue status type (parameter identifier: MQIACF\_Q\_STATUS\_TYPE).

Specifies the type of status information.

#### ▶ z/OS

### *TaskNumber* (MQCFST)

CICS task number (parameter identifier: MQCACF\_TASK\_NUMBER).

A 7-digit CICS task number. This parameter is valid on z/OS only.

The length of the string is MQ\_TASK\_NUMBER\_LENGTH.

### *ThreadId* (MQCFIN)

The thread ID of the open application (parameter identifier: MQIACF\_THREAD\_ID).

A value of zero indicates that the handle was opened by a shared connection. A handle created by a shared connection is logically open to all threads.

#### ▶ z/OS

### *TransactionId* (MQCFST)

CICS transaction identifier (parameter identifier: MQCACF\_TRANSACTION\_ID).

A 4-character CICS transaction identifier. This parameter is valid on z/OS only.

The length of the string is MQ\_TRANSACTION\_ID\_LENGTH.

### *UOWIdentifier* (MQCFBS)

The external unit of recovery associated with the connection (parameter identifier: MQBACF\_EXTERNAL\_UOW\_ID).

This parameter is the recovery identifier for the unit of recovery. Its format is determined by the value of *UOWType*.

The maximum length of the string is MQ\_UOW\_ID\_LENGTH.

### *UOWType* (MQCFIN)

Type of external unit of recovery identifier as perceived by the queue manager (parameter identifier: MQIACF\_UOW\_TYPE).

The value can be any of the following values:

## MQUOWT\_Q\_MGR

### MQUOWT\_CICS

 Valid only on z/OS.

### MQUOWT\_RRS

 Valid only on z/OS.

### MQUOWT\_IMS

 Valid only on z/OS.

### MQUOWT\_XA

*UOWType* identifies the *UOWIdentifier* type and not the type of the transaction coordinator. When the value of *UOWType* is MQUOWT\_Q\_MGR, the associated identifier is in *QMgrUOWId* (and not *UOWIdentifier*).

#### *UserIdentifier* (MQCFST)

Open application user name (parameter identifier: MQCACF\_USER\_IDENTIFIER).

The maximum length of the string is MQ\_MAX\_USER\_ID\_LENGTH.

#### Inquire Security:

The Inquire Security (MQCMD\_INQUIRE\_SECURITY) command returns information about the current settings for the security parameters.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				

#### Optional parameters

##### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

##### *SecurityAttrs* (MQCFIL)

Security parameter attributes (parameter identifier: MQIACF\_SECURITY\_ATTRS).

The attribute list might specify the following value on its own - default value used if the parameter is not specified:

#### MQIACF\_ALL

All attributes.

or a combination of the following:

**MQIACF\_SECURITY\_SWITCH**

Current setting of the switch profiles. If the subsystem security switch is off, no other switch profile settings are returned.

**MQIACF\_SECURITY\_TIMEOUT**

Timeout value.

**MQIACF\_SECURITY\_INTERVAL**

Time interval between checks.

**Inquire Security (Response):** z/OS

The response to the Inquire Security (MQCMD\_INQUIRE\_SECURITY) command consists of the response header followed by the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

One message is returned if either *SecurityTimeout* or *SecurityInterval* is specified on the command. If *SecuritySwitch* is specified, one message per security switch found is returned. This message includes the *SecuritySwitch*, *SecuritySwitchSetting*, and *SecuritySwitchProfile* attribute parameter structures.

**Returned if requested:**

*SecurityInterval*, *SecuritySwitch*, *SecuritySwitchProfile*, *SecuritySwitchSetting*,  
*SecurityTimeout*

**Response data*****SecurityInterval* (MQCFIN)**

Time interval between checks (parameter identifier: MQIACF\_SECURITY\_INTERVAL).

The interval, in minutes, between checks for user IDs and their associated resources to determine whether *SecurityTimeout* has expired.

***SecuritySwitch* (MQCFIN)**

Security switch profile (parameter identifier: MQIA\_CF\_LEVEL). The value can be any of the following values:

**MQSECSW\_SUBSYSTEM**

Subsystem security switch.

**MQSECSW\_Q\_MGR**

Queue manager security switch.

**MQSECSW\_QSG**

Queue sharing group security switch.

**MQSECSW\_CONNECTION**

Connection security switch.

**MQSECSW\_COMMAND**

Command security switch.

**MQSECSW\_CONTEXT**

Context security switch.

**MQSECSW\_ALTERNATE\_USER**

Alternate user security switch.

**MQSECSW\_PROCESS**

Process security switch.

**MQSECSW\_NAMELIST**

Namelist security switch.

**MQSECSW\_TOPIC**

Topic security switch.

**MQSECSW\_Q**

Queue security switch.

**MQSECSW\_COMMAND\_RESOURCES**

Command resource security switch.

***SecuritySwitchProfile (MQCFST)***

Security switch profile (parameter identifier: MQCACF\_SECURITY\_PROFILE).

The maximum length of the string is MQ\_SECURITY\_PROFILE\_LENGTH.

***SecuritySwitchSetting (MQCFIN)***

Setting of the security switch (parameter identifier: MQIACF\_SECURITY\_SETTING).

The value can be:

**MQSECSW\_ON\_FOUND**

Switch ON, profile found.

**MQSECSW\_OFF\_FOUND**

Switch OFF, profile found.

**MQSECSW\_ON\_NOT\_FOUND**

Switch ON, profile not found.

**MQSECSW\_OFF\_NOT\_FOUND**

Switch OFF, profile not found.

**MQSECSW\_OFF\_ERROR**

Switch OFF, profile error.

**MQSECSW\_ON\_OVERRIDDEN**

Switch ON, profile overridden.

***SecurityTimeout (MQCFIN)***

Timeout value (parameter identifier: MQIACF\_SECURITY\_TIMEOUT).

How long, in minutes, security information about an unused user ID and associated resources is retained.

## Inquire Service:

The Inquire Service (MQCMD\_INQUIRE\_SERVICE) command inquires about the attributes of existing IBM MQ services.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

## Required parameters

### *ServiceName* (MQCFST)

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

This parameter is the name of the service whose attributes are required. Generic service names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all services having names that start with the selected character string. An asterisk on its own matches all possible names.

The service name is always returned regardless of the attributes requested.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

## Optional parameters

### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ServiceAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

### *ServiceAttrs* (MQCFIL)

Service attributes (parameter identifier: MQIACF\_SERVICE\_ATTRS).

The attribute list might specify the following value on its own - default value if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCA\_ALTERATION\_DATE**

Date on which the definition was last altered.

#### **MQCA\_ALTERATION\_TIME**

Time at which the definition was last altered.

#### **MQCA\_SERVICE\_DESC**

Description of service definition.

#### **MQCA\_SERVICE\_NAME**

Name of service definition.

#### **MQCA\_SERVICE\_START\_ARGS**

Arguments to be passed to the service program.

#### **MQCA\_SERVICE\_START\_COMMAND**

Name of program to run to start the service.

**MQCA\_SERVICE\_STOP\_ARGS**

Arguments to be passed to the stop program to stop the service.

**MQCA\_STDERR\_DESTINATION**

Destination of standard error for the process.

**MQCA\_STDOUT\_DESTINATION**

Destination of standard output for the process.

**MQCA\_SERVICE\_START\_ARGS**

Arguments to be passed to the service program.

**MQIA\_SERVICE\_CONTROL**

When the queue manager must start the service.

**MQIA\_SERVICE\_TYPE**

Mode in which the service is to run.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ServiceAttrs* except MQCA\_SERVICE\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFSF - PCF string filter parameter" on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

**Inquire Service (Response):**

The response to the Inquire Service (MQCMD\_INQUIRE\_SERVICE) command consists of the response header followed by the *ServiceName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

If a generic service name was specified, one such message is generated for each service found.

**Always returned:**

*ServiceName*

**Returned if requested:**

*AlterationDate, AlterationTime, Arguments, ServiceDesc, ServiceType, StartArguments, StartCommand, StartMode, StderrDestination, StdoutDestination, StopArguments, StopCommand*

**Response data****AlterationDate (MQCFST)**

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date on which the information was last altered in the form yyyy-mm-dd.

**AlterationTime (MQCFST)**

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time at which the information was last altered in the form hh.mm.ss.

**ServiceDesc (MQCFST)**

Description of service definition (parameter identifier: MQCA\_SERVICE\_DESC).

The maximum length of the string is MQ\_SERVICE\_DESC\_LENGTH.

*ServiceName* (**MQCFST**)

Name of service definition (parameter identifier: MQCA\_SERVICE\_NAME).

The maximum length of the string is MQ\_SERVICE\_NAME\_LENGTH.

*ServiceType* (**MQCFIN**)

The mode in which the service is to run (parameter identifier: MQIA\_SERVICE\_TYPE).

The value can be:

**MQSVC\_TYPE\_SERVER**

Only one instance of the service can be executed at a time, with the status of the service made available by the Inquire Service Status command.

**MQSVC\_TYPE\_COMMAND**

Multiple instances of the service can be started.

*StartArguments* (**MQCFST**)

The arguments to be passed to the user program at queue manager startup (parameter identifier: MQCA\_SERVICE\_START\_ARGS).

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

*StartCommand* (**MQCFST**)

Service program name (parameter identifier: MQCA\_SERVICE\_START\_COMMAND).

The name of the program which is to run.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

*StartMode* (**MQCFIN**)

Service mode (parameter identifier: MQIA\_SERVICE\_CONTROL).

Specifies how the service is to be started and stopped. The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The service is not to be started automatically or stopped automatically. It is to be controlled by user command.

**MQSVC\_CONTROL\_Q\_MGR**

The service is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The service is to be started at the same time as the queue manager is started, but is not requested to stop when the queue manager is stopped.

*StderrDestination* (**MQCFST**)

The path to a file to which the standard error (stderr) of the service program is to be redirected (parameter identifier: MQCA\_STDERR\_DESTINATION).

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

*StdoutDestination* (**MQCFST**)

The path to a file to which the standard output (stdout) of the service program is to be redirected (parameter identifier: MQCA\_STDOUT\_DESTINATION).

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

*StopArguments* (**MQCFST**)

The arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA\_SERVICE\_STOP\_ARGS).

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

*StopCommand* (**MQCFST**)

Service program stop command (parameter identifier: MQCA\_SERVICE\_STOP\_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

### Inquire Service Status:

The Inquire Service Status (MQCMD\_INQUIRE\_SERVICE\_STATUS) command inquires about the status of one or more IBM MQ service instances.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

### Required parameters

#### *ServiceName* (MQCFST)

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

Generic service names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all services having names that start with the selected character string. An asterisk on its own matches all possible names.

The service name is always returned, regardless of the attributes requested.

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### Optional parameters (Inquire Service Status)

#### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *ServiceStatusAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See "MQCFIF - PCF integer filter parameter" on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

#### *ServiceStatusAttrs* (MQCFIL)

Service status attributes (parameter identifier: MQIACF\_SERVICE\_STATUS\_ATTRS).

The attribute list can specify the following value on its own - is the default value used if the parameter is not specified:

#### **MQIACF\_ALL**

All attributes.

or a combination of the following:

#### **MQCA\_SERVICE\_DESC**

Description of service definition.

#### **MQCA\_SERVICE\_NAME**

Name of service definition.

#### **MQCA\_SERVICE\_START\_ARGS**

The arguments to pass to the service program.

#### **MQCA\_SERVICE\_START\_COMMAND**

The name of the program to run to start the service.

#### **MQCA\_SERVICE\_STOP\_ARGS**

The arguments to pass to the stop command to stop the service.

**MQCA\_SERVICE\_STOP\_COMMAND**

The name of the program to run to stop the service.

**MQCA\_STDERR\_DESTINATION**

Destination of standard error for the process.

**MQCA\_STDOUT\_DESTINATION**

Destination of standard output for the process.

**MQCACF\_SERVICE\_START\_DATE**

The date on which the service was started.

**MQCACF\_SERVICE\_START\_TIME**

The time at which the service was started.

**MQIA\_SERVICE\_CONTROL**

How the service is to be started and stopped.

**MQIA\_SERVICE\_TYPE**

The mode in which the service is to run.

**MQIACF\_PROCESS\_ID**

The process identifier of the operating system task under which this service is executing.

**MQIACF\_SERVICE\_STATUS**

Status of the service.

***StringFilterCommand* (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *ServiceStatusAttrs* except MQCA\_SERVICE\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

**Error codes**

This command might return the following error code in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

***Reason* (MQLONG)**

The value can be any of the following values:

**MQRCCF\_SERV\_STATUS\_NOT\_FOUND**

Service status not found.

## Inquire Service Status (Response):

The response to the Inquire Service Status (MQCMD\_INQUIRE\_SERVICE\_STATUS) command consists of the response header followed by the *ServiceName* structure and the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

If a generic service name was specified, one such message is generated for each service found.

### Always returned:

*ServiceName*

### Returned if requested:

*ProcessId, ServiceDesc, StartArguments, StartCommand, StartDate, StartMode, StartTime, Status, StderrDestination, StdoutDestination, StopArguments, StopCommand*

### Response data

#### *ProcessId* (MQCFIN)

Process identifier (parameter identifier: MQIACF\_PROCESS\_ID).

The operating system process identifier associated with the service.

#### *ServiceDesc* (MQCFST)

Description of service definition (parameter identifier: MQCACH\_SERVICE\_DESC).

The maximum length of the string is MQ\_SERVICE\_DESC\_LENGTH.

#### *ServiceName* (MQCFST)

Name of the service definition (parameter identifier: MQCA\_SERVICE\_NAME).

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

#### *StartArguments* (MQCFST)

Arguments to be passed to the program on startup (parameter identifier: MQCA\_SERVICE\_START\_ARGS).

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

#### *StartCommand* (MQCFST)

Service program name (parameter identifier: MQCA\_SERVICE\_START\_COMMAND).

Specifies the name of the program which is to run.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

#### *StartDate* (MQCFST)

Start date (parameter identifier: MQIACF\_SERVICE\_START\_DATE).

The date, in the form yyyy-mm-dd, on which the service was started.

The maximum length of the string is MQ\_DATE\_LENGTH.

#### *StartMode* (MQCFIN)

Service mode (parameter identifier: MQIACH\_SERVICE\_CONTROL).

How the service is to be started and stopped. The value can be:

#### **MQSVC\_CONTROL\_MANUAL**

The service is not to be started automatically or stopped automatically. It is to be controlled by user command.

**MQSVC\_CONTROL\_Q\_MGR**

The service is to be started and stopped at the same time as the queue manager is started and stopped.

**MQSVC\_CONTROL\_Q\_MGR\_START**

The service is to be started at the same time as the queue manager is started, but is not request to stop when the queue manager is stopped.

**StartTime (MQCFST)**

Start date (parameter identifier: MQIACF\_SERVICE\_START\_TIME).

The time, in the form hh.mm.ss, at which the service was started.

The maximum length of the string is MQ\_TIME\_LENGTH

**Status (MQCFIN)**

Service status (parameter identifier: MQIACF\_SERVICE\_STATUS).

The status of the service. The value can be any of the following values:

**MQSVC\_STATUS\_STARTING**

The service is in the process of initializing.

**MQSVC\_STATUS\_RUNNING**

The service is running.

**MQSVC\_STATUS\_STOPPING**

The service is stopping.

**StderrDestination (MQCFST)**

Specifies the path to a file to which the standard error (stderr) of the service program is to be redirected (parameter identifier: MQCA\_STDERR\_DESTINATION).

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

**StdoutDestination (MQCFST)**

Specifies the path to a file to which the standard output (stdout) of the service program is to be redirected (parameter identifier: MQCA\_STDOUT\_DESTINATION).

The maximum length of the string is MQ\_SERVICE\_PATH\_LENGTH.

**StopArguments (MQCFST)**

Specifies the arguments to be passed to the stop program when instructed to stop the service (parameter identifier: MQCA\_SERVICE\_STOP\_ARGS).

The maximum length of the string is MQ\_SERVICE\_ARGS\_LENGTH.

**StopCommand (MQCFST)**

Service program stop command (parameter identifier: MQCA\_SERVICE\_STOP\_COMMAND).

This parameter is the name of the program that is to run when the service is requested to stop.

The maximum length of the string is MQ\_SERVICE\_COMMAND\_LENGTH.

**Inquire SMDS:** 

The Inquire SMDS (MQCMD\_INQUIRE\_SMDS) command inquires about the attributes of shared message data sets for a CF application structure.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Required parameters****SMDS (qmgr\_name)**

Specifies the queue manager for which the shared message data set properties are to be displayed, or an asterisk to display the properties for all shared message data sets associated with the specified CFSTRUCT (parameter identifier: MQCACF\_CF\_SMDS).

**CFStrucName (MQCFST)**

The name of the CF application structure with SMDS properties that you want to inquire on (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

**Optional parameters****CFSMDSAttrs (MQCFIL)**

CF application structure SMDS attributes (parameter identifier: MQIACF\_SMDS\_ATTRS).

The default value used if this parameter is not specified is:

**MQIACF\_ALL**

All attributes.

The attribute list might specify MQIACF\_ALL on its own, or may specify a combination of the following:

**MQIA\_CF\_SMDS\_BUFFERS**

The shared message data set DSBUFS property.

**MQIACF\_CF\_SMDS\_EXPAND**

The shared message data set DSEXPAND property.

**Inquire SMDS (Response):** 

The response to the Inquire SMDS (MQCMD\_INQUIRE\_SMDS) command returns the attribute parameters of the shared message data set connection.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Response Data****SMDS (MQCFST)**

The queue manager name for which the shared message data set properties are displayed (parameter identifier: MQCACF\_CF\_SMDS).

**CFStrucName (MQCFST)**

CF Structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length is MQ\_CF\_STRUC\_NAME\_LENGTH.

**DSBUFS (MQCFIN)**

The CF DSBUFS property (parameter identifier: MQIA\_CF\_SMDS\_BUFFERS).

The returned value is in the range 0 - 9999.

The value is the number of buffers to be allocated in each queue manager for accessing shared message data sets. The size of each buffer is equal to the logical block size.

**DSEXPAND (MQCFIN)**

The CF DSEXPAND property (parameter identifier: MQIACF\_CF\_SMDS\_EXPAND).

**MQDSE\_YES**

The data set can be expanded.

**MQDSE\_NO**

The data set cannot be expanded.

**MQDSE\_DEFAULT**

Only returned on Inquire CF Struct when not explicitly set

**Inquire SMDS Connection:** z/OS

The response to the Inquire SMDS Connection (MQCMD\_INQUIRE\_SMDSCONN) command returns status and availability information about the connection between the queue manager and the shared message data sets for the specified *CFStrucName*.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Required parameters**

**SMDSCONN (MQCFST)**

Specify the queue manager which owns the SMDS for which the connection information is to be returned, or an asterisk to return the connection information for all shared message data sets associated with the specified *CFStrucName* (parameter identifier: MQCACF\_CF\_SMDSCONN).

**CFStrucName (MQCFST)**

The name of the CF application structure with SMDS connections properties that you want to inquire on (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Inquire SMDS Connection (Response):

The response to the Inquire SMDS Connection (MQCMD\_INQUIRE\_SMDSCONN) command returns status and availability information about the connection between the queue manager and the shared message data sets for the specified *CFStrucName*.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

### Response Data

#### *SMDSCONN* (MQCFST)

The queue manager which owns the SMDS for which the connection information is returned (parameter identifier: MQCACF\_CF\_SMDSCONN).

#### *CFStrucName* (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to inquire on (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

#### *Avail* (MQCFIN)

The availability of this data set connection as seen by this queue manager. This is one of the following values:

##### **MQS\_AVAIL\_NORMAL**

The connection can be used and no error has been detected.

##### **MQS\_AVAIL\_ERROR**

The connection is unavailable because of an error.

The queue manager may try to enable access again automatically if the error may no longer be present, for example when recovery completes or the status is manually set to RECOVERED. Otherwise, it can be enabled again using the START SMDSCONN command in order to retry the action which originally failed.

##### **MQS\_AVAIL\_STOPPED**

The connection cannot be used because it has been explicitly stopped using the STOP SMDSCONN command. It can only be made available again by using a START SMDSCONN command to enable it.

#### *ExpandST* (MQCFIN)

The data set automatic expansion status. This is one of the following values:

##### **MQS\_EXPANDST\_NORMAL**

No problem has been noted which would affect automatic expansion.

##### **MQS\_EXPANDST\_FAILED**

A recent expansion attempt failed, causing the DSEXPAND option to be set to NO for this specific data set. This status is cleared when ALTER SMDS is used to set the DSEXPAND option back to YES or DEFAULT.

##### **MQS\_EXPANDST\_MAXIMUM**

The maximum number of extents has been reached, so future expansion is not possible (except by taking the data set out of service and copying it to larger extents).

#### *OpenMode* (MQCFIN)

Indicates the mode in which the shared message data set is currently open by this queue manager.

**MQS\_OPENMODE\_NONE**

The shared message data set is not open.

**MQS\_OPENMODE\_READONLY**

The shared message data set is owned by another queue manager, and is open for read-only access.

**MQS\_OPENMODE\_UPDATE**

The shared message data set is owned by this queue manager, and is open for update access.

**MQS\_OPENMODE\_RECOVERY**

The shared message data set is open for recovery processing

**Status (MQCFIN)**

Indicates the shared message data set connection status as seen by this queue manager.

**MQS\_STATUS\_CLOSED**

This data set is not currently open.

**MQS\_STATUS\_CLOSING**

This queue manager is currently in the process of closing this data set, including quiescing normal I/O activity and storing the saved space map if necessary.

**MQS\_STATUS\_OPENING**

This queue manager is currently in the process of opening and validating this data set (including space map restart processing when necessary).

**MQS\_STATUS\_OPEN**

This queue manager has successfully opened this data set and it is available for normal use.

**MQS\_STATUS\_NOTENABLED**

The SMDS definition is not in the ACCESS(ENABLED) state so the data set is not currently available for normal use. This status is only set when the SMDSCONN status does not already indicate some other form of failure.

**MQS\_STATUS\_ALLOCFAIL**

This queue manager was unable to locate or allocate this data set.

**MQS\_STATUS\_OPENFAIL**

This queue manager was able to allocate the data set but was unable to open it, so it has now been deallocated.

**MQS\_STATUS\_STGFAIL**

The data set could not be used because the queue manager was unable to allocate associated storage areas for control blocks, or for space map or header record processing.

**MQS\_STATUS\_DATAFAIL**

The data set was successfully opened but the data was found to be invalid or inconsistent, or a permanent I/O error occurred, so it has now been closed and deallocated.

This might result in the shared message data set itself being marked as STATUS(FAILED).

**Inquire Storage Class:** z/OS

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

The Inquire Storage Class (MQCMD\_INQUIRE\_STG\_CLASS) command returns information about storage classes.

**Required parameters*****StorageClassName* (MQCFST)**

Storage class name (parameter identifier: MQCA\_STORAGE\_CLASS).

Generic storage class names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

**Optional parameters*****CommandScope* (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

***IntegerFilterCommand* (MQCFIF)**

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *StgClassAttrs* except MQIACF\_ALL. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter for *PageSetId*, you cannot also specify the *PageSetId* parameter.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

***PageSetId* (MQCFIN)**

Page set identifier that the storage class is associated with (parameter identifier: MQIA\_PAGESET\_ID).

If you omit this parameter, storage classes with any page set identifiers qualify.

***QSGDisposition* (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be:

**MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

**MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

**StgClassAttrs (MQCFIL)**

Storage class parameter attributes (parameter identifier: MQIACF\_STORAGE\_CLASS\_ATTRS).

The attribute list might specify the following value on its own - is the default value used if the parameter is not specified:

**MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQCA\_STORAGE\_CLASS**

Storage class name.

**MQCA\_STORAGE\_CLASS\_DESC**

Description of the storage class.

**MQIA\_PAGESET\_ID**

The page set identifier to which the storage class maps.

**MQCA\_XCF\_GROUP\_NAME**

The name of the XCF group of which IBM MQ is a member.

**MQIA\_XCF\_MEMBER\_NAME**

The XCF member name of the IMS system within the XCF group specified in MQCA\_XCF\_GROUP\_NAME.

**MQCA\_ALTERATION\_DATE**

The date on which the definition was last altered.

**MQCA\_ALTERATION\_TIME**

The time at which the definition was last altered.

### *StringFilterCommand* (MQCFSF)

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *StgClassAttrs* except MQCA\_STORAGE\_CLASS. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

### Inquire Storage Class (Response):

The response to the Inquire Storage Class (MQCMD\_INQUIRE\_STG\_CLASS) command consists of the response header followed by the *StgClassName* structure, the *PageSetId* structure and the *QSGDisposition* structure which are followed by the requested combination of attribute parameter structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

#### Always returned:

*PageSetId*, *QSGDisposition*, *StgClassName*

#### Returned if requested:

*AlterationDate*, *AlterationTime*, *PassTicketApplication*, *StorageClassDesc*, *XCFGGroupName*, *XCFMemberName*,

#### Response data

##### *AlterationDate* (MQCFST)

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

This parameter is the date, in the form yyyy-mm-dd, on which the definition was last altered.

The maximum length of the string is MQ\_DATE\_LENGTH.

##### *AlterationTime* (MQCFST)

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

This parameter is the time, in the form hh.mm.ss, at which the definition was last altered.

The maximum length of the string is MQ\_TIME\_LENGTH.

##### *PageSetId* (MQCFIN)

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID).

The page set identifier to which the storage class maps.

##### *PassTicketApplication* (MQCFST)

PassTicket application (parameter identifier: MQCA\_PASS\_TICKET\_APPL).

The application name that is passed to RACF when authenticating the PassTicket specified in the MQIIH header.

The maximum length is MQ\_PASS\_TICKET\_APPL\_LENGTH.

##### *QSGDisposition* (MQCFIN)

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be any of the following values:

##### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

## MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP.

## MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

### *StorageClassDesc* (MQCFST)

Description of the storage class (parameter identifier: MQCA\_STORAGE\_CLASS\_DESC).

The maximum length is MQ\_STORAGE\_CLASS\_DESC\_LENGTH.

### *StgClassName* (MQCFST)

Name of the storage class (parameter identifier: MQCA\_STORAGE\_CLASS).

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

### *XCFGroupName* (MQCFST)

Name of the XCF group of which IBM MQ is a member (parameter identifier: MQCA\_XCF\_GROUP\_NAME).

The maximum length is MQ\_XCF\_GROUP\_NAME\_LENGTH.

### *XCFMemberName* (MQCFST)

Name of the XCF group of which IBM MQ is a member (parameter identifier: MQCA\_XCF\_MEMBER\_NAME).

The maximum length is MQ\_XCF\_MEMBER\_NAME\_LENGTH.

## Inquire Storage Class Names:

The Inquire Storage Class Names (MQCMD\_INQUIRE\_STG\_CLASS\_NAMES) command inquires a list of storage class names that match the generic storage class name specified.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

## Required parameters

### *StorageClassName* (MQCFST)

Storage class name (parameter identifier: MQCA\_STORAGE\_CLASS).

Generic storage class names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all storage classes having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_STORAGE\_CLASS\_LENGTH.

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### **QSGDisposition (MQCFIN)**

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_PRIVATE**

The object is defined with either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

#### **Inquire Storage Class Names (Response):** ▶ z/OS

The response to the Inquire Storage Class Names (MQCMD\_INQUIRE\_STG\_CLASS\_NAMES) command consists of the response header followed by a parameter structure giving zero or more names that match the specified namelist name.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

In addition to this, the *QSGDispositions* structure (with the same number of entries as the *StorageClassNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *StorageClassNames* structure.

#### **Always returned:**

*StorageClassNames, QSGDispositions*

#### **Returned if requested:**

None

## Response data

### *StorageClassNames* (MQCFSL)

List of storage class names (parameter identifier: MQCACF\_STORAGE\_CLASS\_NAMES).

### *QSGDispositions* (MQCFIL)

List of QSG dispositions (parameter identifier: MQIACF\_QSG\_DISPS). Possible values for fields in this structure are those permitted for the *QSGDisposition* parameter (MQQSGD\_\*). Possible values for fields in this structure are:

#### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

#### MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP.

#### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

## Inquire Subscription:

The Inquire Subscription (MQCMD\_INQUIRE\_SUBSCRIPTION) command inquires about the attributes of a subscription.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

## Required parameters

### *SubName* (MQCFST)

The unique identifier of the application for a subscription (parameter identifier: MQCACF\_SUB\_NAME).

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be inquired.

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

### *SubId* (MQCFBS)

Subscription identifier (parameter identifier: MQBACF\_SUB\_ID).

Specifies the unique internal subscription identifier. If the queue manager is generating the *CorrelId* for a subscription, then the *SubId* is used as the *DestinationCorrelId*.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

## Optional parameters z/OS

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- A queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

#### *Durable* (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

##### **MQSUB\_DURABLE\_YES**

Information about durable subscriptions only is displayed.

##### **MQSUB\_DURABLE\_NO**

Information about nondurable subscriptions only is displayed.

##### **MQSUB\_DURABLE\_ALL**

Information about all subscriptions is displayed.

#### *SubscriptionAttrs* (MQCFIL)

Subscription attributes (parameter identifier: MQIACF\_SUB\_ATTRS).

Use one of the following parameters to select the attributes you want to display:

- ALL to display all attributes.
- SUMMARY to display a subset of the attributes (see MQIACF\_SUMMARY for a list).
- Any of the following parameters individually or in combination.

##### **MQIACF\_ALL**

All attributes.

##### **MQIACF\_SUMMARY**

Use this parameter to display:

- MQBACF\_DESTINATION\_CORREL\_ID
- MQBACF\_SUB\_ID
- MQCACF\_DESTINATION
- MQCACF\_DESTINATION\_Q\_MGR
- MQCACF\_SUB\_NAME
- MQCA\_TOPIC\_STRING
- MQIACF\_SUB\_TYPE

##### **MQBACF\_ACCOUNTING\_TOKEN**

The accounting token passed by the subscriber for propagation into messages sent to this subscription in the AccountingToken field of the MQMD.

##### **MQBACF\_DESTINATION\_CORREL\_ID**

The CorrelId used for messages sent to this subscription.

##### **MQBACF\_SUB\_ID**

The internal unique key identifying a subscription.

##### **MQCA\_ALTERATION\_DATE**

The date of the most recent MQSUB with MQSO\_ALTER or ALTER SUB command.

##### **MQCA\_ALTERATION\_TIME**

The time of the most recent MQSUB with MQSO\_ALTER or ALTER SUB command.

**MQCA\_CREATION\_DATE**

The date of the first MQSUB command that caused this subscription to be created.

**MQCA\_CREATION\_TIME**

The time of the first MQSUB that caused this subscription to be created.

**MQCA\_TOPIC\_STRING**

The resolved topic string the subscription is for.

**MQCACF\_APPL\_IDENTITY\_DATA**

The identity data passed by the subscriber for propagation into messages sent to this subscription in the ApplIdentity field of the MQMD.

**MQCACF\_DESTINATION**

The destination for messages published to this subscription.

**MQCACF\_DESTINATION\_Q\_MGR**

The destination queue manager for messages published to this subscription.

**MQCACF\_SUB\_NAME**

The unique identifier of an application for a subscription.

**MQCACF\_SUB\_SELECTOR**

The SQL 92 selector string to be applied to messages published on the named topic to select whether they are eligible for this subscription.

**MQCACF\_SUB\_USER\_DATA**

The user data associated with the subscription.

**MQCACF\_SUB\_USER\_ID**

The userid that owns the subscription. MQCACF\_SUB\_USER\_ID is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription.

**MQCA\_TOPIC\_NAME**

The name of the topic object that identifies a position in the topic hierarchy to which the topic string is concatenated.

**MQIACF\_DESTINATION\_CLASS**

Indicated whether this subscription is a managed subscription.

**MQIACF\_DURABLE\_SUBSCRIPTION**

Whether the subscription is durable, persisting over queue manager restart.

**MQIACF\_EXPIRY**

The time to live from creation date and time.

**MQIACF\_PUB\_PRIORITY**

The priority of the messages sent to this subscription.

**MQIACF\_PUBSUB\_PROPERTIES**

The manner in which publish/subscribe related message properties are added to messages sent to this subscription.

**MQIACF\_REQUEST\_ONLY**

Indicates whether the subscriber polls for updates by using MQSUBRQ API, or whether all publications are delivered to this subscription.

**MQIACF\_SUB\_TYPE**

The type of subscription - how it was created.

**MQIACF\_SUBSCRIPTION\_SCOPE**

Whether the subscription forwards messages to all other queue managers directly connected by using a Publish/Subscribe collective or hierarchy, or the subscription forwards messages on this topic within this queue manager only.

**MQIACF\_SUB\_LEVEL**

The level within the subscription interception hierarchy at which this subscription is made.

**MQIACF\_VARIABLE\_USER\_ID**

Users other than the creator of this subscription that can connect to it (subject to topic and destination authority checks).

**MQIACF\_WILDCARD\_SCHEMA**

The schema to be used when interpreting wildcard characters in the topic string.

**MQIA\_DISPLAY\_TYPE**

Controls the output returned in the **TOPICSTR** and **TOPICOBJ** attributes.

*SubscriptionType (MQCFIN)*

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF\_SUB\_TYPE).

**MQSUBTYPE\_ADMIN**

Subscriptions which have been created by an admin interface or modified by an admin interface are selected.

**MQSUBTYPE\_ALL**

All subscription types are displayed.

**MQSUBTYPE\_API**

Subscriptions created by applications by way of the IBM MQ API are displayed.

**MQSUBTYPE\_PROXY**

System created subscriptions relating to inter-queue manager subscriptions are displayed.

**MQSUBTYPE\_USER**

USER subscriptions (with SUBTYPE of either ADMIN or API) are displayed. MQSUBTYPE\_USER is the default value.

*DisplayType (MQCFIN)*

Controls the output returned in the **MQCA\_TOPIC\_STRING** and **MQCA\_TOPIC\_NAME** attributes (parameter identifier: MQIA\_DISPLAY\_TYPE).

**MQDOPT\_RESOLVED**

Returns the resolved (full) topic string in the **MQCA\_TOPIC\_STRING** attribute. The value of the **MQCA\_TOPIC\_NAME** attribute is also returned.

**MQDOPT\_DEFINED**

Returns the values of the **MQCA\_TOPIC\_NAME** and **MQCA\_TOPIC\_STRING** attributes provided when the subscription was created. The **MQCA\_TOPIC\_STRING** attribute will contain the application part of the topic string only. You can use the values returned with **MQCA\_TOPIC\_NAME** and **MQCA\_TOPIC\_STRING** to fully recreate the subscription by using **MQDOPT\_DEFINED**.

## Inquire Subscription (Response):

The response to the Inquire Subscription (MQCMD\_INQUIRE\_SUBSCRIPTION) command consists of the response header followed by the *SubId* and *SubName* structures, and the requested combination of attribute parameter structures (where applicable).

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### Always returned

*SubID, SubName*

### Returned if requested

*AlterationDate, AlterationTime, CreationDate, CreationTime, Destination, DestinationClass, DestinationCorrelId, DestinationQueueManager, Expiry, PublishedAccountingToken, PublishedApplicationIdentityData, PublishPriority, PublishSubscribeProperties, Requestonly, Selector, SelectorType, SubscriptionLevel, SubscriptionScope, SubscriptionType, SubscriptionUser, TopicObject, TopicString, Userdata, VariableUser, WildcardSchema*

### Response Data

#### *AlterationDate* (MQCFST)

The date of the most recent **MQSUB** or **Change Subscription** command that modified the properties of the subscription (parameter identifier: MQCA\_ALTERATION\_DATE).

#### *AlterationTime* (MQCFST)

The time of the most recent **MQSUB** or **Change Subscription** command that modified the properties of the subscription (parameter identifier: MQCA\_ALTERATION\_TIME).

#### *CreationDate* (MQCFST)

The creation date of the subscription, in the form yyyy-mm-dd (parameter identifier: MQCA\_CREATION\_DATE).

#### *CreationTime* (MQCFST)

The creation time of the subscription, in the form hh.mm.ss (parameter identifier: MQCA\_CREATION\_TIME).

#### *Destination* (MQCFST)

Destination (parameter identifier: MQCACF\_DESTINATION).

Specifies the name of the alias, local, remote, or cluster queue to which messages for this subscription are put.

#### *DestinationClass* (MQCFIN)

Destination class (parameter identifier: MQIACF\_DESTINATION\_CLASS).

Whether the destination is managed.

The value can be any of the following values:

#### **MQDC\_MANAGED**

The destination is managed.

#### **MQDC\_PROVIDED**

The destination queue is as specified in the *Destination* field.

#### *DestinationCorrelId* (MQCFBS)

Destination correlation identifier (parameter identifier: MQBACF\_DESTINATION\_CORREL\_ID).

A correlation identifier that is placed in the *CorrelId* field of the message descriptor for all the messages sent to this subscription.

The maximum length is MQ\_CORREL\_ID\_LENGTH.

**DestinationQueueManager (MQCFST)**

Destination queue manager (parameter identifier: MQCACF\_DESTINATION\_Q\_MGR).

Specifies the name of the destination queue manager, either local or remote, to which messages for the subscription are forwarded.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

**DisplayType (MQCFIN)**

The type of output requested for MQCA\_TOPIC\_STRING and MQCA\_TOPIC\_NAME is returned (parameter identifier: MQIA\_DISPLAY\_TYPE).

**MQDOPT\_RESOLVED**

Returns the resolved (full) topic string in the MQCA\_TOPIC\_STRING attribute. The value of the MQCA\_TOPIC\_NAME attribute is also returned.

**MQDOPT\_DEFINED**

The application portion of the topic string is returned in the MQCA\_TOPIC\_STRING attribute. MQCA\_TOPIC\_NAME contains the name of the TOPIC Object used when defining the subscription.

**Durable (MQCFIN)**

Whether this subscription is a durable subscription (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

The value can be any of the following values:

**MQSUB\_DURABLE\_YES**

The subscription persists, even if the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. The queue manager reinstates the subscription during restart.

**MQSUB\_DURABLE\_NO**

The subscription is non-durable. The queue manager removes the subscription when the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. If the subscription has a destination class (DESTCLAS) of MANAGED, the queue manager removes any messages not yet consumed when it closes the subscription.

**Expiry (MQCFIN)**

The time, in tenths of a second, at which a subscription expires after its creation date and time (parameter identifier: MQIACF\_EXPIRY).

A value of unlimited means that the subscription never expires.

After a subscription has expired it becomes eligible to be discarded by the queue manager and receives no further publications.

**PublishedAccountingToken (MQCFBS)**

Value of the accounting token used in the AccountingToken field of the message descriptor (parameter identifier: MQBACF\_ACCOUNTING\_TOKEN).

The maximum length of the string is MQ\_ACCOUNTING\_TOKEN\_LENGTH.

**PublishedApplicationIdentityData (MQCFST)**

Value of the application identity data used in the ApplIdentityData field of the message descriptor (parameter identifier: MQCACF\_APPL\_IDENTITY\_DATA).

The maximum length of the string is MQ\_APPL\_IDENTITY\_DATA\_LENGTH.

**PublishPriority (MQCFIN)**

The priority of messages sent to this subscription (parameter identifier: MQIACF\_PUB\_PRIORITY).

The value can be any of the following values:

**MQPRI\_PRIORITY\_AS\_PUBLISHED**

The priority of messages sent to this subscription is taken from that priority supplied to the published message. MQPRI\_PRIORITY\_AS\_PUBLISHED is the supplied default value.

**MQPRI\_PRIORITY\_AS\_QDEF**

The priority of messages sent to this subscription is determined by the default priority of the queue defined as a destination.

**0-9** An integer value providing an explicit priority for messages sent to this subscription.

*PublishSubscribeProperties* (**MQCFIN**)

Specifies how publish/subscribe related message properties are added to messages sent to this subscription (parameter identifier: MQIACF\_PUBSUB\_PROPERTIES).

The value can be any of the following values:

**MQPSPROP\_NONE**

Publish/subscribe properties are not added to the messages. MQPSPROP\_NONE is the supplied default value.

**MQPSPROP\_MSGPROP**

Publish/subscribe properties are added as PCF attributes.

**MQPSPROP\_COMPAT**

If the original publication is a PCF message, then the publish/subscribe properties are added as PCF attributes. Otherwise, publish/subscribe properties are added within an MQRFH version 1 header. This method is compatible with applications coded for use with previous versions of IBM MQ.

**MQPSPROP\_RFH2**

Publish/subscribe properties are added within an MQRFH version 2 header. This method is compatible with applications coded for use with IBM Integration Bus brokers.

*Requestonly* (**MQCFIN**)

Indicates whether the subscriber polls for updates using the MQSUBRQ API call, or whether all publications are delivered to this subscription (parameter identifier: MQIACF\_REQUEST\_ONLY).

The value can be:

**MQRU\_PUBLISH\_ALL**

All publications on the topic are delivered to this subscription.

**MQRU\_PUBLISH\_ON\_REQUEST**

Publications are only delivered to this subscription in response to an MQSUBRQ API call.

*Selector* (**MQCFST**)

Specifies the selector applied to messages published to the topic (parameter identifier: MQCACF\_SUB\_SELECTOR).

Only those messages that satisfy the selection criteria are put to the destination specified by this subscription.

*SelectorType* (**MQCFIN**)

The type of selector string that has been specified (parameter identifier: MQIACF\_SELECTOR\_TYPE).

The value can be any of the following values:

**MQSELTYPE\_NONE**

No selector has been specified.

**MQSELTYPE\_STANDARD**

The selector references only the properties of the message, not its content, using the standard IBM MQ selector syntax. Selectors of this type are to be handled internally by the queue manager.

## **MQSELTYPE\_EXTENDED**

The selector uses extended selector syntax, typically referencing the content of the message. Selectors of this type cannot be handled internally by the queue manager; extended selectors can be handled only by another program such as IBM Integration Bus.

### **SubID (MQCFBS)**

The internal, unique key identifying a subscription (parameter identifier: MQBACF\_SUB\_ID).

### **SubscriptionLevel (MQCFIN)**

The level within the subscription interception hierarchy at which this subscription is made (parameter identifier: MQIACF\_SUB\_LEVEL).

The value can be:

- 0 - 9** An integer in the range 0-9. The default value is 1. Subscribers with a subscription level of 9 will intercept publications before they reach subscribers with lower subscription levels.

### **SubscriptionScope (MQCFIN)**

Determines whether this subscription is passed to other queue managers in the network (parameter identifier: MQIACF\_SUBSCRIPTION\_SCOPE).

The value can be:

#### **MQTSCOPE\_ALL**

The subscription is forwarded to all queue managers directly connected through a publish/subscribe collective or hierarchy. MQTSCOPE\_ALL is the supplied default value.

#### **MQTSCOPE\_QMGR**

The subscription only forwards messages published on the topic within this queue manager.

### **SubscriptionType (MQCFIN)**

Indicates how the subscription was created (parameter identifier: MQIACF\_SUB\_TYPE).

#### **MQSUBTYPE\_PROXY**

An internally created subscription used for routing publications through a queue manager.

#### **MQSUBTYPE\_ADMIN**

Created using **DEF SUB** MQSC or PCF command. This **SUBTYPE** also indicates that a subscription has been modified using an administrative command.

#### **MQSUBTYPE\_API**

Created using an **MQSUB** API request.

### **SubscriptionUser (MQCFST)**

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF\_SUB\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

### **TopicObject (MQCFST)**

The name of a previously defined topic object from which is obtained the topic name for the subscription (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

### **TopicString (MQCFST)**

The resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING).

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

### **Userdata (MQCFST)**

User data (parameter identifier: MQCACF\_SUB\_USER\_DATA).

Specifies the user data associated with the subscription

The maximum length of the string is MQ\_USER\_DATA\_LENGTH.

**VariableUser (MQCFIN)**

Specifies whether a user other than the one who created the subscription, that is, the user shown in *SubscriptionUser* can take over the ownership of the subscription (parameter identifier: MQIACF\_VARIABLE\_USER\_ID).

The value can be any of the following values:

**MQVU\_ANY\_USER**

Any user can take over the ownership. MQVU\_ANY\_USER is the supplied default value.

**MQVU\_FIXED\_USER**

No other user can take over the ownership.

**WildcardSchema (MQCFIN)**

Specifies the schema to be used when interpreting any wildcard characters contained in the *TopicString* (parameter identifier: MQIACF\_WILDCARD\_SCHEMA).

The value can be any of the following values:

**MQWS\_CHAR**

Wildcard characters represent portions of strings; it is for compatibility with IBM MQ V6.0 broker.

**MQWS\_TOPIC**

Wildcard characters represent portions of the topic hierarchy; this is for compatibility with IBM Integration Bus brokers. MQWS\_TOPIC is the supplied default value.

**Inquire Subscription Status:**

The Inquire Subscription Status (MQCMD\_INQUIRE\_SUB\_STATUS) command inquires about the status of a subscription.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

**Required parameters**

**SubName (MQCFST)**

The unique identifier of an application for a subscription (parameter identifier: MQCACF\_SUB\_NAME).

If *SubName* is not provided, *SubId* must be specified to identify the subscription to be inquired.

The maximum length of the string is MQ\_SUB\_NAME\_LENGTH.

**SubId (MQCFBS)**

Subscription identifier (parameter identifier: MQBACF\_SUB\_ID).

Specifies the unique internal subscription identifier. If the queue manager is generating the CorrelId for a subscription, then the *SubId* is used as the *DestinationCorrelId*.

You must supply a value for *SubId* if you have not supplied a value for *SubName*.

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is processed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command is processed on the queue manager on which it was entered.
- A queue manager name. The command is processed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command is processed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter on which to filter.

### *Durable* (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

#### **MQSUB\_DURABLE\_YES**

Information about durable subscriptions only is displayed. MQSUB\_DURABLE\_YES is the default.

#### **MQSUB\_DURABLE\_NO**

Information about non-durable subscriptions only is displayed.

### *SubscriptionType* (MQCFIN)

Specify this attribute to restrict the type of subscriptions which are displayed (parameter identifier: MQIACF\_SUB\_TYPE).

#### **MQSUBTYPE\_ADMIN**

Subscriptions which have been created by an admin interface or modified by an admin interface are selected.

#### **MQSUBTYPE\_ALL**

All subscription types are displayed.

#### **MQSUBTYPE\_API**

Subscriptions created by applications through an IBM MQ API call are displayed.

#### **MQSUBTYPE\_PROXY**

System created subscriptions relating to inter-queue-manager subscriptions are displayed.

#### **MQSUBTYPE\_USER**

USER subscriptions (with SUBTYPE of either ADMIN or API) are displayed. MQSUBTYPE\_USER is the default value.

### *StatusAttrs* (MQCFIL)

Subscription status attributes (parameter identifier: MQIACF\_SUB\_STATUS\_ATTRS).

To select the attributes you want to display you can specify;

- ALL to display all attributes.
- any of the following parameters individually or in combination.

#### **MQIACF\_ALL**

All attributes.

**MQBACF\_CONNECTION\_ID**

The currently active *ConnectionID* that has opened the subscription.

**MQIACF\_DURABLE\_SUBSCRIPTION**

Whether the subscription is durable, persisting over queue manager restart.

**MQCACF\_LAST\_MSG\_DATE**

The date that a message was last sent to the destination specified by the subscription.

**MQCACF\_LAST\_MSG\_TIME**

The time when a message was last sent to the destination specified by the subscription.

**MQIACF\_MESSAGE\_COUNT**

The number of messages put to the destination specified by the subscription.

**MQCA\_RESUME\_DATE**

The date of the most recent MQSUB command that connected to the subscription.

**MQCA\_RESUME\_TIME**

The time of the most recent MQSUB command that connected to the subscription.

**MQIACF\_SUB\_TYPE**

The type of subscription - how it was created.

**MQCACF\_SUB\_USER\_ID**

The userid owns the subscription.

**MQCA\_TOPIC\_STRING**

Returns the fully resolved topic string of the subscription.

**Inquire Subscription Status (Response):**

The response to the Inquire Subscription Status (MQCMD\_INQUIRE\_SUB\_STATUS) command consists of the response header followed by the *SubID* and *SubName* structures, and the requested combination of attribute parameter structures (where applicable).

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

**Always returned**

*SubID, SubName*

**Returned if requested**

*ActiveConnection, Durable, LastPublishDate, LastPublishTime, MCastRelIndicator, NumberMsgs, ResumeDate, ResumeTime, SubType, TopicString*

**Response Data*****ActiveConnection* (MQCFBS)**

The *ConnId* of the *HConn* that currently has this subscription open (parameter identifier: MQBACF\_CONNECTION\_ID).

***Durable* (MQCFIN)**

A durable subscription is not deleted when the creating application closes its subscription handle (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

**MQSUB\_DURABLE\_NO**

The subscription is removed when the application that created it is closed or disconnected from the queue manager.

**MQSUB\_DURABLE\_YES**

The subscription persists even when the creating application is no longer running or has been disconnected. The subscription is reinstated when the queue manager restarts.

**LastMessageDate (MQCFST)**

The date that a message was last sent to the destination specified by the subscription (parameter identifier: MQCACF\_LAST\_MSG\_DATE).

**LastMessageTime (MQCFST)**

The time when a message was last sent to the destination specified by the subscription (parameter identifier: MQCACF\_LAST\_MSG\_TIME).

**MCastRelIndicator (MQCFIN)**

The multicast reliability indicator (parameter identifier: MQIACF\_MCAST\_REL\_INDICATOR).

**NumberMsgs (MQCFIN)**

The number of messages put to the destination specified by this subscription (parameter identifier: MQIACF\_MESSAGE\_COUNT).

**ResumeDate (MQCFST)**

The date of the most recent **MQSUB** API call that connected to the subscription (parameter identifier: MQCA\_RESUME\_DATE).

**ResumeTime (MQCFST)**

The time of the most recent **MQSUB** API call that connected to the subscription (parameter identifier: MQCA\_RESUME\_TIME).

**SubscriptionUser (MQCFST)**

The userid that 'owns' this subscription. This parameter is either the userid associated with the creator of the subscription, or, if subscription takeover is permitted, the userid which last took over the subscription. (parameter identifier: MQCACF\_SUB\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

**SubID (MQCFBS)**

The internal, unique key identifying a subscription (parameter identifier: MQBACF\_SUB\_ID).

**SubName (MQCFST)**

The unique identifier of a subscription (parameter identifier: MQCACF\_SUB\_NAME).

**SubType (MQCFIN)**

Indicates how the subscription was created (parameter identifier: MQIA\_SUB\_TYPE).

**MQSUBTYPE\_PROXY**

An internally created subscription used for routing publications through a queue manager.

**MQSUBTYPE\_ADMIN**

Created using the **DEF SUB** MQSC or **Create Subscription** PCF command. This Subtype also indicates that a subscription has been modified using an administrative command.

**MQSUBTYPE\_API**

Created using an **MQSUB** API call.

**TopicString (MQCFST)**

The resolved topic string (parameter identifier: MQCA\_TOPIC\_STRING). The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

**Inquire System:** z/OS

The Inquire System (MQCMD\_INQUIRE\_SYSTEM) command returns general system parameters and information.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**Inquire System (Response):** z/OS

The response to the Inquire System (MQCMD\_INQUIRE\_SYSTEM) command consists of the response header followed by the *ParameterType* structure and the combination of attribute parameter structures determined by the value of the parameter type.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Always returned:**

*ParameterType*

Possible values of *ParameterType* are:

**MQSYSP\_TYPE\_INITIAL**

The initial settings of the system parameters.

**MQSYSP\_TYPE\_SET**

The settings of the system parameters if they have been altered since their initial setting.

**Returned if *ParameterType* is MQSYSP\_TYPE\_INITIAL or MQSYSP\_TYPE\_SET (and a value is set):**

*CheckpointCount, ClusterCacheType, CodedCharSetId, CommandUserId, ConnSwap, DB2BlobTasks, DB2Name, DB2Tasks, DSGName, Exclmsg, ExitInterval, ExitTasks, MULCCapture, OpMode, OTMADruExit, OTMAGroup, OTMAInterval, OTMAMember, OTMSTpipePrefix, QIndexDefer, QSGName, RESLEVELAudit, RoutingCode, Service, SMFAccounting, SMFStatistics, SMFInterval, Splcap, TraceClass, TraceSize, WLMInterval, WLMIntervalUnits*

## Response data

### *CheckpointCount* (MQCFIN)

The number of log records written by IBM MQ between the start of one checkpoint and the next (parameter identifier: MQIACF\_SYSP\_CHKPOINT\_COUNT).

### *ClusterCacheType* (MQCFIN)

The type of the cluster cache (parameter identifier: MQIACF\_SYSP\_CLUSTER\_CACHE).

The value can be any of the following values:

#### **MQCLCT\_STATIC**

Static cluster cache.

#### **MQCLCT\_DYNAMIC**

Dynamic cluster cache.

### *CodedCharSetId* (MQCFIN)

Archive retention period (parameter identifier: MQIA\_CODED\_CHAR\_SET\_ID).

The coded character set identifier for the queue manager.

### *CommandUserId* (MQCFST)

Command user ID (parameter identifier: MQCACF\_SYSP\_CMD\_USER\_ID).

Specifies the default user ID for command security checks.

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

### *ConnSwap* (MQCFIN)

Specifies whether jobs that are issuing certain MQ API calls are swappable or non-swappable (parameter identifier: MQIACF\_CONNECTION\_SWAP).

This value can be either MQSYSP\_YES or MQSYSP\_NO.

### *DB2BlobTasks* (MQCFIN)

The number of Db2 server tasks to be used for BLOBs (parameter identifier: MQIACF\_SYSP\_DB2\_BLOB\_TASKS).

### *DB2Name* (MQCFST)

The name of the Db2 subsystem or group attachment to which the queue manager is to connect (parameter identifier: MQCACF\_DB2\_NAME).

The maximum length of the string is MQ\_DB2\_NAME\_LENGTH.

### *DB2Tasks* (MQCFIN)

The number of Db2 server tasks to use (parameter identifier: MQIACF\_SYSP\_DB2\_TASKS).

### *DSGName* (MQCFST)

The name of the Db2 data-sharing group to which the queue manager is to connect (parameter identifier: MQCACF\_DSG\_NAME).

The maximum length of the string is MQ\_DSG\_NAME\_LENGTH.

### *Exclmsg* (MQCFSL)

A list of message identifiers to be excluded from being written to any log (parameter identifier: MQCACF\_EXCL\_OPERATOR\_MESSAGES).

The maximum length of each message identifier is MQ\_OPERATOR\_MESSAGE\_LENGTH.

The list can contain a maximum of 16 message identifiers.

### *ExitInterval* (MQCFIN)

The time, in seconds, for which queue manager exits can execute during each invocation (parameter identifier: MQIACF\_SYSP\_EXIT\_INTERVAL).

*ExitTasks* (**MQCFIN**)

Specifies how many started server tasks to use to run queue manager exits (parameter identifier: MQIACF\_SYSP\_EXIT\_TASKS).

*MULCCapture* (**MQCFIN**)

The Measured Usage Pricing property is used to control the algorithm for gathering data used by Measured Usage License Charging (MULC) (parameter identifier: MQIACF\_MULC\_CAPTURE).

The returned values can be MQMULC\_STANDARD or MQMULC\_REFINED.

*OpMode* (**MQCFIL**)

An integer item list containing two elements which describe the current operation mode (parameter identifier: MQIACF\_OPERATION\_MODE).

1. The first integer element can be one of the following:

**MQOPMODE\_COMPAT**

The queue manager is operating in compatibility mode (COMPAT). Only those functions in the specified level or an earlier level of queue manager are available.

**MQOPMODE\_NEW\_FUNCTION**

The queue manager is operating in new function mode (NEWFUNC).

2. The second integer element contains the current compatibility level. The value is in the format of the MQCMDL\_LEVEL\_\* constants. See Constants.

When the queue manager is in compatibility mode, the compatibility level indicates which version and fix level the queue manager has been migrated from and thus can fall back to if necessary. For more details, see Using CSQ6SYSP.

This parameter is valid only on z/OS.

*OTMADruExit* (**MQCFST**)

The name of the OTMA destination resolution user exit to be run by IMS (parameter identifier: MQCACF\_SYSP\_OTMA\_DRU\_EXIT).

The maximum length of the string is MQ\_EXIT\_NAME\_LENGTH.

*OTMAGroup* (**MQCFST**)

The name of the XCF group to which this instance of IBM MQ belongs (parameter identifier: MQCACF\_SYSP\_OTMA\_GROUP).

The maximum length of the string is MQ\_XCF\_GROUP\_NAME\_LENGTH.

*OTMAInterval* (**MQCFIN**)

The length of time, in seconds, that a user ID from IBM MQ is considered previously verified by IMS (parameter identifier: MQIACF\_SYSP\_OTMA\_INTERVAL).

*OTMAMember* (**MQCFST**)

The name of the XCF member to which this instance of IBM MQ belongs (parameter identifier: MQCACF\_SYSP\_OTMA\_MEMBER).

The maximum length of the string is MQ\_XCF\_MEMBER\_NAME\_LENGTH.

*OTMSTpipePrefix* (**MQCFST**)

The prefix to be used for Tpipe names (parameter identifier: MQCACF\_SYSP\_OTMA\_TPIPE\_PFX).

The maximum length of the string is MQ\_TPIPE\_PFX\_LENGTH.

*QIndexDefer* (**MQCFIN**)

Specifies whether queue manager restart completes before all indexes are built deferring building to later, or waits until all indexes are built (parameter identifier: MQIACF\_SYSP\_Q\_INDEX\_DEFER).

The value can be any of the following values:

**MQSYSP\_YES**

Queue manager restart completes before all indexes are built.

**MQSYSP\_NO**

Queue manager restart waits until all indexes are built.

**QSGName (MQCFST)**

The name of the queue-sharing group to which the queue manager belongs (parameter identifier: MQCA\_QSG\_NAME).

The maximum length of the string is MQ\_QSG\_NAME\_LENGTH.

**RESLEVELAudit (MQCFIN)**

Specifies whether RACF audit records are written for RESLEVEL security checks performed during connection processing (parameter identifier: MQIACF\_SYSP\_RESLEVEL\_AUDIT).

The value can be any of the following values:

**MQSYSP\_YES**

RACF audit records are written.

**MQSYSP\_NO**

RACF audit records are not written.

**RoutingCode (MQCFIL)**

z/OS routing code list (parameter identifier: MQIACF\_SYSP\_ROUTING\_CODE).

Specifies the list of z/OS routing codes for messages that are not sent in direct response to an MQSC command. There can be in the range 1 through 16 entries in the list.

**Service (MQCFST)**

Service parameter setting (parameter identifier: MQCACF\_SYSP\_SERVICE).

The maximum length of the string is MQ\_SERVICE\_NAME\_LENGTH.

**SMFAccounting (MQCFIN)**

Specifies whether IBM MQ sends accounting data to SMF automatically when the queue manager starts (parameter identifier: MQIACF\_SYSP\_SMF\_ACCOUNTING).

The value can be any of the following values:

**MQSYSP\_YES**

Accounting data is sent automatically.

**MQSYSP\_NO**

Accounting data is not sent automatically.

**SMFStatistics (MQCFIN)**

Specifies whether IBM MQ sends statistics data to SMF automatically when the queue manager starts (parameter identifier: MQIACF\_SYSP\_SMF\_STATS).

The value can be any of the following values:

**MQSYSP\_YES**

Statistics data is sent automatically.

**MQSYSP\_NO**

Statistics data is not sent automatically.

**SMFInterval (MQCFIN)**

The default time, in minutes, between each gathering of statistics (parameter identifier: MQIACF\_SYSP\_SMF\_INTERVAL).

**Splcap (MQCFIN)**

If the IBM MQ AMS component is installed for the version of IBM MQ that the queue manager is running under, the attribute has a value YES (MQCAP\_SUPPORTED). If the IBM MQ AMS component is not installed, the value is NO (MQCAP\_NOT\_SUPPORTED).

The value can be one of the following values:

**MQCAP\_SUPPORTED**

If the IBM MQ AMS component is installed for the version of IBM MQ that the queue manager is running under.

**MQCAP\_NOT\_SUPPORTED**

If the IBM MQ AMS component is not installed.

**TraceClass (MQCFIL)**

Classes for which tracing is started automatically (parameter identifier: MQIACF\_SYSP\_TRACE\_CLASS). There can be in the range 1 through 4 entries in the list.

**TraceSize (MQCFIN)**

The size of the trace table, in 4 KB blocks, to be used by the global trace facility (parameter identifier: MQIACF\_SYSP\_TRACE\_SIZE).

**WLMInterval (MQCFIN)**

The time between scans of the queue index for WLM-managed queues (parameter identifier: MQIACF\_SYSP\_WLM\_INTERVAL).

**WLMIntervalUnits (MQCFIN)**

Whether the value of *WLMInterval* is given in seconds or minutes (parameter identifier: MQIACF\_SYSP\_WLM\_INT\_UNITS). The value can be any of the following values:

**MQTIME\_UNITS\_SEC**

The value of *WLMInterval* is given in seconds.

**MQTIME\_UNITS\_MINS**

The value of *WLMInterval* is given in minutes.

**Inquire Topic:**

The Inquire Topic (MQCMD\_INQUIRE\_TOPIC) command inquires about the attributes of existing IBM MQ administrative topic objects

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

**Required parameters****TopicName (MQCFST)**

Administrative topic object name (parameter identifier: MQCA\_TOPIC\_NAME).

Specifies the name of the administrative topic object about which information is to be returned. Generic topic object names are supported. A generic name is a character string followed by an asterisk (\*). For example, ABC\* selects all administrative topic objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

**Optional parameters****ClusterInfo (MQCFIN)**

Cluster information (parameter identifier: MQIACF\_CLUSTER\_INFO).

This parameter requests that, in addition to information about attributes of topics defined on this queue manager, cluster information about these topics and other topics in the repository that match the selection criteria is returned.

In this case, there might be multiple topics with the same name returned.

You can set this parameter to any integer value: the value used does not affect the response to the command.

The cluster information is obtained locally from the queue manager.

z/OS

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use *CommandScope* as a parameter to filter on.

### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor. The parameter identifier must be any integer type parameter allowed in *TopicAttrs* except MQIACF\_ALL.

Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFIF - PCF integer filter parameter” on page 1588 for information about using this filter condition.

If you specify an integer filter, you cannot also specify a string filter using the *StringFilterCommand* parameter.

z/OS

### *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

**MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

**MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

**MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

**MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

You cannot use *QSGDisposition* as a parameter to filter on.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed in *TopicAttrs* except MQCA\_TOPIC\_NAME. Use this parameter to restrict the output from the command by specifying a filter condition. See “MQCFSF - PCF string filter parameter” on page 1595 for information about using this filter condition.

If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

**TopicAttrs (MQCFIL)**

Topic object attributes (parameter identifier: MQIACF\_TOPIC\_ATTRS).

The attribute list can specify the following value on its own - default value if the parameter is not specified:

**MQIACF\_ALL**

All attributes.

or a combination of the following:

**MQCA\_ALTERATION\_DATE**

The date on which the information was last altered.

**MQCA\_ALTERATION\_TIME**

The time at which the information was last altered.

**MQCA\_CLUSTER\_NAME**

The cluster that is to be used for the propagation of publications and subscription to publish/subscribe cluster-connected queue managers for this topic.

**MQCA\_CLUSTER\_DATE**

The date on which this information became available to the local queue manager.

**MQCA\_CLUSTER\_TIME**

The time at which this information became available to the local queue manager.

**MQCA\_CLUSTER\_Q\_MGR\_NAME**

Queue manager that hosts the topic.

**MQCA\_CUSTOM**

The custom attribute for new features.

**MQCA\_MODEL\_DURABLE\_Q**

Name of the model queue for durable managed subscriptions.

**MQCA\_MODEL\_NON\_DURABLE\_Q**

Name of the model queue for non-durable managed subscriptions.

**MQCA\_TOPIC\_DESC**

Description of the topic object.

**MQCA\_TOPIC\_NAME**

Name of the topic object.

**MQCA\_TOPIC\_STRING**

The topic string for the topic object.

**MQIA\_CLUSTER\_OBJECT\_STATE**

The current state of the clustered topic definition.

**MQIA\_CLUSTER\_PUB\_ROUTE**

The routing behavior of publications between queue managers in a cluster.

**MQIA\_DEF\_PRIORITY**

Default message priority.

**MQIA\_DEF\_PUT\_RESPONSE\_TYPE**

Default put response.

**MQIA\_DURABLE\_SUB**

Whether durable subscriptions are permitted.

**MQIA\_INHIBIT\_PUB**

Whether publications are allowed.

**MQIA\_INHIBIT\_SUB**

Whether subscriptions are allowed.

**MQIA\_NPM\_DELIVERY**

The delivery mechanism for non-persistent messages.

**MQIA\_PM\_DELIVERY**

The delivery mechanism for persistent messages.

**MQIA\_PROXY\_SUB**

Whether a proxy subscription is to be sent for this topic, even if no local subscriptions exist.

**MQIA\_PUB\_SCOPE**

Whether this queue manager propagates publications to queue managers as part of a hierarchy or a publish/subscribe cluster.

**MQIA\_SUB\_SCOPE**

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or a publish/subscribe cluster.

**MQIA\_TOPIC\_DEF\_PERSISTENCE**

Default message persistence.

**MQIA\_USE\_DEAD\_LETTER\_Q**

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue.

**TopicType (MQCFIN)**

Cluster information (parameter identifier: MQIA\_TOPIC\_TYPE).

If this parameter is present, eligible queues are limited to the specified type. Any attribute selector that is specified in the TopicAttrs list and that is valid only for topics of different type is ignored; no error is raised.

If this parameter is not present (or if MQIACF\_ALL is specified), queues of all types are eligible. Each attribute specified must be a valid topic attribute selector (that is, it must be in the following list), but it need not be applicable to all or any of the topics returned. Topic attribute selectors that are valid but not applicable to the queue are ignored; no error messages occur and no attribute is returned.

The value can be any of the following values:

## MQTOPT\_ALL

All topic types are displayed. MQTOPT\_ALL includes cluster topics, if ClusterInfo is also specified. MQTOPT\_ALL is the default value.

## MQTOPT\_CLUSTER

Topics that are defined in publish/subscribe clusters are returned.

## MQTOPT\_LOCAL

Locally defined topics are displayed.

### Inquire Topic (Response):

The response to the Inquire Topic (MQCMD\_INQUIRE\_TOPIC) command consists of the response header followed by the *TopicName* structure (and on z/OS only, the *QSG Disposition* structure), and the requested combination of attribute parameter structures (where applicable).

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### Always returned:

*TopicName*, *TopicType*,  *QSGDisposition*

### Returned if requested:

*AlterationDate*, *AlterationTime*, *ClusterName*, *ClusterObjectState*, *ClusterPubRoute*, *CommInfo*, *Custom*, *DefPersistence*, *DefPriority*, *DefPutResponse*, *DurableModelQName*, *DurableSubscriptions*, *InhibitPublications*, *InhibitSubscriptions*, *Multicast*, *NonDurableModelQName*, *NonPersistentMsgDelivery*, *PersistentMsgDelivery*, *ProxySubscriptions*, *PublicationScope*, *QMgrName*, *SubscriptionScope*, *TopicDesc*, *TopicString*, *UseDLQ*, *WildcardOperation*

### Response data

#### *AlterationDate* (MQCFST)

Alteration date (parameter identifier: MQCA\_ALTERATION\_DATE).

The date when the information was last altered, in the form yyyy-mm-dd.

#### *AlterationTime* (MQCFST)

Alteration time (parameter identifier: MQCA\_ALTERATION\_TIME).

The time when the information was last altered, in the form hh.mm.ss.

#### *ClusterName* (MQCFST)

The name of the cluster to which this topic belongs. (parameter identifier: MQCA\_CLUSTER\_NAME).

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see Distributed publish/subscribe networks.

The value can be any of the following values:

**Blank** If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

**String** The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if **PublicationScope** or **SubscriptionScope** are set to MQSCOPE\_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

#### *ClusterObjectState* (MQCFIN)

The current state of the clustered topic definition (parameter identifier: MQIA\_CLUSTER\_OBJECT\_STATE).

The value can be any of the following values:

##### **MQCLST\_ACTIVE**

The cluster topic is correctly configured and being adhered to by this queue manager.

##### **MQCLST\_PENDING**

Only seen by a hosting queue manager, this state is reported when the topic has been created but the full repository has not yet propagated it to the cluster. This might be because the host queue manager is not connected to a full repository, or because the full repository has deemed the topic to be invalid.

##### **MQCLST\_INVALID**

This clustered topic definition conflicts with an earlier definition in the cluster and is therefore not currently active.

##### **MQCLST\_ERROR**

An error has occurred with respect to this topic object.

This parameter is typically used to aid diagnosis when multiple definitions of the same clustered topic are defined on different queue managers, and the definitions are not identical. See Routing for publish/subscribe clusters: Notes on behavior.

#### *ClusterPubRoute* (MQCFIN)

The routing behavior of publications between queue managers in a cluster (parameter identifier: MQIA\_CLUSTER\_PUB\_ROUTE).

The value can be any of the following values:

##### **MQCLROUTE\_DIRECT**

When you configure a direct routed clustered topic on a queue manager, all queue managers in the cluster become aware of all other queue managers in the cluster. When performing publish and subscribe operations, each queue manager can connect direct to any other queue manager in the cluster.

##### **MQCLROUTE\_TOPIC\_HOST**

When you use topic host routing, all queue managers in the cluster become aware of the cluster queue managers that host the routed topic definition (that is, the queue managers on which you have defined the topic object). When performing publish and subscribe operations, queue managers in the cluster connect only to these topic host queue managers, and not directly to each other. The topic host queue managers are responsible for routing publications from queue managers on which publications are published to queue managers with matching subscriptions.

#### *CommInfo* (MQCFST)

The name of the communication information object (parameter identifier: MQCA\_COMM\_INFO\_NAME).

Shows the resolved value of the name of the communication information object to be used for this topic node.

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

**Custom (MQCFST)**

Custom attribute for new features (parameter identifier: MQCA\_CUSTOM).

This attribute is reserved for the configuration of new features before separate attributes have been introduced. It can contain the values of zero or more attributes as pairs of attribute name and value, separated by at least one space. The attribute name and value pairs have the form NAME(VALUE).

This description will be updated when features using this attribute are introduced.

**DefPersistence (MQCFIN)**

Default persistence (parameter identifier: MQIA\_TOPIC\_DEF\_PERSISTENCE).

The value can be:

**MQPER\_PERSISTENCE\_AS\_PARENT**

The default persistence is based on the setting of the closest parent administrative topic object in the topic tree.

**MQPER\_PERSISTENT**

Message is persistent.

**MQPER\_NOT\_PERSISTENT**

Message is not persistent.

**DefPriority (MQCFIN)**

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

**DefPutResponse (MQCFIN)**

Default put response (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

The value can be:

**MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

**MQPRT\_RESPONSE\_AS\_PARENT**

The default put response is based on the setting of the closest parent administrative topic object in the topic tree.

**MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

**DurableModelQName (MQCFST)**

Name of the model queue to be used for durable managed subscriptions (parameter identifier: MQCA\_MODEL\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**DurableSubscriptions (MQCFIN)**

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA\_DURABLE\_SUB).

The value can be:

**MQSUB\_DURABLE\_AS\_PARENT**

Whether durable subscriptions are permitted is based on the setting of the closest parent administrative topic object in the topic tree.

**MQSUB\_DURABLE**

Durable subscriptions are permitted.

**MQSUB\_NON\_DURABLE**

Durable subscriptions are not permitted.

*InhibitPublications* (**MQCFIN**)

Whether publications are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_PUB).

The value can be:

**MQTA\_PUB\_AS\_PARENT**

Whether messages can be published to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQTA\_PUB\_INHIBITED**

Publications are inhibited for this topic.

**MQTA\_PUB\_ALLOWED**

Publications are allowed for this topic.

*InhibitSubscriptions* (**MQCFIN**)

Whether subscriptions are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_SUB).

The value can be:

**MQTA\_SUB\_AS\_PARENT**

Whether applications can subscribe to this topic is based on the setting of the closest parent administrative topic object in the topic tree.

**MQTA\_SUB\_INHIBITED**

Subscriptions are inhibited for this topic.

**MQTA\_SUB\_ALLOWED**

Subscriptions are allowed for this topic.

*Multicast* (**MQCFIN**)

Whether multicast is used for this topic (parameter identifier: MQIA\_MULTICAST).

Returned value:

**MQMC\_ENABLED**

Multicast can be used.

**MQMC\_DISABLED**

Multicast is not used.

**MQMC\_ONLY**

Only Multicast publish/subscribe can be used on this topic.

*NonDurableModelQName* (**MQCFST**)

Name of the model queue to be used for non-durable managed subscriptions (parameter identifier: MQCA\_MODEL\_NON\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

*NonPersistentMsgDelivery* (**MQCFIN**)

The delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA\_NPM\_DELIVERY).

The value can be:

**MQDLV\_AS\_PARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**MQDLV\_ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_DUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_AVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**PersistentMsgDelivery (MQCFIN)**

The delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA\_PM\_DELIVERY).

The value can be:

**MQDLV\_AS\_PARENT**

The delivery mechanism used is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

**MQDLV\_ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_DUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no other subscribers receive the message and the MQPUT fails.

**MQDLV\_ALL\_AVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

**ProxySubscriptions (MQCFIN)**

Whether a proxy subscription is to be sent for this topic, even if no local subscriptions exist, to directly connected queue managers (parameter identifier: MQIA\_PROXY\_SUB).

The value can be:

**MQTA\_PROXY\_SUB\_FORCE**

A proxy subscription is sent to connected queue managers even if no local subscriptions exist.

**MQTA\_PROXY\_SUB\_FIRSTUSE**

A proxy subscription is sent for this topic only when a local subscription exists.

**PublicationScope (MQCFIN)**

Whether this queue manager propagates publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_PUB\_SCOPE).

The value can be:

**MQSCOPE\_ALL**

Publications for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

**MQSCOPE\_AS\_PARENT**

Whether this queue manager propagates publications to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQSCOPE\_AS\_PARENT is the default value for this parameter if no value is specified.

#### **MQSCOPE\_QMGR**

Publications for this topic are not propagated to other queue managers.

**Note:** You can override this behavior on a publication-by-publication basis, using MQPMO\_SCOPE\_QMGR on the Put Message Options.

#### **QMgrName (MQCFST)**

Name of local queue manager (parameter identifier: MQCA\_CLUSTER\_Q\_MGR\_NAME).

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH

#### **SubscriptionScope (MQCFIN)**

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_SUB\_SCOPE).

The value can be:

#### **MQSCOPE\_ALL**

Subscriptions for this topic are propagated to hierarchically connected queue managers and to publish/subscribe cluster-connected queue managers.

#### **MQSCOPE\_AS\_PARENT**

Whether this queue manager propagates subscriptions to queue managers as part of a hierarchy or as part of a publish/subscribe cluster is based on the setting of the first parent administrative node found in the topic tree relating to this topic.

MQSCOPE\_AS\_PARENT is the default value for this parameter if no value is specified.

#### **MQSCOPE\_QMGR**

Subscriptions for this topic are not propagated to other queue managers.

**Note:** You can override this behavior on a subscription-by-subscription basis, using MQSO\_SCOPE\_QMGR on the Subscription Descriptor or SUBSCOPE(QMGR) on DEFINE SUB.

#### **TopicDesc (MQCFST)**

Topic description (parameter identifier: MQCA\_TOPIC\_DESC).

The maximum length is MQ\_TOPIC\_DESC\_LENGTH.

#### **TopicName (MQCFST)**

Topic object name (parameter identifier: MQCA\_TOPIC\_NAME).

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH

#### **TopicString (MQCFST)**

The topic string (parameter identifier: MQCA\_TOPIC\_STRING).

The '/' character within this string has special meaning. It delimits the elements in the topic tree. A topic string can start with the '/' character but is not required to. A string starting with the '/' character is not the same as the string which starts without the '/' character. A topic string cannot end with the "/" character.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

#### **TopicType (MQCFIN)**

Whether this object is a local or cluster topic (parameter identifier: MQIA\_TOPIC\_TYPE).

The value can be:

#### **MQTOPT\_LOCAL**

This object is a local topic.

#### **MQTOPT\_CLUSTER**

This object is a cluster topic.

### *UseDLQ (MQCFIN)*

Whether the dead-letter queue (or undelivered message queue) should be used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value might be:

#### **MQUSEDLQ\_NO**

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message and the application's MQPUT to a topic will fail in accordance with the settings of NPMSGDLV and PMSGDLV.

#### **MQUSEDLQ\_YES**

If the queue manager DEADQ attribute provides the name of a dead-letter queue then it will be used, otherwise the behaviour will be as for MQUSEDLQ\_NO.

#### **MQUSEDLQ\_AS\_PARENT**

Whether to use the dead-letter queue is based on the setting of the closest administrative topic object in the topic tree.

### *WildcardOperation (MQCFIN)*

Behavior of subscriptions including wildcards made to this topic (parameter identifier: MQIA\_WILDCARD\_OPERATION).

The value can be:

#### **MQTA\_PASSTHRU**

Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object receive publications made to this topic and to topic strings more specific than this topic. MQTA\_PASSTHRU is the default supplied with IBM MQ.

#### **MQTA\_BLOCK**

Subscriptions made using wildcard topic names that are less specific than the topic string at this topic object do not receive publications made to this topic or to topic strings more specific than this topic.

### **Inquire Topic Names:**

The Inquire Topic Names (MQCMD\_INQUIRE\_TOPIC\_NAMES) command inquires a list of administrative topic names that match the generic topic name specified.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### **Required parameters**

#### *TopicName (MQCFST)*

Administrative topic object name (parameter identifier: MQCA\_TOPIC\_NAME).

Specifies the name of the administrative topic object that information is to be returned for.

Generic topic object names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_LIVE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_LIVE is the default value if the parameter is not specified.

#### **MQQSGD\_ALL**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY.

If there is a shared queue manager environment, and the command is being executed on the queue manager where it was issued, this option also displays information for objects defined with MQQSGD\_GROUP.

If MQQSGD\_LIVE is specified or defaulted, or if MQQSGD\_ALL is specified in a shared queue manager environment, the command might give duplicated names (with different dispositions).

#### **MQQSGD\_COPY**

The object is defined as MQQSGD\_COPY.

#### **MQQSGD\_GROUP**

The object is defined as MQQSGD\_GROUP. MQQSGD\_GROUP is permitted only in a shared queue environment.

#### **MQQSGD\_Q\_MGR**

The object is defined as MQQSGD\_Q\_MGR.

#### **MQQSGD\_PRIVATE**

The object is defined as MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE returns the same information as MQQSGD\_LIVE.

## Inquire Topic Names (Response):

The response to the Inquire Topic Names (MQCMD\_INQUIRE\_TOPIC\_NAMES) command consists of the response header followed by a parameter structure giving zero or more names that match the specified administrative topic name.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### ▶ z/OS

Additionally, on z/OS only, the *QSGDispositions* parameter structure (with the same number of entries as the *TopicNames* structure) is returned. Each entry in this structure indicates the disposition of the object with the corresponding entry in the *TopicNames* structure.

#### Always returned:

*TopicNames*, ▶ z/OS *QSGDispositions*

#### Returned if requested:

None

#### Response data

##### *TopicNames* (MQCFSL)

List of topic object names (parameter identifier: MQCACF\_TOPIC\_NAMES).

### ▶ z/OS

##### *QSGDispositions* (MQCFIL)

List of QSG dispositions (parameter identifier: MQIACF\_QSG\_DISPS). This parameter is valid on z/OS only. The value can be:

##### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

##### MQQSGD\_GROUP

The object is defined as MQQSGD\_GROUP.

##### MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

## Inquire Topic Status:

The Inquire Topic Status (MQCMD\_INQUIRE\_TOPIC\_STATUS) command inquires the status of a particular topic, or of a topic and its child topics. The Inquire Topic Status command has a required parameter. The Inquire Topic Status command has optional parameters.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

## Required parameters

### *TopicString* (MQCFST)

The topic string (parameter identifier: MQCA\_TOPIC\_STRING).

The name of the topic string to display. IBM MQ uses the topic wildcard characters ('#' and '+') and does not treat a trailing asterisk as a wildcard. For more information about using wildcard characters, refer to the related topic.

The maximum length of the string is MQ\_TOPIC\_STR\_LENGTH.

## Optional parameters

### ▶ z/OS *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- Blank (or omit the parameter altogether). The command runs on the queue manager on which you enter it.
- A queue manager name. The command runs on the queue manager that you specify, if it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which you entered the command, you must be using a queue-sharing group environment, and the command server must be enabled.
- An asterisk (\*). The command runs on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

You cannot use CommandScope as a filter parameter.

### *IntegerFilterCommand* (MQCFIF)

Integer filter command descriptor that you use to restrict the output from the command. The parameter identifier must be an integer type and must be one of the values allowed for MQIACF\_TOPIC\_SUB\_STATUS, MQIACF\_TOPIC\_PUB\_STATUS or MQIACF\_TOPIC\_STATUS, except MQIACF\_ALL.

If you specify an integer filter, you cannot also specify a string filter with the *StringFilterCommand* parameter.

### *StatusType* (MQCFIN)

The type of status to return (parameter identifier: MQIACF\_TOPIC\_STATUS\_TYPE).

The value can be:

**MQIACF\_TOPIC\_STATUS**  
**MQIACF\_TOPIC\_SUB**  
**MQIACF\_TOPIC\_PUB**

This command ignores any attribute selectors specified in the *TopicStatusAttrs* list that are not valid for the selected *StatusType* and the command raises no error.

The default value if this parameter is not specified is **MQIACF\_TOPIC\_STATUS**.

**StringFilterCommand (MQCFSF)**

String filter command descriptor. The parameter identifier must be any string type parameter allowed for *MQIACF\_TOPIC\_SUB\_STATUS*, *MQIACF\_TOPIC\_PUB\_STATUS* or *MQIACF\_TOPIC\_STATUS*, except *MQIACF\_ALL*, or the identifier *MQCA\_TOPIC\_STRING\_FILTER* to filter on the topic string.

Use the parameter identifier to restrict the output from the command by specifying a filter condition. Ensure that the parameter is valid for the type selected in *StatusType*. If you specify a string filter, you cannot also specify an integer filter using the *IntegerFilterCommand* parameter.

**TopicStatusAttrs (MQCFIL)**

Topic status attributes (parameter identifier: *MQIACF\_TOPIC\_STATUS\_ATTRS*)

The default value used if the parameter is not specified is:

*MQIACF\_ALL*

You can specify any of the parameter values listed in “Inquire Topic Status (Response).” It is not an error to request status information that is not relevant for a particular status type, but the response contains no information for the value concerned.

**Inquire Topic Status (Response):**

The response of the Inquire topic (*MQCMD\_INQUIRE\_TOPIC\_STATUS*) command consists of the response header, followed by the *TopicString* structure, and the requested combination of attribute parameter structures (where applicable). The Inquire Topic Status command returns the values requested when the *StatusType* is *MQIACF\_TOPIC\_STATUS*. The Inquire Topic Status command returns the values requested when the *StatusType* is *MQIACF\_TOPIC\_STATUS\_SUB*. The Inquire Topic Status command returns the values requested when the *StatusType* is *MQIACF\_TOPIC\_STATUS\_PUB*.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

**Always returned:**

*TopicString*

**Returned if requested and StatusType is MQIACF\_TOPIC\_STATUS:**

*Cluster, ClusterPubRoute, CommInfo, DefPriority, DefaultPutResponse, DefPersistence, DurableSubscriptions, InhibitPublications, InhibitSubscriptions, AdminTopicName, Multicast, DurableModelQName, NonDurableModelQName, PersistentMessageDelivery, NonPersistentMessageDelivery, RetainedPublication, PublishCount, SubscriptionScope, SubscriptionCount, PublicationScope, UseDLQ*

**Note:** The Inquire Topic Status command returns only resolved values for the topic, and no *AS\_PARENT* values.

**Returned if requested and StatusType is MQIACF\_TOPIC\_SUB:**

*SubscriptionId, SubscriptionUserId, Durable, SubscriptionType, ResumeDate, ResumeTime, LastMessageDate, LastMessageTime, NumberOfMessages, ActiveConnection*

**Returned if requested and StatusType is MQIACF\_TOPIC\_PUB:**

*LastPublishDate, LastPublishTime, NumberOfPublishes, ActiveConnection*

## Response data (TOPIC\_STATUS)

### *ClusterName* (MQCFST)

The name of the cluster to which this topic belongs. (parameter identifier: MQCA\_CLUSTER\_NAME).

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH. Setting this parameter to a cluster that this queue manager is a member of makes all queue managers in the cluster aware of this topic. Any publication to this topic or a topic string below it put to any queue manager in the cluster is propagated to subscriptions on any other queue manager in the cluster. For more details, see Distributed publish/subscribe networks.

The value can be any of the following values:

**Blank** If no topic object above this topic in the topic tree has set this parameter to a cluster name, then this topic does not belong to a cluster. Publications and subscriptions for this topic are not propagated to publish/subscribe cluster-connected queue managers. If a topic node higher in the topic tree has a cluster name set, publications and subscriptions to this topic are also propagated throughout the cluster.

This value is the default value for this parameter if no value is specified.

**String** The topic belongs to this cluster. It is not recommended that this is set to a different cluster from a topic object above this topic object in the topic tree. Other queue managers in the cluster will honor this object's definition unless a local definition of the same name exists on those queue managers.

Additionally, if **PublicationScope** or **SubscriptionScope** are set to MQSCOPE\_ALL, this value is the cluster to be used for the propagation of publications and subscriptions, for this topic, to publish/subscribe cluster-connected queue managers.

### *ClusterPubRoute* (MQCFIN)

The routing behavior to use for this topic in the cluster (parameter identifier: MQIA\_CLUSTER\_PUB\_ROUTE).

The values can be as follows:

#### **MQCLROUTE\_DIRECT**

A publication on this topic string, originating from this queue manager, is sent direct to any queue manager in the cluster with a matching subscription.

#### **MQCLROUTE\_TOPIC\_HOST**

A publication on this topic string, originating from this queue manager, is sent to one of the queue managers in the cluster that hosts a definition of the corresponding clustered topic object, and from there to any queue manager in the cluster with a matching subscription.

#### **MQCLROUTE\_NONE**

This topic node is not clustered.

### *CommInfo* (MQCFST)

The name of the communication information object (parameter identifier: MQCA\_COMM\_INFO\_NAME).

Shows the resolved value of the name of the communication information object to be used for this topic node.

The maximum length of the string is MQ\_COMM\_INFO\_NAME\_LENGTH.

### *DefPersistence* (MQCFIN)

Default persistence (parameter identifier: MQIA\_TOPIC\_DEF\_PERSISTENCE).

Returned value:

#### **MQPER\_PERSISTENT**

Message is persistent.

**MQPER\_NOT\_PERSISTENT**

Message is not persistent.

**DefaultPutResponse (MQCFIN)**

Default put response (parameter identifier: MQIA\_DEF\_PUT\_RESPONSE\_TYPE).

Returned value:

**MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

**MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

**DefPriority (MQCFIN)**

Default priority (parameter identifier: MQIA\_DEF\_PRIORITY).

Shows the resolved default priority of messages published to the topic.

**DurableSubscriptions (MQCFIN)**

Whether applications are permitted to make durable subscriptions (parameter identifier: MQIA\_DURABLE\_SUB).

Returned value:

**MQSUB\_DURABLE\_ALLOWED**

Durable subscriptions are permitted.

**MQSUB\_DURABLE\_INHIBITED**

Durable subscriptions are not permitted.

**InhibitPublications (MQCFIN)**

Whether publications are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_PUB).

Returned value:

**MQTA\_PUB\_INHIBITED**

Publications are inhibited for this topic.

**MQTA\_PUB\_ALLOWED**

Publications are allowed for this topic.

**InhibitSubscriptions (MQCFIN)**

Whether subscriptions are allowed for this topic (parameter identifier: MQIA\_INHIBIT\_SUB).

Returned value:

**MQTA\_SUB\_INHIBITED**

Subscriptions are inhibited for this topic.

**MQTA\_SUB\_ALLOWED**

Subscriptions are allowed for this topic.

**AdminTopicName (MQCFST)**

Topic object name (parameter identifier: MQCA\_ADMIN\_TOPIC\_NAME).

If the topic is an admin-node, the command displays the associated topic object name containing the node configuration. If the field is not an admin-node the command displays a blank.

The maximum length of the string is MQ\_TOPIC\_NAME\_LENGTH.

**Multicast (MQCFIN)**

Whether multicast is used for this topic (parameter identifier: MQIA\_MULTICAST).

Returned value:

**MQMC\_ENABLED**

Multicast can be used.

**MQMC\_DISABLED**

Multicast is not used.

**MQMC\_ONLY**

Only Multicast publish/subscribe can be used on this topic.

***DurableModelQName (MQCFST)***

The name of the model queue used for managed durable subscriptions (parameter identifier: MQCA\_MODEL\_DURABLE\_Q).

Shows the resolved value of the name of the model queue to be used for durable subscriptions that request the queue manager to manage the destination of publications.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

***NonDurableModelQName (MQCFST)***

The name of the model queue for managed non-durable subscriptions (parameter identifier: MQCA\_MODEL\_NON\_DURABLE\_Q).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

***PersistentMessageDelivery (MQCFIN)***

Delivery mechanism for persistent messages published to this topic (parameter identifier: MQIA\_PM\_DELIVERY).

Returned value:

**MQDLV\_ALL**

Persistent messages must be delivered to all subscribers, irrespective of durability, for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**MQDLV\_ALL\_DUR**

Persistent messages must be delivered to all durable subscribers. Failure to deliver a persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**MQDLV\_ALL\_AVAIL**

Persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

***NonPersistentMessageDelivery (MQCFIN)***

Delivery mechanism for non-persistent messages published to this topic (parameter identifier: MQIA\_NPM\_DELIVERY).

Returned value:

**MQDLV\_ALL**

Non-persistent messages must be delivered to all subscribers, irrespective of durability, for the MQPUT call to report success. If a delivery failure to any subscriber occurs, no other subscribers receive the message and the MQPUT call fails.

**MQDLV\_ALL\_DUR**

Non-persistent messages must be delivered to all durable subscribers. Failure to deliver a non-persistent message to any non-durable subscribers does not return an error to the MQPUT call. If a delivery failure to a durable subscriber occurs, no subscribers receive the message and the MQPUT call fails.

**MQDLV\_ALL\_AVAIL**

Non-persistent messages are delivered to all subscribers that can accept the message. Failure to deliver the message to any subscriber does not prevent other subscribers from receiving the message.

*RetainedPublication* (MQCFIN)

Whether there is a retained publication for this topic (parameter identifier: MQIACF\_RETAINED\_PUBLICATION).

Returned value:

**MQQSO\_YES**

There is a retained publication for this topic.

**MQQSO\_NO**

There is no retained publication for this topic.

*PublishCount* (MQCFIN)

Publish count (parameter identifier: MQIA\_PUB\_COUNT).

The number of applications currently publishing to the topic.

*SubscriptionCount* (MQCFIN)

Subscription count (parameter identifier: MQIA\_SUB\_COUNT).

The number of subscribers for this topic string, including durable subscribers who are not currently connected.

*SubscriptionScope* (MQCFIN)

Determines whether this queue manager propagates subscriptions for this topic to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_SUB\_SCOPE).

Returned value:

**MQSCOPE\_QMGR**

The queue manager does not propagate subscriptions for this topic to other queue managers.

**MQSCOPE\_ALL**

The queue manager propagates subscriptions for this topic to hierarchically connected queue managers and to publish/subscribe cluster connected queues.

*PublicationScope* (MQCFIN)

Determines whether this queue manager propagates publications for this topic to queue managers as part of a hierarchy or as part of a publish/subscribe cluster (parameter identifier: MQIA\_PUB\_SCOPE).

Returned value:

**MQSCOPE\_QMGR**

The queue manager does not propagate publications for this topic to other queue managers.

**MQSCOPE\_ALL**

The queue manager propagates publications for this topic to hierarchically connected queue managers and to publish/subscribe cluster connected queues.

*UseDLQ* (MQCFIN)

Determines whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue (parameter identifier: MQIA\_USE\_DEAD\_LETTER\_Q).

The value can be any of the following values:

**MQUSEDLQ\_NO**

Publication messages that cannot be delivered to their correct subscriber queue are treated as a failure to put the message. The MQPUT of an application to a topic fails in accordance with the settings of MQIA\_NPM\_DELIVERY and MQIA\_PM\_DELIVERY.

**MQUSEDLQ\_YES**

If the DEADQ queue manager attribute provides the name of a dead-letter queue then it is used, otherwise the behavior is as for MQUSEDLQ\_NO.

## Response data (TOPIC\_STATUS\_SUB)

### *SubscriptionId* (MQCFBS)

Subscription identifier (parameter identifier: MQBACF\_SUB\_ID).

The queue manager assigns *SubscriptionId* as an all time unique identifier for this subscription.

The maximum length of the string is MQ\_CORREL\_ID\_LENGTH.

### *SubscriptionUserId* (MQCFST)

The user ID that owns this subscription (parameter identifier: MQCACF\_SUB\_USER\_ID).

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

### *Durable* (MQCFIN)

Whether this subscription is a durable subscription (parameter identifier: MQIACF\_DURABLE\_SUBSCRIPTION).

#### **MQSUB\_DURABLE\_YES**

The subscription persists, even if the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. The queue manager reinstates the subscription during restart.

#### **MQSUB\_DURABLE\_NO**

The subscription is non-durable. The queue manager removes the subscription when the creating application disconnects from the queue manager or issues an MQCLOSE call for the subscription. If the subscription has a destination class (DESTCLAS) of MANAGED, the queue manager removes any messages not yet consumed when it closes the subscription.

### *SubscriptionType* (MQCFIN)

The type of subscription (parameter identifier: MQIACF\_SUB\_TYPE).

The value can be:

MQSUBTYPE\_ADMIN

MQSUBTYPE\_API

MQSUBTYPE\_PROXY

### *ResumeDate* (MQCFST)

Date of the most recent MQSUB call that connected to this subscription (parameter identifier: MQCA\_RESUME\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

### *ResumeTime* (MQCFST)

Time of the most recent MQSUB call that connected to this subscription (parameter identifier: MQCA\_RESUME\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

### *LastMessageDate* (MQCFST)

Date on which an MQPUT call last sent a message to this subscription. The queue manager updates the date field after the MQPUT call successfully puts a message to the destination specified by this subscription (parameter identifier: MQCACF\_LAST\_MSG\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**Note:** An MQSUBRQ call updates this value.

### *LastMessageTime* (MQCFST)

Time at which an MQPUT call last sent a message to this subscription. The queue manager updates the time field after the MQPUT call successfully puts a message to the destination specified by this subscription (parameter identifier: MQCACF\_LAST\_MSG\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**Note:** An **MQSUBRQ** call updates this value.

**NumberOfMessages (MQCFIN)**

Number of messages put to the destination specified by this subscription (parameter identifier: MQIACF\_MESSAGE\_COUNT).

**Note:** An **MQSUBRQ** call updates this value.

**ActiveConnection (MQCFBS)**

The currently active *ConnectionId* (CONNID) that opened this subscription (parameter identifier: MQBACF\_CONNECTION\_ID).

The maximum length of the string is MQ\_CONNECTION\_ID\_LENGTH.

**Response data (TOPIC\_STATUS\_PUB)**

**LastPublicationDate (MQCFST)**

Date on which this publisher last sent a message (parameter identifier: MQCACF\_LAST\_PUB\_DATE).

The maximum length of the string is MQ\_DATE\_LENGTH.

**LastPublicationTime (MQCFST)**

Time at which this publisher last sent a message (parameter identifier: MQCACF\_LAST\_PUB\_TIME).

The maximum length of the string is MQ\_TIME\_LENGTH.

**NumberOfPublishes (MQCFIN)**

Number of publishes made by this publisher (parameter identifier: MQIACF\_PUBLISH\_COUNT).

**ActiveConnection (MQCFBS)**

The currently active *ConnectionId* (CONNID) associated with the handle that has this topic open for publish (parameter identifier: MQBACF\_CONNECTION\_ID).

The maximum length of the string is MQ\_CONNECTION\_ID\_LENGTH.

**Inquire Usage:** 

The Inquire Usage (MQCMD\_INQUIRE\_USAGE) command inquires about the current state of a page set, or information about the log data sets.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Optional parameters**

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**PageSetId (MQCFIN)**

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID). If you omit this parameter, all page set identifiers are returned.

**UsageType (MQCFIN)**

The type of information to be returned (parameter identifier: MQIACF\_USAGE\_TYPE).

The value can be any of the following values:

**MQIACF\_USAGE\_PAGESET**

Return page set (MQIACF\_USAGE\_PAGESET) and buffer pool information (MQIACF\_USAGE\_BUFFER\_POOL).

**MQIACF\_USAGE\_DATA\_SET**

Return data set information for log data sets (MQIACF\_USAGE\_DATA\_SET).

**MQIACF\_ALL**

Return page set, buffer pool, and data set information (MQIACF\_USAGE\_PAGESET), (MQIACF\_USAGE\_BUFFER\_POOL), and (MQIACF\_USAGE\_DATA\_SET).

**MQIACF\_USAGE\_SMDS**

Return shared message data set usage ( MQIACF\_USAGE\_SMDS) and buffer pool information (MQIACF\_USAGE\_BUFFER\_POOL).

This includes the allocated, and used space for each data set, and information about the number of buffers currently active, the number with valid contents, and the number of free buffers.

**Inquire Usage (Response):** z/OS

The response to the Inquire Usage (MQCMD\_INQUIRE\_USAGE) command consists of the response header followed by one or more *UsageType* structure and a set of attribute parameter structures determined by the value of *UsageType* in the Inquire command.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Always returned:**

*UsageType*

Possible values of *ParameterType* are:

**MQIACF\_USAGE\_PAGESET**

Page set information.

**MQIACF\_USAGE\_BUFFER\_POOL**

Buffer pool information.

**MQIACF\_USAGE\_DATA\_SET**

Data set information for log data sets.

**MQIACF\_USAGE\_SMDS**

Return shared message data set usage and buffer pool information.

This includes the allocated, and used space for each data set, and information about the number of buffers currently active, the number with valid contents, and the number of free buffers.

**Returned if UsageType is MQIACF\_USAGE\_PAGESET:**

*BufferPoolId, ExpandCount, ExpandType, LogRBA, NonPersistentDataPages, PageSetId, PageSetStatus, PersistentDataPages, TotalPages, UnusedPages*

**Returned if UsageType is MQIACF\_USAGE\_BUFFER\_POOL:**

*BufferPoolId, FreeBuffers, FreeBuffersPercentage, TotalBuffers, BufferPoolLocation, PageClass*

**Returned if UsageType is MQIACF\_USAGE\_DATA\_SET:**

*DataSetName, DataSetType, LogRBA, LogLRSN*

**Returned if UsageType is MQIACF\_USAGE\_SMDS:**

*DataSetName, DataSetType*

**Response data if UsageType is MQIACF\_USAGE\_PAGESET**

**BufferPoolId (MQCFIN)**

Buffer pool identifier (parameter identifier: MQIACF\_BUFFER\_POOL\_ID).

This parameter identifies the buffer pool being used by the page set.

**ExpandCount (MQCFIN)**

The number of times the page set has been dynamically expanded since restart (parameter identifier: MQIACF\_USAGE\_EXPAND\_COUNT).

**ExpandType (MQCFIN)**

How the queue manager expands a page set when it becomes nearly full, and further pages are required within it (parameter identifier: MQIACF\_USAGE\_EXPAND\_TYPE).

The value can be:

**MQUSAGE\_EXPAND\_NONE**

No further page set expansion is to take place.

**MQUSAGE\_EXPAND\_USER**

The secondary extent size that was specified when the page set was defined is used. If no secondary extent size was specified, or it was specified as zero, then no dynamic page set expansion can take place.

At restart, if a previously used page set has been replaced with a data set that is smaller, it is expanded until it reaches the size of the previously used data set. Only one extent is required to reach this size.

**MQUSAGE\_EXPAND\_SYSTEM**

A secondary extent size that is approximately 10 per cent of the current size of the page set is used. MQUSAGE\_EXPAND\_SYSTEM can be rounded up to the nearest cylinder of DASD.

**NonPersistentDataPages (MQCFIN)**

The number of pages holding nonpersistent data (parameter identifier: MQIACF\_USAGE\_NONPERSIST\_PAGES).

These pages are being used to store nonpersistent message data.

**PageSetId (MQCFIN)**

Page set identifier (parameter identifier: MQIA\_PAGESET\_ID).

The string consists of two numeric characters, in the range 00 through 99.

**PageSetStatus (MQCFIN)**

Current status of the page set (parameter identifier: MQIACF\_PAGESET\_STATUS).

The value can be any of the following values:

**MQUSAGE\_PS\_AVAILABLE**

The page set is available.

**MQUSAGE\_PS\_DEFINED**

The page set has been defined but has never been used.

**MQUSAGE\_PS\_OFFLINE**

The page set is currently not accessible by the queue manager, for example because the page set has not been defined to the queue manager.

**MQUSAGE\_PS\_NOT\_DEFINED**

The command was issued for a specific page set that is not defined to the queue manager.

**MQUSAGE\_PS\_SUSPENDED**

The page set has been suspended. For further information about suspended page sets, see message CSQP059E.

**PersistentDataPages (MQCFIN)**

The number of pages holding persistent data (parameter identifier: MQIACF\_USAGE\_PERSIST\_PAGES).

These pages are being used to store object definitions and persistent message data.

**TotalPages (MQCFIN)**

The total number of 4 KB pages in the page set (parameter identifier: MQIACF\_USAGE\_TOTAL\_PAGES).

**UnusedPages (MQCFIN)**

The number of pages that are not used (that is, available page sets) (parameter identifier: MQIACF\_USAGE\_UNUSED\_PAGES).

**LogRBA (MQCFST)**

Log RBA (parameter identifier: MQCACF\_USAGE\_LOG\_RBA).

The maximum length is MQ\_RBA\_LENGTH.

This response is returned only if PageSetStatus is set to MQUSAGE\_PS\_NOT\_DEFINED or MQUSAGE\_SUSPENDED. However, the response is not always returned if PageSetStatus is set to MQUSAGE\_PS\_NOT\_DEFINED.

A value of 'FFFFFFFFFFFFFFFF' indicates that the page set has never been online.

**Response data if UsageType is MQIACF\_USAGE\_BUFFER\_POOL****BufferPoolId (MQCFIN)**

Buffer pool identifier (parameter identifier: MQIACF\_BUFFER\_POOL\_ID).

This parameter identifies the buffer pool being used by the page set.

**FreeBuffers (MQCFIN)**

Number of free buffers (parameter identifier: MQIACF\_USAGE\_FREE\_BUFF).

**FreeBuffersPercentage (MQCFIN)**

Number of free buffers as a percentage of all buffers in the buffer pool (parameter identifier: MQIACF\_USAGE\_FREE\_BUFF\_PERC).

**TotalBuffers (MQCFIN)**

The number of buffers defined for specified buffer pool (parameter identifier: MQIACF\_USAGE\_TOTAL\_BUFFERS).

**BufferPoolLocation (MQCFIN)**

The location of the buffers in this buffer pool relative to the bar. This is one of the following values:

**MQBPLOCATION\_ABOVE**

All buffer pool buffers are above the bar.

**MQBPLOCATION\_BELOW**

All buffer pool buffers are below the bar.

**MQBPLOCATION\_SWITCHING\_ABOVE**

Buffer pool buffers are being moved above the bar.

**MQBPLOCATION\_SWITCHING\_BELOW**

Buffer pool buffers are being moved below the bar.

**PageClass (MQCFIN)**

The type of virtual storage pages used for backing the buffers in the buffer pool. This is one of the following values:

**MQPAGECLAS\_4KB**

Pageable 4 KB pages are used.

**MQPAGECLAS\_FIXED4KB**

Fixed 4 KB pages are used.

**Response data if UsageType is MQIACF\_USAGE\_DATA\_SET****DataSetName (MQCFST)**

Data set name (parameter identifier: MQCACF\_DATA\_SET\_NAME).

The maximum length is MQ\_DATA\_SET\_NAME\_LENGTH.

**DataSetType (MQCFIN)**

The type of data set, and circumstance (parameter identifier: MQIACF\_USAGE\_DATA\_SET\_TYPE).

The value can be:

**MQUSAGE\_DS\_OLDEST\_ACTIVE\_UOW**

The log data set containing the start RBA of the oldest active unit of work for the queue manager

**MQUSAGE\_DS\_OLDEST\_PS\_RECOVERY**

The log data set containing the oldest restart RBA of any page set for the queue manager.

**MQUSAGE\_DS\_OLDEST\_CF\_RECOVERY**

The log data set containing the LRSN which matches the time of the oldest current backup of any CF structure in the queue-sharing group.

**LogRBA (MQCFST)**

Log RBA (parameter identifier: MQCACF\_USAGE\_LOG\_RBA).

The maximum length is MQ\_RBA\_LENGTH.

**LogLRSN (MQCFST)**

Log LRSN (parameter identifier: MQIACF\_USAGE\_LOG\_LRSN).

The length of the string is MQ\_LRSN\_LENGTH.

**Response data if UsageType is MQIACF\_USAGE\_SMDS****SMDSStatus (MQCFIN)**

SMDS status (parameter identifier: MQIACF\_SMDS\_STATUS).

**MQUSAGE\_SMDS\_NO\_DATA**

There is no SMDS data available. Nothing further is returned.

**MQUSAGE\_SMDS\_AVAILABLE**

For each CF structure two sets of PCF data are returned:

**A**

**CFStrucNames (MQCFSL)**

List of CF application structure names (parameter identifier: MQCACF\_CF\_STRUC\_NAME).

***MQIACF\_USAGE\_OFFLOAD\_MSGS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_OFFLOAD\_MSGS).

***MQIACF\_USAGE\_TOTAL\_BLOCKS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_TOTAL\_BLOCKS).

***MQIACF\_USAGE\_DATA\_BLOCKS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_DATA\_BLOCKS).

***MQIACF\_USAGE\_USED\_BLOCKS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_USED\_BLOCKS).

***MQIACF\_USAGE\_USED\_RATE (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_USED\_RATE).

***MQIACF\_SMDS\_STATUS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_SMDS\_STATUS). The value is MQUSAGE\_SMDS\_AVAILABLE.

***MQIACF\_USAGE\_TYPE (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_TYPE).

## **B**

***CFStrucNames (MQCFSL)***  
 List of CF application structure names (parameter identifier: MQCACF\_CF\_STRUC\_NAME).

***MQIACF\_USAGE\_BLOCK\_SIZE (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_BLOCK\_SIZE).

***MQIACF\_USAGE\_TOTAL\_BUFFERS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_TOTAL\_BUFFERS).

***MQIACF\_USAGE\_INUSE\_BUFFERS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_INUSE\_BUFFERS).

***MQIACF\_USAGE\_SAVED\_BUFFERS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_SAVED\_BUFFERS).

***MQIACF\_USAGE\_EMPTY\_BUFFERS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_EMPTY\_BUFFERS).

***MQIACF\_USAGE\_READS\_SAVED (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_READS\_SAVED).

***MQIACF\_USAGE\_LOWEST\_FREE (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_LOWEST\_FREE).

***MQIACF\_USAGE\_WAIT\_RATE (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_WAIT\_RATE).

***MQIACF\_SMDS\_STATUS (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_SMDS\_STATUS). The value is MQUSAGE\_SMDS\_AVAILABLE.

***MQIACF\_USAGE\_TYPE (MQCFIN)***  
 Description required (parameter identifier: MQIACF\_USAGE\_TYPE).

**Move Queue:** z/OS

The Move Queue (MQCMD\_MOVE\_Q) command moves all the messages from one local queue to another.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Required parameters****FromQName (MQCFST)**

From queue name (parameter identifier: MQCACF\_FROM\_Q\_NAME).

The name of the local queue from which messages are moved. The name must be defined to the local queue manager.

The command fails if the queue contains uncommitted messages.

If an application has this queue open, or has open a queue that eventually resolves to this queue, the command fails. For example, the command fails if this queue is a transmission queue, and any queue that is, or resolves to, a remote queue that references this transmission queue, is open.

An application can open this queue while the command is in progress but the application waits until the command has completed.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Optional parameters (Move Queue)****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**MoveType (MQCFIN)**

Move type (parameter identifier: MQIA\_QSG\_DISP).

Specifies how the messages are moved. The value can be any of the following values:

**MQIACF\_MOVE\_TYPE\_MOVE**

Move the messages from the source queue to the empty target queue.

The command fails if the target queue already contains one or more messages. The messages are deleted from the source queue. MQIACF\_MOVE\_TYPE\_MOVE is the default value.

**MQIACF\_MOVE\_TYPE\_ADD**

Move the messages from the source queue and add them to any messages already on the target queue.

The messages are deleted from the source queue.

### *QSGDisposition* (MQCFIN)

Disposition of the object within the group (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object for which information is to be returned (that is, where it is defined and how it behaves). The value can be any of the following values:

#### **MQQSGD\_PRIVATE**

The object is defined as either MQQSGD\_Q\_MGR or MQQSGD\_COPY. MQQSGD\_PRIVATE is the default value.

#### **MQQSGD\_SHARED**

The object is defined as MQQSGD\_SHARED. MQQSGD\_SHARED is valid only in a shared queue environment.

### *ToQName* (MQCFST)

To queue name (parameter identifier: MQCACF\_TO\_Q\_NAME).

The name of the local queue to which messages are moved. The name must be defined to the local queue manager.

The name of the target queue can be the same as the name of the source queue only if the queue exists as both a shared and a private queue. In this case, the command moves messages to the queue that has the opposite disposition (shared or private) from that disposition specified for the source queue on the *QSGDisposition* parameter.

If an application has this queue open, or has open a queue that eventually resolves to this queue, the command fails. The command also fails if this queue is a transmission queue, and any queue that is, or resolves to, a remote queue that references this transmission queue, is open.

No application can open this queue while the command is in progress.

If you specify a value of MQIACF\_MOVE\_TYPE\_MOVE on the *MoveType* parameter, the command fails if the target queue already contains one or more messages.

The *DefinitionType*, *HardenGetBackout*, *Usage* parameters of the target queue must be the same as those parameters of the source queue.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

### **Ping Channel:**

The Ping Channel (MQCMD\_PING\_CHANNEL) command tests a channel by sending data as a special message to the remote message queue manager and checking that the data is returned. The data is generated by the local queue manager.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

This command can only be used for channels with a *ChannelType* value of MQCHT\_SENDER, MQCHT\_SERVER, or MQCHT\_CLUSSDR.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

The command is not valid if the channel is running; however it is valid if the channel is stopped or in retry mode.

## Required parameters

### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be tested. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

## Optional parameters

### *DataCount* (MQCFIN)

Data count (parameter identifier: MQIACH\_DATA\_COUNT).

Specifies the length of the data.

Specify a value in the range 16 through 32 768. The default value is 64 bytes.

## z/OS

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## z/OS

### *ChannelDisposition* (MQCFIN)

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be tested.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

#### **MQCHLD\_PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

#### **MQCHLD\_SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue-sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

## MQCHLD\_FIXSHARED

Tests shared channels, tied to a specific queue manager.

The combination of the *ChannelDisposition* and *CommandScope* parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in Table 125

Table 125. *ChannelDisposition* and *CommandScope* for PING CHANNEL

<i>ChannelDisposition</i>	<i>CommandScope</i> <b>blank or local-qmgr</b>	<i>CommandScope</i> <b>qmgr-name</b>	<i>CommandScope</i> (*)
MQCHLD_PRIVATE	Ping private channel on the local queue manager	Ping private channel on the named queue manager	Ping private channel on all active queue managers
MQCHLD_SHARED	<p>Ping a shared channel on the most suitable queue manager in the group</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted
MQCHLD_FIXSHARED	Ping a shared channel on the local queue manager	Ping a shared channel on the named queue manager	Not permitted

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_ALLOCATE\_FAILED**

Allocation failed.

#### **MQRCCF\_BIND\_FAILED**

Bind failed.

**MQRCCF\_CCSID\_ERROR**  
Coded character-set identifier error.

**MQRCCF\_CHANNEL\_CLOSED**  
Channel closed.

**MQRCCF\_CHANNEL\_IN\_USE**  
Channel in use.

**MQRCCF\_CHANNEL\_NOT\_FOUND**  
Channel not found.

**MQRCCF\_CHANNEL\_TYPE\_ERROR**  
Channel type not valid.

**MQRCCF\_CONFIGURATION\_ERROR**  
Configuration error.

**MQRCCF\_CONNECTION\_CLOSED**  
Connection closed.

**MQRCCF\_CONNECTION\_REFUSED**  
Connection refused.

**MQRCCF\_DATA\_TOO\_LARGE**  
Data too large.

**MQRCCF\_ENTRY\_ERROR**  
Connection name not valid.

**MQRCCF\_HOST\_NOT\_AVAILABLE**  
Remote system not available.

**MQRCCF\_NO\_COMMS\_MANAGER**  
Communications manager not available.

**MQRCCF\_PING\_DATA\_COMPARE\_ERROR**  
Ping Channel command failed.

**MQRCCF\_PING\_DATA\_COUNT\_ERROR**  
Data count not valid.

**MQRCCF\_PING\_ERROR**  
Ping error.

**MQRCCF\_RECEIVE\_FAILED**  
Receive failed.

**MQRCCF\_RECEIVED\_DATA\_ERROR**  
Received data error.

**MQRCCF\_REMOTE\_QM\_TERMINATING**  
Remote queue manager terminating.

**MQRCCF\_REMOTE\_QM\_UNAVAILABLE**  
Remote queue manager not available.

**MQRCCF\_SEND\_FAILED**  
Send failed.

**MQRCCF\_STRUCTURE\_TYPE\_ERROR**  
Structure type not valid.

**MQRCCF\_TERMINATED\_BY\_SEC\_EXIT**  
Channel terminated by security exit.

### MQRCCF\_UNKNOWN\_REMOTE\_CHANNEL

Remote channel not known.

### MQRCCF\_USER\_EXIT\_NOT\_AVAILABLE

User exit not available.

### Ping Queue Manager:

The Ping Queue Manager (MQCMD\_PING\_Q\_MGR) command tests whether the queue manager and its command server is responsive to commands. If the queue manager is responding a positive reply is returned.

HP Integrity NonStop Server	IBM i	UNIX and Linux systems	Windows	z/OS
✓	✓	✓	✓	

### Required parameters:

None

### Optional parameters:

None

### Purge Channel:

The Purge Channel (MQCMD\_PURGE\_CHANNEL) command stops and purges an IBM MQ telemetry channel.

HP Integrity NonStop Server	IBM i	AIX and Linux	Windows	z/OS
		✓	✓	

This command can only be issued to an MQTT channel type.

Purging a telemetry channel disconnects all the MQTT clients connect to it, cleans up the state of the MQTT clients, and stops the telemetry channel. Cleaning the state of a client deletes all the pending publications and removes all the subscriptions from the client.

### Required parameters

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be stopped and purged. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### *ChannelType* (MQCFIN)

Channel type. This parameter must follow immediately after the **ChannelName** parameter  on all platforms except z/OS, and the value must be MQTT.

### Optional parameters

#### *ClientIdentifier* (MQCFST)

Client identifier. The client identifier is a 23-byte string that identifies an IBM MQ Telemetry

Transport client. When the Purge Channel command specifies a *ClientIdentifier*, only the connection for the specified client identifier is purged. If the *ClientIdentifier* is not specified, all the connections on the channel are purged.

The maximum length of the string is MQ\_CLIENT\_ID\_LENGTH.

**Recover CF Structure:** z/OS

The Recover CF Structure (MQCMD\_RECOVER\_CF\_STRUC) command initiates recovery of CF application structures.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Note:** This command is valid only on z/OS when the queue manager is a member of a queue-sharing group.

**Required parameters**

*CFStrucName* (MQCFST)

CF application structure name (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

**Optional parameters**

*CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

*Purge* (MQCFIN)

Recover to empty CF structure (parameter identifier: MQIACF\_PURGE).

Specifies whether the CF application structure is emptied. The value can be any of the following values:

**MQPO\_YES**

Recover to empty CF structure. Any messages in the CF structure are lost.

**MQPO\_NO**

Performs a true recovery of the CF structure. MQPO\_NO is the default value.

## Refresh Cluster:

The Refresh Cluster (MQCMD\_REFRESH\_CLUSTER) command discards all locally held cluster information, including any auto-defined channels that are not in doubt, and forces the repository to be rebuilt.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

**Note:** For large clusters, use of the **REFRESH CLUSTER** command can be disruptive to the cluster while it is in progress, and again at 27 day intervals thereafter when the cluster objects automatically send status updates to all interested queue managers. See Refreshing in a large cluster can affect performance and availability of the cluster.

## Required parameters

### *ClusterName* (MQCFST)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster to be refreshed.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

This parameter is the name of the cluster to be refreshed. If an asterisk (\*) is specified for the name, the queue manager is refreshed in all the clusters to which it belongs.

If an asterisk (\*) is specified with *RefreshRepository* set to MQCFO\_REFRESH\_REPOSITORY\_YES, the queue manager restarts its search for repository queue managers, using information in the local cluster-sender channel definitions.

## Optional parameters z/OS

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### *RefreshRepository* (MQCFIN)

Whether repository information is refreshed (parameter identifier: MQIACF\_REFRESH\_REPOSITORY).

This parameter indicates whether the information about repository queue managers is refreshed.

The value can be:

#### **MQCFO\_REFRESH\_REPOSITORY\_YES**

Refresh repository information.

This value cannot be specified if the queue manager is itself a repository queue manager.

MQCFO\_REFRESH\_REPOSITORY\_YES specifies that in addition to MQCFO\_REFRESH\_REPOSITORY\_NO behavior, objects representing full repository cluster queue managers are also refreshed. Do not use this option if the queue manager is itself a full repository.

If it is a full repository, you must first alter it so that it is not a full repository for the cluster in question.

The full repository location is recovered from the manually defined cluster-sender channel definitions. After the refresh with MQCFO\_REFRESH\_REPOSITORY\_YES has been issued the queue manager can be altered so that it is once again a full repository.

### MQCFO\_REFRESH\_REPOSITORY

Do not refresh repository information. MQCFO\_REFRESH\_REPOSITORY is the default.

If you select MQCFO\_REFRESH\_REPOSITORY\_YES, check that all cluster-sender channels in the relevant cluster are inactive or stopped before you issue the Refresh Cluster command. If there are cluster-sender channels running at the time when the Refresh is processed, and they are used exclusively by the cluster or clusters being refreshed and MQCFO\_REFRESH\_REPOSITORY\_YES is used, the channels are stopped, by using the Stop Channel command with a value of MQMODE\_FORCE in the *Mode* parameter if necessary.

This scenario ensures that the Refresh can remove the channel state and that the channel will run with the refreshed version after the Refresh has completed. If the state of a channel cannot be deleted, for example because it is in doubt, or because it is also running as part of another cluster, its state is not new after the refresh and it does not automatically restart if it was stopped.

#### Related information:

Clustering: Using REFRESH CLUSTER best practices

#### Refresh Queue Manager:

Use the Refresh Queue Manager (MQCMD\_REFRESH\_Q\_MGR) command to perform special operations on queue managers.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

#### Required parameters

##### *RefreshType* (MQCFIN)

Type of information to be refreshed (parameter identifier: MQIACF\_REFRESH\_TYPE).

Use this parameter to specify the type of information to be refreshed. The value can be any of the following values:

##### MQRT\_CONFIGURATION

MQRT\_CONFIGURATION causes the queue manager to generate configuration event messages for every object definition that matches the selection criteria specified by the *ObjectType*, *ObjectName*, and *RefreshInterval* parameters.

A Refresh Queue Manager command with a *RefreshType* value of MQRT\_CONFIGURATION is generated automatically when the value of the queue manager's *ConfigurationEvent* parameter changes from MQEVR\_DISABLED to MQEVR\_ENABLED.

Use this command with a *RefreshType* of MQRT\_CONFIGURATION to recover from problems such as errors on the event queue. In such cases, use appropriate selection criteria, to avoid excessive processing time and event message generation.

## MQRT\_EXPIRY

This requests that the queue manager performs a scan to discard expired messages for every queue that matches the selection criteria specified by the *ObjectName* parameter.

**Note:**  Valid only on z/OS.

## MQRT\_EARLY

Requests that the subsystem function routines (generally known as early code) for the queue manager replace themselves with the corresponding routines in the linkpack area (LPA).

You need to use this command only after you install new subsystem function routines (provided as corrective maintenance or with a new version or release of IBM MQ). This command instructs the queue manager to use the new routines.

 See Task 3: Update the z/OS link list and LPA for more information about IBM MQ early code routines.

## MQRT\_PROXYSUB

Requests that the queue manager resynchronizes the proxy subscriptions that are held with, and on behalf of, queue managers that are connected in a hierarchy or publish/subscribe cluster.

You should only resynchronize the proxy subscriptions in exceptional circumstances. See Resynchronization of proxy subscriptions.

### Optional parameters (Refresh Queue Manager)

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *ObjectName* (MQCFST)

Name of object to be included in the processing of this command (parameter identifier: MQCACF\_OBJECT\_NAME).

Use this parameter to specify the name of the object to be included in the processing of this command.

Generic names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length is MQ\_OBJECT\_NAME\_LENGTH.

#### *ObjectType* (MQCFIN)

Object type for which configuration data is to be refreshed (parameter identifier: MQIACF\_OBJECT\_TYPE).

Use this parameter to specify the object type for which configuration data is to be refreshed. This parameter is valid only if the value of *RefreshType* is MQOT\_CONFIGURATION. The default value, in that case, is MQOT\_ALL. The value can be one of:

**MQOT\_AUTH\_INFO**

Authentication information object.

**MQOT\_CF\_STRUC**

CF structure.

**MQOT\_CHANNEL**

Channel.

**MQOT\_CHLAUTH**

Channel authentication

**MQOT\_LISTENER**

Listener.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process definition.

**MQOT\_Q**

Queue.

**MQOT\_LOCAL\_Q**

Local queue.

**MQOT\_MODEL\_Q**

Model queue.

**MQOT\_ALIAS\_Q**

Alias queue.

**MQOT\_REMOTE\_Q**

Remote queue.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_CFSTRUC**

CF structure.

**MQOT\_SERVICE**

Service.

**Note:**  Not valid on z/OS.

**MQOT\_STORAGE\_CLASS**

Storage class.

**MQOT\_TOPIC**

Topic name.

*RefreshInterval* (**MQCFIN**)

Refresh interval (parameter identifier: MQIACF\_REFRESH\_INTERVAL).

Use this parameter to specify a value, in minutes, defining a period immediately before the current time. This requests that only objects that have been created or altered within that period (as defined by their *AlterationDate* and *AlterationTime* attributes) are included.

Specify a value in the range zero through 999 999. A value of zero means there is no time limit (0 is the default).

This parameter is valid only if the value of *RefreshType* is MQRT\_CONFIGURATION.

### Usage Notes for Refresh Queue Manager

1. Issue this command with *RefreshType*(MQRT\_CONFIGURATION) after setting the MQRT\_CONFIGURATION queue manager attribute to ENABLED, to bring the queue manager configuration up to date. To ensure that complete configuration information is generated, include all objects; if you have many objects, it might be preferable to use several commands, each with a different selection of objects, but such that all are included.
2. You can also use the command with *RefreshType*(MQRT\_CONFIGURATION) to recover from problems such as errors on the event queue. In such cases, use appropriate selection criteria, to avoid excessive processing time and event messages generation.
3. Issue the command with *RefreshType* (MQRT\_EXPIRY) at any time when you believe that a queue could contain numbers of expired messages.
4. If *RefreshType* (MQRT\_EARLY) is specified, no other keywords are allowed and the command can be issued only from the z/OS console and only if the queue manager is not active.
5. You are unlikely to use **Refresh Queue Manager RefreshType (MQRT\_PROXYSUB)** other than in exceptional circumstances. See Resynchronization of proxy subscriptions.
6. If a **Refresh Queue Manager Object Type(MQRT\_PROXYSUB)** command is issued on z/OS when the CHINIT is not running, the command is queued up and will be processed when the CHINIT starts.
7. **V8.0.0.4** Running the command Refresh Queue Manager RefreshType (MQRT\_CONFIGURATION) Object Type(MQOT\_ALL) includes authority records.  
You cannot specify the **Refresh Interval** and **Object Name** parameters if you explicitly specify Authority Record events. If you specify **Object Type(MQOT\_ALL)** the **Refresh Interval** and **Object Name** parameters are ignored.

### Refresh Security:

The Refresh Security (MQCMD\_REFRESH\_SECURITY) command refreshes the list of authorizations held internally by the authorization service component.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### Optional parameters

▶ z/OS

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

z/OS

#### *SecurityItem* (MQCFIN)

Resource class for which the security refresh is to be performed (parameter identifier: MQIACF\_SECURITY\_ITEM). This parameter applies to z/OS only.

Use this parameter to specify the resource class for which the security refresh is to be performed. The value can be any of the following values:

#### **MQSECITEM\_ALL**

A full refresh of the type specified is performed. MQSECITEM\_ALL is the default value.

#### **MQSECITEM\_MQADMIN**

Specifies that administration type resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### **MQSECITEM\_MQNLIST**

Specifies that namelist resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### **MQSECITEM\_MQPROC**

Specifies that process resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### **MQSECITEM\_MQQUEUE**

Specifies that queue resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### **MQSECITEM\_MXADMIN**

Specifies that administration type resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### **MQSECITEM\_MXNLIST**

Specifies that namelist resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### **MQSECITEM\_MXPROC**

Specifies that process resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### **MQSECITEM\_MXQUEUE**

Specifies that queue resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### **MQSECITEM\_MXTOPIC**

Specifies that topic resources are to be refreshed. Valid only if the value of *SecurityType* is MQSECTYPE\_CLASSES.

#### *SecurityType* (MQCFIN)

Security type (parameter identifier: MQIACF\_SECURITY\_TYPE).

Use this parameter to specify the type of security refresh to be performed. The value can be any of the following values:

#### **MQSECTYPE\_AUTHSERV**

The list of authorizations held internally by the authorization services component is refreshed. MQSECTYPE\_AUTHSERV is not valid on z/OS.

MQSECTYPE\_AUTHSERV is the default on platforms other than z/OS.

#### **MQSECTYPE\_CLASSES**

Permits you to select specific resource classes for which to perform the security refresh.

MQSECTYPE\_CLASSES is valid only on z/OS where it is the default.

### MQSECTYPE\_CONNAUTH

Refreshes the cached view of the configuration for connection authentication.

On distributed platforms this is also a synonym for MQSECTYPE\_AUTHSERV.

### MQSECTYPE\_SSL

MQSECTYPE\_SSL refreshes the locations of the LDAP servers to be used for Certified Revocation Lists and the key repository. It also refreshes any cryptographic hardware parameters specified through IBM MQ and the cached view of the Secure Sockets Layer key repository. It also allows updates to become effective on successful completion of the command.

MQSECTYPE\_SSL updates all SSL channels currently running, as follows:

- Sender, server, and cluster-sender channels using SSL are allowed to complete the current batch. In general, they then run the SSL handshake again with the refreshed view of the SSL key repository. However, you must manually restart a requester-server channel on which the server definition has no CONNAME parameter.
- All other channel types using SSL are stopped with a STOP CHANNEL MODE(FORCE) STATUS(INACTIVE) command. If the partner end of the stopped message channel has retry values defined, the channel tries again and the new SSL handshake uses the refreshed view of the contents of the SSL key repository, the location of the LDAP server to be used for Certification Revocation Lists, and the location of the key repository. If there is a server-connection channel, the client application loses its connection to the queue manager and must reconnect in order to continue.

### Reset CF Structure:

The Reset coupling facility (CF) Structure (MQCMD\_RESET\_CF\_STRUC) command modifies the status of a specific application structure.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

### Required parameters

#### *CFStructName* (MQCFST)

The name of the coupling facility application structure that you want to reset (parameter identifier: MQCA\_CF\_STRUC\_NAME). The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

#### *Action* (MQCFIN)

The action to perform to reset the named application structure (parameter identifier: MQIACF\_ACTION).

#### MQACT\_FAIL

A structure failure is simulated and the status of the application structure is set to FAILED.

## Reset Channel:

The Reset Channel (MQCMD\_RESET\_CHANNEL) command resets the message sequence number for an IBM MQ channel with, optionally, a specified sequence number to be used the next time that the channel is started.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

This command can be issued to a channel of any type (except MQCHT\_SVRCONN and MQCHT\_CLNTCONN). However, if it is issued to a sender (MQCHT\_SENDER), server (MQCHT\_SERVER), or cluster-sender (MQCHT\_CLUSSDR) channel, the value at both ends (issuing end and receiver or requester end), is reset when the channel is next initiated or resynchronized. The value at both ends is reset to be equal.

If the command is issued to a receiver (MQCHT\_RECEIVER), requester (MQCHT\_REQUESTER), or cluster-receiver (MQCHT\_CLUSRCVR) channel, the value at the other end is *not* reset as well; this step must be done separately if necessary.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

### Required parameters

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be reset. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### Optional parameters z/OS

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### z/OS

#### *ChannelDisposition* (MQCFIN)

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be reset.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

**MQCHLD\_PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

**MQCHLD\_SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue-sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

The combination of the *ChannelDisposition* and *CommandScope* parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in Table 126

Table 126. *ChannelDisposition* and *CommandScope* for RESET CHANNEL

<i>ChannelDisposition</i>	<i>CommandScope</i> <b>blank or local-qmgr</b>	<i>CommandScope</i> <b>qmgr-name</b>
MQCHLD_PRIVATE	Reset private channel on the local queue manager	Reset private channel on the named queue manager
MQCHLD_SHARED	Reset a shared channel on all active queue managers.  MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.  The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.	Not permitted

*MsgSeqNumber* (**MQCFIN**)

Message sequence number (parameter identifier: MQIACH\_MSG\_SEQUENCE\_NUMBER).

Specifies the new message sequence number.

The value must be in the range 1 through 999 999 999. The default value is one.

**Error codes**

This command might return the following error code in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

*Reason* (**MLONG**)

The value can be any of the following values:

## MQRCCF\_CHANNEL\_NOT\_FOUND

Channel not found.

### Reset Cluster:

The Reset Cluster (MQCMD\_RESET\_CLUSTER) command forces a queue manager to leave a cluster.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### Required parameters

#### *ClusterName* (MQCFST)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster to be reset.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

#### *QMgrIdentifier* (MQCFST)

Queue manager identifier (parameter identifier: MQCA\_Q\_MGR\_IDENTIFIER).

This parameter is the unique identifier of the queue manager to be forcibly removed from the cluster. Only one of *QMgrIdentifier* and *QMgrName* can be specified. Use *QMgrIdentifier* in preference to *QMgrName*, because *QMgrName* might not be unique.

#### *QMgrName* (MQCFST)

Queue manager name (parameter identifier: MQCA\_Q\_MGR\_NAME).

This parameter is the name of the queue manager to be forcibly removed from the cluster. Only one of *QMgrIdentifier* and *QMgrName* can be specified. Use *QMgrIdentifier* in preference to *QMgrName*, because *QMgrName* might not be unique.

#### *Action* (MQCFIN)

Action (parameter identifier: MQIACF\_ACTION).

Specifies the action to take place. This parameter can be requested only by a repository queue manager.

The value can be any of the following values:

#### **MQACT\_FORCE\_REMOVE**

Requests that a queue manager is forcibly removed from a cluster.

### Optional parameters

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### *RemoveQueues* (MQCFIN)

Whether cluster queues are removed from the cluster (parameter identifier: MQIACF\_REMOVE\_QUEUES).

This parameter indicates whether the cluster queues that belong to the queue manager being removed from the cluster are to be removed from the cluster. This parameter can be specified even if the queue manager identified by the *QMgrName* parameter is not currently in the cluster.

The value can be any of the following values:

#### **MQCFO\_REMOVE\_QUEUES\_YES**

Remove queues belonging to the queue manager being removed from the cluster.

#### **MQCFO\_REMOVE\_QUEUES\_NO**

Do not remove queues belonging to the queue manager being removed. MQCFO\_REMOVE\_QUEUES\_NO is the default.

### **Error codes**

This command might return the following error code in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

#### *Reason* (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_ACTION\_VALUE\_ERROR**

Value not valid.

### **Reset Queue Manager:**

Use the Reset Queue Manager (MQCMD\_RESET\_Q\_MGR) command as part of your backup and recovery procedures on AIX, HP-UX, Linux, Solaris, IBM i, and Windows.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

You can use this command to request that the queue manager starts writing to a new log extent, making the previous log extent available for archiving.

Use the Reset Queue Manager (MQCMD\_RESET\_Q\_MGR) command to forcibly remove a publish/subscribe hierarchical connection for which this queue manager is nominated as either the parent or the child in a hierarchical connection. Valid on all supported platforms.

### **Required parameters**

#### *Action* (MQCFIN)

Action (parameter identifier: MQIACF\_ACTION).

Specifies the action to take place.

The value can be any of the following values:

#### **MQACT\_ADVANCE\_LOG**

Requests that the queue manager starts writing to a new log extent, making the previous log extent available for archiving. This command is accepted only if the queue manager is configured to use linear logging.

**Note:** Not valid on Compaq NSK, or z/OS.

## MQACT\_COLLECT\_STATISTICS

Requests that the queue manager ends the current statistics collection period, and writes the statistics collected.

**Note:** Not valid on Compaq NSK, or z/OS.

## MQACT\_PUBSUB

Requests a publish/subscribe reset. This value requires that one of the optional parameters, ChildName or ParentName, is specified.

### Optional parameters

#### ChildName (MQCFST)

The name of the child queue manager for which the hierarchical connection is to be forcibly canceled (parameter identifier: MQCA\_CHILD).

This attribute is valid only when the Action parameter has the value MQACT\_PUBSUB.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

#### ParentName (MQCFST)

The name of the parent queue manager for which the hierarchical connection is to be forcibly canceled (parameter identifier: MQCA\_PARENT).

This attribute is valid only when the Action parameter has the value MQACT\_PUBSUB.

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### Error codes

This command might return the following error code in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

#### Reason (MQLONG)

The value can be any of the following values:

#### MQRC\_RESOURCE\_PROBLEM

Insufficient system resources available.

### Reset Queue Statistics:

The Reset Queue Statistics (MQCMD\_RESET\_Q\_STATS) command reports the performance data for a queue and then resets the performance data. Performance data is maintained for each local queue (including transmission queues).

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

Performance data is reset at the following times:

- When a Reset Queue Statistics command is issued
- When the queue manager is restarted
- When a performance event is generated for a queue

### Required parameters

#### QName (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

The name of the local queue to be tested and reset.

Generic queue names are supported. A generic name is a character string followed by an asterisk (\*), for example ABC\*, and it selects all objects having names that start with the selected character string. An asterisk on its own matches all possible names.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

z/OS

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

### *Reason* (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_Q\_WRONG\_TYPE**

Action not valid for the queue of specified type.

#### **MQRCCF\_EVENTS\_DISABLED**

The queue manager performance events are disabled (PERFMEV). On z/OS, it is necessary to enable queue manager performance events to use this command. For more details, see the PerformanceEvent property in the “Change Queue Manager” on page 1145 command.

## Reset Queue Statistics (Response):

The response to the Reset Queue Statistics (MQCMD\_RESET\_Q\_STATS) command consists of the response header followed by the *QName* structure and the attribute parameter structures shown in the following sections.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

If a generic queue name was specified, one such message is generated for each queue found.

### Always returned:

*HighQDepth*, *MsgDeqCount*, *MsgEnqCount*, *QName*,  *QSGDisposition*, *TimeSinceReset*

### Response data

#### *HighQDepth* (MQCFIN)

Maximum number of messages on a queue (parameter identifier: MQIA\_HIGH\_Q\_DEPTH).

This count is the peak value of the *CurrentQDepth* local queue attribute since the last reset. The *CurrentQDepth* is incremented during an MQPUT call, and during backout of an MQGET call, and is decremented during a (nonbrowse) MQGET call, and during backout of an MQPUT call.

#### *MsgDeqCount* (MQCFIN)

Number of messages dequeued (parameter identifier: MQIA\_MSG\_DEQ\_COUNT).

This count includes messages that have been successfully retrieved (with a nonbrowse MQGET) from the queue, even though the MQGET has not yet been committed. The count is not decremented if the MQGET is later backed out.

 On z/OS, if the value exceeds 999 999 999, it is returned as 999 999 999

#### *MsgEnqCount* (MQCFIN)

Number of messages enqueued (parameter identifier: MQIA\_MSG\_ENQ\_COUNT).

This count includes messages that have been put to the queue, but have not yet been committed. The count is not decremented if the put is later backed out.

 On z/OS, if the value exceeds 999 999 999, it is returned as 999 999 999

#### *QName* (MQCFST)

Queue name (parameter identifier: MQCA\_Q\_NAME).

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

#### *QSGDisposition* (MQCFIN)

QSG disposition (parameter identifier: MQIA\_QSG\_DISP).

Specifies the disposition of the object (that is, where it is defined and how it behaves). This parameter is valid on z/OS only. The value can be any of the following values:

##### MQQSGD\_COPY

The object is defined as MQQSGD\_COPY.

##### MQQSGD\_SHARED

The object is defined as MQQSGD\_SHARED.

## MQQSGD\_Q\_MGR

The object is defined as MQQSGD\_Q\_MGR.

### *TimeSinceReset* (MQCFIN)

Time since statistics reset in seconds (parameter identifier: MQIA\_TIME\_SINCE\_RESET).

### Reset SMDS:

The Reset SMDS (MQCMD\_RESET\_SMDS) command modifies the availability or status information relating to one or more shared message data sets associated with a specific application structure

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

## Required parameters

### *SMDS* (MQCFST)

Specifies the queue manager for which the shared message data set availability or status information is to be modified or an asterisk to modify the information for all data sets associated with the specified CFSTRUCT. (parameter identifier: MQCACF\_CF\_SMDS).

The maximum length of the string is 4 characters.

### *CFStrucName* (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to reset (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

## Optional parameters

### *Access* (MQCFIN)

Availability of the share message data set (parameter identifier: MQIACF\_CF\_STRUC\_ACCESS).

#### **MQCFACCESS\_ENABLED**

The shared message data set is available for use.

#### **MQCFACCESS\_DISABLED**

The shared message data set is disabled.

### *Status* (MQCFIN)

Status information indicates the state of a resource (parameter identifier: MQIACF\_CF\_STRUC\_STATUS).

#### **MQCFSTATUS\_FAILED**

The shared message data set is in an unusable state.

#### **MQCFSTATUS\_RECOVERED**

The data set is set to recovered, and is ready for use again, but requires some restart processing the next time it is opened. This restart processing ensures that obsolete references to any deleted messages have been removed from the coupling facility structure before the data set is made available again. The restart processing also rebuilds the data set space map.

## Resolve Channel:

The Resolve Channel (MQCMD\_RESOLVE\_CHANNEL) command requests a channel to commit or back out in-doubt messages. This command is used when the other end of a link fails during the confirmation stage, and for some reason it is not possible to reestablish the connection. In this situation the sending end remains in an in-doubt state, whether the messages were received. Any outstanding units of work must be resolved using Resolve Channel with either backout or commit.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

Care must be exercised in the use of this command. If the resolution specified is not the same as the resolution at the receiving end, messages can be lost or duplicated.

This command can only be used for channels with a *ChannelType* value of MQCHT\_SENDER, MQCHT\_SERVER, or MQCHT\_CLUSSDR.

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

### Required parameters

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be resolved. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

#### *InDoubt* (MQCFIN)

Indoubt resolution (parameter identifier: MQIACH\_IN\_DOUBT).

Specifies whether to commit or back out the in-doubt messages.

The value can be:

**MQIDO\_COMMIT**

Commit.

**MQIDO\_BACKOUT**

Backout.

#### z/OS

### Optional parameters

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**ChannelDisposition (MQCFIN)**

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be resolved.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

**MQCHLD\_PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

**MQCHLD\_SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue-sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

The combination of the *ChannelDisposition* and *CommandScope* parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in Table 127

Table 127. ChannelDisposition and CommandScope for RESOLVE CHANNEL

<i>ChannelDisposition</i>	<i>CommandScope</i> <b>blank or local-qmgr</b>	<i>CommandScope</i> <b>qmgr-name</b>
MQCHLD_PRIVATE	Resolve private channel on the local queue manager	Resolve private channel on the named queue manager
MQCHLD_SHARED	Resolve a shared channel on all active queue managers.  MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.  The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.	Not permitted

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

#### **MQRCCF\_INDOUBT\_VALUE\_ERROR**

In-doubt value not valid.

## Resume Queue Manager:

The Resume Queue Manager (MQCMD\_RESUME\_Q\_MGR) command renders the queue manager available again for the processing of IMS or Db2 messages. It reverses the action of the Suspend Queue Manager (MQCMD\_SUSPEND\_Q\_MGR) command.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

## Required parameters

### Facility (MQCFIN)

Facility (parameter identifier: MQIACF\_FACILITY).

The type of facility for which activity is to be resumed. The value can be:

#### **MQQMFAC\_DB2**

Resumes normal activity with Db2.

#### **MQQMFAC\_IMS\_BRIDGE**

Resumes normal IMS bridge activity.

## Optional parameters

### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Resume Queue Manager Cluster:

The Resume Queue Manager Cluster (MQCMD\_RESUME\_Q\_MGR\_CLUSTER) command informs other queue managers in a cluster that the local queue manager is again available for processing, and can be sent messages. It reverses the action of the Suspend Queue Manager Cluster (MQCMD\_SUSPEND\_Q\_MGR\_CLUSTER) command.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

## Required parameters

### *ClusterName* (MQCFST)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster for which availability is to be resumed.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

### *ClusterNamelist* (MQCFST)

Cluster Namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

The name of the namelist specifying a list of clusters for which availability is to be resumed.

## z/OS

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Error codes

This command might return the following error code in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

### *Reason* (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CLUSTER\_NAME\_CONFLICT**

Cluster name conflict.

**Reverify Security:** 

The Reverify Security (MQCMD\_REVERIFY\_SECURITY) to set a reverification flag for all specified users. The user is reverified the next time that security is checked for that user.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Required parameters****UserId (MQCFST)**

User ID (parameter identifier: MQCACF\_USER\_IDENTIFIER).

Use this parameter to specify one or more user IDs. Each user ID specified is signed off and signed back on again the next time that a request requiring a security check is issued on behalf of that user.

The maximum length of the string is MQ\_USER\_ID\_LENGTH.

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**Set Archive:** 

Use the Set Archive (MQCMD\_SET\_ARCHIVE) to dynamically change certain archive system parameter values initially set by your system parameter module at queue manager startup.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Required parameters****ParameterType (MQCFIN)**

Parameter type (parameter identifier: MQIACF\_SYSP\_TYPE).

Specifies how the parameters are to be reset:

**MQSYSP\_TYPE\_INITIAL**

The initial settings of the archive system parameters. MQSYSP\_TYPE\_INITIAL resets all the archive system parameters to the values set at queue manager startup.

## **MQSYSP\_TYPE\_SET**

MQSYSP\_TYPE\_SET indicates that you intend to change one, or more, of the archive system parameter settings.

### **Optional parameters**

#### ***AllocPrimary* (MQCFIN)**

Primary space allocation for DASD data sets (parameter identifier: MQIACF\_SYSP\_ALLOC\_PRIMARY).

Specifies the primary space allocation for DASD data sets in the units specified in the *AllocUnits* parameter.

Specify a value greater than zero. This value must be sufficient for a copy of either the log data set or its corresponding BSDS, whichever is the larger.

#### ***AllocSecondary* (MQCFIN)**

Secondary space allocation for DASD data sets (parameter identifier: MQIACF\_SYSP\_ALLOC\_SECONDARY).

Specifies the secondary space allocation for DASD data sets in the units specified in the *AllocUnits* parameter.

Specify a value greater than zero.

#### ***AllocUnits* (MQCFIN)**

Allocation unit (parameter identifier: MQIACF\_SYSP\_ALLOC\_UNIT).

Specifies the unit in which primary and secondary space allocations are made. The value can be any of the following values:

#### **MQSYSP\_ALLOC\_BLK**

Blocks.

#### **MQSYSP\_ALLOC\_TRK**

Tracks.

#### **MQSYSP\_ALLOC\_CYL**

Cylinders.

#### ***ArchivePrefix1* (MQCFST)**

Specifies the prefix for the first archive log data set name (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_PFX1).

The maximum length of the string is MQ\_ARCHIVE\_PFX\_LENGTH.

#### ***ArchivePrefix2* (MQCFST)**

Specifies the prefix for the second archive log data set name (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_PFX2).

The maximum length of the string is MQ\_ARCHIVE\_PFX\_LENGTH.

#### ***ArchiveRetention* (MQCFIN)**

Archive retention period (parameter identifier: MQIACF\_SYSP\_ARCHIVE\_RETAIN).

Specifies the retention period, in days, to be used when the archive log data set is created. Specify a value in the range zero through 9999.

See the Administering IBM MQ for z/OS for information about discarding archive log data sets.

#### ***ArchiveUnit1* (MQCFST)**

Specifies the device type or unit name of the device that is used to store the first copy of the archive log data set (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_UNIT1).

Specify a device type or unit name of 1-8 characters.

If you archive to DASD, you can specify a generic device type with a limited volume range.

The maximum length of the string is MQ\_ARCHIVE\_UNIT\_LENGTH.

**ArchiveUnit2 (MQCFST)**

Specifies the device type or unit name of the device that is used to store the second copy of the archive log data set (parameter identifier: MQCACF\_SYSP\_ARCHIVE\_UNIT2).

Specify a device type or unit name of 1-8 characters.

If this parameter is blank, the value set for the *ArchiveUnit1* parameter is used.

The maximum length of the string is MQ\_ARCHIVE\_UNIT\_LENGTH.

**ArchiveWTOR (MQCFIN)**

Specifies whether a message is to be sent to the operator and a reply is received before attempting to mount an archive log data set (parameter identifier: MQIACF\_SYSP\_ARCHIVE\_WTOR).

Other IBM MQ users might be forced to wait until the data set is mounted, but they are not affected while IBM MQ is waiting for the reply to the message.

The value can be any of the following values:

**MQSYSP\_YES**

A message is to be sent and a reply received before an attempt to mount an archive log data set.

**MQSYSP\_NO**

A message is not to be sent and a reply received before an attempt to mount an archive log data set.

**BlockSize (MQCFIN)**

Block size of the archive log data set (parameter identifier: MQIACF\_SYSP\_BLOCK\_SIZE).

The block size you specify must be compatible with the device type you specify in the *ArchiveUnit1* and *ArchiveUnit2* parameters.

Specify a value in the range 4 097 through 28 672. The value you specify is rounded up to a multiple of 4 096.

This parameter is ignored for data sets that are managed by the storage management system (SMS).

**Catalog (MQCFIN)**

Specifies whether archive log data sets are cataloged in the primary integrated catalog facility (parameter identifier: MQIACF\_SYSP\_CATALOG).

The value can be:

**MQSYSP\_YES**

Archive log data sets are cataloged.

**MQSYSP\_NO**

Archive log data sets are not cataloged.

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**Compact (MQCFIN)**

Specifies whether data written to archive logs is to be compacted (parameter identifier: MQIACF\_SYSP\_COMPACT).

This parameter applies to a 3480 or 3490 device that has the improved data recording capability (IDRC) feature. When this feature is turned on, hardware in the tape control unit writes data at a much higher density than normal, allowing for more data on each volume. Specify MQSYSP\_NO if you do not use a 3480 device with the IDRC feature or a 3490 base model, except for the 3490E. Specify MQSYSP\_YES if you want the data to be compacted.

The value can be:

**MQSYSP\_YES**

Data is to be compacted.

**MQSYSP\_NO**

Data is not to be compacted.

**Protect (MQCFIN)**

Protection by external security manager (ESM) (parameter identifier: MQIACF\_SYSP\_PROTECT).

Specifies whether archive log data sets are protected by ESM profiles when the data sets are created.

If you specify MQSYSP\_YES, ensure that:

- ESM protection is active for IBM MQ.
- The user ID associated with the IBM MQ address space has authority to create these profiles.
- The TAPEVOL class is active if you are archiving to tape.

otherwise, offload processing fails.

The value can be any of the following values:

**MQSYSP\_YES**

Data set profiles are created when logs are offloaded.

**MQSYSP\_NO**

Profiles are not created.

**QuiesceInterval (MQCFIN)**

Maximum time allowed for the quiesce (parameter identifier: MQIACF\_SYSP\_QUIESCE\_INTERVAL).

Specifies the maximum time, in seconds, allowed for the quiesce.

Specify a value in the range 1 through 999.

**RoutingCode (MQCFIL)**

z/OS routing code list (parameter identifier: MQIACF\_SYSP\_ROUTING\_CODE).

Specifies the list of z/OS routing codes for messages about the archive log data sets to the operator.

Specify up to 14 routing codes, each with a value in the range zero through 16. You must specify at least one code.

**TimeStampFormat (MQCFIN)**

Time stamp included (parameter identifier: MQIACF\_SYSP\_TIMESTAMP).

Specifies whether the archive log data set name has a time stamp in it.

The value can be:

**MQSYSP\_YES**

Names include a time stamp. The archive log data sets are named:

*arcpfxi.cyyddd.T hhmsst.A nnnnnn*

where *c* is 'D' for the years up to and including 1999 or 'E' for the year 2000 and later, and *arcpfxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpfxi* can have up to 19 characters.

#### **MQSYSP\_NO**

Names do not include a time stamp. The archive log data sets are named:

*arcpfxi.A nnnnnn*

Where *arcpfxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpfxi* can have up to 35 characters.

#### **MQSYSP\_EXTENDED**

Names include a time stamp. The archive log data sets are named:

*arcpfxi.D yyyddd.T hhmsst.A nnnnnn*

Where *arcpfxi* is the data set name prefix specified by *ArchivePrefix1* or *ArchivePrefix2*. *arcpfxi* can have up to 17 characters.

#### **Set Authority Record:**

The Set Authority Record (MQCMD\_SET\_AUTH\_REC) command sets the authorizations of a profile, object, or class of objects. Authorizations can be granted to, or revoked from, any number of principals or groups.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

#### **Required parameters**

##### **ProfileName (MQCFST)**

Profile name (parameter identifier: MQCACF\_AUTH\_PROFILE\_NAME).

The authorizations apply to all IBM MQ objects with names that match the profile name specified. You can define a generic profile. If you specify an explicit profile name, the object must exist.

The maximum length of the string is MQ\_AUTH\_PROFILE\_NAME\_LENGTH.

##### **ObjectType (MQCFIN)**

The type of object for which to set authorizations (parameter identifier: MQIACF\_OBJECT\_TYPE).

The value can be any of the following values:

##### **MQOT\_AUTH\_INFO**

Authentication information.

##### **MQOT\_CHANNEL**

Channel object.

##### **MQOT\_CLNTCONN\_CHANNEL**

Client-connection channel object.

##### **MQOT\_COMM\_INFO**

Communication information object

##### **MQOT\_LISTENER**

Listener object.

**MQOT\_NAMELIST**

Namelist.

**MQOT\_PROCESS**

Process.

**MQOT\_Q**

Queue, or queues, that match the object name parameter.

**MQOT\_Q\_MGR**

Queue manager.

**MQOT\_REMOTE\_Q\_MGR\_NAME**

Remote queue manager.

**MQOT\_SERVICE**

Service object.

**MQOT\_TOPIC**

Topic object.

**Note:** The required parameters must be in the order **ProfileName** followed by **ObjectType**.

**Optional parameters****AuthorityAdd (MQCFIL)**

Authority values to set (parameter identifier: MQIACF\_AUTH\_ADD\_AUTHS).

This parameter is a list of authority values to set for the named profile. The values can be:

**MQAUTH\_NONE**

The entity has authority set to 'none'.

**MQAUTH\_ALT\_USER\_AUTHORITY**

Specify an alternate user ID on an MQI call.

**MQAUTH\_BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

**MQAUTH\_CHANGE**

Change the attributes of the specified object, using the appropriate command set.

**MQAUTH\_CLEAR**

Clear a queue.

**MQAUTH\_CONNECT**

Connect the application to the specified queue manager by issuing an MQCONN call.

**MQAUTH\_CREATE**

Create objects of the specified type using the appropriate command set.

**MQAUTH\_DELETE**

Delete the specified object using the appropriate command set.

**MQAUTH\_DISPLAY**

Display the attributes of the specified object using the appropriate command set.

**MQAUTH\_INPUT**

Retrieve a message from a queue by issuing an MQGET call.

**MQAUTH\_INQUIRE**

Make an inquiry on a specific queue by issuing an MQINQ call.

**MQAUTH\_OUTPUT**

Put a message on a specific queue by issuing an MQPUT call.

**MQAUTH\_PASS\_ALL\_CONTEXT**

Pass all context.

**MQAUTH\_PASS\_IDENTITY\_CONTEXT**

Pass the identity context.

**MQAUTH\_SET**

Set attributes on a queue from the MQI by issuing an MQSET call.

**MQAUTH\_SET\_ALL\_CONTEXT**

Set all context on a queue.

**MQAUTH\_SET\_IDENTITY\_CONTEXT**

Set the identity context on a queue.

**MQAUTH\_CONTROL**

For listeners and services, start and stop the specified channel, listener, or service.

For channels, start, stop, and ping the specified channel.

For topics, define, alter, or delete subscriptions.

**MQAUTH\_CONTROL\_EXTENDED**

Reset or resolve the specified channel.

**MQAUTH\_PUBLISH**

Publish to the specified topic.

**MQAUTH\_SUBSCRIBE**

Subscribe to the specified topic.

**MQAUTH\_RESUME**

Resume a subscription to the specified topic.

**MQAUTH\_SYSTEM**

Use queue manager for internal system operations.

**MQAUTH\_ALL**

Use all operations applicable to the object.

**MQAUTH\_ALL\_ADMIN**

Use all administration operations applicable to the object.

**MQAUTH\_ALL\_MQI**

Use all MQI calls applicable to the object.

The contents of the *AuthorityAdd* and *AuthorityRemove* lists must be mutually exclusive. You must specify a value for either *AuthorityAdd* or *AuthorityRemove*. An error occurs if you do not specify either.

***AuthorityRemove* (MQCFIL)**

Authority values to remove (parameter identifier: MQIACF\_AUTH\_REMOVE\_AUTHS).

This parameter is a list of authority values to remove from the named profile. The values can be:

**MQAUTH\_NONE**

The entity has authority set to 'none'.

**MQAUTH\_ALT\_USER\_AUTHORITY**

Specify an alternate user ID on an MQI call.

**MQAUTH\_BROWSE**

Retrieve a message from a queue by issuing an MQGET call with the BROWSE option.

**MQAUTH\_CHANGE**

Change the attributes of the specified object, using the appropriate command set.

**MQAUTH\_CLEAR**  
Clear a queue.

**MQAUTH\_CONNECT**  
Connect the application to the specified queue manager by issuing an MQCONN call.

**MQAUTH\_CREATE**  
Create objects of the specified type using the appropriate command set.

**MQAUTH\_DELETE**  
Delete the specified object using the appropriate command set.

**MQAUTH\_DISPLAY**  
Display the attributes of the specified object using the appropriate command set.

**MQAUTH\_INPUT**  
Retrieve a message from a queue by issuing an MQGET call.

**MQAUTH\_INQUIRE**  
Make an inquiry on a specific queue by issuing an MQINQ call.

**MQAUTH\_OUTPUT**  
Put a message on a specific queue by issuing an MQPUT call.

**MQAUTH\_PASS\_ALL\_CONTEXT**  
Pass all context.

**MQAUTH\_PASS\_IDENTITY\_CONTEXT**  
Pass the identity context.

**MQAUTH\_SET**  
Set attributes on a queue from the MQI by issuing an MQSET call.

**MQAUTH\_SET\_ALL\_CONTEXT**  
Set all context on a queue.

**MQAUTH\_SET\_IDENTITY\_CONTEXT**  
Set the identity context on a queue.

**MQAUTH\_CONTROL**  
For listeners and services, start and stop the specified channel, listener, or service.  
For channels, start, stop, and ping the specified channel.  
For topics, define, alter, or delete subscriptions.

**MQAUTH\_CONTROL\_EXTENDED**  
Reset or resolve the specified channel.

**MQAUTH\_PUBLISH**  
Publish to the specified topic.

**MQAUTH\_SUBSCRIBE**  
Subscribe to the specified topic.

**MQAUTH\_RESUME**  
Resume a subscription to the specified topic.

**MQAUTH\_SYSTEM**  
Use queue manager for internal system operations.

**MQAUTH\_ALL**  
Use all operations applicable to the object.

**MQAUTH\_ALL\_ADMIN**  
Use all administration operations applicable to the object.

## **MQAUTH\_ALL\_MQI**

Use all MQI calls applicable to the object.

The contents of the *AuthorityAdd* and *AuthorityRemove* lists must be mutually exclusive. You must specify a value for either *AuthorityAdd* or *AuthorityRemove*. An error occurs if you do not specify either.

### **GroupNames (MQCFSL)**

Group names (parameter identifier: MQCACF\_GROUP\_ENTITY\_NAMES).

The names of groups having their authorizations set. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ\_ENTITY\_NAME\_LENGTH.

### **PrincipalNames (MQCFSL)**

Principal names (parameter identifier: MQCACF\_PRINCIPAL\_ENTITY\_NAMES).

The names of principals having their authorizations set. At least one group name or principal name must be specified. An error occurs if neither are specified.

Each member in this list can be a maximum length of MQ\_ENTITY\_NAME\_LENGTH.

### **ServiceComponent (MQCFST)**

Service component (parameter identifier: MQCACF\_SERVICE\_COMPONENT).

If installable authorization services are supported, this parameter specifies the name of the authorization service to which the authorizations apply.

If you omit this parameter, the authorization inquiry is made to the first installable component for the service.

The maximum length of the string is MQ\_SERVICE\_COMPONENT\_LENGTH.

## **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

### **Reason (MQLONG)**

The value can be any of the following values:

#### **MQRC\_UNKNOWN\_ENTITY**

Userid not authorized, or unknown.

#### **MQRCCF\_AUTH\_VALUE\_ERROR**

Invalid authorization.

#### **MQRCCF\_AUTH\_VALUE\_MISSING**

Authorization missing.

#### **MQRCCF\_ENTITY\_NAME\_MISSING**

Entity name missing.

#### **MQRCCF\_OBJECT\_TYPE\_MISSING**

Object type missing.

#### **MQRCCF\_PROFILE\_NAME\_ERROR**

Invalid profile name.

## Set Channel Authentication Record:

The Set Channel Authentication Record (MQCMD\_SET\_CHLAUTH\_REC) command sets the allowed partner details and mappings to MCAUSER for a channel or set of channels.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

## Syntax diagram

See the syntax diagram in the MQSC “SET CHLAUTH” on page 991 command for combinations of parameters and values that are allowed.

## Required parameters

The required parameters are valid for the **Action** values of:

- MQACT\_ADD or MQACT\_REPLACE
- MQACT\_REMOVE
- MQACT\_REMOVEALL

### *ProfileName* (MQCFST)

The name of the channel or set of channels for which you are setting channel authentication configuration (parameter identifier: MQCACH\_CHANNEL\_NAME). You can use one or more asterisks (\*), in any position, as wildcards to specify a set of channels. If you set Type to MQCAUT\_BLOCKADDR, you must set the generic channel name to a single asterisk, which matches all channel names.

The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

### *Type* (MQCFIN)

The **Type** parameter must follow the **ProfileName** parameter.

The type of channel authentication record for which to set allowed partner details or mappings to MCAUSER (parameter identifier: MQIACF\_CHLAUTH\_TYPE). The following values are valid:

#### **MQCAUT\_BLOCKUSER**

This channel authentication record prevents a specified user or users from connecting. The MQCAUT\_BLOCKUSER parameter must be accompanied by a UserList.

#### **MQCAUT\_BLOCKADDR**

This channel authentication record prevents connections from a specified IP address or addresses. The MQCAUT\_BLOCKADDR parameter must be accompanied by an AddrList.

#### **MQCAUT\_SSLPEERMAP**

This channel authentication record maps SSL Distinguished Names (DNs) to MCAUSER values. The MQCAUT\_SSLPEERMAP parameter must be accompanied by an SSLPeer.

#### **MQCAUT\_ADDRESSMAP**

This channel authentication record maps IP addresses to MCAUSER values. The MQCAUT\_ADDRESSMAP parameter must be accompanied by an Address.

#### **MQCAUT\_USERMAP**

This channel authentication record maps asserted user IDs to MCAUSER values. The MQCAUT\_USERMAP parameter must be accompanied by a ClntUser.

## MQCAUT\_QMGRMAP

This channel authentication record maps remote queue manager names to MCAUSER values. The MQCAUT\_QMGRMAP parameter must be accompanied by a QMName.

### Optional parameters

The following table shows which parameters are valid for each value of **Action**:

Parameter	MQACT_ADD or MQACT_REPLACE	MQACT_REMOVE	MQACT_REMOVEALL
 CommandScope	✓	✓	✓
Action	✓	✓	✓
Address	✓	✓	
Addrlist	✓	✓	
CheckClient	✓	✓	
ClntUser	✓	✓	
MCAUser	✓		
QMName	✓	✓	
SSLCertIssuer	✓	✓	
SSLPeer	✓	✓	
UserList	✓	✓	
UserSrc	✓		
Warn	✓		
Description	✓		

### Action (MQCFIN)

The action to perform on the channel authentication record (parameter identifier: MQIACF\_ACTION). The following values are valid:

#### MQACT\_ADD

Add the specified configuration to a channel authentication record. This is the default value.

For types MQCAUT\_SSLPEERMAP, MQCAUT\_ADDRESSMAP, MQCAUT\_USERMAP and MQCAUT\_QMGRMAP, if the specified configuration exists, the command fails.

For types MQCAUT\_BLOCKUSER and MQCAUT\_BLOCKADDR, the configuration is added to the list.

#### MQACT\_REPLACE

Replace the current configuration of a channel authentication record.

For types MQCAUT\_SSLPEERMAP, MQCAUT\_ADDRESSMAP, MQCAUT\_USERMAP and MQCAUT\_QMGRMAP, if the specified configuration exists, it is replaced with the new configuration. If it does not exist it is added.

For types MQCAUT\_BLOCKUSER and MQCAUT\_BLOCKADDR, the configuration specified replaces the current list, even if the current list is empty. If you replace the current list with an empty list, this acts like MQACT\_REMOVEALL.

### **MQACT\_REMOVE**

Remove the specified configuration from the channel authentication records. If the configuration does not exist the command fails. If you remove the last entry from a list, this acts like MQACT\_REMOVEALL.

### **MQACT\_REMOVEALL**

Remove all members of the list and thus the whole record (for MQCAUT\_BLOCKADDR and MQCAUT\_BLOCKUSER ) or all previously defined mappings (for MQCAUT\_ADDRESSMAP, MQCAUT\_SSLPEERMAP, MQCAUT\_QMGRMAP and MQCAUT\_USERMAP ) from the channel authentication records. This option cannot be combined with specific values supplied in **AddrList**, **UserList**, **Address**, **SSLPeer**, **QMName** or **CIntUser**. If the specified type has no current configuration the command still succeeds.

### *Address* (MQCFST)

**Attention:** Host names can be specified in this parameter, only on queue managers that have IBM MQ Version 8.0 new functions enabled with OPMODE.

The filter to be used to compare with the IP address, or host name, of the partner queue manager or client at the other end of the channel (parameter identifier: MQCACH\_CONNECTION\_NAME).

This parameter is mandatory when **Type** is MQCAUT\_ADDRESMAP and is also valid when **Type** is MQCAUT\_SSLPEERMAP, MQCAUT\_USERMAP, or MQCAUT\_QMGRMAP and **Action** is MQACT\_ADD, MQACT\_REPLACE, or MQACT\_REMOVE. You can define more than one channel authentication object with the same main identity, for example the same SSL or TLS peer name, with different addresses. See “Generic IP addresses” on page 998 for more information about filtering IP addresses.

The maximum length of the string is MQ\_CONN\_NAME\_LENGTH.

### *AddrList* (MQCFSL)

A list of up to 100 generic IP addresses which are banned from accessing this queue manager on any channel (parameter identifier: MQCACH\_CONNECTION\_NAME\_LIST).

This parameter is only valid when **Type** is MQCAUT\_BLOCKADDR.

The maximum length of each address is MQ\_CONN\_NAME\_LENGTH.

### *CheckClient* (MQCFIN)

**Attention:** This parameter is valid only on queue managers that have IBM MQ Version 8.0 new functions enabled with OPMODE.

The user ID and password requirements for the client connection to be successful. The following values are valid:

### **MQCHK\_REQUIRED\_ADMIN**

A valid user ID and password are required for the connection to be allowed if you are using a privileged user ID. The password cannot contain single quotation marks ( ' ).

Any connections using a non-privileged user ID are not required to provide a user ID and password.

The user ID and password are checked against the user repository details provided in an authentication information object, and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

This option is not valid on z/OS platforms.

### **MQCHK\_REQUIRED**

A valid user ID and password are required for the connection to be allowed. The password cannot contain single quotation marks ( ' ).

The user id and password are checked against the user repository details provided in an authentication information object and supplied on ALTER QMGR in the CONNAUTH field.

If no user repository details are provided, so that user ID and password checking are not enabled on the queue manager, the connection is not successful.

### **MQCHK\_AS\_Q\_MGR**

In order for the connection to be allowed, it must meet the connection authentication requirements defined on the queue manager.

If the CONNAUTH field provides an authentication information object, and the value of CHCKCLNT is REQUIRED, the connection fails unless a valid user ID and password are supplied.

If the CONNAUTH field does not provide an authentication information object, or the value of CHCKCLNT is not REQUIRED, the user ID and password are not required.

### *ClntUser* (**MQCFST**)

The client asserted user ID to be mapped to a new user ID, allowed through unchanged, or blocked (parameter identifier: MQCACH\_CLIENT\_USER\_ID).

This can be the user ID flowed from the client indicating the user ID the client side process is running under, or the user ID presented by the client on an MQCONN call using MQCSP.

This parameter is valid only with TYPE(USERMAP) and when **Match** is MQMATCH\_RUNCHECK.

The maximum length of the string is MQ\_CLIENT\_USER\_ID\_LENGTH.

### *CommandScope* (**MQCFST**)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is run when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is run on the queue manager on which it was entered.
- a queue manager name. The command is run on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which the command was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is run on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

### *Custom* (**MQCFST**)

Reserved for future use.

### *Description* (**MQCFST**)

Provides descriptive information about the channel authentication record, which is displayed when you issue the Inquire Channel Authentication Records command (parameter identifier: MQCA\_CHLAUTH\_DESC).

This parameter must contain only displayable characters. In a DBCS installation, it can contain DBCS characters. The maximum length of the string is MQ\_CHLAUTH\_DESC\_LENGTH.

**Note:** Use characters from the coded character set identifier (CCSID) for this queue manager. Other characters might be translated incorrectly if the information is sent to another queue manager.

### *MCAUser* (MQCFST)

The user identifier to be used when the inbound connection matches the SSL DN, IP address, client asserted user ID or remote queue manager name supplied (parameter identifier: MQCACH\_MCA\_USER\_ID).

This parameter is mandatory when **UserSrc** is MQUSRC\_MAP and is valid when **Type** is MQCAUT\_SSLPEERMAP, MQCAUT\_ADDRESSMAP, MQCAUT\_USERMAP, or MQCAUT\_QMGRMAP.

This parameter is valid only when **Action** is MQACT\_ADD or MQACT\_REPLACE.

The maximum length of the string is MQ\_MCA\_USER\_ID\_LENGTH.

### *QMName* (MQCFST)

The name of the remote partner queue manager, or pattern that matches a set of queue manager names, to be mapped to a user ID or blocked (parameter identifier: MQCA\_REMOTE\_Q\_MGR\_NAME).

This parameter is valid only when **Type** is MQCAUT\_QMGRMAP

The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

### *SSLCertIssuer* (MQCFST)

**Attention:** This parameter is valid only on queue managers that have IBM MQ Version 8.0 new functions enabled with OPMODE.

This parameter is additional to the **SSLPeer** parameter.

**SSLCertIssuer** restricts matches to being within certificates issued by a particular Certificate Authority.

### *SSLPeer* (MQCFST)

The filter to use to compare with the Distinguished Name of the certificate from the peer queue manager or client at the other end of the channel (parameter identifier: MQCACH\_SSL\_PEER\_NAME).

The **SSLPeer** value is specified in the standard form used to specify a Distinguished Name. See Distinguished Names and IBM MQ rules for SSLPEER values.

The maximum length of the string is MQ\_SSL\_PEER\_NAME\_LENGTH .

### *UserList* (MQCFSL)

A list of up to 100 user IDs which are banned from using this channel or set of channels (parameter identifier: MQCACH\_MCA\_USER\_ID\_LIST).

The following special value can be used:

#### **\*MQADMIN**

The exact meaning of this value is determined at runtime. If you are using the OAM supplied with IBM MQ, the meaning depends on platform, as follows:

- On Windows, all members of the mqm group, the Administrators group and SYSTEM
- On UNIX and Linux, all members of the mqm group
- On IBM i, the profiles (users) qmqm and qmqmadm and all members of the qmqmadm group, and any user defined with the \*ALLOBJ special setting
-  On z/OS, the user ID that the CHINIT and the user ID that the MSTR address spaces are running under

This parameter is only valid when **TYPE** is MQCAUT\_BLOCKUSER.

The maximum length of each user ID is MQ\_MCA\_USER\_ID\_LENGTH .

### *UserSrc* (MQCFIN)

The source of the user ID to be used for MCAUSER at run time (parameter identifier: MQIACH\_USER\_SOURCE).

The following values are valid:

#### **MQUSRC\_MAP**

Inbound connections that match this mapping use the user ID specified in the **MCAUser** attribute. This is the default value.

#### **MQUSRC\_NOACCESS**

Inbound connections that match this mapping have no access to the queue manager and the channel ends immediately.

#### **MQUSRC\_CHANNEL**

Inbound connections that match this mapping use the flowed user ID or any user defined on the channel object in the MCAUSER field.

Note that *Warn* and MQUSRC\_CHANNEL, or MQUSRC\_MAP are incompatible. This is because channel access is never blocked in these cases, so there is never a reason to generate a warning.

### *Warn* (MQCFIN)

Indicates whether this record operates in warning mode (parameter identifier: MQIACH\_WARNING).

#### **MQWARN\_NO**

This record does not operate in warning mode. Any inbound connection that matches this record is blocked. This is the default value.

#### **MQWARN\_YES**

This record operates in warning mode. Any inbound connection that matches this record and would therefore be blocked is allowed access. An error message is written and, if events are configured, an event message is created showing the details of what would have been blocked. The connection is allowed to continue. An attempt is made to find another record that is set to WARN(NO) to set the credentials for the inbound channel.

### **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown at "Error codes applicable to all commands" on page 1051.

### *Reason* (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CHLAUTH\_TYPE\_ERROR**

Channel authentication record type not valid.

#### **MQRCCF\_CHLAUTH\_ACTION\_ERROR**

Channel authentication record action not valid.

#### **MQRCCF\_CHLAUTH\_USERSRC\_ERROR**

Channel authentication record user source not valid.

#### **MQRCCF\_WRONG\_CHLAUTH\_TYPE**

Parameter not allowed for this channel authentication record type.

#### **MQRCCF\_CHLAUTH\_ALREADY\_EXISTS**

Channel authentication record already exists

## Related information:

Channel authentication records

## Set Log:

Use the Set Log (MQCMD\_SET\_LOG) command to dynamically change certain log system parameter values initially set by your system parameter module at queue manager startup.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

## Required parameters:

*ParameterType*

## Optional parameters (if the value of *ParameterType* is MQSYSP\_TYPE\_SET:

*CommandScope*, *DeallocateInterval*, *LogCompression*, *MaxArchiveLog*, *MaxConcurrentOffloads*, *MaxReadTapeUnits*, *OutputBufferCount*

## Optional parameters if *ParameterType* type is MQSYSP\_INITIAL:

*CommandScope*

## Required parameters

### *ParameterType* (MQCFIN)

Parameter type (parameter identifier: MQIACF\_SYSP\_TYPE).

Specifies how the parameters are to be set:

### MQSYSP\_TYPE\_INITIAL

The initial settings of the log system parameters. This MQSYSP\_TYPE\_INITIAL resets all the log system parameters to the values at queue manager startup.

### MQSYSP\_TYPE\_SET

This MQSYSP\_TYPE\_SET indicates that you intend to change one, or more, of the archive log system parameter settings.

## Optional parameters

### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### *DeallocateInterval* (MQCFIN)

Deallocation interval (parameter identifier: MQIACF\_SYSP\_DEALLOC\_INTERVAL).

Specifies the length of time, in minutes, that an allocated archive read tape unit is allowed to remain unused before it is deallocated. This parameter, together with the *MaxReadTapeUnits* parameter, allows IBM MQ to optimize archive log reading from tape devices. You are recommended to specify the maximum values, within system constraints, for both parameters, in order to achieve the optimum performance for reading archive tapes.

Specify a value in the range zero and 1440. Zero means that a tape unit is deallocated immediately. If you specify a value of 1440, the tape unit is never deallocated.

**LogCompression (MQCFIN)**

Log compression parameter (parameter identifier: MQIACF\_LOG\_COMPRESS).

Specifies the log compression algorithm to enable.

The possible values are:

**MQCOMPRESS\_NONE**

Log compression is disabled.

**MQCOMPRESS\_RLE**

Enable run-length encoding log compression.

**MQCOMPRESS\_ANY**

Enable the queue manager to select the compression algorithm that gives the greatest degree of log record compression.

 For more details see The log files.

**MaxArchiveLog (MQCFIN)**

Specifies the maximum number of archive log volumes that can be recorded in the BSDS (parameter identifier: MQIACF\_SYSP\_MAX\_ARCHIVE).

When this value is exceeded, recording recommences at the start of the BSDS.

Specify a value in the range 10 through 100.

**MaxConcurrentOffloads (MQCFIN)**

Specifies the maximum number of concurrent log offload tasks (parameter identifier: MQIACF\_SYSP\_MAX\_CONC\_OFFLOADS).

Specify a decimal number between 1 and 31. If no value is specified the default of 31 applies.

Configure a number lower than the default if your archive logs are allocated on a tape device, and there are constraints on the number of such devices that can be concurrently allocated to the queue manager.

**MaxReadTapeUnits (MQCFIN)**

Specifies the maximum number of dedicated tape units that can be allocated to read archive log tape volumes (parameter identifier: MQIACF\_SYSP\_MAX\_READ\_TAPES).

This parameter, together with the *DeallocateInterval* parameter, allows IBM MQ to optimize archive log reading from tape devices.

Specify a value in the range 1 through 99.

If you specify a value that is greater than the current specification, the maximum number of tape units allowable for reading archive logs increases. If you specify a value that is less than the current specification, tape units that are not being used are immediately deallocated to adjust to the new value. Active, or premounted, tapes remain allocated.

**OutputBufferCount (MQCFIN)**

Specifies the number of 4 KB output buffers to be filled before they are written to the active log data sets (parameter identifier: MQIACF\_SYSP\_OUT\_BUFFER\_COUNT).

Specify the number of buffers in the range 1 through 256.

The larger the number of buffers and the less often the write takes place improves the performance of IBM MQ. The buffers might be written before this number is reached if significant events, such as a commit point, occur.

### Set Policy:

The Set Policy (MQCMD\_CHANGE\_PROT\_POLICY) command sets the protection policy.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

**Important:** You must have an IBM MQ Advanced Message Security (AMS) license installed to issue this command. If you attempt to issue the **Set Policy** command without an AMS license installed, you receive message AMQ7155 - License file not found or not valid.

### Syntax diagram

See the syntax diagram in the MQSC "SET POLICY" on page 1002 command for combinations of parameters and values that are allowed.

### Required parameters

#### *PolicyName* (MQCFST)

Specifies the name of the policy. The policy name must match the name of the queue which is to be protected (parameter identifier: MQCA\_POLICY\_NAME).

The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### Optional parameters

#### *SignAlg* (MQCFIN)

Specifies the digital signature algorithm (parameter identifier: MQIA\_SIGNATURE\_ALGORITHM). The following values are valid:

##### **MQESE\_SIGN\_ALG\_NONE**

No digital signature algorithm specified. This is the default value.

##### **MQESE\_SIGN\_ALG\_MD5**

MD5 digital signature algorithm specified.

##### **MQESE\_SIGN\_ALG\_SHA1**

SHA1 digital signature algorithm specified.

##### **MQESE\_SIGN\_ALG\_256**

SHA256 digital signature algorithm specified.

##### **MQESE\_SIGN\_ALG\_384**

SHA384 digital signature algorithm specified.

##### **MQESE\_SIGN\_ALG\_512**

SHA512 digital signature algorithm specified.

#### *EncAlg* (MQCFIN)

Specifies the encryption algorithm (parameter identifier: MQIA\_ENCRYPTION\_ALGORITHM). The following values are valid:

##### **MQESE\_ENC\_ALG\_NONE**

No encryption algorithm specified. This is the default value.

**MQESE\_ENC\_ALG\_RC2**  
RC2 encryption algorithm specified.

**MQESE\_ENC\_ALG\_DES**  
DES encryption algorithm specified.

**MQESE\_ENC\_ALG\_3DES**  
3DES encryption algorithm specified.

**MQESE\_ENC\_ALG\_AES128**  
AES128 encryption algorithm specified.

**MQESE\_ENC\_ALG\_AES256**  
AES256 encryption algorithm specified.

**Signer (MQCFST)**

Specifies the distinguished name of an authorized signer. This parameter can be specified multiple times (parameter identifier: MQCA\_SIGNER\_DN).

**Recipient (MQCFST)**

Specifies the distinguished name of the intended recipient. This parameter can be specified multiple times (parameter identifier: MQCA\_RECIPIENT\_DN).

**Enforce and Tolerate (MQCFST)**

Indicates whether the security policy should be enforced or whether unprotected messages are tolerated (parameter identifier: MQIA\_TOLERATE\_UNPROTECTED). The following values are valid:

**MQESE\_TOLERATE\_NO**

Specifies that all message must be protected when retrieved from the queue. Any unprotected message encountered is moved to the SYSTEM.PROTECTION.ERROR.QUEUE. This is the default value.

**MQESE\_TOLERATE\_YES**

Specifies that the messages that are not protected when retrieved from the queue can ignore the policy.

Toleration is optional and exists to facilitate staged implementation, where:

- Policies have been applied to queues, but those queues might already contain unprotected messages, or
- Queues might still receive messages from remote systems that do not yet have the policy set.

**Action (MQCFIN)**

Specifies the action for the parameters supplied, as they apply to any existing policy (parameter identifier: MQIACF\_ACTION). The following values are valid:

**MQACT\_REPLACE**

Has the effect of replacing any existing policy with the parameters supplied. This is the default value.

**MQACT\_ADD**

Has the effect that signers and recipients parameters have an additive effect. That is, if a signer or recipient is specified, and does not already exist in a preexisting policy, the signer or recipient value is added to the existing policy definition.

**MQACT\_REMOVE**

Has the opposite effect of *MQACT\_ADD*. That is, if any of the signer or recipient values specified exist in a preexisting policy, those values are removed from the policy definition.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown at "Error codes applicable to all commands" on page 1051.

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_POLICY\_TYPE\_ERROR**

Policy type not valid.

### Set System:

Use the Set System (MQCMD\_SET\_SYSTEM) command to dynamically change certain general system parameter values initially set from your system parameter module at queue manager startup.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

### Required parameters:

*ParameterType*

### Optional parameters (if the value of *ParameterType* is **MQSYSP\_TYPE\_SET**:

*CheckpointCount, CommandScope, Exclmsg, MaxConnects, MaxConnectsBackground, MaxConnectsForeground, Service, SMFInterval, TraceSize*

### Optional parameters if *ParameterType* type is **MQSYSP\_INITIAL**:

*CommandScope*

### Required parameters

#### *ParameterType* (**MQCFIN**)

Parameter type (parameter identifier: MQIACF\_SYSP\_TYPE).

Specifies how the parameters are to be set:

#### **MQSYSP\_TYPE\_INITIAL**

The initial settings of the system parameters. **MQSYSP\_TYPE\_INITIAL** resets the parameters to the values specified in the system parameters at queue manager startup.

#### **MQSYSP\_TYPE\_SET**

**MQSYSP\_TYPE\_SET** indicates that you intend to change one, or more, of the system parameter settings.

### Optional parameters

#### *CheckpointCount* (**MQCFIN**)

The number of log records written by IBM MQ between the start of one checkpoint and the next (parameter identifier: MQIACF\_SYSP\_CHKPOINT\_COUNT).

IBM MQ starts a new checkpoint after the number of records that you specify has been written.

Specify a value in the range 200 through 16 000 000.

#### *CommandScope* (**MQCFST**)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *Exclmsg* (MQCFSL)

A list of message identifiers to be excluded from being written to any log (parameter identifier: MQIACF\_EXCL\_OPERATOR\_MESSAGES).

Specify a list of error message identifiers to be excluded from being written to any log. For example, to exclude message CSQX500I, add X500 to this list. Messages in this list are not sent to the z/OS console and hardcopy log. As a result using the EXCLMSG parameter to exclude messages is more efficient from a CPU perspective than using z/OS mechanisms such as the message processing facility list and should be used instead where possible.

The maximum length of each message identifier is MQ\_OPERATOR\_MESSAGE\_LENGTH.

The list can contain a maximum of 16 message identifiers.

#### *Service* (MQCFST)

Service parameter setting (parameter identifier: MQIACF\_SYSP\_SERVICE).

This parameter is reserved for use by IBM.

#### *SMFInterval* (MQCFIN)

The default time, in minutes, between each gathering of statistics (parameter identifier: MQIACF\_SYSP\_SMF\_INTERVAL).

Specify a value in the range zero through 1440.

If you specify a value of zero, statistics data and accounting data are both collected at the SMF data collection broadcast.

#### *TraceSize* (MQCFIN)

The size of the trace table, in 4 KB blocks, to be used by the global trace facility (parameter identifier: MQIACF\_SYSP\_TRACE\_SIZE).

Specify a value in the range zero through 999.

## Start Channel:

The Start Channel (MQCMD\_START\_CHANNEL) command starts an IBM MQ channel. This command can be issued to a channel of any type (except MQCHT\_CLNTCONN). If, however, it is issued to a channel with a *ChannelType* value of MQCHT\_RECEIVER, MQCHT\_SVRCONN, or MQCHT\_CLUSRCVR, the only action is to enable the channel, not start it.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

### Required parameters

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be started. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

This parameter is required for all channel types including MQTT channels.

#### ▶ z/OS

### Optional parameters

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *ChannelDisposition* (MQCFIN)

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be started.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be:

**MQCHLD\_PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

**MQCHLD\_SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue-sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

**MQCHLD\_FIXSHARED**

Shared channels tied to a specific queue manager.

The combination of the *ChannelDisposition* and *CommandScope* parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.
- On another specific named queue manager in the group.
- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in Table 128

*Table 128. ChannelDisposition and CommandScope for START CHANNEL*

<i>ChannelDisposition</i>	<i>CommandScope</i> <b>blank or local-qmgr</b>	<i>CommandScope</i> <b>qmgr-name</b>	<i>CommandScope</i> (*)
MQCHLD_PRIVATE	Start as a private channel on the local queue manager	Start as a private channel on the named queue manager	Start as a private channel on all active queue managers

Table 128. ChannelDisposition and CommandScope for START CHANNEL (continued)

ChannelDisposition	CommandScope blank or local-qmgr	CommandScope qmgr-name	CommandScope (*)
MQCHLD_SHARED	<p>For channels of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, start as a shared channel on the most suitable queue manager in the group.</p> <p>For a shared channel of <i>ChannelType</i> MQCHT_RECEIVER and MQCHT_SVRCONN, start the channel on all active queue managers.</p> <p>For a shared channel of <i>ChannelType</i> MQCHT_CLUSSDR and MQCHT_CLUSRCVR, this option is not permitted.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted
MQCHLD_FIXSHARED	For a shared channel of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, with a nonblank <i>ConnectionName</i> , start as a shared channel on the local queue manager.	For a shared channel of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, with a nonblank <i>ConnectionName</i> , start as a shared channel on the named queue manager.	Not permitted

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHANNEL\_INDOUBT**  
Channel in-doubt.

**MQRCCF\_CHANNEL\_IN\_USE**  
Channel in use.

**MQRCCF\_CHANNEL\_NOT\_FOUND**  
Channel not found.

**MQRCCF\_CHANNEL\_TYPE\_ERROR**  
Channel type not valid.

**MQRCCF\_MQCONN\_FAILED**  
MQCONN call failed.

**MQRCCF\_MQINQ\_FAILED**  
MQINQ call failed.

**MQRCCF\_MQOPEN\_FAILED**  
MQOPEN call failed.

**MQRCCF\_NOT\_XMIT\_Q**  
Queue is not a transmission queue.

#### **Start Channel (MQTT):**

The Start Channel (MQCMD\_START\_CHANNEL) command starts an IBM MQ channel. This command can be issued to a channel of type MQCHT\_MQTT.

#### **Required parameters**

##### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be started. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

This parameter is required for all channel types including MQTT channels.

##### *ChannelType* (MQCFIN)

The type of channel (parameter identifier: MQIACH\_CHANNEL\_TYPE). This parameter is currently only used with MQTT Telemetry channels, and is required when starting a Telemetry channel. The only value that can currently be given to the parameter is MQCHT\_MQTT.

#### **Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

##### *Reason* (MQLONG)

The value can be any of the following values:

##### **MQRCCF\_PARM\_SYNTAX\_ERROR**

The parameter specified contained a syntax error.

##### **MQRCCF\_PARM\_MISSING**

Parameters are missing.

##### **MQRCCF\_CHANNEL\_NOT\_FOUND**

The channel specified does not exist.

##### **MQRCCF\_CHANNEL\_IN\_USE**

The command did not specify a parameter or parameter value that was required.

**MQRCCF\_NO\_STORAGE**

Insufficient storage is available.

**MQRCCF\_COMMAND\_FAILED**

The command has failed.

**MQRCCF\_PORT\_IN\_USE**

The port is in use.

**MQRCCF\_BIND\_FAILED**

The bind to a remote system during session negotiation has failed.

**MQRCCF\_SOCKET\_ERROR**

Socket error has occurred.

**MQRCCF\_HOST\_NOT\_AVAILABLE**

An attempt to allocate a conversation to a remote system was unsuccessful. The error might be transitory, and the allocate might succeed later. This reason can occur if the listening program at the remote system is not running.

**Start Channel Initiator:**

The Start Channel Initiator (MQCMD\_START\_CHANNEL\_INIT) command starts an IBM MQ channel initiator.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

**Required parameters****InitiationQName (MQCFST)**

Initiation queue name (parameter identifier: MQCA\_INITIATION\_Q\_NAME).

The name of the initiation queue for the channel initiation process. That is, the initiation queue that is specified in the definition of the transmission queue.

This parameter is not valid on z/OS.

The maximum length of the string is MQ\_Q\_NAME\_LENGTH.

**Optional parameters****CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

**EnvironmentInfo (MQCFST)**

Environment information (parameter identifier: MQCACF\_ENV\_INFO).

The parameters and values to be substituted in the JCL procedure (xxxxCHIN, where xxxx is the queue manager name) that is used to start the channel initiator address space. This parameter applies to z/OS only.

The maximum length of the string is MQ\_ENV\_INFO\_LENGTH.

### Error codes

This command might return the following error codes in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

#### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_MQCONN\_FAILED**

MQCONN call failed.

#### **MQRCCF\_MQGET\_FAILED**

MQGET call failed.

#### **MQRCCF\_MQOPEN\_FAILED**

MQOPEN call failed.

### Start Channel Listener:

The Start Channel Listener (MQCMD\_START\_CHANNEL\_LISTENER) command starts an IBM MQ listener. On z/OS, this command is valid for any transmission protocol; on other platforms, it is valid only for TCP transmission protocols.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### Optional parameters z/OS

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_Q\_MGR\_NAME\_LENGTH.

### z/OS

#### InboundDisposition (MQCFIN)

Inbound transmission disposition (parameter identifier: MQIACH\_INBOUND\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the inbound transmissions that are to be handled. The value can be any of the following values:

## **MQINBD\_Q\_MGR**

Listen for transmissions directed to the queue manager. MQINBD\_Q\_MGR is the default.

## **MQINBD\_GROUP**

Listen for transmissions directed to the queue-sharing group. MQINBD\_GROUP is permitted only if there is a shared queue manager environment.

▶ z/OS

### *IPAddress* (**MQCFST**)

IP address (parameter identifier: MQCACH\_IP\_ADDRESS). This parameter applies to z/OS only.

The IP address for TCP/IP specified in IPv4 dotted decimal, IPv6 hexadecimal, or alphanumeric form. This parameter is valid only for channels that have a *TransportType* of MQXPT\_TCP.

The maximum length of the string is MQ\_IP\_ADDRESS\_LENGTH.

### *ListenerName* (**MQCFST**)

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME). This parameter does not apply to z/OS.

The name of the listener definition to be started. On those platforms on which this parameter is valid, if this parameter is not specified, the default listener SYSTEM.DEFAULT.LISTENER is assumed. If this parameter is specified, no other parameters can be specified.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

▶ z/OS

### *LUName* (**MQCFST**)

LU name (parameter identifier: MQCACH\_LU\_NAME). This parameter applies to z/OS only.

The symbolic destination name for the logical unit (LU) as specified in the APPC side information data set. The LU must be the same LU that is specified in the channel initiator parameters to be used for outbound transmissions. This parameter is valid only for channels with a *TransportType* of MQXPT\_LU62.

The maximum length of the string is MQ\_LU\_NAME\_LENGTH.

▶ z/OS

### *Port* (**MQCFIN**)

Port number for TCP (parameter identifier: MQIACH\_PORT\_NUMBER). This parameter applies to z/OS only.

The port number for TCP. This parameter is valid only for channels with a *TransportType* of MQXPT\_TCP.

▶ z/OS

### *TransportType* (**MQCFIN**)

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_LU62**

LU 6.2.

**MQXPT\_TCP**

TCP.

**MQXPT\_NETBIOS**

NetBIOS.

**MQXPT\_SPX**  
SPX.

On platforms other than z/OS, this parameter is invalid.

### Error codes

This command might return the following error codes in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

#### Reason (MQLONG)

The value can be any of the following values:

**MQRCCF\_COMMS\_LIBRARY\_ERROR**  
Communications protocol library error.

**MQRCCF\_LISTENER\_NOT\_STARTED**  
Listener not started.

**MQRCCF\_LISTENER\_RUNNING**  
Listener already running.

**MQRCCF\_NETBIOS\_NAME\_ERROR**  
NetBIOS listener name error.

### Start Service:

The Start Service (MQCMD\_START\_SERVICE) command starts an existing IBM MQ service definition.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

### Required parameters

#### ServiceName (MQCFST)

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

This parameter is the name of the service definition to be started. The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

### Error codes

This command might return the following error codes in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

#### Reason (MQLONG)

The value can be any of the following values:

**MQRCCF\_NO\_START\_CMD**  
The *StartCommand* parameter of the service is blank.

**MQRCCF\_SERVICE\_RUNNING**  
Service is already running.

## Start SMDS Connection:

Use the Start SMDS Connection (MQCMD\_INQUIRE\_SMDSCONN) command after connections have been put into the AVAIL(STOPPED) state by a previous STOP SMDSCONN command. It can also be used to signal to the queue manager to retry a connection which is in the AVAIL(ERROR) state after a previous error.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

### Required parameters

#### *SMDSConn* (MQCFST)

Specifies the queue manager name relating to the connection between the shared message data set and the queue manager (parameter identifier: MQCACF\_CF\_SMDSCONN).

An asterisk value can be used to denote all shared message data sets associated with a specific CFSTRUCT name.

The maximum length of the string is 4 characters.

#### *CFStrucName* (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to start (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Stop Channel:

The Stop Channel (MQCMD\_STOP\_CHANNEL) command stops an IBM MQ channel.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

This command can be issued to a channel of any type (except MQCHT\_CLNTCONN).

Where there is both a locally defined channel and an auto-defined cluster-sender channel of the same name, the command applies to the locally defined channel.

If there is no locally defined channel but more than one auto-defined cluster-sender channel, the command applies to the last channel added to the repository on the local queue manager.

None of the following attributes are applicable to MQTT channels unless specifically mentioned in the parameter description.

### Required parameters

#### *ChannelName* (MQCFST)

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

The name of the channel to be stopped. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

This parameter is required for all channel types..

### Optional parameters

#### ▶ z/OS *ChannelDisposition* (MQCFIN)

Channel disposition (parameter identifier: MQIACH\_CHANNEL\_DISP). This parameter applies to z/OS only.

Specifies the disposition of the channels to be stopped.

If this parameter is omitted, then the value for the channel disposition is taken from the default channel disposition attribute of the channel object.

The value can be any of the following values:

#### **MQCHLD\_PRIVATE**

A receiving channel is private if it was started in response to an inbound transmission directed to the queue manager.

A sending channel is private if its transmission queue has a disposition other than MQQSGD\_SHARED.

#### **MQCHLD\_SHARED**

A receiving channel is shared if it was started in response to an inbound transmission directed to the queue-sharing group.

A sending channel is shared if its transmission queue has a disposition of MQQSGD\_SHARED.

The combination of the *ChannelDisposition* and *CommandScope* parameters also controls from which queue manager the channel is operated. The possible options are:

- On the local queue manager where the command is issued.

- On another specific named queue manager in the group.
- On every active queue manager in the group.
- On the most suitable queue manager in the group, determined automatically by the queue manager itself.

The various combinations of *ChannelDisposition* and *CommandScope* are summarized in Table 129

Table 129. *ChannelDisposition* and *CommandScope* for STOP CHANNEL

<i>ChannelDisposition</i>	<i>CommandScope</i> blank or local-qmgr	<i>CommandScope</i> qmgr-name	<i>CommandScope</i> (*)
MQCHLD_PRIVATE	Stop as a private channel on the local queue manager	Stop as a private channel on the named queue manager	Stop as a private channel on all active queue managers
MQCHLD_SHARED	<p>For channels of <i>ChannelType</i> MQCHT_RECEIVER or MQCHT_SVRCONN, stop as shared channel on all active queue managers.</p> <p>For channels of <i>ChannelType</i> MQCHT_SENDER, MQCHT_REQUESTER, and MQCHT_SERVER, stop as a shared channel on the queue manager where it is running. If the channel is in an inactive state (not running), or if it is in RETRY state because the channel initiator on which it was running has stopped, a STOP request for the channel is issued on the local queue manager.</p> <p>MQCHLD_SHARED might automatically generate a command using <i>CommandScope</i> and send it to the appropriate queue manager. If there is no definition for the channel on the queue manager to which the command is sent, or if the definition is unsuitable for the command, the command fails.</p> <p>The definition of a channel on the queue manager where the command is entered might be used to determine the target queue manager where the command is run. Therefore, it is important that channel definitions are consistent. Inconsistent channel definitions might result in unexpected command behavior.</p>	Not permitted	Not permitted

#### *ChannelStatus* (MQCFIN)

The new state of the channel after the command is executed (parameter identifier: MQIACH\_CHANNEL\_STATUS).

The value can be any of the following values:

## **MQCHS\_INACTIVE**

Channel is inactive.

## **MQCHS\_STOPPED**

Channel is stopped. MQCHS\_STOPPED is the default if nothing is specified.

### **z/OS CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

### **ConnectionName (MQCFST)**

Connection name of channel to be stopped (parameter identifier: MQCACH\_CONNECTION\_NAME).

This parameter is the connection name of the channel to be stopped. If this parameter is omitted, all channels with the specified channel name and remote queue manager name are stopped. On platforms other than z/OS, the maximum length of the string is MQ\_CONN\_NAME\_LENGTH. On z/OS, the maximum length of the string is MQ\_LOCAL\_ADDRESS\_LENGTH.

If this parameter is specified, ChannelStatus must be MQCHS\_INACTIVE.

### **Mode (MQCFIN)**

How the channel must be stopped (parameter identifier: MQIACF\_MODE).

The value can be:

#### **MQMODE QUIESCE**

Quiesce the channel. MQMODE QUIESCE is the default.

If you issue a Stop Channel <channelname> Mode(MQMODE QUIESCE) command on a server-connection channel with the sharing conversations feature enabled, the IBM MQ client infrastructure becomes aware of the stop request in a timely manner; this time is dependent upon the speed of the network. The client application becomes aware of the stop request as a result of issuing a subsequent call to IBM MQ.

#### **MQMODE FORCE**

Stop the channel immediately; the thread or process of the channel is not terminated. Stops transmission of any current batch.

For server-connection channels, breaks the current connection, returning MQRC\_CONNECTION\_BROKEN.

For other types of channels, this situation is likely to result in in-doubt situations.

**z/OS** On z/OS, this option interrupts any message reallocation in progress, which can leave BIND\_NOT\_FIXED messages partially reallocated or out of order.

#### **MQMODE TERMINATE**

**z/OS** On z/OS, MQMODE\_TERMINATE is synonymous with FORCE. On distributed platforms, stop the channel immediately; the thread or process of the channel is terminated.

► **z/OS** On z/OS, this option interrupts any message reallocation in progress, which can leave BIND\_NOT\_FIXED messages partially reallocated or out of order.

**Note:** This parameter was previously called *Quiesce* (MQIACF\_QUIESCE), with values MQQO\_YES and MQQO\_NO. The old names can still be used.

**QMgrName (MQCFST)**

Name of remote queue manager (parameter identifier: MQCA\_Q\_MGR\_NAME).

This parameter is the name of the remote queue manager to which the channel is connected. If this parameter is omitted, all channels with the specified channel name and connection name are stopped. The maximum length of the string is MQ\_Q\_MGR\_NAME\_LENGTH.

If this parameter is specified, ChannelStatus must be MQCHS\_INACTIVE.

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHANNEL\_DISABLED**

Channel disabled.

**MQRCCF\_CHANNEL\_NOT\_ACTIVE**

Channel not active.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_MODE\_VALUE\_ERROR**

Mode value not valid.

**MQRCCF\_MQCONN\_FAILED**

MQCONN call failed.

**MQRCCF\_MQOPEN\_FAILED**

MQOPEN call failed.

**MQRCCF\_MQSET\_FAILED**

MQSET call failed.

**Stop Channel (MQTT):**

The Stop Channel (MQCMD\_STOP\_CHANNEL) command stops an IBM MQ Telemetry channel.

**Required parameters**

**ChannelName (MQCFST)**

Channel name (parameter identifier: MQCACH\_CHANNEL\_NAME).

This parameter is required.

The name of the channel to be stopped. The maximum length of the string is MQ\_CHANNEL\_NAME\_LENGTH.

**Optional parameters**

**ChannelType (MQCFIN)**

The type of channel (parameter identifier: MQIACH\_CHANNEL\_TYPE). This parameter is currently

only used with MQTT Telemetry channels, and is required when stopping a Telemetry channel. The only value that can currently be given to the parameter is **MQCHT\_MQTT**.

**ClientIdentifier (MQCFST)**

Client identifier. The client identifier is a 23-byte string that identifies an IBM MQ Telemetry Transport client. When the Stop Channel command specifies a *ClientIdentifier*, only the connection for the specified client identifier is stopped. If the CLIENTID is not specified, all the connections on the channel are stopped.

**Error codes**

This command might return the following error codes in the response format header, in addition to the values shown in “Error codes applicable to all commands” on page 1051.

**Reason (MQLONG)**

The value can be any of the following values:

**MQRCCF\_CHANNEL\_DISABLED**

Channel disabled.

**MQRCCF\_CHANNEL\_NOT\_ACTIVE**

Channel not active.

**MQRCCF\_CHANNEL\_NOT\_FOUND**

Channel not found.

**MQRCCF\_MODE\_VALUE\_ERROR**

Mode value not valid.

**MQRCCF\_MQCONN\_FAILED**

MQCONN call failed.

**MQRCCF\_MQOPEN\_FAILED**

MQOPEN call failed.

**MQRCCF\_MQSET\_FAILED**

MQSET call failed.

**Stop Channel Initiator:** z/OS

The Stop Channel Initiator (MQCMD\_STOP\_CHANNEL\_INIT) command stops an IBM MQ channel initiator.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

**Optional parameters**

**CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.

- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### **SharedChannelRestart (MQCFIN)**

Shared channel restart (parameter identifier: MQIACH\_SHARED\_CHANNEL\_RESTART).

Specifies whether the channel initiator attempts to restart any active sending channels, started with the *ChannelDisposition* parameter set to MQCHLD\_SHARED, that it owns on another queue manager. The value can be:

#### **MQCHSH\_RESTART\_YES**

Shared sending channels are to be restarted. MQCHSH\_RESTART\_YES is the default.

#### **MQCHSH\_RESTART\_NO**

Shared sending channels are not to be restarted, so become inactive.

Active channels started with the *ChannelDisposition* parameter set to MQCHLD\_FIXSHARED are not restarted, and always become inactive.

### **Stop Channel Listener:**

The Stop Channel Listener (MQCMD\_STOP\_CHANNEL\_LISTENER) command stops an IBM MQ listener.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	✓

### **Required parameters**

#### **ListenerName (MQCFST)**

Listener name (parameter identifier: MQCACH\_LISTENER\_NAME). This parameter does not apply to z/OS.

The name of the listener definition to be stopped. If this parameter is specified, no other parameters can be specified.

The maximum length of the string is MQ\_LISTENER\_NAME\_LENGTH.

#### **z/OS**

### **Optional parameters**

#### **CommandScope (MQCFST)**

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

This parameter is valid only on z/OS.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

***InboundDisposition (MQCFIN)***

Inbound transmission disposition (parameter identifier: MQIACH\_INBOUND\_DISP).

Specifies the disposition of the inbound transmissions that the listener handles. The value can be any of the following values:

**MQINBD\_Q\_MGR**

Handling for transmissions directed to the queue manager. MQINBD\_Q\_MGR is the default.

**MQINBD\_GROUP**

Handling for transmissions directed to the queue-sharing group. MQINBD\_GROUP is permitted only if there is a shared queue manager environment.

This parameter is valid only on z/OS.

***IPAddress (MQCFST)***

IP address (parameter identifier: MQCACH\_IP\_ADDRESS).

The IP address for TCP/IP specified in dotted decimal or alphanumeric form. This parameter is valid on z/OS only where channels have a *TransportType* of MQXPT\_TCP.

The maximum length of the string is MQ\_IP\_ADDRESS\_LENGTH.

***Port (MQCFIN)***

Port number for TCP (parameter identifier: MQIACH\_PORT\_NUMBER).

The port number for TCP. This parameter is valid only on z/OS where channels have a *TransportType* of MQXPT\_TCP.

***TransportType (MQCFIN)***

Transmission protocol type (parameter identifier: MQIACH\_XMIT\_PROTOCOL\_TYPE).

The value can be:

**MQXPT\_LU62**

LU 6.2.

**MQXPT\_TCP**

TCP.

This parameter is valid only on z/OS.

**Error codes**

This command might return the following error code in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

***Reason (MQLONG)***

The value can be any of the following values:

**MQRCCF\_LISTENER\_STOPPED**

Listener not running.

## Stop Connection:

The Stop Connection (MQCMD\_STOP\_CONNECTION) command attempts to break a connection between an application and the queue manager. There might be circumstances in which the queue manager cannot implement this command.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

## Required parameters

### *ConnectionId* (MQCFBS)

Connection identifier (parameter identifier: MQBACF\_CONNECTION\_ID).

This parameter is the unique connection identifier associated with an application that is connected to the queue manager.

The length of the byte string is MQ\_CONNECTION\_ID\_LENGTH.

## Stop Service:

The Stop Service (MQCMD\_STOP\_SERVICE) command stops an existing IBM MQ service definition that is running.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
	✓	✓	✓	

## Required parameters

### *ServiceName* (MQCFST)

Service name (parameter identifier: MQCA\_SERVICE\_NAME).

This parameter is the name of the service definition to be stopped. The maximum length of the string is MQ\_OBJECT\_NAME\_LENGTH.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown on page “Error codes applicable to all commands” on page 1051.

### *Reason* (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_NO\_STOP\_CMD**

The *StopCommand* parameter of the service is blank.

#### **MQRCCF\_SERVICE\_STOPPED**

Service is not running.

## Stop SMDS Connection:

Use the Stop SMDS Connection (MQCMD\_STOP\_SMDSCONN) command to terminate the connection from this queue manager to one or more specified shared message data sets (causing them to be closed and deallocated) and to mark the connection as STOPPED.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

### Required parameters

#### *SMDSConn* (MQCFST)

Specifies the queue manager name relating to the connection between the shared message data set and the queue manager (parameter identifier: MQCACF\_CF\_SMDSCONN).

An asterisk value can be used to denote all shared message data sets associated with a specific CFSTRUCT name.

The maximum length of the string is 4 characters.

#### *CFStrucName* (MQCFST)

The name of the CF application structure with SMDS connections properties that you want to stop (parameter identifier: MQCA\_CF\_STRUC\_NAME).

The maximum length of the string is MQ\_CF\_STRUC\_NAME\_LENGTH.

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.
- an asterisk (\*). The command is executed on the local queue manager and is also passed to every active queue manager in the queue-sharing group.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Suspend Queue Manager:

The Suspend Queue Manager (MQCMD\_SUSPEND\_Q\_MGR) command renders the local queue manager unavailable for the processing of IMS or Db2 messages. Its action can be reversed by the Resume Queue Manager command (MQCMD\_RESUME\_Q\_MGR) command.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
				✓

### Required parameters

#### Facility (MQCFIN)

Facility (parameter identifier: MQIACF\_FACILITY).

The type of facility for which activity is to be suspended. The value can be:

#### MQQMFACT\_DB2

The existing connection to Db2 is terminated.

Any in-flight or subsequent MQGET or MQPUT requests are suspended and applications wait until the Db2 connection is re-established by the Resume Queue Manager command, or if the queue manager is stopped.

#### MQQMFACT\_IMS\_BRIDGE

Resumes normal IMS bridge activity.

Stops the sending of messages from IMS bridge queues to OTMA. No further messages are sent to IMS until one of these events occurs:

- OTMA is stopped and restarted
- IMS or IBM MQ is stopped or restarted
- A Resume Queue Manager command is processed

Messages returning from IMS OTMA to the queue manager are unaffected.

### Optional parameters

#### CommandScope (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE).

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

## Suspend Queue Manager Cluster:

The Suspend Queue Manager Cluster (MQCMD\_SUSPEND\_Q\_MGR\_CLUSTER) command informs other queue managers in a cluster that the local queue manager is not available for processing, and cannot be sent messages. Its action can be reversed by the Resume Queue Manager Cluster (MQCMD\_RESUME\_Q\_MGR\_CLUSTER) command.

HP Integrity NonStop Server	IBM i	UNIX and Linux	Windows	z/OS
✓	✓	✓	✓	✓

### Required parameters

#### *ClusterName* (MQCFST)

Cluster name (parameter identifier: MQCA\_CLUSTER\_NAME).

The name of the cluster for which availability is to be suspended.

The maximum length of the string is MQ\_CLUSTER\_NAME\_LENGTH.

#### *ClusterNamelist* (MQCFST)

Cluster Namelist (parameter identifier: MQCA\_CLUSTER\_NAMELIST).

The name of the namelist specifying a list of clusters for which availability is to be suspended.

### Optional parameters z/OS

#### *CommandScope* (MQCFST)

Command scope (parameter identifier: MQCACF\_COMMAND\_SCOPE). This parameter applies to z/OS only.

Specifies how the command is executed when the queue manager is a member of a queue-sharing group. You can specify one of the following:

- blank (or omit the parameter altogether). The command is executed on the queue manager on which it was entered.
- a queue manager name. The command is executed on the queue manager you specify, providing it is active within the queue sharing group. If you specify a queue manager name other than the queue manager on which it was entered, you must be using a queue-sharing group environment, and the command server must be enabled.

The maximum length is MQ\_QSG\_NAME\_LENGTH.

#### *Mode* (MQCFIN)

How the local queue manager is suspended from the cluster (parameter identifier: MQIACF\_MODE).

The value can be:

##### **MQMODE QUIESCE**

Other queue managers in the cluster are told not to send further messages to the local queue manager.

##### **MQMODE FORCE**

All inbound and outbound channels to other queue managers in the cluster are stopped forcibly.

**Note:** This parameter was previously called *Quiesce* (MQIACF QUIESCE), with values MQQO\_YES and MQQO\_NO. The old names can still be used.

## Error codes

This command might return the following error codes in the response format header, in addition to the values shown in "Error codes applicable to all commands" on page 1051.

### Reason (MQLONG)

The value can be any of the following values:

#### **MQRCCF\_CLUSTER\_NAME\_CONFLICT**

Cluster name conflict.

#### **MQRCCF\_MODE\_VALUE\_ERROR**

Mode value not valid.

## Structures for commands and responses

PCF commands and responses have a consistent structure including of a header and any number of parameter structures of defined types.

Commands and responses have the form:

- PCF header (MQCFH) structure (described in topic "MQCFH - PCF header" on page 1579 ), followed by
- Zero or more parameter structures. Each of these is one of the following:
  - PCF byte string filter parameter (MQCFBF, see topic "MQCFBF - PCF byte string filter parameter" on page 1583 )
  - PCF byte string parameter (MQCFBS, see topic "MQCFBS - PCF byte string parameter" on page 1586 )
  - PCF integer filter parameter (MQCFIF, see topic "MQCFIF - PCF integer filter parameter" on page 1588 )
  - PCF integer list parameter (MQCFIL, see topic "MQCFIL - PCF integer list parameter" on page 1591 )
  - PCF integer parameter (MQCFIN, see topic "MQCFIN - PCF integer parameter" on page 1593 )
  - PCF string filter parameter (MQCFSF, see topic "MQCFSF - PCF string filter parameter" on page 1595 )
  - PCF string list parameter (MQCFSL, see topic "MQCFSL - PCF string list parameter" on page 1599 )
  - PCF string parameter (MQCFST, see topic "MQCFST - PCF string parameter" on page 1602 )

### How the structures are shown:

The structures are described in a language-independent form.

The declarations are shown in the following programming languages:

- C
- COBOL
- PL/I
- S/390 assembler
- Visual Basic

### Data types

For each field of the structure, the data type is given in brackets after the field name. These data types are the elementary data types described in Data types used in the MQI.

## Initial values and default structures

See IBM MQ COPY, header, include, and module files for details of the supplied header files that contain the structures, constants, initial values, and default structures.

### Usage notes:

The format of the strings in the PCF message determines the settings of the character set fields in the message descriptor to enable conversion of strings within the message.

If all of the strings in a PCF message have the same coded character-set identifier, the *CodedCharSetId* field in the message descriptor MQMD should be set to that identifier when the message is put, and the *CodedCharSetId* fields in the MQCFST, MQCFSL, and MQCFSF structures within the message should be set to MQCCSI\_DEFAULT.

If the format of the PCF message is MQFMT\_ADMIN, MQFMT\_EVENT, or MQFMT\_PCF and some of the strings in the message have different character-set identifiers, the *CodedCharSetId* field in MQMD should be set to MQCCSI\_EMBEDDED when the message is put, and the *CodedCharSetId* fields in the MQCFST, MQCFSL, and MQCFSF structures within the message should all be set to the identifiers that apply.

This enables conversions of the strings within the message, to the *CodedCharSetId* value in the MQMD specified on the MQGET call, if the MQGMO\_CONVERT option is also specified.

For more information about the MQEPH structure, see MQEPH - Embedded PCF header.

**Note:** If you request conversion of the internal strings in the message, the conversion will occur only if the value of the *CodedCharSetId* field in the MQMD of the message is different from the *CodedCharSetId* field of the MQMD specified on the MQGET call.

Do not specify MQCCSI\_EMBEDDED in MQMD when the message is put, with MQCCSI\_DEFAULT in the MQCFST, MQCFSL, or MQCFSF structures within the message, as this will prevent conversion of the message.

### MQCFH - PCF header:

The MQCFH structure describes the information that is present at the start of the message data of a command message, or a response to a command message. In either case, the message descriptor *Format* field is MQFMT\_ADMIN.

The PCF structures are also used for event messages. In this case the message descriptor *Format* field is MQFMT\_EVENT.

The PCF structures can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see Message descriptor for a PCF command ). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength* and *ParameterCount* fields to the values appropriate to the data.

### Fields for MQCFH

#### Type (MQLONG)

Structure type.

This field indicates the content of the message. The following are valid for commands:

#### MQCFT\_COMMAND

Message is a command.

**MQCFT\_COMMAND\_XR**

Message is a command to which standard or extended responses might be sent.

This value is required on z/OS.

**MQCFT\_RESPONSE**

Message is a response to a command.

**MQCFT\_XR\_MSG**

Message is an extended response to a command. It contains informational or error details.

**MQCFT\_XR\_ITEM**

Message is an extended response to an Inquire command. It contains item data.

**MQCFT\_XR\_SUMMARY**

Message is an extended response to a command. It contains summary information.

**MQCFT\_USER**

User-defined PCF message.

**StrucLength (MQLONG)**

Structure length.

This field is the length in bytes of the MQCFH structure. The value must be:

**MQCFH\_STRUC\_LENGTH**

Length of command format header structure.

**Version (MQLONG)**

Structure version number.

For z/OS, the value must be:

**MQCFH\_VERSION\_3**

Version number for command format header structure.

The following constant specifies the version number of the current version:

**MQCFH\_CURRENT\_VERSION**

Current version of command format header structure.

**Command (MQLONG)**

Command identifier.

For a command message, this field identifies the function to be performed. For a response message, it identifies the command to which this field is the reply. See the description of each command for the value of this field.

**MsgSeqNumber (MQLONG)**

Message sequence number.

This field is the sequence number of the message within a set of related messages. For a command, this field must have the value one (because a command is always contained within a single message). For a response, the field has the value one for the first (or only) response to a command, and increases by one for each successive response to that command.

The last (or only) message in a set has the MQCFC\_LAST flag set in the *Control* field.

**Control (MQLONG)**

Control options.

The following are valid:

**MQCFC\_LAST**

Last message in the set.

For a command, this value must always be set.

### **MQCFC\_NOT\_LAST**

Not the last message in the set.

### **CompCode (MQLONG)**

Completion code.

This field is meaningful only for a response; its value is not significant for a command. The following are possible:

### **MQCC\_OK**

Command completed successfully.

### **MQCC\_WARNING**

Command completed with warning.

### **MQCC\_FAILED**

Command failed.

### **MQCC\_UNKNOWN**

Whether command succeeded is not known.

### **Reason (MQLONG)**

Reason code qualifying completion code.

This field is meaningful only for a response; its value is not significant for a command.

The possible reason codes that can be returned in response to a command are listed in, "Definitions of the Programmable Command Formats" on page 1044 and in the description of each command.

### **ParameterCount (MQLONG)**

Count of parameter structures.

This field is the number of parameter structures (MQCFBF, MQCFBS, MQCFIF, MQCFIL, MQCFIN, MQCFSL, MQCFSE, and MQCFST) that follow the MQCFH structure. The value of this field is zero or greater.

## **C language declaration**

### **MQCFBF - PCF byte string filter parameter:**

The MQCFBF structure describes a byte string filter parameter. The format name in the message descriptor is MQFMT\_ADMIN.

The MQCFBF structure is used in Inquire commands to provide a filter description. This filter description is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter description.

When an MQCFBF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH\_VERSION\_3 or higher.

### **Fields for MQCFBF**

#### **Type (MQLONG)**

Structure type.

This indicates that the structure is a MQCFBF structure describing a byte string filter parameter. The value must be:

#### **MQCFT\_BYTE\_STRING\_FILTER**

Structure defining a byte string filter.

#### **StrucLength (MQLONG)**

Structure length.

This is the length, in bytes, of the MQCFBF structure, including the string at the end of the structure (the *FilterValue* field). The length must be a multiple of 4, and must be sufficient to contain the string. Bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *FilterValue* field:

#### **MQCFBF\_STRUC\_LENGTH\_FIXED**

Length of fixed part of command format filter string-parameter structure.

#### **Parameter (MQLONG)**

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on.

The parameter is one of the following:

- MQBACF\_EXTERNAL\_UOW\_ID
- MQBACF\_Q\_MGR\_UOW\_ID
- MQBACF\_ORIGIN\_UOW\_ID (on z/OS only)

#### **Operator (MQLONG)**

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

**MQCFOP\_GREATER**

Greater than

**MQCFOP\_LESS**

Less than

**MQCFOP\_EQUAL**

Equal to

**MQCFOP\_NOT\_EQUAL**

Not equal to

**MQCFOP\_NOT\_LESS**

Greater than or equal to

**MQCFOP\_NOT\_GREATER**

Less than or equal to

**FilterValueLength (MQLONG)**

Length of filter-value string.

This is the length, in bytes, of the data in the *FilterValue* field. This must be zero or greater, and does not need to be a multiple of 4.

**FilterValue (MQBYTE x FilterValueLength)**

Filter value.

This specifies the filter-value that must be satisfied. Use this parameter where the response type of the filtered parameter is a byte string.

**Note:** If the specified byte string is shorter than the standard length of the parameter in MQFMT\_ADMIN command messages, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.

### C language declaration

```
typedef struct tagMQCFBF {
    MQLONG Type;           /* Structure type */
    MQLONG StructLength;  /* Structure length */
    MQLONG Parameter;     /* Parameter identifier */
    MQLONG Operator;      /* Operator identifier */
    MQLONG FilterValueLength; /* Filter value length */
    MQBYTE FilterValue[1]; /* Filter value -- first byte */
} MQCFBF;
```

### COBOL language declaration

## **MQCFBS - PCF byte string parameter:**

The MQCFBS structure describes a byte-string parameter in a PCF message. The format name in the message descriptor is MQFMT\_ADMIN.

When an MQCFBS structure is present, the *Version* field in the MQCFH structure at the start of the PCF must be MQCFH\_VERSION\_2 or greater.

In a user PCF message, the *Parameter* field has no significance, and can be used by the application for its own purposes.

The structure ends with a variable-length byte string; see the *String* field in the following section for further details.

### **Fields for MQCFBS**

#### **Type (MQLONG)**

Structure type.

This indicates that the structure is an MQCFBS structure describing byte string parameter. The value must be:

#### **MQCFT\_BYTE\_STRING**

Structure defining a byte string.

#### **StrucLength (MQLONG)**

Structure length.

This is the length in bytes of the MQCFBS structure, including the variable-length string at the end of the structure (the *String* field). The length must be a multiple of four, and must be sufficient to contain the string; any bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *String* field:

#### **MQCFBS\_STRUC\_LENGTH\_FIXED**

Length of fixed part of MQCFBS structure.

#### **Parameter (MQLONG)**

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see "MQCFH - PCF header" on page 1579 for details. In user PCF messages (MQCFT\_USER), this field has no significance.

The parameter is from the MQBACF\_\* group of parameters.

#### **StringLength (MQLONG)**

Length of string.

This is the length in bytes of the data in the *string* field; it must be zero or greater. This length does not need to be a multiple of four.

#### **String (MQBYTE x StringLength)**

String value.

This is the value of the parameter identified by the *parameter* field. The string is a byte string, and so is not subject to character-set conversion when sent between different systems.

**Note:** A null character in the string is treated as normal data, and does not act as a delimiter for the string

For MQFMT\_ADMIN messages, if the specified string is shorter than the standard length of the *parameter*, the omitted characters are assumed to be nulls. If the specified string is longer than the standard length, it is an error.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For other programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFBS in a larger structure, and declare additional fields following MQCFBS, to represent the *String* field as required.

### C language declaration

```
typedef struct tagMQCFBS {
    MQLONG  Type;          /* Structure type */
    MQLONG  StrucLength;  /* Structure length */
    MQLONG  Parameter;    /* Parameter identifier */
    MQLONG  StringLength; /* Length of string */
    MQBYTE  String[1];    /* String value - first byte */

} MQCFBS;
```

### COBOL language declaration

### MQCFIF - PCF integer filter parameter:

The MQCFIF structure describes an integer filter parameter. The format name in the message descriptor is MQFMT\_ADMIN.

The MQCFIF structure is used in Inquire commands to provide a filter condition. This filter condition is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter condition.

When an MQCFIF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH\_VERSION\_3 or higher.

### Fields for MQCFIF

#### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIF structure describing an integer filter parameter. The value must be:

#### MQCFT\_INTEGER\_FILTER

Structure defining an integer filter.

#### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIF structure. The value must be:

#### MQCFIF\_STRUC\_LENGTH

Length of command format integer-parameter structure.

#### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on. Any of the parameters which can be used in the Inquire command can be used in this field.

The parameter is from the following groups of parameters:

- MQIA\_\*
- MQIACF\_\*
- MQIAMO\_\*

- MQIACH\_\*

**Operator (MQLONG)**

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

**MQCFOP\_GREATER**

Greater than

**MQCFOP\_LESS**

Less than

**MQCFOP\_EQUAL**

Equal to

**MQCFOP\_NOT\_EQUAL**

Not equal to

**MQCFOP\_NOT\_LESS**

Greater than or equal to

**MQCFOP\_NOT\_GREATER**

Less than or equal to

**MQCFOP\_CONTAINS**

Contains a specified value. Use MQCFOP\_CONTAINS when filtering on lists of values or integers.

**MQCFOP\_EXCLUDES**

Does not contain a specified value. Use MQCFOP\_EXCLUDES when filtering on lists of values or integers.

See the *FilterValue* description for details telling you which operators can be used in which circumstances.

**FilterValue (MQLONG)**

Filter value identifier.

This specifies the filter-value that must be satisfied.

Depending on the parameter, the value and the permitted operators can be:

- An explicit integer value, if the parameter takes a single integer value.
  - You can only use the following operators:
    - MQCFOP\_GREATER
    - MQCFOP\_LESS
    - MQCFOP\_EQUAL
    - MQCFOP\_NOT\_EQUAL
    - MQCFOP\_NOT\_GREATER
    - MQCFOP\_NOT\_LESS
- An MQ constant, if the parameter takes a single value from a possible set of values (for example, the value MQCHT\_SENDER on the *ChannelType* parameter). You can only use MQCFOP\_EQUAL or MQCFOP\_NOT\_EQUAL.
- An explicit value or an MQ constant, as the case might be, if the parameter takes a list of values. You can use either MQCFOP\_CONTAINS or MQCFOP\_EXCLUDES. For example, if the value 6 is specified with the operator MQCFOP\_CONTAINS, all items where one of the parameter values is 6 are listed.

For example, if you need to filter on queues that are enabled for put operations in your Inquire Queue command, the parameter would be MQIA\_INHIBIT\_PUT and the filter-value would be MQQA\_PUT\_ALLOWED.

The filter value must be a valid value for the parameter being tested.

### C language declaration

```
typedef struct tagMQCFIF {
    MQLONG Type;          /* Structure type */
    MQLONG StrucLength;   /* Structure length */
    MQLONG Parameter;     /* Parameter identifier */

### MQCFIL - PCF integer list parameter:

The MQCFIL structure describes an integer-list parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT\_ADMIN.

The MQCFIL structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see Message descriptor for a PCF command ). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *Count*, and *Values* fields to the values appropriate to the data.

The structure ends with a variable-length array of integers; see the *Values* field in the following section for further details.

### Fields for MQCFIL

#### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIL structure describing an integer-list parameter. The value must be:

#### MQCFT\_INTEGER\_LIST

Structure defining an integer list.

#### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIL structure, including the array of integers at the end of the structure (the *Values* field). The length must be a multiple of four, and must be sufficient to contain the array; any bytes between the end of the array and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *Values* field:

#### MQCFIL\_STRUC\_LENGTH\_FIXED

Length of fixed part of command format integer-list parameter structure.

#### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with values that are contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see “MQCFH - PCF header” on page 1579 for details.

The parameter is from the following groups of parameters:

- MQIA\_\*
- MQIACF\_\*
- MQIAMO\_\*
- MQIACH\_\*

### Count (MQLONG)

Count of parameter values.

This is the number of elements in the *Values* array; it must be zero or greater.

### Values (MQLONG x Count)

Parameter values.

This is an array of values for the parameter identified by the *Parameter* field. For example, for MQIACF\_Q\_ATTRS, this field is a list of attribute selectors (MQCA\_\* and MQIA\_\* values).

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFIL in a larger structure, and declare additional fields following MQCFIL, to represent the *Values* field as required.

### C language declaration

```
typedef struct tagMQCFIL {
    MQLONG  Type;          /* Structure type */
    MQLONG  StrucLength;  /* Structure length */
    MQLONG  Parameter;    /* Parameter identifier */
    MQLONG  Count;        /* Count of parameter values */
    MQLONG  Values[1];    /* Parameter values - first element */
} MQCFIL;
```

## MQCFIN - PCF integer parameter:

The MQCFIN structure describes an integer parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT\_ADMIN.

The MQCFIN structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see Message descriptor for a PCF command ). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *Value* field to the value appropriate to the data.

## Fields for MQCFIN

### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFIN structure describing an integer parameter. The value must be:

#### MQCFT\_INTEGER

Structure defining an integer.

### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFIN structure. The value must be:

#### MQCFIN\_STRUC\_LENGTH

Length of command format integer-parameter structure.

### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see “MQCFH - PCF header” on page 1579 for details.

The parameter is from the following groups of parameters:

- MQIA\_\*
- MQIACF\_\*

- MQIAMO\_\*
- MQIACH\_\*

#### Value (MQLONG)

Parameter value.

This is the value of the parameter identified by the *Parameter* field.

#### C language declaration

```
typedef struct tagMQCFIN {
    MQLONG Type;          /* Structure type */
    MQLONG StrucLength;   /* Structure length */
    MQLONG Parameter;    /* Parameter identifier */
    MQLONG Value;        /* Parameter value */

### MQCFSF - PCF string filter parameter:

The MQCFSF structure describes a string filter parameter. The format name in the message descriptor is MQFMT\_ADMIN.

The MQCFSF structure is used in Inquire commands to provide a filter condition. This filter condition is used to filter the results of the Inquire command and return to the user only those objects that satisfy the filter condition.

The results of filtering character strings on EBCDIC-based systems might be different from those results achieved on ASCII-based systems. This difference is because comparison of character strings is based on the collating sequence of the internal built-in values representing the characters.

When an MQCFSF structure is present, the Version field in the MQCFH structure at the start of the PCF must be MQCFH\_VERSION\_3 or higher.

### Fields for MQCFSF

#### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFSF structure describing a string filter parameter. The value must be:

#### MQCFT\_STRING\_FILTER

Structure defining a string filter.

#### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFSF structure. The value must be:

#### MQCFSF\_STRUC\_LENGTH

MQCFSF\_STRUC\_LENGTH is the length, in bytes, of the MQCFSF structure, including the string at the end of the structure (the *FilterValue* field). The length must be a multiple of 4, and must be sufficient to contain the string. Bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *FilterValue* field:

#### MQCFSF\_STRUC\_LENGTH\_FIXED

Length of fixed part of command format filter string-parameter structure.

#### Parameter (MQLONG)

Parameter identifier.

This identifies the parameter that is to be filtered on. The value of this identifier depends on the parameter to be filtered on. Any of the parameters which can be used in the Inquire command can be used in this field.

The parameter is from the following groups of parameters:

- MQCA\_\*
- MQCACF\_\*
- MQCAMO\_\*

- MQCACH\_\*

**Operator (MQLONG)**

Operator identifier.

This identifies the operator that is being used to evaluate whether the parameter satisfies the filter-value.

Possible values are:

**MQCFOP\_GREATER**

Greater than

**MQCFOP\_LESS**

Less than

**MQCFOP\_EQUAL**

Equal to

**MQCFOP\_NOT\_EQUAL**

Not equal to

**MQCFOP\_NOT\_LESS**

Greater than or equal to

**MQCFOP\_NOT\_GREATER**

Less than or equal to

**MQCFOP\_LIKE**

Matches a generic string

**MQCFOP\_NOT\_LIKE**

Does not match a generic string

**MQCFOP\_CONTAINS**

Contains a specified string. Use MQCFOP\_CONTAINS when filtering on lists of strings.

**MQCFOP\_EXCLUDES**

Does not contain a specified string. Use MQCFOP\_EXCLUDES when filtering on lists of strings.

**MQCFOP\_CONTAINS\_GEN**

Contains an item which matches a generic string. Use MQCFOP\_CONTAINS\_GEN when filtering on lists of strings.

**MQCFOP\_EXCLUDES\_GEN**

Does not contain any item which matches a generic string. Use MQCFOP\_EXCLUDES\_GEN when filtering on lists of strings.

See the *FilterValue* description for details telling you which operators can be used in which circumstances.

**CodedCharSetId (MQLONG)**

Coded character set identifier.

This specifies the coded character set identifier of the data in the *FilterValue* field. The following special value can be used:

**MQCCSI\_DEFAULT**

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

### *FilterValueLength* (MQLONG)

Length of filter-value string.

This is the length, in bytes, of the data in the *FilterValue* field. This parameter must be zero or greater, and does not need to be a multiple of 4.

**Note:**  On z/OS there is a 256 character limit for the filter-value of the MQSC **WHERE** clause. This limit is not in place for other platforms.

### *FilterValue* (MQCHAR x *FilterValueLength*)

Filter value.

This specifies the filter-value that must be satisfied. Depending on the parameter, the value and the permitted operators can be:

- An explicit string value.

You can only use the following operators:

- MQCFOP\_GREATER
- MQCFOP\_LESS
- MQCFOP\_EQUAL
- MQCFOP\_NOT\_EQUAL
- MQCFOP\_NOT\_GREATER
- MQCFOP\_NOT\_LESS

- A generic string value. This field is a character string with an asterisk at the end, for example ABC\*. The operator must be either MQCFOP\_LIKE or MQCFOP\_NOT\_LIKE. The characters must be valid for the attribute you are testing. If the operator is MQCFOP\_LIKE, all items where the attribute value begins with the string (ABC in the example) are listed. If the operator is MQCFOP\_NOT\_LIKE, all items where the attribute value does not begin with the string are listed.
- If the parameter takes a list of string values, the operator can be:
  - MQCFOP\_CONTAINS
  - MQCFOP\_EXCLUDES
  - MQCFOP\_CONTAINS\_GEN
  - MQCFOP\_EXCLUDES\_GEN

An item in a list of values. The value can be explicit or generic. If it is explicit, use MQCFOP\_CONTAINS or MQCFOP\_EXCLUDES as the operator. For example, if the value DEF is specified with the operator MQCFOP\_CONTAINS, all items where one of the attribute values is DEF are listed. If it is generic, use MQCFOP\_CONTAINS\_GEN or MQCFOP\_EXCLUDES\_GEN as the operator. If ABC\* is specified with the operator MQCFOP\_CONTAINS\_GEN, all items where one of the attribute values begins with ABC are listed.

#### **Note:**

1. If the specified string is shorter than the standard length of the parameter in MQFMT\_ADMIN command messages, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
2. When the queue manager reads an MQCFSF structure in an MQFMT\_ADMIN message from the command input queue, the queue manager processes the string as though it had been specified on an MQI call. This processing means that within the string, the first null and the characters following it (up to the end of the string) are treated as blanks.
3. On z/OS there is a 256 character limit for the filter-value of the MQSC **WHERE** clause. This limit is not in place for other platforms.

The filter value must be a valid value for the parameter being tested.

### **C language declaration**

```
typedef struct tagMQCFSF {  
    MQLONG  Type;           /* Structure type */  
    MQLONG  StrucLength;    /* Structure length */  
    MQLONG  Parameter;     /* Parameter identifier */  
};
```

```

MQLONG Operator;      /* Operator identifier */
MQLONG CodedCharSetId; /* Coded character set identifier */
MQLONG FilterValueLength /* Filter value length */
MQCHAR[1] FilterValue; /* Filter value */
} MQCFSF;

```

### MQCFSL - PCF string list parameter:

The MQCFSL structure describes a string-list parameter in a message which is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT\_ADMIN.

The MQCFSL structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see Message descriptor for a PCF command ). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StrucLength*, *Count*, *StringLength*, and *Strings* fields to the values appropriate to the data.

The structure ends with a variable-length array of character strings; see the *Strings* field section for further details.

See "Usage notes" on page 1579 for further information about how to use the structure.

### Fields for MQCFSL

#### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFSL structure describing a string-list parameter. The value must be:

#### MQCFT\_STRING\_LIST

Structure defining a string list.

#### StrucLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFSL structure, including the data at the end of the structure (the *Strings* field). The length must be a multiple of four, and must be sufficient to contain all the strings; any bytes between the end of the strings and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *Strings* field:

#### MQCFSL\_STRUC\_LENGTH\_FIXED

Length of fixed part of command format string-list parameter structure.

### **Parameter (MQLONG)**

Parameter identifier.

This identifies the parameter with values that are contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see “MQCFH - PCF header” on page 1579 for details.

The parameter is from the following groups of parameters:

- MQCA\_\*
- MQCACF\_\*
- MQCAMO\_\*
- MQCACH\_\*

### **CodedCharSetId (MQLONG)**

Coded character set identifier.

This specifies the coded character set identifier of the data in the *Strings* field. The following special value can be used:

#### **MQCCSI\_DEFAULT**

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

### **Count (MQLONG)**

Count of parameter values.

This is the number of strings present in the *Strings* field; it must be zero or greater.

### **StringLength (MQLONG)**

Length of one string.

This is the length in bytes of one parameter value, that is the length of one string in the *Strings* field; all the strings are this length. The length must be zero or greater, and need not be a multiple of four.

### **Strings (MQCHAR x StringLength x Count)**

String values.

This is a set of string values for the parameter identified by the *Parameter* field. The number of strings is given by the *Count* field, and the length of each string is given by the *StringLength* field. The strings are concatenated together, with no bytes skipped between adjacent strings. The total length of the strings is the length of one string multiplied by the number of strings present (that is, *StringLength x Count*)

- In MQFMT\_ADMIN command messages, if the specified string is shorter than the standard length of the parameter, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
- In MQFMT\_ADMIN response messages, string parameters might be returned padded with blanks to the standard length of the parameter.
- In MQFMT\_EVENT messages, trailing blanks might be omitted from string parameters (that is, the string might be shorter than the standard length of the parameter).

In all cases, *StringLength* gives the length of the string present in the message.

The strings can contain any characters that are in the character set defined by *CodedCharSetId*, and that are valid for the parameter identified by *Parameter*.

**Note:** When the queue manager reads an MQCFSL structure in an MQFMT\_ADMIN message from the command input queue, the queue manager processes each string in the list as though it had been

specified on an MQI call. This processing means that within each string, the first null, and the characters following it (up to the end of the string) are treated as blanks.

In responses and all other cases, a null character in a string is treated as normal data, and does not act as a delimiter for the string. This treatment means that when a receiving application reads a MQFMT\_PCF, MQFMT\_EVENT, or MQFMT\_ADMIN message, the receiving application receives all the data specified by the sending application.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, RPG, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, you must include MQCFSL in a larger structure, and declare additional fields following MQCFSL, to represent the *Strings* field as required.

### C language declaration

```
typedef struct tagMQCFSL {
    MQLONG  Type;          /* Structure type */
    MQLONG  StrucLength;   /* Structure length */
    MQLONG  Parameter;     /* Parameter identifier */
    MQLONG  CodedCharSetId; /* Coded character set identifier */
    MQLONG  Count;         /* Count of parameter values */
    MQLONG  StringLength;  /* Length of one string */
    MQCHAR  Strings[1];    /* String values - first
                           character */
} MQCFSL;
```

### COBOL language declaration

### MQCFST - PCF string parameter:

The MQCFST structure describes a string parameter in a message that is a command or a response to a command. In either case, the format name in the message descriptor is MQFMT\_ADMIN.

The MQCFST structure can also be used for user-defined message data. In this case the message descriptor *Format* field is MQFMT\_PCF (see Message descriptor for a PCF command ). Also in this case, not all the fields in the structure are meaningful. The supplied initial values can be used for most fields, but the application must set the *StructLength*, *StringLength*, and *String* fields to the values appropriate to the data.

The structure ends with a variable-length character string; see the *String* field section for further details.

See “Usage notes” on page 1579 for further information about how to use the structure.

### Fields for MQCFST

#### Type (MQLONG)

Structure type.

This indicates that the structure is an MQCFST structure describing a string parameter. The value must be:

#### MQCFST\_STRING

Structure defining a string.

#### StructLength (MQLONG)

Structure length.

This is the length in bytes of the MQCFST structure, including the string at the end of the structure (the *String* field). The length must be a multiple of four, and must be sufficient to contain the string; any bytes between the end of the string and the length defined by the *StrucLength* field are not significant.

The following constant gives the length of the *fixed* part of the structure, that is the length excluding the *String* field:

**MQCFST\_STRUC\_LENGTH\_FIXED**

Length of fixed part of command format string-parameter structure.

**Parameter (MQLONG)**

Parameter identifier.

This identifies the parameter with a value that is contained in the structure. The values that can occur in this field depend on the value of the *Command* field in the MQCFH structure; see “MQCFH - PCF header” on page 1579 for details.

The parameter is from the following groups of parameters:

- MQCA\_\*
- MQCACF\_\*
- MQCAMO\_\*
- MQCACH\_\*

**CodedCharSetId (MQLONG)**

Coded character set identifier.

This specifies the coded character set identifier of the data in the *String* field. The following special value can be used:

**MQCCSI\_DEFAULT**

Default character set identifier.

The string data is in the character set defined by the *CodedCharSetId* field in the MQ header structure that *precedes* the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH structure is at the start of the message.

**StringLength (MQLONG)**

Length of string.

This is the length in bytes of the data in the *String* field; it must be zero or greater. This length does not need to be a multiple of four.

**String (MQCHAR x StringLength)**

String value.

This is the value of the parameter identified by the *Parameter* field:

- In MQFMT\_ADMIN command messages, if the specified string is shorter than the standard length of the parameter, the omitted characters are assumed to be blanks. If the specified string is longer than the standard length, it is an error.
- In MQFMT\_ADMIN response messages, string parameters might be returned padded with blanks to the standard length of the parameter.
- In MQFMT\_EVENT messages, trailing blanks might be omitted from string parameters (that is, the string can be shorter than the standard length of the parameter).

The value of *StringLength* depends on whether, when the specified string is shorter than the standard length, padding blanks have been added to the string. If so, the value of *StringLength* is the sum of the actual length of the string plus the padded blanks.

The string can contain any characters that are in the character set defined by *CodedCharSetId*, and that are valid for the parameter identified by *Parameter*.

**Note:** When the queue manager reads an MQCFST structure in an MQFMT\_ADMIN message from the command input queue, the queue manager processes the string as though it had been specified on an MQI call. This processing means that within the string, the first null and the characters following it (up to the end of the string) are treated as blanks.

In responses and all other cases, a null character in the string is treated as normal data, and does not act as a delimiter for the string. This treatment means that when a receiving application reads a MQFMT\_PCF, MQFMT\_EVENT, or MQFMT\_ADMIN message, the receiving application receives all the data specified by the sending application.

The way that this field is declared depends on the programming language:

- For the C programming language, the field is declared as an array with one element. Storage for the structure must be allocated dynamically, and pointers used to address the fields within it.
- For the COBOL, PL/I, and System/390 assembler programming languages, the field is omitted from the structure declaration. When an instance of the structure is declared, the user must include MQCFST in a larger structure, and declare an additional field or additional fields following MQCFST, to represent the *String* field as required.

### C language declaration

```
typedef struct tagMQCFST {
    MQLONG  Type;           /* Structure type */
    MQLONG  StrucLength;    /* Structure length */

### PCF example

The compiled program, written in C language, in the example uses IBM MQ for Windows. It inquires of the default queue manager about a subset of the attributes for all local queues defined to it. It then produces an output file, SAVEQMGR.TST, in the directory from which it was run for use with RUNMQSC.

### Inquire local queue attributes

This following section provides an example of how Programmable Command Formats can be used in a program for administration of IBM MQ queues.

The program is given as an example of using PCFs and has been limited to a simple case. This program is of most use as an example if you are considering the use of PCFs to manage your IBM MQ environment.

### Program listing

```

/*=====*/
/*
/* This is a program to inquire of the default queue manager about the
/* local queues defined to it.
/*
/* The program takes this information and appends it to a file
/* SAVEQMGR.TST which is of a format suitable for RUNMQSC. It could,
/* therefore, be used to recreate or clone a queue manager.
/*
/* It is offered as an example of using Programmable Command Formats (PCFs)
/* as a method for administering a queue manager.
/*
/*=====*/

/* Include standard libraries */

```

```

## Using the IBM MQ utilities for z/OS

Reference information about the syntax, and usage of the various IBM MQ utility programs.

### An overview of the IBM MQ utilities

Use this topic as a reference to the different categories of utilities.

This topic introduces the IBM MQ utility programs that are provided to help you perform various administrative tasks. The utility programs are described in the subsequent sections:

Table 130

Table 131 on page 1619

Table 132 on page 1619

Table 134 on page 1620

Table 135 on page 1620 summarizes what you can do with these utilities.

*Table 130. The IBM MQ CSQUTIL utility program: Managing page sets*

Purpose	Function	See topic
Format VSAM data sets as IBM MQ page sets.	FORMAT	"Formatting page sets (FORMAT)" on page 1624
Control recovery processing used for IBM MQ page sets.	FORMAT	"Formatting page sets (FORMAT)" on page 1624
Extract page set information.	PAGEINFO	"Page set information (PAGEINFO)" on page 1627
Copy IBM MQ page sets.	COPYPAGE	"Expanding a page set (COPYPAGE)" on page 1629
Copy IBM MQ page sets and reset the log information.	RESETPAGE	"Copying a page set and resetting the log (RESETPAGE)" on page 1631

Table 131. The IBM MQ CSQUTIL utility program: Issuing commands

Purpose	Function	See topic
Issue IBM MQ commands.	COMMAND	"Using the COMMAND function of CSQUTIL" on page 1633
Produce a set of DEFINE, ALTER or DELETE commands for objects.	COMMAND	Making a list of DEFINE commands
Produce a client channel definition file.	COMMAND	Making a client channel definition file
Produce a set of DEFINE commands for objects (offline).	SDEFS	"Producing a list of IBM MQ define commands (SDEFS)" on page 1639

Table 132. The IBM MQ CSQUTIL utility program: Managing queues

Purpose	Function	See topic
Copy contents of a queue to a data set.	COPY	"Copying queues into a data set while the queue manager is running (COPY)" on page 1642
Copy contents of a queue to a data set (offline).	SCOPY	"Copying queues into a data set while the queue manager is not running (SCOPY)" on page 1644
Delete contents of a queue.	EMPTY	"Emptying a queue of all messages (EMPTY)" on page 1648
Restore contents of a queue.	LOAD	"Restoring messages from a data set to a queue (LOAD)" on page 1649

Table 133. The IBM MQ CSQUTIL utility program: Migrating CSQXPARM

Purpose	Function	See topic
Produce an ALTER QMGR command from a channel initiator parameter module.	XPARM	"Migrating a channel initiator parameter module (XPARM)" on page 1654

Table 134. The IBM MQ CSQJU003 Change log inventory utility

Purpose	Function	See topic
Add active or archive log data sets.	NEWLOG	"Adding information about a data set to the BSDS (NEWLOG)" on page 1658
Delete active or archive log data sets.	DELETE	"Deleting information about a data set from the BSDS (DELETE)" on page 1661
Supply passwords for archive logs.	ARCHIVE	"Supplying a password for archive log data sets (ARCHIVE)" on page 1661
Control the next restart of the queue manager.	CRESTART	"Controlling the next restart (CRESTART)" on page 1662
Set checkpoint records.	CHECKPT	"Setting checkpoint records (CHECKPT)" on page 1663
Update the highest written log RBA.	HIGHRBA	"Updating the highest written log RBA (HIGHRBA)" on page 1664

Table 135. The remaining IBM MQ utilities

Name	Purpose	See topic
CSQJU004 (Print log map utility)	List information about the log.	"The print log map utility (CSQJU004)" on page 1665
CSQ1LOGP (Log print utility)	Print the log. Extract log records into sequential files.	"The log print utility (CSQ1LOGP)" on page 1666
CSQ5PQSG ( IBM MQ table update utility)	Add and remove queue-sharing group and queue manager entries in the IBM MQ tables held in the shared Db2 data-sharing group.	"The queue-sharing group utility (CSQ5PQSG)" on page 1676
CSQJUFMT (Active log preformat utility)	Preformat log data sets Preformat Shared Message Data Sets (SMDS)	"The active log preformat utility (CSQJUFMT)" on page 1680
CSQUDLQH (Dead-letter queue handler utility)	Process messages on the dead-letter queue.	"The dead-letter queue handler utility (CSQUDLQH)" on page 1681
CSQUCVX (Data conversion exit utility)	Generate data conversion exit routines.	Writing a data-conversion exit program for IBM MQ for z/OS

These utilities are located in the thlqual.SCSQAUTH or thlqual.SCSQLOAD IBM MQ load libraries. Concatenate the appropriate IBM MQ language load library thlqual.SCSQANLx (where x is the language letter) in the STEPLIB with the thlqual.SCSQAUTH and thlqual.SCSQLOAD. The utility control statements are available only in U.S. English. In some cases, the Db2 library db2qual.SDSNLOAD is also needed.

## Syntax diagrams

The syntax for a command and its options is presented in the form of a syntax diagram called a railroad diagram.

Railroad diagrams are a visual format suitable for sighted users; see, “How to read railroad diagrams” on page 176. It tells you what options you can supply with the command, how to enter them, indicates relationships between different options, and sometimes different values of an option.

## IBM MQ utility program (CSQUTIL)

The CSQUTIL utility program is provided with IBM MQ to help you to perform backup, restoration, and reorganization tasks, and to issue IBM MQ commands.

Through this utility program, you can invoke functions in these groups:

### Page set management

These functions enable you to manage IBM MQ page sets. You can format data sets as page sets, change the recovery processing performed against page sets, extract page set information, increase the size of page sets and reset the log information contained in a page set. The page set must not belong to a queue manager that is currently running.

### Command management

These functions enable you to:

- Issue commands to IBM MQ
- Produce a list of DEFINE, ALTER, or DELETE commands for your IBM MQ objects

### Queue management

These functions enable you to back up and restore queues and page sets, copy queues and page sets to another queue manager, reset your queue manager, or to migrate from one queue manager to another.

Specifically, you can:

- Copy messages from a queue to a data set
- Delete messages from a queue
- Restore previously copied messages to their appropriate queues

The scope of these functions can be either:

- A *queue*, in which case the function operates on all messages in the specified queue.
- A *page set*, in which case the function operates on all the messages, in all the queues, on the specified page set.

Use these functions only for your own queues; do not use them for system queues (those with names beginning SYSTEM).

All the page set management functions, and some of the other functions, operate while the queue manager is not running, so you do not need any special authorization other than the appropriate access to the page set data sets. For the functions that operate while the queue manager is running, CSQUTIL runs as an ordinary z/OS batch IBM MQ program, issuing commands through the command server, and using the IBM MQ API to access queues.

You need the necessary authority to use the command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.\*), to use the IBM MQ DISPLAY commands, and to use the IBM MQ API to access any queues that you want to manage. See the usage notes for each function for more information.

**Attention:** If you use CSQUTIL to define a channel, and the connection name contains two parts (the host name and port number) you must enclose the host name and port number within single quotation marks to maintain the limit on the number of permissible parameters. Similarly, if your connection name consists of an IP address and port number, you must enclose these parameters within single quotation marks.

### Invoking the IBM MQ utility program:

Use this topic to understand how to invoke CSQUTIL, the format of its parameters, and its return codes.

The CSQUTIL utility program runs as a z/OS batch program, below the 16 MB storage line. Specify the resources that the utility is to work with in the PARM parameter of the EXEC statement of the JCL.

```
// EXEC PGM=CSQUTIL,PARM=
```

Figure 11. How to invoke the CSQUTIL utility program

where PARM= expands to:

- PARM parameters
- Return codes

### PARM parameters

#### QMGRname

Specifies the 1- to 4-character name of the queue manager or queue-sharing group to which CSQUTIL is to connect.

If you specify the name of a queue-sharing group, CSQUTIL connects to any queue manager in that group

#### QSGname

Specifies the 1- to 4-character name of the queue-sharing group from which CSQUTIL is to extract definitions.

#### DSGname

Specifies the 8-character name of the Db2 data-sharing group from which CSQUTIL is to extract definitions.

#### DB2ssid

Specifies the 4-character name, or group attach name, of the Db2 database subsystem to which CSQUTIL is to attach for stand-alone functions.

### Which PARM parameters do you need?

Figure 11 shows that you can specify one of four options on the PARM statement. The option you specify depends on the function you need to implement, as follows:

- Use PARM= (or omit it all together) if you are using only offline functions, and not QSGDISP(GROUP) or QSGDISP(SHARED).
- Use PARM=' QMGRname ' only if you intend to use functions that require the queue manager to be running, such as COPY and COMMAND.
- Use PARM=' QSGname,DSGname,DB2ssid ' if you intend to use the SDEFS function with either QSGDISP(GROUP) or QSGDISP(SHARED) specified. This is because CSQUTIL requires access to Db2 to perform the SDEFS function in this situation.
- Use PARM=' QMGRname,QSGname,DSGname,DB2ssid ' if you intend to combine the previous two functions in one CSQUTIL job.

If you specify a queue manager name as blanks, CSQUTIL uses the name of the default queue manager specified for z/OS batch programs in CSQBDEFV. The utility then uses this queue manager for the whole job step. When the utility connects to the queue manager, the authorization of the "signed-on user name" is checked to see which functions the invocation is allowed to use.

You specify the functions required by statements in the SYSIN data set according to these rules:

- The data set must have a record length of 80.
- Only columns 1 through 72 are significant. Columns 73 through 80 are ignored.
- Records with an asterisk ( \*) in column 1 are interpreted as comments and are ignored.
- Blank records are ignored.
- Each statement must start on a new line.
- A trailing - means continue from column 1 of the next record.
- A trailing + means continue from the first non-blank column of the next record.
- The keywords of statements are not case-sensitive. However, some arguments, such as queue name, are case sensitive.

The utility statements refer to the default or explicitly named DDnames for input and output. Your job can use the COPY and LOAD functions repeatedly and process different page sets or queues during a single run of the utility.

All output messages are sent to the SYSPRINT data set, which must have a record format of VBA and a record length of 125.

While running, CSQUTIL uses temporary dynamic queues with names of the form SYSTEM.CSQUTIL.\*

## Return codes

When you are using the COMMAND verb to issue MQSC commands, you must use FAILURE(CONTINUE) so any failure in the commands that are issued give a non-zero return code. The default is FAILURE(IGNORE) and the return code from the command is always zero.

When CSQUTIL returns to the operating system, the return code can be:

- |           |  |
|-----------|--|
| <b>0</b>  | All functions completed successfully.  |
| <b>4</b>  | Some functions completed successfully, some did not, or forced a sync point.                               |
| <b>8</b>  | All the attempted functions failed.  |
| <b>12</b> | No functions attempted; there was a syntax error in the statements or the expected data sets were missing. |

In most cases, if a function fails or is forced to take a sync point, no further functions are attempted. In this case, the message CSQU147I replaces the normal completion message CSQU148I.

See the usage notes for each function for more information about success or failure.

## Syncpoints

The queue management functions used when the queue manager is running operate within a syncpoint so that, if a function fails, its effects can be backed out. The queue manager attribute, MAXUMSGS, specifies the maximum number of messages that a task can get or put within a single unit of recovery.

MAXUMSGS should normally be set to a low value, both to protect against looping applications, and because there might be a very large processor cost in committing many messages.

The utility forcibly takes sync points as required and issues the warning message CSQU087I. If the function later fails, the changes already committed are not backed out. Do not just rerun the job to correct the problem or you might get duplicate messages on your queues. Instead, use the current depth of the queue to work out, from the utility output, which messages have not been backed out. Then determine the most appropriate course of action. For example, if the function is LOAD, you can empty the queue and start again, or you can choose to accept duplicate messages on the queues.

To avoid such difficulties if the function fails, but at the risk of incurring a large processor cost, set MAXUMSGS to be greater than:

- The number of messages in the queue, if you are working with a single queue.
- The number of messages in the longest queue in the page set, if you are working with an entire page set.

Use the DISPLAY QSTATUS command to find out the value of the CURDEPTH attribute, which is the current depth of the queue. To find out the value of MAXUMSGS, use the DISPLAY QMGR MAXUMSGS command.

### Monitoring the progress of the IBM MQ utility program:

You can monitor the progress of the CSQUTIL program by monitoring statements output to SYSPRINT.

To record the progress of CSQUTIL, every SYSIN statement is echoed to SYSPRINT.

The utility first checks the syntax of the statements in the SYSIN. The requested functions are started only if all the statements are syntactically correct.

Messages giving a commentary on the progress of each function are sent to SYSPRINT. When the processing of the utility is complete, statistics are printed with an indication of how the functions completed.

### Formatting page sets (FORMAT):

You can use the CSQUTIL program to format page sets.

Use the FORMAT function to format page sets on all data sets specified by DDnames CSQP0000 through CSQP0099. In this way, you can format up to 100 page sets in a single invocation of the utility program. Use the FORCE keyword to reuse existing data sets.

You can also use the FORMAT function to change the recovery processing that is performed against page sets when the queue manager starts, using the TYPE keyword. This can assist in changing or recovering page sets, or reintroducing page sets that have been offline or suspended.

In summary:

- to reinstate a page set with no data, use FORMAT with the TYPE(NEW) option
- to reinstate a page set with old data, use FORMAT with the TYPE(REPLACE) option

- to reinstate a page set with old data made up-to-date, do not use FORMAT but start the queue manager with a backed-up copy of the page set

Page sets have identifiers (PSIDs, in the range 00 through 99) which are established by the DDnames used for the data sets in the queue manager started task procedure; DDname CSQP00nn specifies the page set with identifier nn. The DDnames you use for the FORMAT function do not have to correspond to those used in the queue manager started task procedure, and do not therefore have any significance regarding page set identifiers.

### Page set management (FORMAT)

- Keywords and parameters
- Example
- Usage notes

### Keywords and parameters

#### FORCE

Specifies that existing data sets are to be reused without having to delete and redefine them first. You must define any page sets you want to reuse with the REUSE attribute in the AMS DEFINE CLUSTER statement. For more information about DEFINE CLUSTER, see the *DFSMS/MVS Access Method Services for VSAM* or the *DFSMS/MVS Access Method Services for the Integrated Catalog Facility* manual.

The FORCE keyword is not valid if TYPE(REPLACE) is specified.

#### PAGES (nnn)

Specifies the minimum number of pages to format in each page set. This enables a data set that spans more than one volume to be formatted.

Formatting of the data set is always done in whole space allocations, as specified as primary or secondary quantities when the data set is defined. The number of space allocations formatted is the minimum necessary to provide the requested number of pages; if there is insufficient data set space available, as many extents as can be obtained are formatted. If an existing page set is being reused (with the FORCE keyword), the whole page set is formatted, if that is larger.

The number of pages must be in the range 1 through 16 777 213 (because the maximum page set size is 64 GB (gigabytes)). The default is 1.

The PAGES keyword is not valid if TYPE(REPLACE) is specified.

#### TYPE

Specifies the type of recovery processing that is performed against queue manager page sets. Values are:

#### RECOVER

Use RECOVER for a data set that is to be a new page set for a queue manager (that is, to have a PSID which was never been used before).

This is the default.

The data set is formatted, and any messages or other data are erased. If a DDname is added to the queue manager's started task procedure for the new PSID that specifies this data set, it will be recognized as a new page set when the queue manager is restarted.

If such a data set was used as a page set with a PSID that has been used before, on restart the queue manager attempts to recover all queues and their messages that use storage classes that reference the page set from the time the page set was first used. This may make restart a lengthy process, and is unlikely to be what is wanted.

## NEW

Use NEW for a data set that is to be a page set with a PSID that has been used before for a queue manager and with data that can be discarded, to restart a failed queue manager quickly or to reintroduce the page set after it has been offline or suspended.

The data set is formatted, and any messages or other data are erased. When the queue manager is restarted, with a DDname for the old PSID that specifies this data set, it does not recover the page set but treats it as if it has been newly added to the queue manager, and any historical information about it is discarded. All queues that use storage classes referencing this page set are cleared of all messages, in a similar fashion to the way that nonpersistent messages are cleared during restart processing. This means that there will be no effect on restart time.

## REPLACE

Use REPLACE for a data set with a PSID that has been used before for a queue manager and with data that is known to be consistent and up to date, to reintroduce the page set after being offline or suspended.

The data set is not formatted, and any messages or other data are preserved. When the queue manager is restarted with a DDname for the PSID that specifies this data set, it does not recover the page set but treats it as if it has never been offline, or suspended, and any historical information about it is retained. All queues that use storage classes that reference the page set keep their messages. This means that there will be no effect on restart time.

This option will only be successful if the page set is in a consistent state; that is, on its last use the queue manager was terminated normally by a STOP QMGR MODE(FORCE) or MODE(QUIESCE) command.

## Example

Figure 12 illustrates how the FORMAT command is invoked from CSQUTIL. In this example, two page sets, referenced by CSQP0000 and CSQP0003, are formatted by CSQUTIL.

```
//FORMAT EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//CSQP0000 DD DISP=OLD,DSN=pageset.dsname0
//CSQP0003 DD DISP=OLD,DSN=pageset.dsname3
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
FORMAT
/*
```

Figure 12. Sample JCL for the FORMAT function of CSQUTIL

Figure 13 on page 1627 illustrates how the FORMAT command with the TYPE option is invoked from CSQUTIL. In this example, the page set referenced by CSQP0003 is formatted by CSQUTIL.

```

//FORMAT EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqual.SCSQANLE
// DD DISP=SHR,DSN=thlqual.SCSQAUTH
//CSQP0003 DD DISP=OLD,DSN=page set.dsname3
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
FORMAT TYPE(RECOVER)
/*

```

Figure 13. Sample JCL for the **FORMAT** function of **CSQUTIL** with the **TYPE** option

### Usage notes

1. You cannot format page sets that belong to a queue manager that is still running.
2. When you use **FORMAT**, it is not necessary to specify a queue manager name.
3. If you use **TYPE(REPLACE)**, recovery logs starting from when the page set was first used with the queue manager, or from when the page set was last formatted, must be available.
4. If you use data set names in which the queue manager name is a high-level qualifier, you can more easily identify which page sets are used by which queue manager, if more than one queue manager is defined.
5. Any update to a resource due to the resolution of an incomplete unit of work, where the update relates to a page on a page set that has been formatted with **TYPE(REPLACE)** or **TYPE(NEW)**, is not honored. The update to the resource is lost.
6. If there is an error when formatting a page set, it does not prevent other page sets from being formatted, although the **FORMAT** function is considered to have failed.
7. Failure of this function does not prevent other **CSQUTIL** functions being attempted.

### Page set information (PAGEINFO):

Use the **PAGEINFO** function to extract page set information from one or more page sets, specified by **DDnames** in the range **CSQP0000** through **CSQP0099**, for the source data sets from which page set information is required.

### Page set management (PAGEINFO)

▶▶—PAGEINFO—◀◀

### Keywords and parameters

There are no keywords or parameters.

### Example

In Figure 14 on page 1628, page set information is required from two existing page sets.

```

//PAGEINFO EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqual.SCSQANLE
// DD DISP=SHR,DSN=thlqual.SCSQAUTH
//CSQP0001 DD DISP=OLD,DSN=page set.existing.name1
//CSQP0006 DD DISP=OLD,DSN=page set.existing.name6
//SYSPRINT DD SYSOUT=*
//SYSIN DD
* Extract page set information for 2 existing page sets (CSQS0001 and CSQS0006)
PAGEINFO
/*

```

Figure 14. Sample JCL showing the use of the PAGEINFO function

where:

#### **CSQP0001, CSQP0006**

Are the DDnames of the source data sets from which you want to extract page set information.

Information returned from PAGEINFO might include:

- Page set number
- Number of pages in a page set
- Queue manager associated with a page set
- Utility status information
- Page set recovery RBA for each page set
- System recovery RBA for all the page sets reported on by the PAGEINFO function

#### **Usage notes**

1. You cannot use PAGEINFO on the page sets of a queue manager that is running.
2. Failure of this function does not prevent other CSQUTIL functions from being attempted.
3. If you attempt to use the PAGEINFO function after the queue manager has terminated abnormally, the page sets might not have been closed properly. If a page set has not been closed properly, you cannot successfully run the PAGEINFO function against it. To avoid this problem, run the AMS VERIFY command before using the PAGEINFO function. The AMS VERIFY command might produce error messages. However, it does close the page sets properly so that the PAGEINFO function can complete successfully.

For more information about the AMS VERIFY command, see the *DFSMS/MVS™ Access Method Services for VSAM* or the *DFSMS/MVS Access Method Services for the Integrated Catalog Facility* manual.

4. The system recovery RBA relates only to those page sets processed; it does not relate to the whole queue manager unless all the page sets for the queue manager are included. If the page sets are from more than one queue manager, no system recovery RBA can be determined.

## Expanding a page set (COPYPAGE):

Use the COPYPAGE function to copy one or more page sets to a larger page set.

**Note:** The COPYPAGE function is only used for *expanding* page sets. It is not used for making backup copies of page sets. If you want to do this, use AMS REPRO as described in How to back up and recover page sets. When you have used the COPYPAGE function, the page sets cannot be used by a queue manager with a different name, so do not rename your queue manager.

Use the COPYPAGE function to copy one or more page sets to a larger page set. All queues and messages on the page set are copied. If you copy page set zero, all the IBM MQ object definitions are also copied. Each page set is copied to a destination data set that must be formatted as a page set. Copying to a smaller page set is not supported.

If you use this function, you must modify the page set definition in the started task procedure to reflect the change of the name of the data set on which the new page set resides.

To use the COPYPAGE function, define DDnames in the range CSQS0000 through CSQS0099 for the source data sets, and define DDnames for the target data sets from CSQT0000 through CSQT0099.

For more information, see Managing page sets.

## Page set management (COPYPAGE)

►►—COPYPAGE—◄◄

### Keywords and parameters

There are no keywords or parameters.

### Example

In Sample JCL showing the use of the COPYPAGE function, two existing page sets are copied onto two new page sets. The procedure for this is:

1. Set up the required DDnames, where:

**CSQP0005, CSQP0006**

Identify the destination data sets. These DDnames are used by the FORMAT function.

**CSQS0005, CSQS0006**

Identify the source data sets containing the two page sets you want to copy.

**CSQT0005, CSQT0006**

Identify the destination data sets (page sets), but this time for the COPYPAGE function.

2. Format the destination data sets, referenced by DDnames CSQP0005 and CSQP0006, as page sets using the FORMAT function.
3. Copy the two existing page sets onto the new page sets using the COPYPAGE function.

```

//JOB LIB DD DISP=SHR,DSN=ANTZ.MQ.&VER..&LVL..OUT.SCSQANLE
// DD DISP=SHR,DSN=ANTZ.MQ.&VER..&LVL..OUT.SCSQAUTH
//*
//S1 EXEC PGM=IDCAMS
//* Delete any prior attempt, then allocate a new larger pageset
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
DELETE 'VICY.MQ38.PAGE01.NEW' CLUSTER
DEFINE CLUSTER (NAME('VICY.MQ38.PAGE01.NEW') +
MODEL('VICY.MQ38.PAGE01') +
DATACLASS(EXTENDED) +
LINEAR CYLINDERS(100,50))
//*
//MQMUTIL EXEC PGM=CSQUTIL,PARM='',REGION=4M
//* CSQUTIL
//* FORMAT acts on DDNAME like CSQPnnnn
//* optional, FORMAT PAGES(nnn) to force allocation and format of
//* secondary extents.
//* COPYPAGE copies from source, CSQSnnnn
//* to target, CSQTnnnn
//SYSPRINT DD SYSOUT=*
//CSQP0001 DD DISP=SHR,DSN=VICY.MQ38.PAGE01.NEW
//CSQS0001 DD DISP=SHR,DSN=VICY.MQ38.PAGE01
//CSQT0001 DD DISP=SHR,DSN=VICY.MQ38.PAGE01.NEW
//SYSIN DD * FORMAT COPYPAGE
//*
//RENAME EXEC PGM=IDCAMS
//* the cluster and data components must be renamed independently
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
ALTER 'VICY.MQ38.PAGE01' NEWNAME('VICY.MQ38.PAGE01.OLD')
ALTER 'VICY.MQ38.PAGE01.DATA' +
NEWNAME('VICY.MQ38.PAGE01.OLD.DATA')
ALTER 'VICY.MQ38.PAGE01.NEW' +
NEWNAME('VICY.MQ38.PAGE01')
ALTER 'VICY.MQ38.PAGE01.NEW.DATA' +
NEWNAME('VICY.MQ38.PAGE01.DATA')
/*

```

Figure 15. Sample JCL showing the use of the COPYPAGE function

### Usage notes

1. You cannot use COPYPAGE on page sets of a queue manager that is running.
2. Using COPYPAGE involves stopping the queue manager. This results in the loss of nonpersistent messages.
3. Before you use COPYPAGE, the new data sets must be preformatted as page sets. To do this, use the FORMAT function, as shown in Figure 15.
4. Ensure that the new (destination) data sets are larger than the old (source) data sets.
5. You cannot change the page set identifier (PSID) associated with a page set. For example, you cannot 'make' page set 03 become page set 05.
6. Failure of this function does not prevent other CSQUTIL functions from being attempted.
7. If you attempt to use the COPYPAGE function after the queue manager has terminated abnormally, the page sets might not have been closed properly. If a page set has not been closed properly, you cannot successfully run the COPYPAGE function against it.

To avoid this problem, run the AMS VERIFY command before using the COPYPAGE function. The AMS VERIFY command might produce error messages. However, it does close the page sets properly, so that the COPYPAGE function can complete successfully.

For more information about the AMS VERIFY command, see the *DFSMS/MVS Access Method Services for VSAM* or the *DFSMS/MVS Access Method Services for the Integrated Catalog Facility* manual.

## Copying a page set and resetting the log (RESETPAGE):

The RESETPAGE function is like the COPYPAGE function except that it also resets the log information in the new page sets.

RESETPAGE lets you restart the queue manager from a known, valid set of page sets, even if the corresponding log data sets have been corrupted.

The source page sets for RESETPAGE must be in a consistent state. They must be either:

- Page sets that have been through a successful queue manager shutdown using the IBM MQ command STOP QMGR.
- Copies of page sets that have been through a successful stop.

The RESETPAGE function must not be run against copies of page sets made using fuzzy backup (see Method 2: Fuzzy backup ), or against page sets that are from a queue manager that has terminated abnormally.

RESETPAGE either:

- Copies page sets on all data sets referenced by DDnames CSQS0000 through CSQS0099 to new data sets referenced by DDnames CSQT0000 through CSQT0099. If you use this function, modify the page set definition in the started task procedure to reflect the change of the name of the data set on which the new page set resides.
- Resets the log information in the page set referenced by DDnames CSQP0000 through CSQP0099.

For more information, see Managing page sets.

### Using the RESETPAGE function

You can use the RESETPAGE function to update a set of consistent page sets so that they can be used with a set of new (clean) BSDS and log data sets to start the queue manager. You only have to use the RESETPAGE function if both copies of the log have been lost or damaged; you can restart from backup copies of page sets (and accept the resulting loss of data from the time the copies were made), or from your existing page sets.

In this situation, use the RESETPAGE function on **all** the page sets of the affected queue manager. You must also create new BSDS and log data sets.

**Note:** Do not use the RESETPAGE function on a subset of the page sets known to IBM MQ.

If you run the RESETPAGE function against any page sets, but do not provide clean BSDS and log data sets for the queue manager, IBM MQ attempts to recover the logs from RBA zero, and treats the page sets as empty. For example, the following messages are produced if you attempt to use the RESETPAGE function to generate page sets zero, 1, 2, and 3 without providing a clean set of BSDS and log data sets:

```
CSQI021I +CSQ1 CSQIECUR PAGE SET 0 IS EMPTY. MEDIA RECOVERY STARTED
CSQI021I +CSQ1 CSQIECUR PAGE SET 1 IS EMPTY. MEDIA RECOVERY STARTED
CSQI021I +CSQ1 CSQIECUR PAGE SET 2 IS EMPTY. MEDIA RECOVERY STARTED
CSQI021I +CSQ1 CSQIECUR PAGE SET 3 IS EMPTY. MEDIA RECOVERY STARTED
```

## Page set management (RESETPAGE)

### Keywords and parameters

#### FORCE

Specifies that the page sets specified by DDnames CSQP0000 through CSQP00nn are to be reset in place.

If FORCE is not specified, the page sets specified by DDnames CSQS0000 through CSQS00nn are copied to new page sets specified by DDnames CSQT0000 through CSQT00nn. This is the default.

### Example

An existing page set, referenced by DDname CSQS0007, is copied to a new data set referenced by DDname CSQT0007. The new data set, which is also referenced by DDname CSQP0007, is already formatted as a page set before the RESETPAGE function is called.

```
//RESTPAGE EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//CSQP0007 DD DISP=OLD,DSN=pageset.newname7
//CSQS0007 DD DISP=OLD,DSN=pageset.oldname7
//CSQT0007 DD DISP=OLD,DSN=pageset.newname7
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
* Format new data set, CSQP0007, as page set
FORMAT
* Copy page set CSQS0007 to CSQT0007 and reset it
RESETPAGE
/*
```

Figure 16. Sample JCL showing the use of the RESETPAGE function

### Usage notes

1. Do not use the RESETPAGE function against page sets after the queue manager has terminated abnormally. Page sets from a queue manager that terminated abnormally will probably contain inconsistent data; using RESETPAGE on page sets in this state leads to data integrity problems.
2. You cannot use RESETPAGE on page sets belonging to a queue manager that is running.
3. Before you use RESETPAGE, the new data sets must be pre-formatted as page sets. To do this, use the FORMAT function, as shown in Figure 16.
4. Ensure that the new (destination) data sets are larger than the old (source) data sets.
5. You cannot change the page set identifier (PSID) associated with a page set. For example, you cannot 'make' page set 03 become page set 05.
6. Failure of this function does not prevent other CSQUTIL functions from being attempted.

## Using the COMMAND function of CSQUTIL:

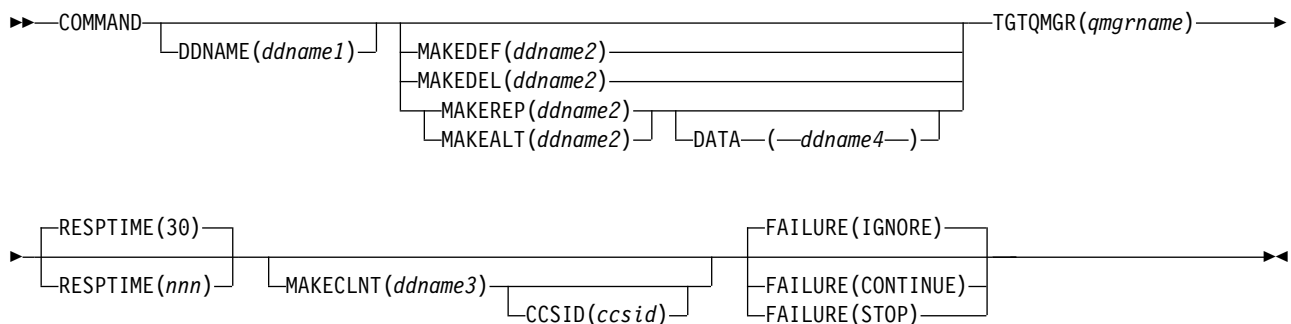

You can use the COMMAND function of CSQUTIL to direct commands to the queue manager.

Use the COMMAND function to:

1. Pass commands from an input data set to the queue manager.
2. Produce a list of DEFINE commands that describe the objects in a queue manager. The commands can be used to keep a record of the object definitions or to regenerate all or part of a queue manager's objects as part of a migration from one queue manager to another.
3. Produce a list of commands to change or delete a set of objects in a queue manager.
4. Make a client channel definition file.

The queue manager specified in the PARM parameter of the EXEC statement must be running.

### Command management (COMMAND)

- Keywords and parameters
- Examples
- Usage notes for CSQUTIL COMMAND

If you use **FAILURE (IGNORE)** the job step always obtains return code 0.

If you use **FAILURE (STOP)** or **FAILURE (CONTINUE)** the job step obtains return code 8 if there were any non zero return codes from the statements.

You should use **FAILURE (STOP)** or **FAILURE (CONTINUE)** to report any errors in the definitions.

### Keywords and parameters

#### DDNAME (ddname1)

Specifies that the commands are to be read from a named input data set. If this keyword is omitted, the default DDname, CSQUCMD, is used.

*ddname1* specifies the DDname that identifies the input data set from which commands are to be read.

#### MAKEDEF (ddname2), MAKEDEL (ddname2), MAKEREP (ddname2), MAKEALT (ddname2)

Specify that commands are to be generated from any DISPLAY object commands in the input data set.

The commands that are generated are:

#### MAKEDEF

DEFINE NOREPLACE, with all the attributes and values returned by the DISPLAY commands. For the queue manager object, an ALTER command is generated with all the attributes and values. For channel authentication records, a SET command is generated.

Both CSQUTIL SDEFS and the CSQUTIL COMMAND with the MAKEDEF option can be used to produce a set of MQSC commands to recreate the objects currently defined in the queue manager.

The difference between the two is that CSQUTIL COMMAND must be run against an active queue manager and is most appropriate for regular backup of object definitions, whereas CSQUTIL SDEFS can be used to recreate definitions for a queue manager that is not currently running. This makes the CSQUTIL SDEFS option more appropriate for recovery scenarios.

#### **MAKEDEL**

DELETE. For local queues, NOPURGE is used. For channel authentication records, a SET command with ACTION(REMOVE) is used

#### **MAKEREP**

DEFINE REPLACE, with any keywords and values from the data set specified by the DATA keyword. For channel authentication records, a SET command with ACTION(REPLACE) is used.

#### **MAKEALT**

ALTER, with any keywords and values from the data set specified by the DATA keyword. For channel authentication records, a SET command with ACTION(REPLACE) is used.

Only one of these keywords may be specified. If these keywords are omitted, no commands are generated.

*ddname2* specifies the DDname that identifies the output data set in which the DEFINE, DELETE or ALTER commands are to be stored. The data set should be RECFM=FB, LRECL=80. This data set can then be used as input for a later invocation of the COMMAND function or it can be incorporated into the initialization data sets CSQINP1 and CSQINP2.

#### **DATA( *ddname4* )**

*ddname4* specifies a data set from which command keywords and values are to be read, and appended to each command generated for MAKEREP or MAKEALT.

#### **TGTQMGR(*qmgrname*)**

Specifies the name of the queue manager where you want the commands to be performed. You can specify a target queue manager that is not the one you connect to. In this case, you would normally specify the name of a remote queue manager object that provides a queue manager alias definition (the name is used as the *ObjectQMGrName* when opening the command input queue). To do this, you must have suitable queues and channels set up to access the remote queue manager.

The default is that commands are performed on the queue manager to which you are connected, as specified in the PARM field of the EXEC statement.

#### **RESPTIME(*nnn*)**

Specifies the time in seconds to wait for a response to each command, in the range 5 through 999.

The default is 30 seconds.

#### **MAKECLNT(*ddname3*)**

Specifies that a client channel definition file is generated from any DISPLAY CHANNEL commands in the input data set that return information about client-connection channels, and any DISPLAY AUTHINFO commands that return information about authentication information objects for which the LDAPUSER and LDAPPWD attributes are not set.

If this keyword is omitted, no file is generated.

**Important:** The MAKECLNT utility is now stabilized at the IBM WebSphere MQ Version 7.1 level. You should use the **runmqsc** command using the **-n** option; see “runmqsc” on page 273 for further information.

*ddname3* specifies the DDname that identifies the output data set in which the generated file is to be stored; the data set should be RECFM=U, LRECL=6144. The file can then be downloaded as binary data to the client machine by a suitable file transfer program.

## CCSID(*ccsid*)

Specifies the coded character set identifier (CCSID) that is to be used for the data in a client channel definition file. The value must be in the range 1 through 65535; the default is 437. You can only specify CCSID if you also specify MAKECLNT.

**Note:** IBM MQ assumes that the data is to be in ASCII, and that the encoding for numeric data is to be MQENC\_INTEGER\_REVERSED.

## FAILURE

Specifies what action to take if an IBM MQ command that is issued fails to execute successfully. Values are:

### IGNORE

Ignore the failure; continue reading and issuing commands, and treat the COMMAND function as being successful. This is the default.

### CONTINUE

Read and issue any remaining commands in the input data set, but treat the COMMAND function as being unsuccessful.

**STOP** Do not read or issue any more commands, and treat the COMMAND function as being unsuccessful.

## Examples

This section gives examples of using the COMMAND function for the following:

- “Issuing commands”
- “Making a list of DEFINE commands”
- “Making a list of ALTER commands” on page 1636
- “Making a client channel definition file” on page 1637

## Issuing commands

In Figure 17, the data sets referenced by DDnames CSQUCMD and OTHER contain sets of commands. The first COMMAND statement takes commands from the default input data set MY.COMMANDS(COMMAND1) and passes them to the queue manager. The second COMMAND statement takes commands from the input data set MY.COMMANDS(OTHER1), which is referenced by DDname OTHER, and passes them to the queue manager.

```
//COMMAND EXEC PGM=CSQUTIL,PARM='CSQ1'  
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE  
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH  
//CSQUCMD DD DSN=MY.COMMANDS(COMMAND1),DISP=SHR  
//OTHER DD DSN=MY.COMMANDS(OTHER1),DISP=SHR  
//SYSPRINT DD SYSOUT=*  
//SYSIN DD *  
* THE NEXT STATEMENT CAUSES COMMANDS TO BE READ FROM CSQUCMD DDNAME  
COMMAND  
* THE NEXT SET OF COMMANDS WILL COME FROM 'OTHER' DDNAME  
COMMAND DDNAME(OTHER)  
* THE NEXT STATEMENT CAUSES COMMANDS TO BE READ FROM CSQUCMD  
* DDNAME AND ISSUED ON QUEUE MANAGER CSQ2 WITH A RESPONSE TIME  
* OF 10 SECONDS  
COMMAND TGTQMGR(CSQ2) RESPTIME(10)  
/*
```

Figure 17. Sample JCL for issuing IBM MQ commands using CSQUTIL

## Making a list of DEFINE commands

In Figure 18, the data set referenced by DDname CMDINP contains a set of DISPLAY commands. These DISPLAY commands specify generic names for each object type (except the queue manager itself). If you run these commands, a list is produced containing all the IBM MQ objects. In these DISPLAY commands, the ALL keyword is specified to ensure that all the attributes of all the objects are included in the list, and that all queue-sharing group dispositions are included.

The MAKEDEF keyword causes this list to be converted into a corresponding set of DEFINE NOREPLACE commands (ALTER for the queue manager). These commands are put into a data set referenced by the *ddname2* parameter of the MAKEDEF keyword, that is, OUTPUT1. If you run this set of commands, IBM MQ regenerates all the object definitions in the queue manager.

```
//QDEFS EXEC PGM=CSQUTIL,PARM='CSQ1'
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUT1 DD DISP=OLD,DSN=MY.COMMANDS(DEFS)
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
COMMAND DDNAME(CMDINP) MAKEDEF(OUTPUT1)
/*
//CMDINP DD *
DISPLAY STGCLASS(*) ALL QSGDISP(QMGR)
DISPLAY STGCLASS(*) ALL QSGDISP(GROUP)
DISPLAY CFSTRUCT(*) ALL

DISPLAY QUEUE(*) ALL QSGDISP(QMGR)
DISPLAY QUEUE(*) ALL QSGDISP(GROUP)
DISPLAY QUEUE(*) ALL QSGDISP(SHARED)
DISPLAY TOPIC(*) ALL QSGDISP(QMGR)
DISPLAY TOPIC(*) ALL QSGDISP(GROUP)
DISPLAY NAMELIST(*) ALL QSGDISP(QMGR)
DISPLAY NAMELIST(*) ALL QSGDISP(GROUP)
DISPLAY PROCESS(*) ALL QSGDISP(QMGR)
DISPLAY PROCESS(*) ALL QSGDISP(GROUP)
DISPLAY CHANNEL(*) ALL QSGDISP(QMGR)
DISPLAY CHANNEL(*) ALL QSGDISP(GROUP)
DISPLAY AUTHINFO(*) ALL QSGDISP(QMGR)
DISPLAY AUTHINFO(*) ALL QSGDISP(GROUP)
DISPLAY CHLAUTH('*') ALL
DIS SUB(*) SUBTYPE(ADMIN) ALL DISTYPE(DEFINED)

DISPLAY QMGR ALL

/*
```

Figure 18. Sample JCL for using the MAKEDEF option of the COMMAND function

### Making a list of ALTER commands

In Figure 19 on page 1637, the data set referenced by DDname CMDINP contains a DISPLAY command that will produce a list of all local queues with names beginning "ABC".

The MAKEALT keyword causes this list to be converted into a corresponding set of ALTER commands, each of which includes the data from the data set referenced by DDname CMDALT. These commands are put into a data set referenced by the *ddname2* parameter of the MAKEALT keyword, that is, OUTPUTA. If you run this set of commands, all the local queues with names beginning "ABC" will be disabled for PUT and GET.

```

//QALTS EXEC PGM=CSQUTIL,PARM='CSQ1 '
//STEPLIB DD DISP=SHR,DSN=th1qua1.SCSQANLE
//          DD DISP=SHR,DSN=th1qua1.SCSQAUTH
//OUTPUTA DD DISP=OLD,DSN=MY.COMMANDS(ALTS)
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
COMMAND DDNAME(CMDINP) MAKEALT(OUTPUTA) DATA(CMDALT)
/*
//CMDINP DD *
DISPLAY QLOCAL(ABC*)
/*
//CMDALT DD *
PUT(DISABLED) +
GET(DISABLED)
/*

```

Figure 19. Sample JCL for using the MAKEALT option of the COMMAND function

### Making a client channel definition file

In Figure 20, the data set referenced by DDname CMDCHL contains a DISPLAY CHANNEL command and a DISPLAY AUTHINFO command. The DISPLAY commands specify a generic name and the ALL keyword is specified to ensure that all the attributes are included.

The MAKECLNT keyword converts these attributes into a corresponding set of client channel definitions. These are put into a data set referenced by the *ddname3* parameter of the MAKECLNT keyword, that is, OUTCLNT, which is ready to be downloaded to the client machine.

```

//CLIENT EXEC PGM=CSQUTIL,PARM='CSQ1'
//STEPLIB DD DISP=SHR,DSN=th1qua1.SCSQANLE
//          DD DISP=SHR,DSN=th1qua1.SCSQAUTH
//OUTCLNT DD DISP=OLD,DSN=MY.CLIENTS
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
COMMAND DDNAME(CMDCHL) MAKECLNT(OUTCLNT)
/*
//CMDCHL DD *
DISPLAY CHANNEL(*) ALL TYPE(CLNTCONN)
DISPLAY AUTHINFO(*) ALL
/*

```

Figure 20. Sample JCL for using the MAKECLNT option of the COMMAND function

### Usage notes for CSQUTIL COMMAND

1. The rules for specifying commands in the input data set are the same as for the initialization data sets:
  - The data set must have a record length of 80.
  - Only columns 1 through 72 are significant. Columns 73 through 80 are ignored.
  - Records with an asterisk (\*) in column 1 are interpreted as comments and are ignored.
  - Blank records are ignored.
  - Each command must start on a new record.
  - A trailing - means continue from column 1 of the next record.
  - A trailing + means continue from the first non-blank column of the next record.
  - The maximum number of characters permitted in a command is 32 762.

With the additional rule:

- A semicolon (;) can be used to terminate a command; the remaining data in the record is ignored.

See “Building command scripts” on page 341 for more information about the rules for building IBM MQ commands.

2. If you specify the MAKEDEF keyword:

- In the input data set, the DISPLAY commands for objects must contain the ALL parameter so that the complete definition of each object is produced. See Figure 18 on page 1636.
- To obtain a complete definition, you must DISPLAY the following:
  - queues
  - topic
  - namelists
  - process definitions
  - channels
  - storage classes
  - authentication information objects
  - CF structures
  - channel authentication records
  - queue manager

**Note:** DEFINE commands are not generated for any local queues that can be identified as dynamic, or for channels that were defined automatically.

- Do not specify the same MAKEDEF data set for more than one COMMAND function, unless its DD statement specifies a sequential data set with DISP=MOD.

3. If you specify the MAKEREP, MAKEALT, or MAKEDEL keywords:

- In the input data set, include DISPLAY commands that select the set of objects for which you want to generate commands.
- For MAKEREP and MAKEALT, the data (if any) from the data set specified by the DATA keyword is appended to each generated command, exactly as entered. The format of the data set and the rules for specifying command data are the same as for the command input data set. Because the same data is appended to each command, if you want to process several sets of objects, you will need to use several separate COMMAND functions, each with a different DATA data set.
- Commands are not generated for channels that were defined automatically.

4. If you specify the MAKEDEF, MAKEREP, MAKEALT, or MAKEDEL keywords, commands are generated only for objects reported by the target queue manager (as specified by the TGTQMGR keyword or defaulted), even if CMDSCOPE is used in the DISPLAY commands. To generate commands for several queue managers in a queue-sharing group, use a separate COMMAND function for each.

In a queue-sharing group, queues, processes, channels, storage classes and authentication information objects should each have two DISPLAY commands, one with QSGDISP(QMGR) and one with QSGDISP(GROUP). Queues should have a third with QSGDISP(SHARED). It is not necessary to specify QSGDISP(COPY) because the required commands will be generated automatically when the commands for objects with QSGDISP(GROUP) are issued.

5. Do not specify the same MAKEDEF, MAKEREP, MAKEALT, or MAKEDEL data set for more than one COMMAND function, unless its DD statement specifies a sequential data set with DISP=MOD.
6. If you specify the MAKECLNT keyword:
- In the input data set, the display commands for channels and authentication information objects must contain the ALL parameter so that the complete definition of each channel and authentication information object is produced.
  - If the DISPLAY commands return information for a particular channel more than once, only the last set of information is used.
  - Do not specify the same client definition file data set for more than one COMMAND function, unless its DD statement specifies a sequential data set with DISP=MOD.

7. The results of DISPLAY commands used in conjunction with MAKEDEF, MAKEREP, MAKEALT, MAKEDEL or MAKECLNT are also sent to SYSPRINT.
8. If you specify the FAILURE keyword, a command is determined to be a success or failure according to the codes returned in message CSQN205I. If the return code is 00000000 and the reason code is 00000000 or 00000004, it is a success; for all other values it is a failure.
9. The COMMAND function is determined to be a success only if both:
  - All the commands in the input data set are read and issued and get a response from IBM MQ, regardless of whether the response indicates successful execution of the command or not.
  - Every command issued executes successfully, if FAILURE(CONTINUE) or FAILURE(STOP) is specified.

If COMMAND fails, no further CSQUTIL functions are attempted.

10. You need the necessary authority to use command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.\*) and to use the IBM MQ commands that you want to issue.

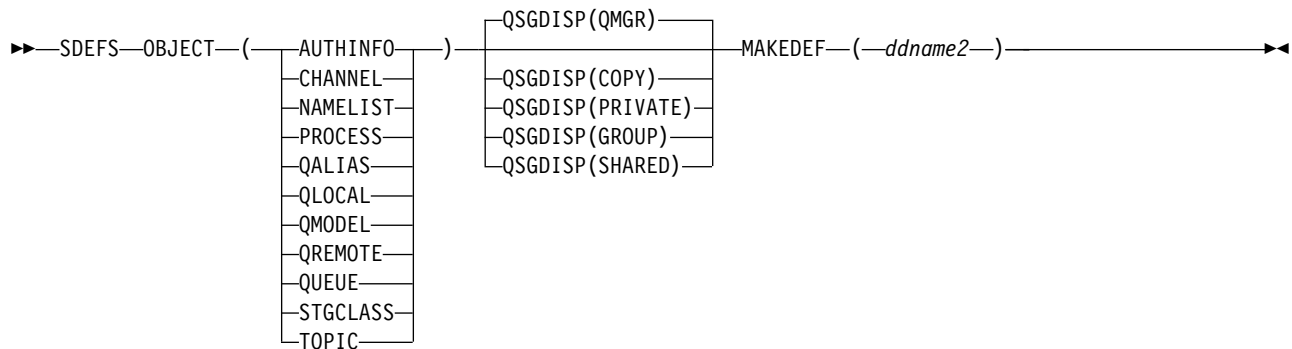

### Producing a list of IBM MQ define commands (SDEFS):

You can use the SDEFS function of CSQUTIL to produce a list of DEFINE commands describing the objects in your queue manager or queue-sharing group.

Both CSQUTIL SDEFS and the CSQUTIL COMMAND with the MAKEDEF option can be used to produce a set of MQSC commands to recreate the objects currently defined in the queue manager.

The difference between the two is that CSQUTIL COMMAND must be run against an active queue manager and is most appropriate for regular backup of object definitions, whereas CSQUTIL SDEFS can be used to recreate definitions for a queue manager that is not currently running. This makes the CSQUTIL SDEFS option more appropriate for recovery scenarios.

### Command management (SDEFS)

- Keywords and parameters
- Examples
- Usage notes

### Keywords and parameters

#### OBJECT

Specifies the type of object to be listed.

A value of QUEUE lists queues of all types, as if you had specified QALIAS, QLOCAL, QMODEL and QREMOTE.

## QSGDISP

Specifies from where the object definition information is obtained. Depending on how the object has been defined, this information is either:

- On the page set zero referred to by the CSQP0000 DD statement, or
- In a Db2 shared repository.

Permitted values are shown in Table 136.

Table 136. SDEFS QSGDISP parameters and their actions

QSGDISP parameter	What the SDEFS utility does
QMGR	Creates DEFINE statements for the specified object type from definitions held on the page set zero referred to by the CSQP0000 DD statement. (1)  Only objects defined with QSGDISP(QMGR) are included.
COPY	Creates DEFINE statements for the specified object type from definitions held on the page set zero referred to by the CSQP0000 DD statement. (1)  Only objects defined with QSGDISP(COPY) are included.
PRIVATE	Creates DEFINE statements for the specified object type from definitions held on the page set zero referred to by the CSQP0000 DD statement. (1)  Both QSGDISP(QMGR) and QSGDISP(COPY) objects are included.
GROUP	Creates DEFINE statements for the specified object type from definitions held on Db2 resource definition tables for the specified queue-sharing group.  Only objects defined with QSGDISP(GROUP) are included.  No CSQP0000 DD statement is required; the Db2 subsystem specified at object definition is accessed. The Db2 library db2qual.SDSNLOAD is required.
SHARED	Creates DEFINE statements for all local queues defined with QSGDISP(SHARED) by accessing the Db2 resource definition table for the specified queue-sharing group.  This parameter is permitted only with OBJECT(QLOCAL) or OBJECT(QQUEUE).  No CSQP0000 DD statement is required; the Db2 subsystem specified at object definition is accessed. The Db2 library db2qual.SDSNLOAD is required.

### Notes:

1. Because only page set zero is accessed, you must ensure that the queue manager is not running.

## MAKEDEF ( ddname2 )

Specifies that define commands generated for the object are to be placed in the output data set identified by the DDname. The data set should be RECFM=FB, LRECL=80. This data set can then be used as input for a later invocation of the COMMAND function or it can be incorporated into the initialization data sets CSQINP1 and CSQINP2.

The commands generated are DEFINE NOREPLACE, with all the attributes and values for the object.

**Note:** DEFINE commands are not generated for any local queues that can be identified as dynamic, or for channels that were defined automatically.

## Examples

```

//SDEFS EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//CSQP0000 DD DISP=OLD,DSN=pageset.dsname0

Figure 23. Sample JCL for the SDEFS function of CSQUTIL, when recovering all objects from a valid page set zero

## Usage notes

1. For local definitions, do not use SDEFS for a queue manager that is running because results will be unpredictable. You can avoid doing this accidentally by using DISP=OLD in the CSQP0000 DD statement. For shared or group queue definitions, this does not matter because the information is derived from Db2.
2. When you use SDEFS for local queues you do not need to specify a queue manager name. However, for shared and group queue definitions, a queue manager name is required to access Db2.
3. To use the SDEFS function more than once in a job, specify different DDnames and data sets for each invocation of the function, or specify a sequential data set and DISP=MOD in the DD statements.
4. If the SDEFS function fails, no further CSQUTIL functions are attempted.

## Related information:

IBM MQ utility program (CSQUTIL)

The CSQUTIL utility program is provided with IBM MQ to help you to perform backup, restoration, and reorganization tasks, and to issue IBM MQ commands.

## Copying queues into a data set while the queue manager is running (COPY):

You can use the COPY function of CSQUTIL to copy queued messages to a sequential data set while the queue manager is running, without destroying any messages in the original queues.

The scope of the COPY function is determined by the keyword that you specify in the first parameter. You can either copy all the messages from a named queue, or all the messages from all the queues on a named page set.

Use the complementary function, LOAD, to restore the messages to their appropriate queues.

## Note:

1. If you want to copy the object definitions from the named page set, use COPYPAGE.
2. If you want to copy messages to a data set when the queue manager is stopped, use SCOPY.
3. See Syncpoints for information about how to avoid problems with duplicate messages if this function fails.

## Queue management (COPY)

►► COPY | Object Selection | DDname Selection |

### Object Selection

### DDname Selection

- Keywords and parameters
- Example
- Usage notes
- Syncpoints

## Keywords and parameters

### QUEUE(*q-name*)

Specifies that messages in the named queue are to be copied. The keyword QUEUE can be abbreviated to Q.

*q-name* specifies the name of the queue to be copied. This name is case-sensitive.

### PSID(*psid-number*)

Specifies that all the messages in all the queues in the specified page set are to be copied.

*psid-number* is the page set identifier, which specifies the page set to be used. This identifier is a two-digit integer (whole number) representing a single page set.

### DEFTYPE

Specifies whether to copy dynamic queues:

**ALL** Copy all queues; this is the default.

### PREDEFINED

Do not include dynamic queues; this is the same set of queues that are selected by the COMMAND and SDEFS functions with the MAKEDEF parameter.

### DDNAME(*ddname*)

Specifies that the messages are to be copied to a named data set. If this keyword is omitted, the default DDname, CSQUOUT, is used. The keyword DDname can be abbreviated to DD.

*ddname* specifies the DDname of the destination data set, which is used to store the messages. The record format of this data set must be variable block spanned (VBS).

## Example

```
//COPY EXEC PGM=CSQUTIL,PARM='CSQ1',REGION=0M
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUTA DD DSN=SAMPLE.UTILITY.COPYA,DISP=(NEW,CATLG),
// SPACE=(CYL,(5,1),RLSE),UNIT=SYSDA,
// DCB=(RECFM=VBS,BLKSIZE=23200)
//CSQUOUT DD DSN=SAMPLE.UTILITY.COPY3,DISP=(NEW,CATLG),
// SPACE=(CYL,(5,1),RLSE),UNIT=SYSDA,
// DCB=(RECFM=VBS,BLKSIZE=23200)
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
* COPY WHOLE PAGE SET TO 'CSQUOUT'
COPY PSID(03)
* COPY ONE QUEUE TO 'OUTPUT'
COPY QUEUE(ABC123A) DDNAME(OUTPUTA)
/*
```

Figure 24. Sample JCL for the CSQUTIL COPY functions. The sample shows two instances of the COPY function—one COPY to the default DDNAME, CSQUOUT; the other to DDNAME OUTPUTA, which overrides CSQUOUT.

## Usage notes

1. The queues involved must not be in use when the function is started.
2. If you want to operate on a range of page sets, repeat the COPY function for each page set.
3. The function operates only on local queues.
4. A COPY PSID function is considered successful only if it successfully copies all the queues on the page set.
5. If you try to copy an empty queue (either explicitly by COPY QUEUE or because there are one or more empty queues on a page set that you are copying), data indicating this is written to the

sequential data set, and the copy is considered to be a success. However, if you attempt to copy a nonexistent queue, or a page set containing no queues, the COPY function fails, and no data is written to the data set.

6. If COPY fails, no further CSQUTIL functions are attempted.
7. To use the COPY function more than once in the job, specify different DDnames and data sets for each invocation of the function, or specify a sequential data set and DISP=MOD in the DD statements.
8. You need the necessary authority to use the command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.\*), to use the DISPLAY QUEUE and DISPLAY STGCLASS MQSC commands, and to open the queues that you want to copy with the MQOO\_INPUT\_EXCLUSIVE and MQOO\_BROWSE options.
9. For the **REGION** parameter, a value of 0M means that the job is allowed to have the amount of storage it needs. However, if a job tries to acquire too much storage, it might impact other jobs in the system. You must ideally look to limit the REGION size and specify an absolute maximum value that the job is allowed to acquire.

### Copying queues into a data set while the queue manager is not running (SCOPY):

You can use the SCOPY function of CSQUTIL to copy queued messages to a sequential data set when the queue manager is not running, without destroying any messages in the original queues.

The scope of the SCOPY function is determined by the keyword that you specify in the first parameter. You can either copy all the messages from a named queue, or all the messages from all the queues on a named page set.

Use the complementary function, LOAD, to restore the messages to their queues.

To use the SCOPY function, DDname CSQP0000 must specify the data set with page set zero for the subsystem required.

**Note:** The SCOPY function does not operate on shared queues.

### Queue Management (SCOPY)

#### Object Selection

#### DDname Selection

- Keywords and parameters
- Example
- Usage notes

## Keywords and parameters

### **QUEUE** (*q-name*)

Specifies that messages in the named queue are to be copied. The keyword QUEUE can be abbreviated to Q.

*q-name* specifies the name of the queue to be copied. This name is case-sensitive.

DDname CSQP00 *nn* must specify the data set with page set *nn* for the subsystem required, where *nn* is the number of the page set where the queue resides.

### **PSID** (*psid-number*)

Specifies that all the messages in all the queues in the specified page set are to be copied.

*psid-number* is the page set identifier, which specifies the page set to be used. This identifier is a two-digit integer (whole number) representing a single page set.

DDname CSQP00 *psid-number* must specify the data set with the required page set for the subsystem required.

### **DEFTYPE**

Specifies whether to copy dynamic queues:

**ALL** Copy all queues; this is the default.

#### **PREDEFINED**

Do not include dynamic queues; this is the same set of queues that are selected by the COMMAND and SDEFS functions with the MAKEDEF parameter.

This parameter is only valid if you specify PSID.

### **DDNAME** (*ddname*)

Specifies that the messages are to be copied to a named data set. If this keyword is omitted, the default DDname, CSQUOUT, is used. The keyword DDname can be abbreviated to DD.

*ddname* specifies the DDname of the destination data set, which is used to store the messages. The record format of this data set must be variable block spanned (VBS).

Do not specify the same DDname on more than one SCOPY statement, unless its DD statement specifies a sequential data set with DISP=MOD.

## Example

```
//SCOPY EXEC PGM=CSQUTIL,REGION=0M
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUTA DD DSN=SAMPLE.UTILITY.COPYA,DISP=(NEW,CATLG),
// SPACE=(CYL,(5,1),RLSE),UNIT=SYSDA,
// DCB=(RECFM=VBS,BLKSIZE=23200)
//CSQUOUT DD DSN=SAMPLE.UTILITY.COPY3,DISP=(NEW,CATLG),
// SPACE=(CYL,(5,1),RLSE),UNIT=SYSDA,
// DCB=(RECFM=VBS,BLKSIZE=23200)
//CSQP0000 DD DISP=OLD,DSN=pageset.dsname0
//CSQP0003 DD DISP=OLD,DSN=pageset.dsname3
//CSQP0006 DD DISP=OLD,DSN=pageset.dsname6
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
* COPY WHOLE PAGE SET TO 'CSQUOUT'
SCOPY PSID(03)
* COPY ONE QUEUE TO 'OUTPUT' - QUEUE IS ON PAGE SET 6
SCOPY QUEUE(ABC123A) DDNAME(OUTPUTA)
/*
```

Figure 25. Sample JCL for the CSQUTIL SCOPY functions. The sample shows two instances of the SCOPY function; one SCOPY to the default DDNAME, CSQUOUT; the other to DDNAME OUTPUTA, which overrides CSQUOUT.

## Usage notes

1. Do not use SCOPY for a queue manager that is running because results are unpredictable. You can avoid doing this accidentally by using DISP=OLD in the page set DD statement.
2. When you use SCOPY, you do not need to specify a queue manager name.
3. If you want to operate on a range of page sets, repeat the SCOPY function for each page set.
4. The function operates only on local queues and only for persistent messages.
5. A SCOPY PSID function is considered successful only if it successfully copies all the queues on the page set that have messages; empty queues are ignored. If the page set has no queues with messages, the SCOPY function fails, and no data is written to the data set.
6. If you try to copy an empty queue explicitly by SCOPY QUEUE, data indicating this is written to the sequential data set, and the copy is considered to be a success. However, if you attempt to copy a nonexistent queue, the SCOPY function fails, and no data is written to the data set.
7. If the SCOPY function fails, no further CSQUTIL functions are attempted.
8. To use the SCOPY function more than once in the job, specify different DDnames and data sets for each invocation of the function, or specify a sequential data set and DISP=MOD in the DD statements.
9. For the **REGION** parameter, a value of 0M means that the job is allowed to have the amount of storage it needs. However, if a job tries to acquire too much storage, it might impact other jobs in the system. You must ideally look to limit the REGION size and specify an absolute maximum value that the job is allowed to acquire.

## Analyzing the queue data copied to a data set by COPY or SCOPY using ANALYZE:

Use this topic to understand analyzing the queue data copied to a data set by COPY or SCOPY.

This function reads and analyzes a data set (created using COPY or SCOPY), and for each queue, displays:

- queue name
- number of messages for the queue
- total length of the messages

### Data analysis (ANALYZE)

▶▶—ANALYZE—| DDname Selection |—————▶▶

### DDname Selection

|—————|  
| DDNAME—(—ddname—)|

- “Keywords and parameters”
- “Example”
- “Usage notes”

### Keywords and parameters

#### DDNAME(ddname)

Specifies the data set to be processed. This keyword can be abbreviated to DD.

ddname specifies the DDname that identifies the destination data set of a prior COPY or SCOPY operation. This name is not case sensitive, and can be up to eight characters long.

### Example

```
//LOAD EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUTA DD DSN=MY.UTILITY.OUTPUTA,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
ANALYZE DDNAME(OUTPUTA)
```

Figure 26. Sample JCL for the CSQUTIL ANALYZE function

### Usage notes

1. If you omit DDname(ddname) the default DDname, CSQUINP, is used.

## Emptying a queue of all messages (EMPTY):

You can use the EMPTY function of CSQUTIL to delete all messages from a named queue or all the queues on a page set.

The queue manager must be running. The scope of the function is determined by the keyword that you specify in the first parameter.

Use this function with care. Only delete messages of which copies have already been made.

**Note:** See “Syncpoints” on page 1624 for information about how to avoid problems with duplicate messages if this function fails.

### Queue management (EMPTY)

►►—EMPTY—| Object Selection |—————►►

#### Object Selection

|—QUEUE—(—*q-name*—)|  
|—PSID—(—*psid-number*—)|

- Keywords and parameters
- Example
- Usage notes

#### Keywords and parameters

You must specify the scope of the EMPTY function. Choose one of these:

##### QUEUE(*q-name*)

Specifies that messages are to be deleted from a named queue. This keyword can be abbreviated to Q.

*q-name* specifies the name of the queue from which messages are to be deleted. This name is case sensitive.

##### PSID(*psid-number*)

Specifies that all the messages are to be deleted from all queues in the named page set.

*psid-number* specifies the page-set identifier. This identifier is a two-digit integer (whole number) representing a single page set.

#### Example

```
//EMPTY EXEC PGM=CSQUTIL,PARM=('CSQ1')
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
EMPTY QUEUE(SPARE)
EMPTY PSID(66)
/*
```

Figure 27. Sample JCL for the CSQUTIL EMPTY function

### Usage notes

1. The queues involved must not be in use when the function is invoked.
2. This function operates only on local queues.
3. If you want to operate on a range of page sets, repeat the EMPTY function for each page set.
4. You cannot empty the system-command input queue (SYSTEM.COMMAND.INPUT).
5. An EMPTY PSID function is considered successful only if it successfully empties all the queues on the page set.
6. If you empty a queue that is already empty (either explicitly by EMPTY QUEUE or because there are one or more empty queues on a page set that you are emptying), the EMPTY function is considered to be a success. However, if you attempt to empty a nonexistent queue, or a page set containing no queues, the EMPTY function fails.
7. If EMPTY fails or is forced to take a syncpoint, no further CSQUTIL functions are attempted.
8. You need the necessary authority to use the command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.\*), to use the DISPLAY QUEUE and DISPLAY STGCLASS MQSC commands, and to use the IBM MQ API to get messages from the queues that you want to empty.

### Related concepts:

“Invoking the IBM MQ utility program” on page 1622

Use this topic to understand how to invoke CSQUTIL, the format of its parameters, and its return codes.

### Restoring messages from a data set to a queue (LOAD):

The LOAD function of CSQUTIL is complementary to the COPY or SCOPY function. LOAD restores messages from the destination data set of an earlier COPY or SCOPY operation. The queue manager must be running.

The data set can contain messages from one queue only if it was created by COPY or SCOPY QUEUE, or from a number of queues if it was created by COPY PSID or several successive COPY or SCOPY QUEUE operations. Messages are restored to queues with the same name as those from which they were copied. You can specify that the first or only queue is loaded to a queue with a different name. (This would normally be used with a data set created with a single COPY queue operation to restore the messages to a queue with a different name.)

**Note:** See “Syncpoints” on page 1624 for information about how to avoid problems with duplicate messages if this function fails.

Messages are restored to queues with the same name as those from which they were copied. You can specify that the first or only queue is loaded to a queue with a different name using the **QUEUE** parameter. (This would normally be used with a data set created with a single COPY queue operation to restore the messages to a queue with a different name.) For a data set containing multiple queues, the first queue to be processed can be specified using the **FROMQUEUE** parameter. Messages are restored to this queue and all subsequent queues in the data set.

## Queue management (LOAD)

### Object Selection

### DDname Selection

### Record Selection

- Keywords and parameters
- Example
- Usage notes

### Keywords and parameters

#### QUEUE(*q-name*)

This parameter specifies that the messages from the first or only queue on the destination data set of a prior COPY or SCOPY operation are loaded to a named queue. Messages from any subsequent queues are loaded to queues with the same names as those they came from. The keyword QUEUE can be abbreviated to Q.

*q-name* specifies the name of the queue to which the messages are to be loaded. This name is case sensitive. It must not be a model queue.

#### FROMQUEUE(*q\_name*)

Specifies the name of the first queue to process on the destination data set of a prior COPY or SCOPY operation. Messages from this queue and any subsequent queues on the data set are loaded to queues with the same names as those that they came from. If this parameter is removed, the LOAD function starts with the first queue on the data set and processes all queues. The keyword FROMQUEUE can be abbreviated to FROMQ.

#### DDNAME(*ddname*)

Specifies that messages are loaded from a named data set. This keyword can be abbreviated to DD.

*ddname* specifies the **DDNAME** that identifies the destination data set of a prior COPY or SCOPY operation, from which the messages are to be loaded. This name is not case sensitive, and can be up to 8 characters long.

If you omit **DDNAME** (*ddname*) the default **DDNAME**, CSQUINP, is used.

#### SKIPMSGS(*n*)

Specifies that the first *n* messages in the sequential data set are to be skipped before commencing the load of the queue.

If you omit SKIPMSGS(*n*) no messages are skipped; the load starts at the first message.

## MSGCOUNT( *m* )

Specifies that only *m* messages are read from the data set and loaded to the queue.

If you omit MSGCOUNT( *m* ) the number of messages read is unlimited.

### Example

```
//LOAD EXEC PGM=CSQUTIL,PARM=('CSQ1'),REGION=0M
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//OUTPUTA DD DSN=MY.UTILITY.OUTPUTA,DISP=SHR
//CSQUINP DD DSN=MY.UTILITY.COPYA,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
LOAD QUEUE(ABC123) DDNAME(OUTPUTA)
LOAD QUEUE(TOQ) FROMQUEUE(QUEUEA) SKIPMSGS(55)
/*
```

Figure 28. Sample JCL for the CSQUTIL LOAD function

### Note:

REGION - A value of 0M means that the job is allowed to have the amount of storage it needs. However, if a job tries to acquire too much storage, it might impact other jobs in the system. You must ideally look to limit the REGION size and specify an absolute maximum value that the job is allowed to acquire.

LOAD QUEUE(ABC123) DDNAME(OUTPUTA) - Reloads all queues from the input data set MY.UTILITY.OUTPUTA. The names of the queues loaded are the same as the queue names from which the data was copied, apart from the first queue on the dataset which is reloaded to queue ABC123.

LOAD QUEUE(TOQ) FROMQUEUE(QUEUEA) SKIPMSGS(55) - Reloads all queues from the input data set MY.UTILITY.COPYA, starting from queue QUEUEA. The names of the queues loaded are the same as the queue names from which the data was copied, apart from the first queue QUEUEA, which is reloaded to queue TOQ. In processing the messages in QUEUEA, the first 55 messages are ignored, and loading starts from the 56th message.

### Usage notes

1. To use the LOAD function, the queues or page sets involved must not be in use when the function is invoked.
2. If the data set contains multiple queues, the LOAD function is considered successful only if it successfully loads all the queues on the data set. (or all those following the starting queue specified with FROMQUEUE, if this is set).
3. If LOAD fails, or is forced to take a syncpoint, no further CSQUTIL functions are attempted.
4. CSQUTIL uses MQPMO\_SET\_ALL\_CONTEXT to ensure that the message descriptor fields remain the same as the original copy. It therefore needs an access of CONTROL in the CONTEXT profile of the queue. For full details, see Profiles for context security.

## Restoring messages from a data set to a queue (SLOAD):

The SLOAD function of CSQUTIL is complementary to the COPY or SCOPY function. SLOAD restores messages from the destination data set of an earlier COPY or SCOPY operation. SLOAD processes a single queue.

To use SLOAD the queue manager must be running.

If the data set was created by COPY or SCOPY QUEUE it contains messages from one queue only. If the data set was created by COPY PSID or several successive COPY or SCOPY QUEUE operations, it might contain messages from a number of queues.

By default, SLOAD processes the first queue on the data set. You can specify a particular queue to process using the **FROMQUEUE** parameter.

By default, messages are restored to a queue with the same name as the one from which it was copied. You can specify that the queue is loaded to a queue with a different name using the **QUEUE** parameter.

**Note:** See “Syncpoints” on page 1624 for information about how to avoid problems with duplicate messages if this function fails.

### Queue management (SLOAD)

- “Keywords and parameters”
- “Example” on page 1653
- “Usage notes” on page 1653

#### Keywords and parameters

##### QUEUE (*q-name*)

This parameter specifies that the messages from the first or only queue on the destination data set of a prior COPY or SCOPY operation are to be loaded to a named queue. The keyword QUEUE can be abbreviated to Q.

*q-name* specifies the name of the queue to which the messages are to be loaded. This name is case sensitive. It must not be a model queue.

**FROMQUEUE** (*q-name*)

Specifies the name of the queue to process. If this parameter is omitted, the first queue is processed.

The keyword FROMQUEUE can be abbreviated to FROMQ.

*q-name* specifies the name of the queue to be processed. This name is case sensitive.

**DDNAME** (*ddname*)

Specifies that messages are to be loaded from a named data set. This keyword can be abbreviated to DD.

*ddname* specifies the **DDNAME** that identifies the destination data set of a prior COPY or SCOPY operation, from which the messages are to be loaded. This name is not case sensitive, and can be up to 8 characters long.

If you omit **DDNAME** (*ddname*) the default **DDNAME**, CSQUINP, is used.

**SKIPMSGS** (*n*)

Specifies that the first *n* messages in the sequential data set are to be skipped before commencing the load of the queue.

If you omit SKIPMSGS(*n*) no messages are skipped; the load starts at the first message.

**MSGCOUNT** (*m*)

Specifies that only *m* messages are to be read from the data set and loaded to the queue.

If you omit MSGCOUNT(*m*) the number of messages read is unlimited.

**Example**

```
//SLOAD EXEC PGM=CSQUTIL,PARM=('CSQ1'),REGION=0M
//STEPLIB DD DISP=SHR,DSN=th1qua1.SCSQANLE
// DD DISP=SHR,DSN=th1qua1.SCSQAUTH
//OUTPUTA DD DSN=MY.UTILITY.OUTPUTA,DISP=SHR
//CSQUINP DD DSN=MY.UTILITY.COPYA,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
SLOAD DDNAME(OUTPUTA)
SLOAD QUEUE(TOQ) FROMQUEUE(QUEUEA) SKIPMSGS(55)
/*
```

Figure 29. Sample JCL for the CSQUTIL SLOAD function

**Note:**

- **REGION** - A value of 0M means that the job is allowed to have the amount of storage it needs. However, if a job tries to acquire too much storage, it might impact other jobs in the system. You must ideally look to limit the REGION size and specify an absolute maximum value that the job is allowed to acquire.
- **SLOAD DDNAME(OUTPUTA)** - Reloads the first queue from the input data set MY.UTILITY.OUTPUTA. The name of the queue loaded is the same as the queue name from which the data was copied.
- **SLOAD QUEUE(TOQ) FROMQUEUE(QUEUEA) SKIPMSGS(55)** - Reloads the messages that were copied from the queue QUEUEA (from the input data set MY.UTILITY.COPYA). The messages are reloaded to the queue called TOQ. In processing the messages in QUEUEA, the first 55 messages are ignored, and loading starts from the 56th message.

**Usage notes**

1. To use the SLOAD function, the queues or page sets involved must not be in use when the function is invoked.
2. If SLOAD fails, or is forced to take a syncpoint, no further CSQUTIL functions are attempted.

3. CSQUTIL uses MQPMO\_SET\_ALL\_CONTEXT to ensure that the message descriptor fields remain the same as the original copy. It therefore needs an access of CONTROL in the CONTEXT profile of the queue. For full details, see Profiles for context security.

### Migrating a channel initiator parameter module (XPARM):

You can use the XPARM function of CSQUTIL to generate ALTER QMGR command that can be used to migrate to Version 7.0.

In versions of IBM MQ for z/OS before Version 6.0, you could tailor the channel initiator by creating a channel initiator parameter load module. In Version 7.0, you do it by setting queue manager attributes. To make it easier to migrate to Version 7.0, this command generates an ALTER QMGR command from a pre-Version 6.0 channel initiator parameter module.

### Migration (XPARM)

►►—XPARM—DDNAME(*ddname*)—MEMBER(*membername*)—MAKEALT(*ddname2*)—◄◄

### Keywords and parameters

#### DDNAME(*ddname*)

Specifies that an ALTER QMGR command is to be generated from a channel initiator parameter module in this data set.

#### MEMBER(*membername*)

Specifies the name of the channel initiator parameter module in the data set specified by DDNAME(*ddname2*).

#### MAKEALT(*ddname2*)

Specifies the DDname that identifies the output data set in which the ALTER command is to be stored. The data set should be RECFM=FB, LRECL=80. This data set can then be used as input for a later invocation of the COMMAND function or it can be incorporated into the CSQINP2 initialization input data sets.

### Example

```
//MIGRATE1 EXEC PGM=CSQUTIL
//STEPLIB DD DISP=SHR,DSN=th1qua1.SCSQANLE
// DD DISP=SHR,DSN=th1qua1.SCSQAUTH
//CSQXPARM DD DISP=SHR,DSN=user.loadlib
//SYSPRINT DD SYSOUT=*
//ALTQMGR DD DISP=OLD,DSN=user.commands(ALTQMGR)
//SYSIN DD *
XPARM DDNAME(CSQXPARM) MEMBER(MQ3AXPRM) MAKEALT(ALTQMGR)
/*
```

Figure 30. Sample JCL for the CSQUTIL XPARM function

## Switch the transmission queue associated with cluster-sender channels (SWITCH):

You can use the SWITCH function of CSQUTIL to switch or query the transmission queue associated with cluster-sender channels.

To use the SWITCH function the queue manager must be running.

### Switch transmission queue (SWITCH)

- Keywords and parameters
- Example
- Usage notes

### Keywords and parameters

#### CHANNEL (*channel name*)

Specifies the name of a cluster-sender channel, or a generic channel name.

If a generic channel name is specified each cluster-sender channel that matches the generic name is processed.

If a single asterisk is specified all cluster-sender channels are processed.

#### MOVEMSGS

Specifies whether messages queued for the channel should be moved from the old transmission queue to the new transmission queue during the switching process. Values are:

##### YES

Messages are moved from the old transmission queue to the new transmission queue. This is the default.

##### NO

Messages are not moved from the old transmission queue to the new transmission queue. If this option is selected it is the responsibility of the system programmer to resolve any messages for the channel on the old transmission queue after the switch has completed.

#### STATUS

Display the switching status for matching cluster-sender channels. If this keyword is not specified the command switches the transmission queue for stopped or inactive cluster-sender channels that require switching.

### Examples

Figure 1 illustrates how the SWITCH function can be used to query the switching status of all cluster-sender channels whose names match the generic name CLUSTER.\*.

```

//SWITCH EXEC PGM=CSQUTIL,PARM=('CSQ1')
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
SWITCH CHANNEL(CLUSTER.*) STATUS
/*

```

Figure 31. Sample JCL for querying the switching status of cluster-sender channels using the CSQUTIL SWITCH function

Figure 2 illustrates how the SWITCH function can be used to switch the transmission queue for the cluster-sender channel CLUSTER.TO.QM1.

```

//SWITCH EXEC PGM=CSQUTIL,PARM=('CSQ1')
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
SWITCH CHANNEL(CLUSTER.TO.QM1)
/*

```

Figure 32. Sample JCL for switching the transmission queue associated with a cluster-sender channel using the CSQUTIL SWITCH function

#### Usage notes

1. The channel initiator must be running to initiate a switch of transmission queue for cluster-sender channels.
2. The transmission queue associated with a cluster-sender channel can only be switched if the channel is STOPPED or INACTIVE.
3. You need the necessary authority to use the command server queues (SYSTEM.COMMAND.INPUT, SYSTEM.COMMAND.REPLY.MODEL, and SYSTEM.CSQUTIL.\*)
4. You need the necessary authority to issue the START CHANNEL command.
5. To initiate a switch of transmission queue for a cluster-sender channel, you also need command resource authority for the channel.
6. You cannot use the SWITCH function to query the status of, or switch the transmission queue for, a cluster-sender channel that has not been started since version 8 new function has been enabled using the OPMODE parameter in the CSQ6SYSP macro.

## Related information:

Clustering: Switching cluster transmission queues

## The change log inventory utility (CSQJU003)

z/OS

The IBM MQ change log inventory utility runs as a z/OS batch job to change the bootstrap data set (BSDS).

Through this utility, you can invoke these functions:

### NEWLOG

Add active or archive log data sets.

### DELETE

Delete active or archive log data sets.

### ARCHIVE

Supply passwords for archive logs.

### CRESTART

Control the next restart of IBM MQ.

### CHECKPT

Set checkpoint records.

### HIGHRBA

Update the highest written log RBA.

Only run this utility when IBM MQ is stopped. This is because the active log data sets named in the BSDS are dynamically added for exclusive use to IBM MQ and remain allocated exclusively to IBM MQ until it terminates. You can add new active log data sets to an active queue manager with the “DEFINE LOG” on page 622 command.

The DEFINE LOG command can be used to update a BSDS of any version. However, you must use the CSQJUCNV utility to convert the BSDS from version 1 to version 2. A version 1 BSDS has space for up to 31 active log data sets in each log copy ring, whereas a version 2, or higher, BSDS has space for up to 310 active log data sets in each log copy ring.

### Invoking the CSQJU003 utility:

Use this topic to understand how to invoke the CSQJU003 utility.

The utility runs as a z/OS batch program. Figure 33 gives an example of the JCL required.

```
//JU003 EXEC PGM=CSQJU003
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//SYSPRINT DD SYSOUT=*,DCB=BLKSIZE=629
//SYSUT1 DD DISP=SHR,DSN=bsds.dsname
//SYSIN DD *
NEWLOG DSNNAME=CSQREPAL.A0001187,COPY1VOL=CSQV04,UNIT=SYSDA,
STARTRBA=3A190000,ENDRBA=3A1F0FFF,CATALOG=YES,PASSWORD=PASSWRD
/*
```

Figure 33. Sample JCL to invoke the CSQJU003 utility

## Data definition (DD) statements

CSQJU003 requires DD statements with these DDnames:

### **SYSUT1**

This statement is required; it names the BSDS.

### **SYSUT2**

This statement is required if you use dual BSDSs; it names the second copy of the BSDS.

### **Dual BSDSs and CSQJU003**

Each time you run the CSQJU003 utility, the BSDS time stamp field is updated with the current system time. If you run CSQJU003 separately for each copy of a dual copy BSDS, the time stamp fields are not synchronized, so the queue manager fails at startup, issuing error message CSQJ120E. Therefore, if CSQJU003 is used to update dual copy BSDSs, both BSDSs must be updated within a single run of CSQJU003.

### **SYSPRINT**

This statement is required; it names a data set for print output. The logical record length (LRECL) is 125. The block size (BLKSIZE) must be 629.

### **SYSIN**

This statement is required; it names the input data set for statements that specify what the utility is to do. The logical record length (LRECL) is 80.

You can use more than one statement of each type. In each statement, separate the operation name (NEWLOG, DELETE, ARCHIVE, CRESTART) from the first parameter by one or more blanks. You can use parameters in any order; separate them by commas with no blanks. Do not split a parameter description across two SYSIN records.

A statement containing an asterisk (\*) in column 1 is considered to be a comment, and is ignored. However, it appears in the output listing. To include a comment or sequence number in a SYSIN record, separate it from the last comma by a blank. When a blank follows a comma, the rest of the record is ignored.

## Multiple statement operation

When running CSQJU003, a significant error in any statement causes the control statements for the statement in error and all following statements to be skipped. Therefore, BSDS updates cannot occur for any operation specified in the statement in error, or any following statements. However, all the remaining statements are checked for syntax errors.

## Adding information about a data set to the BSDS (NEWLOG):

You can use the NEWLOG function of CSQJU003 to add information about a data set to BSDS.

The NEWLOG function declares one of the following data sets:

- A VSAM data set that is available for use as an active log data set.  
Use the keywords DSNAME, COPY1, COPY2, and PASSWORD.
- An active log data set that is replacing one that encountered an I/O error.  
Use the keywords DSNAME, COPY1, COPY2, STARTRBA, ENDRBA, and PASSWORD.
- An archive log data set volume.  
Use the keywords DSNAME, COPY1VOL, COPY2VOL, STARTRBA, ENDRBA, STRTLRSN, ENDLRSN, UNIT, CATALOG, and PASSWORD.

In a queue-sharing group environment, you should always supply LRSN information. Run the print log map utility (CSQJU004) to find RBAs and LRSNs to use for archive log data sets.

*startrba* is a hexadecimal number of up to 16 characters. The value must end with 000. If you use fewer than 16 characters, leading zeros are added. The RBA can be obtained from messages or by printing the log map.

The value of STARTRBA must be a multiple of 4096. (The hexadecimal value must end in 000.)

A value higher than FFFFFFFF000 cannot be specified for a version 1 format BSDS.

**ENDRBA=** *endrba*

Gives the log RBA (relative byte address within the log) of the end of the replacement active log data set or the archive log data set volume specified by DSNAME.

*endrba* is a hexadecimal number of up to 16 characters. The value must end with FFF. If you use fewer than 16 characters, leading zeros are added.

A value higher than FFFFFFFF cannot be specified for a version 1 format BSDS.

**STARTIME=** *starttime*

Start time of the RBA in the BSDS. This is an optional field. The time stamp format (with valid values in parentheses) is *yyyymmddhhmmsst*, where:

**yyyy** Indicates the year (1993 through 2099)

**ddd** Indicates the day of the year (1 through 365; 366 in leap years)

**hh** Indicates the hour (zero through 23)

**mm** Indicates the minutes (zero through 59)

**ss** Indicates the seconds (zero through 59)

**t** Indicates tenths of a second

If fewer than 14 digits are specified for the STARTIME and ENDTIME parameter, trailing zeros are added.

STARTRBA is required when STARTIME is specified.

**ENDTIME=** *endtime*

End time of the RBA in the BSDS. This is an optional field. For time stamp format, see the STARTIME option. The ENDTIME value must be greater than or equal to the value of STARTIME.

**STRTLRSN=** *strtlrsn*

Gives the LRSN (logical record sequence number) of the first complete log record on the new archive data set.

*strtlrsn* is a hexadecimal number of up to 12 characters. If you use fewer than 12 characters, leading zeros are added.

**ENDLRSN=** *endlrsn*

Gives the LRSN (logical record sequence number) of the last log record on the new archive data set.

*endlrsn* is a hexadecimal number of up to 12 characters. If you use fewer than 12 characters, leading zeros are added.

**COPY1VOL=** *vol-id*

The volume serial of the copy-1 archive log data set named after DSNAME.

**COPY2VOL=** *vol-id*

The volume serial of the copy-2 archive log data set named after DSNAME.

**UNIT=** *unit-id*

The device type of the archive log data set named after DSNAME.

**CATALOG**

Specifies whether the archive log data set is cataloged:

- NO** The archive log data set is not cataloged. All subsequent allocations of the data set are made using the unit and volume information specified on the function. This is the default.
  - YES** The archive log data set is cataloged. A flag is set in the BSDS indicating this, and all subsequent allocations of the data set are made using the catalog.
- IBM MQ requires that all archive log data sets on DASD be cataloged. Select CATALOG=YES if the archive log data set is on DASD.

**Deleting information about a data set from the BSDS (DELETE):**

You can use the DELETE function of CSQJU003 to delete all information about a specified log data set or data set volume from the bootstrap data sets.

For example, you can use this function to delete outdated archive log data sets.

**DELETE**

**Keywords and parameters**

**DSNAME=** *dsname*

Specifies the name of the log data set.

*dsname* can be up to 44 characters long.

**COPY1VOL=** *vol-id*

The volume serial number of the copy-1 archive log data set named after DSNAME.

**COPY2VOL=** *vol-id*

The volume serial number of the copy-2 archive log data set named after DSNAME.

**Supplying a password for archive log data sets (ARCHIVE):**

You can use the ARCHIVE function of CSQJU003 to assign a password to all archive data sets created after this operation.

This password is added to the z/OS password data set each time a new archive log data set is created.

Use the NOPASSWD keyword to remove the password protection for all archives created after the archive operation.

**Note:** Typically, use an external security manager (ESM), such as RACF, if you want to implement security on any IBM MQ data sets.

## ARCHIVE

►► ARCHIVE { PASSWORD=*password* | NOPASSWD } ►►

### Keywords and parameters

#### PASSWORD= *password*

Specifies that a password is to be assigned to the archive log data sets.

*password* specifies the password, which is a data set password and it must follow the standard VSAM convention; that is, 1 through 8 alphanumeric characters (A through Z, 0 through 9) or special characters (& \* + - . ; ' /).

#### NOPASSWD

Specifies that archive password protection is not to be active for all archives created after this operation. No other keyword can be used with NOPASSWD.

### Controlling the next restart (CRESTART):

You can use the CRESTART function of CSQJU003 to control the next restart of the queue manager, either by creating a new conditional restart control record or by canceling the one currently active.

These records limit the scope of the log data used during restart (truncating the log, in effect) . Any existing conditional restart control record governs every restart until one of these events occurs:

- A restart operation completes
- A CRESTART CANCEL is issued
- A new conditional restart control record is created

**Attention:** This can override IBM MQ efforts to maintain data in a consistent state. Only use this function when implementing the disaster recovery process described in Recovering a single queue manager at an alternative site and Recovering a queue-sharing group at the alternative site, or under the guidance of IBM service.

## CRESTART

►► CRESTART { CREATE { , ENDRBA=*endrba* | , ENDLRSN=*endlrsn* } | CANCEL } ►►

### Keywords and parameters

#### CREATE

Creates a new conditional restart control record. When the new record is created, the previous control record becomes inactive.

#### CANCEL

Makes the currently active conditional restart control record inactive. The record remains in the BSDS as historical information.

No other keyword can be used with CANCEL.

#### ENDRBA= *endrba*

Gives the last RBA of the log to be used during restart (the point at which the log is to be truncated), and the starting RBA of the next active log to be written after restart. Any log information in the bootstrap data set and the active logs, with an RBA greater than *endrba*, is discarded.

*endrba* is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added.

The value of ENDRBA must be a multiple of 4096. (The hexadecimal value must end in 000.)

A value higher than FFFFFFFF000 cannot be specified for a version 1 format BSDS.

**ENDLRSN= *endlrsn***

Gives the LRSN of the last log record to be used during restart (the point at which the log is to be truncated). Any log information in the bootstrap data set and the active logs with an LRSN greater than *endlrsn* is discarded.

**Setting checkpoint records (CHECKPT):**

You can use the CHECKPT function of CSQJU003 to add or delete a record in the BSDS checkpoint queue.

Use the STARTRBA and ENDRBA keywords to add a record, or the STARTRBA and CANCEL keywords to delete a record.

**Attention:** This can override IBM MQ efforts to maintain data in a consistent state. Only use this function when implementing the disaster recovery process described in Recovering a single queue manager at an alternative site and Recovering a queue-sharing group at the alternative site, or under the guidance of IBM service.

**CHECKPT**

**Keywords and parameters**

**STARTRBA= *startrba***

Indicates the start checkpoint log record.

*startrba* is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added. The RBA can be obtained from messages or by printing the log map.

A value higher than FFFFFFFF000 cannot be specified for a version 1 format BSDS.

**ENDRBA= *endrba***

Indicates the end checkpoint log record corresponding to the start checkpoint record.

*endrba* is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added. The RBA can be obtained from messages or by printing the log map.

A value higher than FFFFFFFF000 cannot be specified for a version 1 format BSDS.

**TIME= *time***

Gives the time the start checkpoint record was written. The time stamp format (with valid values in parentheses) is *yyyymmddhhmmsst*, where:

- yyyy** Indicates the year (1993 through 2099)
- ddd** Indicates the day of the year (1 through 365; 366 in leap years)
- hh** Indicates the hour (zero through 23)
- mm** Indicates the minutes (zero through 59)
- ss** Indicates the seconds (zero through 59)
- t** Indicates tenths of a second

If fewer than 14 digits are specified for the TIME parameter, trailing zeros are added.

#### CANCEL

Deletes the checkpoint queue record containing a starting RBA that matches the RBA specified by STARTRBA.

#### Updating the highest written log RBA (HIGHRBA):

You can use the HIGHRBA function of CSQJU003 to update the highest written log RBA recorded in the BSDS for either the active or archive log data sets.

Use the STARTRBA keyword to update the active log, and the OFFLRBA keyword to update the archive log.

**Attention:** This can override IBM MQ efforts to maintain data in a consistent state. Only use this function when implementing the disaster recovery process described in Recovering a single queue manager at an alternative site, or under the guidance of IBM service personnel.

#### HIGHRBA

#### Keywords and parameters

##### STARTRBA= *startrba*

Indicates the log RBA of the highest written log record in the active log data set.

*startrba* is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added. The RBA can be obtained from messages or by printing the log map.

A value higher than FFFFFFFFFF cannot be specified for a version 1 format BSDS.

##### TIME= *time*

Specifies when the log record with the highest RBA was written to the log. The time stamp format (with valid values in parentheses) is *yyydddhhmmsst*, where:

- yyyy** Indicates the year (1993 through 2099)
- ddd** Indicates the day of the year (1 through 365; 366 in leap years)
- hh** Indicates the hour (zero through 23)
- mm** Indicates the minutes (zero through 59)
- ss** Indicates the seconds (zero through 59)
- t** Indicates tenths of a second

If fewer than 14 digits are specified for the TIME parameter, trailing zeros are added.

##### OFFLRBA= *offlrba*

Specifies the highest offloaded RBA in the archive log.

*offlrba* is a hexadecimal number of up to 16 digits. If you use fewer than 16 digits, leading zeros are added. The value must end with hexadecimal 'FFF'.

A value higher than FFFFFFFFFF cannot be specified for a version 1 format BSDS.

## The print log map utility (CSQJU004)

CSQJU004 is the batch utility program used to print log data information from the BSDS.

The IBM MQ print log map utility runs as a z/OS batch program to list the following information:

- The BSDS version
- Log data set name and log RBA association for both copies of all active and archive log data sets
- Active log data sets available for new log data
- Contents of the queue of checkpoint records in the bootstrap data set (BSDS)
- Contents of the quiesce history record
- System and utility time stamps
- Passwords for the active and archive log data sets, if provided

You can run the CSQJU004 program regardless of whether the queue manager is running. However, if the queue manager is running, consistent results from the utility can be ensured only if both the utility and the queue manager are running under control of the same z/OS system.

For further information, see

- Invoking the CSQJU004 utility
- Data definition statements required for the CSQJU004 utility

To use this utility, the user ID of the job must have the requisite security authorization, or, if the BSDS is password protected, the appropriate VSAM password for the data set.

### Invoking the CSQJU004 utility

The following example shows the JCL used to invoke the CSQJU004 utility:

```
//JU004 EXEC PGM=CSQJU004
//STEPLIB DD DISP=SHR,DSN=thlqual.SCSQANLE
// DD DISP=SHR,DSN=thlqual.SCSQAUTH
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DISP=SHR,DSN=bsds.dsname
```

Figure 34. Sample JCL to invoke the CSQJU004 utility

The EXEC statement can use an optional parameter TIME(RAW) which changes the way timestamps are formatted.

```
//JU004 EXEC PGM=CSQJU004,PARM='TIME(RAW)'
```

This parameter causes timestamps to be formatted without applying timezone or leap second offsets for the formatting system. You can use this mode of operation when formatting a BSDS created at a remote site, or before a daylight saving time change, for example. The default, no parameter specified, is to format timestamps using the current formatting system's timezone and leap second corrections.

Formatted times affected by this parameter are:

- highest RBA written
- archive log command times
- checkpoint times
- conditional restart record times

### Data definition statements

The CSQJU004 utility requires DD statements with the following DDnames:

## **SYSUT1**

This statement is required to specify and allocate the bootstrap data set. If the BSDS must be shared with a concurrently running queue manager subsystem, use DISP=SHR on the DD statement.

## **SYSPRINT**

This statement is required to specify a data set or print spool class for print output. The logical record length (LRECL) is 125 and the record format (RECFM) is VBA.

Finding out what the BSDS contains describes the output.

## **The log print utility (CSQ1LOGP)**

Use this utility to print information contained in the IBM MQ log data sets or the BSDS.

- Invoking the CSQ1LOGP utility
- Input control parameters
- Usage notes
- The EXTRACT function
  - Example of processing EXTRACT data
- CSQ1LOGP output
  - Detail report
  - Record layouts for the output data sets

## **Invoking the CSQ1LOGP utility**

You run the IBM MQ log print utility as a z/OS batch program. You can specify:

- A bootstrap data set (BSDS)
- Active log data sets (with no BSDS)
- Archive log data sets (with no BSDS)

Sample JCL to invoke the CSQ1LOGP utility is shown in Figure 35 on page 1667, Figure 36 on page 1667, Figure 37 on page 1668 and Figure 38 on page 1668.

These data definition statements must be provided:

### **SYSPRINT**

All error messages, exception conditions, and the detail report are written to this data set. The logical record length (LRECL) is 131.

### **SYSIN**

Input selection criteria can be specified in this data set. See “Input control parameters” on page 1668 for more information.

The logical record length (LRECL) must be 80, but only columns 1 through 72 are significant; columns 73 through 80 are ignored. At most 50 records can be used. Records with an asterisk (\*) in column 1 are interpreted as comments and are ignored.

### **SYSSUMRY**

If a summary report is requested, by specifying the parameter **SUMMARY ( YES )** or **SUMMARY ( ONLY )**, the output is written to this data set. The logical record length (LRECL) is 131.

**BSDS** Name of the bootstrap data set (BSDS).

### **ACTIVEn**

Name of an active log data set you want to print (n=number).

### **ARCHIVE**

Name of an archive log data set you want to print.

If you specify the keyword **EXTRACT** ( YES ), provide one or more of the following DD statements, depending on what types of data you want to extract. Do not specify an LRECL, as it is set internally by the utility. These DDs are the required DCB parameters for the output data set.

#### **CSQBACK**

This data set contains persistent messages written to the log by units of work that were rolled back during the log range specified.

#### **CSQCMT**

This data set contains persistent messages written to the log by units of work that were committed during the log range specified.

#### **CSQBOTH**

This data set contains persistent messages written to the log by units of work that were either committed or rolled back during the log range specified.

#### **CSQINFLT**

This data set contains persistent messages written to the log by units of work that remained in flight during the log range specified.

#### **CSQOBJ**

This data set contains information about object alterations that occurred during the log range specified.

For each DD statement, the record format (RECFM) is VB, the logical record length (LRECL) is 32756, and the block size (BLKSIZE) must be 32760.

If you are processing active log data sets, the utility runs even if IBM MQ is running, if the BSDS and active log data sets are defined by using at least SHAREOPTIONS(2 3).

```
//PRTLOG EXEC PGM=CSQ1LOGP
//STEPLIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQLOAD
//BSDS DD DSN=qmgr.bsds.dsname,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSSUMRY DD SYSOUT=*
//SYSIN DD *
* extract records for pageset 3. Produce both summary and detail reports
PAGESET(3)

//CSQOBS DD DSN=objects.dataset,DISP=(NEW,CATLG)

```

Figure 38. Sample JCL showing additional statements for the EXTRACT keyword

The EXEC statement can use an optional parameter TIME(RAW) which changes the way timestamps are formatted.

```
//PRTLOG EXEC PGM=CSQ1LOGP,PARM='TIME(RAW)'
```

This causes timestamps to be formatted without applying timezone or leap second offsets for the formatting system. You can use this mode of operation when formatting log data created at a remote site, or before a daylight saving time change, for example.

If no parameter is specified, the default behavior is to format timestamps using the timezone and leap second corrections of the system doing the formatting.

Formatted times affected by this parameter are those associated with:

- checkpoint time
- restart time
- UR start time

## Input control parameters

The keywords that you can use in the SYSIN data set are described in the following list.

You can specify various selection criteria to limit the log records that are processed. These are:

- log range, using RBASTART-RBAEND or LRSNSTART-LRSNEND
- page sets, using PAGESET
- units of recovery, using URID
- record contents, using DATA
- resource manager, using RM

Different types of selection criteria can be combined; only records meeting all the criteria are processed.

**LRSNSTART** (*hexadecimal-constant*)

Specifies the logical record sequence number (LRSN) from which to begin processing. You cannot use this keyword together with RBASTART. Use this keyword only if your queue manager is in a queue-sharing group.

LRSN values are always greater than A00000000000; this value is used as the start value if a lower value is specified.

You can also use the forms STARTLRSN or STRTLRSN or LRSNSTRT. Specify this keyword only once.

**LRSNEND** (*hexadecimal-constant*)

Specifies the logical record sequence number (LRSN) of the last record to be scanned. The default is FFFFFFFFFF (the end of the data sets). You can use this keyword only with LRSNSTART.

You can also use the form ENDLRSN.

Specify this keyword only once.

**RBASTART** (*hexadecimal-constant*)

Specifies the log RBA from which to begin processing. You cannot use this keyword together with LRSNSTART.

You can also use the forms STARTRBA or ST. Specify this keyword only once.

**RBAEND** (*hexadecimal-constant*)

Specifies the last valid log RBA that is to be processed. If this keyword is omitted, processing continues to the end of the log (FFFFFFFF if 6 byte RBAs are in use, or FFFFFFFFFFFFFFFF if 8 byte RBAs are in use). You can use this keyword only with RBASTART.

You can also use the forms ENDRBA or EN. Specify this keyword only once.

**PAGESET** (*decimal-integer*)

Specifies a page set identifier. The number must be in the range 00 through 99. You can specify a maximum of 10 PAGESET keywords. If PAGESET keywords are specified, only log records associated with the page sets you specify are processed.

**URID** (*hexadecimal-constant*)

Specifies a hexadecimal unit of recovery identifier. Changes to data occur in the context of an IBM MQ unit of recovery. A unit of recovery is identified on the log by a BEGIN UR record. The log RBA of that BEGIN UR record is the URID value you must use. If you know the URID for a particular UR that you are interested in, you can limit the extraction of information from the log to that URID.

The hexadecimal constant can consist of 1 through 16 characters (8 bytes), and leading zeros are not required.

You can specify a maximum of 10 URID keywords.

**DATA** (*hexadecimal-string*)

Specifies a data string in hexadecimal.

The string can consist of 2 through 48 characters (24 bytes), and must have an even number of characters.

You can specify a maximum of 10 DATA keywords.

If DATA keywords are specified, only log records that contain at least one of the strings are processed.

**Note:** Though you can use the DATA and EXTRACT parameters together, it is difficult to reliably derive meaning from the output, unless you have a good understanding of the internal implementation of IBM MQ. This is because only the low level individual log records that contain the requested DATA are processed so you do not extract the full output that is logically associated with the data, only the records where that DATA sequence actually appears. For example you might get

only records associated with putting messages and not with getting messages, or you might get only the first part of the data for long messages because the rest of the data is in other log records that do not contain the requested DATA string.

**RM** (*resource\_manager*)

Specifies a particular resource manager. Only records associated with this resource manager are processed. Valid values for this keyword are:

**RECOVERY**

Recovery log manager

**DATA** Data manager

**BUFFER**

Buffer manager

**IMSBRIDGE**

IMS bridge

**SUMMARY** (*YES|NO|ONLY*)

Specifies whether a summary report is to be produced or not:

**YES** Produce a summary report in addition to the detail report.

**NO** Do not produce a summary report.

**ONLY** Produce only a summary report (no detail report).

The default is NO.

**EXTRACT** (*YES|NO*)

Specifying EXTRACT(YES) causes each log record that meets the input selection criteria to be written to the appropriate output file, as explained on page “The EXTRACT function” on page 1671. The default is NO.

**Note:** Though you can use the DATA and EXTRACT parameters together, it is difficult to reliably derive meaning from the output, unless you have a good understanding of the internal implementation of IBM MQ. This is because only the low level individual log records that contain the requested DATA are processed so you do not extract the full output that is logically associated with the data, only the records where that DATA sequence actually appears. For example you might get only records associated with putting messages and not with getting messages, or you might get only the first part of the data for long messages because the rest of the data is in other log records that do not contain the requested DATA string.

**DECOMPRESS** (*YES|NO*)

Specifies whether any compressed log records will be expanded:

**YES** Any compressed log records will be expanded before a Search, Print or Extract function is performed

**NO** Any compressed log records will not be expanded before a Search or Print function is performed. Do not use DECOMPRESS(NO) with the Extract function

The default is YES.

**Usage notes**

1. If your queue manager is in a queue-sharing group, you can specify the log range required by either LRSNSTART (optionally with LRSNEND) or RBASTART (optionally with RBAEND). You cannot mix LRSN and RBA specifications.

If you need to coordinate the log information from the different queue managers in the queue-sharing group, use LRSN specifications.

2. If your queue manager is not in a queue-sharing group, you cannot use LRSN specifications; you must use RBA specifications.
3. If you are using a BSDS, RBASTART or LRSNSTART must be specified.
4. CSQ1LOGP starts its processing on the first record containing an LRSN or RBA value greater than or equal to the value specified on LRSNSTART or RBASTART.
5. Normally you are only interested in the most recent additions to the log. Take care to choose a suitable value for the start of the log range, and do not use the defaults. Otherwise, you create an enormous amount of data, most of which is of no interest to you.

## The **EXTRACT** function

Typical uses of the **EXTRACT** parameter are to:

- Review which persistent messages were put to or got from a queue and whether the request was committed. This allows messages to be replayed.
- Review persistent messages that were put or got, but the request was backed out.
- Display which applications backed out rather than committed.
- Discover the volume of persistent data processed by queues, to identify the high use queues.
- Identify which applications set object attributes.
- re-create object definitions for recovery purposes after a major failure.

When CSQ1LOGP with the **EXTRACT** parameter set is run against a log data set it processes all records in the data set, or all those within a specified range. Processing is as follows:

1. When a commit request is found, if the CSQCMT ddname is present then the data is written to this data set. If the CSQBOTH ddname is present the data is also written to this data set.
2. When a backout request is found, if the CSQBACK ddname is present then the data is written to this data set. If the CSQBOTH ddname is present the data is also written to this data set.
3. When changes to objects are detected, the information is written to the data set identified by the CSQOBS ddname.
4. When the last record has been processed, information about remaining units of work is written to the data set identified by the CSQINFLT ddname.

If you do not want to collect one or more of these classes of information, then omit the appropriate DD statements.

### Example of processing **EXTRACT** data

The following job uses DFSORT facilities to process the file of committed records to add up the number of bytes put to each queue.

```

//TOOLRUN EXEC PGM=ICETOOL,REGION=1024K
//TOOLMSG DD SYSOUT=*
//DFSMSG DD SYSOUT=*
//TOOLIN DD *
SORT FROM(IN) TO(TEMP1) USING(CTL1)
DISPLAY FROM(TEMP1) LIST(OUT1) ON(5,48,CH) ON(53,4,BI)
/*
//CTL1 DD *
* SELECT THE RECORDS WHICH WERE PUT
  INCLUDE COND=(180,5,CH,EQ,C'MQPUT')
* SORT BY QUEUE NAME
  SORT FIELDS=(112,48,CH,A)
* ONLY COPY THE QUEUE NAME AND SIZE OF USER DATA TO OUTPUT REC
  OUTREC FIELDS=(1,4,112,48,104,4)
* ADD UP THE NUMBER OF BYTES PROCESSED
* SUM FIELDS=(104,4,FI)
/*
//IN DD DISP=SHR,DSN=commit.dataset
//TEMP1 DD DISP=(NEW,DELETE),DSN=&TEMP1,SPACE=(CYL,(10,10))
//OUT1 DD SYSOUT=*

```

Figure 39. Accumulating bytes put to each queue

This produces output in the following format:

BA1	3605616
BA10	3572328
BA2	3612624
BA3	3579336
BA4	3572328
BA5	3491736
BA6	3574080
BA7	3532032
BA8	3577584
BA9	3539040
SYSTEM.ADMIN.CHANNEL.EVENT	186120
SYSTEM.ADMIN.QMGR.EVENT	384
SYSTEM.CHANNEL.SYNCQ	46488312

The following table lists the samples that are provided to allow you to print and interpret the data generated when EXTRACT(YES) is used

Sample	Description
thlqual.SCSQLOAD(CSQ4LOGS)	Sample C program to report on the UOW activity and object manipulation
thlqual.SCSQC37S(CSQ4LOGS)	Source for sample C program
thlqual.SCSQC370(CSQ4LOGD)	C header file to map records generated when using the EXTRACT(YES) function of CSQ1LOGP
thlqual.SCSQPROC(CSQ4LOGJ)	Sample JCL to run program CSQ4LOGS

## CSQ1LOGP output

### Detail report

The detail report begins by echoing the input selection criteria specified by SYSIN, and then prints each valid log record encountered. Definitions of keywords in the detail report are as follows:

**RM** Resource manager that wrote the log record.

**TYPE** Type of log record.

**URID** BEGIN UR for this unit of recovery, see the previous description.

**LRID** Logical record identifier in the form: AAAAAAAA.BBBBBBCC where:

**AAAAAAA**

Is the page set number.

**BBBBB**

Is the relative page number in the page set.

**CC**

Is the relative record number on the page.

**LRSN** Logical record sequence number (LRSN) of the log record scanned.

**SUBTYPE**

Subtype of the log record type.

**CHANGE LENGTH**

Length of the logged change.

**CHANGE OFFSET**

Start position of the change.

**BACKWARD CHAIN**

Pointer to the previous page.

**FORWARD CHAIN**

Pointer to the next page.

**RECORD LENGTH**

Length of the inserted record.

### **Record layouts for the output data sets**

The data sets produced when the **EXTRACT** keyword is specified contains information about persistent messages. Messages are identified by their queue name and an eight character key. Once a message has been got, the key can be reused by another message, so it is important to ensure that time sequence is maintained. In the records are times. A time stamp can be extracted only from a Begin-UR record or from an MQPUT request. Thus if there is only a long running transaction which is getting messages, the times when the gets occurred are the time the transaction started (the Begin-UR record). If there are many short units of work, or many messages being put, the time is reasonably accurate (within milliseconds). Otherwise the times become less and less accurate.

**Note:** There is a 4 byte Record Descriptor Word at the front of each record because the files are Variable Blocked format. The first data byte of a variable-length record has relative position 5 and the first 4 bytes contain the record descriptor word. The field names correspond to those in the C header file CSQ4LOGD in thlqual.SCSQC370.

The information in the data sets has the following layout:

Offset		Type	Length	Name	Description
Dec	Hex				
0	0	Character	21	csrecorddate	The approximate time the log was written, in the format yyyy.ddd hh:mm:ss.thm
21	15	Character	7	cstimedelta	Approximate time difference in milliseconds from the start of the unit of work. Right-aligned and padded with blanks.
28	1C	64-bit integer	8	dtodout	Estimated time that the log record was created, in STCK format.
36	24	Character	8	csurid	Queue manager-specific unique identifier of the unit of work that created the log record.
44	2C	Character	12	cscorrelator	Thread correlation identifier
56	38	Character	8	csauth	Authorization identifier (Userid associated with unit of work)
64	40	64-bit integer	8	dtime	Time that the unit of work was started, in STCK format
72	48	Character	8	csresource	Resource name
80	50	Character	8	cscnty	Connection type: one of BATCH, RRSBATCH, IMS, CICS, CHIN, or nulls for an internal task
88	58	Character	8	cscnid	Connection ID of thread that created this unit of work
96	60	Character	3	csstatus	Unit of work type: BUR for begin or CP for checkpoint information
99	63	Integer	4	ldatalen	Length of the message data (if any)
103	67	Character	4	csqmgrname	Name of queue manager
107	6B	Character	48	csqueueuname	Name of queue, for get, put, or expired messages. This field can be question marks. Question marks appear when it is not possible to determine the user ID associated with the entry. This typically happens when the begin_ur record or the checkpoint record from which you might get the URID is not in the log range specified in the job, nor on the log data sets used.
155	9B	Character	12	cssqdmcp	Shared queue message key. Blank if not a shared queue
167	A7	Character	8	csdmcp	Non-shared queue message key. Blank if a shared queue.

Offset		Type	Length	Name	Description
175	AF	Character	8	csverb	Activity: <b>ALTER</b> the object was changed <b>DEFINE</b> the object was created <b>MQGET</b> the message was got <b>MQPUT</b> the message was put <b>EXPIRE</b> the message expired <b>ABORT2</b> the message was backed out <b>PHASE1</b> the first phase of two-phase commit <b>PHASE2</b> the second phase of two-phase commit, or the only phase of one phase commit
183	B7	Character	1	cscmitstatus	Status of unit of work: <b>B</b> backed out <b>C</b> committed <b>I</b> inflight
184	B8	Character	1	csshunt	Shunted indicator: <b>S</b> shunted record <b>N</b> not shunted
185	B9	Character	8	cslogrba	RBA of log record
193	C1	Character	8	csshuntrba	RBA of shunted log record
201	C9	Character	1	csuowscope	UOW scope in hexadecimal: <b>01</b> local <b>02</b> shared
202	CA	Integer	4	lsegment	The segment number of the data, starting from 1.
206	CE		Variable		Data part
206	CE	Character	1	csbora	If csverb is ALTER, indicates whether the data is the 'before' or 'after' copy of the object. <b>B</b> before <b>A</b> after
207	CF	Character	Variable	csvardata	Message or object data. Length as given in ldatalen.

## The queue-sharing group utility (CSQ5PQSG)

You can use the CSQ5PQSG utility program to add queue-sharing group and queue manager definitions to the IBM MQ Db2 tables, and to remove them.

The CSQ5PQSG utility can also be used to verify the consistency of Db2 object definitions for queue manager, CF structure, and shared queue objects, within a queue-sharing group.

- Invoking the queue-sharing group utility
- Syntax, keywords, and parameters
- Example

### Invoking the queue-sharing group utility

Figure 40 shows an example of the JCL used to invoke the CSQ5PQSG utility.

```
//S001 EXEC PGM=CSQ5PQSG,REGION=4M,  
//      PARM='function,function parameters'  
//STEPLIB DD DSN=th1qua1.SCSQANLE,DISP=SHR  
//          DD DSN=th1qua1.SCSQAUTH,DISP=SHR  
//          DD DSN=db2qua1.SDSNLOAD,DISP=SHR  
//SYSPRINT DD SYSOUT=*
```

Figure 40. Sample JCL to invoke the CSQ5PQSG utility

### Data definition statements

The CSQ5PQSG utility requires data definition statements with the following DDname:

#### SYSPRINT

This statement is required; it names the data set for print output. The logical record length (LRECL) is 125.

### Syntax, keywords, and parameters

#### Queue-sharing group utility

```
►► PARM=' ADD QMGR—,qmgr-name,qsg-name,dsg-name,DB2-ssid— ' ◀◀  
      ADD QSG—,qsg-name,dsg-name,DB2-ssid—  
      REMOVE QMGR—,qmgr-name,qsg-name,dsg-name,DB2-ssid—  
      REMOVE QSG—,qsg-name,dsg-name,DB2-ssid—  
      MIGRATE DSG—,dsg-name,DB2-ssid—  
      MIGRATE QSG—,qsg-name,dsg-name,DB2-ssid—  
      FORCE QMGR—,qmgr-name,qsg-name,dsg-name,DB2-ssid—  
      VERIFY QSG—,qsg-name,dsg-name,DB2-ssid—
```

A queue-sharing group name ( *qsg-name* ) can have up to 4 characters, comprising uppercase A-Z, 0-9, \$, #, @. It must not start with a numeric. For implementation reasons, names of less than 4 characters are padded internally with @ symbols, so do not use names ending in @.

The queue-sharing group name must be different from any of the queue manager names within the queue-sharing group.

#### PARM

This field contains the function request followed by the function-specific parameters. These are described in the following text:

## ADD QMGR

Add a queue manager record into the CSQ.ADMIN\_B\_QMGR table. This operation completes successfully only if all the following conditions are met:

- A corresponding queue-sharing group record exists in the CSQ.ADMIN\_B\_QSG table.
- The queue manager entry does not exist in the CSQ.ADMIN\_B\_QMGR table as the member of a different queue-sharing group.
- There is no member entry in the XCF group with a different QMGR number value than the one created by the utility when you add a record to the CSQ.ADMIN\_B\_QMGR table.

If there are members in the XCF group without the corresponding entries in the Db2 table, you can use the utility to add them. Add queue managers in the order that is indicated by the CSQU524I messages that are issued by the queue sharing group utility (CSQ5PQSG) when it is run with the **VERIFY QSG** parameter.

If a queue manager exists in Db2 table CSQ.ADMIN\_B\_QMGR, but is missing from MVS XCF group, you can run this utility to restore the appropriate XCF group entry, as indicated by CSQ5010E message.

*qmgr-name*

The queue manager name

*qsg-name*

The queue-sharing group name

*dsg-name*

The Db2 data-sharing group name

*DB2-ssid*

The Db2 subsystem ID

## ADD QSG

Add a queue-sharing group record into the CSQ.ADMIN\_B\_QSG table.

*qsg-name*

The queue-sharing group name

*dsg-name*

The Db2 data-sharing group name

*DB2-ssid*

The Db2 subsystem ID

## REMOVE QMGR

Remove a queue manager record from the CSQ.ADMIN\_B\_QMGR table. This only completes successfully if the queue manager has either never been started, or terminated normally from its last execution.

*qmgr-name*

The queue manager name

*qsg-name*

The queue-sharing group name

*dsg-name*

The Db2 data-sharing group name

*DB2-ssid*

The Db2 subsystem ID

## REMOVE QSG

Remove a queue-sharing group record from the CSQ.ADMIN\_B\_QSG table. This only completes successfully if no queue managers are defined to the queue-sharing group.

*qsg-name*  
The queue-sharing group name

*dsg-name*  
The Db2 data-sharing group name

*DB2-ssid*  
The Db2 subsystem ID

### **MIGRATE DSG**

Check that the installation is ready to migrate its Db2 data-sharing group table definitions from IBM WebSphere MQ Version 7.0, or Version 7.1 to IBM MQ Version 8.0.

It verifies that:

- All the queue managers in the data-sharing group have applied the migration & coexistence PTF and have since been started.
- The data-sharing group has not already been migrated.

*dsg-name*  
The Db2 data-sharing group name

*DB2-ssid*  
The Db2 subsystem ID

This function does not actually do the migration, which involves several steps. It is included as part of the sample migration job CSQ4570T and CSQ4571T in thlqual SCSQPROC.

Migration requires that a migration PTF is installed on **all** queue managers in the data-sharing group.

### **MIGRATE QSG**

Check that the installation is ready to migrate its Db2 queue-sharing group table definitions from IBM WebSphere MQ Version 7.0, or Version 7.1, to IBM MQ Version 8.0

The MIGRATE QSG and MIGRATE DSG functions perform the same function. The only difference is in the scope of the processing. MIGRATE QSG works on a single queue-sharing group only, MIGRATE DSG works on all queue-sharing groups that are defined within the data-sharing group.

It verifies that:

- All the queue managers in the queue-sharing group have applied the migration & coexistence PTF and have since been started.

*qsg-name*  
The queue-sharing group name

*dsg-name*  
The Db2 data-sharing group name

*DB2-ssid*  
The Db2 subsystem ID

This function does not actually do the migration, which involves several steps. It is included as part of the sample migration job CSQ4570T and CSQ4571T in thlqual SCSQPROC.

Migration requires that a migration PTF is installed on **all** queue managers in the queue-sharing group.

### **FORCE QMGR**

Remove a queue manager record from the CSQ.ADMIN\_B\_QMGR table, even if the queue manager has terminated abnormally.

Use the **FORCE** option, rather than **REMOVE**, to remove the last queue manager in a queue sharing group.

**Attention:** This can override IBM MQ efforts to maintain data in a consistent state. Only use this function when you cannot carry out the procedure for removing a queue manager from a queue sharing group on page Removing a queue manager from a queue-sharing group.

*qmgr-name*

The queue manager name

*qsg-name*

The queue-sharing group name

*dsg-name*

The Db2 data-sharing group name

*DB2-ssid*

The Db2 subsystem ID

### VERIFY QSG

Validate the consistency of the Db2 object definitions for queue manager, CF structure, and shared queue objects, within the queue-sharing group.

*qsg-name*

The queue-sharing group name

*dsg-name*

The Db2 data-sharing group name

*DB2-ssid*

The Db2 subsystem ID

### Example

The following sample JCL adds an entry for queue manager QM01 into queue-sharing group QSG1. It specifies a connection to Db2 subsystem DB2A, which is a member of Db2 data-sharing group DSN510PG.

```
//S001 EXEC PGM=CSQ5PQSG,REGION=4M,  
//      PARM='ADD QMGR,QM01,QSG1,DSN510PG,DB2A'  
//STEPLIB DD DSN=th1qua1.SCSQANLE,DISP=SHR  
//          DD DSN=th1qua1.SCSQAUTH,DISP=SHR  
//          DD DSN=db2qua1.SDSNLOAD,DISP=SHR  
//SYSPRINT DD SYSOUT=*
```

Figure 41. Using the queue-sharing group utility to add a queue manager into a queue-sharing group

## The active log preformat utility (CSQJUFMT)

You can use the CSQJUFMT utility to format active log data sets before they are used by a queue manager.

If the active log data sets are preformatted by the utility, log write performance is improved on the queue manager's first pass through the active logs. If the utility is not used, the queue manager must format each log control interval at log write time before it is used. On the second and subsequent passes through the active log data sets, the log control intervals already contain data, so need no further formatting, and no performance benefit accrues.

### Invoking the CSQJUFMT utility

You can only run the CSQJUFMT program before starting the queue manager that use the logs.

**Note:** Do not use this utility to format a log data set after the queue manager has started, or data will be lost.

```
EXEC PGM=CSQJUFMT
```

Each step running the CQJUFMT utility formats a single active log dataset. Add additional CSQJUFMT steps for each active log being created.

**Attention:** JCL limits the number of steps in a single job to 255. If you are formatting more than 255 active log datasets, you will need to run multiple jobs.

These DD statements should be provided:

#### SYSPRINT

This statement is required to specify a data set or print spool class for print output.

#### SYSUT1

This statement identifies the log data set to be preformatted.

```
//JOB LIB DD DISP=SHR,DSN=thlqua1.SCSQANLE
// DD DISP=SHR,DSN=thlqua1.SCSQAUTH
//*
//JUFMT11 EXEC PGM=CSQJUFMT
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DISP=OLD,DSN=h1q.LOGCOPY1.DS01
//*
//JUFMT21 EXEC PGM=CSQJUFMT
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DISP=OLD,DSN=h1q.LOGCOPY2.DS01
```

Figure 42. Example of the JCL used to invoke the CSQJUFMT utility

Sample JCL is supplied in thlqua1.SCSQPROC (CSQ4LFMT) for preformatting a newly defined dual log data set. It contains two steps, one step to format each of the copies of the log data set.

## The dead-letter queue handler utility (CSQUDLQH)

You can use the default dead-letter utility (CSQUDLQH) to handle message written to the dead-letter queue.

A *dead-letter queue* (DLQ) is a holding queue for messages that cannot be delivered to their destination queues. Every queue manager in a network can have an associated DLQ.

Queue managers, message channel agents, and applications can put messages on the DLQ. All messages on the DLQ can be prefixed with a *dead-letter header* structure, MQDLH. Messages put on the DLQ by a queue manager or by a message channel agent always have a dead-letter header; ensure that applications putting messages on the DLQ also supply a dead-letter header structure. The *Reason* field of the MQDLH structure contains a reason code that identifies why the message is on the DLQ.

Implement a routine that runs regularly to process messages on the DLQ. Such a routine is called a *dead-letter queue handler*. IBM MQ supplies a default *dead-letter queue handler* (DLQ handler) called CSQUDLQH. A user-written *rules table* supplies instructions to the DLQ handler, for processing messages on the DLQ. That is, the DLQ handler matches messages on the DLQ against entries in the rules table. When a DLQ message matches an entry in the rules table, the DLQ handler performs the action associated with that entry.

### Invoking the DLQ handler:

Use this topic to understand how to invoke the CSQUDLQH utility program, and its data definition statements.

The CSQUDLQH utility program runs as a z/OS batch program. Specify the name of the dead-letter queue that you want to process and the queue manager on which it resides. You can do this in one of the following two ways (in these examples, the dead-letter queue is called CSQ1.DEAD.QUEUE and the queue manager is called CSQ1):

1. The names can be specified as positional parameters in the PARM parameter of the EXEC statement within the submitted JCL, for example:

```
//READQ EXEC PGM=CSQUDLQH,  
// PARM='CSQ1.DEAD.QUEUE CSQ1'
```

Figure 43. Specifying the queue manager and dead-letter queue names for the dead-letter queue handler in the JCL

2. The names can be specified in the rules table, for example:

```
INPUTQ(CSQ1.DEAD.QUEUE) INPUTQM(CSQ1)
```

Figure 44. Specifying the queue manager and dead-letter queue names for the dead-letter queue handler in the rules table

Any parameters that you specify in the PARM parameter override those in the rules table. If you specify only one parameter in the PARM statement, it is used as the name of the dead-letter queue. The rules table is taken from the SYSIN data set.

For further information on the keywords you can specify, to match and process pattern and action keywords, see “Rules (patterns and actions)” on page 1684.

### Stopping the DLQ handler

The CSQUDLQH utility is stopped when any of the following conditions is true:

- The dead letter queue is empty for a specified amount of time as configured by the WAIT control data keyword.
- The dead letter queue is set to GET(DISABLED).
- The queue manager is quiesced.
- The CSQUDLQH job is cancelled.

Messages generated during the handling of the queue are written to the standard output when the CSQUDLQH utility ends in a controlled manner. If the handler is cancelled, it does not generate these messages.

### Data definition statements

CSQUDLQH requires DD statements with these DDnames:

#### SYSOUT

This statement is required; it names the data set for print output. You can specify the logical record length (LRECL) and block size (BLKSIZE) for this output data set.

#### SYSIN

This statement is required; it names the input data set containing the rules table that specifies what the utility is to do. The logical record length (LRECL) is 80.

### Sample JCL

```
//READQ EXEC PGM=CSQUDLQH,
//      PARM='CSQ1.DEAD.QUEUE CSQ1'
//STEPLIB DD DSN=th1qua1.SCSQAUTH,DISP=SHR
//      DD DSN=th1qua1.SCSQLOAD,DISP=SHR
//      DD DSN=th1qua1.SCSQANLE,DISP=SHR
//SYSOUT DD SYSOUT=*
//SYSIN  DD *
INPUTQM(CSQ2) INPUTQ('CSQ2.DEAD.QUEUE')
ACTION(RETRY)
/*
```

*Figure 45. Sample JCL to invoke the CSQUDLQH utility.* In this example, queue manager CSQ1 and dead-letter queue CSQ1.DEAD.QUEUE are used because the values specified in the PARM statement override the values specified in the SYSIN data set.

### The DLQ handler rules table:

The DLQ handler rules table defines how the DLQ handler is to process messages that arrive on the DLQ.

There are two types of entry in a rules table:

- The first entry in the table, which is optional, contains “Control data” on page 1683.
- All other entries in the table are *rules* for the DLQ handler to follow. Each rule consists of a *pattern* (a set of message characteristics) that a message is matched against, and an *action* to be taken when a message on the DLQ matches the specified pattern. There must be at least one rule in a rules table.

Each entry in the rules table comprises one or more keywords.

See “Rules table conventions” on page 1687 for information about the syntax of the rules table.

See Rules (patterns and actions) for information about how the pattern-matching, and action keywords control the CSQUDLQH utility

## Control data

This section describes the keywords that you can include in a control-data entry in a DLQ handler rules table.

- All keywords are optional.
- If a control-data entry is included in the rules table, it *must* be the first entry in the table.
- The default value for a keyword, if any, is underlined>.
- The vertical line (|) separates alternatives. You can specify only one of these.

### **INPUTQ** (*QueueName* | ' ' )

Specifies the name of the DLQ that you want to process:

1. If you specify a queue name in the PARM parameter of the EXEC statement, this overrides any INPUTQ value in the rules table.
2. If you do not specify a queue name in the PARM parameter of the EXEC statement, the INPUTQ value in the rules table is used.
3. If you do not specify a queue name in the PARM parameter of the EXEC statement or the rules table, the dead-letter queue named *qmgr-name*.DEAD.QUEUE is used if it has been defined. If this queue does not exist, the program fails and returns error message CSQU224E, giving the reason code for the error.

### **INPUTQM** (*QueueManagerName* | ' ' )

Specifies the name of the queue manager that owns the DLQ named on the INPUTQ keyword.

1. If you specify a queue manager name in the PARM parameter of the EXEC statement, this overrides any INPUTQM value in the rules table.
2. If you do not specify a queue manager name in the PARM parameter of the EXEC statement, the INPUTQM value in the rules table is used.
3. If you do not specify a queue manager name in the PARM parameter of the EXEC statement or the rules table, the default queue manager is used (if one has been defined using CSQBDEFV). If not, the program fails and returns error message CSQU220E, giving the reason code for the error.

### **RETRYINT** (*Interval* | 60)

Specifies the interval, in seconds, at which the DLQ handler should attempt to reprocess messages on the DLQ that could not be processed at the first attempt, and for which repeated attempts have been requested. The DLQ handler reprocesses messages after it has first browsed to the end of the queue.

The default is 60 seconds.

### **WAIT** (YES | NO | *nnn*)

Specifies whether the DLQ handler should wait for further messages to arrive on the DLQ when it detects that there are no further messages that it can process.

**YES** The DLQ handler waits indefinitely.

**NO** The DLQ handler terminates when it detects that the DLQ is either empty or contains no messages that it can process.

*nnn* The DLQ handler waits for *nnn* seconds for new work to arrive after it detects that the queue is either empty or contains no messages that it can process, before terminating.

Specify a value in the range 1 through 999 999.

Specify WAIT (YES) for busy DLQs, and WAIT (NO) or WAIT ( *nnn* ) for DLQs that have a low level of activity. If the DLQ handler is allowed to terminate, you can use triggering to invoke it when needed.

Rules (patterns and actions):

The DLQ handler is controlled with a series of pattern-matching and action keywords described here.

Figure 46 shows an example rule from a DLQ handler rules table.

```
PERSIST(MQPER_PERSISTENT) REASON (MQRC_PUT_INHIBITED) +  
ACTION (RETRY) RETRY (3)
```

Figure 46. An example rule from a DLQ handler rules table. This rule instructs the DLQ handler to make three attempts to deliver to its destination queue any persistent message that was put on the DLQ because MQPUT and MQPUT1 were inhibited.

This section describes the keywords that you can include in a rules table. It begins with a description of the pattern-matching keywords (those keywords against which messages on the DLQ are matched). It then describes the action keywords (those keywords that determine how the DLQ handler is to process a matching message).

- All keywords except ACTION are optional.
- The default value for a keyword, if any, is underlined>. For most keywords, the default value is asterisk (\*), which matches any value.
- The vertical line (|) separates alternatives. You can specify only one of these keywords.

The keywords can be grouped as follows:

- The pattern-matching keywords
- The action keywords

### The pattern-matching keywords

The pattern-matching keywords, are described in the following table. You use these keywords to specify values against which messages on the DLQ are matched. All pattern-matching keywords are optional.

**APPLIDAT** (*ApplIdentityData* | \*)

The *ApplIdentityData* value of the message on the DLQ, specified in the message descriptor, MQMD.

**APPLNAME** (*PutAppName* | \*)

The name of the application that issued the MQPUT or MQPUT1 call, as specified in the *PutAppName* field of the message descriptor, MQMD, of the message on the DLQ.

**APPLTYPE** (*PutApplType* | \*)

The *PutApplType* value specified in the message descriptor, MQMD, of the message on the DLQ.

**DESTQ** (*QueueName* | \*)

The name of the message queue for which the message is destined.

**DESTQM** (*QueueManagerName* | \*)

The queue manager name for the message queue for which the message is destined.

**FEEDBACK** (*Feedback* | \*)

Describes the nature of the report when the *MsgType* value is MQMT\_REPORT.

You can use symbolic names. For example, you can use the symbolic name MQFB\_COA to identify those messages on the DLQ that require confirmation of their arrival on their destination queues. A few symbolic names are not accepted by the utility and lead to a syntax error. In these cases, you can use the corresponding numeric value.

**FORMAT** (*Format* | \*)

The name that the sender of the message uses to describe the format of the message data.

**MSGTYPE** (*MsgType* | \*)

The message type of the message on the DLQ.

You can use symbolic names. For example, you can use the symbolic name MQMT\_REQUEST to identify those messages on the DLQ that require replies.

**PERSIST** (*Persistence* | \*)

The persistence value of the message. (The persistence of a message determines whether it survives restarts of the queue manager.)

You can use symbolic names. For example, you can use the symbolic name MQPER\_PERSISTENT to identify those messages on the DLQ that are persistent.

**REASON** (*ReasonCode* | \*)

The reason code that describes why the message was put to the DLQ.

You can use symbolic names. For example, you can use the symbolic name MQRC\_Q\_FULL to identify those messages placed on the DLQ because their destination queues were full. A few symbolic names are not accepted by the utility and lead to a syntax error. In these cases, you can use the corresponding numeric value.

**REPLYQ** (*QueueName* | \*)

The reply-to queue name specified in the message descriptor, MQMD, of the message on the DLQ.

**REPLYQM** (*QueueManagerName* | \*)

The queue manager name of the reply-to queue specified in the REPLYQ keyword.

**USERID** (*UserIdentifier* | \*)

The user ID of the user who originated the message on the DLQ, as specified in the message descriptor, MQMD.

**The action keywords**

The action keywords are described in the following table. You use these keywords to describe how a matching message is processed.

**ACTION** ( **DISCARD**|**IGNORE**|**RETRY**|**FWD**)

The action taken for any message on the DLQ that matches the pattern defined in this rule.

**DISCARD**

Causes the message to be deleted from the DLQ.

**IGNORE**

Causes the message to be left on the DLQ.

**RETRY**

Causes the DLQ handler to try again to put the message on its destination queue.

**FWD** Causes the DLQ handler to forward the message to the queue named on the FWDQ keyword.

You must specify the ACTION keyword. The number of attempts made to implement an action is governed by the RETRY keyword. The RETRYINT keyword of the control data controls the interval between attempts.

**CONVERT** (**YES** |**NO**)

By default, this keyword is set to CONVERT(YES). When forwarding or retrying a message, the DLQ handler performs an MQGET with MQGMO\_CONVERT; that is, it converts the message data to the CCSID and encoding of the queue manager.

However, setting CONVERT(NO) forwards or retries the message without converting the message contents.

**FWDQ** (*QueueName* |&DESTQ|&REPLYQ)

The name of the message queue to which the message is forwarded when you select the ACTION keyword.

*QueueName*

This parameter is the name of a message queue. FWDQ(' ') is not valid.

**&DESTQ**

Takes the queue name from the *DestQName* field in the MQDLH structure.

**&REPLYQ**

Takes the name from the *ReplyToQ* field in the message descriptor, MQMD. You can specify REPLYQ (?\*) in the message pattern to avoid error messages, when a rule specifying FWDQ (&REPLYQ), matches a message with a blank *ReplyToQ* field.

**FWDQM** (*QueueManagerName* |&DESTQM|&REPLYQM|' ') 

The queue manager of the queue to which a message is forwarded.

*QueueManagerName*

This parameter defines the queue manager name for the queue to which the message is forwarded when you select the ACTION (FWD) keyword.

**&DESTQM**

Takes the queue manager name from the *DestQMgrName* field in the MQDLH structure.

**&REPLYQM**

Takes the name from the *ReplyToQMgr* field in the message descriptor, MQMD.

' ' The local queue manager.

**HEADER** (YES |NO)

Whether the MQDLH should remain on a message for which ACTION (FWD) is requested. By default, the MQDLH remains on the message. The HEADER keyword is not valid for actions other than FWD.

**PUTAUT** (DEF |CTX)

The authority with which messages should be put by the DLQ handler:

**DEF** Puts messages with the authority of the DLQ handler itself.

**CTX** Causes the messages to be put with the authority of the user ID in the message context. You must be authorized to assume the identity of other users, if you specify PUTAUT (CTX).

**RETRY** (*RetryCount* | 1)

The number of times that an action should be attempted (at the interval specified on the RETRYINT keyword of the control data). Specify a value in the range 1 through 999 999 999.

**Note:** The count of attempts made by the DLQ handler to implement any particular rule is specific to the current instance of the DLQ handler; the count does not persist across restarts. If you restart the DLQ handler, the count of attempts made to apply a rule is reset to zero.

*Rules table conventions:*

Use this topic to understand the conventions used in the CSQUDLQH rule table.

The rules table must adhere to the following conventions regarding its syntax, structure, and contents:

- A rules table must contain at least one rule.
- Keywords can occur in any order.
- A keyword can be included once only in any rule.
- Keywords are not case-sensitive.
- A keyword and its parameter value can be separated from other keywords by at least one blank or comma.
- Any number of blanks can occur at the beginning or end of a rule, and between keywords, punctuation, and values.
- Each rule must begin on a new line.
- For reasons of portability, the significant length of a line should not be greater than 72 characters.
- Use the plus sign (+) as the last nonblank character on a line to indicate that the rule continues from the first nonblank character in the next line. Use the minus sign (-) as the last nonblank character on a line to indicate that the rule continues from the start of the next line. Continuation characters can occur within keywords and parameters.

For example:

```
APPLNAME('ABC+  
D')
```

results in 'ABCD'.

```
APPLNAME('ABC-  
D')
```

results in 'ABC D'.

- Comment lines, which begin with an asterisk (\*), can occur anywhere in the rules table.
- Blank lines are ignored.

Each entry in the DLQ handler rules table comprises one or more keywords and their associated parameters. The parameters must follow these syntax rules:

- Each parameter value must include at least one significant character. The delimiting quotation marks in following examples are not considered significant. For example, these parameters are valid:

**FORMAT('ABC')**

3 significant characters

**FORMAT(ABC)**

3 significant characters

**FORMAT('A')**

1 significant character

**FORMAT(A)**

1 significant character

**FORMAT(' ')**

1 significant character

These parameters are not valid because they contain no significant characters:

- FORMAT('')
- FORMAT( )
- FORMAT()
- FORMAT

- Wildcard characters are supported. You can use the question mark (?) instead of any single character, except a trailing blank. You can use the asterisk (\*) instead of zero or more adjacent characters. The asterisk (\*) and the question mark (?) are *always* interpreted as wildcard characters in parameter values.
- You cannot include wildcard characters in the parameters of these keywords: ACTION, HEADER, RETRY, FWDQ, FWDQM, and PUTAUT.
- Trailing blanks in parameter values, and in the corresponding fields in the message on the DLQ, are not significant when performing wildcard matches. However, leading and embedded blanks within strings in quotation marks are significant to wildcard matches.
- Numeric parameters cannot include the question mark (?) wildcard character. You can include the asterisk (\*) instead of an entire numeric parameter, but the asterisk cannot be included as part of a numeric parameter. For example, these are valid numeric parameters:

**MSGTYPE(2)**

Only reply messages are eligible

**MSGTYPE(\*)**

Any message type is eligible

**MSGTYPE(' \*')**

Any message type is eligible

However, MSGTYPE('2\*') is not valid, because it includes an asterisk (\*) as part of a numeric parameter.

- Numeric parameters must be in the range zero through 999 999 999 unless otherwise stated. If the parameter value is in this range, it is accepted, even if it is not currently valid in the field to which the keyword relates. You can use symbolic names for numeric parameters.
- If a string value is shorter than the field in the MQDLH or MQMD to which the keyword relates, the value is padded with blanks to the length of the field. If the value, excluding asterisks, is longer than the field, an error is diagnosed. For example, these are all valid string values for an eight character field:

**'ABCDEFGH'**

8 characters

**'A\*C\*E\*G\*I'**

5 characters excluding asterisks

**'\*A\*C\*E\*G\*I\*K\*M\*O\*'**

8 characters excluding asterisks

- Strings that contain blanks, lowercase characters, or special characters other than period (.), forward slash (/), underscore (\_), and percent sign (%) must be enclosed in single quotation marks. Lowercase characters not enclosed in quotation marks are folded to uppercase. If the string includes a quotation, two single quotation marks must be used to denote both the beginning and the end of the quotation. When the length of the string is calculated, each occurrence of double quotation marks is counted as a single character.

## Processing the rules table:

Use this topic to understand how the CSQUDLQH utility processes the rules table.

The DLQ handler searches the rules table for a rule with a pattern that matches a message on the DLQ. The search begins with the first rule in the table, and continues sequentially through the table. When a rule with a matching pattern is found, the rules table attempts the action from that rule. The DLQ handler increments the retry count for a rule by 1 whenever it attempts to apply that rule. If the first attempt fails, the attempt is repeated until the count of attempts made matches the number specified on the RETRY keyword. If all attempts fail, the DLQ handler searches for the next matching rule in the table.

This process is repeated for subsequent matching rules until an action is successful. When each matching rule has been attempted the number of times specified on its RETRY keyword, and all attempts have failed, ACTION (IGNORE) is assumed. ACTION (IGNORE) is also assumed if no matching rule is found.

For further information, see Ensuring that all DLQ messages are processed.

### Note:

1. Matching rule patterns are sought only for messages on the DLQ that begin with an MQDLH. If the dead-letter queue handler encounters one or more messages that are not prefixed by an MQDLH, it issues an information message to report this. Messages that do not contain an MQDLH are not processed by the DLQ handler and remain on the dead-letter queue until dealt with by another method.
2. All pattern keywords can default, so that a rule can consist of an action only. Note, however, that action-only rules are applied to all messages on the queue that have MQDLHs and that have not already been processed in accordance with other rules in the table.
3. The rules table is validated when the DLQ handler starts, and errors flagged at that time. You can change the rules table at any time, but those changes do not come into effect until the DLQ handler is restarted.
4. The DLQ handler does not alter the content of messages, of the MQDLH, or of the message descriptor. The DLQ handler always puts messages to other queues with the message option MQPMO\_PASS\_ALL\_CONTEXT.
5. Consecutive syntax errors in the rules table might not be recognized because the validation of the rules table is designed to eliminate the generation of repetitive errors.
6. The DLQ handler opens the DLQ with the MQOO\_INPUT\_AS\_Q\_DEF option.
7. Do not run applications that perform MQGET calls against the queue at the same time as the DLQ handler. This includes multiple instances of the DLQ handler. There is typically a one-to-one relationship between the dead-letter queue and the DLQ handler.

## Ensuring that all DLQ messages are processed

The DLQ handler keeps a record of all messages on the DLQ that have been seen but not removed. If you use the DLQ handler as a filter to extract a small subset of the messages from the DLQ, the DLQ handler still keeps a record of those messages on the DLQ that it did not process. Also, the DLQ handler cannot guarantee that new messages arriving on the DLQ will be seen, even if the DLQ is defined as first-in first-out (FIFO). Therefore, if the queue is not empty, the DLQ is periodically rescanned to check all messages. For these reasons, ensure that the DLQ contains as few messages as possible. If messages that cannot be discarded or forwarded to other queues (for whatever reason) are allowed to accumulate on the queue, the workload of the DLQ handler increases and the DLQ itself is in danger of filling up.

You can take specific measures to enable the DLQ handler to empty the DLQ. For example, do not use ACTION (IGNORE), which leaves messages on the DLQ. (Remember that ACTION (IGNORE) is assumed for messages that are not explicitly addressed by other rules in the table.) Instead, for those messages that you would otherwise ignore, use an action that moves the messages to another queue. For

example:

```
ACTION (FWD) FWDQ (IGNORED.DEAD.QUEUE) HEADER (YES)
```

Similarly, the final rule in the table should be a catchall to process messages that have not been addressed by earlier rules in the table. For example, the final rule in the table could be something like this:

```
ACTION (FWD) FWDQ (REALLY.DEAD.QUEUE) HEADER (YES)
```

This forwards messages that fall through to the final rule in the table to the queue REALLY.DEAD.QUEUE, where they can be processed manually. If you do not have such a rule, messages are likely to remain on the DLQ indefinitely.

### An example DLQ handler rules table:

Use this topic as an example of the DLQ handler rules table.

Here is an example rules table that contains a single control-data entry and several rules:

```
*****
*           An example rules table for the CSQUDLQH utility           *
*****
* Control data entry
* -----
* If no queue manager name is supplied as an explicit parameter to CSQUDLQH,
* use the default queue manager.
* If no queue name is supplied as an explicit parameter to CSQUDLQH, use the
* DLQ defined for the queue manager.
*
inputqm(' ') inputq(' ')

* Rules
* -----

* The first check deals with attempted security violations.
* If a message was placed on the DLQ because the putter did not have the
* appropriate authority for the target queue, forward the message to a queue
* for manual inspection.

REASON(MQRC_NOT_AUTHORIZED) ACTION(FWD) +
FWDQ(DEADQ.MANUAL.SECURITY)

* The next set of rules with ACTION (RETRY) try to deliver the message to the
* intended destination.

* If a message is placed on the DLQ because its destination queue is full,
* attempt to forward the message to its destination queue. Make 5 attempts at
* approximately 60-second intervals (the default value for RETRYINT).

REASON(MQRC_Q_FULL) ACTION(RETRY) RETRY(5)

* If a message is placed on the DLQ because there has been a problem starting the
* application by triggering, forward the message to another queue for manual
* inspection.

REASON(MQFB_APPL_CANNOT_BE_STARTED) ACTION(FWD) +
FWDQ(DEADQ.MANUAL.TRIGGER)

* If a message is placed on the DLQ because of a put inhibited condition, attempt
* to forward the message to its destination queue. Make 5 attempts at
* approximately 60-second intervals (the default value for RETRYINT).

REASON(MQRC_PUT_INHIBITED) ACTION(RETRY) RETRY(5)

* The AAAA corporation often send messages with incorrect addresses. When we find
```

- \* a request from the AAAA corporation, we return it to the DLQ (DEADQ) of the
- \* reply-to queue manager (&REPLYQM). The AAAA DLQ handler attempts to
- \* redirect the message.

```
MSGTYPE(MQMT_REQUEST) REPLYQM(AAAA.*) +  
  ACTION(FWD) FWDQ(DEADQ) FWDQM(&REPLYQM)
```

- \* The BBBB corporation requests that we try sending messages to queue manager
- \* BBB2 if queue manager BBB1 is unavailable.

```
DESTQM(BBB1) +  
  ACTION(FWD) FWDQ(&DESTQ) FWDQM(BBB2) HEADER(NO)
```

- \* The CCCC corporation is very security conscious, and believes that none of its
- \* messages will ever end up on one of our DLQs. If we do see a message from a
- \* CCCC queue manager on our DLQ, we send it to a special destination in the CCCC
- \* organization where the problem is investigated.

```
REPLYQM(CCCC.*) +  
  ACTION(FWD) FWDQ(ALARM) FWDQM(CCCC.SYSTEM)
```

- \* Messages that are not persistent risk being lost when a queue manager terminates.
- \* If an application is sending nonpersistent messages, it will be able to cope with
- \* the message being lost, so we can afford to discard the message.

```
PERSIST(MQPER_NOT_PERSISTENT) ACTION(DISCARD)
```

- \* For performance and efficiency reasons, we like to keep the number of messages on
- \* the DLQ small. If we receive a message that has not been processed by an earlier
- \* rule in the table, we assume that it requires manual intervention to resolve the
- \* problem.

- \* Some problems are best solved at the node where the problem was detected, and
- \* others are best solved where the message originated. We do not have the message
- \* origin, but we can use the REPLYQM to identify a node that has some interest
- \* in this message. Attempt to put the message onto a manual intervention queue
- \* at the appropriate node. If this fails, put the message on the manual
- \* intervention queue at this node.

```
REPLYQM('?*') +  
  ACTION(FWD) FWDQ(DEADQ.MANUAL.INTERVENTION) FWDQM(&REPLYQM)
```

```
ACTION(FWD) FWDQ(DEADQ.MANUAL.INTERVENTION)
```

## The BSDS conversion utility (CSQJUCNV)

You can use the CSQJUCNV BSDS conversion utility to convert a version 1 bootstrap data set (BSDS) to version 2. CSQJUCNV runs as a batch job.

A version 1 BSDS supports 6 byte log RBA (Relative Byte Address) values. A version 2 BSDS can be used by queue managers running IBM MQ Version 8.0, and supports 8 byte log RBA values. For more information about the change from 6 byte to 8 byte log RBA, see Larger log Relative Byte Address.

A version 2 BSDS can be used only by queue managers that have Version 8.0 new functions enabled with OPMODE. If the queue manager is in a queue-sharing group, all queue managers in the queue-sharing group must either have been started with OPMODE(NEWFUNC,800), or added into the queue-sharing group at Version 8.0, before the BSDS can be converted to version 2.

If the parameters provided specify that the queue manager is in a queue-sharing group, the utility checks that the queue managers are at the correct level, before allowing the conversion of the BSDS to proceed. For queue managers that are not in a queue-sharing group, the utility does not check that the queue manager has been started in Version 8.0 new function mode.

The converted BSDSs are written to new data sets. These new data sets must be allocated with similar attributes to the current BSDS before the utility is run, and must be empty. A version 2 BSDS contains more data than a version 1 BSDS, therefore, you must ensure that the new data sets are allocated with sufficient available space. See Planning your logging environment, and the associated topics, for the recommended values when defining a new BSDS.

The current BSDSs are not modified and can be used to start the queue manager, should the attempt to convert the BSDSs and restart the queue manager with the new BSDS be unsuccessful.

**Important:**

1. Only run this utility when the queue manager that owns the BSDS is stopped.
2. Do not attempt to start the queue manager with the new BSDS until the utility has completed successfully. If a queue manager is started with a BSDS that is the output of an unsuccessful or incomplete conversion, it terminates with reason code 00D10121.
3. To use this utility, your user ID of the job must have read and write access to both the old and new BSDSs.
  - “Invoking the CSQJUCNV utility”
  - “Syntax, keywords, and parameters”
  - “Data definition (DD) statements” on page 1693

**Invoking the CSQJUCNV utility**

The utility runs as a z/OS batch program. Figure 1 shows an example of the JCL used to invoke the CSQJUCNV utility for a queue manager that is a member of a queue-sharing group.

```
//CONVERT EXEC PGM=CSQJUCNV,REGION=32M,
//          PARM=(' INQSG,qsgname,dsgname,db2ssid')
//STEPLIB DD DSN=th1qua1.SCSQAUTH,DISP=SHR
//          DD DSN=th1qua1.SCSQANLE,DISP=SHR
//          DD DSN=db2qua1.SDSNLOAD,DISP=SHR
//SYSPRINT DD SYSOUT=*
//SYSUT1 DD DSN=h1q.BSDS01,DISP=SHR
//SYSUT2 DD DSN=h1q.BSDS02,DISP=SHR
//SYSUT3 DD DSN=newh1q.BSDS01,DISP=OLD
//SYSUT4 DD DSN=newh1q.BSDS02,DISP=OLD
```

Figure 47. Sample JCL to invoke the CSQJUCNV utility

Sample JCL to run the utility is also provided in th1qua1.SCSQPROC(CSQ4BCNV).

**Syntax, keywords, and parameters**

**BSDS conversion utility**

**PARM**

This field must contain one of the following parameters to indicate whether the queue manager is a member of a queue-sharing group or not, followed by any function-specific parameters described in the following text:

**INQSG**

The queue manager that owns the BSDS is a member of a queue-sharing group. Specifying

this parameter causes the utility to verify that all members of the queue-sharing group have either been started with OPMODE(NEWFUNC,800), or been added into the queue-sharing group at Version 8.0.

See Implementing the larger log Relative Byte Address for details on how you perform this task.

The utility terminates with a nonzero reason code, without writing anything to the output BSDS, if this condition is not met.

*qsgname*

The queue-sharing group name

*dsgname*

The Db2 data-sharing group name

*db2ssid*

The Db2 subsystem ID

#### **NOQSG**

The queue manager that owns the BSDS is not a member of a queue-sharing group. The BSDS is converted, regardless of whether the queue manager has been started with OPMODE(NEWFUNC,800).

**Attention:** Do not specify this parameter for a queue manager that is a member of a queue-sharing group.

### **Data definition (DD) statements**

CSQJUCNV recognizes DD statements with the following DD names:

#### **SYSUT1**

Specifies the old BSDS that is to be converted. This statement is required.

#### **SYSUT2**

Specifies the second copy of the old BSDS that is to be converted. If you are using dual BSDS, you should specify this.

#### **SYSUT3**

Specifies the new, converted BSDS. This statement is required.

#### **SYSUT4**

Specifies the second copy of the converted BSDS. This statement is required if the installation uses dual BSDSs; otherwise, it is optional.

#### **SYSPRINT**

Contains the output messages from the conversion utility. This statement is required.

## The message security policy utility (CSQ0UTIL)

The IBM MQ Advanced Message Security policy utility is provided to manage security policies that specify the cryptographic encryption and signature algorithms for encrypting and authenticating messages that flow through queues.

Using this utility program, you can display, define, alter, delete and export security policies.

The CSQ0UTIL utility program runs as a z/OS batch utility that accepts **SYSIN** command input. Sample JCL to run the utility is provided in member CSQ40CFG of thlqual.SCSQPROC.

```
-----  
//CSQ40CFG JOB 1,CSQ0,CLASS=A,MSGCLASS=X  
//CSQ40CFG EXEC PGM=CSQ0UTIL,  
//          PARM='ENVAR("_CEE_ENVFILE_S=DD:ENVARS") /'  
//STEPLIB DD DSN=thlqua1.SCSQANLE,DISP=SHR  
//          DD DSN=thlqua1.SCSQAUTH,DISP=SHR  
//ENVARS  DD DSN=thlqua1.SCSQPROC(CSQ40ENV),DISP=SHR  
//SYSPRINT DD SYSOUT=*  
//SYSIN   DD *  
dspmqspl -m <qmgr>  
/*  
-----
```

The utility accepts the following commands:

### **dspmqspl**

Display or export information about one or more security policies.

### **setmqspl**

Define, alter or remove a security policy

For information on how to use these commands to manage security policies see Managing security policies.

## General usage notes

When specifying distinguished names (DNs) that have embedded blanks, you must enclose the entire DN in double quotes ("). For example:

```
-a "CN=John Smith,O=IBM,C=US"  
-r "CN=JSmith,O=IBM Australia,C=AU"
```

Arguments that would exceed column 80 of a SYSIN input record can be continued on subsequent SYSIN records provided those arguments are enclosed in double quotes ("), and relevant continuations resume in column 1 of subsequent SYSIN records.

When exporting policy information using **dspmqspl** with the **-export** parameter the output is written to an additional DD named EXPORT. The EXPORT DD can be SYSOUT=\*, a sequential data set, or the member of a partitioned data set. The record format is fixed block and the logical record length is 80. The output is in the form of one or more **setmqspl** commands that can subsequently be used as input to CSQ0UTIL.

To use this utility you need connect authority to the queue manager and access to the queue SYSTEM.PROTECTION.POLICY.QUEUE. If command events have been enabled for the queue manager you need put authority to the queue SYSTEM.ADMIN.COMMAND.EVENT. If configuration events have been enabled for the queue manager you need put authority to the queue SYSTEM.ADMIN.CONFIG.EVENT.

**Related information:**

Security policies

**dspmqspl:**

Use the **dspmqspl** command to display a list of all policies and details of a named policy.

**Syntax**

Table 137. *dspmqspl* command flags.

Command flag	Explanation
-m	Queue manager name ( <b>mandatory</b> ).
-p	Policy name.
-export	Adding this flag generates output which can easily be applied to a different queue manager.

**setmqspl:**

Use the **setmqspl** command to define a new security policy, alter an already existing one, or remove an existing policy.

**Syntax**

**Policy definition:**

**Notes:**

- 1 If an encryption algorithm is selected, a recipient DN must also be provided.
- 2 If an author DN is provided, a signing algorithm must also be selected.

Table 138. *setmqspl* command flags.

Command flag	Explanation
-m	Queue manager name. This flag is mandatory for all actions on security policies.
-p	Policy name. Set the policy name to the name of the queue you want the policy to apply to.
-s	Digital signature algorithm. IBM MQ Advanced Message Security supports the following values: MD5, SHA1, SHA256, SHA384, and SHA512. All must be in uppercase. The default value is NONE <b>Important:</b> <ul style="list-style-type: none"> <li>For the SHA384 and SHA512 cryptographic hash functions, keys used for signing must be longer than 768 bits.</li> <li>The name, or names, of the encryption algorithms must be in uppercase.</li> <li>The signature algorithm cannot be NONE if the encryption algorithm is different from NONE.</li> </ul>
-e	Digital encryption algorithm. IBM MQ Advanced Message Security supports the following encryption algorithms: RC2, DES, 3DES, AES128, AES256. The default value is NONE. <b>Important:</b> The name, or names, of the encryption algorithms must be in uppercase
-r	The distinguished name (DN) of the message recipient (certificate of a DN provided is used to encrypt a given message). Recipients can be specified only if encryption algorithm is different from NONE. Multiple recipients can be included for a message. Each DN must be provided with a separate -r flag. <b>Important:</b> <ul style="list-style-type: none"> <li>DN attribute names must be in uppercase.</li> <li>Commas must be used as a name separators.</li> <li>To avoid command interpreter errors, place quotation marks around the DNs.</li> </ul> For example: -r "CN=alice, O=ibm, C=US"
-a	Signature DN that is validated during message retrieval. Only messages signed by a user with a DN provided are accepted during the retrieval. Signature DNs can be specified only if the signature algorithm is different from NONE. Multiple authors can be included. Each author needs to have a separate -a flag. <b>Important:</b> DN attribute name must be in uppercase.

Table 138. *setmqspl* command flags. (continued)

Command flag	Explanation
-t	<p>Toleration flag that indicates whether a policy that is associated with a queue can be ignored when an attempt to retrieve a message from the queue involves a message with no security policy set. Valid values include:</p> <ul style="list-style-type: none"> <li>•</li> <li> <p><b>0 (default)</b> Toleration flag off.</p> </li> <li>•</li> <li> <p><b>1</b> Toleration flag on.</p> </li> </ul> <p>Toleration is optional and facilitates staged implementation, where policies were applied to queues but those queues may already contain messages that have no policy, or still receive messages from remote systems that do not have the security policy set.</p>
-remove	<p>Delete policy.</p> <p>If specified, only the -p flag remains valid.</p>

## IBM MQ Administration Interface

Use the reference information in this section to accomplish the tasks that address your business needs.

### MQAI reference

Reference information for the MQAI.

A list of reference information for the MQAI.

There are two types of selector: *user selector* and *system selector*. These are described in “MQAI Selectors” on page 1775.

There are three types of call:

- Data-bag manipulation calls for configuring data bags:
  - “mqAddBag” on page 1698
  - “mqAddByteString” on page 1700
  - “mqAddByteStringFilter” on page 1702
  - “mqAddInquiry” on page 1704
  - “mqAddInteger” on page 1706
  - “mqAddInteger64” on page 1707
  - “mqAddIntegerFilter” on page 1709
  - “mqAddString” on page 1710
  - “mqAddStringFilter” on page 1712
  - “mqClearBag” on page 1717
  - “mqCountItems” on page 1718
  - “mqCreateBag” on page 1720
  - “mqDeleteBag” on page 1723
  - “mqDeleteItem” on page 1724
  - “mqInquireBag” on page 1732
  - “mqInquireByteString” on page 1734

- "mqInquireByteStringFilter" on page 1736
- "mqInquireInteger" on page 1739
- "mqInquireInteger64" on page 1741
- "mqInquireIntegerFilter" on page 1743
- "mqInquireItemInfo" on page 1745
- "mqInquireString" on page 1747
- "mqInquireStringFilter" on page 1750
- "mqSetByteString" on page 1756
- "mqSetByteStringFilter" on page 1758
- "mqSetInteger" on page 1761
- "mqSetInteger64" on page 1763
- "mqSetIntegerFilter" on page 1765
- "mqSetString" on page 1767
- "mqSetStringFilter" on page 1770
- "mqTruncateBag" on page 1774
- Command calls for sending and receiving administration commands and PCF messages:
  - "mqBagToBuffer" on page 1714
  - "mqBufferToBag" on page 1716
  - "mqExecute" on page 1726
  - "mqGetBag" on page 1730
  - "mqPutBag" on page 1754
- Utility calls for handling blank-padded and null-terminated strings:
  - "mqPad" on page 1753
  - "mqTrim" on page 1773

These calls are described in alphabetical order in the following sections.

### **mqAddBag:**

The mqAddBag call nests a bag in another bag.

#### **Syntax for mqAddBag**

**mqAddBag** (*Bag, Selector, ItemValue, CompCode, Reason*)

#### **Parameters for mqAddBag**

##### **Bag (MQHBAG) - input**

Bag handle into which the item is to be added.

The bag must be a user bag. This means that it must have been created using the MQCBO\_USER\_BAG option on the mqCreateBag call. If the bag was not created in this way, MQRC\_WRONG\_BAG\_TYPE results.

##### **Selector (MQLONG) - input**

Selector identifying the item to be nested.

If the selector is less than zero (that is, a system selector), MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

If the selector is zero or greater (that is, a user selector) and the bag was created with the MQCBO\_CHECK\_SELECTORS option, the selector must be in the range MQGA\_FIRST through MQGA\_LAST; if not, again MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value of zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC\_INCONSISTENT\_ITEM\_TYPE results if it is not.

**ItemValue (MQHBAG) - input**

The bag which is to be nested.

If the bag is not a group bag, MQRC\_BAG\_WRONG\_TYPE results. If an attempt is made to add a bag to itself, MQRC\_HBAG\_ERROR results.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the mqAddBag call:

**MQRC\_BAG\_WRONG\_TYPE**

Wrong type of bag for intended use (either Bag or ItemValue).

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of this occurrence of selector differs from data type of first occurrence.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**Usage notes for mqAddBag**

If a bag with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.

**C language invocation for mqAddBag**

```
mqAddBag (Bag, Selector, ItemValue, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHBAG Bag; /* Bag handle */
MQLONG Selector; /* Selector */
MQHBAG ItemValue; /* Nested bag handle */
MQLONG CompCode; /* Completion code */
MQLONG Reason; /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqAddBag**

(Supported on Windows only.)

```
mqAddGroup Bag, Selector, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemValue As Long 'Nested bag handle'
Dim CompCode As Long 'Completion code'
Dim Reason As Long 'Reason code qualifying CompCode'
```

**Note:** The `mqAddBag` call can be used with user bags only; you cannot add nested bags to administration or command bags. You can only nest group bags.

### **mqAddByteString:**

The `mqAddByteString` call adds a byte string identified by a user selector to the end of a specified bag.

#### **Syntax for mqAddByteString**

**mqAddByteString** (*Bag, Selector, BufferLength, Buffer, CompCode, Reason*)

#### **Parameters for mqAddByteString**

##### **Bag (MQHBAG) - input**

Handle of the bag to be modified.

This value must be the handle of a bag created by the user, not the handle of a system bag.

`MQRC_SYSTEM_BAG_NOT_ALTERABLE` results if the value you specify relates to a system bag.

##### **Selector (MQLONG) - input**

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), `MQRC_SELECTOR_OUT_OF_RANGE` results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the `MQCBO_CHECK_SELECTORS` option or as an administration bag (`MQCBO_ADMIN_BAG`), the selector must be in the range `MQBA_FIRST` through `MQBA_LAST`.

`MQRC_SELECTOR_OUT_OF_RANGE` results if it is not in the correct range.

If `MQCBO_CHECK_SELECTORS` was not specified, the selector can be any value zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence;

`MQRC_INCONSISTENT_ITEM_TYPE` results if it is not.

##### **BufferLength (MQLONG) - input**

The length in bytes of the string contained in the *Buffer* parameter. The value must be zero or greater.

##### **Buffer (MQBYTE × BufferLength) - input**

Buffer containing the byte string.

The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter. In all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

##### **CompCode (MQLONG) - output**

Completion code.

##### **Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqAddByteString` call:

##### **MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

##### **MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

##### **MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of this occurrence of selector differs from data type of first occurrence.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**Usage notes for mqAddByteString**

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.

**C language invocation for mqAddByteString**

```
mqAddByteString (hBag, Selector, BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;     /* Selector */
MQLONG  BufferLength; /* Buffer length */
PMQBYTE Buffer         /* Buffer containing item value */
MQLONG  CompCode;    /* Completion code */
MQLONG  Reason;      /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqAddByteString**

(Supported on Windows only.)

```
mqAddByteString Bag, Selector, BufferLength, Buffer, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'
Dim Selector      As Long 'Selector'
Dim BufferLength  As Long 'Buffer length'
Dim Buffer        As Byte  'Buffer containing item value'
Dim CompCode     As Long  'Completion code'
Dim Reason       As Long  'Reason code qualifying CompCode'
```

## **mqAddByteStringFilter:**

The `mqAddByteStringFilter` call adds a byte string filter identified by a user selector to the end of a specified bag.

### **Syntax for mqAddByteStringFilter**

`mqAddByteStringFilter` (*Bag, Selector, BufferLength, Buffer, Operator, CompCode, Reason*)

### **Parameters for mqAddByteStringFilter**

#### **Bag (MQHBAG) - input**

Handle of the bag to be modified.

This value must be the handle of a bag created by the user, not the handle of a system bag.

MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if the value you specify relates to a system bag.

#### **Selector (MQLONG) - input**

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQBA\_FIRST through MQBA\_LAST.

MQRC\_SELECTOR\_OUT\_OF\_RANGE results if it is not in the correct range.

If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence;

MQRC\_INCONSISTENT\_ITEM\_TYPE results if it is not.

#### **BufferLength (MQLONG) - input**

The length in bytes of the condition byte string contained in the *Buffer* parameter. The value must be zero or greater.

#### **Buffer (MQBYTE x BufferLength) - input**

Buffer containing the condition byte string.

The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter. In all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

#### **Operator (MQLONG) - input**

The byte string filter operator to be placed in the bag. Valid operators are of the form MQCFOP\_\*.

#### **CompCode (MQLONG) - output**

Completion code.

#### **Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqAddByteStringFilter` call:

#### **MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not accessible).

#### **MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

#### **MQRC\_FILTER\_OPERATOR\_ERROR**

Filter operator not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of this occurrence of selector differs from data type of first occurrence.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**Usage notes for mqAddByteStringFilter**

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.

**C language invocation for mqAddByteStringFilter**

```
mqAddByteStringFilter (hBag, Selector, BufferLength, Buffer, Operator,
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   hBag;           /* Bag handle */
MQLONG   Selector;      /* Selector */
MQLONG   BufferLength;  /* Buffer length */
PMQBYTE  Buffer          /* Buffer containing item value */
MQLONG   Operator       /* Operator */
PMQLONG  CompCode;     /* Completion code */
PMQLONG  Reason;       /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqAddByteStringFilter**

(Supported on Windows only.)

```
mqAddByteStringFilter Bag, Selector, BufferLength, Buffer, Operator, CompCode,
Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'
Dim Selector      As Long 'Selector'
Dim BufferLength  As Long 'Buffer length'
Dim Buffer        As String 'Buffer containing item value'
Dim Operator     As Long 'Operator'
Dim CompCode     As Long 'Completion code'
Dim Reason       As Long 'Reason code qualifying CompCode'
```

## mqAddInquiry:

The mqAddInquiry call can be used with administration bags only; it is specifically for administration purposes.

The mqAddInquiry call adds a selector to an administration bag. The selector refers to an IBM MQ object attribute that is to be returned by a PCF INQUIRE command. The value of the Selector parameter specified on this call is added to the end of the bag, as the value of a data item that has the selector value MQIACF\_INQUIRY.

### Syntax for mqAddInquiry

**mqAddInquiry** (*Bag, Selector, CompCode, Reason*)

### Parameters for mqAddInquiry

#### **Bag (MQHBAG) - input**

Bag handle.

The bag must be an administration bag; that is, it must have been created with the MQCBO\_ADMIN\_BAG option on the mqCreateBag call. If the bag was not created this way, MQRC\_BAG\_WRONG\_TYPE results.

#### **Selector (MQLONG) - input**

Selector of the IBM MQ object attribute that is to be returned by the appropriate INQUIRE administration command.

#### **CompCode (MQLONG) - output**

Completion code.

#### **Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the mqAddInquiry call:

#### **MQRC\_BAG\_WRONG\_TYPE**

Wrong type of bag for intended use.

#### **MQRC\_HBAG\_ERROR**

Bag handle not valid.

#### **MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

#### **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

#### **MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

### Usage notes for mqAddInquiry

1. When the administration message is generated, the MQAI constructs an integer list with the MQIACF\_\*\_ATTRS or MQIACH\_\*\_ATTRS selector that is appropriate to the Command value specified on the mqExecute, mqPutBag, or mqBagToBuffer call. It then adds the values of the attribute selectors specified by the mqAddInquiry call.
2. If the Command value specified on the mqExecute, mqPutBag, or mqBagToBuffer call is not recognized by the MQAI, MQRC\_INQUIRY\_COMMAND\_ERROR results. Instead of using the mqAddInquiry call, this can be overcome by using the mqAddInteger call with the appropriate MQIACF\_\*\_ATTRS or MQIACH\_\*\_ATTRS selector and the ItemValue parameter of the selector being inquired.

## C language invocation for mqAddInquiry

```
mqAddInquiry (Bag, Selector, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;      /* Selector */
MQLONG  CompCode;     /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

## Visual Basic invocation for mqAddInquiry

(Supported on Windows only.)

```
mqAddInquiry Bag, Selector, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## Supported INQUIRE command codes

- MQCMD\_INQUIRE\_AUTH\_INFO
- MQCMD\_INQUIRE\_AUTH\_RECS
- MQCMD\_INQUIRE\_AUTH\_SERVICE
- MQCMD\_INQUIRE\_CF\_STRUC
- MQCMD\_INQUIRE\_CHANNEL
- MQCMD\_INQUIRE\_CHANNEL\_STATUS
- MQCMD\_INQUIRE\_CLUSTER\_Q\_MGR
- MQCMD\_INQUIRE\_CONNECTION
- MQCMD\_INQUIRE\_LISTENER
- MQCMD\_INQUIRE\_LISTENER\_STATUS
- MQCMD\_INQUIRE\_NAMELIST
- MQCMD\_INQUIRE\_PROCESS
- MQCMD\_INQUIRE\_Q
- MQCMD\_INQUIRE\_Q\_MGR
- MQCMD\_INQUIRE\_Q\_MGR\_STATUS
- MQCMD\_INQUIRE\_Q\_STATUS
- MQCMD\_INQUIRE\_SECURITY

For an example that demonstrates the use of supported INQUIRE command codes, see *Inquiring about queues and printing information (amqsailq.c)*.

## **mqAddInteger:**

The `mqAddInteger` call adds an integer item identified by a user selector to the end of a specified bag.

### **Syntax for `mqAddInteger`**

`mqAddInteger` (*Bag, Selector, ItemValue, CompCode, Reason*)

### **Parameters for `mqAddInteger`**

#### ***Bag* (MQHBAG) - input**

Handle of the bag to be modified.

This must be the handle of a bag created by the user, not the handle of a system bag.

`MQRC_SYSTEM_BAG_NOT_ALTERABLE` results if the value you specify identifies a system bag.

#### ***Selector* (MQLONG)**

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), `MQRC_SELECTOR_OUT_OF_RANGE` results.

If the selector is zero or greater (that is, a user selector) and the bag was created with the `MQCBO_CHECK_SELECTORS` option or as an administration bag (`MQCBO_ADMIN_BAG`), the selector must be in the range `MQIA_FIRST` through `MQIA_LAST`; if not, again `MQRC_SELECTOR_OUT_OF_RANGE` results.

If `MQCBO_CHECK_SELECTORS` was not specified, the selector can be any value of zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; `MQRC_INCONSISTENT_ITEM_TYPE` results if it is not.

#### ***ItemValue* (MQLONG) - input**

The integer value to be placed in the bag.

#### ***CompCode* (MQLONG) - output**

Completion code.

#### ***Reason* (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the `mqAddInteger` call:

#### **MQRC\_HBAG\_ERROR**

Bag handle not valid.

#### **MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of this occurrence of selector differs from data type of first occurrence.

#### **MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

#### **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

#### **MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

### **Usage notes for `mqAddInteger`**

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily next to the existing instance.

2. This call cannot be used to add a system selector to a bag.

### C language invocation for mqAddInteger

mqAddInteger (Bag, Selector, ItemValue, &CompCode, &Reason)

Declare the parameters as follows:

```
MQHBAG  Bag;      /* Bag handle */
MQLONG  Selector; /* Selector */
MQLONG  ItemValue; /* Integer value */
MQLONG  CompCode; /* Completion code */
MQLONG  Reason;   /* Reason code qualifying CompCode */
```

### Visual Basic invocation for mqAddInteger

(Supported on Windows only.)

mqAddInteger Bag, Selector, ItemValue, CompCode, Reason

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemValue As Long 'Integer value'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### mqAddInteger64:

The mqAddInteger64 call adds a 64-bit integer item identified by a user selector to the end of a specified bag.

### Syntax for mqAddInteger64

mqAddInteger64 (Bag, Selector, ItemValue, CompCode, Reason)

### Parameters for mqAddInteger64

#### Bag (MQHBAG) - input

Handle of the bag to be modified.

This must be the handle of a bag created by the user, not the handle of a system bag.

MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if the value you specify identifies a system bag.

#### Selector (MQLONG) - input

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

If the selector is zero or greater (that is, a user selector) and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQIA\_FIRST through MQIA\_LAST; if not, again MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value of zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence;

MQRC\_INCONSISTENT\_ITEM\_TYPE results if it is not.

#### ItemValue (MQINT64) - input

The 64-bit integer value to be placed in the bag.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the `mqAddInteger64` call:

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of this occurrence of selector differs from data type of first occurrence.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

#### **Usage notes for `mqAddInteger64`**

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.

#### **C language invocation for `mqAddInteger64`**

`mqAddInteger64` (Bag, Selector, ItemValue, &CompCode, &Reason)

Declare the parameters as follows:

```
MQHBAG  Bag;      /* Bag handle */
MQLONG  Selector; /* Selector */
MQINT64 ItemValue; /* Integer value */
MQLONG  CompCode; /* Completion code */
MQLONG  Reason;   /* Reason code qualifying CompCode */
```

#### **Visual Basic invocation for `mqAddInteger64`**

(Supported on Windows only.)

`mqAddInteger64` Bag, Selector, ItemValue, CompCode, Reason

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim Item Value As Long 'Integer value'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## **mqAddIntegerFilter:**

The `mqAddIntegerFilter` call adds an integer filter identified by a user selector to the end of a specified bag.

### **Syntax for `mqAddIntegerFilter`**

**`mqAddIntegerFilter`** (*Bag, Selector, ItemValue, Operator, CompCode, Reason*)

### **Parameters for `mqAddIntegerFilter`**

#### ***Bag* (MQHBAG) - input**

Handle of the bag to be modified.

This must be the handle of a bag created by the user, not the handle of a system bag.

MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if the value you specify identifies a system bag.

#### ***Selector* (MQLONG) - input**

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

If the selector is zero or greater (that is, a user selector) and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQIA\_FIRST through MQIA\_LAST; if not, again MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value of zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC\_INCONSISTENT\_ITEM\_TYPE results if it is not.

#### ***ItemValue* (MQLONG) - input**

The integer condition value to be placed in the bag.

#### ***Operator* (MQLONG) - input**

The integer filter operator to be placed in the bag. Valid operators take the form MQCFOP\_\*.

#### ***CompCode* (MQLONG) - output**

Completion code.

#### ***Reason* (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicate error conditions that can be returned from the `mqAddIntegerFilter` call:

#### **MQRC\_FILTER\_OPERATOR\_ERROR**

Filter operator not valid.

#### **MQRC\_HBAG\_ERROR**

Bag handle not valid.

#### **MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of this occurrence of selector differs from data type of first occurrence.

#### **MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

#### **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

## MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE

System bag cannot be altered or deleted.

### Usage notes for mqAddIntegerFilter

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.

### C language invocation for mqAddIntegerFilter

```
mqAddIntegerFilter (Bag, Selector, ItemValue, Operator, &CompCode, &Reason)
```

Declare the parameters as follows:

```
MQHBAG  Bag;      /* Bag handle */
MQLONG  Selector; /* Selector */
MQLONG  ItemValue; /* Integer value */
MQLONG  Operator; /* Item operator */
MQLONG  CompCode; /* Completion code */
MQLONG  Reason;   /* Reason code qualifying CompCode */
```

### Visual Basic invocation for mqAddIntegerFilter

(Supported on Windows only.)

```
mqAddIntegerFilter Bag, Selector, ItemValue, Operator, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemValue As Long 'Integer value'
Dim Operator As Long 'Item Operator'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### mqAddString:

The mqAddString call adds a character data item identified by a user selector to the end of a specified bag.

### Syntax for mqAddString

```
mqAddString (Bag, Selector, BufferLength, Buffer, CompCode, Reason)
```

### Parameters for mqAddString

#### Bag (MQHBAG) - input

Handle of the bag to be modified.

This value must be the handle of a bag created by the user, not the handle of a system bag. MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if the value you specify relates to a system bag.

#### Selector (MQLONG) - input

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQCA\_FIRST through MQCA\_LAST.

MQRC\_SELECTOR\_OUT\_OF\_RANGE results if it is not in the correct range.

If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC\_INCONSISTENT\_ITEM\_TYPE results if it is not.

**BufferLength (MQLONG) - input**

The length in bytes of the string contained in the *Buffer* parameter. The value must be zero or greater, or the special value MQBL\_NULL\_TERMINATED:

- If MQBL\_NULL\_TERMINATED is specified, the string is delimited by the first null encountered in the string. The null is not added to the bag as part of the string.
- If MQBL\_NULL\_TERMINATED is not specified, *BufferLength* characters are inserted into the bag, even if null characters are present. Nulls do not delimit the string.

**Buffer (MQCHAR x BufferLength) -input**

Buffer containing the character string.

The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter. In all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqAddString call:

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_CODED\_CHAR\_SET\_ID\_ERROR**

Bag CCSID is MQCCSI\_EMBEDDED.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of this occurrence of selector differs from data type of first occurrence.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**Usage notes for mqAddString**

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.
3. The Coded Character Set ID associated with this string is copied from the current CCSID of the bag.

## C language invocation for mqAddString

```
mqAddString (hBag, Selector, BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG   hBag;           /* Bag handle */
MQLONG   Selector;       /* Selector */
MQLONG   BufferLength;   /* Buffer length */
PMQCHAR  Buffer;         /* Buffer containing item value */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

## Visual Basic invocation for mqAddString

(Supported on Windows only.)

```
mqAddString Bag, Selector, BufferLength, Buffer, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'
Dim Selector      As Long 'Selector'
Dim BufferLength   As Long 'Buffer length'
Dim Buffer         As String 'Buffer containing item value'
Dim CompCode     As Long 'Completion code'
Dim Reason        As Long 'Reason code qualifying CompCode'
```

### mqAddStringFilter:

The mqAddStringFilter call adds a string filter identified by a user selector to the end of a specified bag.

### Syntax for mqAddStringFilter

```
mqAddStringFilter (Bag, Selector, BufferLength, Buffer, Operator, CompCode, Reason)
```

### Parameters for mqAddStringFilter

#### Bag (MQHBAG) - input

Handle of the bag to be modified.

This value must be the handle of a bag created by the user, not the handle of a system bag. MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if the value you specify relates to a system bag.

#### Selector (MQLONG) - input

Selector identifying the item to be added to the bag.

If the selector is less than zero (that is, a system selector), MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQCA\_FIRST through MQCA\_LAST. MQRC\_SELECTOR\_OUT\_OF\_RANGE results if it is not in the correct range.

If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value zero or greater.

If the call is creating a second or later occurrence of a selector that is already in the bag, the data type of this occurrence must be the same as the data type of the first occurrence; MQRC\_INCONSISTENT\_ITEM\_TYPE results if it is not.

#### BufferLength (MQLONG) - input

The length in bytes of the character condition string contained in the Buffer parameter. The value must be zero or greater, or the special value MQBL\_NULL\_TERMINATED:

- If MQBL\_NULL\_TERMINATED is specified, the string is delimited by the first null encountered in the string. The null is not added to the bag as part of the string.
- If MQBL\_NULL\_TERMINATED is not specified, *BufferLength* characters are inserted into the bag, even if null characters are present. Nulls do not delimit the string.

**Buffer (MQCHAR x BufferLength) - input**

Buffer containing the character condition string.

The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter. In all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

**Operator (MQLONG) - input**

The string filter operator to be placed in the bag. Valid operators are of the form MQCFOP\_\*.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqAddStringFilter call:

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_CODED\_CHAR\_SET\_ID\_ERROR**

Bag CCSID is MQCCSI\_EMBEDDED.

**MQRC\_FILTER\_OPERATOR\_ERROR**

Filter operator not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of this occurrence of selector differs from data type of first occurrence.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**Usage notes for mqAddStringFilter**

1. If a data item with the specified selector is already present in the bag, an additional instance of that selector is added to the end of the bag. The new instance is not necessarily adjacent to the existing instance.
2. This call cannot be used to add a system selector to a bag.
3. The Coded Character Set ID associated with this string is copied from the current CCSID of the bag.

**C language invocation for mqAddStringFilter**

```
mqAddStringFilter (hBag, Selector, BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```

MQHBAG  hBag;          /* Bag handle */
MQLONG  Selector;     /* Selector */
MQLONG  BufferLength; /* Buffer length */
PMQCHAR Buffer         /* Buffer containing item value */
MQLONG  Operator     /* Operator */
MQLONG  CompCode;    /* Completion code */
MQLONG  Reason;      /* Reason code qualifying CompCode */

```

### Visual Basic invocation for mqAddStringFilter

(Supported on Windows only.)

```
mqAddStringFilter Bag, Selector, BufferLength, Buffer, Operator, CompCode, Reason
```

Declare the parameters as follows:

```

Dim Bag          As Long 'Bag handle'
Dim Selector     As Long 'Selector'
Dim BufferLength As Long 'Buffer length'
Dim Buffer       As String 'Buffer containing item value'
Dim Operator    As Long 'Item operator'
Dim CompCode   As Long 'Completion code'
Dim Reason     As Long 'Reason code qualifying CompCode'

```

### mqBagToBuffer:

The mqBagToBuffer call converts the bag into a PCF message in the supplied buffer.

### Syntax for mqBagToBuffer

```
mqBagToBuffer (OptionsBag, DataBag, BufferLength, Buffer, DataLength, CompCode, Reason)
```

### Parameters for mqBagToBuffer

#### OptionsBag (MQHBAG) - input

Handle of the bag containing options that control the processing of the call. This is a reserved parameter; the value must be MQHB\_NONE.

#### DataBag (MQHBAG) - input

The handle of the bag to convert.

If the bag contains an administration message and mqAddInquiry was used to insert values into the bag, the value of the MQIASY\_COMMAND data item must be an INQUIRE command that is recognized by the MQAI; MQRC\_INQUIRY\_COMMAND\_ERROR results if it is not.

If the bag contains nested system bags, MQRC\_NESTED\_BAG\_NOT\_SUPPORTED results.

#### BufferLength (MQLONG) - input

Length in bytes of the buffer supplied.

If the buffer is too small to accommodate the message generated, MQRC\_BUFFER\_LENGTH\_ERROR results.

#### Buffer (MQBYTE x BufferLength) - output

The buffer to hold the message.

#### DataLength (MQLONG) - output

The length in bytes of the buffer required to hold the entire bag. If the buffer is not long enough, the contents of the buffer are undefined but the DataLength is returned.

#### CompCode (MQLONG) - output

Completion code.

#### Reason (MQLONG) - output

Reason code qualifying CompCode.

The following reason codes indicating error conditions can be returned from the `mqBagToBuffer` call:

**MQRC\_BAG\_WRONG\_TYPE**

Input data bag is a group bag.

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid or buffer too small. (Required length returned in *DataLength*.)

**MQRC\_DATA\_LENGTH\_ERROR**

*DataLength* parameter not valid (invalid parameter address).

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INQUIRY\_COMMAND\_ERROR**

`mqAddInquiry` used with a command code that is not recognized as an INQUIRE command.

**MQRC\_NESTED\_BAG\_NOT\_SUPPORTED**

Input data bag contains one or more nested system bags.

**MQRC\_OPTIONS\_ERROR**

Options bag contains unsupported data items or a supported option has an invalid value.

**MQRC\_PARAMETER\_MISSING**

An administration message requires a parameter that is not present in the bag.

**Note:** This reason code occurs for bags created with the `MQCBO_ADMIN_BAG` or `MQCBO_REORDER_AS_REQUIRED` options only.

**MQRC\_SELECTOR\_WRONG\_TYPE**

`mqAddString` or `mqSetString` was used to add the `MQIACF_INQUIRY` selector to the bag.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**Usage notes for `mqBagToBuffer`**

1. The PCF message is generated with an encoding of `MQENC_NATIVE` for the numeric data.
2. The buffer that holds the message can be null if the `BufferLength` is zero. This is useful if you use the `mqBagToBuffer` call to calculate the size of buffer necessary to convert your bag.

**C language invocation for `mqBagToBuffer`**

```
mqBagToBuffer (OptionsBag, DataBag, BufferLength, Buffer, &DataLength,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG OptionsBag;    /* Options bag handle */  
MQHBAG DataBag;      /* Data bag handle */  
MQLONG BufferLength; /* Buffer length */  
MQBYTE Buffer[n];     /* Buffer to contain PCF */  
MQLONG DataLength;  /* Length of PCF returned in buffer */  
MQLONG CompCode;    /* Completion code */  
MQLONG Reason;      /* Reason code qualifying CompCode */
```

**Visual Basic invocation for `mqBagToBuffer`**

(Supported on Windows only.)

```
mqBagToBuffer OptionsBag, DataBag, BufferLength, Buffer, DataLength,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim OptionsBag As Long 'Options bag handle'  
Dim DataBag As Long 'Data bag handle'  
Dim BufferLength As Long 'Buffer length'  
Dim Buffer As Long 'Buffer to contain PCF'  
Dim DataLength As Long 'Length of PCF returned in buffer'  
Dim CompCode As Long 'Completion code'  
Dim Reason As Long 'Reason code qualifying CompCode'
```

### **mqBufferToBag:**

The mqBufferToBag call converts the supplied buffer into bag form.

### **Syntax for mqBufferToBag**

**mqBufferToBag** (*OptionsBag, BufferLength, Buffer, DataBag, CompCode, Reason*)

### **Parameters for mqBufferToBag**

#### **OptionsBag (MQHBAG) - input**

Handle of the bag containing options that control the processing of the call. This is a reserved parameter; the value must be MQHB\_NONE.

#### **BufferLength (MQLONG) - input**

Length in bytes of the buffer.

#### **Buffer (MQBYTE x BufferLength) - input**

Pointer to the buffer containing the message to be converted.

#### **Databag (MQHBAG) - input/output**

Handle of the bag to receive the message. The MQAI performs an mqClearBag call on the bag before placing the message in the bag.

#### **CompCode (MQLONG) - output**

Completion code.

#### **Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqBufferToBag call:

#### **MQRC\_BAG\_CONVERSION\_ERROR**

Data could not be converted into a bag. This indicates a problem with the format of the data to be converted into a bag (for example, the message is not a valid PCF).

#### **MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not accessible).

#### **MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

#### **MQRC\_HBAG\_ERROR**

Bag handle not valid.

#### **MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of second occurrence of selector differs from data type of first occurrence.

#### **MQRC\_OPTIONS\_ERROR**

Options bag contains unsupported data items, or a supported option has a value that is not valid.

#### **MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

## **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

## **MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

### **Usage notes for mqBufferToBag**

The buffer must contain a valid PCF message. The encoding of numeric data in the buffer must be MQENC\_NATIVE.

The Coded Character Set ID of the bag is unchanged by this call.

### **C language invocation for mqBufferToBag**

```
mqBufferToBag (OptionsBag, BufferLength, Buffer, DataBag,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  OptionsBag;    /* Options bag handle */  
MQLONG  BufferLength;  /* Buffer length */  
MQBYTE  Buffer[n];     /* Buffer containing PCF */  
MQHBAG  DataBag;      /* Data bag handle */  
MQLONG  CompCode;     /* Completion code */  
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

### **Visual Basic invocation for mqBufferToBag**

(Supported on Windows only.)

```
mqBufferToBag OptionsBag, BufferLength, Buffer, DataBag,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim OptionsBag As Long 'Options bag handle'  
Dim BufferLength As Long 'Buffer length'  
Dim Buffer As Long 'Buffer containing PCF'  
Dim DataBag As Long 'Data bag handle'  
Dim CompCode As Long 'Completion code'  
Dim Reason As Long 'Reason code qualifying CompCode'
```

### **mqClearBag:**

The mqClearBag call deletes all user items from the bag, and resets system items to their initial values.

### **Syntax for mqClearBag**

```
mqClearBag (Bag, CompCode, Reason)
```

### **Parameters for mqClearBag**

#### **Bag (MQHBAG) - input**

Handle of the bag to be cleared. This must be the handle of a bag created by the user, not the handle of a system bag. MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if you specify the handle of a system bag.

#### **CompCode (MQLONG) - output**

Completion code.

#### **Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqClearBag call:

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**Usage notes for mqClearBag**

1. If the bag contains system bags, they are also deleted.
2. The call cannot be used to clear system bags.

**C language invocation for mqClearBag**

```
mqClearBag (Bag, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqClearBag**

(Supported on Windows only.)

```
mqClearBag Bag, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

**mqCountItems:**

The mqCountItems call returns the number of occurrences of user items, system items, or both, that are stored in a bag with the same specific selector.

**Syntax for mqCountItems**

```
mqCountItems (Bag, Selector, ItemCount, CompCode, Reason)
```

**Parameters for mqCountItems**

**Bag (MQHBAG) - input**

Handle of the bag with items that are to be counted. This can be a user bag or a system bag.

**Selector (MQLONG) - input**

Selector of the data items to count.

If the selector is less than zero (a system selector), the selector must be one that is supported by the MQAL. MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

If the specified selector is not present in the bag, the call succeeds and zero is returned for *ItemCount*.

The following special values can be specified for *Selector*:

**MQSEL\_ALL\_SELECTORS**

All user and system items are to be counted.

**MQSEL\_ALL\_USER\_SELECTORS**

All user items are to be counted; system items are excluded from the count.

## **MQSEL\_ALL\_SYSTEM\_SELECTORS**

All system items are to be counted; user items are excluded from the count.

### **ItemCount (MQLONG) - output**

Number of items of the specified type in the bag (can be zero).

### **CompCode (MQLONG) - output**

Completion code.

### **Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the *mqCountItems* call:

### **MQRC\_HBAG\_ERROR**

Bag handle not valid.

### **MQRC\_ITEM\_COUNT\_ERROR**

*ItemCount* parameter not valid (invalid parameter address).

### **MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

### **MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

## **Usage notes for mqCountItems**

This call counts the number of data items, not the number of unique selectors in the bag. A selector can occur multiple times, so there might be fewer unique selectors in the bag than data items.

## **C language invocation for mqCountItems**

```
mqCountItems (Bag, Selector, &ItemCount, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG Bag;          /* Bag handle */
MQLONG Selector;     /* Selector */
MQLONG ItemCount;    /* Number of items */
MQLONG CompCode;     /* Completion code */
MQLONG Reason;       /* Reason code qualifying CompCode */
```

## **Visual Basic invocation for mqCountItems**

(Supported on Windows only.)

```
mqCountItems Bag, Selector, ItemCount, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag;           As Long 'Bag handle'
Dim Selector       As Long 'Selector'
Dim ItemCount     As Long 'Number of items'
Dim CompCode      As Long 'Completion code'
Dim Reason        As Long 'Reason code qualifying CompCode'
```

## **mqCreateBag:**

The mqCreateBag call creates a new bag.

### **Syntax for mqCreateBag**

**mqCreateBag** (*Options, Bag, CompCode, Reason*)

### **Parameters for mqCreateBag**

#### **Options (MQLONG) - input**

Options for creation of the bag.

The following are valid:

#### **MQCBO\_ADMIN\_BAG**

Specifies that the bag is for administering IBM MQ objects. MQCBO\_ADMIN\_BAG automatically implies the MQCBO\_LIST\_FORM\_ALLOWED, MQCBO\_REORDER\_AS\_REQUIRED, and MQCBO\_CHECK\_SELECTORS options.

Administration bags are created with the MQIASY\_TYPE system item set to MQCFT\_COMMAND.

#### **MQCBO\_COMMAND\_BAG**

Specifies that the bag is a command bag. MQCBO\_COMMAND\_BAG is an alternative to the administration bag (MQCBO\_ADMIN\_BAG) and MQRC\_OPTIONS\_ERROR results if both are specified.

A command bag is processed in the same way as a user bag except that the value of the MQIASY\_TYPE system item is set to MQCFT\_COMMAND when the bag is created.

The command bag is also created for administering objects but they are not used to send administration messages to a command server as an administration bag is. The bag options assume the following default values:

- MQCBO\_LIST\_FORM\_INHIBITED
- MQCBO\_DO\_NOT\_REORDER
- MQCBO\_DO\_NOT\_CHECK\_SELECTORS

Therefore, the MQAI does not change the order of data items or create lists within a message as with administration bags.

#### **MQCBO\_GROUP\_BAG**

Specifies that the bag is a group bag. This means that the bag is used to hold a set of grouped items. Group bags cannot be used for the administration of IBM MQ objects. The bag options assume the following default values:

- MQCBO\_LIST\_FORM\_ALLOWED
- MQCBO\_REORDER\_AS\_REQUIRED
- MQCBO\_DO\_NOT\_CHECK\_SELECTORS

Therefore, the MQAI can change the order of data items or create lists within a bag of grouped items.

Group bags are created with two system selectors: MQIASY\_BAG\_OPTIONS and MQIASY\_CODED\_CHAR\_SET\_ID.

If a group bag is nested in a bag in which MQCBO\_CHECK\_SELECTORS was specified, the group bag to be nested has its selectors checked at that point whether MQCBO\_CHECK\_SELECTORS was specified when the group bag was created.

#### **MQCBO\_USER\_BAG**

Specifies that the bag is a user bag. MQCBO\_USER\_BAG is the default bag-type option. User

bags can also be used for the administration of IBM MQ objects, but the MQCBO\_LIST\_FORM\_ALLOWED and MQCBO\_REORDER\_AS\_REQUIRED options must be specified to ensure correct generation of the administration messages.

User bags are created with the MQIASY\_TYPE system item set to MQCFT\_USER.

For user bags, one or more of the following options can be specified:

#### **MQCBO\_LIST\_FORM\_ALLOWED**

Specifies that the MQAI can use the more compact list form in the message sent whenever there are two or more adjacent occurrences of the same selector in the bag. However, the items cannot be reordered if this option is used. Therefore, if the occurrences of the selector are not adjacent in the bag, and MQCBO\_REORDER\_AS\_REQUIRED is not specified, the MQAI cannot use the list form for that particular selector.

If the data items are character strings, these strings must have the same Character Set ID and the same selector, in order to be compacted into list form. If the list form is used, the shorter strings are padded with blanks to the length of the longest string.

This option must be specified if the message to be sent is an administration message but MQCBO\_ADMIN\_BAG is not specified.

**Note:** MQCBO\_LIST\_FORM\_ALLOWED does not imply that the MQAI definitely uses the list form. The MQAI considers various factors in deciding whether to use the list form.

#### **MQCBO\_LIST\_FORM\_INHIBITED**

Specifies that the MQAI cannot use the list form in the message sent, even if there are adjacent occurrences of the same selector in the bag.

MQCBO\_LIST\_FORM\_INHIBITED is the default list-form option.

#### **MQCBO\_REORDER\_AS\_REQUIRED**

Specifies that the MQAI can change the order of the data items in the message sent. This option does not affect the order of the items in the sending bag.

This option means that you can insert items into a data bag in any order. That is, the items do not need to be inserted in the way that they must be in the PCF message, because the MQAI can reorder these items as required.

If the message is a user message, the order of the items in the receiving bag is the same as the order of the items in the message. This order can be different from the order of the items in the sending bag.

If the message is an administration message, the order of the items in the receiving bag is determined by the message received.

This option must be specified if the message to be sent is an administration message but MQCBO\_ADMIN is not specified.

#### **MQCBO\_DO\_NOT\_REORDER**

Specifies that the MQAI cannot change the order of data items in the message sent. Both the message sent and the receiving bag contain the items in the same order as they occur in the sending bag. This option is the default ordering option.

#### **MQCBO\_CHECK\_SELECTORS**

Specifies that user selectors (selectors that are zero or greater) must be checked to ensure that the selector is consistent with the data type implied by the mqAddInteger, mqAddInteger64, mqAddIntegerFilter, mqAddString, mqAddStringFilter, mqAddByteString, mqAddByteStringFilter, mqSetInteger, mqSetInteger64, mqSetIntegerFilter, mqSetString, mqSetStringFilter, mqSetByteString, or mqSetByteStringFilter call:

- For the integer, 64-bit integer, and integer filter calls, the selector must be in the range MQIA\_FIRST through MQIA\_LAST.
- For the string and string filter calls, the selector must be in the range MQCA\_FIRST through MQCA\_LAST.
- For byte string and byte string filter calls, the selector must be in the range MQBA\_FIRST through MQBA\_LAST.
- For group bag calls, the selector must be in the range MQGA\_FIRST through MQGA\_LAST.
- For the handle calls, the selector must be in the range MQHA\_FIRST through MQHA\_LAST.

The call fails if the selector is outside the valid range. System selectors (selectors less than zero) are always checked, and if a system selector is specified, it must be one that is supported by the MQAI.

#### **MQCBO\_DO\_NOT\_CHECK\_SELECTORS**

Specifies that user selectors (selectors that are zero or greater) are not checked. Any selector that is zero or positive can be used with any call. This option is the default selectors option. System selectors (selectors less than zero) are always checked.

#### **MQCBO\_NONE**

Specifies that all options must have their default values. This option is provided to aid program documentation, and must not be specified with any of the options that have a nonzero value.

The following list summarizes the default option values:

- MQCBO\_USER\_BAG
  - MQCBO\_LIST\_FORM\_INHIBITED
  - MQCBO\_DO\_NOT\_REORDER
  - MQCBO\_DO\_NOT\_CHECK\_SELECTORS

#### **Bag (MQHBAG) - output**

The handle of the bag created by the call.

#### **CompCode (MQLONG) - output**

Completion code.

#### **Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqCreateBag call:

#### **MQRC\_HBAG\_ERROR**

Bag handle not valid (invalid parameter address or the parameter location is read-only).

#### **MQRC\_OPTIONS\_ERROR**

Options not valid or not consistent.

#### **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

### **Usage notes for mqCreateBag**

Any options used for creating your bag are contained in a system item within the bag when it is created.

### **C language invocation for mqCreateBag**

```
mqCreateBag (Options, &Bag, &CompCode, &Reason);
```

Declare the parameters as follows:

```

MQLONG Options;      /* Bag options */
MQHBAG Bag;          /* Bag handle */
MQLONG CompCode;    /* Completion code */
MQLONG Reason;      /* Reason code qualifying CompCode */

```

### Visual Basic invocation for mqCreateBag

(Supported on Windows only.)

mqCreateBag Options, Bag, CompCode, Reason

Declare the parameters as follows:

```

Dim Options As Long 'Bag options'
Dim Bag As Long 'Bag handle'
Dim CompCode As Long 'Completion code'
Dim Reason As Long 'Reason code qualifying CompCode'

```

### mqDeleteBag:

The mqDeleteBag call deletes the specified bag.

### Syntax for mqDeleteBag

mqDeleteBag (*Bag*, *CompCode*, *Reason*)

### Parameters for mqDeleteBag

#### *Bag* (MQHBAG) - input/output

The handle of the bag to be deleted. This must be the handle of a bag created by the user, not the handle of a system bag. MQRC\_SYSTEM\_BAG\_NOT\_DELETABLE results if you specify the handle of a system bag. The handle is reset to MQHB\_UNUSABLE\_HBAG.

If the bag contains system-generated bags, they are also deleted.

#### *CompCode* (MQLONG) - output

Completion code.

#### *Reason* (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqDeleteBag call:

#### **MQRC\_HBAG\_ERROR**

Bag handle not valid, or invalid parameter address, or parameter location is read only.

#### **MQRC\_SYSTEM\_BAG\_NOT\_DELETABLE**

System bag cannot be deleted.

### Usage notes for mqDeleteBag

1. Delete any bags created with mqCreateBag.
2. Nested bags are deleted automatically when the containing bag is deleted.

### C language invocation for mqDeleteBag

mqDeleteBag (&Bag, CompCode, Reason);

Declare the parameters as follows:

```

MQHBAG Bag;          /* Bag handle */
MQLONG CompCode;    /* Completion code */
MQLONG Reason;      /* Reason code qualifying CompCode */

```

## Visual Basic invocation for mqDeleteBag

(Supported on Windows only.)

mqDeleteBag Bag, CompCode, Reason

Declare the parameters as follows:

```
Dim Bag;      As Long 'Bag handle'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### mqDeleteItem:

The mqDeleteItem call removes one or more user items from a bag.

### Syntax for mqDeleteItem

**mqDeleteItem** (*Bag, Selector, ItemIndex, CompCode, Reason*)

### Parameters for mqDeleteItem

#### **Hbag (MQHBAG) - input**

Handle of the bag to be modified.

This must be the handle of a bag created by the user, and not the handle of a system bag; MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if it is a system bag.

#### **Selector (MQLONG) - input**

Selector identifying the user item to be deleted.

If the selector is less than zero (that is, a system selector), MQRC\_SELECTOR\_OUT\_OF\_RANGE results.

The following special values are valid:

#### **MQSEL\_ANY\_SELECTOR**

The item to be deleted is a user item identified by the ItemIndex parameter, the index relative to the set of items that contains both user and system items.

#### **MQSEL\_ANY\_USER\_SELECTOR**

The item to be deleted is a user item identified by the ItemIndex parameter, the index relative to the set of user items.

If an explicit selector value is specified, but the selector is not present in the bag, the call succeeds if MQIND\_ALL is specified for ItemIndex, and fails with reason code MQRC\_SELECTOR\_NOT\_PRESENT if MQIND\_ALL is not specified.

#### **ItemIndex (MQLONG) - input**

Index of the data item to be deleted.

The value must be zero or greater, or one of the following special values:

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results. If MQIND\_NONE is specified with one of the MQSEL\_XXX\_SELECTOR values, MQRC\_INDEX\_ERROR results.

#### **MQIND\_ALL**

This specifies that all occurrences of the selector in the bag are to be deleted. If MQIND\_ALL is specified with one of the MQSEL\_XXX\_SELECTOR values, MQRC\_INDEX\_ERROR results. If MQIND\_ALL is specified when the selector is not present within the bag, the call succeeds.

If MQSEL\_ANY\_SELECTOR is specified for the Selector parameter, the ItemIndex parameter is the index relative to the set of items that contains both user items and system items, and

must be zero or greater. If `ItemIndex` identifies a system selector `MQRC_SYSTEM_ITEM_NOT_DELETABLE` results. If `MQSEL_ANY_USER_SELECTOR` is specified for the `Selector` parameter, the `ItemIndex` parameter is the index relative to the set of user items, and must be zero or greater.

If an explicit selector value is specified, `ItemIndex` is the index relative to the set of items that have that selector value, and can be `MQIND_NONE`, `MQIND_ALL`, zero, or greater.

If an explicit index is specified (that is, not `MQIND_NONE` or `MQIND_ALL`) and the item is not present in the bag, `MQRC_INDEX_NOT_PRESENT` results.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqDeleteItem` call:

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

`MQIND_NONE` or `MQIND_ALL` specified with one of the `MQSEL_ANY_XXX_SELECTOR` values.

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

`MQIND_NONE` specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag is read only and cannot be altered.

**MQRC\_SYSTEM\_ITEM\_NOT\_DELETABLE**

System item is read only and cannot be deleted.

**Usage notes for `mqDeleteItem`**

1. Either a single occurrence of the specified selector can be removed, or all occurrences of the specified selector.
2. The call cannot remove system items from the bag, or remove items from a system bag. However, the call can remove the handle of a system bag from a user bag. This way, a system bag can be deleted.

**C language invocation for `mqDeleteItem`**

`mqDeleteItem (Bag, Selector, ItemIndex, &CompCode, &Reason)`

Declare the parameters as follows:

```
MQHBAG  Hbag;          /* Bag handle */
MQLONG  Selector;     /* Selector */
MQLONG  ItemIndex;    /* Index of the data item */
MQLONG  CompCode;     /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

## Visual Basic invocation for mqDeleteItem

(Supported on Windows only.)

mqDeleteItem Bag, Selector, ItemIndex, CompCode, Reason

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim Selector As Long 'Selector'  
Dim ItemIndex As Long 'Index of the data item'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### mqExecute:

The mqExecute call sends an administration command message and waits for the reply (if expected).

### Syntax for mqExecute

**mqExecute** (*Hconn, Command, OptionsBag, AdminBag, ResponseBag, AdminQ, ResponseQ, CompCode, Reason*)

### Parameters for mqExecute

#### **Hconn (MQHCONN) - input**

MQI Connection handle.

This is returned by a preceding MQCONN call issued by the application.

#### **Command (MQLONG) - input**

The command to be executed.

This should be one of the MQCMD\_\* values. If it is a value that is not recognized by the MQAI servicing the mqExecute call, the value is still accepted. However, if mqAddInquiry was used to insert values in the bag, the Command parameter must be an INQUIRE command recognized by the MQAI; MQRC\_INQUIRY\_COMMAND\_ERROR results if it is not.

#### **OptionsBag (MQHBAG) - input**

Handle of a bag containing options that affect the operation of the call.

This must be the handle returned by a preceding mqCreateBag call or the following special value:

#### **MQHB\_NONE**

No options bag; all options assume their default values.

Only the options listed in this topic can be present in the options bag (MQRC\_OPTIONS\_ERROR results if other data items are present).

The appropriate default value is used for each option that is not present in the bag. The following option can be specified:

#### **MQIACF\_WAIT\_INTERVAL**

This data item specifies the maximum time in milliseconds that the MQAI should wait for each reply message. The time interval must be zero or greater, or the special value MQWI\_UNLIMITED; the default is thirty seconds. The mqExecute call completes either when all of the reply messages are received or when the specified wait interval expires without the expected reply message having been received.

**Note:** The time interval is an approximate quantity.

If the MQIACF\_WAIT\_INTERVAL data item has the wrong data type, or there is more than one occurrence of that selector in the options bag, or the value of the data item is not valid, MQRC\_WAIT\_INTERVAL\_ERROR results.

#### *AdminBag (MQHBAG) - input*

Handle of the bag containing details of the administration command to be issued.

All user items placed in the bag are inserted into the administration message that is sent. It is the application's responsibility to ensure that only valid parameters for the command are placed in the bag.

If the value of the MQIASY\_TYPE data item in the command bag is not MQCFT\_COMMAND, MQRC\_COMMAND\_TYPE\_ERROR results. If the bag contains nested system bags, MQRC\_NESTED\_BAG\_NOT\_SUPPORTED results.

#### *ResponseBag (MQHBAG) - input*

Handle of the bag where reply messages are placed.

The MQAI performs an mqClearBag call on the bag before placing reply messages in the bag. To retrieve the reply messages, the selector, MQIACF\_CONVERT\_RESPONSE, can be specified.

Each reply message is placed into a separate system bag, with a handle that is then placed in the response bag. Use the mqInquireBag call with selector MQHA\_BAG\_HANDLE to determine the handles of the system bags within the reply bag, and those bags can then be inquired to determine their contents.

If some but not all of the expected reply messages are received, MQCC\_WARNING with MQRC\_NO\_MSG\_AVAILABLE results. If none of the expected reply messages is received, MQCC\_FAILED with MQRC\_NO\_MSG\_AVAILABLE results.

Group bags cannot be used as response bags.

#### *AdminQ (MQHOBj) - input*

Object handle of the queue on which the administration message is to be placed.

This handle was returned by a preceding MQOPEN call issued by the application. The queue must be open for output.

The following special value can be specified:

##### **MQHO\_NONE**

This indicates that the administration message should be placed on the SYSTEM.ADMIN.COMMAND.QUEUE belonging to the currently connected queue manager. If MQHO\_NONE is specified, the application need not use MQOPEN to open the queue.

#### *ResponseQ*

Object handle of the queue on which reply messages are placed.

This handle was returned by a preceding MQOPEN call issued by the application. The queue must be open for input and for inquiry.

The following special value can be specified:

##### **MQHO\_NONE**

This indicates that the reply messages should be placed on a dynamic queue created automatically by the MQAI. The queue is created by opening SYSTEM.DEFAULT.MODEL.QUEUE, that must therefore have suitable characteristics. The queue created exists for the duration of the call only, and is deleted by the MQAI on exit from the mqExecute call.

#### *CompCode*

Completion code.

#### *Reason*

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqExecute call:

- MQRC\_\***  
Anything from the MQINQ, MQPUT, MQGET, or MQOPEN calls.
- MQRC\_BAG\_WRONG\_TYPE**  
Input data bag is a group bag.
- MQRC\_CMD\_SERVER\_NOT\_AVAILABLE**  
The command server that processes administration commands is not available.
- MQRC\_COMMAND\_TYPE\_ERROR**  
The value of the MQIASY\_TYPE data item in the request bag is not MQCFT\_COMMAND.
- MQRC\_HBAG\_ERROR**  
Bag handle not valid.
- MQRC\_INQUIRY\_COMMAND\_ERROR**  
mqAddInteger call used with a command code that is not a recognized INQUIRE command.
- MQRC\_NESTED\_BAG\_NOT\_SUPPORTED**  
Input data bag contains one or more nested system bags.
- MQRC\_NO\_MSG\_AVAILABLE**  
Some reply messages received, but not all. Reply bag contains system-generated bags for messages that were received.
- MQRC\_NO\_MSG\_AVAILABLE**  
No reply messages received during the specified wait interval.
- MQRC\_OPTIONS\_ERROR**  
Options bag contains unsupported data items, or a supported option has a value which is not valid.
- MQRC\_PARAMETER\_MISSING**  
Administration message requires a parameter which is not present in the bag. This reason code occurs for bags created with the MQCBO\_ADMIN\_BAG or MQCBO\_REORDER\_AS\_REQUIRED options only.
- MQRC\_SELECTOR\_NOT\_UNIQUE**  
Two or more instances of a selector exist within the bag for a mandatory parameter that permits one instance only.
- MQRC\_SELECTOR\_WRONG\_TYPE**  
mqAddString or mqSetString was used to add the MQIACF\_INQUIRY selector to the bag.
- MQRC\_STORAGE\_NOT\_AVAILABLE**  
Insufficient storage available.
- MQRCCF\_COMMAND\_FAILED**  
Command failed; details of failure are contained in system-generated bags within the reply bag.

#### Usage notes for mqExecute

1. If no *AdminQ* is specified, the MQAI checks to see if the command server is active before sending the administration command message. However, if the command server is not active, the MQAI does not start it. If you are sending many administration command messages, you are recommended to open the SYSTEM.ADMIN.COMMAND.QUEUE yourself and pass the handle of the administration queue on each administration request.
2. Specifying the MQHO\_NONE value in the *ResponseQ* parameter simplifies the use of the mqExecute call, but if mqExecute is issued repeatedly by the application (for example, from within a loop), the response queue will be created and deleted repeatedly. In this situation, it is better for the application itself to open the response queue before any mqExecute call, and close it after all mqExecute calls have been issued.

3. If the administration command results in a message being sent with a message type of MQMT\_REQUEST, the call waits for the time given by the MQIACF\_WAIT\_INTERVAL data item in the options bag.
4. If an error occurs during the processing of the call, the response bag might contain some data from the reply message, but the data will typically be incomplete.

### C language invocation for mqExecute

```
mqExecute (Hconn, Command, OptionsBag, AdminBag, ResponseBag,
AdminQ, ResponseQ, CompCode, Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;          /* MQI connection handle */
MQLONG   Command;       /* Command to be executed */
MQHBAG   OptionsBag;    /* Handle of a bag containing options */
MQHBAG   AdminBag;      /* Handle of administration bag containing
                        /* details of administration command */
MQHBAG   ResponseBag;   /* Handle of bag for response messages */
MQHOBJ   AdminQ         /* Handle of administration queue for
                        /* administration messages */
MQHOBJ   ResponseQ;     /* Handle of response queue for response
                        /* messages */
MQLONG   pCompCode;     /* Completion code */
MQLONG   pReason;       /* Reason code qualifying CompCode */
```

### Visual Basic invocation for mqExecute

(Supported on Windows only.)

```
mqExecute (Hconn, Command, OptionsBag, AdminBag, ResponseBag,
AdminQ, ResponseQ, CompCode, Reason);
```

Declare the parameters as follows:

```
Dim HConn      As Long 'MQI connection handle'
Dim Command    As Long 'Command to be executed'
Dim OptionsBag As Long 'Handle of a bag containing options'
Dim AdminBag   As Long 'Handle of command bag containing details of
                        administration command'
Dim ResponseBag As Long 'Handle of bag for reply messages'
Dim AdminQ     As Long 'Handle of command queue for
                        administration messages'
Dim ResponseQ  As Long 'Handle of response queue for reply messages'
Dim CompCode   As Long 'Completion code'
Dim Reason     As Long 'Reason code qualifying CompCode'
```

## mqGetBag:

The mqGetBag call removes a message from the specified queue and converts the message data into a data bag.

### Syntax for mqGetBag

**mqGetBag** (*Hconn*, *Hobj*, *MsgDesc*, *GetMsgOpts*, *Bag*, *CompCode*, *Reason*)

### Parameters for mqGetBag

#### *Hconn* (MQHCONN) - input

MQI connection handle.

#### *Hobj* (MQHOBJ) - input

Object handle of the queue from which the message is to be retrieved. This handle was returned by a preceding MQOPEN call issued by the application. The queue must be open for input.

#### *MsgDesc* (MQMD) - input/output

Message descriptor (for more information, see MQMD - Message descriptor ).

If the *Format* field in the message has a value other than MQFMT\_ADMIN, MQFMT\_EVENT, or MQFMT\_PCF, MQRC\_FORMAT\_NOT\_SUPPORTED results.

If, on entry to the call, the *Encoding* field in the application's MQMD has a value other than MQENC\_NATIVE and MQGMO\_CONVERT is specified, MQRC\_ENCODING\_NOT\_SUPPORTED results. Also, if MQGMO\_CONVERT is not specified, the value of the *Encoding* parameter must be the retrieving application's MQENC\_NATIVE; if not, again MQRC\_ENCODING\_NOT\_SUPPORTED results.

#### *GetMsgOpts* (MQGMO) - input/output

Get-message options (for more information, see MQGMO - Get-message options ).

MQGMO\_ACCEPT\_TRUNCATED\_MSG cannot be specified; MQRC\_OPTIONS\_ERROR results if it is. MQGMO\_LOCK and MQGMO\_UNLOCK are not supported in a 16-bit or 32-bit Window environment. MQGMO\_SET\_SIGNAL is supported in a 32-bit Window environment only.

#### *Bag* (MQHBAG) - input/output

Handle of a bag into which the retrieved message is placed. The MQAI performs an mqClearBag call on the bag before placing the message in the bag.

#### MQHB\_NONE

Gets the retrieved message. This provides a means of deleting messages from the queue.

If an option of MQGMO\_BROWSE\_\* is specified, this value sets the browse cursor to the selected message; it is not deleted in this case.

#### *CompCode* (MQLONG) - output

Completion code.

#### *Reason* (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating warning and error conditions can be returned from the mqGetBag call:

#### MQRC\_\*

Anything from the MQGET call or bag manipulation.

#### MQRC\_BAG\_CONVERSION\_ERROR

Data could not be converted into a bag.

This indicates a problem with the format of the data to be converted into a bag (for example, the message is not a valid PCF).

If the message was retrieved destructively from the queue (that is, not browsing the queue), this reason code indicates that it has been discarded.

#### **MQRC\_BAG\_WRONG\_TYPE**

Input data bag is a group bag.

#### **MQRC\_ENCODING\_NOT\_SUPPORTED**

Encoding not supported; the value in the *Encoding* field of the MQMD must be MQENC\_NATIVE.

#### **MQRC\_FORMAT\_NOT\_SUPPORTED**

Format not supported; the *Format* name in the message is not MQFMT\_ADMIN, MQFMT\_EVENT, or MQFMT\_PCF. If the message was retrieved destructively from the queue (that is, not browsing the queue), this reason code indicates that it has been discarded.

#### **MQRC\_HBAG\_ERROR**

Bag handle not valid.

#### **MQRC\_INCONSISTENT\_ITEM\_TYPE**

Data type of second occurrence of selector differs from data type of first occurrence.

#### **MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

#### **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

#### **MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

### **Usage notes for mqGetBag**

1. Only messages that have a supported format can be returned by this call. If the message has a format that is not supported, the message is discarded, and the call completes with an appropriate reason code.
2. If the message is retrieved within a unit of work (that is, with the MQGMO\_SYNCPOINT option), and the message has an unsupported format, the unit of work can be backed out, reinstating the message on the queue. This allows the message to be retrieved by using the MQGET call in place of the mqGetBag call.

### **C language invocation for mqGetBag**

```
mqGetBag (hConn, hObj, &MsgDesc, &GetMsgOpts, hBag, CompCode, Reason);
```

Declare the parameters as follows:

```
MQHCONN  hConn;          /* MQI connection handle */
MQHOBJ    hObj;          /* Object handle */
MQMD      MsgDesc;       /* Message descriptor */
MQGMO     GetMsgOpts;    /* Get-message options */
MQHBAG    hBag;          /* Bag handle */
MQLONG    CompCode;      /* Completion code */
MQLONG    Reason;        /* Reason code qualifying CompCode */
```

### **Visual Basic invocation for mqGetBag**

(Supported on Windows only.)

```
mqGetBag (HConn, HObj, MsgDesc, GetMsgOpts, Bag, CompCode, Reason);
```

Declare the parameters as follows:

```
Dim HConn As Long 'MQI connection handle'
Dim HObj As Long 'Object handle'
Dim MsgDesc As Long 'Message descriptor'
```

Dim GetMsgOpts As Long 'Get-message options'  
Dim Bag As Long 'Bag handle'  
Dim CompCode As Long 'Completion code'  
Dim Reason As Long 'Reason code qualifying CompCode'

### **mqInquireBag:**

The mqInquireBag call inquires the value of a bag handle that is present in the bag. The data item can be a user item or a system item.

### **Syntax for mqInquireBag**

**mqInquireBag** (*Bag, Selector, ItemIndex, ItemValue, CompCode, Reason*)

### **Parameters for mqInquireBag**

#### **Bag (MQHBAG) - input**

Bag handle to be inquired. The bag can be a user bag or a system bag.

#### **Selector (MQLONG) - input**

Selector identifying the item to be inquired.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

The data type of the item must agree with the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

The following special values can be specified for Selector:

#### **MQSEL\_ANY\_SELECTOR**

The item to be inquired is a user or system item identified by the ItemIndex parameter.

#### **MQSEL\_ANY\_USER\_SELECTOR**

The item to be inquired is a user item identified by the ItemIndex parameter.

#### **MQSEL\_ANY\_SYSTEM\_SELECTOR**

The item to be inquired is a system item identified by the ItemIndex parameter.

#### **ItemIndex (MQLONG) - input**

Index of the data item to be inquired.

The value must be zero or greater, or the special value MQIND\_NONE. If the value is less than zero and not MQIND\_NONE, MQRC\_INDEX\_ERROR results. If the item is not already present in the bag, MQRC\_INDEX\_NOT\_PRESENT results.

The following special value can be specified:

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

If MQSEL\_ANY\_SELECTOR is specified for the Selector parameter, the ItemIndex parameter is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL\_ANY\_USER\_SELECTOR is specified for the Selector parameter, the ItemIndex parameter is the index relative to the set of system items, and must be zero or greater.

If MQSEL\_ANY\_SYSTEM\_SELECTOR is specified for the Selector parameter, the ItemIndex parameter is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, the `ItemIndex` parameter is the index relative to the set of items that have that selector value and can be `MQIND_NONE`, zero, or greater.

***ItemValue* (MQHBAG) - output**

Value of the item in the bag.

***CompCode* (MQLONG) - output**

Completion code.

***Reason* (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqInquireBag` call:

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not `MQIND_NONE`, or `MQIND_NONE` specified with one of the `MQSEL_ANY_xxx_SELECTOR` values).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_ITEM\_VALUE\_ERROR**

The `ItemValue` parameter is not valid (invalid parameter address).

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

`MQIND_NONE` specified when more than one occurrence of the specified selector is present within the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**C language invocation for `mqInquireBag`**

```
mqInquireBag (Bag, Selector, ItemIndex, &ItemValue, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;      /* Selector */
MQLONG  ItemIndex;     /* Index of the data item to be inquired */
MQHBAG  ItemValue;     /* Value of item in the bag */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

**Visual Basic invocation for `mqInquireBag`**

(Supported on Windows only.)

```
mqInquireBag (Bag, Selector, ItemIndex, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```

Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemIndex As Long 'Index of the data item to be inquired'
Dim ItemValue As Long 'Value of item in the bag'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'

```

### **mqInquireByteString:**

The mqInquireByteString call requests the value of a byte string data item that is present in the bag. The data item can be a user item or a system item.

### **Syntax for mqInquireByteString**

**mqInquireByteString** (*Bag, Selector, ItemIndex, Bufferlength, Buffer, ByteStringLength, CompCode, Reason*)

### **Parameters for mqInquireByteString**

#### **Bag (MQHBAG) - input**

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

#### **Selector (MQLONG) - input**

Selector of the item to which the inquiry relates.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

The data type of the item must be the same as the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

The following special values can be specified for *Selector*:

#### **MQSEL\_ANY\_SELECTOR**

The item to be inquired about is a user or system item identified by *ItemIndex*.

#### **MQSEL\_ANY\_USER\_SELECTOR**

The item to be inquired about is a user item identified by *ItemIndex*.

#### **MQSEL\_ANY\_SYSTEM\_SELECTOR**

The item to be inquired about is a system item identified by *ItemIndex*.

#### **ItemIndex (MQLONG) - input**

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND\_NONE. If the value is less than zero and not MQIND\_NONE, MQRC\_INDEX\_ERROR results. If the item is not already present in the bag, MQRC\_INDEX\_NOT\_PRESENT results. The following special value can be specified:

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

If MQSEL\_ANY\_SELECTOR is specified for the *Selector* parameter, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL\_ANY\_USER\_SELECTOR is specified for the *Selector* parameter, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL\_ANY\_SYSTEM\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND\_NONE, zero, or greater.

**BufferLength (MQLONG) - input**

Length in bytes of the buffer to receive the byte string. Zero is a valid value.

**Buffer (MQBYTE x BufferLength) - output**

Buffer to receive the byte string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

The string is padded with nulls to the length of the buffer. If the string is longer than the buffer, the string is truncated to fit; in this case *ByteStringLength* indicates the size of the buffer needed to accommodate the string without truncation.

**ByteStringLength (MQLONG) - output**

The length in bytes of the string contained in the bag. If the *Buffer* parameter is too small, the length of the string returned is less than *ByteStringLength*.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the *mqInquireByteString* call:

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE, or MQIND\_NONE specified with one of the MQSEL\_ANY\_xxx\_SELECTOR values).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_STRING\_LENGTH\_ERROR**

*ByteStringLength* parameter not valid (invalid parameter address).

## MQRC\_STRING\_TRUNCATED

Data too long for output buffer and has been truncated.

### C language invocation for mqInquireByteString

```
mqInquireByteString (Bag, Selector, ItemIndex,  
BufferLength, Buffer, &StringLength, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */  
MQLONG  Selector;     /* Selector */  
MQLONG  ItemIndex;    /* Item index */  
MQLONG  BufferLength;  /* Buffer length */  
PMQBYTE Buffer;        /* Buffer to contain string */  
MQLONG  ByteStringLength; /* Length of byte string returned */  
MQLONG  CompCode;     /* Completion code */  
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

### Visual Basic invocation for mqInquireByteString

(Supported on Windows only.)

```
mqInquireByteString Bag, Selector, ItemIndex,  
BufferLength, Buffer, StringLength, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long 'Bag handle'  
Dim Selector      As Long 'Selector'  
Dim ItemIndex     As Long 'Item index'  
Dim BufferLength   As Long 'Buffer length'  
Dim Buffer         As Byte 'Buffer to contain string'  
Dim ByteStringLength As Long 'Length of byte string returned'  
Dim CompCode      As Long 'Completion code'  
Dim Reason        As Long 'Reason code qualifying CompCode'
```

### mqInquireByteStringFilter:

The mqInquireByteStringFilter call requests the value and operator of a byte string filter item that is present in the bag. The data item can be a user item or a system item.

### Syntax for mqInquireByteStringFilter

```
mqInquireByteStringFilter (Bag, Selector, ItemIndex, Bufferlength, Buffer, ByteStringLength,  
Operator, CompCode, Reason)
```

### Parameters for mqInquireByteStringFilter

#### Bag (MQHBAG) - input

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

#### Selector (MQLONG) - input

Selector of the item to which the inquiry relates.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

The data type of the item must be the same as the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

The following special values can be specified for *Selector*:

### **MQSEL\_ANY\_SELECTOR**

The item to be inquired about is a user or system item identified by *ItemIndex*.

### **MQSEL\_ANY\_USER\_SELECTOR**

The item to be inquired about is a user item identified by *ItemIndex*.

### **MQSEL\_ANY\_SYSTEM\_SELECTOR**

The item to be inquired about is a system item identified by *ItemIndex*.

### ***ItemIndex* (MQLONG) - input**

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND\_NONE. If the value is less than zero and not MQIND\_NONE, MQRC\_INDEX\_ERROR results. If the item is not already present in the bag, MQRC\_INDEX\_NOT\_PRESENT results. The following special value can be specified:

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

If MQSEL\_ANY\_SELECTOR is specified for the *Selector* parameter, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL\_ANY\_USER\_SELECTOR is specified for the *Selector* parameter, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL\_ANY\_SYSTEM\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND\_NONE, zero, or greater.

### ***BufferLength* (MQLONG) - input**

Length in bytes of the buffer to receive the condition byte string. Zero is a valid value.

### ***Buffer* (MQBYTE x *BufferLength*) - output**

Buffer to receive the condition byte string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

The string is padded with blanks to the length of the buffer; the string is not null-terminated. If the string is longer than the buffer, the string is truncated to fit; in this case *ByteStringLength* indicates the size of the buffer needed to accommodate the string without truncation.

### ***ByteStringLength* (MQLONG) - output**

The length in bytes of the condition string contained in the bag. If the *Buffer* parameter is too small, the length of the string returned is less than *StringLength*.

### ***Operator* (MQLONG) - output**

Byte string filter operator in the bag.

### ***CompCode* (MQLONG) - output**

Completion code.

### ***Reason* (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the `mqInquireByteStringFilter` call:

#### **MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

#### **MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_FILTER\_OPERATOR\_ERROR**

Filter operator not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE, or MQIND\_NONE specified with one of the MQSEL\_ANY\_xxx\_SELECTOR values).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_STRING\_LENGTH\_ERROR***ByteStringLength* parameter not valid (invalid parameter address).**MQRC\_STRING\_TRUNCATED**

Data too long for output buffer and has been truncated.

**C language invocation for mqInquireByteStringFilter**

```
mqInquireByteStringFilter (Bag, Selector, ItemIndex,
BufferLength, Buffer, &ByteStringLength, &Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;     /* Selector */
MQLONG  ItemIndex;    /* Item index */
MQLONG  BufferLength;  /* Buffer length */
PMQBYTE Buffer;        /* Buffer to contain string */
MQLONG  ByteStringLength; /* Length of string returned */
MQLONG  Operator      /* Item operator */
PMQLONG CompCode;     /* Completion code */
PMQLONG Reason;       /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqInquireByteStringFilter**

(Supported on Windows only.)

```
mqInquireByteStringFilter Bag, Selector, ItemIndex,
BufferLength, Buffer, ByteStringLength,
Operator, CompCode, Reason
```

Declare the parameters as follows:

Dim Bag	As Long	'Bag handle'
Dim Selector	As Long	'Selector'
Dim ItemIndex	As Long	'Item index'
Dim BufferLength	As Long	'Buffer length'
Dim Buffer	As String	'Buffer to contain string'
Dim ByteStringLength	As Long	'Length of byte string returned'
Dim Operator	As Long	'Operator'
Dim CompCode	As Long	'Completion code'
Dim Reason	As Long	'Reason code qualifying CompCode'

### **mqInquireInteger:**

The `mqInquireInteger` call requests the value of an integer data item that is present in the bag. The data item can be a user item or a system item.

### **Syntax for `mqInquireInteger`**

**`mqInquireInteger`** (*Bag, Selector, ItemIndex, ItemValue, CompCode, Reason*)

### **Parameters for `mqInquireInteger`**

#### ***Bag* (MQHBAG) - input**

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

#### ***Selector* (MQLONG) - input**

Selector identifying the item to which the inquiry relates.

If the selector is less than zero (a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

The data type of the item must agree with the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

The following special values can be specified for *Selector*:

#### **MQSEL\_ANY\_SELECTOR**

The item to be inquired about is a user or system item identified by *ItemIndex*.

#### **MQSEL\_ANY\_USER\_SELECTOR**

The item to be inquired about is a user item identified by *ItemIndex*.

#### **MQSEL\_ANY\_SYSTEM\_SELECTOR**

The item to be inquired about is a system item identified by *ItemIndex*.

#### ***ItemIndex* (MQLONG) - input**

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND\_NONE. If the value is less than zero and is not MQIND\_NONE, MQRC\_INDEX\_ERROR results. If the item is not already present in the bag, MQRC\_INDEX\_NOT\_PRESENT results. The following special value can be specified:

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

If MQSEL\_ANY\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL\_ANY\_USER\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL\_ANY\_SYSTEM\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND\_NONE, zero, or greater.

**ItemValue (MQLONG) - output**

The value of the item in the bag.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqInquireInteger call:

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE, or MQIND\_NONE specified with one of the MQSEL\_ANY\_xxx\_SELECTOR values).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_ITEM\_VALUE\_ERROR**

*ItemValue* parameter not valid (invalid parameter address).

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**C language invocation for mqInquireInteger**

```
mqInquireInteger (Bag, Selector, ItemIndex, &ItemValue,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;          /* Bag handle */  
MQLONG  Selector;     /* Selector */  
MQLONG  ItemIndex;    /* Item index */  
MQLONG  ItemValue;    /* Item value */  
MQLONG  CompCode;     /* Completion code */  
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqInquireInteger**

(Supported on Windows only.)

```
mqInquireInteger Bag, Selector, ItemIndex, ItemValue,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim Selector As Long 'Selector'  
Dim ItemIndex As Long 'Item index'  
Dim ItemValue As Long 'Item value'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### **mqInquireInteger64:**

The `mqInquireInteger64` call requests the value of a 64-bit integer data item that is present in the bag. The data item can be a user item or a system item.

### **Syntax for mqInquireInteger64**

**mqInquireInteger64** (*Bag, Selector, ItemIndex, ItemValue, CompCode, Reason*)

### **Parameters for mqInquireInteger64**

#### **Bag (MQHBAG) - input**

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

#### **Selector (MQLONG) - input**

Selector identifying the item to which the inquiry relates.

If the selector is less than zero (a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

The data type of the item must agree with the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

The following special values can be specified for *Selector*:

#### **MQSEL\_ANY\_SELECTOR**

The item to be inquired about is a user or system item identified by *ItemIndex*.

#### **MQSEL\_ANY\_USER\_SELECTOR**

The item to be inquired about is a user item identified by *ItemIndex*.

#### **MQSEL\_ANY\_SYSTEM\_SELECTOR**

The item to be inquired about is a system item identified by *ItemIndex*.

#### **ItemIndex (MQLONG) - input**

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND\_NONE. If the value is less than zero and is not MQIND\_NONE, MQRC\_INDEX\_ERROR results. If the item is not already present in the bag, MQRC\_INDEX\_NOT\_PRESENT results. The following special value can be specified:

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

If MQSEL\_ANY\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL\_ANY\_USER\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL\_ANY\_SYSTEM\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND\_NONE, zero, or greater.

**ItemValue (MQINT64) - output**

The value of the item in the bag.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqInquireInteger64 call:

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE, or MQIND\_NONE specified with one of the MQSEL\_ANY\_XXX\_SELECTOR values).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_ITEM\_VALUE\_ERROR**

*ItemValue* parameter not valid (invalid parameter address).

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**C language invocation for mqInquireInteger64**

```
mqInquireInteger64 (Bag, Selector, ItemIndex, &ItemValue,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */  
MQLONG  Selector;     /* Selector */  
MQLONG  ItemIndex;    /* Item index */  
MQINT64 ItemValue;    /* Item value */  
MQLONG  CompCode;     /* Completion code */  
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqInquireInteger64**

(Supported on Windows only.)

```
mqInquireInteger64 Bag, Selector, ItemIndex, ItemValue,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim Selector As Long 'Selector'  
Dim ItemIndex As Long 'Item index'  
Dim ItemValue As Long 'Item value'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### **mqInquireIntegerFilter:**

The mqInquireIntegerFilter call requests the value and operator of an integer filter item that is present in the bag. The data item can be a user item or a system item.

### **Syntax for mqInquireIntegerFilter**

**mqInquireIntegerFilter** (*Bag, Selector, ItemIndex, ItemValue, Operator, CompCode, Reason*)

### **Parameters for mqInquireIntegerFilter**

#### **Bag (MQHBAG) - input**

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

#### **Selector (MQLONG) - input**

Selector identifying the item to which the inquiry relates.

If the selector is less than zero (a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

The data type of the item must agree with the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

The following special values can be specified for *Selector*:

#### **MQSEL\_ANY\_SELECTOR**

The item to be inquired about is a user or system item identified by *ItemIndex*.

#### **MQSEL\_ANY\_USER\_SELECTOR**

The item to be inquired about is a user item identified by *ItemIndex*.

#### **MQSEL\_ANY\_SYSTEM\_SELECTOR**

The item to be inquired about is a system item identified by *ItemIndex*.

#### **ItemIndex (MQLONG) - input**

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND\_NONE. If the value is less than zero and is not MQIND\_NONE, MQRC\_INDEX\_ERROR results. If the item is not already present in the bag, MQRC\_INDEX\_NOT\_PRESENT results. The following special value can be specified:

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

If MQSEL\_ANY\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL\_ANY\_USER\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL\_ANY\_SYSTEM\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND\_NONE, zero, or greater.

**ItemValue (MQLONG) - output**

The condition value.

**Operator (MQLONG) - output**

Integer filter operator in the bag.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqInquireIntegerFilter call:

**MQRC\_FILTER\_OPERATOR\_ERROR**

Filter operator not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE, or MQIND\_NONE specified with one of the MQSEL\_ANY\_XXX\_SELECTOR values).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_ITEM\_VALUE\_ERROR**

*ItemValue* parameter not valid (invalid parameter address).

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**C language invocation for mqInquireIntegerFilter**

```
mqInquireIntegerFilter (Bag, Selector, ItemIndex, &ItemValue,  
&Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */  
MQLONG  Selector;      /* Selector */  
MQLONG  ItemIndex;     /* Item index */  
MQLONG  ItemValue;     /* Item value */  
MQLONG  Operator;      /* Item operator */  
MQLONG  CompCode;      /* Completion code */  
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

## Visual Basic invocation for mqInquireIntegerFilter

(Supported on Windows only.)

mqInquireIntegerFilter Bag, Selector, ItemIndex, ItemValue,  
Operator, CompCode, Reason

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim Selector As Long 'Selector'  
Dim ItemIndex As Long 'Item index'  
Dim ItemValue As Long 'Item value'  
Dim Operator As Long 'Item operator'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### mqInquireItemInfo:

The mqInquireItemInfo call returns information about a specified item in a bag. The data item can be a user item or a system item.

### Syntax for mqInquireItemInfo

**mqInquireItemInfo** (*Bag, Selector, ItemIndex, ItemType, OutSelector, CompCode, Reason*)

### Parameters for mqInquireItemInfo

#### **Bag (MQHBAG) - input**

Handle of the bag to be inquired.

The bag can be a user bag or a system bag.

#### **Selector (MQLONG) - input**

Selector identifying the item to be inquired.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

The following special values can be specified for Selector:

#### **MQSEL\_ANY\_SELECTOR**

The item to be inquired is a user or system item identified by the ItemIndex parameter.

#### **MQSEL\_ANY\_USER\_SELECTOR**

The item to be inquired is a user item identified by the ItemIndex parameter.

#### **MQSEL\_ANY\_SYSTEM\_SELECTOR**

The item to be inquired is a system item identified by the ItemIndex parameter.

#### **ItemIndex (MQLONG) - input**

Index of the data item to be inquired.

The item must be present within the bag; MQRC\_INDEX\_NOT\_PRESENT results if it is not. The value must be zero or greater, or the following special value:

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

If MQSEL\_ANY\_SELECTOR is specified for the Selector parameter, the ItemIndex parameter is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL\_ANY\_USER\_SELECTOR is specified for the Selector parameter, the ItemIndex parameter is the index relative to the set of system items, and must be zero or greater.

If MQSEL\_ANY\_SYSTEM\_SELECTOR is specified for the Selector parameter, the ItemIndex parameter is the index relative to the set of system items, and must be zero or greater. If an explicit selector value is specified, the ItemIndex parameter is the index relative to the set of items that have that selector value and can be MQIND\_NONE, zero, or greater.

**ItemType (MQLONG) - output**

The data type of the specified data item.

The following can be returned:

**MQITEM\_BAG**

Bag handle item.

**MQITEM\_BYTE\_STRING**

Byte string.

**MQITEM\_INTEGER**

Integer item.

**MQITEM\_INTEGER\_FILTER**

Integer filter.

**MQITEM\_INTEGER64**

64-bit integer item.

**MQITEM\_STRING**

Character-string item.

**MQITEM\_STRING\_FILTER**

String filter.

**OutSelector (MQLONG) - output**

Selector of the specified data item.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqInquireItemInfo call:

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

MQIND\_NONE specified with one of the MQSEL\_ANY\_XXX\_SELECTOR values.

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_ITEM\_TYPE\_ERROR**

ItemType parameter not valid (invalid parameter address).

**MQRC\_OUT\_SELECTOR\_ERROR**

OutSelector parameter not valid (invalid parameter address).

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

### **MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

### **MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

### **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

## **C language invocation for mqInquireItemInfo**

```
mqInquireItemInfo (Bag, Selector, ItemIndex, &OutSelector, &ItemType,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */  
MQLONG  Selector;      /* Selector identifying item */  
MQLONG  ItemIndex;     /* Index of data item */  
MQLONG  OutSelector;   /* Selector of specified data item */  
MQLONG  ItemType;      /* Data type of data item */  
MQLONG  CompCode;      /* Completion code */  
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

## **Visual Basic invocation for mqInquireItemInfo**

(Supported on Windows only.)

```
mqInquireItemInfo Bag, Selector, ItemIndex, OutSelector, ItemType,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim Selector As Long 'Selector identifying item'  
Dim ItemIndex As Long 'Index of data item'  
Dim OutSelector As Long 'Selector of specified data item'  
Dim ItemType As Long 'Data type of data item'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## **mqInquireString:**

The mqInquireString call requests the value of a character data item that is present in the bag. The data item can be a user item or a system item.

### **Syntax for mqInquireString**

```
mqInquireString (Bag, Selector, ItemIndex, Bufferlength, Buffer, StringLength, CodedCharSetId,  
CompCode, Reason)
```

### **Parameters for mqInquireString**

#### **Bag (MQHBAG) - input**

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

#### **Selector (MQLONG) - input**

Selector of the item to which the inquiry relates.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

The data type of the item must be the same as the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

The following special values can be specified for *Selector*:

**MQSEL\_ANY\_SELECTOR**

The item to be inquired about is a user or system item identified by *ItemIndex*.

**MQSEL\_ANY\_USER\_SELECTOR**

The item to be inquired about is a user item identified by *ItemIndex*.

**MQSEL\_ANY\_SYSTEM\_SELECTOR**

The item to be inquired about is a system item identified by *ItemIndex*.

***ItemIndex* (MQLONG) - input**

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND\_NONE. If the value is less than zero and not MQIND\_NONE, MQRC\_INDEX\_ERROR results. If the item is not already present in the bag, MQRC\_INDEX\_NOT\_PRESENT results. The following special value can be specified:

**MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

If MQSEL\_ANY\_SELECTOR is specified for the *Selector* parameter, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL\_ANY\_USER\_SELECTOR is specified for the *Selector* parameter, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL\_ANY\_SYSTEM\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND\_NONE, zero, or greater.

***BufferLength* (MQLONG) - input**

Length in bytes of the buffer to receive the string. Zero is a valid value.

***Buffer* (MQCHAR x *BufferLength*) - output**

Buffer to receive the character string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

The string is padded with blanks to the length of the buffer; the string is not null-terminated. If the string is longer than the buffer, the string is truncated to fit; in this case *StringLength* indicates the size of the buffer needed to accommodate the string without truncation.

***StringLength* (MQLONG) - output**

The length in bytes of the string contained in the bag. If the *Buffer* parameter is too small, the length of the string returned is less than *StringLength*.

***CodedCharSetId* (MQLONG) - output**

The coded character set identifier for the character data in the string. This parameter can be set to a null pointer if not required.

***CompCode* (MQLONG) - output**

Completion code.

***Reason* (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the mqInquireString call:

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE, or MQIND\_NONE specified with one of the MQSEL\_ANY\_xxx\_SELECTOR values).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_STRING\_LENGTH\_ERROR**

*StringLength* parameter not valid (invalid parameter address).

**MQRC\_STRING\_TRUNCATED**

Data too long for output buffer and has been truncated.

**C language invocation for mqInquireString**

```
mqInquireString (Bag, Selector, ItemIndex,
BufferLength, Buffer, &StringLength, &CodedCharSetId,
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;      /* Selector */
MQLONG  ItemIndex;     /* Item index */
MQLONG  BufferLength;   /* Buffer length */
PMQCHAR Buffer;         /* Buffer to contain string */
MQLONG  StringLength;  /* Length of string returned */
MQLONG  CodedCharSetId /* Coded Character Set ID */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqInquireString**

(Supported on Windows only.)

```
mqInquireString Bag, Selector, ItemIndex,
BufferLength, Buffer, StringLength, CodedCharSetId,
CompCode, Reason
```

Declare the parameters as follows:

Dim Bag	As Long	'Bag handle'
Dim Selector	As Long	'Selector'
Dim ItemIndex	As Long	'Item index'
Dim BufferLength	As Long	'Buffer length'
Dim Buffer	As String	'Buffer to contain string'
Dim StringLength	As Long	'Length of string returned'
Dim CodedCharSetId	As Long	'Coded Character Set ID'
Dim CompCode	As Long	'Completion code'
Dim Reason	As Long	'Reason code qualifying CompCode'

### **mqInquireStringFilter:**

The `mqInquireStringFilter` call requests the value and operator of a string filter item that is present in the bag. The data item can be a user item or a system item.

### **Syntax for mqInquireStringFilter**

**mqInquireStringFilter** (*Bag*, *Selector*, *ItemIndex*, *Bufferlength*, *Buffer*, *StringLength*, *CodedCharSetId*, *Operator*, *CompCode*, *Reason*)

### **Parameters for mqInquireStringFilter**

#### **Bag (MQHBAG) - input**

Handle of the bag to which the inquiry relates. The bag can be a user bag or a system bag.

#### **Selector (MQLONG) - input**

Selector of the item to which the inquiry relates.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

The specified selector must be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

The data type of the item must be the same as the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

The following special values can be specified for *Selector*:

#### **MQSEL\_ANY\_SELECTOR**

The item to be inquired about is a user or system item identified by *ItemIndex*.

#### **MQSEL\_ANY\_USER\_SELECTOR**

The item to be inquired about is a user item identified by *ItemIndex*.

#### **MQSEL\_ANY\_SYSTEM\_SELECTOR**

The item to be inquired about is a system item identified by *ItemIndex*.

#### **ItemIndex (MQLONG) - input**

Index of the data item to which the inquiry relates. The value must be zero or greater, or the special value MQIND\_NONE. If the value is less than zero and not MQIND\_NONE, MQRC\_INDEX\_ERROR results. If the item is not already present in the bag, MQRC\_INDEX\_NOT\_PRESENT results. The following special value can be specified:

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

If MQSEL\_ANY\_SELECTOR is specified for the *Selector* parameter, *ItemIndex* is the index relative to the set of items that contains both user items and system items, and must be zero or greater.

If MQSEL\_ANY\_USER\_SELECTOR is specified for the *Selector* parameter, *ItemIndex* is the index relative to the set of user items, and must be zero or greater.

If MQSEL\_ANY\_SYSTEM\_SELECTOR is specified for *Selector*, *ItemIndex* is the index relative to the set of system items, and must be zero or greater.

If an explicit selector value is specified, *ItemIndex* is the index relative to the set of items that have that selector value, and can be MQIND\_NONE, zero, or greater.

**BufferLength (MQLONG) - input**

Length in bytes of the buffer to receive the condition string. Zero is a valid value.

**Buffer (MQCHAR x BufferLength) - output**

Buffer to receive the character condition string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

The string is padded with blanks to the length of the buffer; the string is not null-terminated. If the string is longer than the buffer, the string is truncated to fit; in this case *StringLength* indicates the size of the buffer needed to accommodate the string without truncation.

**StringLength (MQLONG) - output**

The length in bytes of the condition string contained in the bag. If the *Buffer* parameter is too small, the length of the string returned is less than *StringLength*.

**CodedCharSetId (MQLONG) - output**

The coded character set identifier for the character data in the string. This parameter can be set to a null pointer if not required.

**Operator (MQLONG) - output**

String filter operator in the bag.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the *mqInquireStringFilter* call:

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_FILTER\_OPERATOR\_ERROR**

Filter operator not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE, or MQIND\_NONE specified with one of the MQSEL\_ANY\_XXX\_SELECTOR values).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_STRING\_LENGTH\_ERROR**

*StringLength* parameter not valid (invalid parameter address).

**MQRC\_STRING\_TRUNCATED**

Data too long for output buffer and has been truncated.

**C language invocation for mqInquireStringFilter**

```
mqInquireStringFilter (Bag, Selector, ItemIndex,
BufferLength, Buffer, &StringLength, &CodedCharSetId,
&Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;      /* Selector */
MQLONG  ItemIndex;     /* Item index */
MQLONG  BufferLength;  /* Buffer length */
PMQCHAR Buffer;        /* Buffer to contain string */
MQLONG  StringLength; /* Length of string returned */
MQLONG  CodedCharSetId /* Coded Character Set ID */
MQLONG  Operator       /* Item operator */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqInquireStringFilter**

(Supported on Windows only.)

```
mqInquireStringFilter Bag, Selector, ItemIndex,
BufferLength, Buffer, StringLength, CodedCharSetId,
Operator, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long   'Bag handle'
Dim Selector      As Long   'Selector'
Dim ItemIndex     As Long   'Item index'
Dim BufferLength   As Long   'Buffer length'
Dim Buffer         As String  'Buffer to contain string'
Dim StringLength  As Long   'Length of string returned'
Dim CodedCharSetId As Long   'Coded Character Set ID'
Dim Operator      As Long   'Item operator'
Dim CompCode      As Long   'Completion code'
Dim Reason        As Long   'Reason code qualifying CompCode'
```

## mqPad:

The mqPad call pads a null-terminated string with blanks.

### Syntax for mqPad

**mqPad** (*String*, *BufferLength*, *Buffer*, *CompCode*, *Reason*)

### Parameters for mqPad

#### *String* (MQCHAR) - input

Null-terminated string. The null pointer is valid for the address of the *String* parameter, and denotes a string of zero length.

#### *BufferLength* (MQLONG) - input

Length in bytes of the buffer to receive the string padded with blanks. Must be zero or greater.

#### *Buffer* (MQCHAR x *BufferLength*) - output

Buffer to receive the blank-padded string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

If the number of characters preceding the first null in the *String* parameter is greater than the *BufferLength* parameter, the excess characters are omitted and MQRC\_DATA\_TRUNCATED results.

#### *CompCode* (MQLONG) - output

Completion code.

#### *Reason* (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the mqPad call:

#### MQRC\_BUFFER\_ERROR

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

#### MQRC\_BUFFER\_LENGTH\_ERROR

Buffer length not valid.

#### MQRC\_STRING\_ERROR

String parameter not valid (invalid parameter address or buffer not completely accessible).

#### MQRC\_STRING\_TRUNCATED

Data too long for output buffer and has been truncated.

### Usage notes for mqPad

1. If the buffer pointers are the same, the padding is done in place. If not, at most *BufferLength* characters are copied into the second buffer; any space remaining, including the null-termination character, is overwritten with spaces.
2. If the *String* and *Buffer* parameters partially overlap, the result is undefined.

### C language invocation for mqPad

```
mqPad (String, BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQCHAR  String;          /* String to be padded */
MQLONG  BufferLength;    /* Buffer length */
PMQCHAR Buffer           /* Buffer to contain padded string */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

**Note:** This call is not supported in Visual Basic.

### **mqPutBag:**

The mqPutBag call converts the contents of the specified bag into a PCF message and sends the message to the specified queue. The contents of the bag are unchanged after the call.

#### **Syntax for mqPutBag**

**mqPutBag** (*Hconn*, *Hobj*, *MsgDesc*, *PutMsgOpts*, *Bag*, *CompCode*, *Reason*)

#### **Parameters for mqPutBag**

**Hconn (MQHCONN) - input**

MQI connection handle.

**Hobj (MQHOBJ) - input**

Object handle of the queue on which the message is to be placed. This handle was returned by a preceding MQOPEN call issued by the application. The queue must be open for output.

**MsgDesc (MQMD) - input/output**

Message descriptor. (For more information, see MQMD - Message descriptor.)

If the *Format* field has a value other than MQFMT\_ADMIN, MQFMT\_EVENT, or MQFMT\_PCF, MQRC\_FORMAT\_NOT\_SUPPORTED results.

If the *Encoding* field has a value other than MQENC\_NATIVE, MQRC\_ENCODING\_NOT\_SUPPORTED results.

**PutMsgOpts (MQPMO) - input/output**

Put-message options. (For more information, see MQPMO - Put-message options.)

**Bag (MQHBAG) - input**

Handle of the data bag to be converted to a message.

If the bag contains an administration message, and mqAddInquiry was used to insert values into the bag, the value of the MQIASY\_COMMAND data item must be an INQUIRE command recognized by the MQAI; MQRC\_INQUIRY\_COMMAND\_ERROR results if it is not.

If the bag contains nested system bags, MQRC\_NESTED\_BAG\_NOT\_SUPPORTED results.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*. The following reason codes indicating error and warning conditions can be returned from the mqPutBag call:

**MQRC\_\***

Anything from the MQPUT call or bag manipulation.

**MQRC\_BAG\_WRONG\_TYPE**

Input data bag is a group bag.

**MQRC\_ENCODING\_NOT\_SUPPORTED**

Encoding not supported (value in *Encoding* field in MQMD must be MQENC\_NATIVE).

**MQRC\_FORMAT\_NOT\_SUPPORTED**

Format not supported (name in *Format* field in MQMD must be MQFMT\_ADMIN, MQFMT\_EVENT, or MQFMT\_PCF).

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

#### **MQRC\_INQUIRY\_COMMAND\_ERROR**

mqAddInquiry call used with a command code that is not a recognized INQUIRE command.

#### **MQRC\_NESTED\_BAG\_NOT\_SUPPORTED**

Input data bag contains one or more nested system bags.

#### **MQRC\_PARAMETER\_MISSING**

Administration message requires a parameter that is not present in the bag. This reason code occurs for bags created with the MQCBO\_ADMIN\_BAG or MQCBO\_REORDER\_AS\_REQUIRED options only.

#### **MQRC\_SELECTOR\_WRONG\_TYPE**

mqAddString or mqSetString was used to add the MQIACF\_INQUIRY selector to the bag.

#### **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

### **C language invocation for mqPutBag**

```
mqPutBag (HConn, HObj, &MsgDesc, &PutMsgOpts, Bag,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  HConn;          /* MQI connection handle */  
MQHOBJ   HObj;          /* Object handle */  
MQMD     MsgDesc;       /* Message descriptor */  
MQPMO    PutMsgOpts;    /* Put-message options */  
MQHBAG   Bag;          /* Bag handle */  
MQLONG   CompCode;     /* Completion code */  
MQLONG   Reason;       /* Reason code qualifying CompCode */
```

### **Visual Basic invocation for mqPutBag**

(Supported on Windows only.)

```
mqPutBag (HConn, HObj, MsgDesc, PutMsgOpts, Bag,  
CompCode, Reason);
```

Declare the parameters as follows:

```
Dim HConn      As Long 'MQI connection handle'  
Dim HObj       As Long 'Object handle'  
Dim MsgDesc    As MQMD 'Message descriptor'  
Dim PutMsgOpts As MQPMO 'Put-message options'  
Dim Bag        As Long 'Bag handle'  
Dim CompCode   As Long 'Completion code'  
Dim Reason     As Long 'Reason code qualifying CompCode'
```

## mqSetByteString:

The mqSetByteString call either modifies a byte string data item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but certain system-data items can also be modified.

### Syntax for mqSetByteString

**mqSetByteString** (*Bag, Selector, ItemIndex, Bufferlength, Buffer, CompCode, Reason*)

### Parameters for mqSetByteString

#### **Bag (MQHBAG) - input**

Handle of the bag to be set. This must be the handle of a bag created by the user, not the handle of a system bag; MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if you specify the handle of a system bag.

#### **Selector (MQLONG) - input**

Selector of the item to be modified.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read only, MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC\_MULTIPLE\_INSTANCE\_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQBA\_FIRST through MQBA\_LAST; MQRC\_SELECTOR\_OUT\_OF\_RANGE results if it is not. If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND\_ALL is *not* specified for the *ItemIndex* parameter, the specified selector must already be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

If MQIND\_ALL is *not* specified for the *ItemIndex* parameter, the data type of the item must be the same as the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

#### **ItemIndex (MQLONG) - input**

This identifies which occurrence of the item with the specified selector is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC\_INDEX\_ERROR results.

#### **Zero or greater**

The item with the specified index must already be present in the bag; MQRC\_INDEX\_NOT\_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

#### **MQIND\_NONE**

This specifies that there must be only one occurrence of the specified selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

#### **MQIND\_ALL**

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

**BufferLength (MQLONG) - input**

The length in bytes of the byte string contained in the *Buffer* parameter. The value must be zero or greater.

**Buffer (MQBYTE x BufferLength) - input**

Buffer containing the byte string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqSetByteString` call:

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE or MQIND\_ALL).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_MULTIPLE\_INSTANCE\_ERROR**

Multiple instances of system selector not valid.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE**

System item is read-only and cannot be altered.

**C language invocation for `mqSetByteString`**

```
mqSetByteString (Bag, Selector, ItemIndex, BufferLength, Buffer,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```

MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;     /* Selector */
MQLONG  ItemIndex;   /* Item index */
MQLONG  BufferLength; /* Buffer length */
PMQBYTE Buffer;       /* Buffer containing string */
MQLONG  CompCode;    /* Completion code */
MQLONG  Reason;      /* Reason code qualifying CompCode */

```

## Visual Basic invocation for mqSetByteString

(Supported on Windows only.)

```
mqSetByteString Bag, Selector, ItemIndex, BufferLength, Buffer,
CompCode, Reason
```

Declare the parameters as follows:

```

Dim Bag           As Long   'Bag handle'
Dim Selector      As Long   'Selector'
Dim ItemIndex     As Long   'Item index'
Dim BufferLength  As Long   'Buffer length'
Dim Buffer         As Byte   'Buffer containing string'
Dim CompCode     As Long   'Completion code'
Dim Reason       As Long   'Reason code qualifying CompCode'

```

### mqSetByteStringFilter:

The mqSetByteStringFilter call either modifies a byte string filter item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but certain system-data items can also be modified.

### Syntax for mqSetByteStringFilter

```
mqSetByteStringFilter (Bag, Selector, ItemIndex, Bufferlength, Buffer, Operator, CompCode,
Reason)
```

### Parameters for mqSetByteStringFilter

#### Bag (MQHBAG) - input

Handle of the bag to be set. This must be the handle of a bag created by the user, not the handle of a system bag; MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if you specify the handle of a system bag.

#### Selector (MQLONG) - input

Selector of the item to be modified.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read only, MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC\_MULTIPLE\_INSTANCE\_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQBA\_FIRST through MQBA\_LAST; MQRC\_SELECTOR\_OUT\_OF\_RANGE results if it is not. If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND\_ALL is *not* specified for the ItemIndex parameter, the specified selector must already be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

If `MQIND_ALL` is *not* specified for the *ItemIndex* parameter, the data type of the item must be the same as the data type implied by the call; `MQRC_SELECTOR_WRONG_TYPE` results if it is not.

***ItemIndex* (MQLONG) - input**

This identifies which occurrence of the item with the specified selector is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, `MQRC_INDEX_ERROR` results.

**Zero or greater**

The item with the specified index must already be present in the bag; `MQRC_INDEX_NOT_PRESENT` results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

**MQIND\_NONE**

This specifies that there must be only one occurrence of the specified selector in the bag. If there is more than one occurrence, `MQRC_SELECTOR_NOT_UNIQUE` results.

**MQIND\_ALL**

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

***BufferLength* (MQLONG) - input**

The length in bytes of the condition byte string contained in the *Buffer* parameter. The value must be zero or greater.

***Buffer* (MQBYTE x *BufferLength*) - input**

Buffer containing the condition byte string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

***Operator* (MQLONG x *Operator*) - input**

Byte string filter operator to be placed in the bag. Valid operators are of the form `MQCFOP_*`.

***CompCode* (MQLONG) - output**

Completion code.

***Reason* (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the `mqSetByteStringFilter` call:

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_FILTER\_OPERATOR\_ERROR**

Bag handle not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not `MQIND_NONE` or `MQIND_ALL`).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_MULTIPLE\_INSTANCE\_ERROR**

Multiple instances of system selector not valid.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE**

System item is read-only and cannot be altered.

**C language invocation for mqSetByteStringFilter**

```
mqSetByteStringFilter (Bag, Selector, ItemIndex, BufferLength, Buffer,
Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;      /* Selector */
MQLONG  ItemIndex;    /* Item index */
MQLONG  BufferLength;  /* Buffer length */
PMQBYTE Buffer;        /* Buffer containing string */
MQLONG  Operator;     /* Operator */
PMQLONG CompCode;     /* Completion code */
PMQLONG Reason;       /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqSetByteStringFilter**

(Supported on Windows only.)

```
mqSetByteStringFilter Bag, Selector, ItemIndex, BufferLength, Buffer,
Operator, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag          As Long  'Bag handle'
Dim Selector     As Long  'Selector'
Dim ItemIndex    As Long  'Item index'
Dim BufferLength  As Long  'Buffer length'
Dim Buffer        As String 'Buffer containing string'
Dim Operator     As Long  'Item operator'
Dim CompCode     As Long  'Completion code'
Dim Reason       As Long  'Reason code qualifying CompCode'
```

## mqSetInteger:

The `mqSetInteger` call either modifies an integer item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but specific system-data items can also be modified.

### Syntax for `mqSetInteger`

`mqSetInteger` (*Bag*, *Selector*, *ItemIndex*, *ItemValue*, *CompCode*, *Reason*)

### Parameters for `mqSetInteger`

#### *Bag* (MQHBAG) - input

Handle of the bag to be set. This must be the handle of a bag created by the user, and not the handle of a system bag; MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if the handle you specify refers to a system bag.

#### *Selector* (MQLONG) - input

Selector of the item to be modified. If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read-only, MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC\_MULTIPLE\_INSTANCE\_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQIA\_FIRST through MQIA\_LAST; MQRC\_SELECTOR\_OUT\_OF\_RANGE results if it is not. If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND\_ALL is *not* specified for the *ItemIndex* parameter, the specified selector must already be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

If MQIND\_ALL is *not* specified for the *ItemIndex* parameter, the data type of the item must agree with the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

#### *ItemIndex* (MQLONG) - input

This value identifies the occurrence of the item with the specified selector that is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC\_INDEX\_ERROR results.

#### **Zero or greater**

The item with the specified index must already be present in the bag; MQRC\_INDEX\_NOT\_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

#### **MQIND\_NONE**

This specifies that there must be one occurrence only of the specified selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

#### **MQIND\_ALL**

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

**Note:** For system selectors, the order is not changed.

**ItemValue (MQLONG) - input**

The integer value to be placed in the bag.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the *mqSetInteger* call:

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE or MQIND\_ALL).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_MULTIPLE\_INSTANCE\_ERROR**

Multiple instances of system selector not valid.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not in valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE**

System item is read only and cannot be altered.

**C language invocation for *mqSetInteger***

```
mqSetInteger (Bag, Selector, ItemIndex, ItemValue, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;      /* Selector */
MQLONG  ItemIndex;     /* Item index */
MQLONG  ItemValue;     /* Integer value */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

**Visual Basic invocation for *mqSetInteger***

(Supported on Windows only.)

```
mqSetInteger Bag, Selector, ItemIndex, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim Selector As Long 'Selector'  
Dim ItemIndex As Long 'Item index'  
Dim ItemValue As Long 'Integer value'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### **mqSetInteger64:**

The `mqSetInteger64` call either modifies a 64-bit integer item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but specific system-data items can also be modified.

### **Syntax for mqSetInteger64**

**mqSetInteger64** (*Bag, Selector, ItemIndex, ItemValue, CompCode, Reason*)

### **Parameters for mqSetInteger64**

#### **Bag (MQHBAG) - input**

Handle of the bag to be set. This must be the handle of a bag created by the user, and not the handle of a system bag; `MQRC_SYSTEM_BAG_NOT_ALTERABLE` results if the handle you specify refers to a system bag.

#### **Selector (MQLONG) - input**

Selector of the item to be modified. If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; `MQRC_SELECTOR_NOT_SUPPORTED` results if it is not.

If the selector is a supported system selector, but is one that is read-only, `MQRC_SYSTEM_ITEM_NOT_ALTERABLE` results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, `MQRC_MULTIPLE_INSTANCE_ERROR` results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the `MQCBO_CHECK_SELECTORS` option or as an administration bag (`MQCBO_ADMIN_BAG`), the selector must be in the range `MQIA_FIRST` through `MQIA_LAST`; `MQRC_SELECTOR_OUT_OF_RANGE` results if it is not. If `MQCBO_CHECK_SELECTORS` was not specified, the selector can be any value zero or greater.

If `MQIND_ALL` is *not* specified for the *ItemIndex* parameter, the specified selector must already be present in the bag; `MQRC_SELECTOR_NOT_PRESENT` results if it is not.

If `MQIND_ALL` is *not* specified for the *ItemIndex* parameter, the data type of the item must agree with the data type implied by the call; `MQRC_SELECTOR_WRONG_TYPE` results if it is not.

#### **ItemIndex (MQLONG) - input**

This value identifies the occurrence of the item with the specified selector that is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, `MQRC_INDEX_ERROR` results.

#### **Zero or greater**

The item with the specified index must already be present in the bag; `MQRC_INDEX_NOT_PRESENT` results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

## **MQIND\_NONE**

This specifies that there must be one occurrence only of the specified selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

## **MQIND\_ALL**

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

**Note:** For system selectors, the order is not changed.

### *ItemValue* (MQINT64) - **input**

The integer value to be placed in the bag.

### *CompCode* (MQLONG) - **output**

Completion code.

### *Reason* (MQLONG) - **output**

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the mqSetInteger64 call:

### **MQRC\_HBAG\_ERROR**

Bag handle not valid.

### **MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE or MQIND\_ALL).

### **MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

### **MQRC\_MULTIPLE\_INSTANCE\_ERROR**

Multiple instances of system selector not valid.

### **MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

### **MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

### **MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

### **MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not in valid range for call.

### **MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

### **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

### **MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

### **MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE**

System item is read only and cannot be altered.

## **C language invocation for mqSetInteger64**

```
mqSetInteger64 (Bag, Selector, ItemIndex, ItemValue, &CompCode, &Reason);
```

Declare the parameters as follows:

```

MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;     /* Selector */
MQLONG  ItemIndex;    /* Item index */
MQINT64 ItemValue;    /* Integer value */
MQLONG  CompCode;     /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */

```

## Visual Basic invocation for mqSetInteger64

(Supported on Windows only.)

```
mqSetInteger64 Bag, Selector, ItemIndex, ItemValue, CompCode, Reason
```

Declare the parameters as follows:

```

Dim Bag      As Long 'Bag handle'
Dim Selector As Long 'Selector'
Dim ItemIndex As Long 'Item index'
Dim ItemValue As Long 'Integer value'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'

```

### mqSetIntegerFilter:

The `mqSetIntegerFilter` call either modifies an integer filter item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but specific system-data items can also be modified.

### Syntax for mqSetIntegerFilter

```
mqSetIntegerFilter (Bag, Selector, ItemIndex, ItemValue, Operator, CompCode, Reason)
```

### Parameters for mqSetIntegerFilter

#### **Bag (MQHBAG) - input**

Handle of the bag to be set. This must be the handle of a bag created by the user, and not the handle of a system bag; `MQRC_SYSTEM_BAG_NOT_ALTERABLE` results if the handle you specify refers to a system bag.

#### **Selector (MQLONG) - input**

Selector of the item to be modified. If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; `MQRC_SELECTOR_NOT_SUPPORTED` results if it is not.

If the selector is a supported system selector, but is one that is read-only, `MQRC_SYSTEM_ITEM_NOT_ALTERABLE` results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, `MQRC_MULTIPLE_INSTANCE_ERROR` results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the `MQCBO_CHECK_SELECTORS` option or as an administration bag (`MQCBO_ADMIN_BAG`), the selector must be in the range `MQIA_FIRST` through `MQIA_LAST`; `MQRC_SELECTOR_OUT_OF_RANGE` results if it is not. If `MQCBO_CHECK_SELECTORS` was not specified, the selector can be any value zero or greater.

If `MQIND_ALL` is *not* specified for the *ItemIndex* parameter, the specified selector must already be present in the bag; `MQRC_SELECTOR_NOT_PRESENT` results if it is not.

If `MQIND_ALL` is *not* specified for the *ItemIndex* parameter, the data type of the item must agree with the data type implied by the call; `MQRC_SELECTOR_WRONG_TYPE` results if it is not.

***ItemIndex* (MQLONG) - input**

This value identifies the occurrence of the item with the specified selector that is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC\_INDEX\_ERROR results.

**Zero or greater**

The item with the specified index must already be present in the bag; MQRC\_INDEX\_NOT\_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

**MQIND\_NONE**

This specifies that there must be one occurrence only of the specified selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

**MQIND\_ALL**

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

**Note:** For system selectors, the order is not changed.

***ItemValue* (MQLONG) - input**

The integer condition value to be placed in the bag.

***Operator* (MQLONG) - input**

The integer filter operator to be placed in the bag. Valid operators are of the form MQCFOP\_\*.

***CompCode* (MQLONG) - output**

Completion code.

***Reason* (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error and warning conditions can be returned from the mqSetIntegerFilter call:

**MQRC\_FILTER\_OPERATOR\_ERROR**

Filter operator not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE or MQIND\_ALL).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_MULTIPLE\_INSTANCE\_ERROR**

Multiple instances of system selector not valid.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not in valid range for call.

#### **MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

#### **MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

#### **MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

#### **MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE**

System item is read only and cannot be altered.

### **C language invocation for mqSetIntegerFilter**

```
mqSetIntegerFilter (Bag, Selector, ItemIndex, ItemValue, Operator,  
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */  
MQLONG  Selector;     /* Selector */  
MQLONG  ItemIndex;    /* Item index */  
MQLONG  ItemValue;    /* Integer value */  
MQLONG  Operator;     /* Item operator */  
MQLONG  CompCode;     /* Completion code */  
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

### **Visual Basic invocation for mqSetIntegerFilter**

(Supported on Windows only.)

```
mqSetIntegerFilter Bag, Selector, ItemIndex, ItemValue, Operator,  
CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim Selector As Long 'Selector'  
Dim ItemIndex As Long 'Item index'  
Dim ItemValue As Long 'Integer value'  
Dim Operator As Long 'Item operator'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### **mqSetString:**

The `mqSetString` call either modifies a character data item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but certain system-data items can also be modified.

### **Syntax for mqSetString**

```
mqSetString (Bag, Selector, ItemIndex, Bufferlength, Buffer, CompCode, Reason)
```

### **Parameters for mqSetString**

#### **Bag (MQHBAG) - input**

Handle of the bag to be set. This must be the handle of a bag created by the user, not the handle of a system bag; `MQRC_SYSTEM_BAG_NOT_ALTERABLE` results if you specify the handle of a system bag.

#### **Selector (MQLONG) - input**

Selector of the item to be modified.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read only, MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC\_MULTIPLE\_INSTANCE\_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQCA\_FIRST through MQCA\_LAST; MQRC\_SELECTOR\_OUT\_OF\_RANGE results if it is not. If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND\_ALL is *not* specified for the *ItemIndex* parameter, the specified selector must already be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

If MQIND\_ALL is *not* specified for the *ItemIndex* parameter, the data type of the item must be the same as the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

#### ***ItemIndex* (MQLONG) - input**

This identifies which occurrence of the item with the specified selector is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC\_INDEX\_ERROR results.

##### **Zero or greater**

The item with the specified index must already be present in the bag; MQRC\_INDEX\_NOT\_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

##### **MQIND\_NONE**

This specifies that there must be only one occurrence of the specified selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

##### **MQIND\_ALL**

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

#### ***BufferLength* (MQLONG) - input**

The length in bytes of the string contained in the *Buffer* parameter. The value must be zero or greater, or the special value MQBL\_NULL\_TERMINATED.

If MQBL\_NULL\_TERMINATED is specified, the string is delimited by the first null encountered in the string.

If MQBL\_NULL\_TERMINATED is not specified, *BufferLength* characters are inserted into the bag, even if null characters are present; the nulls do not delimit the string.

#### ***Buffer* (MQCHAR x *BufferLength*) - input**

Buffer containing the character string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

#### ***CompCode* (MQLONG) - output**

Completion code.

#### ***Reason* (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqSetString call:

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE or MQIND\_ALL).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_MULTIPLE\_INSTANCE\_ERROR**

Multiple instances of system selector not valid.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE**

System item is read-only and cannot be altered.

**Usage notes for mqSetString**

The Coded Character Set ID (CCSID) associated with this string is copied from the current CCSID of the bag.

**C language invocation for mqSetString**

```
mqSetString (Bag, Selector, ItemIndex, BufferLength, Buffer,
&CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;          /* Bag handle */
MQLONG  Selector;     /* Selector */
MQLONG  ItemIndex;    /* Item index */
MQLONG  BufferLength;  /* Buffer length */
PMQCHAR Buffer;        /* Buffer containing string */
MQLONG  CompCode;     /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

## Visual Basic invocation for mqSetString

(Supported on Windows only.)

mqSetString Bag, Selector, ItemIndex, BufferLength, Buffer, CompCode, Reason

Declare the parameters as follows:

```
Dim Bag           As Long   'Bag handle'
Dim Selector      As Long   'Selector'
Dim ItemIndex     As Long   'Item index'
Dim BufferLength  As Long   'Buffer length'
Dim Buffer         As String 'Buffer containing string'
Dim CompCode     As Long   'Completion code'
Dim Reason       As Long   'Reason code qualifying CompCode'
```

### mqSetStringFilter:

The mqSetStringFilter call either modifies a string filter item that is already present in the bag, or deletes all existing occurrences of the specified selector and adds a new occurrence at the end of the bag. The data item is usually a user item, but certain system-data items can also be modified.

### Syntax for mqSetStringFilter

**mqSetStringFilter** (*Bag, Selector, ItemIndex, Bufferlength, Buffer, Operator, CompCode, Reason*)

### Parameters for mqSetStringFilter

#### **Bag (MQHBAG) - input**

Handle of the bag to be set. This must be the handle of a bag created by the user, not the handle of a system bag; MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if you specify the handle of a system bag.

#### **Selector (MQLONG) - input**

Selector of the item to be modified.

If the selector is less than zero (that is, a system selector), the selector must be one that is supported by the MQAI; MQRC\_SELECTOR\_NOT\_SUPPORTED results if it is not.

If the selector is a supported system selector, but is one that is read only, MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE results.

If the selector is an alterable system selector, but is always a single-instance selector and the application attempts to create a second instance in the bag, MQRC\_MULTIPLE\_INSTANCE\_ERROR results.

If the selector is zero or greater (that is, a user selector), and the bag was created with the MQCBO\_CHECK\_SELECTORS option or as an administration bag (MQCBO\_ADMIN\_BAG), the selector must be in the range MQCA\_FIRST through MQCA\_LAST; MQRC\_SELECTOR\_OUT\_OF\_RANGE results if it is not. If MQCBO\_CHECK\_SELECTORS was not specified, the selector can be any value zero or greater.

If MQIND\_ALL is *not* specified for the *ItemIndex* parameter, the specified selector must already be present in the bag; MQRC\_SELECTOR\_NOT\_PRESENT results if it is not.

If MQIND\_ALL is *not* specified for the *ItemIndex* parameter, the data type of the item must be the same as the data type implied by the call; MQRC\_SELECTOR\_WRONG\_TYPE results if it is not.

#### **ItemIndex (MQLONG) - input**

This identifies which occurrence of the item with the specified selector is to be modified. The value must be zero or greater, or one of the special values described in this topic; if it is none of these, MQRC\_INDEX\_ERROR results.

**Zero or greater**

The item with the specified index must already be present in the bag; MQRC\_INDEX\_NOT\_PRESENT results if it is not. The index is counted relative to the items in the bag that have the specified selector. For example, if there are five items in the bag with the specified selector, the valid values for *ItemIndex* are 0 through 4.

**MQIND\_NONE**

This specifies that there must be only one occurrence of the specified selector in the bag. If there is more than one occurrence, MQRC\_SELECTOR\_NOT\_UNIQUE results.

**MQIND\_ALL**

This specifies that all existing occurrences of the specified selector (if any) are to be deleted from the bag, and a new occurrence of the selector created at the end of the bag.

**BufferLength (MQLONG) - input**

The length in bytes of the condition string contained in the *Buffer* parameter. The value must be zero or greater, or the special value MQBL\_NULL\_TERMINATED.

If MQBL\_NULL\_TERMINATED is specified, the string is delimited by the first null encountered in the string.

If MQBL\_NULL\_TERMINATED is not specified, *BufferLength* characters are inserted into the bag, even if null characters are present; the nulls do not delimit the string.

**Buffer (MQCHAR x BufferLength) - input**

Buffer containing the character condition string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

**Operator (MQLONG x Operator) - input**

String filter operator to be placed in the bag. Valid operators are of the form MQCFOP\_\*.

**CompCode (MQLONG) - output**

Completion code.

**Reason (MQLONG) - output**

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqSetStringFilter call:

**MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

**MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

**MQRC\_FILTER\_OPERATOR\_ERROR**

Bag handle not valid.

**MQRC\_HBAG\_ERROR**

Bag handle not valid.

**MQRC\_INDEX\_ERROR**

Index not valid (index negative and not MQIND\_NONE or MQIND\_ALL).

**MQRC\_INDEX\_NOT\_PRESENT**

No item with the specified index is present within the bag for the selector given.

**MQRC\_MULTIPLE\_INSTANCE\_ERROR**

Multiple instances of system selector not valid.

**MQRC\_SELECTOR\_NOT\_PRESENT**

No item with the specified selector is present within the bag.

**MQRC\_SELECTOR\_NOT\_SUPPORTED**

Specified system selector not supported by the MQAI.

**MQRC\_SELECTOR\_NOT\_UNIQUE**

MQIND\_NONE specified when more than one occurrence of the specified selector is present in the bag.

**MQRC\_SELECTOR\_OUT\_OF\_RANGE**

Selector not within valid range for call.

**MQRC\_SELECTOR\_WRONG\_TYPE**

Data item has wrong data type for call.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

Insufficient storage available.

**MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

**MQRC\_SYSTEM\_ITEM\_NOT\_ALTERABLE**

System item is read-only and cannot be altered.

**Usage notes for mqSetStringFilter**

The Coded Character Set ID (CCSID) associated with this string is copied from the current CCSID of the bag.

**C language invocation for mqSetStringFilter**

```
mqSetStringFilter (Bag, Selector, ItemIndex, BufferLength, Buffer,
Operator, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  Bag;           /* Bag handle */
MQLONG  Selector;      /* Selector */
MQLONG  ItemIndex;     /* Item index */
MQLONG  BufferLength;  /* Buffer length */
PMQCHAR Buffer;        /* Buffer containing string */
MQLONG  Operator;      /* Item operator */
MQLONG  CompCode;     /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

**Visual Basic invocation for mqSetStringFilter**

(Supported on Windows only.)

```
mqSetStringFilter Bag, Selector, ItemIndex, BufferLength, Buffer,
Operator, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Bag           As Long   'Bag handle'
Dim Selector      As Long   'Selector'
Dim ItemIndex     As Long   'Item index'
Dim BufferLength  As Long   'Buffer length'
Dim Buffer        As String  'Buffer containing string'
Dim Operator      As Long   'Item operator'
Dim CompCode     As Long   'Completion code'
Dim Reason       As Long   'Reason code qualifying CompCode'
```

## mqTrim:

The mqTrim call trims the blanks from a blank-padded string, then terminates it with a null.

### Syntax for mqTrim

**mqTrim** (*BufferLength*, *Buffer*, *String*, *CompCode*, *Reason*)

### Parameters for mqTrim

#### *BufferLength* (MQLONG) - input

Length in bytes of the buffer containing the string padded with blanks. Must be zero or greater.

#### *Buffer* (MQCHAR × *BufferLength*) - input

Buffer containing the blank-padded string. The length is given by the *BufferLength* parameter. If zero is specified for *BufferLength*, the null pointer can be specified for the address of the *Buffer* parameter; in all other cases, a valid (nonnull) address must be specified for the *Buffer* parameter.

#### *String* (MQCHAR × (*BufferLength* +1)) - output

Buffer to receive the null-terminated string. The length of this buffer must be at least one byte greater than the value of the *BufferLength* parameter.

#### *CompCode* (MQLONG) - output

Completion code.

#### *Reason* (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqTrim call:

#### **MQRC\_BUFFER\_ERROR**

Buffer parameter not valid (invalid parameter address or buffer not completely accessible).

#### **MQRC\_BUFFER\_LENGTH\_ERROR**

Buffer length not valid.

#### **MQRC\_STRING\_ERROR**

String parameter not valid (invalid parameter address or buffer not completely accessible).

### Usage notes for mqTrim

1. If the two buffer pointers are the same, the trimming is done in place. If they are not the same, the blank-padded string is copied into the null-terminated string buffer. After copying, the buffer is scanned backwards from the end until a nonspace character is found. The byte following the nonspace character is then overwritten with a null character.
2. If *String* and *Buffer* partially overlap, the result is undefined.

### C language invocation for mqTrim

```
mqTrim (BufferLength, Buffer, String, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQLONG  BufferLength;    /* Buffer length */
MQCHAR  Buffer;         /* Buffer containing blank-padded string */
MQCHAR  String[n+1];   /* String with blanks discarded */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

**Note:** This call is not supported in Visual Basic.

## mqTruncateBag:

The mqTruncateBag call reduces the number of user items in a user bag to the specified value, by deleting user items from the end of the bag.

### Syntax for mqTruncateBag

**mqTruncateBag** (*Bag*, *ItemCount*, *CompCode*, *Reason*)

### Parameters for mqTruncateBag

#### *Bag* (MQHBAG) - input

Handle of the bag to be truncated. This must be the handle of a bag created by the user, not the handle of a system bag; MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE results if you specify the handle of a system bag.

#### *ItemCount* (MQLONG) - input

The number of user items to remain in the bag after truncation. Zero is a valid value.

**Note:** The *ItemCount* parameter is the number of data items, not the number of unique selectors. (If there are one or more selectors that occur multiple times in the bag, there will be fewer selectors than data items before truncation.) Data items are deleted from the end of the bag, in the opposite order to which they were added to the bag.

If the number specified exceeds the number of user items currently in the bag, MQRC\_ITEM\_COUNT\_ERROR results.

#### *CompCode* (MQLONG) - output

Completion code.

#### *Reason* (MQLONG) - output

Reason code qualifying *CompCode*.

The following reason codes indicating error conditions can be returned from the mqTruncateBag call:

#### **MQRC\_HBAG\_ERROR**

Bag handle not valid.

#### **MQRC\_ITEM\_COUNT\_ERROR**

*ItemCount* parameter not valid (value exceeds the number of user data items in the bag).

#### **MQRC\_SYSTEM\_BAG\_NOT\_ALTERABLE**

System bag cannot be altered or deleted.

### Usage notes for mqTruncateBag

1. System items in a bag are not affected by mqTruncateBag; the call cannot be used to truncate system bags.
2. mqTruncateBag with an *ItemCount* of zero is not the same as the mqClearBag call. The former deletes all of the user items but leaves the system items intact, and the latter deletes all of the user items and resets the system items to their initial values.

### C language invocation for mqTruncateBag

```
mqTruncateBag (Bag, ItemCount, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHBAG  hBag;           /* Bag handle */
MQLONG  ItemCount;     /* Number of items to remain in bag */
MQLONG  CompCode;     /* Completion code */
MQLONG  Reason;       /* Reason code qualifying CompCode */
```

## Visual Basic invocation for mqTruncateBag

(Supported on Windows only.)

mqTruncateBag Bag, ItemCount, CompCode, Reason

Declare the parameters as follows:

```
Dim Bag      As Long 'Bag handle'  
Dim ItemCount As Long 'Number of items to remain in bag'  
Dim CompCode As Long 'Completion code'  
Dim Reason   As Long 'Reason code qualifying CompCode'
```

### MQAI Selectors:

Items in bags are identified by a *selector* that acts as an identifier for the item. There are two types of selector, *user selector* and *system selector*.

#### User selectors

User selectors have values that are zero or positive. For the administration of MQSeries objects, valid user selectors are already defined by the following constants:

- MQCA\_\* and MQIA\_\* (object attributes)
- MQCACF\_\* and MQIACF\_\* (items relating specifically to PCF)
- MQCACH\_\* and MQIACH\_\* (channel attributes)

For user messages, the meaning of a user selector is defined by the application.

The following additional user selectors are introduced by the MQAI:

#### MQIACF\_INQUIRY

Identifies an IBM MQ object attribute to be returned by an Inquire command.

#### MQHA\_BAG\_HANDLE

Identifies a bag handle residing within another bag.

#### MQHA\_FIRST

Lower limit for handle selectors.

#### MQHA\_LAST

Upper limit for handle selectors.

#### MQHA\_LAST\_USED

Upper limit for last handle selector allocated.

#### MQCA\_USER\_LIST

Default user selector. Supported on Visual Basic only. This selector supports character type and represents the default value used if the *Selector* parameter is omitted on the mqAdd\*, mqSet\*, or mqInquire\* calls.

#### MQIA\_USER\_LIST

Default user selector. Supported on Visual Basic only. This selector supports integer type and represents the default value used if the *Selector* parameter is omitted on the mqAdd\*, mqSet\*, or mqInquire\* calls.

#### System selectors

System selectors have negative values. The following system selectors are included in the bag when it is created:

## **MQIASY\_BAG\_OPTIONS**

Bag-creation options. A summation of the options used to create the bag. This selector cannot be changed by the user.

## **MQIASY\_CODED\_CHAR\_SET\_ID**

Character-set identifier for the character data items in the bag. The initial value is the queue-manager's character set.

The value in the bag is used on entry to the mqExecute call and set on exit from the mqExecute call. This also applies when character strings are added to or modified in the bag.

## **MQIASY\_COMMAND**

PCF command identifier. Valid values are the MQCMD\_\* constants. For user messages, the value MQCMD\_NONE should be used. The initial value is MQCMD\_NONE.

The value in the bag is used on entry to the mqPutBag and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag and mqBufferToBag calls.

## **MQIASY\_COMP\_CODE**

Completion code. Valid values are the MQCC\_\* constants. The initial value is MQCC\_OK.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

## **MQIASY\_CONTROL**

PCF control options. Valid values are the MQCFC\_\* constants. The initial value is MQCFC\_LAST.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

## **MQIASY\_MSG\_SEQ\_NUMBER**

PCF message sequence number. Valid values are 1 or greater. The initial value is 1.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

## **MQIASY\_REASON**

Reason code. Valid values are the MQRC\_\* constants. The initial value is MQRC\_NONE.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

## **MQIASY\_TYPE**

PCF command type. Valid values are the MQCFT\_\* constants. For user messages, the value MQCFT\_USER should be used. The initial value is MQCFT\_USER for bags created as user bags and MQCFT\_COMMAND for bags created as administration or command bags.

The value in the bag is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls, and set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

## **MQIASY\_VERSION**

PCF version. Valid values are the MQCFH\_VERSION\_\* constants. The initial value is MQCFH\_VERSION\_1.

If the value in the bag is set to a value other than MQCFH\_VERSION\_1, the value is used on entry to the mqExecute, mqPutBag, and mqBagToBuffer calls. If the value in the bag is MQCFH\_VERSION\_1, the PCF version is the lowest value required for the parameter structures that are present in the message.

The value in the bag is set on exit from the mqExecute, mqGetBag, and mqBufferToBag calls.

## Indexing

Each selector and value within a data item in a bag have three associated index numbers:

- The index relative to other items that have the same selector.
- The index relative to the category of selector (user or system) to which the item belongs.
- The index relative to all the data items in the bag (user and system).

This allows indexing by user selectors, system selectors, or both as shown in Figure 48.

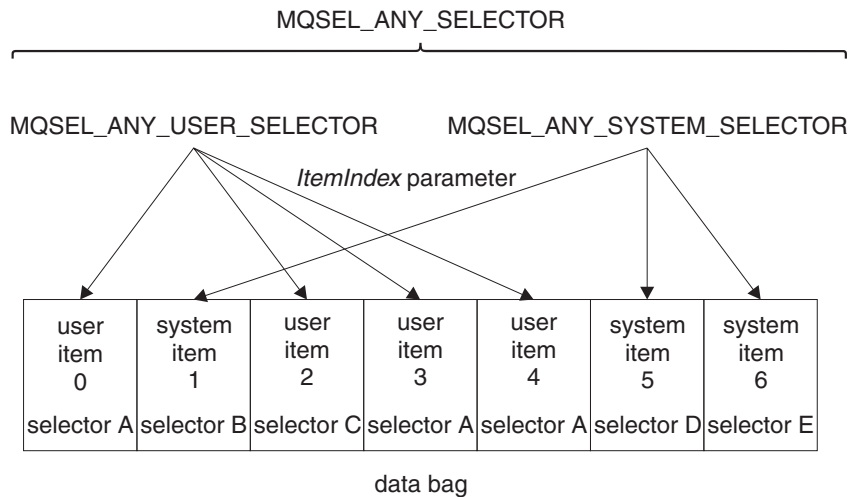

Figure 48. Indexing

In Figure Figure 48, user item 3 (selector A) can be referred to by the following index pairs:

<i>Selector</i>	<i>ItemIndex</i>
selector A	1
MQSEL_ANY_USER_SELECTOR	2
MQSEL_ANY_SELECTOR	3

The index is zero-based like an array in C; if there are 'n' occurrences, the index ranges from zero through 'n-1', with no gaps.

Indexes are used when replacing or removing existing data items from a bag. When used in this way, the insertion order is preserved, but indexes of other data items can be affected. For examples of this, see Changing information within a bag and Deleting data items.

The three types of indexing allow easy retrieval of data items. For example, if there are three instances of a particular selector in a bag, the `mqCountItems` call can count the number of instances of that selector, and the `mqInquire*` calls can specify both the selector and the index to inquire those values only. This is useful for attributes that can have a list of values such as some of the exits on channels.

## Data conversion

Like PCF messages, the strings contained in an MQAI data bag can be in a variety of coded character sets. Usually, all of the strings in a PCF message are in the same coded character set; that is, the same set as the queue manager.

Each string item in a data bag contains two values; the string itself and the CCSID. The string that is added to the bag is obtained from the *Buffer* parameter of the `mqAddString` or `mqSetString` call. The CCSID is obtained from the system item containing a selector of `MQIASY_CODED_CHAR_SET_ID`. This is known as the *bag CCSID* and can be changed using the `mqSetInteger` call.

When you inquire the value of a string contained in a data bag, the CCSID is an output parameter from the call.

Table 139 shows the rules applied when converting data bags into messages and vice versa:

Table 139. CCSID processing

MQAI call	CCSID	Input to call	Output to call
<code>mqBagToBuffer</code>	Bag CCSID ( 1 )	Ignored	Unchanged
<code>mqBagToBuffer</code>	String CCSIDs in bag	Used	Unchanged
<code>mqBagToBuffer</code>	String CCSIDs in buffer	Not applicable	Copied from string CCSIDs in bag
<code>mqBufferToBag</code>	Bag CCSID ( 1 )	Ignored	Unchanged
<code>mqBufferToBag</code>	String CCSIDs in buffer	Used	Unchanged
<code>mqBufferToBag</code>	String CCSIDs in bag	Not applicable	Copied from string CCSIDs in buffer
<code>mqPutBag</code>	MQMD CCSID	Used	Unchanged ( 2 )
<code>mqPutBag</code>	Bag CCSID ( 1 )	Ignored	Unchanged
<code>mqPutBag</code>	String CCSIDs in bag	Used	Unchanged
<code>mqPutBag</code>	String CCSIDs in message sent	Not applicable	Copied from string CCSIDs in bag
<code>mqGetBag</code>	MQMD CCSID	Used for data conversion of message	Set to CCSID of data returned ( 3 )
<code>mqGetBag</code>	Bag CCSID ( 1 )	Ignored	Unchanged
<code>mqGetBag</code>	String CCSIDs in message	Used	Unchanged
<code>mqGetBag</code>	String CCSIDs in bag	Not applicable	Copied from string CCSIDs in message
<code>mqExecute</code>	Request-bag CCSID	Used for MQMD of request message ( 4 )	Unchanged
<code>mqExecute</code>	Reply-bag CCSID	Used for data conversion of reply message ( 4 )	Set to CCSID of data returned ( 3 )
<code>mqExecute</code>	String CCSIDs in request bag	Used for request message	Unchanged
<code>mqExecute</code>	String CCSIDs in reply bag	Not applicable	Copied from string CCSIDs in reply message

### Notes:

1. Bag CCSID is the system item with selector `MQIASY_CODED_CHAR_SET_ID`.
2. `MQCCSI_Q_MGR` is changed to the actual queue manager CCSID.

3. If data conversion is requested, the CCSID of data returned is the same as the output value. If data conversion is not requested, the CCSID of data returned is the same as the message value. Note that no message is returned if data conversion is requested but fails.
4. If the CCSID is MQCCSI\_DEFAULT, the queue manager's CCSID is used.

## Use of the message descriptor

The PCF command type is obtained from the system item with selector MQIASY\_TYPE. When you create your data bag, the initial value of this item is set depending on the type of bag you create:

Table 140. PCF command type

Type of bag	Initial value of MQIASY_TYPE item
MQCBO_ADMIN_BAG	MQCFT_COMMAND
MQCBO_COMMAND_BAG	MQCFT_COMMAND
MQCBO_*	MQCFT_USER

When the MQAI generates a message descriptor, the values used in the *Format* and *MsgType* parameters depend on the value of the system item with selector MQIASY\_TYPE as shown in Table 140.

Table 141. Format and MsgType parameters of the MQMD

PCF command type	Format	MsgType
MQCFT_COMMAND	MQFMT_ADMIN	MQMT_REQUEST
MQCFT_REPORT	MQFMT_ADMIN	MQMT_REPORT
MQCFT_RESPONSE	MQFMT_ADMIN	MQMT_REPLY
MQCFT_TRACE_ROUTE	MQFMT_ADMIN	MQMT_DATAGRAM
MQCFT_EVENT	MQFMT_EVENT	MQMT_DATAGRAM
MQCFT_*	MQFMT_PCF	MQMT_DATAGRAM

Table 141 shows that if you create an administration bag or a command bag, the *Format* of the message descriptor is MQFMT\_ADMIN and the *MsgType* is MQMT\_REQUEST. This is suitable for a PCF request message sent to the command server when a response is expected back.

Other parameters in the message descriptor take the values shown in Table 142.

Table 142. Message descriptor values

Parameter	Value
<i>StrucId</i>	MQMD_STRUC_ID
<i>Version</i>	MQMD_VERSION_1
<i>Report</i>	MQRO_NONE
<i>MsgType</i>	see Table 141
<i>Expiry</i>	30 seconds (note 1 on page 1780 )
<i>Feedback</i>	MQFB_NONE
<i>Encoding</i>	MQENC_NATIVE
<i>CodedCharSetId</i>	depends on the bag CCSID (note 2 on page 1780 )
<i>Format</i>	see Table 141
<i>Priority</i>	MQPRI_PRIORITY_AS_Q_DEF
<i>Persistence</i>	MQPER_NOT_PERSISTENT

Table 142. Message descriptor values (continued)

Parameter	Value
<i>MsgId</i>	MQMI_NONE
<i>CorrelId</i>	MQCI_NONE
<i>BackoutCount</i>	0
<i>ReplyToQ</i>	see note 3
<i>ReplyToQMgr</i>	blank

**Notes:**

1. This value can be overridden on the mqExecute call by using the *OptionsBag* parameter. For information about this, see “mqExecute” on page 1726.
2. See “Data conversion” on page 1778.
3. Name of the user-specified reply queue or MQAI-generated temporary dynamic queue for messages of type MQMT\_REQUEST. Blank otherwise.

**Example code**

Here are some example uses of the mqExecute call.

The example shown in figure Figure 49 creates a local queue (with a maximum message length of 100 bytes) on a queue manager:

```

/* Create a bag for the data you want in your PCF message */
mqCreateBag(MQCBO_ADMIN_BAG, &hbagRequest)

/* Create a bag to be filled with the response from the command server */
mqCreateBag(MQCBO_ADMIN_BAG, &hbagResponse)

/* Create a queue */
/* Supply queue name */
mqAddString(hbagRequest, MQCA_Q_NAME, "QBERT")

/* Supply queue type */
mqAddString(hbagRequest, MQIA_Q_TYPE, MQQT_LOCAL)

/* Maximum message length is an optional parameter */
mqAddString(hbagRequest, MQIA_MAX_MSG_LENGTH, 100)

/* Ask the command server to create the queue */
mqExecute(MQCMD_CREATE_Q, hbagRequest, hbagResponse)

/* Tidy up memory allocated */
mqDeleteBag(hbagRequest)
mqDeleteBag(hbagResponse)

```

Figure 49. Using mqExecute to create a local queue

The example shown in figure Figure 50 on page 1781 inquires about all attributes of a particular queue. The mqAddInquiry call identifies all IBM MQ object attributes of a queue to be returned by the Inquire parameter on mqExecute.

```

/* Create a bag for the data you want in your PCF message */
mqCreateBag(MQCBO_ADMIN_BAG, &hbagRequest)

/* Create a bag to be filled with the response from the command server */
mqCreateBag(MQCBO_ADMIN_BAG, &hbagResponse)

/* Inquire about a queue by supplying its name */
/* (other parameters are optional) */
mqAddString(hbagRequest, MQCA_Q_NAME, "QBERT")

/* Request the command server to inquire about the queue */
mqExecute(MQCMD_INQUIRE_Q, hbagRequest, hbagResponse)

/* If it worked, the attributes of the queue are returned */
/* in a system bag within the response bag */
mqInquireBag(hbagResponse, MQHA_BAG_HANDLE, 0, &hbagAttributes)

/* Inquire the name of the queue and its current depth */
mqInquireString(hbagAttributes, MQCA_Q_NAME, &stringAttribute)
mqInquireString(hbagAttributes, MQIA_CURRENT_Q_DEPTH, &integerAttribute)

/* Tidy up memory allocated */
mqDeleteBag(hbagRequest)
mqDeleteBag(hbagResponse)

```

*Figure 50. Using mqExecute to inquire about queue attributes*

Using mqExecute is the simplest way of administering IBM MQ, but lower-level calls, mqBagToBuffer and mqBufferToBag, can be used. For more information about the use of these calls, see Introduction to the IBM MQ Administration Interface (MQAI).

For sample programs, see Examples of using the MQAI.

## C language examples:

This collection of topics is mostly taken from the IBM MQ for z/OS sample applications. They are applicable to all platforms, except where noted.

### *Connecting to a queue manager:*

This example demonstrates how to use the MQCONN call to connect a program to a queue manager in z/OS batch.

This extract is taken from the Browse sample application (program CSQ4BCA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```
#include <cmqc.h>
:
static char Parm1[MQ_Q_MGR_NAME_LENGTH] ;

int main(int argc, char *argv[] )
{
    /*                               */
    /* Variables for MQ calls        */
    /*                               */
    MQHCONN Hconn;    /* Connection handle */
    MQLONG  CompCode; /* Completion code */
    MQLONG  Reason;   /* Qualifying reason */

    /* Copy the queue manager name, passed in the */
    /* parm field, to Parm1                        */
    strncpy(Parm1,argv[1],MQ_Q_MGR_NAME_LENGTH);

    /*                               */
    /* Connect to the specified queue manager.     */
    /* Test the output of the connect call. If the */
    /* call fails, print an error message showing the */
    /* completion code and reason code, then leave the */
    /* program.                                     */
    /*                               */
    MQCONN(Parm1,
           &Hconn,
           &CompCode,
           &Reason);
    if ((CompCode != MQCC_OK) | (Reason != MQRC_NONE))
    {
        printf(pBuff, MESSAGE_4_E,
              ERROR_IN_MQCONN, CompCode, Reason);
        PrintLine(pBuff);
        RetCode = CSQ4_ERROR;
        goto AbnormalExit2;
    }
:
}
```

### Disconnecting from a queue manager:

This example demonstrates how to use the MQDISC call to disconnect a program from a queue manager in z/OS batch.

The variables used in this code extract are those that were set in "Connecting to a queue manager" on page 1783. This extract is taken from the Browse sample application (program CSQ4BCA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```

:
/*                                     */
/* Disconnect from the queue manager. Test the */
/* output of the disconnect call. If the call */
/* fails, print an error message showing the */
/* completion code and reason code.          */
/*                                     */
MQDISC(&Hconn,
      &CompCode,
      &Reason);
if ((CompCode != MQCC_OK) || (Reason != MQRC_NONE))
{
  sprintf(pBuff, MESSAGE_4_E,
          ERROR_IN_MQDISC, CompCode, Reason);
  PrintLine(pBuff);
  RetCode = CSQ4_ERROR;
}
:

```

### Creating a dynamic queue:

This example demonstrates how to use the MQOPEN call to create a dynamic queue.

This extract is taken from the Mail Manager sample application (program CSQ4TCD1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```

:
MQQLONG HCONN = 0; /* Connection handle */
MQHOBJ HOBJ; /* MailQ Object handle */
MQHOBJ HobjTempQ; /* TempQ Object Handle */
MQQLONG CompCode; /* Completion code */
MQQLONG Reason; /* Qualifying reason */
MQQD ObjDesc = {MQQD_DEFAULT};
/* Object descriptor */
MQQLONG OpenOptions; /* Options control MQOPEN */

/*-----*/
/* Initialize the Object Descriptor (MQQD) */
/* control block. (The remaining fields */
/* are already initialized.) */
/*-----*/
strncpy( ObjDesc.ObjectName,
        SYSTEM_REPLY_MODEL,
        MQ_Q_NAME_LENGTH );
strncpy( ObjDesc.DynamicQName,
        SYSTEM_REPLY_INITIAL,
        MQ_Q_NAME_LENGTH );
OpenOptions = MQQ0_INPUT_AS_Q_DEF;
/*-----*/
/* Open the model queue and, therefore, */
/* create and open a temporary dynamic */
/* queue */
/*-----*/
MQOPEN( HCONN,

```

```

        &ObjDesc,
        OpenOptions,
        &HobjTempQ,
        &CompCode,
        &Reason );
if ( CompCode == MQCC_OK ) {

}
else {
    /*-----*/
    /* Build an error message to report the */
    /* failure of the opening of the model */
    /* queue */
    /*-----*/
    MQMErrorHandling( "OPEN TEMPQ", CompCode,
                    Reason );
    ErrorFound = TRUE;
}
return ErrorFound;
}
:

```

### *Opening an existing queue:*

This example demonstrates how to use the MQOPEN call to open a queue that has already been defined.

This extract is taken from the Browse sample application (program CSQ4BCA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```

#include <cmqc.h>
:
static char Parm1[MQ_Q_MGR_NAME_LENGTH];
:
int main(int argc, char *argv[] )
{
    /*
    /*   Variables for MQ calls
    /*
    MQHCONN Hconn ;           /* Connection handle
    MQLONG  CompCode;        /* Completion code
    MQLONG  Reason;         /* Qualifying reason
    MQOD   ObjDesc = { MQOD_DEFAULT };
    MQLONG  OpenOptions;    /* Options that control
    /* the MQOPEN call
    MQHOBJ  Hobj;          /* Object handle

:
    /* Copy the queue name, passed in the parm field,
    /* to Parm2 strncpy(Parm2,argv[2],
    /* MQ_Q_NAME_LENGTH);

:
    /*
    /* Initialize the object descriptor (MQOD) control
    /* block. (The initialization default sets StrucId,
    /* Version, ObjectType, ObjectQMgrName,
    /* DynamicQName, and AlternateUserid fields)
    /*
    strncpy(ObjDesc.ObjectName,Parm2,MQ_Q_NAME_LENGTH);

:
    /* Initialize the other fields required for the open
    /* call (Hobj is set by the MQCONN call).

```

```

/*                                     */
OpenOptions = MQOO_BROWSE;
:
/*                                     */
/* Open the queue.                    */
/* Test the output of the open call.  If the call */
/* fails, print an error message showing the */
/* completion code and reason code, then bypass */
/* processing, disconnect and leave the program. */
/*                                     */
MQOPEN(Hconn,
       &ObjDesc,
       OpenOptions,
       &Hobj,
       &CompCode,
       &Reason);
if ((CompCode != MQCC_OK) || (Reason != MQRC_NONE))
{
    sprintf(pBuff, MESSAGE_4_E,
           ERROR_IN_MQOPEN, CompCode, Reason);
    PrintLine(pBuff);
    RetCode = CSQ4_ERROR;
    goto AbnormalExit1;    /* disconnect processing */
}
:
} /* end of main */

```

#### *Closing a queue:*

This example demonstrates how to use the MQCLOSE call to close a queue.

This extract is taken from the Browse sample application (program CSQ4BCA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS).

```

:
/*                                     */
/* Close the queue.                    */
/* Test the output of the close call.  If the call */
/* fails, print an error message showing the */
/* completion code and reason code.      */
/*                                     */
MQCLOSE(Hconn,
       &Hobj,
       MQCO_NONE,
       &CompCode,
       &Reason);
if ((CompCode != MQCC_OK) || (Reason != MQRC_NONE))
{
    sprintf(pBuff, MESSAGE_4_E,
           ERROR_IN_MQCLOSE, CompCode, Reason);
    PrintLine(pBuff);
    RetCode = CSQ4_ERROR;
}
:

```

### Putting a message using MQPUT:

This example demonstrates how to use the MQPUT call to put a message on a queue.

This extract is not taken from the sample applications supplied with IBM MQ. For the names and locations of the sample applications, see Sample procedural programs (platforms except z/OS )

► **z/OS** and Sample programs for IBM MQ for z/OS .

```

:
:
qput()
{
    MQMD    MsgDesc;
    MQPMO   PutMsgOpts;
    MQLONG  CompCode;
    MQLONG  Reason;
    MQHCONN Hconn;
    MQHOBJ  Hobj;
    char message_buffer[] = "MY MESSAGE";
    /*-----*/
    /* Set up PMO structure.          */
    /*-----*/
    memset(&PutMsgOpts, '\0', sizeof(PutMsgOpts));
    memcpy(PutMsgOpts.StrucId, MQPMO_STRUC_ID,
           sizeof(PutMsgOpts.StrucId));
    PutMsgOpts.Version = MQPMO_VERSION_1;
    PutMsgOpts.Options = MQPMO_SYNCPOINT;

    /*-----*/
    /* Set up MD structure.          */
    /*-----*/
    memset(&MsgDesc, '\0', sizeof(MsgDesc));
    memcpy(MsgDesc.StrucId, MQMD_STRUC_ID,
           sizeof(MsgDesc.StrucId));
    MsgDesc.Version      = MQMD_VERSION_1;
    MsgDesc.Expiry       = MQEI_UNLIMITED;
    MsgDesc.Report       = MQRO_NONE;
    MsgDesc.MsgType      = MQMT_DATAGRAM;
    MsgDesc.Priority     = 1;
    MsgDesc.Persistence = MQPER_PERSISTENT;
    memset(MsgDesc.ReplyToQ,
           '\0',
           sizeof(MsgDesc.ReplyToQ));
    /*-----*/
    /* Put the message.              */
    /*-----*/
    MQPUT(Hconn, Hobj, &MsgDesc, &PutMsgOpts,
          sizeof(message_buffer), message_buffer,
          &CompCode, &Reason);

    /*-----*/
    /* Check completion and reason codes. */
    /*-----*/
    switch (CompCode)
    {
        case MQCC_OK:
            break;
        case MQCC_FAILED:
            switch (Reason)
            {
                case MQRC_Q_FULL:
                case MQRC_MSG_TOO_BIG_FOR_Q:
                    break;
                default:
                    break; /* Perform error processing */
            }
    }
    break;
}

```

```

        default:
            break;          /* Perform error processing */
    }
}

```

*Putting a message using MQPUT1:*

This example demonstrates how to use the MQPUT1 call to open a queue, put a single message on the queue, then close the queue.

This extract is taken from the Credit Check sample application (program CSQ4CCB5) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```

:
MQLONG   Hconn;           /* Connection handle      */
MQHOBJ   Hobj_CheckQ;    /* Object handle          */
MQLONG   CompCode;       /* Completion code        */
MQLONG   Reason;         /* Qualifying reason      */
MQOD     ObjDesc = {MQOD_DEFAULT};
          /* Object descriptor      */
MQMD     MsgDesc = {MQMD_DEFAULT};

## COBOL examples:

This collection of topics is taken from the IBM MQ for z/OS sample applications. They are applicable to all platforms, except where noted.

### *Connecting to a queue manager:*

This example demonstrates how to use the MQCONN call to connect a program to a queue manager in z/OS batch.

This extract is taken from the Browse sample application (program CSQ4BVA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

### Disconnecting from a queue manager:

This example demonstrates how to use the MQDISC call to disconnect a program from a queue manager in z/OS batch.

The variables used in this code extract are those that were set in “Connecting to a queue manager” on page 1802. This extract is taken from the Browse sample application (program CSQ4BVA1) supplied with IBM MQ for z/OS. For the names and locations of the sample applications on other platforms, see Sample procedural programs (platforms except z/OS ).

```

:
*
* Disconnect from the queue manager
*
      CALL 'MQDISC' USING W03-HCONN
                          W03-COMPCODE
                          W03-REASON.
*
* Test the output of the disconnect call. If the
* call fails, print an error message showing the
* completion code and reason code.
*
      IF (W03-COMPCODE NOT = MQCC-OK) THEN
:
:
          END-IF.

## Constants

Use the reference information in this section to accomplish the tasks that address your business needs.

### IBM MQ COPY, header, include, and module files:

This information is general-use programming interface information.

This section contains information to help you use the MQI for various programming languages, as follows.

#### *C header files:*

Header files are provided to help you write C application programs that use the MQI. These header files are summarized in the table:

Table 143. C header files - call prototypes, data types, return codes, constants, and structures

File name	Description	IBM i	UNIX and Linux systems	Windows	z/OS
<b>Call prototypes, data types, return codes, constants, and structures</b>					
CMQC	MQI definitions	C	C	C	C
CMQBC	MQAI definitions	C	C	C	
CMQEC	Interface Entry Points definition (includes CMQC, CMQXC and CMQZC)		C	C	
CMQCFC	PCF definitions	C	C	C	C
CMQPSC	Publish/Subscribe definitions	C	C	C	C
CMQXC	Channel and exit definitions	C	C	C	C
CMQZC	Installable services definitions	C	C	C	
<b>Key:</b> C= Files provided					

#### *COBOL COPY files:*

Various COPY files are provided to help you write COBOL application programs that use the MQI. These files are summarized in the table:

Table 144. COBOL copy files - return codes, constants, and structures

File name	Description	IBM i	UNIX systems	Windows	z/OS
<b>Return codes and constants</b>					
CMQx	MQI definitions	V	V	V	V
CMQCFx	PCF definitions	V	V	V	V
CMQPSx	Publish/Subscribe definitions	V	V	V	V
CMQXx	Channel and exit definitions	V	V	V	V
<b>Structures</b>					

Table 144. COBOL copy files - return codes, constants, and structures (continued)

File name	Description	IBM i	UNIX systems	Windows	z/OS

Visual Basic module files:

Header (or form) files are provided to help you write Visual Basic application programs that use the MQI. These header files are supplied in 32-bit versions only and are summarized in the table:

Table 147. Visual Basic module files - call declarations, data types, return codes, constants, and structures

File name	Description	IBM i	UNIX and Linux systems	Windows	z/OS
<b>Call declarations, data types, return codes, constants, and structures</b>					
CMQB	MQI definitions			B	
CMQBB	MQAI definitions			B	
CMQCFB	PCF definitions			B	
CMQXB	Channel and exit definitions			B	
<b>Key:</b> B= File provided					

*z/OS Assembler COPY files:*

Various COPY files are provided to help you write z/OS Assembler application programs that use the MQI. These files are summarized in the table:

*Table 148. z/OS Assembler copy files - data types, return codes, constants, and structures*

File name	Description	IBM i	UNIX systems	Windows	z/OS
<b>Data types, return codes, and constants</b>					
CMQA	MQI definitions				A
CMQCFA	PCF definitions				A
CMQPSA	Publish/Subscribe definitions				A
CMQVERA	Structure version control				A
CMQXA	Channel and exit definitions				A
<b>Structures</b>					
CMQCDA	MQCD - Channel definition				
CMQCFBFA	MQCFBF - PCF byte string filter parameter				
CMQCFBSA	MQCFBS - PCF byte string parameter				A
CMQCFGRA	MQCFGR - PCF group parameter				A
CMQCFHA	MQCFH - PCF header				A
CMQCFIFA	MQCFIF - PCF integer filter parameter				A
CMQCFILA	MQCFIL - PCF integer list parameter				A
CMQCFINA	MQCFIN - PCF integer parameter				A
CMQCFSFA	MQCFSF - PCF string filter parameter				A
CMQCFSLA	MQCFSL - PCF string list parameter				A
CMQCFSTA	MQCFST - PCF string parameter				A
CMQCFXLA	MQCFIL64 - PCF 64-bit integer list parameter				A
CMQCFXNA	MQCFIN64 - PCF 64-bit integer parameter				A
CMQCHARVA	MQCHARV - Variable length string				A
CMQCIHA	MQCIH - CICS bridge header				A
CMQCNOA	MQCNO - Connect options				A
CMQCSPA	MQCSP - Security parameters				A
CMQCXPA	MQCXP - Channel exit parameters				A
CMQDHA	MQDHA - Distribution header				A
CMQDLHA	MQDLH - Dead-letter header				A
CMQDXPA	MQDXP - Data conversion exit parameters				A
CMQEPHA	MQEPH - Embedded PCF header				A
CMQGMOA	MQGMO - Get message options				A

Table 148. z/OS Assembler copy files - data types, return codes, constants, and structures (continued)

File name	Description	IBM i	UNIX systems	Windows	z/OS
CMQIIHA	MQIIH - IMS information header				A
CMQMDA	MQMD - Message descriptor				A
CMQMD1A	MQMD1 - Message descriptor version 1				A
CMQMD2A	MQMD2 - Message descriptor version 2				A
CMQMDEA	MQMDE - Message descriptor extended				A
CMQODA	MQOD - Object descriptor				A
CMQORA	MQOR - Object record				A
CMQPMOA	MQPMO - Put message options				A
CMQRFHA	MQRFH - Rules and formatting header				A
CMQRFH2A	MQRFH2 - Rules and formatting header 2				A
CMQRMHA	MQRMH - Reference message header				A
CMQTMA	MQTM - Trigger message				A
CMQTMC2A	MQTMC2 - Trigger message 2 character				A
CMQWCRA	MQWCR - Cluster workload cluster record				A
CMQWDRA	MQWDR - Cluster workload destination record				A
CMQWDR1A	MQWDR1 - Cluster workload destination record version 1				A
CMQWDR2A	MQWDR2 - Cluster workload destination record version 2				A
CMQWIHA	MQWIH - Work information header				A
CMQWQRA	MQWQR - Cluster workload queue record				A
CMQWQR1A	MQWQR1 - Cluster workload queue record version 1				A
CMQWQR2A	MQWQR2 - Cluster workload queue record version 2				A
CMQWXPA	MQWXP - Cluster workload exit parameters				A
CMQWXP1A	MQWXP1 - Cluster workload exit parameters version 1				A
CMQWXP2A	MQWXP2 - Cluster workload exit parameters version 2				A
CMQWXP3A	MQWXP3 - Cluster workload exit parameters version 3				A
CMQXPA	MQXP - CICS API-crossing exit parameters				A

Table 148. z/OS Assembler copy files - data types, return codes, constants, and structures (continued)

File name	Description	IBM i	UNIX systems	Windows	z/OS
CMQXQHA	MQXQH - Transmission queue header				A
CMQXWDA	MQXWD - Exit wait descriptor				A
