MQCLWL_USEQ_ANY	1	X'00000001'
MQCLWL_USEQ_AS_Q_MGR	-3	X'FFFFFFFD'

*MQCLXQ\_\* (Cluster transmission queue type):*

MQCLXQ\_\* are the values you can set in the DEFCLXQ queue manager attribute. The DFTCLXQ attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels.

MQCLXQ_SCTQ	0	X'00000000'
MQCLXQ_CHANNEL	1	X'00000001'

**Related reference:**

“DefClusterXmitQueueType (MQLONG)” on page 2604

The DefClusterXmitQueueType attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels.

“MQINQ - Inquire object attributes” on page 2494

The MQINQ call returns an array of integers and a set of character strings containing the attributes of an object.

**Related information:**

Change Queue Manager

The Change Queue Manager ( MQCMD\_CHANGE\_Q\_MGR ) command changes the specified attributes of the queue manager.

Inquire Queue Manager

The Inquire Queue Manager ( MQCMD\_INQUIRE\_Q\_MGR ) command inquires about the attributes of a queue manager.

Inquire Queue Manager (Response)

The response to the Inquire Queue Manager ( MQCMD\_INQUIRE\_Q\_MGR ) command consists of the response header followed by the *QMgrName* structure and the requested combination of attribute parameter structures.

## Data types used in the MQI

Information on the data types that can be used in the Message Queue Interface (MQI). Descriptions, fields, and language declarations for relevant languages with each data type.

### Introducing data types used in the MQI:

This section introduces the data types used in the MQI, and gives you some guidance on using them in the supported programming languages.

#### *Elementary data types:*

This section contains information about data types used in the MQI (or in exit functions). These are described in detail, followed by examples showing how to declare the elementary data types in the supported programming languages in the following topics.

The data types used in the MQI (or in exit functions) are either:

- Elementary data types, or
- Aggregates of elementary data types (arrays or structures)

The following elementary data types are used in the MQI (or in exit functions):

Elementary data type name	Data type	Description
MQBOOL	Boolean	The MQBOOL data type represents a boolean value. The value 0 represents false. Any other value represents true. An MQBOOL must be aligned as for the MQLONG data type.

Elementary data type name	Data type	Description
MQBYTE	Byte	<p>The MQBYTE data type represents a single byte of data. No particular interpretation is placed on the byte; it is treated as a string of bits, and not as a binary number or character. No special alignment is required.</p> <p>When MQBYTE data is sent between queue managers that use different character sets or encodings, the MQBYTE data is <i>not</i> converted in any way. The <i>MsgId</i> and <i>CorrelId</i> fields in the MQMD structure are like this.</p> <p>An array of MQBYTE is sometimes used to represent an area of main storage that is not known to the queue manager. For example, the area might contain application message data or a structure. The boundary alignment of this area must be compatible with the nature of the data contained within it.</p> <p>In the C programming language, any data type can be used for function parameters that are shown as arrays of MQBYTE. This is because such parameters are always passed by address, and in C the function parameter is declared as a pointer-to-void.</p>
MQBYTEn	String of <i>n</i> bytes	<p>Each MQBYTEn data type represents a string of <i>n</i> bytes, where <i>n</i> can take any of the following values: 8, 16, 24, 32, 40, or 128. Each byte is described by the MQBYTE data type. No special alignment is required.</p> <p>If the data in the byte string is shorter than the defined length of the string, the data must be padded with nulls to fill the string.</p> <p>When the queue manager returns byte strings to the application (for example, on the MQGET call), the queue manager pads with nulls to the defined length of the string.</p> <p>Named constants are available to define the lengths of byte string fields. These are listed in "Constants" on page 1849</p>

Elementary data type name	Data type	Description
MQCHAR	Character	<p>The MQCHAR data type represents a single-byte character, or one byte of a double-byte or multi-byte character. No special alignment is required.</p> <p>When MQCHAR data is sent between queue managers that use different character sets or encodings, the MQCHAR data usually requires conversion in order for the data to be interpreted correctly. The queue manager does this automatically for MQCHAR data in the MQMD structure. Conversion of MQCHAR data in the application message data is controlled by the MQGMO_CONVERT option specified on the MQGET call; see the description of this option in “MQGMO - Get-message options” on page 2128 for further details.</p>
MQCHARn	String of <i>n</i> characters	<p>Each MQCHARn data type represents a string of <i>n</i> characters, where <i>n</i> can take any of the following values: 4, 8, 12, 20, 28, 32, 48, 64, 128, or 256. Each character is described by the MQCHAR data type. No special alignment is required.</p> <p>If the data in the string is shorter than the defined length of the string, the data must be padded with blanks to fill the string. In some cases a null character can be used to end the string prematurely, instead of padding with blanks; the null character and characters following it are treated as blanks, up to the defined length of the string. The places where a null can be used are identified in the call and data type descriptions.</p> <p>When the queue manager returns character strings to the application (for example, on the MQGET call), the queue manager always pads with blanks to the defined length of the string; the queue manager does not use the null character to delimit the string.</p> <p>Named constants are available that define the lengths of character string fields and are listed in “Constants” on page 1849.</p>

Elementary data type name	Data type	Description
MQFLOAT32	32-bit floating point number	<p>The MQFLOAT32 data type is a 32-bit floating-point number represented using the standard IEEE floating-point format. An MQFLOAT32 must be aligned on a 4-byte boundary.</p> <p>The use of MQFLOAT32 in C on z/OS requires the use of the FLOAT(IEEE) compiler flag.</p> <p>The use of MQFLOAT32 in COBOL is limited to compilers that support floating-point numbers in IEEE format. This might require the use of the FLOAT(NATIVE) compiler flag.</p>
MQFLOAT64	64-bit floating point number	<p>The MQFLOAT64 data type is a 64-bit floating-point number represented using the standard IEEE floating-point format. An MQFLOAT64 must be aligned on an 8-byte boundary.</p> <p>The use of MQFLOAT64 in C on z/OS requires the use of the FLOAT(IEEE) compiler flag.</p> <p>The use of MQFLOAT64 in COBOL is limited to compilers that support floating-point numbers in IEEE format. This might require the use of the FLOAT(NATIVE) compiler flag.</p>
MQHCONFIG	Configuration handle	<p>The MQHCONFIG data type represents a configuration handle, that is, the component that is being configured for a particular installable service. A configuration handle must be aligned on its natural boundary.</p> <p>Applications must not rely on the format of the data stored inside this handle. If valid, its value is intended to be usable in further MQI calls, but is not intended to have any meaning besides that purpose.</p>
MQHCONN	Connection handle	<p>The MQHCONN data type represents a connection handle, that is, the connection to a particular queue manager. A connection handle must be aligned on a 4-byte boundary.</p> <p>Applications must not rely on the format of the data stored inside this handle. If valid, its value is intended to be usable in further MQI calls, but is not intended to have any meaning besides that purpose.</p>

Elementary data type name	Data type	Description
MQHMSG	Message handle	<p>The MQHMSG data type represents a message handle that gives access to a message. A message handle must be aligned on an 8-byte boundary.</p> <p>Applications must not rely on the format of the data stored inside this handle. If valid, its value is intended to be usable in further MQI calls, but is not intended to have any meaning besides that purpose.</p>
MQHOBJ	Object handle	<p>The MQHOBJ data type represents an object handle that gives access to an object. An object handle must be aligned on a 4-byte boundary.</p> <p>Applications must not rely on the format of the data stored inside this handle. If valid, its value is intended to be usable in further MQI calls, but is not intended to have any meaning besides that purpose.</p>
MQINT8	8-bit signed integer	<p>The MQINT8 data type is an 8-bit signed integer that can take any value in the range -128 to +127, unless otherwise restricted by the context.</p>
MQINT16	16-bit signed integer	<p>The MQINT16 data type is a 16-bit signed integer that can take any value in the range -32 768 to +32 767, unless otherwise restricted by the context. An MQINT16 must be aligned on a 2-byte boundary.</p>
MQINT32	32-bit signed integer	<p>The MQINT32 data type is a 32-bit signed binary integer that can take any value in the range -2 147 483 648 through +2 147 483 647, unless otherwise restricted by the context.</p> <p>See the definition of MQLONG.</p>
MQINT64	64-bit signed integer	<p>The MQINT64 data type is a 64-bit signed integer that can take any value in the range -9 223 372 036 854 775 808 through +9 223 372 036 854 775 807, unless otherwise restricted by the context.</p> <p>For COBOL, the valid range is limited to -999 999 999 999 999 999 through +999 999 999 999 999 999. A 64-bit integer must be aligned on an 8-byte boundary.</p>

Elementary data type name	Data type	Description
MQLONG	32-bit signed integer	<p>The MQLONG data type is a 32-bit signed binary integer that can take any value in the range -2 147 483 648 through +2 147 483 647, unless otherwise restricted by the context.</p> <p>For COBOL, the valid range is limited to -999 999 999 through +999 999 999. An MQLONG must be aligned on a 4-byte boundary.</p>
MQPID	Process identifier	<p>The IBM MQ process identifier.</p> <p>This is the same identifier used in MQ trace and FFST™ dumps, but might be different from the operating system process identifier.</p>
MQPTR	Pointer	<p>The MQPTR data type is the address of data of any type. A pointer must be aligned on its natural boundary; this is a 16-byte boundary on IBM i, and an 8-byte boundary on other platforms.</p> <p>Some programming languages support typed pointers; the MQI also uses these in a few cases (for example, PMQCHAR and PMQLONG in the C programming language).</p>
MQTID	Thread identifier	<p>The IBM MQ thread identifier.</p> <p>This is the same identifier used in MQ trace and FFST™ dumps, but might be different from the operating system thread identifier.</p>
MQUINT8	8-bit unsigned integer	<p>The MQUINT8 data type is an 8-bit unsigned integer that can take any value in the range 0 to +255, unless otherwise restricted by the context.</p>
MQUINT16	16-bit unsigned integer	<p>The MQUINT16 data type is a 16-bit unsigned integer that can take any value in the range 0 through +65 535, unless otherwise restricted by the context. An MQUINT16 must be aligned on a 2-byte boundary.</p>
MQUINT32	32-bit unsigned integer	<p>The MQUINT32 data type is a 32-bit unsigned binary integer.</p> <p>See the definition of MQLONG.</p>

Elementary data type name	Data type	Description
MQINT64	64-bit unsigned integer	The MQINT64 data type is a 64-bit unsigned integer that can take any value in the range 0 through +18 446 744 073 709 551 615, unless otherwise restricted by the context.  For COBOL, the valid range is limited to 0 through +999 999 999 999 999 999. A 64-bit integer must be aligned on an 8-byte boundary.
MQULONG	32-bit unsigned integer	The MQULONG data type is a 32-bit unsigned binary integer that can take any value in the range 0 through +4 294 967 294, unless otherwise restricted by the context.  For COBOL, the valid range is limited to 0 through +999 999 999. An MQULONG must be aligned on a 4-byte boundary.
PMQACH	Pointer	Pointer to a data structure of type MQACH
PMQAIR	Pointer	Pointer to a data structure of type MQAIR
PMQAXC	Pointer	Pointer to a data structure of type MQAXC
PMQAXP	Pointer	Pointer to a data structure of type MQAXP
PMQBMHO	Pointer	Pointer to a data structure of type MQBMHO
PMQBO	Pointer	Pointer to a data structure of type MQBO
PMQBOOL	Pointer	Pointer to data of type MQBOOL
PMQBYTE	Pointer	Pointer to data of type MQBYTE
PMQBYTEn	Pointer	Pointer to data of type MQBYTEn, where n can be 8, 16, 24, 32, 40, 128
PMQCBC	Pointer	Pointer to a data structure of type MQCBC
PMQCBD	Pointer	Pointer to a data structure of type MQCBD
PMQCHAR	Pointer	Pointer to data of type MQCHAR
PMQCHARN	Pointer	Pointer to a data type of MQCHARN, where n can be 4, 8, 12, 20, 28, 32, 48, 64, 128, 256, 264
PMQCHARV	Pointer	Pointer to a data structure of type MQCHARV
PMQCIH	Pointer	Pointer to a data structure of type MQCIH
PMQCMHO	Pointer	Pointer to a data structure of type MQCMHO

<b>Elementary data type name</b>	<b>Data type</b>	<b>Description</b>
PMQCNO	Pointer	Pointer to a data structure of type MQCNO
PMQCSP	Pointer	Pointer to a data structure of type MQCSP
PMQCTLO	Pointer	Pointer to a data structure of type MQCTLO
PMQDH	Pointer	Pointer to a data structure of type MQDH
PMQDHO	Pointer	Pointer to a data structure of type MQDHO
PMQDLH	Pointer	Pointer to a data structure of type MQDLH
PMQDMHO	Pointer	Pointer to a data structure of type MQDMHO
PMQDMPO	Pointer	Pointer to a data structure of type MQDMPO
PMQEPH	Pointer	Pointer to a data structure of type MQEPH
PMQFLOAT32	Pointer	Pointer to a data structure of type MQFLOAT32
PMQFLOAT64	Pointer	Pointer to a data structure of type MQFLOAT64
PMQFUNC	Pointer	Pointer to a function
PMQGMO	Pointer	Pointer to a data structure of type MQGMO
PMQHCONFIG	Pointer	Pointer to data of type MQHCONFIG
PMQHCONN	Pointer	Pointer to data of type MQHCONN
PMQHMSG	Pointer	Pointer to data of type MQHMSG
PMQHOBJ	Pointer	Pointer to data of type MQHOBJ
PMQIIH	Pointer	Pointer to a data structure of type MQIIH
PMQIMPO	Pointer	Pointer to a data structure of type MQIMPO
PMQINT8	Pointer	Pointer to data of type MQINT8
PMQINT16	Pointer	Pointer to data of type MQINT16
PMQINT32	Pointer	Pointer to data of type MQINT32
PMQINT64	Pointer	Pointer to data of type MQINT64
PMQLONG	Pointer	Pointer to data of type MQLONG
PMQMD	Pointer	Pointer to structure of type MQMD
PMQMDE	Pointer	Pointer to a data structure of type MQMDE
PMQMD1	Pointer	Pointer to a data structure of type MQMD1
PMQMD2	Pointer	Pointer to a data structure of type MQMD2

Elementary data type name	Data type	Description
PMQMHBO	Pointer	Pointer to a data structure of type MQMHBO
PMQOD	Pointer	Pointer to a data structure of type MQOD
PMQOR	Pointer	Pointer to a data structure of type MQOR
PMQPD	Pointer	Pointer to a data structure of type MQPD
PMQPID	Pointer	Pointer to a process identifier
PMQMD	Pointer	Pointer to a data structure of type MQMD
PMQPMO	Pointer	Pointer to a data structure of type MQPMO
PMQPTR	Pointer	Pointer to data of type MQPTR
PMQRFH	Pointer	Pointer to a data structure of type MQRFH
PMQRFH2	Pointer	Pointer to a data structure of type MQRFH2
PMQRMH	Pointer	Pointer to a data structure of type MQRMH
PMQRR	Pointer	Pointer to a data structure of type MQRR
PMQSCO	Pointer	Pointer to a data structure of type MQSCO
PMQSD	Pointer	Pointer to a data structure of type MQSD
PMQSMPO	Pointer	Pointer to a data structure of type MQSMPO
PMQSRO	Pointer	Pointer to a data structure of type MQSRO
PMSSTS	Pointer	Pointer to a data structure of type MQSTS
PMQTID	Pointer	Pointer to a thread ID
PMQTM	Pointer	Pointer to a data structure of type MQTM
PMQTM2	Pointer	Pointer to a data structure of type MQTM2
PMQUINT8	Pointer	Pointer to a data type of MQUINT8
PMQUINT16	Pointer	Pointer to a data type of MQUINT16
PMQUINT32	Pointer	Pointer to a data type of MQUINT32
PMQUINT64	Pointer	Pointer to a data type of MQUINT64
PMQULONG	Pointer	Pointer to a data type of MQULONG
PMQVOID	Pointer	
PMQWIH	Pointer	Pointer to a data structure of type MQWIH
PMQXQH	Pointer	Pointer to a data structure of type MQXQH

MQUINT64	DS D
MQULONG	DS F

*Structure data types - introduction:*

This section introduces the structure data types used in the MQI. The structure data types themselves are described in subsequent sections.

*Summary:*

The following tables summarize the structure data types used in the MQI.

*Table 149. Structure data types used on MQI calls (or exit functions):*

<b>Structure</b>	<b>Description</b>	<b>Calls where used</b>
MQACH	API exit chain header	
MQAIR	Authentication information record	MQCONN
MQAXC	API exit context	
MQAXP	API exit parameter	
MQBMHO	Buffer to message handle options	MQBUFMH
MQBO	Begin options	MQBEGIN
MQCBD	Callback descriptor	MQCB
MQCBO	Create-bag options	mqCreateBag
MQCHARV	Variable length string	MQINQMP
MQCNO	Connect options	MQCONN
MQCSP	Security parameters	MQCONN
MQCTLO	Callback options	MQCTL
MQDMPO	Delete message property options	MQDLTMP
MQGMO	Get-message options	MQGET
MQIMPO	Inquire message property options	MQINQMP
MQMD	Message descriptor	MQBUFMH, MQMHBUF, MQCB, MQGET, MQPUT, MQPUT1
MQMHBO	Message handle to buffer options	MQMHBUF
MQOD	Object descriptor	MQOPEN, MQPUT1
MQOR	Object record	MQOPEN, MQPUT1
MQPD	Property descriptor	MQSETMP
MQPMO	Put-message options	MQPUT, MQPUT1
MQPMR	Put-message record	MQPUT, MQPUT1
MQRR	Response record	MQOPEN, MQPUT, MQPUT1
MQSCO	SSL configuration options	MQCONN
MQSD	Subscription descriptor	MQSUB
MQSMPO	Set message property option	MQSETMP
MQSRO	Subscription request options	MQSUBRQ
MQSTS	Status reporting structure	MQSTAT

Table 150. Structure data types used in message data:

Structure	Description
MQCIH	CICS information header
MQCFH	PCF header
MQEPH	Embedded PCF header
MQDH	Distribution header
MQDLH	Dead letter (undelivered message) header
MQIIH	IMS information header
MQMDE	Message descriptor extension
MQRFH	Rules and formatting header
MQRFH2	Rules and formatting header 2
MQRMH	Reference message header
MQTM	Trigger message
MQTMC2	Trigger message (character format 2)
MQWIH	Work information header
MQXQH	Transmission queue header

**Note:** The MQDXP structure (data conversion exit parameter) is described in “Data conversion” on page 2701, together with the associated data conversion calls.

*Rules for structure data types:*

Programming languages vary in their level of support for structures, and certain rules and conventions are adopted to map the MQI structures consistently in each programming language:

1. Structures must be aligned on their natural boundaries.
  - Most MQI structures require 4-byte alignment.
  - On IBM i, structures containing pointers require 16-byte alignment; these are: MQCNO, MQOD, MQPMO.
2. Each field in a structure must be aligned on its natural boundary.
  - Fields with data types that equate to MQLONG must be aligned on 4-byte boundaries.
  - Fields with data types that equate to MQPTR must be aligned on 16-byte boundaries on IBM i, and 4-byte boundaries in other environments.
  - Other fields are aligned on 1-byte boundaries.
3. The length of a structure must be a multiple of its boundary alignment.
  - Most MQI structures have lengths that are multiples of 4 bytes.
  - On IBM i, structures containing pointers have lengths that are multiples of 16 bytes.
4. Where necessary, padding bytes or fields must be added to ensure compliance with the preceding rules.

*Conventions used in the descriptions:*

The description of each structure data type includes:

- An overview of the purpose and use of the structure
- Descriptions of the fields in the structure, in a form that is independent of the programming language
- Examples of how the structure is declared in each of the supported programming languages

The description of each structure data type contains the following sections:

**Structure name**

The name of the structure, followed by a summary of the fields in the structure.

**Overview**

A brief description of the purpose and use of the structure.

**Fields** Descriptions of the fields. For each field, the name of the field is followed by its elementary data type in parentheses ( ). In text, field names are shown using an italic typeface; for example *Version*.

There is also a description of the purpose of the field, together with a list of any values that the field can take. Names of constants are shown in uppercase; for example MQGMO\_STRUC\_ID. A set of constants having the same prefix is shown using the \* character, for example: MQIA\_\*.

In the descriptions of the fields, the following terms are used:

**input** You supply information in the field when you make a call.

**output**

The queue manager returns information in the field when the call completes or fails.

**input/output**

You supply information in the field when you make a call, and the queue manager changes the information when the call completes or fails.

**Initial values**

A table showing the initial values for each field in the data definition files supplied with the MQI.

**C declaration**

Typical declaration of the structure in C.

**COBOL declaration**

Typical declaration of the structure in COBOL.

**PL/I declaration**

Typical declaration of the structure in PL/I.

**System/390 assembler declaration**

Typical declaration of the structure in System/390 assembler language.

**Visual Basic declaration**

Typical declaration of the structure in Visual Basic.

## C programming:

This section contains information to help you use the MQI from the C programming language.

### Header files:

Header files are provided to help you write C application programs that use the MQI.

These header files are summarized in Table 151.

Table 151. C header files

File	Contents
CMQC	Function prototypes, data types, and named constants for the main MQI
CMQXC	Function prototypes, data types, and named constants for the data conversion exit
CMQEC	Function prototypes, data types, and named constants for the main MQI, data conversion exit and Interface Entry Points structure (CMQEC includes CMQXC and CMQC.)
CMQSTRC	Functions that convert MQI constant definitions to the text equivalent.  <b>Attention:</b>  Not applicable to z/OS.

To improve the portability of applications, code the name of the header file in lowercase on the **#include** preprocessor directive:

```
#include "cmqec.h"
```

### Functions:

You do not need to specify all parameters that are passed by address every time you invoke a function.

- Pass parameters that are *input-only* and of type MQHCONN, MQHOBJ, or MQLONG by value.
- Pass all other parameters by address.

Where a particular parameter is not required, use a null pointer as the parameter on the function invocation, in place of the address of the parameter data. Parameters for which this is possible are identified in the call descriptions.

No parameter is returned as the value of the function; in C terminology, this means that all functions return **void** .

The attributes of the function are defined by the MQENTRY macro variable; the value of this macro variable depends on the environment.

*Parameters with undefined data type:*

The *Buffer* parameter on the MQGET, MQPUT, and MQPUT1 functions has an undefined data type. This parameter is used to send and receive the application's message data.

Parameters of this sort are shown in the C examples as arrays of MQBYTE. You can declare the parameters in this way, but it is usually more convenient to declare them as the particular structure that describes the layout of the data in the message. Declare the actual function parameter as a pointer-to-void, and specify the address of any sort of data as the parameter on the function invocation.

*Data types:*

Define all data types using the C **typedef** statement. For each data type, also define the corresponding pointer data type. The name of the pointer data type is the name of the elementary or structure data type prefixed with the letter P to denote a pointer. Define the attributes of the pointer using the MQPOINTER macro variable; the value of this macro variable depends on the environment. The following illustrates how to declare pointer data types:

```
#define MQPOINTER *                /* depends on environment */
...
typedef MQLONG MQPOINTER PMQLONG; /* pointer to MQLONG */
typedef MQMD MQPOINTER PMQMD;    /* pointer to MQMD */
```

*Manipulating binary strings:*

Declare strings of binary data as one of the MQBYTEn data types.

Whenever you copy, compare, or set fields of this type, use the C functions **memcpy** , **memcmp** , or **memset** ; for example:

```
#include <string.h>
#include "cmqc.h"

MQMD MyMsgDesc;

memcpy(MyMsgDesc.MsgId,          /* set "MsgId" field to nulls */
       MQMI_NONE,              /* ...using named constant */
       sizeof(MyMsgDesc.MsgId));

memset(MyMsgDesc.CorrelId,       /* set "CorrelId" field to nulls */
       0x00,                   /* ...using a different method */
       sizeof(MQBYTE24));
```

Do not use the string functions **strcpy** , **strcmp** , **strncpy** , or **strncmp** , because these do not work correctly for data declared with the MQBYTEn data types.

### Manipulating character strings:

When the queue manager returns character data to the application, the queue manager always pads the character data with blanks to the defined length of the field; the queue manager *does not* return null-terminated strings.

Therefore, when copying, comparing, or concatenating such strings, use the string functions **strncpy** , **strncmp** , or **strncat** .

Do not use the string functions that require the string to be terminated by a null ( **strcpy** , **strcmp** , **strcat** ). Also, do not use the function **strlen** to determine the length of the string; use instead the **sizeof** function to determine the length of the field.

### Initial values for structures:

The header files define various macro variables that you can use to provide initial values for the MQ structures when you declare instances of those structures.

These macro variables have names of the form MQxxx\_DEFAULT, where MQxxx represents the name of the structure. They are used in the following way:

```
MQMD   MyMsgDesc = {MQMD_DEFAULT};
MQPMO  MyPutOpts = {MQPMO_DEFAULT};
```

For some character fields (for example, the *StrucId* fields that occur in most structures, or the *Format* field that occurs in MQMD), the MQI defines particular values that are valid. For each of the valid values, *two* macro variables are provided:

- One macro variable defines the value as a string with a length, excluding the implied null matches, exactly the defined length of the field. For example, for the *Format* field in MQMD the following macro variable is provided ( `␣` represents a blank character):

```
#define MQFMT_STRING "MQSTR␣␣␣"
```

Use this form with the **memcpy** and **memcmp** functions.

- The other macro variable defines the value as an array of characters; the name of this macro variable is the name of the string form suffixed with `_ARRAY`. For example:

```
#define MQFMT_STRING_ARRAY 'M','Q','S','T','R','␣','␣','␣'
```

Use this form to initialize the field when you declare an instance of the structure with values different from those provided by the MQMD\_DEFAULT macro variable. (This is not always necessary; in some environments you can use the string form of the value in both situations. However, you can use the array form for declarations, because this is required for compatibility with the C++ programming language.)

### *Initial values for dynamic structures:*

When a variable number of instances of a structure is required, the instances are typically created in main storage obtained dynamically using the **calloc** or **malloc** functions. To initialize the fields in such structures, consider the following technique:

1. Declare an instance of the structure using the appropriate MQxxx\_DEFAULT macro variable to initialize the structure. This instance becomes the model for other instances:

```
MQMD Model = {MQMD_DEFAULT}; /* declare model instance */
```

The **static** or **auto** keywords can be coded on the declaration in order to give the model instance static or dynamic lifetime, as required.

2. Use the **calloc** or **malloc** functions to obtain storage for a dynamic instance of the structure:

```
PMQMD Instance;  
Instance = malloc(sizeof(MQMD)); /* get storage for dynamic instance */
```

3. Use the **memcpy** function to copy the model instance to the dynamic instance:

```
memcpy(Instance,&Model,sizeof(MQMD)); /* initialize dynamic instance */
```

### *Use from C++:*

For the C++ programming language, the header files contain the following additional statements that are included only when you use a C++ compiler:

```
#ifdef __cplusplus  
extern "C" {  
#endif
```

```
/* rest of header file */
```

```
#ifdef __cplusplus  
}  
#endif
```

### *Notational conventions:*

This information shows how to invoke the functions and declare parameters.

In some cases, the parameters are arrays with a size that is not fixed. For these, a lowercase n is used to represent a numeric constant. When you code the declaration for that parameter, replace the n with the numeric value required.

### *COBOL programming:*

This section contains information to help you use the MQI from the COBOL programming language.

*COPY files:*

Various COPY files are provided to help you write COBOL application programs that use the MQI. There are two files containing named constants, and two files for each of the structures.

Each structure is provided in two forms: a form with initial values, and a form without:

- Use the structures with initial values in the **WORKING-STORAGE SECTION** of a COBOL program; they are contained in COPY files with names suffixed with the letter V (for Values).
- Use the structures without initial values in the **LINKAGE SECTION** of a COBOL program; they are contained in COPY files with names suffixed with the letter L (for Linkage).

The COPY files are summarized in Table 152. Not all the files listed are available in all environments.

*Table 152. COBOL COPY files*

File (with initial values)	File (without initial values)	Contents
CMQAIRV	CMQAIRL	Authentication information record
CMQBOV	CMQBOL	Begin options structure
CMQCIHV	CMQCIHL	CICS information header structure
CMQCNOV	CMQCNOV	Connect options structure
CMQDHSV	CMQDHL	Distribution header structure
CMQDLHV	CMQDLHL	Dead letter header structure
CMQDXPV	CMQDXPL	Data conversion exit parameter structure
CMQGMOV	CMQGMOL	Get message options structure
CMQIIHV	CMQIIHL	IMS information header structure
CMQMDV	CMQMDL	Message descriptor structure
CMQMDEV	CMQMDEL	Message descriptor extension structure
CMQMD1V	CMQMD1L	Message descriptor structure version 1
CMQODV	CMQODL	Object descriptor structure
CMQORV	CMQORL	Object record structure
CMQPMOV	CMQPMOL	Put message options structure
CMQRFHV	CMQRFHL	Rules and formatting header structure
CMQRFH2V	CMQRFH2L	Rules and formatting header structure version 2
CMQRMHV	CMQRMHL	Reference message header structure
CMQRRV	CMQRRL	Response record structure
CMQSCOV	CMQSCOL	SSL configuration options
CMQTMV	CMQTML	Trigger message structure
CMQTMCV	CMQTMCL	Trigger message structure (character format)
CMQTM2V	CMQTM2L	Trigger message structure (character format) version 2
CMQWIHV	CMQWIHL	Work information header structure
CMQXQHV	CMQXQHL	Transmission queue header structure
CMQV	-	Named constants for main MQI
CMQXV	-	Named constants for data conversion exit
CMQMD2V	CMQMD2L	Message descriptor structure version 2

### Structures:

In the COPY file, each structure declaration begins with a level-10 item; this enables you to declare several instances of the structure by coding the level-01 declaration and then using the **COPY** statement to copy in the remainder of the structure declaration. To refer to the appropriate instance, use the **IN** keyword:

```
* Declare two instances of MQMD
01 MY-MQMD.
   COPY CMQMDV.
01 MY-OTHER-MQMD.
   COPY CMQMDV.
*
* Set MSGTYPE field in MY-OTHER-MQMD
  MOVE MQMT-REQUEST TO MQMD-MSGTYPE IN MY-OTHER-MQMD.
```

Align the structures on appropriate boundaries. If you use the **COPY** statement to include a structure following an item that is not the level-01 item, ensure that the structure begins at the appropriate offset from the start of the level-01 item. Most MQI structures require 4-byte alignment; the exceptions to this are MQCNO, MQOD, and MQPMO, which require 16-byte alignment on IBM i.

In this section, the names of fields in structures are shown without a prefix. In COBOL, the field names are prefixed with the name of the structure followed by a hyphen. However, if the structure name ends with a numeric digit, indicating that the structure is a second or later version of the original structure, the numeric digit is omitted from the prefix. Field names in COBOL are shown in uppercase (although lowercase or mixed case can be used if required). For example, the field *MsgType* described in “MQMD - Message descriptor” on page 2179 becomes MQMD-MSGTYPE in COBOL.

The V-suffix structures are declared with initial values for all the fields; you need to set only those fields where you want a value that is different from the supplied initial value.

### Pointers:

Some structures need to address optional data that might be discontinuous with the structure, such as the MQOR and MQRR records addressed by the MQOD structure.

To address this optional data, the structures contain fields that are declared with the pointer data type. However, COBOL does not support the pointer data type in all environments. Because of this, the optional data can also be addressed using fields that contain the offset of the data from the start of the structure.

If you want to port an application between environments, ascertain whether the pointer data type is available in all the intended environments. If it is not, the application must address the optional data using the offset fields instead of the pointer fields.

In those environments where pointers are not supported, declare the pointer fields as byte strings of the appropriate length, with the initial value being the all-null byte string. Do not alter this initial value if you are using the offset fields.

### *Named constants:*

In this section, the names of constants are shown containing the underscore character (`_`) as part of the name. In COBOL, use the hyphen character (`-`) in place of the underscore.

Constants that have character-string values use the single quotation mark as the string delimiter (`'`). In some environments, you might have to specify an appropriate compiler option to cause the compiler to accept the single quotation mark as the string delimiter in place of the double quotation mark.

The named constants are declared in the COPY files as level-10 items. To use the constants, declare the level-01 item explicitly, and then use the **COPY** statement to copy in the declarations of the constants:

```
* Declare a structure to hold the constants
01 MY-MQ-CONSTANTS.
   COPY CMQV.
```

The preceding method causes the constants to occupy storage in the program even if they are not referenced. If you include the constants in many separate programs within the same run unit, multiple copies of the constants exist, consuming main storage unnecessarily. Avoid this effect by using one of the following techniques:

- Add the **GLOBAL** clause to the level-01 declaration:

```
* Declare a global structure to hold the constants
01 MY-MQ-CONSTANTS GLOBAL.
   COPY CMQV.
```

This causes allocates storage for only one set of constants within the run unit. The constants, however, can be referenced by any program within the run unit, not just the program that contains the level-01 declaration.

**Note:** The **GLOBAL** clause is not supported in all environments.

- Manually copy into each program only those constants that are referenced by that program. Do not use the **COPY** statement to copy all the constants into the program.

### *Notational conventions:*

The latter topics in this section show how to invoke the calls and declare parameters. In some cases, the parameters are tables or character strings the size of which is not fixed. For these, a lowercase `n` is used to represent a numeric constant. When you code the declaration for that parameter, replace the `n` with the numeric value required.

### *System/390 assembler programming:*

This section contains information to help to you use the MQI from the System/390 Assembler programming language.

### Macros:

Various macros are provided to help you to write assembler application programs that use the MQI.

There are two macros for named constants, and one macro for each of the structures. These files are summarized in Table 153.

Table 153. Assembler macros

File	Contents
CMQA	Named constants (equates) for main MQI
CMQCIHA	CICS information header structure
CMQCNOA	Connect options structure
CMQDLHA	Dead letter header structure
CMQDXPA	Data conversion exit parameter structure
CMQGMOA	Get message options structure
CMQIIHA	IMS information header structure
CMQMDA	Message descriptor structure
CMQMDEA	Message descriptor extension structure
CMQODA	Object descriptor structure
CMQPMOA	Put message options structure
CMQRFHA	Rules and formatting header structure
CMQRFH2A	Rules and formatting header structure version 2
CMQRMHA	Reference message header structure
CMQTMA	Trigger message structure
CMQTMC2A	Trigger message structure (character format) version 2
CMQVERA	Structure version control
CMQWIHA	Work information header structure
CMQXA	Named constants for data conversion exit
CMQXPA	API crossing exit parameter structure
CMQXQHA	Transmission queue header structure

### Structures:

The structures are generated by macros that have various parameters to control the action of the macro. These parameters are described in the following sections.

From time to time new versions of the MQ structures are introduced. The additional fields in a new version can cause a structure that previously was smaller than 256 bytes to become larger than 256 bytes. Because of this, write assembler instructions that are intended to copy an MQ structure, or to set an MQ structure to nulls, to work correctly with structures that might be larger than 256 bytes. Alternatively, use the **DCLVER** macro parameter or **CMQVERA** macro with the **VERSION** parameter to declare a specific version of the structure.

*Specifying the name of the structure:*

To declare more than one instance of a structure, the macro prefixes the name of each field in the structure with a user-specifiable string and an underscore.

The string used is the label specified on the invocation of the macro. If no label is specified, the name of the structure is used to construct the prefix:

```
* Declare two object descriptors
           CMQODA ,           Prefix used="MQOD_" (the default)
MY_MQOD CMQODA ,           Prefix used="MY_MQOD_"
```

The structure declarations shown in this section use the default prefix.

*Specifying the form of the structure:*

Structure declarations can be generated by the macro in one of two forms, controlled by the **DSECT** parameter:

#### **DSECT=YES**

An assembler **DSECT** instruction is used to start a new data section; the structure definition immediately follows the **DSECT** statement. The label on the macro invocation is used as the name of the data section; if no label is specified, the name of the structure is used.

#### **DSECT=NO**

Assembler **DC** instructions are used to define the structure at the current position in the routine. The fields are initialized with values, which can be specified by coding the relevant parameters on the macro invocation. Fields for which no values are specified on the macro invocation are initialized with default values.

The value specified must be uppercase. If the **DSECT** parameter is not specified, **DSECT=NO** is assumed.

*Controlling the version of the structure:*

By default, the macros always declare the most recent version of each structure.

Although you can use the **VERSION** macro parameter to specify a value for the *Version* field in the structure, that parameter defines the initial value for the *Version* field, and does not control the version of the structure actually declared. To control the version of the structure that is declared, use the **DCLVER** parameter:

#### **DCLVER=CURRENT**

The version declared is the current (most recent) version.

#### **DCLVER=SPECIFIED**

The version declared is the version specified by the **VERSION** parameter. If you omit the **VERSION** parameter, the default is version 1.

If you specify the **VERSION** parameter, the value must be a self-defining numeric constant, or the named constant for the version required (for example, **MQCNO\_VERSION\_3**). If you specify some other value, the structure is declared as if **DCLVER=CURRENT** had been specified, even if the value of **VERSION** resolves to a valid value.

The value specified must be uppercase. If you omit the **DCLVER** parameter, the value used is taken from the **MQDCLVER** global macro variable. You can set this variable using the **CMQVERA** macro.

*Declaring one structure embedded within another:*

To declare one structure as a component of another structure, use the **NESTED** parameter:

**NESTED=YES**

The structure declaration is nested within another.

**NESTED=NO**

The structure declaration is not nested within another.

The value specified must be uppercase. If you omit the **NESTED** parameter, **NESTED=NO** is assumed.

*Specifying initial values for fields:*

Specify the value to be used to initialize a field in a structure by coding the name of that field (without the prefix) as a parameter on the macro invocation, accompanied by the value required.

For example, to declare a message-descriptor structure with the *MsgType* field initialized with **MQMT\_REQUEST**, and the *ReplyToQ* field initialized with the string "MY\_REPLY\_TO\_QUEUE", use the following:

```
MY_MQMD  CMQMDA  MSGTYPE=MQMT_REQUEST,          X
          REPLYTOQ=MY_REPLY_TO_QUEUE
```

If you specify a named constant (equate) as a value on the macro invocation, use the **CMQA** macro to define the named constant. Do not enclose character string values in single quotation marks.

*Controlling the listing:*

Control the appearance of the structure declaration in the assembler listing using the **LIST** parameter:

**LIST=YES**

The structure declaration appears in the assembler listing.

**LIST=NO**

The structure declaration does not appear in the assembler listing.

The value specified must be uppercase. If you omit the **LIST** parameter, **LIST=NO** is assumed.

*CMQVERA macro:*

This macro allows you to set the default value to be used for the **DCLVER** parameter on the structure macros. The value specified by **CMQVERA** is used by the structure macro only if you omit the **DCLVER** parameter from the invocation of the structure macro. The default value is set by coding the **CMQVERA** macro with the **DCLVER** parameter:

**DCLVER=CURRENT**

The default version is set to the current (most recent) version.

**DCLVER=SPECIFIED**

The default version is set to the version specified by the **VERSION** parameter.

You must specify the **DCLVER** parameter, and the value must be uppercase. The value set by **CMQVERA** remains the default value until the next invocation of **CMQVERA**, or the end of the assembly. If you omit **CMQVERA**, the default is **DCLVER=CURRENT**.

*Notational conventions:*

Later sections show how to invoke the calls and declare parameters. In some cases, the parameters are arrays or character strings with a size that is not fixed for which, a lowercase n is used to represent a numeric constant. When you code the declaration for that parameter, replace the n with the numeric value required.

### **MQAIR - Authentication information record:**

The MQAIR structure represents the authentication information record.

The following table summarizes the fields in the structure.

*Table 154. Fields in MQAIR*

<b>Field</b>	<b>Description</b>	<b>Topic</b>
StrucId	Structure identifier	StrucId
Version	Structure version number	Version
AuthInfoType	Type of authentication information	AuthInfoType
AuthInfoConnName	Connection name of LDAP CRL server	AuthInfoConnName
LDAPUserNamePtr	Address of LDAP user name	LDAPUserNamePtr
LDAPUserNameOffset	Offset of LDAP user name from start of MQSCO	LDAPUserNameOffset
LDAPUserNameLength	Length of LDAP user name	LDAPUserNameLength
LDAPPassword	Password to access LDAP server	LDAPPassword
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQAIR_VERSION_2.		
OCSPPresponderURL	URL at which the OCSF responder can be contacted	OCSPPresponderURL

### *Overview for MQAIR:*

The MQAIR structure allows an application running as an IBM MQ MQI client to specify information about an authenticator that is to be used for the client connection. The structure is an input parameter on the MQCONN call.

**Availability:** AIX, HP-UX, Solaris, Linux and Windows clients.

**Character set and encoding:** Data in MQAIR must be in the character set and encoding of the local queue manager; these are given by the **CodedCharSetId** queue manager attribute and MQENC\_NATIVE.

*Fields for MQAIR:*

The MQAIR structure contains the following fields; the fields are described in **alphabetical order**:

*AuthInfoConnName (MQCHAR264):*

This is either the host name or the network address of a host on which the LDAP server is running. This can be followed by an optional port number, enclosed in parentheses. The default port number is 389.

If the value is shorter than the length of the field, terminate the value with a null character, or pad it with blanks to the length of the field. If the value is not valid, the call fails with reason code MQRC\_AUTH\_INFO\_CONN\_NAME\_ERROR.

This is an input field. The length of this field is given by MQ\_AUTH\_INFO\_CONN\_NAME\_LENGTH. The initial value of this field is the null string in C, and blank characters in other programming languages.

*AuthInfoType (MQLONG):*

This is the type of authentication information contained in the record.

The value can be one of the two following parameters:

**MQAIT\_CRL\_LDAP**

Certificate revocation checking using LDAP server.

**MQAIT\_OCSP**

Certificate revocation checking using OCSP.

If the value is not valid, the call fails with reason code MQRC\_AUTH\_INFO\_TYPE\_ERROR.

This is an input field. The initial value of this field is MQAIT\_CRL\_LDAP.

*LDAPPassword (MQCHAR32):*

This is the password needed to access the LDAP CRL server. If the value is shorter than the length of the field, terminate the value with a null character, or pad it with blanks to the length of the field.

If the LDAP server does not require a password, or you omit the LDAP user name, *LDAPPassword* must be null or blank. If you omit the LDAP user name and *LDAPPassword* is not null or blank, the call fails with reason code MQRC\_LDAP\_PASSWORD\_ERROR.

This is an input field. The length of this field is given by MQ\_LDAP\_PASSWORD\_LENGTH. The initial value of this field is the null string in C, and blank characters in other programming languages.

*LDAPUserNameLength* (MQLONG):

This is the length in bytes of the LDAP user name addressed by the *LDAPUserNamePtr* or *LDAPUserNameOffset* field. The value must be in the range zero through MQ\_DISTINGUISHED\_NAME\_LENGTH. If the value is not valid, the call fails with reason code MQRC\_LDAP\_USER\_NAME\_LENGTH\_ERR.

If the LDAP server involved does not require a user name, set this field to zero.

This is an input field. The initial value of this field is 0.

*LDAPUserNameOffset* (MQLONG):

This is the offset in bytes of the LDAP user name from the start of the MQAIR structure.

The offset can be positive or negative. The field is ignored if *LDAPUserNameLength* is zero.

You can use either *LDAPUserNamePtr* or *LDAPUserNameOffset* to specify the LDAP user name, but not both; see the description of the *LDAPUserNamePtr* field for details.

This is an input field. The initial value of this field is 0.

*LDAPUserNamePtr* (PMQCHAR):

This is the LDAP user name.

It consists of the Distinguished Name of the user who is attempting to access the LDAP CRL server. If the value is shorter than the length specified by *LDAPUserNameLength*, terminate the value with a null character, or pad it with blanks to the length *LDAPUserNameLength*. The field is ignored if *LDAPUserNameLength* is zero.

You can supply the LDAP user name in one of two ways:

- By using the pointer field *LDAPUserNamePtr*

In this case, the application can declare a string that is separate from the MQAIR structure, and set *LDAPUserNamePtr* to the address of the string.

Consider using *LDAPUserNamePtr* for programming languages that support the pointer data type in a fashion that is portable to different environments (for example, the C programming language).

- By using the offset field *LDAPUserNameOffset*

In this case, the application must declare a compound structure containing the MQSCO structure followed by the array of MQAIR records followed by the LDAP user name strings, and set *LDAPUserNameOffset* to the offset of the appropriate name string from the start of the MQAIR structure. Ensure that this value is correct, and has a value that can be accommodated within an MQLONG (the most restrictive programming language is COBOL, for which the valid range is -999 999 999 through +999 999 999).

Consider using *LDAPUserNameOffset* for programming languages that do not support the pointer data type, or that implement the pointer data type in a fashion that might not be portable to different environments (for example, the COBOL programming language).

Whichever technique is chosen, use only one of *LDAPUserNamePtr* and *LDAPUserNameOffset* ; the call fails with reason code MQRC\_LDAP\_USER\_NAME\_ERROR if both are nonzero.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length.

*OCSPResponderURL (MQCHAR256):*

For an MQAIR structure that represents connection details for an OCSP responder, this field contains the URL at which the responder can be contacted.

The value of this field is an HTTP URL. This field takes priority over a URL in an AuthorityInfoAccess (AIA) certificate extension.

The value is ignored unless both the following statements are true:

- The MQAIR structure is Version 2 or later (the Version field is set to MQAIR\_VERSION\_2 or greater).
- The AuthInfoType field is set to MQAIT\_OCSP.

If the field does not contain an HTTP URL in the correct format (and is not being ignored), the MQCONNX call fails with reason code MQRC\_OCSP\_URL\_ERROR.

This field is case-sensitive. It must start with the string http:// in lowercase. The rest of the URL might be case-sensitive, depending on the OCSP server implementation.

This field is not subject to data conversion.

*StrucId (MQCHAR4):*

The value must be:

**MQAIR\_STRUC\_ID**

Identifier for the authentication information record.

For the C programming language, the constant MQAIR\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQAIR\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQAIR\_STRUC\_ID.

*Version (MQLONG):*

The version number of the MQAIR structure.

The value must be one of the following:

**MQAIR\_VERSION\_1**

Version-1 authentication information record.

**MQAIR\_VERSION\_2**

Version-2 authentication information record.

The following constant specifies the version number of the current version:

**MQAIR\_CURRENT\_VERSION**

Current version of authentication information record.

This is always an input field. The initial value of this field is MQAIR\_VERSION\_1.

Initial values and language declarations for MQAIR:

Table 155. Initial values of fields in MQAIR

Field name	Name of constant	Value of constant
StrucId	MQAIR_STRUC_ID	'AIR~'
Version	MQAIR_VERSION_1	1
AuthInfoType	MQAIT_CRL_LDAP	1
AuthInfoConnName	None	Null string or blanks
LDAPUserNamePtr	None	Null pointer or null bytes
LDAPUserNameOffset	None	0
LDAPUserNameLength	None	0
LDAPPassword	None	Null string or blanks
OCSPResponderURL	None	Null string or blanks

**Notes:**

1. The symbol ~ represents a single blank character.
2. In the C programming language, the macro variable MQAIR\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  

```
MQAIR MyAIR = {MQAIR_DEFAULT};
```

C declaration:

```
typedef struct tagMQAIR MQAIR;
struct tagMQAIR {
    MQCHAR4    StrucId;           /* Structure identifier */
    MQLONG     Version;          /* Structure version number */
    MQLONG     AuthInfoType;     /* Type of authentication
                                information */
    MQCHAR264  AuthInfoConnName; /* Connection name of CRL LDAP
                                server */
    PMQCHAR    LDAPUserNamePtr;  /* Address of LDAP user name */
    MQLONG     LDAPUserNameOffset; /* Offset of LDAP user name from start
                                of MQAIR structure */
    MQLONG     LDAPUserNameLength; /* Length of LDAP user name */
    MQCHAR32   LDAPPassword;     /* Password to access LDAP server */
    MQCHAR256  OCSPResponderURL; /* URL of OCSP responder */
};
```

*COBOL declaration:*

```

** MQAIR structure
  10 MQAIR.
**   Structure identifier
  15 MQAIR-STRUCID          PIC X(4).
**   Structure version number
  15 MQAIR-VERSION         PIC S9(9) BINARY.
**   Type of authentication information
  15 MQAIR-AUTHINFOTYPE    PIC S9(9) BINARY.
**   Connection name of CRL LDAP server
  15 MQAIR-AUTHINFOCONNNAME PIC X(264).
**   Address of LDAP user name
  15 MQAIR-LDAPUSERNAMEPTR  POINTER.
**   Offset of LDAP user name from start of MQAIR structure
  15 MQAIR-LDAPUSERNAMEOFFSET PIC S9(9) BINARY.
**   Length of LDAP user name
  15 MQAIR-LDAPUSERNAMELENGTH PIC S9(9) BINARY.
**   Password to access LDAP server
  15 MQAIR-LDAPPASSWORD    PIC X(32).
**   URL of OCSP responder
  15 MQAIR-OCSPRESPONDERURL PIC X(256).

```

*Visual Basic declaration:*

```

Type MQAIR
  StrucId          As String*4  'Structure identifier'
  Version          As Long      'Structure version number'
  AuthInfoType     As Long      'Type of authentication information'
  AuthInfoConnName As String*264 'Connection name of CRL LDAP server'
  LDAPUserNamePtr  As MQPTR     'Address of LDAP user name'
  LDAPUserNameOffset As Long    'Offset of LDAP user name from start'
                    'of MQAIR structure'
  LDAPUserNameLength As Long    'Length of LDAP user name'
  LDAPPASSWORD     As String*32 'Password to access LDAP server'
End Type

```

**MQBMHO - Buffer to message handle options:**

The following table summarizes the fields in the structure. MQBMHO structure - buffer to message handle options

*Table 156. Fields in MQBMHO*

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options controlling the action of MQBMHO	Options

*Overview for MQBMHO:*

**Availability:** All. Buffer to message handle options structure - overview

**Purpose:** The MQBMHO structure allows applications to specify options that control how message handles are produced from buffers. The structure is an input parameter on the MQBUFMH call.

**Character set and encoding:** Data in MQBMHO must be in the character set of the application and encoding of the application (MQENC\_NATIVE).

*Fields for MQBMHO:*

Buffer to message handle options structure - fields

The MQBMHO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG):*

Buffer to message handle structure - Options field

The value can be:

**MQBMHO\_DELETE\_PROPERTIES**

Properties that are added to the message handle are deleted from the buffer. If the call fails no properties are deleted.

Default options: If you do not need the option described, use the following option:

**MQBMHO\_NONE**

No options specified.

This is always an input field. The initial value of this field is MQBMHO\_DELETE\_PROPERTIES.

*StrucId (MQCHAR4):*

Buffer to message handle structure - StrucId field

This is the structure identifier. The value must be:

**MQBMHO\_STRUC\_ID**

Identifier for buffer to message handle structure.

For the C programming language, the constant MQBMHO\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQBMHO\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQBMHO\_STRUC\_ID.

Version (MQLONG):

Buffer to message handle structure - Version field

This is the structure version number. The value must be:

**MQBMHO\_VERSION\_1**

Version number for buffer to message handle structure.

The following constant specifies the version number of the current version:

**MQBMHO\_CURRENT\_VERSION**

Current version of buffer to message handle structure.

This is always an input field. The initial value of this field is MQBMHO\_VERSION\_1.

*Initial values and language declarations for MQBMHO:*

Buffer to message handle structure - Initial values

*Table 157. Initial values of fields in MQBMHO*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQBMHO_STRUC_ID	'BMHO'
<i>Version</i>	MQBMHO_VERSION_1	1
<i>Options</i>	MQBMHO_NONE	0

**Notes:**

1. In the C programming language, the macro variable MQBMHO\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  
MQBMHO MyBMHO = {MQBMHO\_DEFAULT};

*C declaration:*

Buffer to message handle structure - C language declaration

```
typedef struct tagMQBMHO MQBMHO;
struct tagMQBMHO {
    MQCHAR4  StrucId;      /* Structure identifier */
    MQLONG   Version;     /* Structure version number */
    MQLONG   Options;     /* Options that control the action of
                          MQBUFMH */
};
```

COBOL declaration:

Buffer to message handle structure - COBOL language declaration

```
** MQBMHO structure
  10 MQBMHO.
**   Structure identifier
  15 MQBMHO-STRUCID          PIC X(4).
**   Structure version number
  15 MQBMHO-VERSION         PIC S9(9) BINARY.
**   Options that control the action of MQBUFMH
  15 MQBMHO-OPTIONS        PIC S9(9) BINARY.
```

PL/I declaration:

Buffer to message handle structure - PL/I language declaration

```
Dcl
  1 MQBMHO based,
  3 StrucId      char(4),      /* Structure identifier */
  3 Version      fixed bin(31), /* Structure version number */
  3 Options      fixed bin(31), /* Options that control the action
                                of MQBUFMH */
```

High Level Assembler declaration:

Buffer to message handle structure - Assembler language declaration

```
MQBMHO          DSECT
MQBMHO_STRUCID  DS  CL4  Structure identifier
MQBMHO_VERSION  DS  F    Structure version number
MQBMHO_OPTIONS  DS  F    Options that control the
*                action of MQBUFMH
MQBMHO_LENGTH   EQU  *-MQBMHO
MQBMHO_AREA     DS  CL(MQBMHO_LENGTH)
```

### MQBO - Begin options:

The following table summarizes the fields in the structure.

Table 158. Fields in MQBO

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options that control the action of MQBEGIN	Options

*Overview for MQBO:*

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows ; not available for IBM MQ MQI clients.

**Purpose:** The MQBO structure allows the application to specify options relating to the creation of a unit of work. The structure is an input/output parameter on the MQBEGIN call.

**Character set and encoding:** Data in MQBO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

*Fields for MQBO:*

The MQBO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG):*

This field is always an input field. Its initial value is MQBO\_NONE.

The value must be:

**MQBO\_NONE**

No options specified.

*StrucId (MQCHAR4):*

This field is always an input field. Its initial value is MQBO\_STRUC\_ID.

The value must be:

**MQBO\_STRUC\_ID**

Identifier for begin-options structure.

For the C programming language, the constant MQBO\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQBO\_STRUC\_ID, but is an array of characters instead of a string.

*Version (MQLONG):*

This field is always an input field. Its initial value is MQBO\_VERSION\_1.

The value must be:

**MQBO\_VERSION\_1**

Version number for begin-options structure.

The following constant specifies the version number of the current version:

**MQBO\_CURRENT\_VERSION**

Current version of begin-options structure.

Initial values and language declarations for MQBO:

Table 159. Initial values of fields in MQBO for MQBO

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQBO_STRUC_ID	'B0¬¬'
<i>Version</i>	MQBO_VERSION_1	1
<i>Options</i>	MQBO_NONE	0

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQBO\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  
MQBO MyBO = {MQBO\_DEFAULT};

C declaration:

```
typedef struct tagMQBO MQBO;
struct tagMQBO {
    MQCHAR4  StrucId; /* Structure identifier */
    MQLONG   Version; /* Structure version number */
    MQLONG   Options; /* Options that control the action of MQBEGIN */
};
```

COBOL declaration:

```
** MQBO structure
  10 MQBO.
**   Structure identifier
  15 MQBO-STRUCID PIC X(4).
**   Structure version number
  15 MQBO-VERSION PIC S9(9) BINARY.
**   Options that control the action of MQBEGIN
  15 MQBO-OPTIONS PIC S9(9) BINARY.
```

PL/I declaration:

```
dcl
  1 MQBO based,
  3 StrucId char(4), /* Structure identifier */
  3 Version fixed bin(31), /* Structure version number */
  3 Options fixed bin(31); /* Options that control the action of
                          MQBEGIN */
```

Visual Basic declaration:

```
Type MQBO
  StrucID As String*4 'Structure identifier'
  Version As Long     'Structure version number'
  Options As Long     'Options that control the action of MQBEGIN'
End Type
```

### MQCBC - Callback context:

The following table summarizes the fields in the structure. Structure describing the callback routine.

Table 160. Fields in MQCBC

Field	Description	Topic
<i>StrucID</i>	Structure identifier	StrucID
<i>Version</i>	Structure version number	Version
<i>CallType</i>	Why function has been called	CallType
<i>Hobj</i>	Object handle	Hobj
<i>CallbackArea</i>	Field for callback function to use	CallbackArea
<i>ConnectionArea</i>	Field for callback function to use	ConnectionArea
<i>CompCode</i>	Completion code	CompCode
<i>Reason</i>	Reason code	Reason
<i>State</i>	Indication of the state of the current consumer	State
<i>DataLength</i>	Message length	DataLength
<i>BufferLength</i>	Length of message buffer in bytes	BufferLength
<i>Flags</i>	General flags	Flags
<b>Note:</b> The remaining field is ignored if Version is less than MQCBC_VERSION_2		
<i>ReconnectDelay</i>	Number of milliseconds before reconnection attempt	ReconnectDelay

Overview for MQCBC:

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS, plus IBM MQ MQI clients connected to these systems.

**Purpose:** The MQCBC structure is used to specify context information that is passed to a callback function.

The structure is an input/output parameter on the call to a message consumer routine.

**Version:** The current version of MQCBC is MQCBC\_VERSION\_2.

**Character set and encoding:** Data in MQCBC must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure will be in the character set and encoding of the client.

*Fields for MQCBC:*

Alphabetic list of fields for the MQCBC structure.

The MQCBC structure contains the following fields; the fields are described in alphabetical order:

*BufferLength (MQLONG):*

This field is the length in bytes of the message buffer that has been passed to this function.

The buffer can be larger than both the MaxMsgLength value defined for the consumer and the ReturnedLength value in the MQGMO.

The actual message length is supplied in DataLength field.

The application can use the entire buffer for its own purposes for the duration of the callback function.

This is an input field to the message consumer function; it is not relevant to an exception handler function.

*CallbackArea (MQPTR):*

This field is available for the callback function to use.

The queue manager makes no decisions based on the contents of this field and it is passed unchanged from the CallbackArea field in the MQCBD structure, which is a parameter on the MQCB call used to define the callback function.

Changes to the *CallbackArea* are preserved across the invocations of the callback function for an *HObj*. This field is not shared with callback functions for other handles.

This is an input/output field to the callback function. The initial value of this field is a null pointer or null bytes.

*CallType (MQLONG):*

Field containing information about why this function has been called; the following are defined.

Message delivery call types: These call types contain information about a message. The *DataLength* and *BufferLength* parameters are valid for these call types.

#### **MQCBCT\_MSG\_REMOVED**

The message consumer function has been invoked with a message that has been destructively removed from the object handle.

If the value of *CompCode* is MQCC\_WARNING, the value of the *Reason* field is MQRC\_TRUNCATED\_MSG\_ACCEPTED or one of the codes indicating a data conversion problem.

#### **MQCBCT\_MSG\_NOT\_REMOVED**

The message consumer function has been invoked with a message that has not yet been destructively removed from the object handle. The message can be destructively removed from the object handle using the *MsgToken*.

The message might not have been removed because:

- The MQGMO options requested a browse operation, MQGMO\_BROWSE\_\*
- The message is larger than the available buffer and the MQGMO options do not specify MQGMO\_ACCEPT\_TRUNCATED\_MSG

If the value of *CompCode* is MQCC\_WARNING, the value of the *Reason* field is MQRC\_TRUNCATED\_MSG\_FAILED or one of the codes indicating a data conversion problem.

Callback control call types: These call types contain information about the control of the callback and do not contain details about a message. These call types are requested using Options in the MQCBD structure.

The *DataLength* and *BufferLength* parameters are not valid for these call types.

#### **MQCBCT\_REGISTER\_CALL**

The purpose of this call type is to allow the callback function to perform some initial setup.

The callback function is invoked immediately after the callback is registered, that is, upon return from an MQCB call using a value for the *Operation* field of MQOP\_REGISTER.

This call type is used both for message consumers and event handlers.

If requested, this is the first invocation of the callback function.

The value of the *Reason* field is MQRC\_NONE.

#### **MQCBCT\_START\_CALL**

The purpose of this call type is to allow the callback function to perform some setup when it is started, for example, reinstating resources that were cleaned up when it was previously stopped.

The callback function is invoked when the connection is started using either MQOP\_START or MQOP\_START\_WAIT.

If a callback function is registered within another callback function, this call type is invoked when the callback returns.

This call type is used for message consumers only.

The value of the *Reason* field is MQRC\_NONE.

#### **MQCBCT\_STOP\_CALL**

The purpose of this call type is to allow the callback function to perform some cleanup when it is stopped for a while, for example, cleaning up additional resources that have been acquired during the consuming of messages.

The callback function is invoked when an MQCTL call is issued using a value for the *Operation* field of MQOP\_STOP.

This call type is used for message consumers only.

The value of the *Reason* field is set to indicate the reason for stopping.

#### **MQCBCT\_DEREGISTER\_CALL**

The purpose of this call type is to allow the callback function to perform final cleanup at the end of the consume process. The callback function is invoked when the:

- Callback function is deregistered using an MQCB call with MQOP\_DEREGISTER.
- Queue is closed, causing an implicit deregister. In this instance the callback function is passed MQHO\_UNUSABLE\_HOBJ as the object handle.
- MQDISC call completes - causing an implicit close and, therefore, a deregister. In this case the connection is not disconnected immediately, and any ongoing transaction is not yet committed.

If any of these actions are taken inside the callback function itself, the action is invoked once the callback returns.

This call type is used both for message consumers and event handlers.

If requested, this is the last invocation of the callback function.

The value of the *Reason* field is set to indicate the reason for stopping.

## **MQCBCT\_EVENT\_CALL**

### **Event handler function**

The event handler function has been invoked without a message when the queue manager or connection stops or quiesces.

This call can be used to take appropriate action for all callback functions. **Message consumer function**

The message consumer function has been invoked without a message when an error (*CompCode* = MQCC\_FAILED) has been detected that is specific to the object handle; for example *Reason* code = MQRC\_GET\_INHIBITED.

The value of the *Reason* field is set to indicate the reason for the call.

## **MQCBCT\_MC\_EVENT\_CALL**

The event handler function has been invoked for multicast events; The event handler is sent IBM MQ Multicast events instead of 'normal' IBM MQ events.

For more information about MQCBCT\_MC\_EVENT\_CALL, see Multicast exception reporting.

*CompCode* (MQLONG):

This field is the completion code. It indicates whether there were any problems consuming the message.

The value is one of the following:

### **MQCC\_OK**

Successful completion

### **MQCC\_WARNING**

Warning (partial completion)

### **MQCC\_FAILED**

Call failed

This is an input field. The initial value of this field is MQCC\_OK.

*ConnectionArea* (MQPTR):

This field is available for the callback function to use.

The queue manager makes no decisions based on the contents of this field and it is passed unchanged from the *ConnectionArea* field in the MQCTLO structure, which is a parameter on the MQCTL call used to control the callback function.

Any changes made to this field by the callback functions are preserved across the invocations of the callback function. This area can be used to pass information that is to be shared by all callback functions. Unlike *CallbackArea*, this area is common across all callbacks for a connection handle.

This is an input and output field. The initial value of this field is a null pointer or null bytes.

*DataLength (MQLONG):*

This is the length in bytes of the application data in the message. If the value is zero, it means that the message contains no application data.

The `DataLength` field contains the length of the message but not necessarily the length of the message data passed to the consumer. It could be that the message was truncated. Use the `ReturnedLength` field in the `MQGMO` to determine how much data has actually been passed to the consumer.

If the reason code indicates the message has been truncated, you can use the `DataLength` field to determine how large the actual message is. This allows you to determine the size of the buffer required to accommodate the message data, and then issue an `MQCB` call to update the `MaxMsgLength` with an appropriate value.

If the `MQGMO_CONVERT` option is specified, the converted message could be larger than the value returned for `DataLength`. In such cases, the application probably needs to issue an `MQCB` call to update the `MaxMsgLength` to be greater than the value returned by the queue manager for `DataLength`.

To avoid message truncation problems, specify `MaxMsgLength` as `MQCBD_FULL_MSG_LENGTH`. This causes the queue manager to allocate a buffer for the full message length after data conversion. Be aware, however, that even if this option is specified, it is still possible that sufficient storage is not available to correctly process the request. Applications should always check the returned reason code. For example, if it is not possible to allocate sufficient storage to convert the message, the message is returned to the application unconverted.

This is an input field to the message consumer function; it is not relevant to an event handler function.

*Flags (MQLONG):*

Flags containing information about this consumer.

The following option is defined:

#### **MQCBCF\_READA\_BUFFER\_EMPTY**

This flag can be returned if a previous `MQCLOSE` call using the `MQCO_QUIESCE` option failed with a reason code of `MQRC_READ_AHEAD_MSGS`.

This code indicated that the last read ahead message is being returned and that the buffer is now empty. If the application issues another `MQCLOSE` call using the `MQCO_QUIESCE` option, it succeeds.

Note, that an application is not guaranteed to be given a message with this flag set, as there might still be messages in the read-ahead buffer that do not match the current selection criteria. In this instance, the consumer function is invoked with the reason code `MQRC_HOBJ_QUIESCED`.

If the read ahead buffer is completely empty, the consumer is invoked with the `MQCBCF_READA_BUFFER_EMPTY` flag and the reason code `MQRC_HOBJ_QUIESCED_NO_MSGS`.

This is an input field to the message consumer function; it is not relevant to an event handler function.

*Hobj (MQHOBJ):*

This is the object handle for calls to the message consumer.

For an event handler, this value is MQHO\_NONE

The application can use this handle and the message token in the Get Message Options block to get the message if a message has not been removed from the queue.

This is always an input field. The initial value of this field is MQHO\_UNUSABLE\_HOBJ

*Reason (MQLONG):*

This is the reason code qualifying the *CompCode*.

This is an input field. The initial value of this field is MQRC\_NONE.

*State (MQLONG):*

An indication as to the state of the current consumer. This field is of most value to an application when a nonzero reason code is passed to the consumer function.

You can use this field to simplify application programming because you do not need to code behavior for each reason code.

This is an input field. The initial value of this field is MQCS\_NONE

State	Queue manager action	Value of constant
<i>MQCS_NONE</i> This reason code represents a normal call with no additional reason information	None; this is the normal operation.	0
<i>MQCS_SUSPENDED_TEMPORARY</i> These reason codes represent temporary conditions.	The callback routine is called to report the condition and then suspended. After a period of time the system might attempt the operation again, which can lead to the same condition being raised again.	1
<i>MQCS_SUSPENDED_USER_ACTION</i> These reason codes represent conditions where the callback needs to take action to resolve the condition.	The consumer is suspended and the callback routine is called to report the condition. The callback routine should resolve the condition if possible and either RESUME or close down the connection.	2
<i>MQCS_SUSPENDED</i> These reason codes represent failures that prevent further message callbacks.	The queue manager automatically suspends the callback function. If the callback function is resumed it is likely to receive the same reason code again.	3
<i>MQCS_STOPPED</i> These reason codes represent the end of message consumption.	Delivered to the exception handler and to callbacks that specified MQCBDO_STOP_CALL. No further messages can be consumed.	4

*StrucId (MQCHAR4):*

The value in this field is the structure identifier.

The value must be:

**MQCBC\_STRUC\_ID**

Identifier for callback context structure.

For the C programming language, the constant MQCBC\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQCBC\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQCBC\_STRUC\_ID.

*Version (MQLONG):*

The value in this field is the structure version number.

The value must be:

**MQCBC\_VERSION\_1**

Version-1 callback context structure.

The following constant specifies the version number of the current version:

**MQCBC\_CURRENT\_VERSION**

Current version of the callback context structure.

This is always an input field. The initial value of this field is MQCBC\_VERSION\_1.

The callback function is always passed the latest version of the structure.

*ReconnectDelay (MQLONG):*

ReconnectDelay indicates how long the queue manager will wait before trying to reconnect. The field can be modified by an event handler to change the delay or stop reconnection altogether.

Use the ReconnectDelay field only if the value of the Reason field in the Callback Context is MQRC\_RECONNECTING.

On entry to the event handler the value of ReconnectDelay is the number of milliseconds the queue manager is going to wait before making a reconnection attempt. Table 161 lists the values that you can set to modify the behavior of the queue manager on return from the event handler.

*Table 161. ReconnectDelay values*

Name	Value	Description
MQRD_NO_RECONNECT	-1	Make no more reconnection attempts. An error is returned to the application.
MQRD_NO_DELAY	0	Try to reconnect immediately.
<i>Milliseconds</i>	>0	Wait for this many milliseconds before retrying the connection.

Initial values and language declarations for MQCBC:

#### Callback context structure - initial values

There are no initial values for the **MQCBC** structure. The structure is passed as a parameter to a callback routine. The queue manager initializes the structure; applications never initialize it.

C declaration:

#### Callback context structure - C language declaration

```
typedef struct tagMQCBC MQCBC;
struct tagMQCBC {
    MQCHAR4   StrucId;           /* Structure identifier */
    MQLONG    Version;          /* Structure version number */
    MQLONG    CallType;         /* Why Function was called */
    MQHOBJS   Hobj;            /* Object Handle */
    MQPTR     CallbackArea;     /* Callback data passed to the function */
    MQPTR     ConnectionArea;   /* MQCTL data area passed to the function */
    MQLONG    CompCode;        /* Completion Code */
    MQLONG    Reason;          /* Reason Code */
    MQLONG    State;           /* Consumer State */
    MQLONG    DataLength;      /* Message Data Length */
    MQLONG    BufferLength;     /* Buffer Length */
    MQLONG    Flags;           /* Flags containing information about
                               this consumer */

    /* Ver:1 */
    MQLONG    ReconnectDelay;   /* Number of milliseconds before */
    /* Ver:2 */ };             /* reconnect attempt */
```

COBOL declaration:

```
** MQCBC structure
10 MQCBC.
** Structure Identifier
15 MQCBC-STRUCID PIC X(4).
** Structure Version
15 MQCBC-VERSION PIC S9(9) BINARY.
** Call Type
15 MQCBC-CALLTYPE PIC S9(9) BINARY.
** Object Handle
15 MQCBC-HOBJ PIC S9(9) BINARY.
** Callback User Area
15 MQCBC-CALLBACKAREA POINTER
** Connection Area
15 MQCBC-CONNECTIONAREA POINTER
** Completion Code
15 MQCBC-COMPCODE PIC S9(9) BINARY.
** Reason Code
15 MQCBC-REASON PIC S9(9) BINARY.
** Consumer State
15 MQCBC-STATE PIC S9(9) BINARY.
** Data Length
15 MQCBC-DATALength PIC S9(9) BINARY.
** Buffer Length
15 MQCBC-BUFFERLENGTH PIC S9(9) BINARY.
** Flags
15 MQCBC-FLAGS PIC S9(9) BINARY.
** Ver:1 **
** Number of milliseconds before reconnect attempt
15 MQCBC-RECONNECTDELAY PIC S9(9) BINARY.
** Ver:2 **
```

PL/I declaration:

```

dcl
  1 MQCBC based,
    3 StrucId          char(4),          /* Structure identifier */
    3 Version          fixed bin(31),    /* Structure version */
    3 CallType         fixed bin(31),    /* Callback type */
    3 Hobj             fixed bin(31),    /* Object Handle */
    3 CallbackArea     pointer,          /* User area passed to the function */
    3 ConnectionArea  pointer,          /* Connection User Area */
    3 CompCode         fixed bin(31);    /* Completion Code */
    3 Reason           fixed bin(31);    /* Reason Code */
    3 State            fixed bin(31);    /* Consumer State */
    3 DataLength       fixed bin(31);    /* Message Data Length */
    3 BufferLength     fixed bin(31);    /* Message Buffer length */
    3 Flags            fixed bin(31);    /* Consumer Flags */
/* Ver:1 */
    3 ReconnectDelay  fixed bin(31);    /* Number of milliseconds before */
/* Ver:2 */                                /* reconnect attempt */

```

High Level Assembler declaration:

```

MQCBC          DSECT
MQCBC          DS 0F   Force fullword alignment
MQCBC_STRUCID  DS CL4  Structure identifier
MQCBC_VERSION  DS F    Structure version number
MQCBC_CALLTYPE DS F    Why Function was called
MQCBC_HOBJ     DS F    Object Handle
MQCBC_CALLBACKAREA DS A  Callback data passed to the function
MQCBC_CONNECTIONAREA DS A  MQCTL Data area passed to the function
MQCBC_COMPCODE DS F    Completion Code
MQCBC_REASON   DS F    Reason Code
MQCBC_STATE    DS F    Consumer State
MQCBC_DATALENGTH DS F  Message Data Length
MQCBC_BUFFERLENGTH DS F  Buffer Length
MQCBC_FLAGS    DS F    Flags containing information about this consumer
MQCBC_RECONNECTDELAY DS F  Number of milliseconds before reconnect
MQCBC_LENGTH   EQU *-MQCBC
               ORG    MQCBC
MQCBC_AREA     DS CL(MQCBC_LENGTH)

```

### MQCBD - Callback descriptor:

The following table summarizes the fields in the structure. Structure specifying the callback function.

Table 162. Fields in MQCBD

Field	Description	Topic
<i>StrucID</i>	Structure identifier	StrucID
<i>Version</i>	Structure version number	Version
<i>CallbackType</i>	Type of callback function	CallbackType
<i>Options</i>	Options controlling message consumption	Options
<i>Callback Area</i>	Field for callback function to use	CallbackArea
<i>CallbackFunction</i>	Whether the function is invoked as an API call	CallbackFunction
<i>CallbackName</i>	Whether the function is invoked as a dynamically-linked program	CallbackName
<i>MaxMsgLength</i>	Length of longest message that can be read	MaxMsgLength

*Overview for MQCBD:*

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS, and IBM MQ MQI clients connected to these systems.

**Purpose:** The MQCBD structure is used to specify a callback function and the options controlling its use by the queue manager.

The structure is an input parameter on the MQCB call.

**Version:** The current version of MQCBD is MQCBD\_VERSION\_1.

**Character set and encoding:** Data in MQCBD must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

*Fields for MQCBD:*

Alphabetic list of fields for the MQCBD structure.

The MQCBD structure contains the following fields; the fields are described in alphabetical order:

*CallbackArea (MQPTR):*

Callback descriptor structure - CallbackArea field

This is a field that is available for the callback function to use.

The queue manager makes no decisions based on the contents of this field and it is passed unchanged from the CallbackArea field in the MQCBC structure, which is a parameter on the callback function declaration.

The value is used only on an *Operation* having a value MQOP\_REGISTER, with no currently defined callback, it does not replace a previous definition.

This is an input and output field to the callback function. The initial value of this field is a null pointer or null bytes.

*CallbackFunction (MQPTR):*

Callback descriptor structure - CallbackFunction field

The callback function is invoked as a function call.

Use this field to specify a pointer to the callback function.

You *must* specify either *CallbackFunction* or *CallbackName*. If you specify both, the reason code MQRC\_CALLBACK\_ROUTINE\_ERROR is returned.

If neither *CallbackName* nor *CallbackFunction* is set, the call fails with the reason code MQRC\_CALLBACK\_ROUTINE\_ERROR.

This option is not supported in the following environment: Programming languages and compilers that do not support function-pointer references. In such situations, the call fails with the reason code MQRC\_CALLBACK\_ROUTINE\_ERROR.

On z/OS the function must expect to be called with OS linkage conventions. For example, in the C programming language, specify:

```
#pragma linkage(MQCB_FUNCTION,OS)
```

This is an input field. The initial value of this field is a null pointer or null bytes.

**Note:** When using CICS with IBM MQ V7.0.1, asynchronous consumption is supported if:

- Apar PK66866 is applied to CICS TS 3.2
- Apar PK89844 is applied to CICS TS 4.1

*CallbackName (MQCHAR128):*

Callback descriptor structure - CallbackName field

The callback function is invoked as a dynamically linked program.

You *must* specify either *CallbackFunction* or *CallbackName*. If you specify both, the reason code MQRC\_CALLBACK\_ROUTINE\_ERROR is returned.

If neither *CallbackName* nor *CallbackFunction* is not set, the call fails with the reason code MQRC\_CALLBACK\_ROUTINE\_ERROR.

The module is loaded when the first callback routine to use is registered, and unloaded when the last callback routine to use it deregisters.

Except where noted in the following text, the name is left-justified within the field, with no embedded blanks; the name itself is padded with blanks to the length of the field. In the descriptions that follow, square brackets ( [ ] ) denote optional information:

#### **IBM i**

The callback name can be one of the following formats:

- Library "/" Program
- Library "/" ServiceProgram ("FunctionName")

For example, MyLibrary/MyProgram(MyFunction).

The library name can be \*LIBL. Both the library and program names are limited to a maximum of 10 characters.

#### **UNIX systems**

The callback name is the name of a dynamically-loadable module or library, suffixed with the name of a function residing in that library. The function name must be enclosed in parentheses. The library name can optionally be prefixed with a directory path:

[path]library(function)

If the path is not specified the system search path is used.

The name is limited to a maximum of 128 characters.

#### **Windows**

The callback name is the name of a dynamic-link library, suffixed with the name of a function residing in that library. The function name must be enclosed in parentheses. The library name can optionally be prefixed with a directory path and drive:

[d:][path]library(function)

If the drive and path are not specified the system search path is used.

The name is limited to a maximum of 128 characters.

**z/OS** The callback name is the name of a load module that is valid for specification on the EP parameter of the LINK or LOAD macro.

The name is limited to a maximum of 8 characters.

#### **z/OS CICS**

The callback name is the name of a load module that is valid for specification on the PROGRAM parameter of the EXEC CICS LINK command macro.

The name is limited to a maximum of 8 characters.

The program can be defined as remote using the REMOTESYSTEM option of the installed PROGRAM definition or by the dynamic routing program.

The remote CICS region must be connected to IBM MQ if the program is to use IBM MQ API calls. Note, however, that the *Hobj* field in the MQCBC structure is not valid in a remote system.

If a failure occurs trying to load *CallbackName*, one of the following error codes is returned to the application:

- MQRC\_MODULE\_NOT\_FOUND
- MQRC\_MODULE\_INVALID
- MQRC\_MODULE\_ENTRY\_NOT\_FOUND

A message is also written to the error log containing the name of the module for which the load was attempted, and the failing reason code from the operating system.

This is an input field. The initial value of this field is a null string or blanks.

*CallbackType* (MQLONG):

Callback descriptor structure - CallbackType field

This is the type of the callback function. The value must be one of:

#### **MQCBT\_MESSAGE\_CONSUMER**

Defines this callback as a message consumer function.

A message consumer callback function is called when a message, meeting the selection criteria specified, is available on an object handle and the connection is started.

#### **MQCBT\_EVENT\_HANDLER**

Defines this callback as the asynchronous event routine; it is not driven to consume messages for a handle.

*Hobj* is not required on the MQCB call defining the event handler and is ignored if specified.

The event handler is called for conditions that affect the whole message consumer environment. The consumer function is invoked without a message when an event, for example, a queue manager or connection stopping, or quiescing, occurs. It is not called for conditions that are specific to a single message consumer, for example, MQRC\_GET\_INHIBITED.

Events are delivered to the application, regardless of whether the connection is started or stopped, except in the following environments:

- CICS on z/OS environment
- nonthreaded applications

If the caller does not pass one of these values, the call fails with a *Reason* code of MQRC\_CALLBACK\_TYPE\_ERROR

This is always an input field. The initial value of this field is MQCBT\_MESSAGE\_CONSUMER.

*MaxMsgLength (MQLONG):*

This is the length in bytes of the longest message that can be read from the handle and given to the callback routine. Callback descriptor structure - *MaxMsgLength* field

If a message has a longer length, the callback routine receives *MaxMsgLength* bytes of the message, and reason code:

- MQRC\_TRUNCATED\_MSG\_FAILED or
- MQRC\_TRUNCATED\_MSG\_ACCEPTED if you specified MQGMO\_ACCEPT\_TRUNCATED\_MSG.

The actual message length is supplied in the *DataLength* field of the MQCBC structure.

The following special value is defined:

#### **MQCBD\_FULL\_MSG\_LENGTH**

The buffer length is adjusted by the system to return messages without truncation.

If insufficient memory is available to allocate a buffer to receive the message, the system calls the callback function with an MQRC\_STORAGE\_NOT\_AVAILABLE reason code.

If, for example, you request data conversion, and there is insufficient memory available to convert the message data, the unconverted message is passed to the callback function.

This is an input field. The initial value of the *MaxMsgLength* field is MQCBD\_FULL\_MSG\_LENGTH.

*Options (MQLONG):*

Callback descriptor structure - Options field

You can specify one or more of these options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

#### **MQCBDO\_FAIL\_IF QUIESCING**

The MQCB call fails if the queue manager is in the quiescing state.

On z/OS, this option also forces the MQCB call to fail if the connection (for a CICS or IMS application) is in the quiescing state.

Specify MQGMO\_FAIL\_IF QUIESCING, in the MQGMO options passed on the MQCB call, to cause notification to message consumers when they are quiescing.

**Control options:** The following options control whether the callback function is called, without a message, when the state of the consumer changes:

#### **MQCBDO\_REGISTER\_CALL**

The callback function is invoked with call type MQCBCT\_REGISTER\_CALL.

#### **MQCBDO\_START\_CALL**

The callback function is invoked with call type MQCBCT\_START\_CALL.

#### **MQCBDO\_STOP\_CALL**

The callback function is invoked with call type MQCBCT\_STOP\_CALL.

#### **MQCBDO\_DEREGISTER\_CALL**

The callback function is invoked with call type MQCBCT\_DEREGISTER\_CALL.

#### **MQCBDO\_EVENT\_CALL**

The callback function is invoked with call type MQCBCT\_EVENT\_CALL.

#### **MQCBDO\_MC\_EVENT\_CALL**

The callback function is invoked with call type MQCBCT\_MC\_EVENT\_CALL.

See CallType for further details about these call types.

**Default option:** If you do not need any of the options described, use the following option:

#### **MQCBDO\_NONE**

Use this value to indicate that no other options have been specified; all options assume their default values.

MQCBDO\_NONE is defined to aid program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

This is an input field. The initial value of the *Options* field is MQCBDO\_NONE.

*StrucId* (MQCHAR4):

Callback descriptor structure - StrucId field

This is the structure identifier; the value must be:

#### **MQCBD\_STRUC\_ID**

Identifier for callback descriptor structure.

For the C programming language, the constant MQCBD\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQCBD\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQCBD\_STRUC\_ID.

*Version* (MQLONG):

Callback descriptor structure - Version field

This is the structure version number; the value must be:

#### **MQCBD\_VERSION\_1**

Version-1 callback descriptor structure.

The following constant specifies the version number of the current version:

#### **MQCBD\_CURRENT\_VERSION**

Current version of callback descriptor structure.

This is always an input field. The initial value of this field is MQCBD\_VERSION\_1.

*Initial values and language declarations for MQCBD:*

Callback descriptor structure - Initial values

*Table 163. Initial values of fields in MQCBD*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQCBD_STRUC_ID	'CBD~'
<i>Version</i>	MQCBD_VERSION_1	1
<i>CallbackType</i>	MQCBT_MESSAGE_CONSUMER	1
<i>Options</i>	MQCBDO_NONE	0
<i>CallbackArea</i>	None	Null pointer or null blanks
<i>CallbackFunction</i>	None	Null pointer or null blanks
<i>CallbackName</i>	None	Null string or blanks

Table 163. Initial values of fields in MQCBD (continued)

Field name	Name of constant	Value of constant
MaxMsgLength	MQCBD_FULL_MSG_LENGTH	-1
<p><b>Notes:</b></p> <ol style="list-style-type: none"> <li>1. The symbol ~ represents a single blank character.</li> <li>2. The value Null string or blanks denotes the null sting in the C programming language, and blank characters in other programming languages.</li> <li>3. In the C programming language, the macro variable MQCBD_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  MQCBD MyCBD = {MQCBD_DEFAULT};</li> </ol>		

C declaration:

Callback descriptor structure - C language declaration

```
typedef struct tagMQCBD MQCBD;
struct tagMQCBD {
    MQCHAR4    StrucId;           /* Structure identifier */
    MQLONG     Version;          /* Structure version number */
    MQLONG     CallBackType;     /* Callback function type */
    MQLONG     Options;          /* Options controlling message
                                consumption */
    MQPTR      CallbackArea;     /* User data passed to the function */
    MQPTR      CallbackFunction; /* Callback function pointer */
    MQCHAR128  CallbackName;    /* Callback name */
    MQLONG     MaxMsgLength;    /* Maximum message length */
};
```

COBOL declaration:

```
** MQCBCD structure
10  MQCBD.
** Structure Identifier
15  MQCBD-STRUCID          PIC X(4).
** Structure Version
15  MQCBD-VERSION        PIC S9(9) BINARY.
** Callback Type
15  MQCBD-CALLBACKTYPE   PIC S9(9) BINARY.
** Options
15  MQCBD-OPTIONS        PIC S9(9) BINARY.
** Callback User Area
15  MQCBD-CALLBACKAREA   POINTER
** Callback Function Pointer
15  MQCBD-CALLBACKFUNCTION FUNCTION-POINTER
** Callback Program Name
15  MQCBD-CALLBACKNAME   PIC X(128)
** Maximum Message Length
15  MQCDB-MAXMSGLENGTH  PIC S9(9) BINARY.
```

PL/I declaration:

```
dc1
 1 MQCBD based,
 3 StrucId          char(4),          /* Structure identifier*/
 3 Version          fixed bin(31), /* Structure version*/
 3 CallbackType     fixed bin(31), /* Callback function type */
 3 Options          fixed bin(31), /* Options */
 3 CallbackArea     pointer,         /* User area passed to the function */
 3 CallbackFunction pointer,         /* Callback Function Pointer */
 3 CallbackName     char(128),      /* Callback Program Name */
 3 MaxMsgLength     fixed bin(31); /* Maximum Message Length */
```

## MQCHARV - Variable Length String:

The following table summarizes the fields in the structure.

Field	Description	Topic
<i>VSPtr</i>	Pointer to the variable length string	VSPtr
<i>VSOffset</i>	Offset in bytes of the variable length string from the start of the structure that contains this MQCHARV structure	VSOffset
<i>VSLength</i>	The length in bytes of the variable length string addressed by the VSPtr or VSOffset field.	VSLength
<i>VSBufSize</i>	The size in bytes of the buffer addressed by the VSPtr or VSOffset field.	VSBufSize
<i>VSCCSID</i>	The character set identifier of the variable length string addressed by the VSPtr or VSOffset field.	VSCCSID

*Overview for MQCHARV:*

**Availability:** AIX, HP-UX, Solaris, Linux, IBM i, Windows, plus IBM MQ MQI clients connected to these systems.

**Purpose:** Use the MQCHARV structure to describe a variable length string.

**Character set and encoding:** Data in the MQCHARV must be in the encoding of the local queue manager that is given by MQENC\_NATIVE and the character set of the VSCCSID field within the structure. If the application is running as an MQ client, the structure must be in the encoding of the client. Some character sets have a representation that depends on the encoding. If VSCCSID is one of these character sets, the encoding used is the same encoding as that of the other fields in the MQCHARV. The character set identified by VSCCSID can be a double-byte character set (DBCS).

**Usage:** The MQCHARV structure addresses data that might be discontinuous with the structure containing it. To address this data, fields declared with the pointer data type can be used. Be aware that COBOL does not support the pointer data type in all environments. Because of this, the data can also be addressed using fields that contain the offset of the data from the start of the structure containing the MQCHARV.

## COBOL programming

If you want to port an application between environments, you must ascertain whether the pointer data type is available in all the intended environments. If not, the application must address the data using the offset fields instead of the pointer fields.

In those environments where pointers are not supported, you can declare the pointer fields as byte strings of the appropriate length, with the initial value being the all-null byte string. Do not alter this initial value if you are using the offset fields. One way to do this without changing the supplied copy books is to use the following:

```
COPY CMQCHRVV REPLACING POINTER BY ==BINARY PIC S9(9)==.
```

where CMQCHRVV can be exchanged for the copy book to be used.

*Fields for MQCHARV:*

The MQCHARV structure contains the following fields; the fields are described in **alphabetical order**:

*VBufSize (MQLONG):*

This is the size in bytes of the buffer addressed by the VSPtr or VSOffset field.

When the MQCHARV structure is used as an output field on a function call, this field must be initialised with the length of the buffer provided. If the value of VSLength is greater than VBufSize then only VBufSize bytes of data are returned to the caller in the buffer.

This value must be a value greater than or equal to zero, or the following special value which is recognized:

#### **MQVS\_USE\_VSLENGTH**

When specified, the length of the buffer is taken from the VSLength field in the MQCHARV structure. Do not use this value when using the structure as an output field and a buffer is provided.

This is the initial value of this field.

*VSCCSID (MQLONG):*

This is the character set identifier of the variable length string addressed by the VSPtr or VSOffset field.

The initial value of this field is MQCCSI\_APPL which is defined by MQ to indicate that it should be changed to the true character set identifier of the current process. As a result, the value MQCCSI\_APPL is never associated with a variable length string. The initial value of this field can be changed by defining a different value for the constant MQCCSI\_APPL for your compile unit by the appropriate means for your application's programming language.

*VSLength (MQLONG):*

The length in bytes of the variable length string addressed by the VSPtr or VSOffset field.

The initial value of this field is 0. The value must be either greater than or equal to zero or the following special value which is recognized:

#### **MQVS\_NULL\_TERMINATED**

If MQVS\_NULL\_TERMINATED is not specified, VSLength bytes are included as part of the string. If null characters are present they do not delimit the string.

If MQVS\_NULL\_TERMINATED is specified, the string is delimited by the first null encountered in the string. The null itself is not included as part of that string.

**Note:** The null character used to terminate a string if MQVS\_NULL\_TERMINATED is specified is a null from the codeset specified by VSCCSID.

For example, in UTF-16 (UCS-2 CCSIDs 1200 and 13488), this is the two byte Unicode encoding where a null is represented by a 16-bit number of all zeros. In UTF-16 it is common to find single bytes set to all zero which are part of characters (7-bit ASCII characters for instance), but the strings will only be null terminated when two 'zero' bytes are found on an even byte boundary. It is possible to get two 'zero' bytes on an odd boundary when they are each part of valid characters. For example `x'01' x'00 x'00' x'30'` represents two valid Unicode characters and does not null terminate the string.

*VSOffset (MQLONG):*

The offset can be positive or negative. You can use either the `VSPtr` or `VSOffset` field to specify the variable length string, but not both. The offset in bytes of the variable length string from the start of the `MQCHARV`, or the structure containing it.

When the `MQCHARV` structure is embedded within another structure, this value is the offset in bytes of the variable length string from the start of the structure that contains this `MQCHARV` structure. When the `MQCHARV` structure is not embedded within another structure, for example, if it is specified as a parameter on a function call, the offset is relative to the start of the `MQCHARV` structure.

The initial value of this field is 0.

*VSPtr (MQPTR):*

This is a pointer to the variable length string.

You can use either the `VSPtr` or `VSOffset` field to specify the variable length string, but not both.

The initial value of this field is a null pointer or null bytes.

*Initial values and language declarations for MQCHARV:*

#### Initial values of fields in MQCHARV

Field name	Name of constant	Value of constant
<code>VSPtr</code>	None	Null pointer or null bytes.
<code>VSOffset</code>	None	0
<code>VBufSize</code>	<code>MQVS_USE_VSLENGTH</code>	0
<code>VSLength</code>	None	0
<code>VCCSID</code>	<code>MQCCSI_APPL</code>	-3

**Note:** In the C programming language, the macro variable `MQCHARV_DEFAULT` contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQCHARV MyVarStr = {MQCHARV_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQCHARV MQCHARV;
struct tagMQCHARV {
    MQPTR    VSPtr;           /* Address of variable length string */
    MQLONG   VSOFFSET;       /* Offset of variable length string */
    MQLONG   VSBufSize;      /* Size of buffer */
    MQLONG   VSLength;       /* Length of variable length string */
    MQLONG   VSCCSID;        /* CCSID of variable length string */
};
```

*COBOL declaration for MQCHARV:*

```
** MQCHARV structure
10 MQCHARV.
** Address of variable length string
15 MQCHARV-VSPTR    POINTER.
** Offset of variable length string
15 MQCHARV-VSOFFSET PIC S9(9) BINARY.
** Size of buffer
15 MQCHARV-VSBUFSIZE PIC S9(9) BINARY.
** Length of variable length string
15 MQCHARV-VSLength PIC S9(9) BINARY.
** CCSID of variable length string
15 MQCHARV-VSCCSID  PIC S9(9) BINARY.
```

*PL/I declaration:*

```
dc1
1 MQCHARV based,
3 VSPtr    pointer,      /* Address of variable length string */
3 VSOFFSET fixed bin(31), /* Offset of variable length string */
3 VSBufSize fixed bin(31), /* Size of buffer */
3 VSLength fixed bin(31), /* Length of variable length string */
3 VSCCSID  fixed bin(31); /* CCSID of variable length string */
```

*High Level Assembler declaration:*

```
MQCHARV          DSECT
MQCHARV_VSPTR    DS  F    Address of variable length string
MQCHARV_VSOFFSET DS  F    Offset of variable length string
MQCHARV_VSBUFSIZE DS  F    Size of buffer
MQCHARV_VSLength DS  F    Length of variable length string
MQCHARV_VSCCSID  DS  F    CCSID of variable length string
*
MQCHARV_LENGTH   EQU  *-MQCHARV
                  ORG  MQCHARV
MQCHARV_AREA     DS    CL(MQCHARV_LENGTH)
```

## Redefinition of MQCCSI\_APPL:

The following examples show how you can override the value of MQCCSI\_APPL in various programming languages. You can change the value of MQCCSI\_APPL, removing the need to set the VSCCSID for each variable length string separately.

In these examples the CCSID is set to 1208; change this to the value you require. This becomes the default value, which you can override by setting the VSCCSID in any specific instance of MQCHARV.

### C usage

```
#define MQCCSI_APPL 1208
#include <cmqc.h>
```

### COBOL usage

```
COPY CMQXYZV REPLACING -3 BY 1208.
```

### PL/I usage

```
%MQCCSI_APPL = '1208';
%include syslib(cmqp);
```

### System/390 assembler usage

```
MQCCSI_APPL EQU 1208
CMQA LIST=NO
```

## MQCIH - CICS bridge header:

The following table summarizes the fields in the structure.

Table 164. Fields in MQCIH

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>StrucLength</i>	Length of MQCIH structure	StrucLength
<i>Encoding</i>	Reserved	Encoding
<i>CodedCharSetId</i>	Reserved	CodedCharSetId
<i>Format</i>	MQ format name of data that follows MQCIH	Format
<i>Flags</i>	Flags	Flags
<i>ReturnCode</i>	Return code from bridge	ReturnCode
<i>CompCode</i>	MQ completion code or CICS EIBRESP	CompCode
<i>Reason</i>	MQ reason or feedback code, or CICS EIBRESP2	Reason
<i>UOWControl</i>	Unit-of-work control	UOWControl
<i>GetWaitInterval</i>	Wait interval for MQGET call issued by bridge task	GetWaitInterval
<i>LinkType</i>	Link type	LinkType
<i>OutputDataLength</i>	Output COMMAREA data length	OutputDataLength
<i>FacilityKeepTime</i>	Bridge facility release time	FacilityKeepTime
<i>ADSDescriptor</i>	Send/receive ADS descriptor	ADSDescriptor
<i>ConversationalTask</i>	Whether task can be conversational	ConversationalTask
<i>TaskEndStatus</i>	Status at end of task	TaskEndStatus
<i>Facility</i>	Bridge facility token	Facility

Table 164. Fields in MQCIH (continued)

Field	Description	Topic
<i>Function</i>	MQ call name or CICS EIBFN function	Function
<i>AbendCode</i>	Abend code	AbendCode
<i>Authenticator</i>	Password or passticket	Authenticator
<i>Reserved1</i>	Reserved	Reserved1
<i>ReplyToFormat</i>	MQ format name of reply message	ReplyToFormat
<i>RemoteSysId</i>	Remote CICS system Id to use	RemoteSysId
<i>RemoteTransId</i>	CICS RTRANSID to use	RemoteTransId
<i>TransactionId</i>	Transaction to attach	TransactionId
<i>FacilityLike</i>	Terminal emulated attributes	FacilityLike
<i>AttentionId</i>	AID key	AttentionId
<i>StartCode</i>	Transaction start code	StartCode
<i>CancelCode</i>	Abend transaction code	CancelCode
<i>NextTransactionId</i>	Next transaction to attach	NextTransactionId
<i>Reserved2</i>	Reserved	Reserved2
<i>Reserved3</i>	Reserved	Reserved3
<b>Note:</b> The remaining fields are not present if <i>Version</i> is less than MQCIH_VERSION_2.		
<i>CursorPosition</i>	Cursor position	CursorPosition
<i>ErrorOffset</i>	Offset of error in message	ErrorOffset
<i>InputItem</i>	Reserved	InputItem
<i>Reserved4</i>	Reserved	Reserved4

#### Overview for MQCIH:

The MQCIH structure describes the header information for a message sent to CICS across the CICS bridge. For any IBM MQ supported platform you can create and transmit a message that includes the MQCIH structure, but only an IBM MQ for z/OS queue manager can use the CICS bridge. Therefore, for the message to get to CICS from a non-z/OS queue manager, your queue manager network must include at least one z/OS queue manager through which the message can be routed.

**Availability:** AIX, HP-UX, z/OS, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

**Purpose:** The MQCIH structure describes the information that can be present at the start of a message sent to the CICS bridge through IBM MQ for z/OS.

**Format name:** MQFMT\_CICS.

**Version:** The current version of MQCIH is MQCIH\_VERSION\_2. Fields that exist only in the more-recent version of the structure are identified as such in the descriptions that follow.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQCIH, with the initial value of the *Version* field set to MQCIH\_VERSION\_2.

**Character set and encoding:** Special conditions apply to the character set and encoding used for the MQCIH structure and application message data:

- Applications that connect to the queue manager that owns the CICS bridge queue must provide an MQCIH structure that is in the character set and encoding of the queue manager. This is because data conversion of the MQCIH structure is not performed in this case.
- Applications that connect to other queue managers can provide an MQCIH structure that is in any of the supported character sets and encodings; the receiving message channel agent connected to the queue manager that owns the CICS bridge queue converts the MQCIH structure.
- The application message data following the MQCIH structure must be in the same character set and encoding as the MQCIH structure. You cannot use the *CodedCharSetId* and *Encoding* fields in the MQCIH structure to specify the character set and encoding of the application message data.  
You must provide a data-conversion exit to convert the application message data if the data is not one of the built-in formats supported by the queue manager.

**Usage:** If the application requires values that are the same as the initial values shown in Table 166 on page 2068, and the bridge is running with AUTH=LOCAL or AUTH=IDENTIFY, you can omit the MQCIH structure from the message. In all other cases, the structure must be present.

The bridge accepts either a version-1 or a version-2 MQCIH structure, but for 3270 transactions, you must use a version-2 structure.

The application must ensure that fields documented as request fields have appropriate values in the message sent to the bridge; these fields are input to the bridge.

Fields documented as response fields are set by the CICS bridge in the reply message that the bridge sends to the application. Error information is returned in the *ReturnCode*, *Function*, *CompCode*, *Reason*, and *AbendCode* fields, but not all of them are set in all cases. Table 165 shows which fields are set for different values of *ReturnCode*.

Table 165. Contents of error information fields in MQCIH structure for MQCIH

<i>ReturnCode</i>	<i>Function</i>	<i>CompCode</i>	<i>Reason</i>	<i>AbendCode</i>
MQCRC_OK	-	-	-	-
MQCRC_BRIDGE_ERROR	-	-	MQFB_CICS_*	-
MQCRC_MQ_API_ERROR MQCRC_BRIDGE_TIMEOUT	MQ call name	MQ <i>CompCode</i>	MQ <i>Reason</i>	-
MQCRC_CICS_EXEC_ERROR MQCRC_SECURITY_ERROR MQCRC_PROGRAM_NOT_AVAILABLE MQCRC_TRANSID_NOT_AVAILABLE	CICS EIBFN	CICS EIBRESP	CICS EIBRESP2	-
MQCRC_BRIDGE_ABEND MQCRC_APPLICATION_ABEND	-	-	-	CICS ABCODE

*Fields for MQCIH:*

The MQCIH structure contains the following fields; the fields are described in **alphabetical order**:

*AbendCode (MQCHAR4):*

AbendCode is a response field. The length of this field is given by MQ\_ABEND\_CODE\_LENGTH. The initial value of this field is 4 blank characters.

The value returned in this field is significant only if the *ReturnCode* field has the value MQCRC\_APPLICATION\_ABEND or MQCRC\_BRIDGE\_ABEND. If it does, *AbendCode* contains the CICS ABCODE value.

*ADSDescriptor (MQLONG):*

This field is an indicator specifying whether to send ADS descriptors on SEND and RECEIVE BMS requests.

The following values are defined:

**MQCADSD\_NONE**

Do not send or receive ADS descriptors.

**MQCADSD\_SEND**

Send ADS descriptors.

**MQCADSD\_RECV**

Receive ADS descriptors.

**MQCADSD\_MSGFORMAT**

Use message format for the ADS descriptors.

This sends or receives the ADS descriptors using the long form of the ADS descriptor. The long form has fields that are aligned on 4-byte boundaries.

Set the *ADSDescriptor* field as follows:

- If you are not using ADS descriptors, set the field to MQCADSD\_NONE.
- If you are using ADS descriptors with the *same* CCSID in each environment, set the field to the sum of MQCADSD\_SEND and MQCADSD\_RECV.
- If you are using ADS descriptors with *different* CCSIDs in each environment, set the field to the sum of MQCADSD\_SEND, MQCADSD\_RECV, and MQCADSD\_MSGFORMAT.

This is a request field used only for 3270 transactions. The initial value of this field is MQCADSD\_NONE.

*AttentionId (MQCHAR4):*

The value in this field determines the initial value of the AID key when the transaction is started. It is a 1 byte value, left-aligned.

AttentionId is a request field used only for 3270 transactions. The length of this field is given by MQ\_ATTENTION\_ID\_LENGTH. The initial value of this field is four blanks.

*Authenticator (MQCHAR8):*

The value of this field is the password or passticket.

If user-identifier authentication is active for the CICS bridge, *Authenticator* is used with the user identifier in the MQMD identity context to authenticate the sender of the message.

This is a request field. The length of this field is given by MQ\_AUTHENTICATOR\_LENGTH. The initial value of this field is 8 blanks.

*CancelCode (MQCHAR4):*

The value in this field is the abend code to be used to terminate the transaction (normally a conversational transaction that is requesting more data). Otherwise this field is set to blanks.

This field is a request field used only for 3270 transactions. The length of this field is given by MQ\_CANCEL\_CODE\_LENGTH. The initial value of this field is four blanks.

*CodedCharSetId (MQLONG):*

CodedCharSetId is a reserved field; its value is not significant. The initial value of this field is 0.

The Character Set ID for supported structures which follow an MQCIH structure is the same as the Character Set ID of the MQCIH structure itself and is taken from any preceding IBM MQ header.

*CompCode (MQLONG):*

This field is a response field. Its initial value is MQCC\_OK

The value returned in this field depends on *ReturnCode* ; see Table 165 on page 2056.

*ConversationalTask (MQLONG):*

This field is an indicator specifying whether to allow the task to issue requests for more information, or to stop the task and issue an abend message.

The value must be one of the following options:

**MQCCT\_YES**

The task is conversational.

**MQCCT\_NO**

The task is not conversational.

This field is a request field used only for 3270 transactions. The initial value of this field is MQCCT\_NO.

*CursorPosition (MQLONG):*

The value in this field shows the initial cursor position when the transaction is started. For conversational transactions, the cursor position is in the RECEIVE vector.

This field is a request field used only for 3270 transactions. The initial value of this field is 0. This field is not present if *Version* is less than MQCIH\_VERSION\_2.

*Encoding (MQLONG):*

This field is a reserved field; its value is not significant. Its initial value is 0.

The Encoding for supported structures which follow an MQCIH structure is the same as the Encoding of the MQCIH structure itself and taken from any preceding IBM MQ header.

*ErrorOffset (MQLONG):*

The ErrorOffset field shows the position of invalid data detected by the bridge exit. This field provides the offset from the start of the message to the location of the invalid data.

ErrorOffset is a response field used only for 3270 transactions. The initial value of this field is 0. This field is not present if *Version* is less than MQCIH\_VERSION\_2.

*Facility (MQBYTE8):*

This field shows the 8-byte bridge facility token.

A bridge facility token enables multiple transactions in a pseudo-conversation to use the same bridge facility (virtual 3270 terminal). In the first, or only, message in a pseudo-conversation, set a value of MQCFAC\_NONE. This value tells CICS to allocate a new bridge facility for this message. A bridge facility token is returned in response messages when a nonzero *FacilityKeepTime* is specified on the input message. Subsequent input messages within a pseudo-conversation must then use the same bridge facility token.

The following special value is defined:

**MQCFAC\_NONE**

No facility token specified.

For the C programming language, the constant MQCFAC\_NONE\_ARRAY is also defined, and has the same value as MQCFAC\_NONE, but is an array of characters instead of a string.

This field is both a request and a response field used only for 3270 transactions. The length of this field is given by MQ\_FACILITY\_LENGTH. The initial value of this field is MQCFAC\_NONE.

### *FacilityKeepTime (MQLONG):*

FacilityKeepTime is the length of time in seconds that the bridge facility is kept after the user transaction ends.

For pseudo-conversational transactions, specify a value that corresponds to the expected duration of a pseudo-conversation; specify zero for the last transaction of a pseudo-conversation, and for other transaction types specify zero.

This field is a request field used only for 3270 transactions. The initial value of this field is 0.

### *FacilityLike (MQCHAR4):*

FacilityLike is the name of an installed terminal that is to be used as a model for the bridge facility.

A value of blanks means that *FacilityLike* is taken from the bridge transaction profile definition, or a default value is used.

This field is a request field used only for 3270 transactions. The length of this field is given by MQ\_FACILITY\_LIKE\_LENGTH. The initial value of this field is four blanks.

### *Flags (MQLONG):*

This field is a request field. The initial value of this field is MQCIH\_NONE.

The value must be:

#### **MQCIH\_NONE**

No flags.

#### **MQCIH\_PASS\_EXPIRATION**

The reply message contains:

- The same expiry report options as the request message.
- The remaining expiry time from the request message with no adjustment made for the processing time of the bridge.

If you omit this value, the expiry time is set to *unlimited*.

#### **MQCIH\_REPLY\_WITHOUT\_NULLS**

The reply message length of a CICS DPL program request is adjusted to exclude trailing nulls (X'00') at the end of the COMMAREA returned by the DPL program. If this value is not set, the nulls might be significant, and the full COMMAREA is returned.

#### **MQCIH\_SYNC\_ON\_RETURN**

The CICS link for DPL requests uses the SYNCONRETURN option, causing CICS to take a sync point when the program completes if it is shipped to another CICS region. The bridge does not specify to which CICS region to ship the request; that is controlled by the CICS program definition or workload balancing facilities.

*Format (MQCHAR8):*

This field shows the IBM MQ format name of the data that follows the MQCIH structure.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as the rules for coding the *Format* field in MQMD.

This format name is also used for the reply message, if the *ReplyToFormat* field has the value MQFMT\_NONE.

- For DPL requests, *Format* must be the format name of the COMMAREA.
- For 3270 requests, *Format* must be CSQCBDCl, and the bridge sets the format to CSQCBDc0 for Reply messages.

The data-conversion exits for these formats must be installed on the queue manager where they are to run.

If the request message generates an error reply message, the error reply message has a format name of MQFMT\_STRING.

This field is a request field. The length of this field is given by MQ\_FORMAT\_LENGTH. The initial value of this field is MQFMT\_NONE.

*Function (MQCHAR4):*

This field is a response field. The length of this field is given by MQ\_FUNCTION\_LENGTH. The initial value of this field is MQCFUNC\_NONE.

The value returned in this field depends on *ReturnCode* ; see Table 165 on page 2056. The following values are possible when *Function* contains an IBM MQ call name:

**MQCFUNC\_MQCONN**  
MQCONN call.

**MQCFUNC\_MQGET**  
MQGET call.

**MQCFUNC\_MQINQ**  
MQINQ call.

**MQCFUNC\_MQOPEN**  
MQOPEN call.

**MQCFUNC\_MQPUT**  
MQPUT call.

**MQCFUNC\_MQPUT1**  
MQPUT1 call.

**MQCFUNC\_NONE**  
No call.

In all cases, for the C programming language the constants MQCFUNC\_\*\_ARRAY are also defined; these constants have the same values as the corresponding MQCFUNC\_\* constants, but are arrays of characters instead of strings.

*GetWaitInterval (MQLONG):*

This field is a request field. Its initial value is MQCGWI\_DEFAULT.

This field applies only when *UOWControl* has the value MQCUOWC\_FIRST. It enables the sending application to specify the approximate time in milliseconds that the MQGET calls issued by the bridge will wait for second and subsequent request messages for the unit of work started by this message. This facility overrides the default wait interval used by the bridge. You can use the following special values:

**MQCGWI\_DEFAULT**

Default wait interval.

This value causes the CICS bridge to wait for the time specified when the bridge was started.

**MQWI\_UNLIMITED**

Unlimited wait interval.

*InputItem (MQLONG):*

This field is a reserved field. The value must be 0.

This field is not present if *Version* is less than MQCIH\_VERSION\_2.

*LinkType (MQLONG):*

This field is a request field. Its initial value is MQCLT\_PROGRAM.

This value indicates the type of object that the bridge tries to link. It must be one of the following values:

**MQCLT\_PROGRAM**

DPL program.

**MQCLT\_TRANSACTION**

3270 transaction.

*NextTransactionId (MQCHAR4):*

This value is the name of the next transaction returned by the user transaction (usually by EXEC CICS RETURN TRANSID). If there is no next transaction, this field is set to blanks.

This field is a response field used only for 3270 transactions. The length of this field is given by MQ\_TRANSACTION\_ID\_LENGTH. The initial value of this field is four blanks.

*OutputDataLength (MQLONG):*

This field is a request field used only for DPL programs. Its initial value is MQCODL\_AS\_INPUT.

This value is the length of the user data to be returned to the client in a reply message. This length includes the 8-byte program name. The length of the COMMAREA passed to the linked program is the maximum of this field and the length of the user data in the request message, minus 8.

**Note:** The length of the user data in a message is the length of the message excluding the MQCIH structure.

If the length of the user data in the request message is smaller than *OutputDataLength*, the DATALENGTH option of the LINK command is used, enabling the LINK to be function-shipped efficiently to another CICS region.

You can use the following special value:

**MQCODL\_AS\_INPUT**

Output length is same as input length.

This value might be needed even if no reply is requested, in order to ensure that the COMMAREA passed to the linked program is of sufficient size.

*Reason (MQLONG):*

This field is a response field. Its initial value is MQRC\_NONE.

The value returned in this field depends on *ReturnCode* ; see Table 165 on page 2056.

*RemoteSysId (MQCHAR4):*

This field shows the CICS system identifier of the CICS system processing the request.

If this field is blank, the CICS system request is processed on the same CICS system as the bridge monitor. The SYSID used is returned in the Reply message.

For a 3270 pseudo-conversation, all subsequent messages in the conversation must specify the remote SYSID returned in the initial reply. If specified, the SYSID must:

- Be active.
- Have access to the IBM MQ Request queue.
- Be accessible by the CICS ISC links from the CICS system of the bridge monitor.

*RemoteTransId* (MQCHAR4):

This field is an optional Request field. The length of this field is given by MQ\_TRANSACTION\_ID\_LENGTH.

If specified, the field is used as the RTRANSID value of CICS START.

*ReplyToFormat* (MQCHAR8):

The value of this field is the IBM MQ format name of the reply message that is sent in response to the current message.

The rules for coding this field are the same as those rules for coding the *Format* field in MQMD.

This field is a request field used only for DPL programs. The length of this field is given by MQ\_FORMAT\_LENGTH. The initial value of this field is MQFMT\_NONE.

*Reserved1* (MQCHAR8):

This field is a reserved field. The value must be 8 blanks.

*Reserved2* (MQCHAR8):

This field is a reserved field. The value must be 8 blanks.

*Reserved3* (MQCHAR8):

This field is a reserved field. The value must be 8 blanks.

*Reserved4* (MQLONG):

This field is a reserved field. The value must be 0.

This field is not present if *Version* is less than MQCIH\_VERSION\_2.

*ReturnCode* (MQLONG):

The value of this field is the return code from the CICS bridge describing the outcome of the processing performed by the bridge. This field is a response field, with an initial value of MQCRC\_OK.

The *Function*, *CompCode*, *Reason*, and *AbendCode* fields might contain additional information (see Table 165 on page 2056 ). The value is one of the following:

**MQCRC\_APPLICATION\_ABEND**

(5, X'005') Application ended abnormally.

**MQCRC\_BRIDGE\_ABEND**

(4, X'004') CICS bridge ended abnormally.

**MQCRC\_BRIDGE\_ERROR**

(3, X'003') CICS bridge detected an error.

**MQCRC\_BRIDGE\_TIMEOUT**

(8, X'008') Second or later message within current unit of work not received within specified time.

**MQCRC\_CICS\_EXEC\_ERROR**

(1, X'001') EXEC CICS statement detected an error.

**MQCRC\_MQ\_API\_ERROR**  
(2, X'002') MQ call detected an error.

**MQCRC\_OK**  
(0, X'000') No error.

**MQCRC\_PROGRAM\_NOT\_AVAILABLE**  
(7, X'007') Program not available.

**MQCRC\_SECURITY\_ERROR**  
(6, X'006') Security error occurred.

**MQCRC\_TRANSID\_NOT\_AVAILABLE**  
(9, X'009') Transaction not available.

*StartCode (MQCHAR4):*

The value of this field is an indicator specifying whether the bridge emulates a terminal transaction or a transaction initiated with START.

The value must be one of the following:

**MQCSC\_START**  
Start.

**MQCSC\_STARTDATA**  
Start data.

**MQCSC\_TERMINPUT**  
Terminal input.

**MQCSC\_NONE**  
None.

In all cases, for the C programming language the constants `MQCSC_*_ARRAY` are also defined; these constants have the same values as the corresponding `MQCSC_*` constants, but are arrays of characters instead of strings.

In the response from the bridge, this field is set to the start code appropriate to the next transaction ID contained in the *NextTransactionId* field. The following start codes are possible in the response:

- `MQCSC_START`
- `MQCSC_STARTDATA`
- `MQCSC_TERMINPUT`

For CICS Transaction Server Version 1.2, this field is a request field only; its value in the response is undefined.

For CICS Transaction Server Version 1.3 and subsequent releases, this field is both a request and a response field.

This field is used only for 3270 transactions. The length of this field is given by `MQ_START_CODE_LENGTH`. The initial value of this field is `MQCSC_NONE`.

*StrucId (MQCHAR4):*

This field is a request field, with an initial value of MQCIH\_STRUC\_ID.

The value must be:

**MQCIH\_STRUC\_ID**

Identifier for CICS information header structure.

For the C programming language, the constant MQCIH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQCIH\_STRUC\_ID, but is an array of characters instead of a string.

*StrucLength (MQLONG):*

This field is a request field, with an initial value of MQCIH\_LENGTH\_2.

The value must be one of the following:

**MQCIH\_LENGTH\_1**

Length of version-1 CICS information header structure.

**MQCIH\_LENGTH\_2**

Length of version-2 CICS information header structure.

The following constant specifies the length of the current version:

**MQCIH\_CURRENT\_LENGTH**

Length of current version of CICS information header structure.

*TaskEndStatus (MQLONG):*

This field is a response field, showing the status of the user transaction at end of task. The field is used only for 3270 transactions, and its initial value is MQCTES\_NOSYNC.

One of the following values is returned:

**MQCTES\_NOSYNC**

Not synchronized.

The user transaction has not yet completed and has not syncpointed. The *MsgType* field in MQMD is MQMT\_REQUEST in this case.

**MQCTES\_COMMIT**

Commit unit of work.

The user transaction has not yet completed, but has syncpointed the first unit of work. The *MsgType* field in MQMD is MQMT\_DATAGRAM in this case.

**MQCTES\_BACKOUT**

Back out unit of work.

The user transaction has not yet completed. The current unit of work is backed out. The *MsgType* field in MQMD is MQMT\_DATAGRAM in this case.

**MQCTES\_ENDTASK**

End task.

The user transaction has ended (or abended). The *MsgType* field in MQMD is MQMT\_REPLY in this case.

*TransactionId* (MQCHAR4):

This field is a request field. Its length is given by MQ\_TRANSACTION\_ID\_LENGTH. The initial value of this field is four blanks.

If *LinkType* has the value MQCLT\_TRANSACTION, *TransactionId* is the transaction identifier of the user transaction to be run; specify a nonblank value in this case.

If *LinkType* has the value MQCLT\_PROGRAM, *TransactionId* is the transaction code under which all programs within the unit of work are to be run. If you specify a blank value, the CICS DPL bridge default transaction code (CKBP) is used. If the value is nonblank, you must have defined it to CICS as a local transaction with an initial program that is CSQCBP00. This field applies only when *UOWControl* has the value MQCUOWC\_FIRST or MQCUOWC\_ONLY.

*UOWControl* (MQLONG):

This field is a request field which controls the unit-of-work processing performed by the CICS bridge. The initial value of this field is MQCUOWC\_ONLY.

You can request the bridge to run a single transaction, or one or more programs within a unit of work. The field indicates whether the CICS bridge starts a unit of work, performs the requested function within the current unit of work, or ends the unit of work by committing it or backing it out. Various combinations are supported, to optimize the data transmission flows.

The value must be one of the following:

**MQCUOWC\_ONLY**

Start unit of work, perform function, then commit the unit of work.

**MQCUOWC\_CONTINUE**

Additional data for the current unit of work (3270 only).

**MQCUOWC\_FIRST**

Start unit of work and perform function.

**MQCUOWC\_MIDDLE**

Perform function within current unit of work

**MQCUOWC\_LAST**

Perform function, then commit the unit of work.

**MQCUOWC\_COMMIT**

Commit the unit of work (DPL only).

**MQCUOWC\_BACKOUT**

Back out the unit of work (DPL only).

Version (MQLONG):

This field is a request field. Its initial value is MQCIH\_VERSION\_2.

The value must be one of the following:

**MQCIH\_VERSION\_1**

Version-1 CICS information header structure.

**MQCIH\_VERSION\_2**

Version-2 CICS information header structure.

Fields that exist only in the more-recent version of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQCIH\_CURRENT\_VERSION**

Current version of CICS information header structure.

Initial values and language declarations for MQCIH:

Table 166. Initial values of fields in MQCIH for MQCIH

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQCIH_STRUC_ID	'CIH~'
<i>Version</i>	MQCIH_VERSION_2	2
<i>StrucLength</i>	MQCIH_LENGTH_2	180
<i>Encoding</i>	None	0
<i>CodedCharSetId</i>	None	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>Flags</i>	MQCIH_NONE	0
<i>ReturnCode</i>	MQCRC_OK	0
<i>CompCode</i>	MQCC_OK	0
<i>Reason</i>	MQRC_NONE	0
<i>UOWControl</i>	MQCUOWC_ONLY	273
<i>GetWaitInterval</i>	MQCGWI_DEFAULT	-2
<i>LinkType</i>	MQCLT_PROGRAM	1
<i>OutputDataLength</i>	MQCODL_AS_INPUT	-1
<i>FacilityKeepTime</i>	None	0
<i>ADSDescriptor</i>	MQCADSD_NONE	0
<i>ConversationalTask</i>	MQCCT_NO	0
<i>TaskEndStatus</i>	MQCTES_NOSYNC	0
<i>Facility</i>	MQCFAC_NONE	Nulls
<i>Function</i>	MQCFUNC_NONE	Blanks
<i>AbendCode</i>	None	Blanks
<i>Authenticator</i>	None	Blanks
<i>Reserved1</i>	None	Blanks
<i>ReplyToFormat</i>	MQFMT_NONE	Blanks
<i>RemoteSysId</i>	None	Blanks
<i>RemoteTransId</i>	None	Blanks

Table 166. Initial values of fields in MQCIH for MQCIH (continued)

Field name	Name of constant	Value of constant
<i>TransactionId</i>	None	Blanks
<i>FacilityLike</i>	None	Blanks
<i>AttentionId</i>	None	Blanks
<i>StartCode</i>	MQCSC_NONE	Blanks
<i>CancelCode</i>	None	Blanks
<i>NextTransactionId</i>	None	Blanks
<i>Reserved2</i>	None	Blanks
<i>Reserved3</i>	None	Blanks
<i>CursorPosition</i>	None	0
<i>ErrorOffset</i>	None	0
<i>InputItem</i>	None	0
<i>Reserved4</i>	None	0
<b>Notes:</b>		
1. The symbol ~ represents a single blank character.		
2. In the C programming language, the macro variable MQCIH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:		
<pre>MQCIH MyCIH = {MQCIH_DEFAULT};</pre>		

*C declaration:*

```
typedef struct tagMQCIH MQCIH;
struct tagMQCIH {
    MQCHAR4  StrucId;           /* Structure identifier */

**MQCMHO - Create message handle options:**

The following table summarizes the fields in the structure.

*Table 167. Fields in MQCMHO*

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options	Options

*Overview for MQCMHO:*

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS and IBM MQ clients.

**Purpose:** The **MQCMHO** structure allows applications to specify options that control how message handles are created. The structure is an input parameter on the **MQCRTMH** call.

**Character set and encoding:** Data in **MQCMHO** must be in the character set of the application and encoding of the application ( **MQENC\_NATIVE** ).

*Fields for MQCMHO:*

The MQCMHO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG):*

This field is always an input field. Its initial value is MQCMHO\_DEFAULT\_VALIDATION.

One of the following options can be specified:

#### **MQCMHO\_VALIDATE**

When **MQSETMP** is called to set a property in this message handle, the property name is validated to ensure that it:

- contains no invalid characters.
- does not begin JMS or usr.JMS except for the following:
  - JMSCorrelationID
  - JMSReplyTo
  - JMSType
  - JMSXGroupID
  - JMSXGroupSeq

These names are reserved for JMS properties.

- is not one of the following keywords, in any mixture of uppercase or lowercase:
  - AND
  - BETWEEN
  - ESCAPE
  - FALSE
  - IN
  - IS
  - LIKE
  - NOT
  - NULL
  - OR
  - TRUE
- does not begin Body. or Root. (except for Root.MQMD.).

If the property is MQ-defined (mq.\*) and the name is recognized, the property descriptor fields are set to the correct values for the property. If the property is not recognized, the *Support* field of the property descriptor is set to **MQPD\_OPTIONAL**.

#### **MQCMHO\_DEFAULT\_VALIDATION**

This value specifies that the default level of validation of property names occur.

The default level of validation is equivalent to the level specified by **MQCMHO\_VALIDATE**.

This value is the default value.

#### **MQCMHO\_NO\_VALIDATION**

No validation on the property name occurs. See the description of **MQCMHO\_VALIDATE**.

**Default option:** If none of the preceding options described is required, the following option can be used:

#### **MQCMHO\_NONE**

All options assume their default values. Use this value to indicate that no other options have been specified. **MQCMHO\_NONE** aids program documentation; it is not intended that this option is used with any other, but as its value is zero, such use cannot be detected.

*StrucId (MQCHAR4):*

This field is always an input field. Its initial value is **MQCMHO\_STRUC\_ID**.

This is the structure identifier; the value must be:

#### **MQCMHO\_STRUC\_ID**

Identifier for create message handle options structure.

For the C programming language, the constant **MQCMHO\_STRUC\_ID\_ARRAY** is also defined; this has the same value as **MQCMHO\_STRUC\_ID**, but is an array of characters instead of a string.

*Version (MQLONG):*

This field is always an input field. Its initial value is **MQCMHO\_VERSION\_1**.

This is the structure version number; the value must be:

#### **MQCMHO\_VERSION\_1**

Version-1 create message handle options structure.

The following constant specifies the version number of the current version:

#### **MQCMHO\_CURRENT\_VERSION**

Current version of create message handle options structure.

*Initial values and language declarations for MQCMHO:*

*Table 168. Initial values of fields in MQCMHO*

Field name	Name of constant	Value of constant
<i>StrucId</i>	<b>MQCMHO_STRUC_ID</b>	'CMHO'
<i>Version</i>	<b>MQCMHO_VERSION_1</b>	1
<i>Options</i>	<b>MQCMHO_DEFAULT_VALIDATION</b>	0

**Notes:**

1. In the C programming language, the macro variable **MQCMHO\_DEFAULT** contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:  

```
MQCMHO MyCMHO = {MQCMHO_DEFAULT};
```

*C declaration:*

```
struct tagMQCMHO {
    MQCHAR4  StrucId;          /* Structure identifier */
    MQLONG   Version;         /* Structure version number */
    MQLONG   Options;         /* Options that control the action of MQCRTMH */
};
```

*COBOL declaration:*

```
** MQCMHO structure
10 MQCMHO.
** Structure identifier
15 MQCMHO-STRUCID PIC X(4).
** Structure version number
15 MQCMHO-VERSION PIC S9(9) BINARY.
** Options that control the action of MQCRTMH
15 MQCMHO-OPTIONS PIC S9(9) BINARY.
```

*PL/I declaration:*

```
dc1
1 MQCMHO based,
3 StrucId char(4), /* Structure identifier */
3 Version fixed bin(31), /* Structure version number */
3 Options fixed bin(31), /* Options that control the action of MQCRTMH */
```

*High Level Assembler declaration:*

```
MQCMHO DSECT
MQCMHO_STRUCID DS CL4 Structure identifier
MQCMHO_VERSION DS F Structure version number
MQCMHO_OPTIONS DS F Options that control the action of
* MQCRTMH
MQCMHO_LENGTH EQU *-MQCMHO
MQCMHO_AREA DS CL(MQCMHO_LENGTH)
```

**MQCNO - Connect options:**

The following table summarizes the fields in the structure.

*Table 169. Fields in MQCNO*

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options that control the action of MQCONN	Options
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQCNO_VERSION_2.		
<i>ClientConnOffset</i>	Offset of MQCD structure for client connection	ClientConnOffset
<i>ClientConnPtr</i>	Address of MQCD structure for client connection	ClientConnPtr
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQCNO_VERSION_3.		
<i>ConnTag</i>	Queue-manager connection tag	ConnTag
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQCNO_VERSION_4.		
<i>SSLConfigPtr</i>	Address of MQSCO structure for client connection	SSLConfigPtr
<i>SSLConfigOffset</i>	Offset of MQSCO structure for client connection	SSLConfigOffset
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQCNO_VERSION_5.		
<i>ConnectionId</i>	Unique connection ID	ConnectionId
<i>SecurityParmsOffset</i>	Security parameters	SecurityParmsOffset
<i>SecurityParmsPtr</i>	Security parameters	SecurityParmsPtr

**Related information:**

Using MQCONNX

*Overview for MQCNO:*

**Availability:** All versions except MQCNO\_VERSION\_4: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

**Purpose:** The MQCNO structure allows the application to specify options relating to the connection to the local queue manager. The structure is an input/output parameter on the MQCONNX call. For more information about using shared handles, and the MQCONNX call, see Shared (thread independent) connections with MQCONNX .

**Version:** The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQCNO, but with the initial value of the *Version* field set to MQCNO\_VERSION\_1. To use fields that are not present in the version-1 structure, the application must set the *Version* field to the version number of the version required.

**Character set and encoding:** Data in MQCNO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an IBM MQ MQI client, the structure must be in the character set and encoding of the client.

*Fields for MQCNO:*

The MQCNO structure contains the following fields; the fields are described in **alphabetical order**:

*ClientConnOffset (MQLONG):*

ClientConnOffset is the offset in bytes of an MQCD channel definition structure from the start of the MQCNO structure. The offset can be positive or negative. This field is an input field with an initial value of 0.

Use *ClientConnOffset* only when the application issuing the MQCONNX call is running as an IBM MQ MQI client. For information about how to use this field, see the description of the *ClientConnPtr* field.

This field is ignored if *Version* is less than MQCNO\_VERSION\_2.

*ClientConnPtr (MQPTR):*

ClientConnPtr is an input field. Its initial value is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise.

Use *ClientConnOffset* and *ClientConnPtr* only when the application issuing the MQCONNX call is running as an IBM MQ MQI client. By specifying one or other of these fields, the application can control the definition of the client connection channel by providing an MQCD channel definition structure that contains the values required.

If the application is running as an IBM MQ MQI client, but does not provide an MQCD structure, the MQSERVER environment variable is used to select the channel definition. If MQSERVER is not set, the client channel table is used.

If the application is not running as an IBM MQ MQI client, *ClientConnOffset* and *ClientConnPtr* are ignored.

If the application provides an MQCD structure, set the fields listed to the values required; other fields in MQCD are ignored. You can pad character strings with blanks to the length of the field, or terminated them with a null character. See “Fields” on page 3343 for more information about the fields in the MQCD structure.

Field in MQCD	Value
<i>ChannelName</i>	Channel name.
<i>Version</i>	Structure version number. Must not be less than MQCD_VERSION_7.
<i>TransportType</i>	Any supported transport type.
<i>ModeName</i>	LU 6.2 mode name.
<i>TpName</i>	LU 6.2 transaction program name.
<i>SecurityExit</i>	Name of channel security exit.
<i>SendExit</i>	Name of channel send exit.
<i>ReceiveExit</i>	Name of channel receive exit.
<i>MaxMsgLength</i>	Maximum length in bytes of messages that can be sent over the client connection channel.
<i>SecurityUserData</i>	User data for security exit.
<i>SendUserData</i>	User data for send exit.
<i>ReceiveUserData</i>	User data for receive exit.
<i>UserIdentifier</i>	User identifier to be used to establish an LU 6.2 session.
<i>Password</i>	Password to be used to establish an LU 6.2 session.
<i>ConnectionName</i>	Connection name.
<i>HeartbeatInterval</i>	Time in seconds between heartbeat flows.
<i>StrucLength</i>	Length of the MQCD structure.
<i>ExitNameLength</i>	Length of exit names addressed by <i>SendExitPtr</i> and <i>ReceiveExitPtr</i> . Must be greater than zero if <i>SendExitPtr</i> or <i>ReceiveExitPtr</i> is set to a value that is not the null pointer.
<i>ExitDataLength</i>	Length of exit data addressed by <i>SendUserDataPtr</i> and <i>ReceiveUserDataPtr</i> . Must be greater than zero if <i>SendUserDataPtr</i> or <i>ReceiveUserDataPtr</i> is set to a value that is not the null pointer.
<i>SendExitsDefined</i>	Number of send exits addressed by <i>SendExitPtr</i> . If zero, <i>SendExit</i> and <i>SendUserData</i> provide the exit name and data. If greater than zero, <i>SendExitPtr</i> and <i>SendUserDataPtr</i> provide the exit names and data, and <i>SendExit</i> and <i>SendUserData</i> must be blank.
<i>ReceiveExitsDefined</i>	Number of receive exits addressed by <i>ReceiveExitPtr</i> . If zero, <i>ReceiveExit</i> and <i>ReceiveUserData</i> provide the exit name and data. If greater than zero, <i>ReceiveExitPtr</i> and <i>ReceiveUserDataPtr</i> provide the exit names and data, and <i>ReceiveExit</i> and <i>ReceiveUserData</i> must be blank.
<i>SendExitPtr</i>	Address of name of first send exit.
<i>SendUserDataPtr</i>	Address of data for first send exit.
<i>ReceiveExitPtr</i>	Address of name of first receive exit.
<i>ReceiveUserDataPtr</i>	Address of data for first receive exit.
<i>LongRemoteUserIdLength</i>	Length of long remote user identifier.
<i>LongRemoteUserIdPtr</i>	Address of long remote user identifier.
<i>RemoteSecurityId</i>	Remote security identifier.
<i>SSLCipherSpec</i>	SSL CipherSpec.
<i>SSLPeerNamePtr</i>	Address of SSL peer name.
<i>SSLPeerNameLength</i>	Length of SSL peer name.
<i>KeepAliveInterval</i>	Value passed to the communications stack for keepalive timing for the channel
<i>LocalAddress</i>	The local communications address, including the IP address of the local network adapter to use, and a range of ports to use for outgoing connections.

Provide the channel definition structure in one of two ways:

- By using the offset field *ClientConnOffset*

In this case, the application must declare a compound structure containing an MQCNO followed by the channel definition structure MQCD, and set *ClientConnOffset* to the offset of the channel definition structure from the start of the MQCNO. Ensure that this offset is correct. *ClientConnPtr* must be set to the null pointer or null bytes.

Use *ClientConnOffset* for programming languages that do not support the pointer data type, or that implement the pointer data type in a way that is not portable to different environments (for example, the COBOL programming language).

For the Visual Basic programming language, a compound structure called MQCNOCD is provided in the header file CMQXB.BAS; this structure contains an MQCNO structure followed by an MQCD structure. Initialize MQCNOCD by invoking the MQCNOCD\_DEFAULTS subroutine. MQCNOCD is used with the MQCONNXAny variant of the MQCONNX call; see the description of the MQCONNX call for further details.

- By using the pointer field *ClientConnPtr*

In this case, the application can declare the channel definition structure separately from the MQCNO structure, and set *ClientConnPtr* to the address of the channel definition structure. Set *ClientConnOffset* to zero.

Use *ClientConnPtr* for programming languages that support the pointer data type in a way that is portable to different environments (for example, the C programming language).

In the C programming language, you can use the macro variable MQCD\_CLIENT\_CONN\_DEFAULT to provide initial values for the structure that are more suitable for use on the MQCONNX call than the initial values provided by MQCD\_DEFAULT.

Whichever technique you choose, you can use only one of *ClientConnOffset* and *ClientConnPtr*; the call fails with reason code MQRC\_CLIENT\_CONN\_ERROR if both are nonzero.

When the MQCONNX call has completed, the MQCD structure is not referenced again.

This field is ignored if *Version* is less than MQCNO\_VERSION\_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*ConnectionId* (MQBYTE24):

*ConnectionId* is a unique 24-byte identifier that allows IBM MQ to reliably identify an application. An application can use this identifier for correlation in PUT and GET calls. This output parameter has an initial value of 24 null bytes in all programming languages.

The queue manager assigns a unique ID to all connections, however they are established. If an MQCONNX establishes the connection with a version 5 MQCNO, the application can determine the *ConnectionId* from the returned MQCNO. The assigned identifier is guaranteed to be unique among all other identifiers that IBM MQ generates, such as *CorrelId*, *MsgID*, and *GroupId*.

Use the *ConnectionId* to identify long running units of work using the PCF command Inquire Connection or the MQSC command DISPLAY CONN. The *ConnectionId* used by MQSC commands (CONN) is derived from the *ConnectionId* returned here. The PCF Inquire and Stop Connection commands can use the *ConnectionId* returned here without modification.

You can use the *ConnectionId* to force the end of a long running unit of work, by specifying the *ConnectionId* using the PCF command Stop Connection or the MQSC command STOP CONN. See Stop Connection and STOP CONN for more information about using these commands.

This field is not returned if *Version* is less than MQCNO\_VERSION\_5.

The length of this field is given by MQ\_CONNECTION\_ID\_LENGTH.

*ConnTag (MQBYTE128):*

ConnTag is a tag that the queue manager associates with the resources that are affected by the application during this connection. Each application or application instance must use a different value for the tag, so that the queue manager can correctly serialize access to the affected resources. This field is an input field, and its initial value is MQCT\_NONE.

See the descriptions of the MQCNO\_\*\_CONN\_TAG\_\* options for further details about values to be used by different applications. The tag ceases to be valid when the application terminates or issues the MQDISC call.

**Note:** Connection tag values beginning with MQ in upper, lower, or mixed case in either ASCII or EBCDIC are reserved for use by IBM products. Do not use connection tag values beginning with these letters.

Use the following special value if you require no tag:

#### **MQCT\_NONE**

The value is binary zero for the length of the field.

For the C programming language, the constant MQCT\_NONE\_ARRAY is also defined; this constant has the same value as MQCT\_NONE, but is an array of characters instead of a string.

This field is used when connecting to a z/OS queue manager. In other environments, specify the value MQCT\_NONE.

The length of this field is given by MQ\_CONN\_TAG\_LENGTH. This field is ignored if *Version* is less than MQCNO\_VERSION\_3.

*Options (MQLONG):*

Options that control the action of MQCONN.

#### **Accounting options**

The following options control the type of accounting if the *AccountingConnOverride* queue manager attribute is set to MQMON\_ENABLED:

#### **MQCNO\_ACCOUNTING\_MQI\_ENABLED**

When monitoring data collection is switched off in the queue manager definition by setting the *MQIAccounting* attribute to MQMON\_OFF, setting this flag enables MQI accounting data collection.

#### **MQCNO\_ACCOUNTING\_MQI\_DISABLED**

When monitoring data collection is switched off in the queue manager definition by setting the *MQIAccounting* attribute to MQMON\_OFF, setting this flag stops MQI accounting data collection.

#### **MQCNO\_ACCOUNTING\_Q\_ENABLED**

When queue-accounting data collection is switched off in the queue manager definition by setting the *MQIAccounting* attribute to MQMON\_OFF, setting this flag enables accounting data collection for those queues that specify a queue manager in the *MQIAccounting* field of their queue definition.

#### **MQCNO\_ACCOUNTING\_Q\_DISABLED**

When queue-accounting data collection is switched off in the queue manager definition by setting the *MQIAccounting* attribute to MQMON\_OFF, setting this flag switches off accounting data collection for those queues that specify a queue manager in the *MQIAccounting* field of their queue definition.

If none of these flags are defined, the accounting for the connection is as defined in the Queue Manager attributes.

## Binding options

The following options control the type of IBM MQ binding to use. Specify only one of these options:

### MQCNO\_STANDARD\_BINDING

The application and the local queue manager agent (the component that manages queuing operations) run in separate units of execution (typically, in separate processes). This arrangement maintains the integrity of the queue manager; that is, it protects the queue manager from errant programs.

If the queue manager supports multiple binding types, and you set MQCNO\_STANDARD\_BINDING, the queue manager uses the *DefaultBindType* attribute in the *Connection* stanza in the *qm.ini* file to select the actual type of binding. If this stanza is not defined, or the value cannot be used or is not appropriate for the application, the queue manager selects an appropriate binding type. The queue manager sets the actual binding type used in the connect options.

Use MQCNO\_STANDARD\_BINDING in situations where the application might not have been fully tested, or might be unreliable or untrustworthy. MQCNO\_STANDARD\_BINDING is the default.

This option is supported in all environments.

If you are linking to the *mqm* library, then a standard server connection using the default bind type is attempted first. If the underlying server library failed to load, a client connection is attempted instead.

- If the MQ\_CONNECT\_TYPE environment variable is specified, one of the following options can be supplied to change the behavior of MQCONN or MQCONNX if MQCNO\_STANDARD\_BINDING is specified. (The exception to this is if MQCNO\_FASTPATH\_BINDING is specified with MQ\_CONNECT\_TYPE set to LOCAL or STANDARD to allow fastpath connections to be downgraded by the administrator without a related change to the application:

Value	Meaning
CLIENT	A client connection only is attempted.
FASTPATH	This value was supported in previous releases, but is now ignored if specified.
LOCAL	A server connection only is attempted. Fastpath connections are downgraded to a standard server connection.
STANDARD	Supported for compatibility with previous releases. This value is now treated as LOCAL.

- If the MQ\_CONNECTI\_TYPE environment variable is not set when MQCONNX is called, a standard server connection using the default bind type is attempted. If the server library fails to load, a client connection is attempted.

### MQCNO\_FASTPATH\_BINDING

The application and the local queue manager agent are part of the same unit of execution. This is in contrast to the typical method of binding, where the application and the local queue manager agent run in separate units of execution.

MQCNO\_FASTPATH\_BINDING is ignored if the queue manager does not support this type of binding; processing continues as though the option had not been specified.

MQCNO\_FASTPATH\_BINDING can be of advantage in situations where multiple processes consume more resources than the overall resource used by the application. An application that uses the fastpath binding is known as a *trusted application*.

Consider the following important points when deciding whether to use the fastpath binding:

- Using the MQCNO\_FASTPATH\_BINDING option does not prevent an application altering or corrupting messages and other data areas belonging to the queue manager. Use this option only in situations where you have fully evaluated these issues.
- The application must not use asynchronous signals or timer interrupts (such as sigkill) with MQCNO\_FASTPATH\_BINDING. There are also restrictions on the use of shared memory segments.
- The application must use the MQDISC call to disconnect from the queue manager.
- The application must finish before you end the queue manager with the endmqm command.
- On IBM i, the job must run under a user profile that belongs to the QMQMADM group. Also, the program must not stop abnormally, otherwise unpredictable results can occur.
- On UNIX systems, the mqm user identifier must be the effective user identifier, and the mqm group identifier must be the effective group identifier. To make the application run in this way, configure the program so that it is owned by the mqm user identifier and mqm group identifier, and then set the setuid and setgid permission bits on the program.

The IBM MQ Object Authority Manager (OAM) still uses the real user ID for authority checking.

- On Windows, the program must be a member of the mqm group. Fastpath binding is not supported for 64 bit applications.

The MQCNO\_FASTPATH\_BINDING option is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, and Windows.

▶ **z/OS** On z/OS, the option is accepted but ignored.

For more information about the implications of using trusted applications, see Restrictions for trusted applications.

## MQCNO\_SHARED\_BINDING

With MQCNO\_SHARED\_BINDING, the application and the local-queue-manager agent share some resources. MQCNO\_SHARED\_BINDING is ignored if the queue manager does not support this type of binding. Processing continues as though the option had not been specified.

## MQCNO\_ISOLATED\_BINDING

In this case, the application process and the local queue manager agent are isolated from each other in that they do not share resources. MQCNO\_ISOLATED\_BINDING is ignored if the queue manager does not support this type of binding. Processing continues as though the option had not been specified.

## MQCNO\_CLIENT\_BINDING

Specify this option to make the application attempt a client connection only. This option has the following limitations:

- ▶ **z/OS** MQCNO\_CLIENT\_BINDING is ignored on z/OS.
- MQCNO\_CLIENT\_BINDING is rejected with MQRC\_OPTIONS\_ERROR if it is specified with any MQCNO binding option other than MQCNO\_STANDARD\_BINDING.
- MQCNO\_CLIENT\_BINDING is not available for Java or .NET as they have their own mechanisms for choosing the bind type.

## MQCNO\_LOCAL\_BINDING

Specify this option to make the application attempt a server connection. If either MQCNO\_FASTPATH\_BINDING, MQCNO\_ISOLATED\_BINDING, or MQCNO\_SHARED\_BINDING is also specified, then the connection is of that type instead, and is documented in this section. Otherwise a standard server connection is attempted using the default bind type. MQCNO\_LOCAL\_BINDING has the following limitations:

-  MQCNO\_LOCAL\_BINDING is ignored on z/OS.
- MQCNO\_LOCAL\_BINDING is rejected with MQRC\_OPTIONS\_ERROR if it is specified with any MQCNO reconnect option other than MQCNO\_RECONNECT\_AS\_DEF.
- MQCNO\_LOCAL\_BINDING is not available for Java or .NET as they have their own mechanisms for choosing the bind type.

On AIX, HP-UX, Solaris, Linux, and Windows, you can use the environment variable MQ\_CONNECT\_TYPE with the bind type specified by the *Options* field, to control the type of binding used. If you specify this environment variable, it must have the value FASTPATH or STANDARD ; if it has a different value, it is ignored. The value of the environment variable is case sensitive; see MQCONN environment variable for more information.

The environment variable and *Options* field interact as follows:

- If you omit the environment variable, or give it a value that is not supported, use of the fastpath binding is determined solely by the *Options* field.
- If you give the environment variable a supported value, the fastpath binding is used only if *both* the environment variable and *Options* field specify the fastpath binding.

#### z/OS

### Connection-tag options

These options are supported only when connecting to a z/OS queue manager and they control the use of the connection tag *ConnTag*. You can specify only one of these options:

#### MQCNO\_SERIALIZE\_CONN\_TAG\_Q\_MGR

This option requests exclusive use of the connection tag within the local queue manager. If the connection tag is already in use in the local queue manager, the MQCONN call fails with reason code MQRC\_CONN\_TAG\_IN\_USE. The outcome of the call is not affected by using the connection tag elsewhere in the queue-sharing group to which the local queue manager belongs.

#### MQCNO\_SERIALIZE\_CONN\_TAG\_QSG

This option requests exclusive use of the connection tag within the queue-sharing group to which the local queue manager belongs. If the connection tag is already in use in the queue-sharing group, the MQCONN call fails with reason code MQRC\_CONN\_TAG\_IN\_USE.

#### MQCNO\_RESTRICT\_CONN\_TAG\_Q\_MGR

This option requests shared use of the connection tag within the local queue manager. If the connection tag is already in use in the local queue manager, the MQCONN call can succeed if the requesting application is running in the same processing scope as the existing user of the tag. If this condition is not satisfied, the MQCONN call fails with reason code MQRC\_CONN\_TAG\_IN\_USE. The outcome of the call is not affected by use of the connection tag elsewhere in the queue-sharing group to which the local queue manager belongs.

- Applications must run within the same MVS address space to share the connection tag. If the application using the connection tag is a client application, MQCNO\_RESTRICT\_CONN\_TAG\_Q\_MGR is not allowed.

#### MQCNO\_RESTRICT\_CONN\_TAG\_QSG

This option requests shared use of the connection tag within the queue-sharing group to which the local queue manager belongs. If the connection tag is already in use in the queue-sharing group, the MQCONN call can succeed provided the requesting application is running in the same processing scope and is connected to the same queue manager, as the existing user of the tag.

If these conditions are not satisfied, the MQCONN call fails with reason code MQRC\_CONN\_TAG\_IN\_USE.

- Applications must run within the same MVS address space to share the connection tag. If the application using the connection tag is a client application, MQCNO\_RESTRICT\_CONN\_TAG\_QSG is not allowed.

If none of these options are specified, *ConnTag* is not used. These options are not valid if *Version* is less than MQCNO\_VERSION\_3.

### Handle-sharing options

These options are supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, and Windows. They control the sharing of handles between different threads (units of parallel processing) within the same process. You can specify only one of these options:

#### MQCNO\_HANDLE\_SHARE\_NONE

This option indicates that connection and object handles can be used only by the thread that caused the handle to be allocated (that is, the thread that issued the MQCONN, MQCONNX, or MQOPEN call). The handles cannot be used by other threads belonging to the same process.

#### MQCNO\_HANDLE\_SHARE\_BLOCK

This option indicates that connection and object handles allocated by one thread of a process can be used by other threads belonging to the same process. However, only one thread at a time can use any particular handle; that is, only serial use of a handle is permitted. If a thread tries to use a handle that is already in use by another thread, the call blocks (waits) until the handle becomes available.

#### MQCNO\_HANDLE\_SHARE\_NO\_BLOCK

This is the same as MQCNO\_HANDLE\_SHARE\_BLOCK, except that if the handle is in use by another thread, the call completes immediately with MQCC\_FAILED and MQRC\_CALL\_IN\_PROGRESS instead of blocking until the handle becomes available.

A thread can have zero or one non-shared handles:

- Each MQCONN or MQCONNX call that specifies MQCNO\_HANDLE\_SHARE\_NONE returns a new nonshared handle on the first call, and the same non-shared handle on the second and later calls (assuming no intervening MQDISC call). The reason code is MQRC\_ALREADY\_CONNECTED for the second and later calls.
- Each MQCONNX call that specifies MQCNO\_HANDLE\_SHARE\_BLOCK or MQCNO\_HANDLE\_SHARE\_NO\_BLOCK returns a new shared handle on each call.

Object handles inherit the same sharing properties as the connection handle specified on the MQOPEN call that created the object handle. Also, units of work inherit the same sharing properties as the connection handle used to start the unit of work; if the unit of work is started in one thread using a shared handle, the unit of work can be updated in another thread using the same handle.

If you do not specify a handle-sharing option, the default is determined by the environment:

- In the Microsoft Transaction Server (MTS) environment, the default is the same as MQCNO\_HANDLE\_SHARE\_BLOCK.
- In other environments, the default is the same as MQCNO\_HANDLE\_SHARE\_NONE.

### Reconnection options

Reconnection options determine if a connection is reconnectable. Only client connections are reconnectable.

#### MQCNO\_RECONNECT\_AS\_DEF

The reconnection option is resolved to its default value. If no default is set, the value of this option resolves to `DISABLED`. The value of the option is passed to the server, and can be queried by PCF and MQSC.

### **MQCNO\_RECONNECT**

The application can be reconnected to any queue manager consistent with the value of the `QmgrName` parameter of `MQCONN`. Use the `MQCNO_RECONNECT` option only if there is no affinity between the client application and the queue manager with which it initially established a connection. The value of the option is passed to the server, and can be queried by PCF and MQSC.

### **MQCNO\_RECONNECT\_DISABLED**

The application cannot be reconnected. The value of the option is not passed to the server.

### **MQCNO\_RECONNECT\_Q\_MGR**

The application can be reconnected only to the queue manager with which it originally connected. Use this value if a client can be reconnected, but there is an affinity between the client application and the queue manager with which it originally established a connection. Choose this value if you want a client to automatically reconnect to the standby instance of a highly available queue manager. The value of the option is passed to the server, and can be queried by PCF and MQSC.

Use the options `MQCNO_RECONNECT`, `MQCNO_RECONNECT_DISABLED` and `MQCNO_RECONNECT_Q_MGR` only for client connections. If the options are used for a binding connection, `MQCONN` fails with completion code `MQCC_FAILED` and reason code `MQRC_OPTIONS_ERROR`. Automatic client reconnect is not supported by IBM MQ classes for Java

### **Conversation-sharing options**

The following options apply only to TCP/IP client connections. For SNA, SPX and NetBios channels, these values are ignored and the channel runs as in previous versions of the product

### **MQCNO\_NO\_CONV\_SHARING**

This option does not permit conversation sharing.

You might use `MQCNO_NO_CONV_SHARING` in situations where conversations are heavily loaded and, therefore, where contention is a possibility on the server-connection end of the channel instance on which the sharing conversations exist. `MQCNO_NO_CONV_SHARING` behaves like `sharecnv(1)` when connected to a channel that supports conversation sharing, and `sharecnv(0)` when connected to a channel that does not support conversation sharing.

### **MQCNO\_ALL\_CONVS\_SHARE**

This option permits conversation sharing; the application does not place any limit on the number of connections on the channel instance. This option is the default value.

If the application indicates that the channel instance can share, but the *SharingConversations* (`SHARECNV`) definition on the server-connection end of the channel is set to one, no sharing occurs and no warning is given to the application.

Similarly, if the application indicates that sharing is permitted but the server-connection *SharingConversations* definition is set to zero, no warning is given, and the application exhibits the same behavior as a client in versions of the product earlier than Version 7.0; the application setting relating to sharing conversations is ignored.

`MQCNO_NO_CONV_SHARING` and `MQCNO_ALL_CONVS_SHARE` are mutually exclusive. If both options are specified on a particular connection, the connection is rejected with a reason code of `MQRC_OPTIONS_ERROR`.

## Channel definition options

The following options control the use of the channel definition structure passed in the MQCNO:

### MQCNO\_CD\_FOR\_OUTPUT\_ONLY

This option permits channel definition structure in the MQCNO to be used only to return the channel name used on a successful MQCONNX call.

If a valid channel definition structure is not provided, the call fails with the reason code MQRC\_CD\_ERROR.

If the application is not running as a client, the option is ignored.

The returned channel name can be used on a subsequent MQCONNX call using the MQCNO\_USE\_CD\_SELECTION option to reconnect using the same channel definition. This can be useful when there are multiple applicable channel definitions in the client channel table.

### MQCNO\_USE\_CD\_SELECTION

This option permits MQCONNX call to connect using the channel name contained in the channel definition structure passed in the MQCNO.

If the MQSERVER environment variable is set, the channel definition defined by it is used. If MQSERVER is not set, the client channel table is used.

If a channel definition with matching channel name and queue manager name is not found, the call fails with reason code MQRC\_Q\_MGR\_NAME\_ERROR.

If a valid channel definition structure is not provided, the call fails with the reason code MQRC\_CD\_ERROR.

If the application is not running as a client, the option is ignored.

## Default option

If you require none of the options described above, you can use the following option:

### MQCNO\_NONE

No options are specified.

Use MQCNO\_NONE to aid program documentation. It is not intended that this option is used with any other MQCNO\_\* option, but because its value is zero, such use cannot be detected.

### *SecurityParmsOffset (MQLONG):*

SecurityParmsOffset is the offset in bytes of the MQCSP structure from the start of the MQCNO structure. The offset can be positive or negative. This field is an input field, with an initial value of 0.

This field is ignored if *Version* is less than MQCNO\_VERSION\_5.

The MQCSP structure is defined in "MQCSP - Security parameters" on page 2091.

*SecurityParmsPtr (PMQCSP):*

SecurityParmsPtr is the address of the MQCSP structure, used to specify a user ID and password for authentication by the authorization service. This field is an input field, and its initial value is a null pointer or null bytes.

This field is ignored if *Version* is less than MQCNO\_VERSION\_5.

The MQCSP structure is defined in “MQCSP - Security parameters” on page 2091.

*SSLConfigOffset (MQLONG):*

SSLConfigOffset is the offset in bytes of an MQSCO structure from the start of the MQCNO structure. The offset can be positive or negative. This field is an input field, with an initial value of 0.

Use *SSLConfigOffset* only when the application issuing the MQCONN call is running as an IBM MQ MQI client. For information about how to use this field, see the description of the *SSLConfigPtr* field.

This field is ignored if *Version* is less than MQCNO\_VERSION\_4.

*SSLConfigPtr (PMQSCO):*

SSLConfigPtr is an input field. Its initial value is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise.

Use *SSLConfigPtr* and *SSLConfigOffset* only when the application issuing the MQCONN call is running as an IBM MQ MQI client and the channel protocol is TCP/IP. If the application is not running as an IBM MQ client, or the channel protocol is not TCP/IP, *SSLConfigPtr* and *SSLConfigOffset* are ignored.

By specifying *SSLConfigPtr* or *SSLConfigOffset*, plus either *ClientConnPtr* or *ClientConnOffset*, the application can control the use of SSL for the client connection. When the SSL information is specified in this way, the environment variables MQSSLKEYR and MQSSLCRYP are ignored; any SSL-related information in the client channel definition table (CCDT) is also ignored.

The SSL information can be specified only on:

- The first MQCONN call of the client process, or
- A subsequent MQCONN call when all previous SSL/TLS connections to the queue manager have been concluded using MQDISC.

These are the only states in which the process-wide SSL environment can be initialized. If an MQCONN call is issued specifying SSL information when the SSL environment already exists, the SSL information on the call is ignored and the connection is made using the existing SSL environment; the call returns completion code MQCC\_WARNING and reason code MQRC\_SSL\_ALREADY\_INITIALIZED in this case.

You can provide the MQSCO structure in the same way as the MQCD structure, either by specifying an address in *SSLConfigPtr*, or by specifying an offset in *SSLConfigOffset*; see the description of *ClientConnPtr* for details of how to do this. However, you can use no more than one of *SSLConfigPtr* and *SSLConfigOffset*; the call fails with reason code MQRC\_SSL\_CONFIG\_ERROR. if both are nonzero.

Once the MQCONN call has completed, the MQSCO structure is not referenced again.

This field is ignored if *Version* is less than MQCNO\_VERSION\_4.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length.

*StrucId* (MQCHAR4):

StrucId is always an input field. Its initial value is MQCNO\_STRUC\_ID.

The value must be:

**MQCNO\_STRUC\_ID**

Identifier for connect-options structure.

For the C programming language, the constant MQCNO\_STRUC\_ID\_ARRAY is also defined; this constant has the same value as MQCNO\_STRUC\_ID, but is an array of characters instead of a string.

*Version* (MQLONG):

Version is always an input field. Its initial value is MQCNO\_VERSION\_1.

The value must be one of the following:

**MQCNO\_VERSION\_1**

Version-1 connect-options structure.

**MQCNO\_VERSION\_2**

Version-2 connect-options structure.

**MQCNO\_VERSION\_3**

Version-3 connect-options structure.

**MQCNO\_VERSION\_4**

Version-4 connect-options structure.

**MQCNO\_VERSION\_5**

Version-5 connect-options structure.

This version of the MQCNO structure extends MQCNO\_VERSION\_3 on z/OS, and MQCNO\_VERSION\_4 on all other platforms.

Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQCNO\_CURRENT\_VERSION**

Current version of connect-options structure.

*Initial values and language declarations for MQCNO:*

Table 170. Initial values of fields in MQCNO for MQCNO

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQCNO_STRUC_ID	'CNO~'
<i>Version</i>	MQCNO_VERSION_1	1
<i>Options</i>	MQCNO_NONE	0
<i>ClientConnOffset</i>	None	0
<i>ClientConnPtr</i>	None	Null pointer or null bytes
<i>ConnTag</i>	MQCT_NONE	Nulls
<i>SSLConfigPtr</i>	None	Null pointer or null bytes
<i>SSLConfigOffset</i>	None	0
<i>ConnectionId</i>	None	Null pointer or null bytes
<i>SecurityParmsOffset</i>	None	Null pointer or null bytes

Table 170. Initial values of fields in MQCNO for MQCNO (continued)

Field name	Name of constant	Value of constant
<i>SecurityParmsPtr</i>	None	Null pointer or null bytes
<b>Notes:</b>		
1. The symbol ~ represents a single blank character. 2. In the C programming language, the macro variable MQCNO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure: MQCNO MyCNO = {MQCNO_DEFAULT};		

*C declaration:*

```
typedef struct tagMQCNO MQCNO;
struct tagMQCNO {
    MQCHAR4   StrucId;           /* Structure identifier */
    MQLONG    Version;          /* Structure version number */
    MQLONG    Options;          /* Options that control the action of
                               MQCONNX */
    MQLONG    ClientConnOffset; /* Offset of MQCD structure for client
                               connection */
    MQPTR     ClientConnPtr;    /* Address of MQCD structure for client
                               connection */
    MQBYTE128 ConnTag;          /* Queue-manager connection tag */
    PMQSCO    SSLConfigPtr;     /* Address of MQSCO structure for client
                               connection */
    MQLONG    SSLConfigOffset;  /* Offset of MQSCO structure for client
                               connection */
    MQBYTE24  ConnectionId;     /* Unique connection identifier */
    MQLONG    SecurityParmsOffset /* Security fields */
    PMQCSP    SecurityParmsPtr /* Security parameters */
};
```

*COBOL declaration:*

```

```

## MQCSP - Security parameters:

The following table summarizes the fields in the structure.

**Warning:** In some cases, the password in an MQCSP structure for a client application will be sent across a network in plain text. To ensure that client application passwords are protected appropriately, see IBM MQCSP password protection.

Table 171. Fields in MQCSP

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>AuthenticationType</i>	Type of authentication	AuthenticationType
<i>Reserved1</i>	Required for pointer alignment on IBM i	Reserved1
<i>CSPUserIdPtr</i>	Address of user ID	CSPUserIdPtr
<i>CSPUserIdOffset</i>	Offset of user ID	CSPUserIdOffset
<i>CSPUserIdLength</i>	Length of user ID	CSPUserIdLength
<i>Reserved2</i>	Required for pointer alignment on IBM i	Reserved2
<i>CSPPasswordPtr</i>	Address of password	CSPPasswordPtr
<i>CSPPasswordOffset</i>	Offset of password	CSPPasswordOffset
<i>CSPPasswordLength</i>	Length of password	CSPPasswordLength

Overview for MQCSP:

**Availability:** All IBM MQ products.

**Purpose:** The MQCSP structure enables the authorization service to authenticate a user ID and password. You specify the MQCSP connection security parameters structure on an MQCONN call.

**Warning:** In some cases, the password in an MQCSP structure for a client application will be sent across a network in plain text. To ensure that client application passwords are protected appropriately, see IBM MQCSP password protection.

**Character set and encoding:** Data in MQCSP must be in the character set and encoding of the local queue manager; these are given by the *CodedCharSetId* queue-manager attribute and MQENC\_NATIVE, respectively.

*Fields for MQCSP:*

The MQCSP structure contains the following fields; the fields are described in **alphabetical order**:

*AuthenticationType (MQLONG):*

AuthenticationType is an input field. Its initial value is MQCSP\_AUTH\_NONE.

This is the type of authentication to perform. Valid values are:

**MQCSP\_AUTH\_NONE**

Do not use user ID and password fields.

**MQCSP\_AUTH\_USER\_ID\_AND\_PWD**

Authenticate user ID and password fields.

The default value is MQCSP\_AUTH\_NONE. With the default setting, no password protection is done.

If you require authentication, you have to set **MQCSP.AuthenticationType** to MQCSP\_AUTH\_USER\_ID\_AND\_PWD.

See MQCSP password protection for more information.

*CSPPasswordLength (MQLONG):*

This field is the length of the password to be used in authentication.

The maximum length of the password is MQ\_CSP\_PASSWORD\_LENGTH. If the length of the password is greater than the maximum length permitted, the authentication request fails with MQRC\_NOT\_AUTHORIZED.

The value of MQ\_CSP\_PASSWORD\_LENGTH is 256.

This field is an input field. The initial value of this field is 0.

*CSPPasswordOffset (MQLONG):*

This is the offset in bytes of the password to be used in authentication. The offset can be positive or negative.

This is an input field. The initial value of this field is 0.

*CSPPasswordPtr (MQPTR):*

This is the address in bytes of the password to be used in authentication.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQCNO\_VERSION\_5.

This field can contain an empty password which is rejected by the operating system or LDAP password checking, depending on setup, but is not rejected by IBM MQ before passing it the authentication method.

*CSPUserIdLength (MQLONG):*

This field is the length of the user ID to be used in authentication.

The maximum length of the user ID is dependent on the platform, see User IDs. If the length of the user ID is greater than the maximum length permitted, the authentication request fails with MQRC\_NOT\_AUTHORIZED.

This field is an input field. The initial value of this field is 0.

*CSPUserIdOffset (MQLONG):*

This is the offset in bytes of the user ID to be used in authentication. The offset can be positive or negative.

This is an input field. The initial value of this field is 0.

*CSPUserIdPtr (MQPTR):*

This is the address in bytes of the user ID to be used in authentication.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQCNO\_VERSION\_5.

This field can contain an operating system user ID when an **AUTHTYPE** of *IDPWOS* is named in the CONNAUTH field of the queue manager.

On Windows this can be a fully qualified domain user ID.

This field can contain an LDAP User ID when an **AUTHTYPE** of *IDPWLDAP* is named in the CONNAUTH field of the queue manager.

*Reserved1 (MQBYTE4):*

A reserved field, required for pointer alignment on IBM i.

This is an input field. The initial value of this field is all null.

*Reserved2 (MQBYTE8):*

A reserved field, required for pointer alignment on IBM i.

This is an input field. The initial value of this field is all null.

*StrucId* (MQCHAR4):

Structure identifier.

The value must be:

**MQCSP\_STRUC\_ID**

Identifier for the security parameters structure.

For the C programming language, the constant MQCSP\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQCSP\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQCSPSTRUC\_ID.

*Version* (MQLONG):

Structure version number.

The value must be:

**MQCSP\_VERSION\_1**

Version-1 security parameters structure.

The following constant specifies the version number of the current version:

**MQCSP\_CURRENT\_VERSION**

Current version of security parameters structure.

This is always an input field. The initial value of this field is MQCSP\_VERSION\_1.

*Initial values and language declarations for MQCSP:*

Table 172. Initial values of fields in MQCSP for MQCSP

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQCSP_STRUC_ID	'CSP¬'
<i>Version</i>	MQCSP_CURRENT_VERSION	1
<i>AuthenticationType</i>	None	MQCSP_AUTH_NONE
<i>Reserved1</i>	None	Null string or blanks
<i>CSPUserIdPtr</i>	None	Null pointer or null bytes
<i>CSPUserIdOffset</i>	None	0
<i>CSPUserIdLength</i>	None	0
<i>Reserved2</i>	None	Null string or blanks
<i>CSPPasswordPtr</i>	None	Null pointer or null bytes
<i>CSPPasswordOffset</i>	None	0
<i>CSPPasswordLength</i>	None	0

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQCSP\_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:  
MQCSP MyCSP = {MQCSP\_DEFAULT};

*C declaration:*

```
typedef struct tagMQCSP MQCSP;
struct tagMQCSP {
    MQCHAR4   StrucId;           /* Structure identifier */
    MQLONG    Version;          /* Structure version number */
    MQLONG    AuthenticationType; /* Type of authentication */
    MQBYTE4   Reserved1;       /* Required for IBM i pointer
                                alignment */

    MQPTR     CSPUserIdPtr;     /* Address of user ID */
    MQLONG    CSPUserIdOffset; /* Offset of user ID */
    MQLONG    CSPUserIdLength; /* Length of user ID */
    MQBYTE8   Reserved2;       /* Required for IBM i pointer
                                alignment */

    MQPTR     CSPPasswordPtr;   /* Address of password */
    MQLONG    CSPPasswordOffset; /* Offset of password */
    MQLONG    CSPPasswordLength; /* Length of password */
};
```

*COBOL declaration:*

```
** MQCSP structure
10 MQCSP.
** Structure identifier
15 MQCSP-STRUCID PIC X(4).
** Structure version number
15 MQCSP-VERSION PIC S9(9) BINARY.
** Type of authentication
15 MQCSP-AUTHENTICATIONTYPE PIC S9(9) BINARY.
** Required for IBM i pointer alignment
15 MQCSP-RESERVED1 PIC X(4).
** Address of user ID
15 MQCSP-CSPUSERIDPTR POINTER.
** Offset of user ID
15 MQCSP-CSPUSERIDOFFSET PIC S9(9) BINARY.
** Length of user ID
15 MQCSP-CSPUSERIDLENGTH PIC S9(9) BINARY.
** Required for IBM i pointer alignment
15 MQCSP-RESERVED2 PIC X(4).
** Address of password
15 MQCSP-CSPPASSWORDPTR POINTER.
** Offset of password
15 MQCSP-CSPPASSWORDOFFSET PIC S9(9) BINARY.
** Length of password
15 MQCSP-CSPPASSWORDLENGTH PIC S9(9) BINARY.
```

*PL/I declaration:*

```
dc1
1 MQCSP based,
3 StrucId char(4), /* Structure identifier */
3 Version fixed bin(31), /* Structure version number */
3 AuthenticationType fixed bin(31), /* Type of authentication */
3 Reserved1 char(4), /* Required for IBM i pointer
                    alignment */
3 CSPUserIdPtr pointer, /* Address of user ID */
3 CSPUserIdOffset fixed bin(31), /* Offset of user ID */
3 CSPUserIdLength fixed bin(31), /* Length of user ID */
3 Reserved2 char(8), /* Required for IBM i pointer
                    alignment */
3 CSPPasswordPtr pointer, /* Address of password */
3 CSPPasswordOffset fixed bin(31), /* Offset of user ID */
3 CSPPasswordLength fixed bin(31); /* Length of user ID */
```

*Visual Basic declaration:*

```
Type MQCSP

  Version           As Long      'Structure version number'
  AuthenticationType As Long      'Type of authentication'
  Reserved1         As MQBYTE4   'Required for IBM i pointer'
                          'alignment'
  CSPUserIdPtr     As MQPTR      'Address of user ID'
  CSPUserIdOffset  As Long      'Offset of user ID'
  CSPUserIdLength  As Long      'Length of user ID'
  Reserved2         As MQBYTE8   'Required for IBM i pointer'
                          'alignment'
  CSPPasswordPtr   As MQPTR      'Address of password'
  CSPPasswordOffset As Long      'Offset of password'
  CSPPasswordLength As Long      'Length of password'
End Type
```

**MQCTLO - Control callback options structure:**

The following table summarizes the fields in the structure. Structure specifying the control callback function.

*Table 173. Fields in MQCTLO*

Field	Description	Topic
<i>StrucID</i>	Structure identifier	StrucID
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options	Options
<i>Reserved</i>	Reserved field	Options
<i>ConnectionArea</i>	Field for callback function to use	ConnectionArea

*Overview for MQCTLO:*

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS, and IBM MQ MQI clients connected to these systems. Overview of the MQCTLO structure.

**Purpose:** The MQCTLO structure is used to specify options relating to a control callbacks function.

The structure is an input and output parameter on the MQCTL call.

**Version:** The current version of MQCTLO is MQCTLO\_VERSION\_1.

**Character set and encoding:** Data in MQCTLO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

*Fields for MQCTLO:*

Alphabetic list of fields for the MQCTLO structure.

The MQCTLO structure contains the following fields; the fields are described in alphabetical order:

*ConnectionArea (MQPTR):*

Control options structure - ConnectionArea field

This is a field that is available for the callback function to use.

The queue manager makes no decisions based on the contents of this field and it is passed unchanged to the ConnectionArea field in the MQCBC structure, which is an input parameter to the callback.

This field is ignored for all operations other than MQOP\_START and MQOP\_START\_WAIT.

This is an input and output field to the callback function. The initial value of this field is a null pointer or null bytes.

*Options (MQLONG):*

Control options structure - Options field

Options that control the action of MQCTL.

#### **MQCTLO\_FAIL\_IF QUIESCING**

Force the MQCTL call to fail if the queue manager or connection is in the quiescing state.

Specify MQGMO\_FAIL\_IF QUIESCING, in the MQGMO options passed on the MQCB call, to cause notification to message consumers when they are quiescing.

#### **MQCTLO\_THREAD\_AFFINITY**

This option informs the system that the application requires that all message consumers, for the same connection, are called on the same thread. This thread will be used for all invocations of the consumers until the connection is stopped.

**Default option:** If you do not need any of the options described, use the following option:

#### **MQCTLO\_NONE**

Use this value to indicate that no other options have been specified; all options assume their default values. MQCTLO\_NONE is defined to aid program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

This is an input field. The initial value of the *Options* field is MQCTLO\_NONE.

*Reserved (MQLONG):*

This is a reserved field. The value must be zero.

*StrucId (MQCHAR4):*

Control options structure - StrucId field

This is the structure identifier; the value must be:

**MQCTLO\_STRUC\_ID**

Identifier for Control Options structure.

For the C programming language, the constant MQCTLO\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQCTLO\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQCTLO\_STRUC\_ID.

*Version (MQLONG):*

Control options structure - Version field

This is the structure version number; the value must be:

**MQCTLO\_VERSION\_1**

Version-1 Control options structure.

The following constant specifies the version number of the current version:

**MQCTLO\_CURRENT\_VERSION**

Current version of Control options structure.

This is always an input field. The initial value of this field is MQCTLO\_VERSION\_1.

*Initial values and language declarations for MQCTLO:*

Control options structure - Initial values

*Table 174. Initial values of fields in MQCTLO*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQCTLO_STRUC_ID	'CTL0'
<i>Version</i>	MQCTLO_VERSION_1	1
<i>Options</i>	MQCTLO_NONE	Nulls
<i>Reserved</i>	Reserved field	
<i>ConnectionArea</i>	None	Null pointer or null bytes
<b>Notes:</b>		
1. In the C programming language, the macro variable MQCTLO_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure: MQCTLO MyCTLO = {MQCTLO_DEFAULT};		

*C declaration:*

Control Options structure - C language declaration

```
typedef struct tagMQCTLO MQCTLO;
struct tagMQCTLO {
    MQCHAR4  StrucId;      /* Structure identifier */
    MQLONG   Version;     /* Structure version number */
    MQLONG   Options;     /* Options that control the action of MQCTL */
    MQLONG   Reserved;    /* Reserved field */

    MQPTR    ConnectionArea; /* Connection work area passed to the function */
};
```

*COBOL declaration:*

```
** MQCTLO structure
10 MQCTLO.
** Structure Identifier
15 MQCTLO-STRUCID                PIC X(4).
** Structure Version
15 MQCTLO-VERSION                PIC S9(9) BINARY.
** Options
15 MQCTLO-OPTIONS                PIC S9(9) BINARY.
** Reserved
15 MQCTLO-RESERVED                PIC S9(9) BINARY.
** ConnectionArea
15 MQCTLO-CONNECTIONAREA        POINTER

### MQDH - Distribution header:

The following table summarizes the fields in the structure.

*Table 175. Fields in MQDH*

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>StrucLength</i>	Length of MQDH structure plus following records	StrucLength
<i>Encoding</i>	Numeric encoding of data that follows array of MQPMR records	Encoding
<i>CodedCharSetId</i>	Character set identifier of data that follows array of MQPMR records	CodedCharSetId
<i>Format</i>	Format name of data that follows array of MQPMR records	Format
<i>Flags</i>	General flags	Flags
<i>PutMsgRecFields</i>	Flags indicating which MQPMR fields are present	PutMsgRecFields
<i>RecsPresent</i>	Number of object records present	RecsPresent
<i>ObjectRecOffset</i>	Offset of first object record from start of MQDH	ObjectRecOffset

Table 175. Fields in MQDH (continued)

Field	Description	Topic
<i>PutMsgRecOffset</i>	Offset of first put-message record from start of MQDH	PutMsgRecOffset

Overview for MQDH:

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

**Purpose:** The MQDH structure describes the additional data that is present in a message when that message is a distribution-list message stored on a transmission queue. A distribution-list message is a message that is sent to multiple destination queues. The additional data consists of the MQDH structure followed by an array of MQOR records and an array of MQPMR records.

This structure is used by specialized applications that put messages directly on transmission queues, or that remove messages from transmission queues (for example: message channel agents).

Applications that want to put messages to distribution lists must not use this structure. Instead, they must use the MQOD structure to define the destinations in the distribution list, and the MQPMO structure to specify message properties or receive information about the messages sent to the individual destinations.

**Format name:** MQFMT\_DIST\_HEADER.

**Character set and encoding:** Data in MQDH must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE.

Set the character set and encoding of the MQDH into the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQDH structure is at the start of the message data), or
- The header structure that precedes the MQDH structure (all other cases).

**Usage:** When an application puts a message to a distribution list, and some or all of the destinations are remote, the queue manager prefixes the application message data with the MQXQH and MQDH structures, and places the message on the relevant transmission queue. The data therefore occurs in the following sequence when the message is on a transmission queue:

- MQXQH structure
- MQDH structure plus arrays of MQOR and MQPMR records
- Application message data

Depending on the destinations, the queue manager can generate more than one such message, and place it on different transmission queues. In this case, the MQDH structures in those messages identify different subsets of the destinations defined by the distribution list opened by the application.

An application that puts a distribution-list message directly on a transmission queue must conform to the sequence described earlier, and must ensure that the MQDH structure is correct. If the MQDH structure is not valid, the queue manager can fail the MQPUT or MQPUT1 call with reason code MQRC\_DH\_ERROR.

You can store messages on a queue in distribution-list form only if you have defined the queue as being able to support distribution list messages (see the *DistLists* queue attribute described in “Attributes for queues” on page 2625 ). If an application puts a distribution-list message directly on a queue that does not support distribution lists, the queue manager splits the distribution list message into individual

messages, and places those on the queue instead.

*Fields for MQDH:*

The MQDH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG):*

This is the character set identifier of the data that follows the arrays of MQOR and MQPMR records; it does not apply to character data in the MQDH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. You can use the following special value:

#### **MQCCSI\_INHERIT**

Inherit character-set identifier of this structure.

Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the MQGET call does not return the value MQCCSI\_INHERIT.

You cannot use MQCCSI\_INHERIT if the value of the *PutApplType* field in MQMD is MQAT\_BROKER.

This value is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

The initial value of this field is MQCCSI\_UNDEFINED.

*Encoding (MQLONG):*

This is the numeric encoding of the data that follows the arrays of MQOR and MQPMR records; it does not apply to numeric data in the MQDH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is 0.

*Flags (MQLONG):*

You can specify the following flag:

#### **MQDHF\_NEW\_MSG\_IDS**

Generate a new message identifier for each destination in the distribution list. Set this only when there are no put-message records present, or when the records are present but they do not contain the *MsgId* field.

Using this flag defers generation of the message identifiers until the moment when the distribution-list message is finally split into individual messages. This minimizes the amount of control information that must flow with the distribution-list message.

When an application puts a message to a distribution list, the queue manager sets MQDHF\_NEW\_MSG\_IDS in the MQDH that it generates when both of the following are true:

- There are no put-message records provided by the application, or the records provided do not contain the *MsgId* field.
- The *MsgId* field in MQMD is MQMI\_NONE, or the *Options* field in MQPMO includes MQPMO\_NEW\_MSG\_ID

If no flags are needed, specify the following:

**MQDHF\_NONE**

No flags have been specified. MQDHF\_NONE is defined to aid program documentation. It is not intended that this constant be used with any other, but as its value is zero, such use cannot be detected.

The initial value of this field is MQDHF\_NONE.

*Format (MQCHAR8):*

This is the format name of the data that follows the arrays of MQOD and MQPMR records (whichever occurs last).

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The initial value of this field is MQFMT\_NONE.

*ObjectRecOffset (MQLONG):*

This gives the offset in bytes of the first record in the array of MQOR object records containing the names of the destination queues. There are *RecsPresent* records in this array. These records (plus any bytes skipped between the first object record and the previous field) are included in the length given by the *StrucLength* field.

A distribution list must always contain at least one destination, so *ObjectRecOffset* must always be greater than zero.

The initial value of this field is 0.

*PutMsgRecFields (MQLONG):*

You can specify none or more of the following flags:

**MQPMRF\_MSG\_ID**

Message-identifier field is present.

**MQPMRF\_CORREL\_ID**

Correlation-identifier field is present.

**MQPMRF\_GROUP\_ID**

Group-identifier field is present.

**MQPMRF\_FEEDBACK**

Feedback field is present.

**MQPMRF\_ACCOUNTING\_TOKEN**

Accounting-token field is present.

If no MQPMR fields are present, specify the following:

**MQPMRF\_NONE**

No put-message record fields are present. MQPMRF\_NONE is defined to aid program documentation. It is not intended that this constant be used with any other, but as its value is zero, such use cannot be detected.

The initial value of this field is MQPMRF\_NONE.

*PutMsgRecOffset* (MQLONG):

This gives the offset in bytes of the first record in the array of MQPMR put message records containing the message properties. If present, there are *RecsPresent* records in this array. These records (plus any bytes skipped between the first put message record and the previous field) are included in the length given by the *StrucLength* field.

Put message records are optional; if no records are provided, *PutMsgRecOffset* is zero, and *PutMsgRecFields* has the value MQPMRF\_NONE.

The initial value of this field is 0.

*RecsPresent* (MQLONG):

This is the number of destinations. A distribution list must always contain at least one destination, so *RecsPresent* must always be greater than zero.

The initial value of this field is 0.

*StrucId* (MQCHAR4):

The value must be:

#### **MQDH\_STRUC\_ID**

Identifier for distribution header structure.

For the C programming language, the constant MQDH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQDH\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQDH\_STRUC\_ID.

*StrucLength* (MQLONG):

This is the number of bytes from the start of the MQDH structure to the start of the message data following the arrays of MQOR and MQPMR records. The data occurs in the following sequence:

- MQDH structure
- Array of MQOR records
- Array of MQPMR records
- Message data

The arrays of MQOR and MQPMR records are addressed by offsets contained within the MQDH structure. If these offsets result in unused bytes between one or more of the MQDH structure, the arrays of records, and the message data, those unused bytes must be included in the value of *StrucLength*, but the content of those bytes is not preserved by the queue manager. It is valid for the array of MQPMR records to precede the array of MQOR records.

The initial value of this field is 0.

Version (MQLONG):

The value must be:

**MQDH\_VERSION\_1**

Version number for distribution header structure.

The following constant specifies the version number of the current version:

**MQDH\_CURRENT\_VERSION**

Current version of distribution header structure.

The initial value of this field is MQDH\_VERSION\_1.

Initial values and language declarations for MQDH:

Table 176. Initial values of fields in MQDH for MQDH

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQDH_STRUC_ID	'DH↯↯'
<i>Version</i>	MQDH_VERSION_1	1
<i>StrucLength</i>	None	0
<i>Encoding</i>	None	0
<i>CodedCharSetId</i>	MQCCSI_UNDEFINED	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>Flags</i>	MQDHF_NONE	0
<i>PutMsgRecFields</i>	MQPMRF_NONE	0
<i>RecsPresent</i>	None	0
<i>ObjectRecOffset</i>	None	0
<i>PutMsgRecOffset</i>	None	0
<b>Notes:</b>		
1. The symbol ↯ represents a single blank character.		
2. In the C programming language, the macro variable MQDH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure: MQDH MyDH = {MQDH_DEFAULT};		

*C declaration:*

```
typedef struct tagMQDH MQDH;
struct tagMQDH {
    MQCHAR4  StrucId;          /* Structure identifier */
    MQLONG   Version;         /* Structure version number */
    MQLONG   StrucLength;     /* Length of MQDH structure plus following
                               MQOR and MQPMR records */
    MQLONG   Encoding;       /* Numeric encoding of data that follows
                               the MQOR and MQPMR records */
    MQLONG   CodedCharSetId; /* Character set identifier of data that
                               follows the MQOR and MQPMR records */
    MQCHAR8  Format;         /* Format name of data that follows the
                               MQOR and MQPMR records */
    MQLONG   Flags;         /* General flags */
    MQLONG   PutMsgRecFields; /* Flags indicating which MQPMR fields are
                               present */
    MQLONG   RecsPresent;    /* Number of MQOR records present */
    MQLONG   ObjectRecOffset; /* Offset of first MQOR record from start
                               of MQDH */
    MQLONG   PutMsgRecOffset; /* Offset of first MQPMR record from start
                               of MQDH */
};
```

*COBOL declaration:*

```
** MQDH structure
10 MQDH.
** Structure identifier
15 MQDH-STRUCID PIC X(4).
** Structure version number
15 MQDH-VERSION PIC S9(9) BINARY.
** Length of MQDH structure plus following MQOR and MQPMR records
15 MQDH-STRUCLength PIC S9(9) BINARY.
** Numeric encoding of data that follows the MQOR and MQPMR records
15 MQDH-ENCODING PIC S9(9) BINARY.
** Character set identifier of data that follows the MQOR and MQPMR
** records
15 MQDH-CODEDCHARSETID PIC S9(9) BINARY.
** Format name of data that follows the MQOR and MQPMR records
15 MQDH-FORMAT PIC X(8).
** General flags
15 MQDH-FLAGS PIC S9(9) BINARY.
** Flags indicating which MQPMR fields are present
15 MQDH-PUTMSGRECFIELDS PIC S9(9) BINARY.
** Number of MQOR records present
15 MQDH-RECSPRESENT PIC S9(9) BINARY.
** Offset of first MQOR record from start of MQDH
15 MQDH-OBJECTRECOFFSET PIC S9(9) BINARY.
** Offset of first MQPMR record from start of MQDH
15 MQDH-PUTMSGRECOFFSET PIC S9(9) BINARY.
```

*PL/I declaration:*

```
dc1
1 MQDH based,

## MQDLH - Dead-letter header:

The following table summarizes the fields in the structure.

Table 177. Fields in MQDLH

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Reason</i>	Reason message arrived on dead-letter queue	Reason
<i>DestQName</i>	Name of original destination queue	DestQName
<i>DestQMgrName</i>	Name of original destination queue manager	DestQMgrName
<i>Encoding</i>	Numeric encoding of data that follows MQDLH	Encoding
<i>CodedCharSetId</i>	Character set identifier of data that follows MQDLH	CodedCharSetId
<i>Format</i>	Format name of data that follows MQDLH	Format
<i>PutApplType</i>	Type of application that put message on dead-letter queue	PutApplType
<i>PutApplName</i>	Name of application that put message on dead-letter queue	PutApplName
<i>PutDate</i>	Date when message was put on dead-letter queue	PutDate
<i>PutTime</i>	Time when message was put on dead-letter queue	PutTime

*Overview for MQDLH:*

**Availability:** All IBM MQ platforms.

**Purpose:** The MQDLH structure describes the information that prefixes the application message data of messages on the dead-letter (undelivered-message) queue. A message can arrive on the dead-letter queue either because the queue manager or message channel agent has redirected it to the queue, or because an application has put the message directly on the queue.

**Format name:** MQFMT\_DEAD\_LETTER\_HEADER.

**Character set and encoding:** The fields in the MQDLH structure are in the character set and encoding given by the *CodedCharSetId* and *Encoding* fields. These are specified in the header structure that precedes the MQDLH, or in the MQMD structure if the MQDLH is at the start of the application message data.

The character set must be one that has single-byte characters for the characters that are valid in queue names.

If you are using the WMQ classes for Java/JMS, and the code page defined in the MQMD is not supported by the Java virtual machine, then the MQDLH is written in the UTF-8 character set.

**Usage:** Applications that put messages directly on the dead-letter queue must prefix the message data with an MQDLH structure, and initialize the fields with appropriate values. However, the queue manager does not require that an MQDLH structure be present, or that valid values have been specified for the fields.

If a message is too long to put on the dead-letter queue, the application must do one of the following:

- Truncate the message data to fit on the dead-letter queue.

- Record the message on auxiliary storage and place an exception report message on the dead-letter queue indicating this.
- Discard the message and return an error to its originator. If the message is (or might be) a critical message, do this only if it is known that the originator still has a copy of the message; for example, a message received by a message channel agent from a communication channel.

Which of the preceding actions is appropriate (if any) depends on the design of the application.

The queue manager performs special processing when a message that is a segment is put with an MQDLH structure at the front; see the description of the MQMDE structure for further details.

**Putting messages on the dead-letter queue:** When a message is put on the dead-letter queue, the MQMD structure used for the MQPUT or MQPUT1 call must be identical to the MQMD associated with the message (usually the MQMD returned by the MQGET call), with the exception of the following:

- Set the *CodedCharSetId* and *Encoding* fields to whatever character set and encoding are used for fields in the MQDLH structure.
- Set the *Format* field to MQFMT\_DEAD\_LETTER\_HEADER to indicate that the data begins with a MQDLH structure.
- Set the context fields (*AccountingToken*, *AppIdentityData*, *AppOriginData*, *PutApplName*, *PutApplType*, *PutDate*, *PutTime*, *UserIdentifier*) by using a context option appropriate to the circumstances:
  - An application putting on the dead-letter queue a message that is not related to any preceding message must use the MQPMO\_DEFAULT\_CONTEXT option; this causes the queue manager to set all of the context fields in the message descriptor to their default values.
  - A server application putting on the dead-letter queue a message that it has just received must use the MQPMO\_PASS\_ALL\_CONTEXT option to preserve the original context information.
  - A server application putting on the dead-letter queue a *reply* to a message that it has just received must use the MQPMO\_PASS\_IDENTITY\_CONTEXT option; this preserves the identity information but sets the origin information to be that of the server application.
  - A message channel agent putting on the dead-letter queue a message that it received from its communication channel must use the MQPMO\_SET\_ALL\_CONTEXT option to preserve the original context information.

In the MQDLH structure itself, set the fields as follows:

- Set the *CodedCharSetId*, *Encoding*, and *Format* fields to the values that describe the data that follows the MQDLH structure, usually the values from the original message descriptor.
- Set the context fields *PutApplType*, *PutApplName*, *PutDate*, and *PutTime* to values appropriate to the application that is putting the message on the dead-letter queue; these values are not related to the original message.
- Set other fields as appropriate.

Ensure that all fields have valid values, and that character fields are padded with blanks to the defined length of the field; do not end the character data prematurely by using a null character, because the queue manager does not convert the null and subsequent characters to blanks in the MQDLH structure.

**Getting messages from the dead-letter queue:** Applications that get messages from the dead-letter queue must verify that the messages begin with an MQDLH structure. The application can determine whether an MQDLH structure is present by examining the *Format* field in the message descriptor MQMD; if the field has the value MQFMT\_DEAD\_LETTER\_HEADER, the message data begins with an MQDLH structure. Be aware also that messages that applications get from the dead-letter queue might be truncated if they were originally too long for the queue.

*Fields for MQDLH:*

The MQDLH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG):*

CodedCharSetId is the character set identifier of the data that flows through the MQDLH structure (usually the data from the original message); it does not apply to character data in the MQDLH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The following special value can be used:

#### **MQCCSI\_INHERIT**

Character data in the data following this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI\_INHERIT is not returned by the MQGET call.

You cannot use MQCCSI\_INHERIT if the value of the *PutApplType* field in MQMD is MQAT\_BROKER.

This value is supported in the following environments: AIX, HP-UX, z/OS, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

The initial value of this field is MQCCSI\_UNDEFINED.

*DestQMgrName (MQCHAR48):*

DestQMgrName is the name of the queue manager that was the original destination for the message.

The length of this field is given by MQ\_Q\_MGR\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*DestQName (MQCHAR48):*

DestQName is the name of the message queue that was the original destination for the message.

The length of this field is given by MQ\_Q\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*Encoding (MQLONG):*

Encoding is the numeric encoding of the data that follows the MQDLH structure (usually the data from the original message); it does not apply to numeric data in the MQDLH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is 0.

*Format (MQCHAR8):*

Format is the format name of the data that follows the MQDLH structure (usually the data from the original message).

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those rules for coding the *Format* field in MQMD.

The length of this field is given by MQ\_FORMAT\_LENGTH. The initial value of this field is MQFMT\_NONE.

*PutApplName (MQCHAR28):*

PutApplName is the name of the application that put the message on the dead-letter (undelivered-message) queue.

The format of the name depends on the *PutApplType* field. The format can vary release to release. See the description of the *PutApplName* field in "MQMD - Message descriptor" on page 2179.

If the queue manager redirects the message to the dead-letter queue, *PutApplName* contains the first 28 characters of the queue-manager name, padded with blanks if necessary.

The length of this field is given by MQ\_PUT\_APPL\_NAME\_LENGTH. The initial value of this field is the null string in C, and 28 blank characters in other programming languages.

*PutApplType (MQLONG):*

PutApplType is the type of application that put the message on the dead-letter (undelivered-message) queue.

This field has the same meaning as the *PutApplType* field in the message descriptor MQMD (see "MQMD - Message descriptor" on page 2179 for details).

If the queue manager redirects the message to the dead-letter queue, *PutApplType* has the value MQAT\_QMGR.

The initial value of this field is 0.

*PutDate (MQCHAR8):*

PutDate is the date when the message was put on the dead-letter (undelivered-message) queue.

The format used for the date when this field is generated by the queue manager is:

- YYYYMMDD

where the characters represent:

**YYYY** year (four numeric digits)

**MM** month of year (01 through 12)

**DD** day of month (01 through 31)

Greenwich Mean Time (GMT) is used for the *PutDate* and *PutTime* fields, subject to the system clock being set accurately to GMT.

The length of this field is given by MQ\_PUT\_DATE\_LENGTH. The initial value of this field is the null string in C, and eight blank characters in other programming languages.

*PutTime* (MQCHAR8):

PutTime is the time when the message was put on the dead-letter (undelivered-message) queue.

The format used for the time when this field is generated by the queue manager is:

- HHMMSSSTH

where the characters represent:

**HH** hours (00 through 23)  
**MM** minutes (00 through 59)  
**SS** seconds (00 through 59; see note)  
**T** tenths of a second (0 through 9)  
**H** hundredths of a second (0 through 9)

**Note:** If the system clock is synchronized to an very accurate time standard, it is possible on rare occasions for 60 or 61 to be returned for the seconds in *PutTime*. This happens when leap seconds are inserted into the global time standard.

Greenwich Mean Time (GMT) is used for the *PutDate* and *PutTime* fields, subject to the system clock being set accurately to GMT.

The length of this field is given by MQ\_PUT\_TIME\_LENGTH. The initial value of this field is the null string in C, and eight blank characters in other programming languages.

*Reason* (MQLONG):

The Reason field identifies the reason why the message was placed on the dead-letter queue instead of on the original destination queue.

This identifies the reason why the message was placed on the dead-letter queue instead of on the original destination queue. It should be one of the MQFB\_\* or MQRC\_\* values (for example, MQRC\_Q\_FULL). See the description of the *Feedback* field in "MQMD - Message descriptor" on page 2179 for details of the common MQFB\_\* values that can occur.

If the value is in the range MQFB\_IMS\_FIRST through MQFB\_IMS\_LAST, the actual IMS error code can be determined by subtracting MQFB\_IMS\_ERROR from the value of the *Reason* field.

Some MQFB\_\* values occur only in this field. They relate to repository messages, trigger messages, or transmission-queue messages that have been transferred to the dead-letter queue. These are:

**MQFB\_APPL\_CANNOT\_BE\_STARTED ( X'00000109' )**

An application processing a trigger message cannot start the application named in the *AppId* field of the trigger message (see "MQTM - Trigger message" on page 2380 ).

On z/OS, the CKTI CICS transaction is an example of an application that processes trigger messages.

**MQFB\_APPL\_TYPE\_ERROR ( X'0000010B' )**

An application processing a trigger message cannot start the application because the *AppType* field of the trigger message is not valid (see "MQTM - Trigger message" on page 2380 ).

On z/OS, the CKTI CICS transaction is an example of an application that processes trigger messages.

**MQFB\_BIND\_OPEN\_CLUSRCVR\_DEL ( X'00000119' )**

The message was on the SYSTEM.CLUSTER.TRANSMIT.QUEUE intended for a cluster queue

that was opened with the MQOO\_BIND\_ON\_OPEN option, but the remote cluster-receiver channel to be used to transmit the message to the destination queue was deleted before the message could be sent. Because MQOO\_BIND\_ON\_OPEN was specified, only the channel selected when the queue was opened can be used to transmit the message. As this channel is no longer available, the message is placed on the dead-letter queue.

**MQFB\_NOT\_A\_REPOSITORY\_MSG ( X'00000118')**

The message is not a repository message.

**MQFB\_STOPPED\_BY\_CHAD\_EXIT ( X'00000115')**

The message was stopped by channel auto-definition exit.

**MQFB\_STOPPED\_BY\_MSG\_EXIT ( X'0000010D')**

The message was stopped by channel message exit.

**MQFB\_TM\_ERROR ( X'0000010A')**

The *Format* field in MQMD specifies MQFMT\_TRIGGER, but the message does not begin with a valid MQTM structure. For example, the *StrucId* mnemonic eye-catcher might not be valid, the *Version* might not be recognized, or the length of the trigger message might be insufficient to contain the MQTM structure.

On z/OS, the CKTI CICS transaction is an example of an application that processes trigger messages and can generate this feedback code.

**MQFB\_XMIT\_Q\_MSG\_ERROR ( X'0000010F')**

A message channel agent has found that a message on the transmission queue is not in the correct format. The message channel agent puts the message on the dead-letter queue using this feedback code.

One common cause is that a message has been put directly to the transmission queue, so the message does not have the expected XQH header. Messages should be put to a transmission queue through a remote queue, unless the application builds the MQXQH header.

The initial value of this field is MQRC\_NONE.

*StrucId* (MQCHAR4):

StrucId is the structure identifier.

The value must be:

**MQDLH\_STRUC\_ID**

Identifier for dead-letter header structure.

For the C programming language, the constant MQDLH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQDLH\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQDLH\_STRUC\_ID.

*Version (MQLONG):*

Version is the structure version number.

The value must be:

**MQDLH\_VERSION\_1**

Version number for dead-letter header structure.

The following constant specifies the version number of the current version:

**MQDLH\_CURRENT\_VERSION**

Current version of dead-letter header structure.

The initial value of this field is MQDLH\_VERSION\_1.

*Initial values and language declarations for MQDLH:*

*Table 178. Initial values of fields in MQDLH for MQDLH*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQDLH_STRUC_ID	'DLH~'
<i>Version</i>	MQDLH_VERSION_1	1
<i>Reason</i>	MQRC_NONE	0
<i>DestQName</i>	None	Null string or blanks
<i>DestQMgrName</i>	None	Null string or blanks
<i>Encoding</i>	None	0
<i>CodedCharSetId</i>	MQCCSI_UNDEFINED	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>PutApplType</i>	None	0
<i>PutApplName</i>	None	Null string or blanks
<i>PutDate</i>	None	Null string or blanks
<i>PutTime</i>	None	Null string or blanks

**Notes:**

1. The symbol ~ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQDLH\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  
`MQDLH MyDLH = {MQDLH_DEFAULT};`

*C declaration:*

```
typedef struct tagMQDLH MQDLH;
struct tagMQDLH {
    MQCHAR4  StrucId;           /* Structure identifier */
    MQLONG   Version;          /* Structure version number */
    MQLONG   Reason;           /* Reason message arrived on dead-letter
                               (undelivered-message) queue */
    MQCHAR48 DestQName;        /* Name of original destination queue */
    MQCHAR48 DestQMgrName;     /* Name of original destination queue
                               manager */
    MQLONG   Encoding;         /* Numeric encoding of data that follows
                               MQDLH */
    MQLONG   CodedCharSetId;   /* Character set identifier of data that
                               follows MQDLH */
    MQCHAR8  Format;           /* Format name of data that follows
                               MQDLH */
    MQLONG   PutApplType;      /* Type of application that put message on
                               dead-letter (undelivered-message)
                               queue */
    MQCHAR28 PutApplName;      /* Name of application that put message on
                               dead-letter (undelivered-message)
                               queue */
    MQCHAR8  PutDate;          /* Date when message was put on dead-letter
                               (undelivered-message) queue */
    MQCHAR8  PutTime;          /* Time when message was put on the
                               dead-letter (undelivered-message)
                               queue */
};
```

*COBOL declaration:*

```
** MQDLH structure
10 MQDLH.
** Structure identifier
15 MQDLH-STRUCID PIC X(4).
** Structure version number

End Type
```

**MQDMHO - Delete message handle options:**

The following table summarizes the fields in the structure.

*Table 179. Fields in MQDMHO*

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options	Options

*Overview for MQDMHO:*

**Availability:** All IBM MQ systems and IBM MQ clients.

**Purpose:** The **MQDMHO** structure allows applications to specify options that control how message handles are deleted. The structure is an input parameter on the **MQDLTMH** call.

**Character set and encoding:** Data in **MQDMHO** must be in the character set of the application and encoding of the application ( **MQENC\_NATIVE** ).

*Fields for MQDMHO:*

The MQDMHO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG):*

The value must be:

**MQDMHO\_NONE**

No options specified.

This is always an input field. The initial value of this field is **MQDMHO\_NONE**.

*StrucId (MQCHAR4):*

This is the structure identifier; the value must be:

**MQDMHO\_STRUC\_ID**

Identifier for delete message handle options structure.

For the C programming language, the constant **MQDMHO\_STRUC\_ID\_ARRAY** is also defined; this has the same value as **MQDMHO\_STRUC\_ID**, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is **MQDMHO\_STRUC\_ID**.

*Version (MQLONG):*

This is the structure version number; the value must be:

**MQDMHO\_VERSION\_1**

Version-1 delete message handle options structure.

The following constant specifies the version number of the current version:

**MQDMHO\_CURRENT\_VERSION**

Current version of delete message handle options structure.

This is always an input field. The initial value of this field is **MQDMHO\_VERSION\_1**.

*Initial values and language declarations for MQDMHO:*

*Table 180. Initial values of fields in MQDMHO*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQDMHO_STRUC_ID	'DMHO'
<i>Version</i>	MQDMHO_VERSION_1	1
<i>Options</i>	MQDMHO_NONE	0

**Notes:**

1. In the C programming language, the macro variable **MQDMHO\_DEFAULT** contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:  

```
MQDMHO MyDMHO = {MQDMHO_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQDMHO;
struct tagMQDMHO {
    MQCHAR4  StrucId;          /* Structure identifier */
    MQLONG   Version;         /* Structure version number */
    MQLONG   Options;        /* Options that control the action of MQDLTMH */
};
```

*COBOL declaration:*

```
** MQDMHO structure
10 MQDMHO.
** Structure identifier
15 MQDMHO-STRUCID PIC X(4).
** Structure version number
15 MQDMHO-VERSION PIC S9(9) BINARY.
** Options that control the action of MQDLTMH
15 MQDMHO-OPTIONS PIC S9(9) BINARY.
```

*PL/I declaration:*

```
dc1
1 MQDMHO based,
3 StrucId char(4), /* Structure identifier */
3 Version fixed bin(31), /* Structure version number */
3 Options fixed bin(31), /* Options that control the action of MQDLTMH */
```

*High Level Assembler declaration:*

```
MQDMHO DSECT
MQDMHO_STRUCID DS CL4 Structure identifier
MQDMHO_VERSION DS F Structure version number
MQDMHO_OPTIONS DS F Options that control the action of
* MQDLTMH
MQDMHO_LENGTH EQU *-MQDMHO
MQDMHO_AREA DS CL(MQDMHO_LENGTH)
```

**MQDMPO - Delete message property options:**

The following table summarizes the fields in the structure. MQDMPO structure - delete message property options

*Table 181. Fields in MQDMPO*

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options controlling the action of MQDMPO	Options

*Overview for MQDMPO:*

**Availability:** All IBM MQ systems and IBM MQ clients.

**Purpose:** The MQDMPO structure allows applications to specify options that control how properties of messages are deleted. The structure is an input parameter on the MQDLTMP call.

**Character set and encoding:** Data in MQDMPO must be in the character set of the application and encoding of the application (MQENC\_NATIVE).

*Fields for MQDMPO:*

Delete message property options structure - fields

The MQDMPO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG):*

Delete message property options structure - Options field

**Location options:** The following options relate to the relative location of the property compared to the property cursor.

**MQDMPO\_DEL\_FIRST**

Deletes the first property that matches the specified name.

**MQDMPO\_DEL\_PROP\_UNDER\_CURSOR**

Deletes the property pointed to by the property cursor; that is the property that was last inquired by using either the MQIMPO\_INQ\_FIRST or the MQIMPO\_INQ\_NEXT option.

The property cursor is reset when the message handle is reused. It is also reset when the message handle is specified in the *MsgHandle* field of the MQGMO structure on an MQGET call, or MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established, the call fails with completion code MQCC\_FAILED and reason MQRC\_PROPERTY\_NOT\_AVAILABLE. If the property pointed to by the property cursor has already been deleted, the call also fails with completion code MQCC\_FAILED and reason MQRC\_PROPERTY\_NOT\_AVAILABLE.

If neither of these options is required, the following option can be used:

**MQDMPO\_NONE**

No options specified.

This field is always an input field. The initial value of this field is MQDMPO\_DEL\_FIRST.

*StrucId* (MQCHAR4):

Delete message property options structure - *StrucId* field

This is the structure identifier. The value must be:

**MQDMPO\_STRUC\_ID**

Identifier for delete message property options structure.

For the C programming language, the constant MQDMPO\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQDMPO\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQDMPO\_STRUC\_ID.

*Version* (MQLONG):

Delete message property options structure - *Version* field

This is the structure version number. The value must be:

**MQDMPO\_VERSION\_1**

Version number for delete message property options structure.

The following constant specifies the version number of the current version:

**MQDMPO\_CURRENT\_VERSION**

Current version of delete message property options structure.

This is always an input field. The initial value of this field is MQDMPO\_VERSION\_1.

*Initial values and language declarations for MQDMPO:*

Delete message property options structure - Initial values

*Table 182. Initial values of fields in MQDPMO*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQDMPO_STRUC_ID	'DMPO'
<i>Version</i>	MQDMPO_VERSION_1	1
<i>Options</i>	Options that control the action of MQDLTMP	MQDMPO_NONE

**Notes:**

1. In the C programming language, the macro variable MQDMPO\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  
`MQDMPO MyDMPO = {MQDMPO_DEFAULT};`

*C declaration:*

Delete message property options structure - C language declaration

```
typedef struct tagMQDMPO MQDMPO;
struct tagMQDMPO {
    MQCHAR4  StrucId;          /* Structure identifier */
    MQLONG   Version;         /* Structure version number */
    MQLONG   Options;         /* Options that control the action of
                               MQDLTMP */
};
```

*COBOL declaration:*

Delete message property options structure - COBOL language declaration

   15 MQDMPO-STRUCID          PIC X(4).
**   Structure version number
   15 MQDMPO-VERSION         PIC S9(9) BINARY.
**   Options that control the action of MQDLTMP
   15 MQDMPO-OPTIONS        PIC S9(9) BINARY.
```

*PL/I declaration:*

Delete message property options structure - PL/I language declaration

```
Dcl
  1 MQDPMO based,
  3 StrucId      char(4),      /* Structure identifier */
  3 Version      fixed bin(31), /* Structure version number */
  3 Options      fixed bin(31), /* Options that control the action
                               of MQDLTMP */
```

*High Level Assembler declaration:*

Delete message property options structure - Assembler language declaration

```
MQDMPO          DSECT
MQDMPO_STRUCID  DS   CL4  Structure identifier
MQDMPO_VERSION  DS   F    Structure version number
MQDMPO_OPTIONS  DS   F    Options that control the
*                action of MQDLTMP
MQDMPO_LENGTH   EQU  *-MQDMPO
MQDMPO_AREA     DS   CL(MQDMPO_LENGTH)
```

## MQEPH - Embedded PCF header:

The following table summarizes the fields in the structure.

Table 183. Fields in MQEPH

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>StrucLength</i>	Length of MQEPH structure plus the MQCFH and parameter structures that follow it	StrucLength
<i>Encoding</i>	Numeric encoding of data that follows last PCF parameter structure	Encoding
<i>CodedCharSetId</i>	Character set identifier of data that follows last PCF parameter structure	CodedCharSetId
<i>Format</i>	Format name of data that follows last PCF parameter structure	Format
<i>Flags</i>	Flags	Flags
<i>PCFHeader</i>	Programmable command format (PCF) header	PCFHeader

Overview for MQEPH:

**Availability:** All IBM MQ platforms.

**Purpose:** The MQEPH structure describes the additional data that is present in a message when that message is a programmable command format (PCF) message. The *PCFHeader* field defines the PCF parameters that follow this structure and this allows you to follow the PCF message data with other headers.

**Format name:** MQFMT\_EMBEDDED\_PCF

**Character set and encoding:** Data in MQEPH must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE.

Set the character set and encoding of the MQEPH into the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQEPH structure is at the start of the message data), or
- The header structure that precedes the MQEPH structure (all other cases).

**Usage:** You cannot use MQEPH structures to send commands to the command server or any other queue manager PCF-accepting server.

Similarly, the command server or any other queue manager PCF-accepting server do not generate responses or events containing MQEPH structures.

*Fields for MQEPH:*

The MQEPH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG):*

This is the character set identifier of the data that follows the MQEPH structure and the associated PCF parameters; it does not apply to character data in the MQEPH structure itself.

The initial value of this field is MQCCSI\_UNDEFINED.

*Encoding (MQLONG):*

This is the numeric encoding of the data that follows the MQEPH structure and the associated PCF parameters; it does not apply to character data in the MQEPH structure itself.

The initial value of this field is 0.

*Flags (MQLONG):*

The following values are available:

**MQEPH\_NONE**

No flags have been specified. MQEPH\_NONE is defined to aid program documentation. It is not intended that this constant be used with any other, but as its value is zero, such use cannot be detected.

**MQEPH\_CCSID\_EMBEDDED**

The character set of the parameters containing character data is specified individually within the CodedCharSetId field in each structure. The character set of the StrucId and Format fields is defined by the CodedCharSetId field in the header structure that precedes the MQEPH structure, or by the CodedCharSetId field in the MQMD if the MQEPH is at the start of the message.

The initial value of this field is MQEPH\_NONE.

*Format (MQCHAR8):*

This is the format name of the data that follows the MQEPH structure and the associated PCF parameters.

The initial value of this field is MQFMT\_NONE.

*PCFHeader (MQCFH):*

This is the programmable command format (PCF) header, defining the PCF parameters that follow the MQEPH structure. This enables you to follow the PCF message data with other headers.

The PCF header is initially defined with the following values:

*Table 184. Initial values of fields in MQCFH*

Field name	Name of constant	Value of constant
<i>Type</i>	MQCFT_NONE	0
<i>StrucLength</i>	MQCFH_STRUC_LENGTH	36
<i>Version</i>	MQCFH_VERSION_3	3
<i>StrucLength</i>	None	0
<i>Command</i>	MQCMD_NONE	0

Table 184. Initial values of fields in MQCFH (continued)

Field name	Name of constant	Value of constant
<i>MsgSeqNumber</i>	None	1
<i>Control</i>	MQCFC_LAST	1
<i>CompCode</i>	MQCC_OK	0
<i>Reason</i>	MQRC_NONE	0
<i>ParameterCount</i>	None	0

The application must change the Type from MQCFT\_NONE to a valid structure type for the use it is making of the embedded PCF header.

*StrucId* (MQCHAR4):

The value must be:

**MQEPH\_STRUC\_ID**

Identifier for distribution header structure.

For the C programming language, the constant MQEPH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQDH\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQEPH\_STRUC\_ID.

*StrucLength* (MQLONG):

This is the amount of data preceding the next header structure. It includes:

- The length of the MQEPH header
- The length of all PCF parameters following the header
- Any blank padding following those parameters

StrucLength must be a multiple of 4.

The fixed length part of the structure is defined by MQEPH\_STRUC\_LENGTH\_FIXED.

The initial value of this field is 68.

*Version* (MQLONG):

The value must be:

**MQEPH\_VERSION\_1**

Version number for embedded PCF header structure.

The following constant specifies the version number of the current version:

**MQCFH\_VERSION\_3**

Current version of embedded PCF header structure.

The initial value of this field is MQEPH\_VERSION\_1.

Initial values and language declarations for MQEPH:

Table 185. Initial values of fields in MQEPH for MQEPH

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQEPH_STRUC_ID	'EPH␣'
<i>Version</i>	MQEPH_VERSION_1	1
<i>StrucLength</i>	MQEPH_STRUC_LENGTH_FIXED	68
<i>Encoding</i>	None	0
<i>CodedCharSetId</i>	MQCCSI_UNDEFINED	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>Flags</i>	MQEPH_NONE	0
<i>PCFHeader</i>	Names and values as defined in Table 184 on page 2123	0
<b>Notes:</b>		
<ol style="list-style-type: none"> <li>1. The symbol ␣ represents a single blank character.</li> <li>2. In the C programming language, the macro variable MQEPH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  MQEPH MyEPH = {MQEPH_DEFAULT};</li> </ol>		

C declaration:

```
typedef struct tagMQEPH MQEPH;
struct tagMQDH {
    MQCHAR4  StrucId;           /* Structure identifier */

## MQGMO - Get-message options:

The following table summarizes the fields in the structure.

Table 186. Fields in MQGMO

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options that control the action of MQGET	MQGMO - Options field
<i>WaitInterval</i>	Wait interval	WaitInterval
<i>Signal1</i>	Signal	Signal1
<i>Signal2</i>	Signal identifier	Signal2
<i>ResolvedQName</i>	Resolved name of destination queue	ResolvedQName
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQGMO_VERSION_2.		
<i>MatchOptions</i>	Options controlling selection criteria used for MQGET	MatchOptions
<i>GroupStatus</i>	Flag indicating whether message retrieved is in a group	GroupStatus
<i>SegmentStatus</i>	Flag indicating whether message retrieved is a segment of a logical message	SegmentStatus
<i>Segmentation</i>	Flag indicating whether further segmentation is allowed for the message retrieved	Segmentation
<i>Reserved1</i>	Reserved	Reserved1
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQGMO_VERSION_3.		
<i>MsgToken</i>	Message token	MsgToken
<i>ReturnedLength</i>	Length of message data returned (bytes)	ReturnedLength
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQGMO_VERSION_4.		
<i>Reserved2</i>	Reserved	Reserved2
<i>MsgHandle</i>	The handle to a message that is to be populated with the properties of the message being retrieved from the queue.	MsgHandle

Overview for MQGMO:

**Availability:** All IBM MQ platforms.

**Purpose:** The MQGMO structure allows the application to control how messages are removed from queues. The structure is an input/output parameter on the MQGET call.

**Version:** The current version of MQGMO is MQGMO\_VERSION\_4. Certain fields are available only in certain versions of MQGMO. If you need to port applications between several environments, you must ensure that the version of MQGMO is consistent across all environments. Fields that exist only in particular versions of the structure are identified as such in “MQGMO - Get-message options” and in the field descriptions.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQGMO that is supported by the environment, but with the initial value of the *Version* field set to MQGMO\_VERSION\_1. To use fields that are not present in the version-1 structure, set the *Version* field to the version number of the version required.

**Character set and encoding:** Data in MQGMO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

*Fields for MQGMO:*

The MQGMO structure contains the following fields; the fields are described in **alphabetical order**:

*GroupStatus (MQCHAR):*

This flag indicates whether the message retrieved is in a group.

It has one of the following values:

**MQGS\_NOT\_IN\_GROUP**

Message is not in a group.

**MQGS\_MSG\_IN\_GROUP**

Message is in a group, but is not the last in the group.

**MQGS\_LAST\_MSG\_IN\_GROUP**

Message is the last in the group.

This is also the value returned if the group consists of only one message.

This is an output field. The initial value of this field is MQGS\_NOT\_IN\_GROUP. This field is ignored if *Version* is less than MQGMO\_VERSION\_2.

*MatchOptions (MQLONG):*

These options allow the application to choose which fields in the *MsgDesc* parameter to use to select the message returned by the MQGET call. The application sets the required options in this field, and then sets the corresponding fields in the *MsgDesc* parameter to the values required for those fields. Only messages that have those values in the MQMD for the message are candidates for retrieval using that *MsgDesc* parameter on the MQGET call. Fields for which the corresponding match option is *not* specified are ignored when selecting the message to be returned. If you specify no selection criteria on the MQGET call (that is, *any* message is acceptable), set *MatchOptions* to MQMO\_NONE.

- On z/OS, the selection criteria that can be used might be restricted by the type of index used for the queue. See the *IndexType* queue attribute for further details.

If you specify MQGMO\_LOGICAL\_ORDER, only certain messages are eligible for return by the next MQGET call:

- If there is no current group or logical message, only messages that have *MsgSeqNumber* equal to 1 and *Offset* equal to 0 are eligible for return. In this situation, you can use one or more of the following match options to select which of the eligible messages is returned:
  - MQMO\_MATCH\_MSG\_ID
  - MQMO\_MATCH\_CORREL\_ID
  - MQMO\_MATCH\_GROUP\_ID
- If there *is* a current group or logical message, only the next message in the group or next segment in the logical message is eligible for return, and this cannot be altered by specifying MQMO\_\* options.

In both of the preceding cases, you can specify match options that do not apply, but the value of the relevant field in the *MsgDesc* parameter must match the value of the corresponding field in the message to be returned; the call fails with reason code MQRC\_MATCH\_OPTIONS\_ERROR if this condition is not satisfied.

*MatchOptions* is ignored if you specify either MQGMO\_MSG\_UNDER\_CURSOR or MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR.

Getting messages based on message property is not done using match options; for more information, see “SelectionString (MQCHARV)” on page 2255.

You can specify one or more of the following match options:

#### **MQMO\_MATCH\_MSG\_ID**

The message to be retrieved must have a message identifier that matches the value of the *MsgId* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the correlation identifier).

If you omit this option, the *MsgId* field in the *MsgDesc* parameter is ignored, and any message identifier will match.

**Note:** The message identifier MQMI\_NONE is a special value that matches *any* message identifier in the MQMD for the message. Therefore, specifying MQMO\_MATCH\_MSG\_ID with MQMI\_NONE is the same as *not* specifying MQMO\_MATCH\_MSG\_ID.

#### **MQMO\_MATCH\_CORREL\_ID**

The message to be retrieved must have a correlation identifier that matches the value of the *CorrelId* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the message identifier).

If you omit this option, the *CorrelId* field in the *MsgDesc* parameter is ignored, and any correlation identifier will match.

**Note:** The correlation identifier MQCI\_NONE is a special value that matches *any* correlation identifier in the MQMD for the message. Therefore, specifying MQMO\_MATCH\_CORREL\_ID with MQCI\_NONE is the same as *not* specifying MQMO\_MATCH\_CORREL\_ID.

#### **MQMO\_MATCH\_GROUP\_ID**

The message to be retrieved must have a group identifier that matches the value of the *GroupId* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the correlation identifier).

If you omit this option, the *GroupId* field in the *MsgDesc* parameter is ignored, and any group identifier will match.

**Note:** The group identifier MQGI\_NONE is a special value that matches *any* group identifier in the MQMD for the message. Therefore, specifying MQMO\_MATCH\_GROUP\_ID with MQGI\_NONE is the same as *not* specifying MQMO\_MATCH\_GROUP\_ID.

#### **MQMO\_MATCH\_MSG\_SEQ\_NUMBER**

The message to be retrieved must have a message sequence number that matches the value of the *MsgSeqNumber* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the group identifier).

If you omit this option, the *MsgSeqNumber* field in the *MsgDesc* parameter is ignored, and any message sequence number will match.

#### **MQMO\_MATCH\_OFFSET**

The message to be retrieved must have an offset that matches the value of the *Offset* field in the *MsgDesc* parameter of the MQGET call. This match is in addition to any other matches that might apply (for example, the message sequence number).

If you omit this option is not specified, the *Offset* field in the *MsgDesc* parameter is ignored, and any offset will match.

- This option is not supported on z/OS.

## MQMO\_MATCH\_MSG\_TOKEN

The message to be retrieved must have a message token that matches the value of the *MsgToken* field in the MQGMO structure specified on the MQGET call.

You can specify this option for all local queues. If you specify it for a queue that has an *IndexType* of MQIT\_MSG\_TOKEN (a WLM-managed queue), you can specify no other match options with MQMO\_MATCH\_MSG\_TOKEN.

You cannot specify MQMO\_MATCH\_MSG\_TOKEN with MQGMO\_WAIT or MQGMO\_SET\_SIGNAL. If the application wants to wait for a message to arrive on a queue that has an *IndexType* of MQIT\_MSG\_TOKEN, specify MQMO\_NONE.

If you omit this option, the *MsgToken* field in MQGMO is ignored, and any message token will match.

If you specify none of the options described, you can use the following option:

## MQMO\_NONE

Use no matches in selecting the message to be returned; all messages on the queue are eligible for retrieval (but subject to control by the MQGMO\_ALL\_MSGS\_AVAILABLE, MQGMO\_ALL\_SEGMENTS\_AVAILABLE, and MQGMO\_COMPLETE\_MSG options).

MQMO\_NONE aids program documentation. It is not intended that this option be used with any other MQMO\_\* option, but as its value is zero, such use cannot be detected.

This is an input field. The initial value of this field is MQMO\_MATCH\_MSG\_ID with MQMO\_MATCH\_CORREL\_ID. This field is ignored if *Version* is less than MQGMO\_VERSION\_2.

**Note:** The initial value of the *MatchOptions* field is defined for compatibility with earlier MQSeries queue managers. However, when reading a series of messages from a queue without using selection criteria, this initial value requires the application to reset the *MsgId* and *CorrelId* fields to MQMI\_NONE and MQCI\_NONE before each MQGET call. Avoid the need to reset *MsgId* and *CorrelId* by setting *Version* to MQGMO\_VERSION\_2, and *MatchOptions* to MQMO\_NONE.

### Related information:

Message selectors in JMS

*MsgHandle* (MQHMSG):

If the MQGMO\_PROPERTIES\_AS\_Q\_DEF option is specified and the PropertyControl queue attribute is not set to MQPROP\_FORCE\_MQRFH2 then this is the handle to a message which will be populated with the properties of the message being retrieved from the queue. The handle is created by an MQCRTMH call. Any properties already associated with the handle will be cleared before retrieving a message.

The following value can also be specified:

MQHM\_NONE

No message handle supplied.

No message descriptor is required on the MQGET call if a valid message handle is supplied and used on output to contain the message properties, the message descriptor associated with the message handle is used for input fields.

If a message descriptor is specified on the MQGET call, it always takes precedence over the message descriptor associated with a message handle.

If MQGMO\_PROPERTIES\_FORCE\_MQRFH2 is specified, or the MQGMO\_PROPERTIES\_AS\_Q\_DEF is specified and the PropertyControl queue attribute is MQPROP\_FORCE\_MQRFH2 then the call fails with reason code MQRC\_MD\_ERROR when no message descriptor parameter is specified.

On return from the MQGET call, the properties and message descriptor associated with this message handle are updated to reflect the state of the message retrieved (as well as the message descriptor if one was supplied on the MQGET call). The properties of the message can then be inquired using the MQINQMP call.

Except for message descriptor extensions, when present, a property that can be inquired with the MQINQMP call is not contained in the message data; if the message on the queue contained properties in the message data these are removed from the message data before the data is returned to the application.

If no message handle is provided or Version is less than MQGMO\_VERSION\_4 then you must supply a valid message descriptor on the MQGET call. Any message properties (except those contained in the message descriptor) are returned in the message data subject to the value of the property options in the MQGMO structure and the PropertyControl queue attribute.

This is an always an input field. The initial value of this field is MQHM\_NONE. This field is ignored if Version is less than MQGMO\_VERSION\_4.

*MsgToken* (MQBYTE16):

MsgToken field - MQGMO structure. This field is used by the queue manager to uniquely identify a message.

This is a byte string that is generated by the queue manager to identify a message uniquely on a queue. The message token is generated when the message is first placed on the queue manager, and remains with the message until the message is permanently removed from the queue manager, unless the queue manager is restarted.

When the message is removed from the queue, the *MsgToken* that identified that instance of the message is no longer valid, and is never reused. If the queue manager is restarted, the *MsgToken* that identified a message on the queue before restart might not be valid after restart. However, the *MsgToken* is never reused to identify a different message instance. The *MsgToken* is generated by the queue manager and is not visible to any external application.

When a message is returned by a call to MQGET where a Version 3 or higher MQGMO is supplied, the *MsgToken* identifying the message on the queue is returned in the MQGMO by the queue manager. There is one exception to this: when the message is being removed from the queue outside syncpoint, the queue manager might not return a *MsgToken* because it is not useful to identify the returned message on a subsequent MQGET call. Applications should only use *MsgToken* to refer to the message on subsequent MQGET calls.

If a *MsgToken* is supplied and the *MatchOption* MQMO\_MATCH\_MSG\_TOKEN is specified and neither MQGMO\_MSG\_UNDER\_CURSOR nor MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR is specified, only the message identified by that *MsgToken* can be returned. The option is valid on all local queues regardless of INDXTYPE, and on z/OS you must use INDXTYPE(MSGTOKEN) only on Workload Manager (WLM) queues.

Any other *MatchOptions* specified are checked, and if they do not match, MQRC\_NO\_MSG\_AVAILABLE is returned. If MQGMO\_BROWSE\_NEXT is coded with MQMO\_MATCH\_MSG\_TOKEN, the message identified by the *MsgToken* is returned only if it is beyond the browse-cursor for the calling handle.

If MQGMO\_MSG\_UNDER\_CURSOR or MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR is specified, MQMO\_MATCH\_MSG\_TOKEN is ignored.

MQMO\_MATCH\_MSG\_TOKEN is not valid with the following get message options:

- MQGMO\_WAIT
- MQGMO\_SET\_SIGNAL

For an MQGET call specifying MQMO\_MATCH\_MSG\_TOKEN, an MQGMO of version 3 or later must be supplied to the call, otherwise MQRC\_WRONG\_GMO\_VERSION is returned.

If the *MsgToken* is not valid at this time, MQCC\_FAILED with MQRC\_NO\_MSG\_AVAILABLE is returned, unless there is another error.

*Options (MQLONG):*

**MQGMO** options control the action of MQGET. You can specify zero or more of the options. If you need more than one optional value:

- Add the values (do not add the same constant more than once), or
- Combine the values using the bitwise OR operation (if the programming language supports bit operations).

Combinations of options that are not valid are noted; all other combinations are valid.

**Wait options:** The following options relate to waiting for messages to arrive on the queue:

**MQGMO\_WAIT**

The application waits until a suitable message arrives. The maximum time that the application waits is specified in *WaitInterval*.

**Important:** There is no wait, or delay, if a suitable message is available immediately.

If MQGET requests are inhibited, or MQGET requests become inhibited while waiting, the wait is canceled. The call completes with MQCC\_FAILED and reason code MQRC\_GET\_INHIBITED, regardless of whether there are suitable messages on the queue.

You can use MQGMO\_WAIT with the MQGMO\_BROWSE\_FIRST or MQGMO\_BROWSE\_NEXT options.

If several applications are waiting on the same shared queue, the following rules select which application is activated when a suitable message arrives:

*Table 187. Rules for activating MQGET calls on a shared queue.*

Number of MQGET calls waiting to be activated		Result
With a BROWSE option	Without a BROWSE option (An MQGET call specifying the MQGMO_LOCK option is treated as a nonbrowse call.)	
None	One or more	One MQGET call without a BROWSE option is activated.
One or more	None	All MQGET calls with a BROWSE option are activated.
One or more	One or more	One MQGET call without a BROWSE option is activated. The number of MQGET calls with a BROWSE option that are activated is unpredictable.

If more than one MQGET call without a BROWSE option is waiting on the same queue, only one is activated. The queue manager attempts to give priority to waiting calls in the following order:

1. Specific get-wait requests that can be satisfied only by certain messages, for example, ones with a specific *MsgId* or *CorrelId* (or both).
2. General get-wait requests that can be satisfied by any message.

**Note:**

- Within the first category, no additional priority is given to more specific get-wait requests. For example, requests that specify both *MsgId* and *CorrelId*.

- Within either category, it cannot be predicted which application is selected. In particular, the application waiting longest is not necessarily the one selected.
- Path length, and priority-scheduling considerations of the operating system, can mean that a waiting application of lower operating system priority than expected retrieves the message.
- It can also happen that an application that is not waiting retrieves the message in preference to one that is.

On z/OS, the following points apply:

- If you want the application to proceed with other work while waiting for the message to arrive, consider using the signal option (MQGMO\_SET\_SIGNAL) instead. However the signal option is environment-specific; applications that you port between different environments must not use it.
- If there is more than one MQGET call waiting for the same message, with a mixture of wait and signal options, each waiting call is considered equally. It is an error to specify MQGMO\_SET\_SIGNAL with MQGMO\_WAIT. It is also an error to specify this option with a queue handle for which a signal is outstanding.
- If you specify MQGMO\_WAIT or MQGMO\_SET\_SIGNAL for a queue that has an *IndexType* of MQIT\_MSG\_TOKEN, no selection criteria are permitted. This means that:
  - If you are using a version-1 MQGMO, set the *MsgId* and *CorrelId* fields in the MQMD specified on the MQGET call to MQMI\_NONE and MQCI\_NONE.
  - If you are using a version-2 or later MQGMO, set the *MatchOptions* field to MQMO\_NONE.
- For an MQGET call on a shared queue and the call is a browse request, or a destructive get of a group message, and neither *MsgId* nor *CorrelId* are to be matched, your signal ECB is posted MQEC\_MSG\_ARRIVED after 200 milliseconds.

This occurs, even though a suitable message might not have arrived on the queue, until the wait interval has expired, when the queue is posted with MQEC\_WAIT\_INTERVAL\_EXPIRED. When MQEC\_MSG\_ARRIVED is posted, you must reissue a second MQGET call to retrieve the message, if one is available.

This technique is used to ensure that you are informed in a timely manner of a message arrival, but can appear as an unexpected processing overhead when compared with a similar call sequence on a nonshared queue.

MQGMO\_WAIT is ignored if specified with MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR or MQGMO\_MSG\_UNDER\_CURSOR ; no error is raised.

#### **MQGMO\_NO\_WAIT**

The application does not wait if no suitable message is available. MQGMO\_NO\_WAIT is the opposite of the MQGMO\_WAIT. MQGMO\_NO\_WAIT is defined to aid program documentation. It is the default if neither is specified.

#### **MQGMO\_SET\_SIGNAL**

Use this option with the *Signal1* and *Signal2* fields. It allows applications to proceed with other work while waiting for a message to arrive. It also allows (if suitable operating system facilities are available) applications to wait for messages arriving on more than one queue.

**Note:** The MQGMO\_SET\_SIGNAL option is environment-specific; do not use it for applications that you want to port.

In two circumstances, the call completes in the same way as if this option had not been specified:

1. If a currently available message satisfies the criteria specified in the message descriptor.
2. If a parameter error or other synchronous error is detected.

If no message satisfying the criteria specified in the message descriptor is currently available, control returns to the application without waiting for a message to arrive. The *CompCode* and *Reason* parameters are set to MQCC\_WARNING and MQRC\_SIGNAL\_REQUEST\_ACCEPTED. Other output

fields in the message descriptor and the output parameters of the MQGET call are not set. When a suitable message arrives later, the signal is delivered by posting the ECB.

The caller must then reissue the MQGET call to retrieve the message. The application can wait for this signal, using functions provided by the operating system.

If the operating system provides a multiple wait mechanism, you can use it to wait for a message arriving on any one of several queues.

If a nonzero *WaitInterval* is specified, the signal is delivered after the wait interval expires. The queue manager can also cancel the wait, in which case the signal is delivered.

More than one MQGET call can set a signal for the same message. The order in which applications are activated is the same as described for MQGMO\_WAIT.

If more than one MQGET call is waiting for the same message, each waiting call is considered equally. The calls can include a mixture of wait and signal options.

Under certain conditions the MQGET call can retrieve a message, and a signal resulting from the arrival of the same message can be delivered. When a signal is delivered, an application must be prepared for no message to be available.

A queue handle can have no more than one signal request outstanding.

This option is not valid with any of the following options:

- MQGMO\_UNLOCK
- MQGMO\_WAIT

For an MQGET call on a shared queue and the call is a browse request, or a destructive get of a group message, and neither *MsgId* or *CorrelId* are to be matched, the user's signal ECB is posted MQEC\_MSG\_ARRIVED after 200 milliseconds.

This occurs, even though a suitable message might not have arrived on the queue, until the wait interval has expired, when the queue is posted with MQEC\_WAIT\_INTERVAL\_EXPIRED. When MQEC\_MSG\_ARRIVED is posted, you must reissue a second MQGET call to retrieve the message, if one is available.

This technique is used to ensure that you are informed in a timely manner of a message arrival, but can appear as an unexpected processing overhead when compared with a similar call sequence on a nonshared queue.

This is not an efficient method of message retrieval when messages are added infrequently. To avoid this overhead for the browse case, specify *MsgId* (if non-indexed or indexed by *MsgId*) or *CorrelId* (if indexed by *CorrelId*) matching on the MQGET call.

This option is supported on z/OS only.

#### **MQGMO\_FAIL\_IF QUIESCING**

Force the MQGET call to fail if the queue manager is in the quiescing state.

On z/OS, this option also forces the MQGET call to fail if the connection (for a CICS or IMS application) is in the quiescing state.

If this option is specified with MQGMO\_WAIT or MQGMO\_SET\_SIGNAL, and the wait or signal is outstanding at the time the queue manager enters the quiescing state:

- The wait is canceled and the call returns completion code MQCC\_FAILED with reason code MQRC\_Q\_MGR QUIESCING or MQRC\_CONNECTION QUIESCING.
- The signal is canceled with an environment-specific signal completion code.

On z/OS, the signal completes with event completion code MQEC\_Q\_MGR QUIESCING or MQEC\_CONNECTION QUIESCING.

If MQGMO\_FAIL\_IF QUIESCING is not specified and the queue manager or connection enters the quiescing state, the wait or signal is not canceled.

**Sync point options:** The following options relate to the participation of the MQGET call within a unit of work:

#### **MQGMO\_SYNCPOINT**

The request is to operate within the normal unit-of-work protocols. The message is marked as being unavailable to other applications, but it is deleted from the queue only when the unit of work is committed. The message is made available again if the unit of work is backed out.

You can leave MQGMO\_SYNCPOINT and MQGMO\_NO\_SYNCPOINT unset. In which case, the inclusion of the get request in unit-of-work protocols is determined by the environment running the queue manager. It is not determined by the environment running the application. On z/OS, the get request is within a unit of work. In all other environments, the get request is not within a unit of work.

Because of these differences, an application that you want to port must not allow this option to default; specify MQGMO\_SYNCPOINT or MQGMO\_NO\_SYNCPOINT explicitly.

This option is not valid with any of the following options:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
- MQGMO\_BROWSE\_NEXT
- MQGMO\_LOCK
- MQGMO\_NO\_SYNCPOINT
- MQGMO\_SYNCPOINT\_IF\_PERSISTENT
- MQGMO\_UNLOCK

#### **MQGMO\_SYNCPOINT\_IF\_PERSISTENT**

The request is to operate within the normal unit-of-work protocols, but *only* if the message retrieved is persistent. A persistent message has the value MQPER\_PERSISTENT in the *Persistence* field in MQMD.

- If the message is persistent, the queue manager processes the call as though the application had specified MQGMO\_SYNCPOINT.
- If the message is not persistent, the queue manager processes the call as though the application had specified MQGMO\_NO\_SYNCPOINT.

This option is not valid with any of the following options:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
- MQGMO\_BROWSE\_NEXT
- MQGMO\_COMPLETE\_MSG
- MQGMO\_MARK\_SKIP\_BACKOUT
- MQGMO\_NO\_SYNCPOINT
- MQGMO\_SYNCPOINT
- MQGMO\_UNLOCK

This option is supported in the following environments: AIX, HP-UX, z/OS, IBM i, Solaris, and Linux, plus IBM MQ MQI clients connected to these systems.

#### **MQGMO\_NO\_SYNCPOINT**

The request is to operate outside the normal unit-of-work protocols. If you get a message without a browse option, it is deleted from the queue immediately. The message cannot be made available again by backing out the unit of work.

This option is assumed if you specify MQGMO\_BROWSE\_FIRST or MQGMO\_BROWSE\_NEXT.

You can leave MQGMO\_SYNCPOINT and MQGMO\_NO\_SYNCPOINT unset. In which case, the inclusion of the get request in unit-of-work protocols is determined by the environment running the queue

manager. It is not determined by the environment running the application. On z/OS, the get request is within a unit of work. In all other environments, the get request is not within a unit of work.

Because of these differences, an application that you want to port must not allow this option to default; specify either MQGMO\_SYNCPOINT or MQGMO\_NO\_SYNCPOINT explicitly.

This option is not valid with any of the following options:

- MQGMO\_MARK\_SKIP\_BACKOUT
- MQGMO\_SYNCPOINT
- MQGMO\_SYNCPOINT\_IF\_PERSISTENT

#### **MQGMO\_MARK\_SKIP\_BACKOUT**

Back out a unit of work without reinstating on the queue the message that was marked with this option.

This option is supported only on z/OS.

If this option is specified, MQGMO\_SYNCPOINT must also be specified. MQGMO\_MARK\_SKIP\_BACKOUT is not valid with any of the following options:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
- MQGMO\_BROWSE\_NEXT
- MQGMO\_LOCK
- MQGMO\_NO\_SYNCPOINT
- MQGMO\_SYNCPOINT\_IF\_PERSISTENT
- MQGMO\_UNLOCK

**Note:** On IMS and CICS, you might have to issue an extran IBM MQ call after backing out a unit of work containing a message marked with MQGMO\_MARK\_SKIP\_BACKOUT. You must issue an IBM MQ call before you commit the new unit of work containing the marked message. The call can be any IBM MQ call you like.

1. On IMS, if you have not applied IMS APAR PN60855 and you are running an IMS MPP or BMP application.
2. On CICS, if you are running any application.

In both cases, issue any IBM MQ call before committing the new unit of work containing the backed out message.

**Note:** Within a unit of work, there can be only one get request marked as skipping backout, as well as none or several unmarked get requests.

If an application backs out of a unit of work, a message that was retrieved using MQGMO\_MARK\_SKIP\_BACKOUT is not restored to its previous state. Other resource updates are backed out. The message is treated as if it had been retrieved in a new unit of work started by the backout request. The message is retrieved without the MQGMO\_MARK\_SKIP\_BACKOUT option.

MQGMO\_MARK\_SKIP\_BACKOUT is useful if, after some resources have been changed, it becomes apparent that the unit of work cannot complete successfully. If you omit this option, backing out the unit of work reinstates the message on the queue. The same sequence of events occurs again, when the message is next retrieved.

However, if you specify MQGMO\_MARK\_SKIP\_BACKOUT on the original MQGET call, backing out the unit of work backs out the updates to the other resources. The message is treated as if it had been retrieved under a new unit of work. The application can perform appropriate error handling. It can send a report message to the sender of the original message, or place the original message on the dead-letter queue. It can then commit the new unit of work. Committing the new unit of work removes the message permanently from the original queue.

MQGMO\_MARK\_SKIP\_BACKOUT marks a single physical message. If the message belongs to a message

group, the other messages in the group are not marked. Similarly, if the marked message is a segment of a logical message, the other segments in the logical message are not marked. Any message in a group can be marked, but if messages are retrieved using MQGMO\_LOGICAL\_ORDER, it is advantageous to mark the first message in the group. If the unit of work is backed out, the first (marked) message is moved to the new unit of work. The second and later messages in the group are reinstated on the queue. The messages left on the queue cannot be retrieved by another application using MQGMO\_LOGICAL\_ORDER. The first message in the group is no longer on the queue. However, the application that backed the unit of work out can retrieve the second and later messages into the new unit of work using the MQGMO\_LOGICAL\_ORDER option. The first message has been retrieved already.

Occasionally you might need to back out the new unit of work. For example, because the dead-letter queue is full and the message must not be discarded. Backing out the new unit of work reinstates the message on the original queue, which prevents the message being lost. However, in this situation processing cannot continue. After backing out the new unit of work, the application must inform the operator or administrator that there is an unrecoverable error, and then finish.

MQGMO\_MARK\_SKIP\_BACKOUT only works if the unit of work containing the get request is interrupted by the application backing it out. If the unit of work containing the get request is backed out because the transaction or system fails, MQGMO\_MARK\_SKIP\_BACKOUT is ignored. Any message retrieved using this option is reinstated on the queue in the same way as messages retrieved without this option.

**Browse options:** The following options relate to browsing messages on the queue:

#### **MQGMO\_BROWSE\_FIRST**

When a queue is opened with the MQOO\_BROWSE option, a browse cursor is established, positioned logically before the first message on the queue. You can then use MQGET calls specifying the MQGMO\_BROWSE\_FIRST, MQGMO\_BROWSE\_NEXT, or MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR option to retrieve messages from the queue nondestructively. The browse cursor marks the position, within the messages on the queue, from which the next MQGET call with MQGMO\_BROWSE\_NEXT searches for a suitable message.

MQGMO\_BROWSE\_FIRST is not valid with any of the following options:

- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
- MQGMO\_BROWSE\_NEXT
- MQGMO\_MARK\_SKIP\_BACKOUT
- MQGMO\_MSG\_UNDER\_CURSOR
- MQGMO\_SYNCPOINT
- MQGMO\_SYNCPOINT\_IF\_PERSISTENT
- MQGMO\_UNLOCK

It is also an error if the queue was not opened for browse.

An MQGET call with MQGMO\_BROWSE\_FIRST ignores the previous position of the browse cursor. The first message on the queue that satisfies the conditions specified in the message descriptor is retrieved. The message remains on the queue, and the browse cursor is positioned on this message.

After this call, the browse cursor is positioned on the message that has been returned. The message might be removed from the queue before the next MQGET call with MQGMO\_BROWSE\_NEXT is issued. In this case, the browse cursor remains at the position in the queue that the message occupied, even though that position is now empty.

Use the MQGMO\_MSG\_UNDER\_CURSOR option with a non-browse MQGET call, to remove the message from the queue.

The browse cursor is not moved by a non-browse MQGET call, even if using the same *Hobj* handle. Nor is it moved by a browse MQGET call that returns a completion code of MQCC\_FAILED, or a reason code of MQRC\_TRUNCATED\_MSG\_FAILED.

Specify the MQGMO\_LOCK option with this option, to lock the message that is browsed.

You can specify MQGMO\_BROWSE\_FIRST with any valid combination of the MQGMO\_\* and MQMO\_\* options that control the processing of messages in groups and segments of logical messages.

If you specify MQGMO\_LOGICAL\_ORDER, the messages are browsed in logical order. If you omit that option, the messages are browsed in physical order. If you specify MQGMO\_BROWSE\_FIRST, you can switch between logical order and physical order. Subsequent MQGET calls using MQGMO\_BROWSE\_NEXT browse the queue in the same order as the most recent call that specified MQGMO\_BROWSE\_FIRST for the queue handle.

The queue manager retains two sets of group and segment information for MQGET calls. The group and segment information for browse calls are retained separately from the information for calls that remove messages from the queue. If you specify MQGMO\_BROWSE\_FIRST, the queue manager ignores the group and segment information for browsing. It scans the queue as though there were no current group and no current logical message. If the MQGET call is successful, completion code MQCC\_OK or MQCC\_WARNING, the group and segment information for browsing is set to that of the message returned. If the call fails, the group and segment information remain the same as they were before the call.

#### **MQGMO\_BROWSE\_NEXT**

Advance the browse cursor to the next message on the queue that satisfies the selection criteria specified on the MQGET call. The message is returned to the application, but remains on the queue.

MQGMO\_BROWSE\_NEXT is not valid with any of the following options:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
- MQGMO\_MARK\_SKIP\_BACKOUT
- MQGMO\_MSG\_UNDER\_CURSOR
- MQGMO\_SYNCPOINT
- MQGMO\_SYNCPOINT\_IF\_PERSISTENT
- MQGMO\_UNLOCK

It is also an error if the queue was not opened for browse.

MQGMO\_BROWSE\_NEXT behaves the same way as MQGMO\_BROWSE\_FIRST, if it is the first call to browse a queue, after the queue has been opened for browse.

The message under cursor might be removed from the queue before the next MQGET call with MQGMO\_BROWSE\_NEXT is issued. The browse cursor logically remains at the position in the queue that the message occupied, even though that position is now empty.

Messages are stored on the queue in one of two ways:

- FIFO within priority (MQMDS\_PRIORITY), or
- FIFO *regardless* of priority (MQMDS\_FIFO)

The *MsgDeliverySequence* queue attribute indicates which method applies (see “Attributes for queues” on page 2625 for details).

A queue might have a *MsgDeliverySequence* of MQMDS\_PRIORITY. A message arrives on the queue that is of a higher priority than the one currently pointed to by the browse cursor. In which case, the higher priority message is not found during the current sweep of the queue using MQGMO\_BROWSE\_NEXT. It can be found only after the browse cursor has been reset with MQGMO\_BROWSE\_FIRST, or by reopening the queue.

The MQGMO\_MSG\_UNDER\_CURSOR option can be used with a non-browse MQGET call if required, to remove the message from the queue.

The browse cursor is not moved by non-browse MQGET calls using the same *Hobj* handle.

Specify the MQGMO\_LOCK option with this option to lock the message that is browsed. You can specify MQGMO\_BROWSE\_NEXT with any valid combination of the MQGMO\_\* and MQMO\_\* options that control the processing of messages in groups and segments of logical messages. If you specify MQGMO\_LOGICAL\_ORDER, the messages are browsed in logical order. If you omit that option, the messages are browsed in physical order. If you specify MQGMO\_BROWSE\_FIRST, you can switch between logical order and physical order. Subsequent MQGET calls using MQGMO\_BROWSE\_NEXT browse the queue in the same order as the most recent call that specified MQGMO\_BROWSE\_FIRST for the queue handle. The call fails with reason code MQRC\_INCONSISTENT\_BROWSE if this condition is not satisfied.

**Note:** Take special care when using an MQGET call to browse beyond the end of a message group if MQGMO\_LOGICAL\_ORDER is not specified. For example, suppose that the last message in the group precedes the first message in the group on the queue. Using MQGMO\_BROWSE\_NEXT to browse beyond the end of the group, specifying MQMO\_MATCH\_MSG\_SEQ\_NUMBER with *MsgSeqNumber* set to 1 returns the first message in the group already browsed. This result can happen immediately, or a number of MQGET calls later if there are intervening groups. The same consideration applies for a logical message not in a group.

The group and segment information for browse calls are retained separately from the information for calls that remove messages from the queue.

#### **MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR**

Retrieve the message pointed to by the browse cursor nondestructively, regardless of the MQMO\_\* options specified in the *MatchOptions* field in MQGMO.

MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR is not valid with any of the following options:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_NEXT
- MQGMO\_MARK\_SKIP\_BACKOUT
- MQGMO\_MSG\_UNDER\_CURSOR
- MQGMO\_SYNCPOINT
- MQGMO\_SYNCPOINT\_IF\_PERSISTENT
- MQGMO\_UNLOCK

It is also an error if the queue was not opened for browse.

The message pointed to by the browse cursor is the one that was last retrieved using either the MQGMO\_BROWSE\_FIRST or the MQGMO\_BROWSE\_NEXT option. The call fails if neither of these calls has been issued for this queue since it was opened. The call also fails if the message that was under the browse cursor has since been retrieved destructively.

The position of the browse cursor is not changed by this call.

The MQGMO\_MSG\_UNDER\_CURSOR option can be used with a non-browse MQGET call, to remove the message from the queue.

The browse cursor is not moved by a non-browse MQGET call, even if using the same *Hobj* handle. Nor is it moved by a browse MQGET call that returns a completion code of MQCC\_FAILED, or a reason code of MQRC\_TRUNCATED\_MSG\_FAILED.

If MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR is specified with MQGMO\_LOCK:

- If there is already a message locked, it must be the one under the cursor, so that is returned without unlocking and locking again. The message remains locked.
- If there is no locked message and there is a message under the browse cursor, it is locked and returned to the application. If there is no message under the browse cursor, the call fails.

If MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR is specified without MQGMO\_LOCK:

- If there is already a message locked, it must be the one under the cursor. The message is returned to the application and then unlocked. Because the message is now unlocked, there is

no guarantee that it can be browsed again, or retrieved destructively by the same application. It might have been retrieved destructively by another application getting messages from the queue.

- If there is no locked message and there is a message under the browse cursor, it is returned to the application. If there is no message under the browse cursor the call fails.

If MQGMO\_COMPLETE\_MSG is specified with MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR, the browse cursor must identify a message whose *Offset* field in MQMD is zero. If this condition is not satisfied, the call fails with reason code MQRC\_INVALID\_MSG\_UNDER\_CURSOR.

The group and segment information for browse calls are retained separately from the information for calls that remove messages from the queue.

#### **MQGMO\_MSG\_UNDER\_CURSOR**

Retrieve the message pointed to by the browse cursor, regardless of the MQMO\_\* options specified in the *MatchOptions* field in MQGMO. The message is removed from the queue.

The message pointed to by the browse cursor is the one that was last retrieved using either the MQGMO\_BROWSE\_FIRST or the MQGMO\_BROWSE\_NEXT option.

If MQGMO\_COMPLETE\_MSG is specified with MQGMO\_MSG\_UNDER\_CURSOR, the browse cursor must identify a message whose *Offset* field in MQMD is zero. If this condition is not satisfied, the call fails with reason code MQRC\_INVALID\_MSG\_UNDER\_CURSOR.

This option is not valid with any of the following options:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
- MQGMO\_BROWSE\_NEXT
- MQGMO\_UNLOCK

It is also an error if the queue was not opened both for browse and for input. If the browse cursor is not currently pointing to a retrievable message, an error is returned by the MQGET call.

#### **MQGMO\_MARK\_BROWSE\_HANDLE**

The message that is returned by a successful MQGET, or identified by the returned *MsgToken*, is marked. The mark is specific to the object handle used in the call.

The message is not removed from the queue.

MQGMO\_MARK\_BROWSE\_HANDLE is valid only if one of the following options is also specified:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
- MQGMO\_BROWSE\_NEXT

MQGMO\_MARK\_BROWSE\_HANDLE is not valid with any of the following options:

- MQGMO\_ALL\_MSGS\_AVAILABLE
- MQGMO\_ALL\_SEGMENTS\_AVAILABLE
- MQGMO\_COMPLETE\_MSG
- MQGMO\_LOCK
- MQGMO\_LOGICAL\_ORDER
- MQGMO\_UNLOCK

The message remains in this state until one of the following events occurs:

- The object handle concerned is closed, either normally or otherwise.
- The message is unmarked for this handle by a call to MQGET with the option MQGMO\_UNMARK\_BROWSE\_HANDLE.
- The message is returned from a call to destructive MQGET, which completes with MQCC\_OK or MQCC\_WARNING. The message state remains changed even if the MQGET is later rolled-back.

- The message expires.

#### **MQGMO\_MARK\_BROWSE\_CO\_OP**

The message that is returned by a successful MQGET, or identified by the returned *MsgToken*, is marked for all handles in the cooperating set.

The cooperative level mark is in addition to any handle level mark that might have been set.

The message is not removed from the queue.

MQGMO\_MARK\_BROWSE\_CO\_OP is valid only if the object handle used was returned by a call to MQOPEN that specified MQOO\_CO\_OP. You must also specify one of the following MQGMO options:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
- MQGMO\_BROWSE\_NEXT

This option is not valid with any of the following options:

- MQGMO\_ALL\_MSGS\_AVAILABLE
- MQGMO\_ALL\_SEGMENTS\_AVAILABLE
- MQGMO\_COMPLETE\_MSG
- MQGMO\_LOCK
- MQGMO\_LOGICAL\_ORDER
- MQGMO\_UNLOCK

If the message is already marked, and the option MQGMO\_UNMARKED\_BROWSE\_MSG is not specified, the call fails with MQCC\_FAILED and reason code MQRC\_MSG\_MARKED\_BROWSE\_CO\_OP.

The message remains in this state until one of the following events occurs:

- All object handles in the cooperating set are closed.
- The message is unmarked for cooperating browsers by a call to MQGET with the option MQGMO\_UNMARK\_BROWSE\_CO\_OP.
- The message is automatically unmarked by the queue manager.
- The message is returned from a call to a non-browse MQGET. The message state remains changed even if the MQGET is later rolled-back.
- The message expires.

#### **MQGMO\_UNMARKED\_BROWSE\_MSG**

A call to MQGET that specifies MQGMO\_UNMARKED\_BROWSE\_MSG returns a message that is considered to be unmarked for its handle. It does not return a message if the message was marked for its handle. It also does not return the message if the queue was opened by a call to MQOPEN, with the option MQOO\_CO\_OP, and the message has been marked by a member of the cooperating set.

This option is not valid with any of the following options:

- MQGMO\_ALL\_MSGS\_AVAILABLE
- MQGMO\_ALL\_SEGMENTS\_AVAILABLE
- MQGMO\_COMPLETE\_MSG
- MQGMO\_LOCK
- MQGMO\_LOGICAL\_ORDER
- MQGMO\_UNLOCK

#### **MQGMO\_UNMARK\_BROWSE\_CO\_OP**

After a call to MQGET that specifies this option, the message is no longer considered by any open handles in the set of cooperating handles to be marked for the cooperating set. The message is still considered to be marked at handle level if it was marked at handle level before this call.

Using MQGMO\_UNMARK\_BROWSE\_CO\_OP is valid only with a handle returned by a successful call to MQOPEN with the option MQOO\_CO\_OP. The MQGET succeeds even if the message is not considered to be marked by the cooperating set of handles.

MQGMO\_UNMARK\_BROWSE\_CO\_OP is not valid on a non-browse MQGET call, or with any of the following options:

- MQGMO\_ALL\_MSGS\_AVAILABLE
- MQGMO\_ALL\_SEGMENTS\_AVAILABLE
- MQGMO\_COMPLETE\_MSG
- MQGMO\_LOCK
- MQGMO\_LOGICAL\_ORDER
- MQGMO\_MARK\_BROWSE\_CO\_OP
- MQGMO\_UNLOCK
- MQGMO\_UNMARKED\_BROWSE\_MSG

#### **MQGMO\_UNMARK\_BROWSE\_HANDLE**

After a call to MQGET that specifies this option, the message located is no longer considered to be marked by this handle.

The call succeeds even if the message is not marked for this handle.

This option is not valid on a non-browse MQGET call, or with any of the following options:

- MQGMO\_ALL\_MSGS\_AVAILABLE
- MQGMO\_ALL\_SEGMENTS\_AVAILABLE
- MQGMO\_COMPLETE\_MSG
- MQGMO\_LOCK
- MQGMO\_LOGICAL\_ORDER
- MQGMO\_MARK\_BROWSE\_CO\_OP
- MQGMO\_UNLOCK
- MQGMO\_UNMARKED\_BROWSE\_MSG

**Lock options:** The following options relate to locking messages on the queue:

#### **MQGMO\_LOCK**

Lock the message that is browsed, so that the message becomes invisible to any other handle open for the queue. The option can be specified only if one of the following options is also specified:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_NEXT
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR

Only one message can be locked for each queue handle. The message can be a logical message or a physical message:

- If you specify MQGMO\_COMPLETE\_MSG, all the message segments that make up the logical message are locked to the queue handle. The messages must all be present on the queue and available for retrieval.
- If you omit MQGMO\_COMPLETE\_MSG, only a single physical message is locked to the queue handle. If this message happens to be a segment of a logical message, the locked segment prevents other applications using MQGMO\_COMPLETE\_MSG to retrieve or browse the logical message.

The locked message is always the one under the browse cursor. The message can be removed from the queue by a later MQGET call that specifies the MQGMO\_MSG\_UNDER\_CURSOR option. Other MQGET calls using the queue handle can also remove the message (for example, a call that specifies the message identifier of the locked message).

If the call returns completion code MQCC\_FAILED, or MQCC\_WARNING with reason code MQRC\_TRUNCATED\_MSG\_FAILED, no message is locked.

If the application does not remove the message from the queue, the lock is released by one of the following actions:

- Issuing another MQGET call for this handle, specifying either MQGMO\_BROWSE\_FIRST or MQGMO\_BROWSE\_NEXT. The lock is released if the call completes with MQCC\_OK or MQCC\_WARNING. The message remains locked if the call completes with MQCC\_FAILED. However, the following exceptions apply:
  - The message is not unlocked if MQCC\_WARNING is returned with MQRC\_TRUNCATED\_MSG\_FAILED.
  - The message is unlocked if MQCC\_FAILED is returned with MQRC\_NO\_MSG\_AVAILABLE.

If you also specify MQGMO\_LOCK, the message returned is locked. If you omit MQGMO\_LOCK, there is no locked message after the call.

If you specify MQGMO\_WAIT, and no message is immediately available, the original message is unlocked before the start of the wait.

- Issuing another MQGET call for this handle, with MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR, without MQGMO\_LOCK. The lock is released if the call completes with MQCC\_OK or MQCC\_WARNING. The message remains locked if the call completes with MQCC\_FAILED. However, the following exception applies:
  - The message is not unlocked if MQCC\_WARNING is returned with MQRC\_TRUNCATED\_MSG\_FAILED.
- Issuing another MQGET call for this handle with MQGMO\_UNLOCK.
- Issuing an MQCLOSE call using the handle. The MQCLOSE might be implicit, caused by the application ending.

No special MQOPEN option is required to specify MQGMO\_LOCK, other than MQOO\_BROWSE, which is needed to specify an accompanying browse option.

MQGMO\_LOCK is not valid with any of the following options:

- MQGMO\_MARK\_SKIP\_BACKOUT
- MQGMO\_SYNCPOINT
- MQGMO\_SYNCPOINT\_IF\_PERSISTENT
- MQGMO\_UNLOCK

MQGMO\_LOCK is not possible when you are using an IBM MQ client on HP Integrity NonStop Server to a z/OS queue manager when coordinated by TMF.

### **MQGMO\_UNLOCK**

The message to be unlocked must have been previously locked by an MQGET call with the MQGMO\_LOCK option. If there is no message locked for this handle, the call completes with MQCC\_WARNING and MQRC\_NO\_MSG\_LOCKED.

The *MsgDesc*, *BufferLength*, *Buffer*, and *DataLength* parameters are not checked or altered if you specify MQGMO\_UNLOCK. No message is returned in *Buffer*.

No special open option is required to specify MQGMO\_UNLOCK (although MQOO\_BROWSE is needed to issue the lock request in the first place).

This option is not valid with any options except the following:

- MQGMO\_NO\_WAIT
- MQGMO\_NO\_SYNCPOINT

Both of these options are assumed whether specified or not.

**Message-data options:** The following options relate to the processing of the message data when the message is read from the queue:

### MQGMO\_ACCEPT\_TRUNCATED\_MSG

If the message buffer is too small to hold the complete message, allow the MQGET call to fill the buffer. MQGET fills the buffer with as much of the message it can. It issues a warning completion code, and completes its processing. This means that:

- When browsing messages, the browse cursor is advanced to the returned message.
- When removing messages, the returned message is removed from the queue.
- Reason code MQRC\_TRUNCATED\_MSG\_ACCEPTED is returned if no other error occurs.

Without this option, the buffer is still filled with as much of the message as it can hold. A warning completion code is issued, but processing is not completed. This means that:

- When browsing messages, the browse cursor is not advanced.
- When removing messages, the message is not removed from the queue.
- Reason code MQRC\_TRUNCATED\_MSG\_FAILED is returned if no other error occurs.

### MQGMO\_CONVERT

This option converts the application data in the message to conform to the *CodedCharSetId* and *Encoding* values specified in the *MsgDesc* parameter on the MQGET call. The data is converted before it is copied to the *Buffer* parameter.

The *Format* field specified when the message was put is assumed by the conversion process to identify the nature of the data in the message. The message data is converted by the queue manager for built-in formats, and by a user-written exit for other formats. See “Data conversion” on page 2701 for details of the data-conversion exit.

- If conversion is successful, the *CodedCharSetId* and *Encoding* fields specified in the *MsgDesc* parameter are unchanged on return from the MQGET call.
- If only conversion fails the message data is returned unconverted. The *CodedCharSetId* and *Encoding* fields in *MsgDesc* are set to the values for the unconverted message. The completion code is MQCC\_WARNING in this case.

In either case, these fields describe the character-set identifier and encoding of the message data that is returned in the *Buffer* parameter.

See the *Format* field described in “MQMD - Message descriptor” on page 2179 for a list of format names for which the queue manager performs the conversion.

**Group and segment options:** The following options relate to the processing of messages in groups and segments of logical messages. Before the option descriptions, here are some definitions of important terms:

#### Physical message

A physical message is the smallest unit of information that can be placed on or removed from a queue. It often corresponds to the information specified or retrieved on a single MQPUT, MQPUT1, or MQGET call. Every physical message has its own message descriptor, MQMD. Typically, physical messages are distinguished by differing values for the message identifier, the *MsgId* field in MQMD. The queue manager does not enforce different values.

#### Logical message

A logical message is a single unit of application information. In the absence of system constraints, a logical message is the same as a physical message. If logical messages are large, system constraints might make it advisable or necessary to split a logical message into two or more physical messages, called segments.

A logical message that has been segmented consists of two or more physical messages that have the same nonnull group identifier, *GroupId* field in MQMD. They have the same message sequence number, *MsgSeqNumber* field in MQMD. The segments are distinguished by differing values for the segment offset, *Offset* field in MQMD. The segment offset is the offset of the data in the physical message from the start of the data in the logical message. Because each segment is a physical message, the segments in a logical message typically have different message identifiers.

A logical message that has not been segmented, but for which segmentation has been permitted by the sending application, also has a nonnull group identifier. In this case there is only one physical message with that group identifier if the logical message does not belong to a message group. Logical messages, for which segmentation has been inhibited by the sending application, have a null group identifier, MQGI\_NONE, unless the logical message belongs to a message group.

### Message group

A message group is a set of one or more logical messages that have the same nonnull group identifier. The logical messages in the group are distinguished by different values for the message sequence number. The sequence number is an integer in the range 1 through n, where n is the number of logical messages in the group. If one or more of the logical messages is segmented, there are more than n physical messages in the group.

### MQGMO\_LOGICAL\_ORDER

MQGMO\_LOGICAL\_ORDER controls the order in which messages are returned by successive MQGET calls for the queue handle. The option must be specified on each call.

If MQGMO\_LOGICAL\_ORDER is specified for successive MQGET calls for the same queue handle, messages in groups are returned in the order of their message sequence numbers. Segments of logical messages are returned in the order given by their segment offsets. This order might be different from the order in which those messages and segments occur on the queue.

**Note:** Specifying MQGMO\_LOGICAL\_ORDER has no adverse consequences on messages that do not belong to groups and that are not segments. In effect, such messages are treated as though each belonged to a message group consisting of only one message. It is safe to specify MQGMO\_LOGICAL\_ORDER when retrieving messages from queues that contain a mixture of messages in groups, message segments, and unsegmented messages not in groups.

To return the messages in the required order, the queue manager retains the group and segment information between successive MQGET calls. The group and segment information identifies the current message group and current logical message for the queue handle. It also identifies the current position within the group and logical message, and whether the messages are being retrieved within a unit of work. Because the queue manager retains this information, the application does not need to set the group and segment information before each MQGET call. Specifically, it means that the application does not need to set the *GroupId*, *MsgSeqNumber*, and *Offset* fields in MQMD. However, the application must set the MQGMO\_SYNCPOINT or MQGMO\_NO\_SYNCPOINT option correctly on each call.

When the queue is opened, there is no current message group and no current logical message. A message group becomes the current message group when a message that has the MQMF\_MSG\_IN\_GROUP flag is returned by the MQGET call. With MQGMO\_LOGICAL\_ORDER specified on successive calls, that group remains the current group until a message is returned that has:

- MQMF\_LAST\_MSG\_IN\_GROUP without MQMF\_SEGMENT (that is, the last logical message in the group is not segmented), or
- MQMF\_LAST\_MSG\_IN\_GROUP with MQMF\_LAST\_SEGMENT (that is, the message returned is the last segment of the last logical message in the group).

When such a message is returned, the message group is terminated, and on successful completion of the MQGET call there is no longer a current group. In a similar way, a logical message becomes the current logical message when a message that has the MQMF\_SEGMENT flag is returned by the MQGET call. The logical message is terminated when the message that has the MQMF\_LAST\_SEGMENT flag is returned.

If no selection criteria are specified, successive MQGET calls return, in the correct order, the messages for the first message group on the queue. They then return the messages for the second message group, and so on, until there are no more messages available. It is possible to select the particular message groups returned by specifying one or more of the following options in the *MatchOptions* field:

- MQMO\_MATCH\_MSG\_ID

- MQMO\_MATCH\_CORREL\_ID
- MQMO\_MATCH\_GROUP\_ID

However, these options are effective only when there is no current message group or logical message. See the *MatchOptions* field described in “MQGMO - Get-message options” on page 2128 for further details.

Table 188 shows the values of the *MsgId*, *CorrelId*, *GroupId*, *MsgSeqNumber*, and *Offset* fields that the queue manager looks for when attempting to find a message to return on the MQGET call. The rules apply both to removing messages from the queue, and browsing messages on the queue. In the table, Either means Yes or No:

**LOG ORD**

Indicates whether the MQGMO\_LOGICAL\_ORDER option is specified on the call.

**Cur grp**

Indicates whether a current message group exists before the call.

**Cur log msg**

Indicates whether a current logical message exists before the call.

**Other columns**

Show the values that the queue manager looks for. Previous denotes the value returned for the field in the previous message for the queue handle.

Table 188. MQGET options relating to messages in groups and segments of logical messages

Options you specify	Group and log-msg status before call		Values the queue manager looks for				
	LOG ORD	Cur grp	Cur log msg	<i>MsgId</i>	<i>CorrelId</i>	<i>GroupId</i>	<i>MsgSeqNumber</i>
Yes	No	No	Controlled by <i>MatchOptions</i>	Controlled by <i>MatchOptions</i>	Controlled by <i>MatchOptions</i>	1	0
Yes	No	Yes	Any message identifier	Any correlation identifier	Previous group identifier	1	Previous offset + previous segment length
Yes	Yes	No	Any message identifier	Any correlation identifier	Previous group identifier	Previous sequence number + 1	0
Yes	Yes	Yes	Any message identifier	Any correlation identifier	Previous group identifier	Previous sequence number	Previous offset + previous segment length
No	Either	Either	Controlled by <i>MatchOptions</i>	Controlled by <i>MatchOptions</i>	Controlled by <i>MatchOptions</i>	Controlled by <i>MatchOptions</i>	Controlled by <i>MatchOptions</i>

If multiple message groups are present on the queue and eligible for return, the groups are returned in the order determined by the position on the queue of the first segment of the first logical message in each group. That is, the physical messages that have message sequence numbers of 1, and offsets of 0, determine the order in which eligible groups are returned.

The MQGMO\_LOGICAL\_ORDER option affects units of work as follows:

- If the first logical message or segment in a group is retrieved within a unit of work, all the other logical messages and segments in the group must be retrieved within a unit of work, if the same queue handle is used. However, they need not be retrieved within the same unit of work. This allows a message group consisting of many physical messages to be split across two or more consecutive units of work for the queue handle.

- If the first logical message or segment in a group is *not* retrieved within a unit of work, and the same queue handle is used, none of the other logical messages and segments in the group can be retrieved within a unit of work.

If these conditions are not satisfied, the MQGET call fails with reason code MQRC\_INCONSISTENT\_UOW.

When MQGMO\_LOGICAL\_ORDER is specified, the MQGMO supplied on the MQGET call must not be less than MQGMO\_VERSION\_2, and the MQMD must not be less than MQMD\_VERSION\_2. If this condition is not satisfied, the call fails with reason code MQRC\_WRONG\_GMO\_VERSION or MQRC\_WRONG\_MD\_VERSION, as appropriate.

If MQGMO\_LOGICAL\_ORDER is *not* specified for successive MQGET calls for the queue handle, messages are returned without regard for whether they belong to message groups, or whether they are segments of logical messages. This means that messages or segments from a particular group or logical message might be returned out of order, or intermingled with messages or segments from other groups or logical messages, or with messages that are not in groups and are not segments. In this situation, the particular messages that are returned by successive MQGET calls is controlled by the MQMO\_\* options specified on those calls (see the *MatchOptions* field described in “MQGMO - Get-message options” on page 2128 for details of these options).

This is the technique that can be used to restart a message group or logical message in the middle, after a system failure has occurred. When the system restarts, the application can set the *GroupId*, *MsgSeqNumber*, *Offset*, and *MatchOptions* fields to the appropriate values, and then issue the MQGET call with MQGMO\_SYNCPOINT or MQGMO\_NO\_SYNCPOINT set, but *without* specifying MQGMO\_LOGICAL\_ORDER. If this call is successful, the queue manager retains the group and segment information, and subsequent MQGET calls using that queue handle can specify MQGMO\_LOGICAL\_ORDER as normal.

The group and segment information that the queue manager retains for the MQGET call is separate from the group and segment information that it retains for the MQPUT call. In addition, the queue manager retains separate information for:

- MQGET calls that remove messages from the queue.
- MQGET calls that browse messages on the queue.

For any given queue handle, the application can mix MQGET calls that specify MQGMO\_LOGICAL\_ORDER with MQGET calls that do not. However, note the following points:

- If you omit MQGMO\_LOGICAL\_ORDER, each successful MQGET call causes the queue manager to set the saved group and segment information to the values corresponding to the message returned; this replaces the existing group and segment information retained by the queue manager for the queue handle. Only the information appropriate to the action of the call (browse or remove) is modified.
- If you omit MQGMO\_LOGICAL\_ORDER, the call does not fail if there is a current message group or logical message; the call might succeed with an MQCC\_WARNING completion code. Table 189 on page 2149 shows the various cases that can arise. In these cases, if the completion code is not MQCC\_OK, the reason code is one of the following (as appropriate):
  - MQRC\_INCOMPLETE\_GROUP
  - MQRC\_INCOMPLETE\_MSG
  - MQRC\_INCONSISTENT\_UOW

**Note:** The queue manager does not check the group and segment information when browsing a queue, or when closing a queue that was opened for browse but not input; in those cases the completion code is always MQCC\_OK (assuming no other errors).

Table 189. Outcome when MQGET or MQCLOSE call is not consistent with group and segment information

Current call is	Previous call was MQGET with MQGMO_LOGICAL_ORDER	Previous call was MQGET without MQGMO_LOGICAL_ORDER
MQGET with MQGMO_LOGICAL_ORDER	MQCC_FAILED	MQCC_FAILED
MQGET without MQGMO_LOGICAL_ORDER	MQCC_WARNING	MQCC_OK
MQCLOSE with an unterminated group or logical message	MQCC_WARNING	MQCC_OK

Applications that want to retrieve messages and segments in logical order are recommended to specify MQGMO\_LOGICAL\_ORDER, as this is the simplest option to use. This option relieves the application of the need to manage the group and segment information, because the queue manager manages that information. However, specialized applications might need more control than that provided by the MQGMO\_LOGICAL\_ORDER option, and this can be achieved by not specifying that option. The application must then ensure that the *MsgId*, *CorrelId*, *GroupId*, *MsgSeqNumber*, and *Offset* fields in MQMD, and the MQMO\_\* options in *MatchOptions* in MQGMO, are set correctly, before each MQGET call.

For example, an application that wants to *forward* physical messages that it receives, without regard for whether those messages are in groups or segments of logical messages, must *not* specify MQGMO\_LOGICAL\_ORDER. In a complex network with multiple paths between sending and receiving queue managers, the physical messages might arrive out of order. By specifying neither MQGMO\_LOGICAL\_ORDER, nor the corresponding MQPMO\_LOGICAL\_ORDER on the MQPUT call, the forwarding application can retrieve and forward each physical message as soon as it arrives, without having to wait for the next one in logical order to arrive.

You can specify MQGMO\_LOGICAL\_ORDER with any of the other MQGMO\_\* options, and with various of the MQMO\_\* options in appropriate circumstances (see preceding section).

- On z/OS, this option is supported for private and shared queues, but the queue must have an index type of MQIT\_GROUP\_ID. For shared queues, the CFSTRUCT object that the queue maps to must be at CFLEVEL(3) or higher.
- On AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems, this option is supported for all local queues.

#### MQGMO\_COMPLETE\_MSG

Only a complete logical message can be returned by the MQGET call. If the logical message is segmented, the queue manager reassembles the segments and returns the complete logical message to the application; the fact that the logical message was segmented is not apparent to the application retrieving it.

**Note:** This is the only option that causes the queue manager to reassemble message segments. If not specified, segments are returned individually to the application if they are present on the queue (and they satisfy the other selection criteria specified on the MQGET call). Applications that do not want to receive individual segments must always specify MQGMO\_COMPLETE\_MSG.

To use this option, the application must provide a buffer that is big enough to accommodate the complete message, or specify the MQGMO\_ACCEPT\_TRUNCATED\_MSG option.

If the queue contains segmented messages with some of the segments missing (perhaps because they have been delayed in the network and have not yet arrived), specifying MQGMO\_COMPLETE\_MSG prevents the retrieval of segments belonging to incomplete logical messages. However, those message segments still contribute to the value of the *CurrentQDepth* queue attribute; this means that there might be no retrievable logical messages, even though *CurrentQDepth* is greater than zero.

For *persistent* messages, the queue manager can reassemble the segments only within a unit of work:

- If the MQGET call is operating within a user-defined unit of work, that unit of work is used. If the call fails during the reassembly process, the queue manager reinstates on the queue any segments that were removed during reassembly. However, the failure does not prevent the unit of work being committed successfully.
- If the call is operating outside a user-defined unit of work, and there is no user-defined unit of work in existence, the queue manager creates a unit of work for the duration of the call. If the call is successful, the queue manager commits the unit of work automatically (the application does not need to do this). If the call fails, the queue manager backs out the unit of work.
- If the call is operating outside a user-defined unit of work, but a user-defined unit of work exists, the queue manager cannot reassemble. If the message does not require reassembly, the call can still succeed. But if the message requires reassembly, the call fails with reason code MQRC\_UOW\_NOT\_AVAILABLE.

For *nonpersistent* messages, the queue manager does not require a unit of work to be available to perform reassembly.

Each physical message that is a segment has its own message descriptor. For the segments constituting a single logical message, most of the fields in the message descriptor are the same for all segments in the logical message; typically it is only the *MsgId*, *Offset*, and *MsgFlags* fields that differ between segments in the logical message. However, if a segment is placed on a dead-letter queue at an intermediate queue manager, the DLQ handler retrieves the message specifying the MQGMO\_CONVERT option, and this can result in the character set or encoding of the segment being changed. If the DLQ handler successfully sends the segment on its way, the segment might have a character set or encoding that differs from the other segments in the logical message when the segment arrives at the destination queue manager.

A logical message consisting of segments in which the *CodedCharSetId* and *Encoding* fields differ cannot be reassembled by the queue manager into a single logical message. Instead, the queue manager reassembles and returns the first few consecutive segments at the start of the logical message that have the same character-set identifiers and encodings, and the MQGET call completes with completion code MQCC\_WARNING and reason code MQRC\_INCONSISTENT\_CCSDS or MQRC\_INCONSISTENT\_ENCODINGS, as appropriate. This happens regardless of whether MQGMO\_CONVERT is specified. To retrieve the remaining segments, the application must reissue the MQGET call without the MQGMO\_COMPLETE\_MSG option, retrieving the segments one by one. MQGMO\_LOGICAL\_ORDER can be used to retrieve the remaining segments in order.

An application that puts segments can also set other fields in the message descriptor to values that differ between segments. However, there is no advantage in doing this if the receiving application uses MQGMO\_COMPLETE\_MSG to retrieve the logical message. When the queue manager reassembles a logical message, it returns in the message descriptor the values from the message descriptor for the *first* segment; the only exception is the *MsgFlags* field, which the queue manager sets to indicate that the reassembled message is the only segment.

If MQGMO\_COMPLETE\_MSG is specified for a report message, the queue manager performs special processing. The queue manager checks the queue to see if all the report messages of that report type relating to the different segments in the logical message are present on the queue. If they are, they can be retrieved as a single message by specifying MQGMO\_COMPLETE\_MSG. For this to be possible, either the report messages must be generated by a queue manager or MCA which supports segmentation, or the originating application must request at least 100 bytes of message data (that is, the appropriate MQRO\_\*\_WITH\_DATA or MQRO\_\*\_WITH\_FULL\_DATA options must be specified). If less than the full amount of application data is present for a segment, the missing bytes are replaced by nulls in the report message returned.

If MQGMO\_COMPLETE\_MSG is specified with MQGMO\_MSG\_UNDER\_CURSOR or MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR, the browse cursor must be positioned on a message whose *Offset* field in MQMD has a value of 0. If this condition is not satisfied, the call fails with reason code MQRC\_INVALID\_MSG\_UNDER\_CURSOR.

MQGMO\_COMPLETE\_MSG implies MQGMO\_ALL\_SEGMENTS\_AVAILABLE, which need not therefore be specified.

MQGMO\_COMPLETE\_MSG can be specified with any of the other MQGMO\_\* options apart from MQGMO\_SYNCPOINT\_IF\_PERSISTENT, and with any of the MQMO\_\* options apart from MQMO\_MATCH\_OFFSET.

- On z/OS, this option is supported for private and shared queues, but the queue must have an index type of MQIT\_GROUP\_ID. For shared queues, the CFSTRUCT object that the queue map to must be at CFLEVEL(3) or higher.
- On AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems, this option is supported for all local queues.

### **MQGMO\_ALL\_MSGS\_AVAILABLE**

Messages in a group become available for retrieval only when *all* messages in the group are available. If the queue contains message groups with some of the messages missing (perhaps because they have been delayed in the network and have not yet arrived), specifying MQGMO\_ALL\_MSGS\_AVAILABLE prevents retrieval of messages belonging to incomplete groups. However, those messages still contribute to the value of the *CurrentQDepth* queue attribute; this means that there may be no retrievable message groups, even though *CurrentQDepth* is greater than zero. If there are no other messages that are retrievable, reason code MQRC\_NO\_MSG\_AVAILABLE is returned after the specified wait interval (if any) has expired.

The processing of MQGMO\_ALL\_MSGS\_AVAILABLE depends on whether MQGMO\_LOGICAL\_ORDER is also specified:

- If both options are specified, MQGMO\_ALL\_MSGS\_AVAILABLE has an effect *only* when there is no current group or logical message. If there *is* a current group or logical message, MQGMO\_ALL\_MSGS\_AVAILABLE is ignored. This means that MQGMO\_ALL\_MSGS\_AVAILABLE can remain on when processing messages in logical order.
- If MQGMO\_ALL\_MSGS\_AVAILABLE is specified without MQGMO\_LOGICAL\_ORDER, MQGMO\_ALL\_MSGS\_AVAILABLE *always* has an effect. This means that the option must be turned off after the first message in the group has been removed from the queue, in order to be able to remove the remaining messages in the group.

Successful completion of an MQGET call specifying MQGMO\_ALL\_MSGS\_AVAILABLE means that at the time that the MQGET call was issued, all the messages in the group were on the queue. However, be aware that other applications can still remove messages from the group (the group is not locked to the application that retrieves the first message in the group).

If you omit this option, messages belonging to groups can be retrieved even when the group is incomplete.

MQGMO\_ALL\_MSGS\_AVAILABLE implies MQGMO\_ALL\_SEGMENTS\_AVAILABLE, which need not therefore be specified.

MQGMO\_ALL\_MSGS\_AVAILABLE can be specified with any of the other MQGMO\_\* options, and with any of the MQMO\_\* options.

- On z/OS, this option is supported for private and shared queues, but the queue must have an index type of MQIT\_GROUP\_ID. For shared queues, the CFSTRUCT object that the queue map to must be at CFLEVEL(3) or higher.
- On AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems, this option is supported for all local queues.

### **MQGMO\_ALL\_SEGMENTS\_AVAILABLE**

Segments in a logical message become available for retrieval only when *all* segments in the logical message are available. If the queue contains segmented messages with some of the segments missing (perhaps because they have been delayed in the network and have not yet arrived), specifying MQGMO\_ALL\_SEGMENTS\_AVAILABLE prevents retrieval of segments belonging to incomplete logical messages. However, those segments still contribute to the value of the *CurrentQDepth*

queue attribute; this means that there might be no retrievable logical messages, even though *CurrentQDepth* is greater than zero. If there are no other messages that are retrievable, reason code MQRC\_NO\_MSG\_AVAILABLE is returned after the specified wait interval (if any) has expired.

The processing of MQGMO\_ALL\_SEGMENTS\_AVAILABLE depends on whether MQGMO\_LOGICAL\_ORDER is also specified:

- If both options are specified, MQGMO\_ALL\_SEGMENTS\_AVAILABLE has an effect *only* when there is no current logical message. If there *is* a current logical message, MQGMO\_ALL\_SEGMENTS\_AVAILABLE is ignored. This means that MQGMO\_ALL\_SEGMENTS\_AVAILABLE can remain on when processing messages in logical order.
- If MQGMO\_ALL\_SEGMENTS\_AVAILABLE is specified without MQGMO\_LOGICAL\_ORDER, MQGMO\_ALL\_SEGMENTS\_AVAILABLE *always* has an effect. This means that the option must be turned off after the first segment in the logical message has been removed from the queue, in order to be able to remove the remaining segments in the logical message.

If this option is not specified, message segments can be retrieved even when the logical message is incomplete.

While both MQGMO\_COMPLETE\_MSG and MQGMO\_ALL\_SEGMENTS\_AVAILABLE require all segments to be available before any of them can be retrieved, the former returns the complete message, whereas the latter allows the segments to be retrieved one by one.

If MQGMO\_ALL\_SEGMENTS\_AVAILABLE is specified for a report message, the queue manager checks the queue to see if there is at least one report message for each of the segments that make up the complete logical message. If there is, the MQGMO\_ALL\_SEGMENTS\_AVAILABLE condition is satisfied. However, the queue manager does not check the *type* of the report messages present, and so there might be a mixture of report types in the report messages relating to the segments of the logical message. As a result, the success of MQGMO\_ALL\_SEGMENTS\_AVAILABLE does not imply that MQGMO\_COMPLETE\_MSG will succeed. If there *is* a mixture of report types present for the segments of a particular logical message, those report messages must be retrieved one by one.

You can specify MQGMO\_ALL\_SEGMENTS\_AVAILABLE with any of the other MQGMO\_\* options, and with any of the MQMO\_\* options.

- On z/OS, this option is supported for private and shared queues, but the queue must have an index type of MQIT\_GROUP\_ID. For shared queues, the CFSTRUCT object that the queue map to must be at CFLEVEL(3) or higher.
- On AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems, this option is supported for all local queues.

**Property options:** The following options relate to the properties of the message:

#### **MQGMO\_PROPERTIES\_AS\_Q\_DEF**

Properties of the message, except those contained in the message descriptor (or extension) should be represented as defined by the *PropertyControl* queue attribute. If a *MsgHandle* is provided this option is ignored and the properties of the message are available via the *MsgHandle*, unless the value of the *PropertyControl* queue attribute is MQPROP\_FORCE\_MQRFH2.

This is the default action if no property options are specified.

#### **MQGMO\_PROPERTIES\_IN\_HANDLE**

Properties of the message should be made available via the *MsgHandle*. If no message handle is provided the call fails with reason MQRC\_HMSG\_ERROR.

**Note:** If the message is later read by an application that does not create a message handle, the queue manager places any message properties into an MQRFH2 structure. You might find that the presence of an unexpected MQRFH2 header disrupts the behavior of an existing application.

#### **MQGMO\_NO\_PROPERTIES**

No properties of the message, except those contained in the message descriptor (or extension) will be retrieved. If a *MsgHandle* is provided it will be ignored.

#### **MQGMO\_PROPERTIES\_FORCE\_MQRFH2**

Properties of the message, except those contained in the message descriptor (or extension) should be represented using MQRFH2 headers. This provides compatibility with earlier version for applications which are expecting to retrieve properties but are unable to be changed to use message handles. If a *MsgHandle* is provided it is ignored.

#### **MQGMO\_PROPERTIES\_COMPATIBILITY**

If the message contains a property with a prefix of "mcd.", "jms.", "usr.", or "mqext.", all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application.

**Default option:** If none of the options described is required, the following option can be used:

#### **MQGMO\_NONE**

Use this value to indicate that no other options have been specified; all options assume their default values. MQGMO\_NONE aids program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

The initial value of the *Options* field is MQGMO\_NO\_WAIT plus MQGMO\_PROPERTIES\_AS\_Q\_DEF.

*Reserved1 (MQCHAR):*

This is a reserved field. The initial value of this field is a blank character. This field is ignored if *Version* is less than MQGMO\_VERSION\_2.

*Reserved2 (MQLONG):*

This is a reserved field. The initial value of this field is a blank character. This field is ignored if *Version* is less than MQGMO\_VERSION\_4.

*ResolvedQName (MQCHAR48):*

This is an output field that the queue manager sets to the local name of the queue from which the message was retrieved, as defined to the local queue manager. This is different from the name used to open the queue if:

- An alias queue was opened (in which case, the name of the local queue to which the alias resolved is returned), or
- A model queue was opened (in which case, the name of the dynamic local queue is returned).

The length of this field is given by MQ\_Q\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ReturnedLength* (MQLONG):

This is an output field that the queue manager sets to the length in bytes of the message data returned by the MQGET call in the *Buffer* parameter. If the queue manager does not support this capability, *ReturnedLength* is set to the value MQRL\_UNDEFINED.

When messages are converted between encodings or character sets, the message data can sometimes change size. On return from the MQGET call:

- If *ReturnedLength* is *not* MQRL\_UNDEFINED, the number of bytes of message data returned is given by *ReturnedLength*.
- If *ReturnedLength* has the value MQRL\_UNDEFINED, the number of bytes of message data returned is usually given by the smaller of *BufferLength* and *DataLength*, but can be *less than* this if the MQGET call completes with reason code MQRC\_TRUNCATED\_MSG\_ACCEPTED. If this happens, the insignificant bytes in the *Buffer* parameter are set to nulls.

The following special value is defined:

**MQRL\_UNDEFINED**

Length of returned data not defined.

On z/OS, the value returned for the *ReturnedLength* field is always MQRL\_UNDEFINED.

The initial value of this field is MQRL\_UNDEFINED. This field is ignored if *Version* is less than MQGMO\_VERSION\_3.

*Segmentation* (MQCHAR):

This is a flag that indicates whether further segmentation is allowed for the message retrieved. It has one of the following values:

**MQSEG\_INHIBITED**

Segmentation not allowed.

**MQSEG\_ALLOWED**

Segmentation allowed.

On z/OS, the queue manager always sets this field to MQSEG\_INHIBITED.

This is an output field. The initial value of this field is MQSEG\_INHIBITED. This field is ignored if *Version* is less than MQGMO\_VERSION\_2.

*SegmentStatus* (MQCHAR):

This is a flag that indicates whether the message retrieved is a segment of a logical message. It has one of the following values:

**MQSS\_NOT\_A\_SEGMENT**

Message is not a segment.

**MQSS\_SEGMENT**

Message is a segment, but is not the last segment of the logical message.

**MQSS\_LAST\_SEGMENT**

Message is the last segment of the logical message.

This is also the value returned if the logical message consists of only one segment.

On z/OS, the queue manager always sets this field to MQSS\_NOT\_A\_SEGMENT.

This is an output field. The initial value of this field is MQSS\_NOT\_A\_SEGMENT. This field is ignored if *Version* is less than MQGMO\_VERSION\_2.

*Signal1 (MQLONG):*

This is an input field that is used only in conjunction with the MQGMO\_SET\_SIGNAL option; it identifies a signal that is to be delivered when a message is available.

**Note:** The data type and usage of this field are determined by the environment; for this reason, applications that you want to port between different environments must not use signals.

- On z/OS, this field must contain the address of an Event Control Block (ECB). The ECB must be cleared by the application before the MQGET call is issued. The storage containing the ECB must not be freed until the queue is closed. The ECB is posted by the queue manager with one of the signal completion codes described. These completion codes are set in bits 2 through 31 of the ECB, the area defined in the z/OS mapping macro IHAECB as being for a user completion code.
- In all other environments, this is a reserved field; its value is not significant.

The signal completion codes are:

**MQEC\_MSG\_ARRIVED**

A suitable message has arrived on the queue. This message has not been reserved for the caller; a second MQGET request must be issued, but another application might retrieve the message before the second request is made.

**MQEC\_WAIT\_INTERVAL\_EXPIRED**

The specified *WaitInterval* has expired without a suitable message arriving.

**MQEC\_WAIT\_CANCELED**

The wait was canceled for an indeterminate reason (such as the queue manager terminating or the queue being disabled). Reissue the request if you want further diagnosis.

**MQEC\_Q\_MGR QUIESCING**

The wait was canceled because the queue manager has entered the quiescing state (MQGMO\_FAIL\_IF QUIESCING was specified on the MQGET call).

**MQEC\_CONNECTION QUIESCING**

The wait was canceled because the connection has entered the quiescing state (MQGMO\_FAIL\_IF QUIESCING was specified on the MQGET call).

The initial value of this field is determined by the environment:

- On z/OS, the initial value is the null pointer.
- In all other environments, the initial value is 0.

*Signal2 (MQLONG):*

This is an input field that is used only in conjunction with the MQGMO\_SET\_SIGNAL option. It is a reserved field; its value is not significant.

The initial value of this field is 0.

*StrucId (MQCHAR4):*

This is the structure identifier. The value must be:

**MQGMO\_STRUC\_ID**

Identifier for get-message options structure.

For the C programming language, the constant MQGMO\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQGMO\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQGMO\_STRUC\_ID.

*Version (MQLONG):*

Version is the structure version number.

The value must be one of the following:

**MQGMO\_VERSION\_1**

Version-1 get-message options structure.

This version is supported in all environments.

**MQGMO\_VERSION\_2**

Version-2 get-message options structure.

This version is supported in all environments.

**MQGMO\_VERSION\_3**

Version-3 get-message options structure.

This version is supported in all environments.

**MQGMO\_VERSION\_4**

Version-4 get-message options structure.

This version is supported in all environments.

Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQGMO\_CURRENT\_VERSION**

Current version of get-message options structure.

This is always an input field. The initial value of this field is MQGMO\_VERSION\_1.

*WaitInterval* (MQLONG):

This is the approximate time, expressed in milliseconds, that the MQGET call waits for a suitable message to arrive (that is, a message satisfying the selection criteria specified in the *MsgDesc* parameter of the MQGET call).

**Important:** There is no wait, or delay, if a suitable message is available immediately.

See the *MsgId* field described in “MQMD - Message descriptor” on page 2179 for more details). If no suitable message has arrived after this time has elapsed, the call completes with MQCC\_FAILED and reason code MQRC\_NO\_MSG\_AVAILABLE.

On z/OS, the period of time that the MQGET call actually waits is affected by system loading and work-scheduling considerations, and can vary between the value specified for *WaitInterval* and approximately 250 milliseconds greater than *WaitInterval*.

*WaitInterval* is used in conjunction with the MQGMO\_WAIT or MQGMO\_SET\_SIGNAL option. It is ignored if neither of these is specified. If one of these is specified, *WaitInterval* must be greater than or equal to zero, or the following special value:

**MQWI\_UNLIMITED**

Unlimited wait interval.

The initial value of this field is 0.

*Initial values and language declarations for MQGMO:*

Table 190. Initial values of fields in MQGMO for MQGMO

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQGMO_STRUC_ID	'GMO-'
<i>Version</i>	MQGMO_VERSION_1	1
<i>Options</i>	MQGMO_NO_WAIT	0
<i>WaitInterval</i>	None	0
<i>Signal1</i>	None	Null pointer on z/OS ; 0 otherwise
<i>Signal2</i>	None	0
<i>ResolvedQName</i>	None	Null string or blanks
<i>MatchOptions</i>	MQMO_MATCH_MSG_ID + MQMO_MATCH_CORREL_ID	3
<i>GroupStatus</i>	MQGS_NOT_IN_GROUP	'△'
<i>SegmentStatus</i>	MQSS_NOT_A_SEGMENT	'△'
<i>Segmentation</i>	MQSEG_INHIBITED	'△'
<i>Reserved1</i>	None	'△'
<i>MsgToken</i>	MQMTOK_NONE	Nulls
<i>ReturnedLength</i>	MQRL_UNDEFINED	-1
<i>Reserved2</i>	None	'△'
<i>MsgHandle</i>	MQHM_NONE	0

Table 190. Initial values of fields in MQGMO for MQGMO (continued)

Field name	Name of constant	Value of constant
<b>Notes:</b>		
1. The symbol $\bar{\phantom{x}}$ represents a single blank character.		
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.		
3. In the C programming language, the macro variable MQGMO_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure: MQGMO MyGMO = {MQGMO_DEFAULT};		

*C declaration:*

```
typedef struct tagMQGMO MQGMO;
struct tagMQGMO {
    MQCHAR4   StrucId;           /* Structure identifier */
    MQLONG    Version;          /* Structure version number */
    MQLONG    Options;          /* Options that control the action of */
                                /* MQGET */
    MQLONG    WaitInterval;     /* Wait interval */
    MQLONG    Signal1;          /* Signal */
    MQLONG    Signal2;          /* Signal identifier */
    MQCHAR48  ResolvedQName;    /* Resolved name of destination queue */
    /* Ver:1 */
    MQLONG    MatchOptions;     /* Options controlling selection */
                                /* criteria used for MQGET */
    MQCHAR    GroupStatus;      /* Flag indicating whether message */
                                /* retrieved is in a group */
    MQCHAR    SegmentStatus;    /* Flag indicating whether message */
                                /* retrieved is a segment of a logical */
                                /* message */
    MQCHAR    Segmentation;     /* Flag indicating whether further */
                                /* segmentation is allowed for the */
                                /* message retrieved */
    MQCHAR    Reserved1;        /* Reserved */
    /* Ver:2 */
    MQBYTE16  MsgToken;         /* Message token */
    MQLONG    ReturnedLength;   /* Length of message data returned */
                                /* (bytes) */
    /* Ver:3 */
    MQLONG    Reserved2;        /* Reserved */
    MQHMSG    MsgHandle;        /* Message handle */
    /* Ver:4 */
};
```

- On z/OS, the *Signal1* field is declared as PMQLONG.

*COBOL declaration:*

```
** MQGMO structure
  10 MQGMO.
**   Structure identifier
  15 MQGMO-STRUCID      PIC X(4).
**   Structure version number
  15 MQGMO-VERSION     PIC S9(9) BINARY.
**   Options that control the action of MQGET
  15 MQGMO-OPTIONS     PIC S9(9) BINARY.
**   Wait interval
  15 MQGMO-WAITINTERVAL PIC S9(9) BINARY.
**   Signal
  15 MQGMO-SIGNAL1     PIC S9(9) BINARY.
**   Signal identifier
  15 MQGMO-SIGNAL2     PIC S9(9) BINARY.
**   Resolved name of destination queue
  15 MQGMO-RESOLVEDQNAME PIC X(48).
**   Options controlling selection criteria used for MQGET
  15 MQGMO-MATCHOPTIONS PIC S9(9) BINARY.
**   Flag indicating whether message retrieved is in a group
  15 MQGMO-GROUPSTATUS PIC X.
**   Flag indicating whether message retrieved is a segment of a
**   logical message
  15 MQGMO-SEGMENTSTATUS PIC X.
**   Flag indicating whether further segmentation is allowed for the
**   message retrieved
  15 MQGMO-SEGMENTATION PIC X.
**   Reserved
  15 MQGMO-RESERVED1   PIC X.
**   Message token
  15 MQGMO-MSGTOKEN    PIC X(16).
**   Length of message data returned (bytes)
  15 MQGMO-RETURNEDLENGTH PIC S9(9) BINARY.
**   Reserved
  15 MQGMO-RESERVED2   PIC S9(9) BINARY.
**   Message handle
  15 MQGMO-MSGHANDLE   PIC S9(18) BINARY.
```

- On z/OS, the *Signal1* field is declared as POINTER.

*PL/I declaration:*

```
dcl
  1 MQGMO based,
  3 StrucId      char(4),      /* Structure identifier */
  3 Version      fixed bin(31), /* Structure version number */
  3 Options      fixed bin(31), /* Options that control the action of
                               MQGET */
  3 WaitInterval fixed bin(31), /* Wait interval */
  3 Signal1      fixed bin(31), /* Signal */
  3 Signal2      fixed bin(31), /* Signal identifier */
  3 ResolvedQName char(48),    /* Resolved name of destination
                               queue */
  3 MatchOptions fixed bin(31), /* Options controlling selection
                               criteria used for MQGET */
  3 GroupStatus  char(1),      /* Flag indicating whether message
                               retrieved is in a group */
  3 SegmentStatus char(1),     /* Flag indicating whether message
                               retrieved is a segment of a logical
                               message */
  3 Segmentation char(1),      /* Flag indicating whether further
                               segmentation is allowed for the
                               message retrieved */
  3 Reserved1    char(1),      /* Reserved */
  3 MsgToken     char(16),     /* Message token */
  3 ReturnedLength fixed bin(31); /* Length of message data returned
```

```

                                (bytes) */
3 Reserved2      fixed bin(31); /* Reserved */
3 MsgHandle      fixed bin(63); /* Message handle */

```

- On z/OS, the *Signal1* field is declared as pointer.

*High Level Assembler declaration:*

```

MQGMO                DSECT

## MQIIH - IMS information header:

The following table summarizes the fields in the structure.

Table 191. Fields in MQIIH

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>StrucLength</i>	Length of MQIIH structure	StrucLength
<i>Encoding</i>	Reserved	Encoding
<i>CodedCharSetId</i>	Reserved	CodedCharSetId
<i>Format</i>	MQ format name of data that follows MQIIH	Format
<i>Flags</i>	Flags	Flags
<i>LTermOverride</i>	Logical terminal override	LTermOverride
<i>MFSMapName</i>	Message format services map name	MFSMapName
<i>ReplyToFormat</i>	MQ format name of reply message	ReplyToFormat
<i>Authenticator</i>	RACF™ password or passticket	Authenticator
<i>TranInstanceId</i>	Transaction instance identifier	TranInstanceId
<i>TranState</i>	Transaction state	TranState
<i>CommitMode</i>	Commit mode	CommitMode
<i>SecurityScope</i>	Security scope	SecurityScope
<i>Reserved</i>	Reserved	Reserved

### Overview for MQIIH:

The MQIIH structure describes the header information for a message sent to IMS across the IMS bridge. For any IBM MQ supported platform you can create and transmit a message that includes the MQIIH structure, but only an IBM MQ for z/OS queue manager can use the IMS bridge. Therefore, for the message to get to IMS from a non-z/OS queue manager, your queue manager network must include at least one z/OS queue manager through which the message can be routed.

**Availability:** All IBM MQ systems and IBM MQ clients.

**Purpose:** The MQIIH structure describes the information that must be present at the start of a message sent to the IMS bridge through IBM MQ for z/OS.

**Format name:** MQFMT\_IMS.

**Character set and encoding:** Special conditions apply to the character set and encoding used for the MQIIH structure and application message data:

- Applications that connect to the queue manager that owns the IMS bridge queue must provide an MQIIH structure that is in the character set and encoding of the queue manager. This is because data conversion of the MQIIH structure is not performed in this case.
- Applications that connect to other queue managers can provide an MQIIH structure that is in any of the supported character sets and encodings; the receiving message channel agent connected to the queue manager that owns the IMS bridge queue converts the MQIIH.
- The application message data following the MQIIH structure must be in the same character set and encoding as the MQIIH structure. Do not use the *CodedCharSetId* and *Encoding* fields in the MQIIH structure to specify the character set and encoding of the application message data.

You must provide a data-conversion exit to convert the application message data if the data is not one of the built-in formats supported by the queue manager.

*Fields for MQIIH:*

The MQIIH structure contains the following fields; the fields are described in **alphabetical order**:

*Authenticator (MQCHAR8):*

This is the RACF password or PassTicket. It is optional; if specified, it is used with the user ID in the MQMD security context to build a UTOKEN that is sent to IMS to provide a security context. If it is not specified, the user ID is used without verification. This depends on the setting of the RACF switches, which might require an authenticator to be present.

This is ignored if the first byte is blank or null. The following special value can be used:

**MQIAUT\_NONE**

No authentication.

For the C programming language, the constant MQIAUT\_NONE\_ARRAY is also defined; this has the same value as MQIAUT\_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ\_AUTHENTICATOR\_LENGTH. The initial value of this field is MQIAUT\_NONE.

*CodedCharSetId (MQLONG):*

This is a reserved field; its value is not significant. The initial value of this field is 0.

The Character Set Id for supported structures which follow a MQIIH structure is the same as that of the MQIIH structure itself and taken from any preceding MQ header.

*CommitMode (MQCHAR):*

This is the IMS commit mode. See the *OTMA Reference* for more information about IMS commit modes. The value must be one of the following:

**MQICM\_COMMIT\_THEN\_SEND**

Commit then send.

This mode implies double queuing of output, but shorter region occupancy times. Fast-path and conversational transactions cannot run with this mode.

**MQICM\_SEND\_THEN\_COMMIT**

Send then commit.

Any IMS transaction initiated as a result of a commit mode of MQICM\_SEND\_THEN\_COMMIT runs in RESPONSE mode regardless of how the transaction is defined in the IMS system definition (MSGTYPE parameter in the TRANSACT macro). This also applies to transactions initiated by means of a transaction switch.

The initial value of this field is MQICM\_COMMIT\_THEN\_SEND.

*Encoding (MQLONG):*

This is a reserved field; its value is not significant. The initial value of this field is 0.

The Encoding for supported structures which follow a MQIIH structure is the same as that of the MQIIH structure itself and taken from any preceding MQ header.

*Flags (MQLONG):*

The flags value must be:

**MQIIH\_NONE**

No flags.

**MQIIH\_PASS\_EXPIRATION**

The reply message contains:

- The same expiry report options as the request message
- The remaining expiry time from the request message with no adjustment made for the bridge's processing time

If this value is not set, the expiry time is set to *unlimited*.

**MQIIH\_REPLY\_FORMAT\_NONE**

Sets the MQIIH.Format field of the reply to MQFMT\_NONE.

**MQIIH\_IGNORE\_PURG**

Sets the TMAMIPRG indicator in the OTMA prefix, which requests that OTMA ignores PURG calls on the TP PCB for CM0 transactions.

**MQIIH\_CM0\_REQUEST\_RESPONSE**

For Commit Mode 0 (CM0) transactions this flag sets the TMAMHRSP indicator in the OTMA prefix. Setting this indicator requests that OTMA/IMS generate a DFS2082 RESPONSE MODE TRANSACTION TERMINATED WITHOUT REPLY message when the original IMS application program does not reply to the IOPCB nor message switch to another transaction.

The initial value of this field is MQIIH\_NONE.

*Format (MQCHAR8):*

This specifies the MQ format name of the data that follows the MQIIH structure.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The length of this field is given by MQ\_FORMAT\_LENGTH. The initial value of this field is MQFMT\_NONE.

*LTermOverride (MQCHAR8):*

The logical terminal override, placed in the IO PCB field. It is optional; if it is not specified, the TPIPE name is used. It is ignored if the first byte is blank, or null.

The length of this field is given by MQ\_LTERM\_OVERRIDE\_LENGTH. The initial value of this field is 8 blank characters.

*MFSMapName (MQCHAR8):*

The message format services map name, placed in the IO PCB field. It is optional. On input it represents the MID, on output it represents the MOD. It is ignored if the first byte is blank or null.

The length of this field is given by MQ\_MFS\_MAP\_NAME\_LENGTH. The initial value of this field is 8 blank characters.

*ReplyToFormat (MQCHAR8):*

This is the MQ format name of the reply message that is sent in response to the current message. The length of this field is given by MQ\_FORMAT\_LENGTH. The initial value of this field is MQFMT\_NONE.

To convert the data in the reply message using MQGMO\_CONVERT, specify either MQIIH.replyToFormat=MQFMT\_STRING or MQIIH.replyToFormat=MQFMT\_IMS\_VAR\_STRING. For an explanation of the use of these fields, see "Format (MQCHAR8)" on page 2196.

If the default value (MQIIH.replyToFormat=MQFMT\_NONE) is used on the request message and the reply message is retrieved using MQGMO\_CONVERT then no data conversion is performed.

*Reserved (MQCHAR):*

This is a reserved field; it must be blank.

*SecurityScope (MQCHAR):*

This indicates the IMS security processing required. The following values are defined:

**MQISS\_CHECK**

Check security scope: an ACEE is built in the control region, but not in the dependent region.

**MQISS\_FULL**

Full security scope: a cached ACEE is built in the control region and a non-cached ACEE is built in the dependent region. If you use MQISS\_FULL, ensure that the user ID for which the ACEE is built has access to the resources used in the dependent region.

If neither MQISS\_CHECK nor MQISS\_FULL is specified for this field, MQISS\_CHECK is assumed.

The initial value of this field is MQISS\_CHECK.

*StrucId (MQCHAR4):*

This is the structure identifier. The value must be:

**MQIIH\_STRUC\_ID**

Identifier for the IMS information header structure.

For the C programming language, the constant MQIIH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQIIH\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQIIH\_STRUC\_ID.

*StrucLength (MQLONG):*

This is the length of MQIIH structure. The value must be:

**MQIIH\_LENGTH\_1**

Length of the IMS information header structure.

The initial value of this field is MQIIH\_LENGTH\_1.

*TranInstanceId (MQBYTE16):*

This is the transaction instance identifier. This field is used by output messages from IMS, so is ignored on first input. If you set *TranState* to MQITS\_IN\_CONVERSATION, this must be provided in the next input, and all subsequent inputs, to enable IMS to correlate the messages to the correct conversation. You can use the following special value:

**MQITII\_NONE**

No transaction instance identifier.

For the C programming language, the constant MQITII\_NONE\_ARRAY is also defined; this has the same value as MQITII\_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ\_TRAN\_INSTANCE\_ID\_LENGTH. The initial value of this field is MQITII\_NONE.

*TranState (MQCHAR):*

This indicates the IMS conversation state. This is ignored on first input because no conversation exists. On subsequent inputs it indicates whether a conversation is active or not. On output it is set by IMS. The value must be one of the following:

**MQITS\_IN\_CONVERSATION**

In conversation.

**MQITS\_NOT\_IN\_CONVERSATION**

Not in conversation.

**MQITS\_ARCHITECTED**

Return transaction state data in architected form.

This value is used only with the IMS /DISPLAY TRAN command. It returns the transaction state data in the IMS architected form instead of character form.  For more information, see Writing IMS transaction programs through IBM MQ.

The initial value of this field is MQITS\_NOT\_IN\_CONVERSATION.

Version (MQLONG):

This is the structure version number. The value must be:

**MQIIH\_VERSION\_1**

Version number for IMS information header structure.

The following constant specifies the version number of the current version:

**MQIIH\_CURRENT\_VERSION**

Current version of IMS information header structure.

The initial value of this field is MQIIH\_VERSION\_1.

Initial values and language declarations for MQIIH:

Table 192. Initial values of fields in MQIIH for MQIIH

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQIIH_STRUC_ID	'IIH?'
<i>Version</i>	MQIIH_VERSION_1	1
<i>StrucLength</i>	MQIIH_LENGTH_1	84
<i>Encoding</i>	None	0
<i>CodedCharSetId</i>	None	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>Flags</i>	MQIIH_NONE	0
<i>LTermOverride</i>	None	Blanks
<i>MFSMapName</i>	None	Blanks
<i>ReplyToFormat</i>	MQFMT_NONE	Blanks
<i>Authenticator</i>	MQIAUT_NONE	Blanks
<i>TranInstanceId</i>	MQITII_NONE	Nulls
<i>TranState</i>	MQITS_NOT_IN_CONVERSATION	'?'
<i>CommitMode</i>	MQICM_COMMIT_THEN_SEND	'0'
<i>SecurityScope</i>	MQISS_CHECK	'C'
<i>Reserved</i>	None	'?'

**Notes:**

1. The symbol ? represents a single blank character.
2. In the C programming language, the macro variable MQIIH\_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQIIH MyIIH = {MQIIH_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQIIH MQIIH;
struct tagMQIIH {
    MQCHAR4   StrucId;           /* Structure identifier */

## MQIMPO - Inquire message property options:

The following table summarizes the fields in the structure. MQIMPO structure - inquire message property options

Table 193. Fields in MQIMPO

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options controlling the action of MQINQMP	Options
<i>RequestedEncoding</i>	Encoding into which the inquired property is to be converted	RequestedEncoding
<i>RequestedCCSID</i>	Character set of the inquired property	RequestedCCSID
<i>ReturnedEncoding</i>	Encoding of the returned value	ReturnedEncoding
<i>ReturnedCCSID</i>	Character set of returned value	ReturnedCCSID
<i>Reserved1</i>	Reserved field	ReturnedCCSID
<i>ReturnedName</i>	Name of the inquired property	ReturnedName
<i>TypeString</i>	String representation of the data type of the property	TypeString

### Overview for MQIMPO:

The inquire message properties options structure.

**Availability:** All IBM MQ systems and IBM MQ clients.

**Purpose:** The MQIMPO structure allows applications to specify options that control how properties of messages are inquired. The structure is an input parameter on the MQINQMP call.

**Character set and encoding:** Data in MQIMPO must be in the character set of the application and encoding of the application (MQENC\_NATIVE).

### Fields for MQIMPO:

Inquire message property options structure - fields

The MQIMPO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG):*

Inquire message property options structure - Options field

The following options control the action of MQINQMP. You can specify one or more of these options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

Combinations of options that are not valid are noted; all other combinations are valid.

**Value data options:** The following options relate to the processing of the value data when the property is retrieved from the message.

#### **MQIMPO\_CONVERT\_VALUE**

This option requests that the value of the property be converted to conform to the *RequestedCCSID* and *RequestedEncoding* values specified before the MQINQMP call returns the property value in the *Value* area.

- If conversion is successful, the *ReturnedCCSID* and *ReturnedEncoding* fields are set to the same as *RequestedCCSID* and *RequestedEncoding* on return from the MQINQMP call.
- If conversion fails, but the MQINQMP call otherwise completes without error, the property value is returned unconverted.

If the property is a string, the *ReturnedCCSID* and *ReturnedEncoding* fields are set to the character set and encoding of the unconverted string. The completion code is MQCC\_WARNING in this case, with reason code MQRC\_PROP\_VALUE\_NOT\_CONVERTED. The property cursor is advanced to the returned property.

If the property value expands during conversion, and exceeds the size of the *Value* parameter, the value is returned unconverted, with completion code MQCC\_FAILED; the reason code is set to MQRC\_PROPERTY\_VALUE\_TOO\_BIG.

The *DataLength* parameter of the MQINQMP call returns the length that the property value would have converted to, in order to allow the application to determine the size of the buffer required to accommodate the converted property value. The property cursor is unchanged.

This option also requests that:

- If the property name contains a wildcard, and
- The *ReturnedName* field is initialized with an address or offset for the returned name,

then the returned name is converted to conform to the *RequestedCCSID* and *RequestedEncoding* values.

- If conversion is successful, the *VSCSID* field of *ReturnedName* and the encoding of the returned name are set to the input value of *RequestedCCSID* and *RequestedEncoding*.
- If conversion fails, but the MQINQMP call otherwise completes without error or warning, the returned name is unconverted. The completion code is MQCC\_WARNING in this case, with reason code MQRC\_PROP\_NAME\_NOT\_CONVERTED.

The property cursor is advanced to the returned property.

MQRC\_PROP\_VALUE\_NOT\_CONVERTED is returned if both the value and the name are not converted.

If the returned name expands during conversion, and exceeds the size of the *VSBufsize* field of the *RequestedName*, the returned string is left unconverted, with completion code MQCC\_FAILED and the reason code is set to MQRC\_PROPERTY\_NAME\_TOO\_BIG.

The *VSLength* field of the MQCHARV structure returns the length that the property value would have converted to, in order to allow the application to determine the size of the buffer required to accommodate the converted property value. The property cursor is unchanged.

## MQIMPO\_CONVERT\_TYPE

This option requests that the value of the property be converted from its current data type, into the data type specified on the *Type* parameter of the MQINQMP call.

- If conversion is successful, the *Type* parameter is unchanged on return of the MQINQMP call.
- If conversion fails, but the MQINQMP call otherwise completes without error, the call fails with reason MQRC\_PROP\_CONV\_NOT\_SUPPORTED. The property cursor is unchanged.

If the conversion of the data type causes the value to expand during conversion, and the converted value exceeds the size of the *Value* parameter, the value is returned unconverted, with completion code MQCC\_FAILED and the reason code is set to MQRC\_PROPERTY\_VALUE\_TOO\_BIG.

The *DataLength* parameter of the MQINQMP call returns the length that the property value would have converted to, in order to allow the application to determine the size of the buffer required to accommodate the converted property value. The property cursor is unchanged.

If the value of the *Type* parameter of the MQINQMP call is not valid, the call fails with reason MQRC\_PROPERTY\_TYPE\_ERROR.

If the requested data type conversion is not supported, the call fails with reason MQRC\_PROP\_CONV\_NOT\_SUPPORTED. The following data type conversions are supported:

Property data type	Supported target data types
MQTYPE_BOOLEAN	MQTYPE_STRING, MQTYPE_INT8, MQTYPE_INT16, MQTYPE_INT32, MQTYPE_INT64
MQTYPE_BYTE_STRING	MQTYPE_STRING
MQTYPE_INT8	MQTYPE_STRING, MQTYPE_INT16, MQTYPE_INT32, MQTYPE_INT64
MQTYPE_INT16	MQTYPE_STRING, MQTYPE_INT32, MQTYPE_INT64
MQTYPE_INT32	MQTYPE_STRING, MQTYPE_INT64
MQTYPE_INT64	MQTYPE_STRING
MQTYPE_FLOAT32	MQTYPE_STRING, MQTYPE_FLOAT64
MQTYPE_FLOAT64	MQTYPE_STRING
MQTYPE_STRING	MQTYPE_BOOLEAN, MQTYPE_INT8, MQTYPE_INT16, MQTYPE_INT32, MQTYPE_INT64, MQTYPE_FLOAT32, MQTYPE_FLOAT64
MQTYPE_NULL	None

The general rules governing the supported conversions are as follows:

- Numeric property values can be converted from one data type to another, provided that no data is lost during the conversion.  
For example, the value of a property with data type MQTYPE\_INT32 can be converted into a value with data type MQTYPE\_INT64, but cannot be converted into a value with data type MQTYPE\_INT16.
- A property value of any data type can be converted into a string.
- A string property value can be converted to any other data type provided the string is formatted correctly for the conversion. If an application attempts to convert a string property value that is not formatted correctly, IBM MQ returns reason code MQRC\_PROP\_NUMBER\_FORMAT\_ERROR.
- If an application attempts a conversion that is not supported, IBM MQ returns reason code MQRC\_PROP\_CONV\_NOT\_SUPPORTED.

The specific rules for converting a property value from one data type to another are as follows:

- When converting an MQTYPE\_BOOLEAN property value to a string, the value TRUE is converted to the string "TRUE", and the value false is converted to the string "FALSE".
- When converting an MQTYPE\_BOOLEAN property value to a numeric data type, the value TRUE is converted to one, and the value FALSE is converted to zero.
- When converting a string property value to an MQTYPE\_BOOLEAN value, the string "TRUE" , or "1" , is converted to TRUE, and the string "FALSE", or "0", is converted to FALSE.

Note that the terms "TRUE" and "FALSE" are not case sensitive.

Any other string cannot be converted; IBM MQ returns reason code MQRC\_PROP\_NUMBER\_FORMAT\_ERROR.

- When converting a string property value to a value with data type MQTYPE\_INT8, MQTYPE\_INT16, MQTYPE\_INT32 or MQTYPE\_INT64, the string must have the following format:

[blanks][sign]digits

The meanings of the components of the string are as follows:

**blanks** Optional leading blank characters

**sign** An optional plus sign (+) or minus sign (-) character.

**digits** A contiguous sequence of digit characters (0-9). At least one digit character must be present.

After the sequence of digit characters, the string can contain other characters that are not digit characters, but the conversion stops as soon as the first of these characters is reached. The string is assumed to represent a decimal integer.

IBM MQ returns reason code MQRC\_PROP\_NUMBER\_FORMAT\_ERROR if the string is not formatted correctly.

- When converting a string property value to a value with data type MQTYPE\_FLOAT32 or MQTYPE\_FLOAT64, the string must have the following format:

[blanks][sign]digits[.digits][e\_char[e\_sign]e\_digits]

The meanings of the components of the string are as follows:

**blanks** Optional leading blank characters

**sign** An optional plus sign (+) or minus sign (-) character.

**digits** A contiguous sequence of digit characters (0-9). At least one digit character must be present.

**e\_char** An exponent character, which is either "E" or "e".

**e\_sign** An optional plus sign (+) or minus sign (-) character for the exponent.

**e\_digits**

A contiguous sequence of digit characters (0-9) for the exponent. At least one digit character must be present if the string contains an exponent character.

After the sequence of digit characters, or the optional characters representing an exponent, the string can contain other characters that are not digit characters, but the conversion stops as soon as the first of these characters is reached. The string is assumed to represent a decimal floating point number with an exponent that is a power of 10.

IBM MQ returns reason code MQRC\_PROP\_NUMBER\_FORMAT\_ERROR if the string is not formatted correctly.

- When converting a numeric property value to a string, the value is converted to the string representation of the value as a decimal number, not the string containing the ASCII character for that value. For example, the integer 65 is converted to the string "65", not the string "A".
- When converting a byte string property value to a string, each byte is converted to the two hexadecimal characters that represent the byte. For example, the byte array {0xF1, 0x12, 0x00, 0xFF} is converted to the string "F11200FF".

## MQIMPO\_QUERY\_LENGTH

Query the type and length of the property value. The length is returned in the *DataLength* parameter of the MQINQMP call. The property value is not returned.

If a *ReturnedName* buffer is specified, the *VSLength* field of the MQCHARV structure is filled in with the length of the property name. The property name is not returned.

**Iteration options:** The following options relate to iterating over properties, using a name with a wildcard character

## MQIMPO\_INQ\_FIRST

Inquire on the first property that matches the specified name. After this call, a cursor is established on the property that is returned.

This is the default value.

The MQIMPO\_INQ\_PROP\_UNDER\_CURSOR option can subsequently be used with an MQINQMP call, if required, to inquire on the same property again.

Note that there is only one property cursor; therefore, if the property name, specified in the MQINQMP call, changes the cursor is reset.

This option is not valid with either of the following options:

MQIMPO\_INQ\_NEXT

MQIMPO\_INQ\_PROP\_UNDER\_CURSOR

## MQIMPO\_INQ\_NEXT

Inquires on the next property that matches the specified name, continuing the search from the property cursor. The cursor is advanced to the property that is returned.

If this is the first MQINQMP call for the specified name, then the first property that matches the specified name is returned.

The MQIMPO\_INQ\_PROP\_UNDER\_CURSOR option can subsequently be used with an MQINQMP call if required, to inquire on the same property again.

If the property under the cursor has been deleted, MQINQMP returns the next matching property following the one that has been deleted.

If a property is added that matches the wildcard, while an iteration is in progress, the property might or might not be returned during the completion of the iteration. The property is returned once the iteration restarts using MQIMPO\_INQ\_FIRST.

A property matching the wildcard that was deleted, while the iteration was in progress, is not returned subsequent to its deletion.

This option is not valid with either of the following options:

MQIMPO\_INQ\_FIRST

MQIMPO\_INQ\_PROP\_UNDER\_CURSOR

## MQIMPO\_INQ\_PROP\_UNDER\_CURSOR

Retrieve the value of the property pointed to by the property cursor. The property pointed to by the property cursor is the one that was last inquired, using either the MQIMPO\_INQ\_FIRST or the MQIMPO\_INQ\_NEXT option.

The property cursor is reset when the message handle is reused, when the message handle is specified in the *MsgHandle* field of the MQGMO on an MQGET call, or when the message handle is specified in *OriginalMsgHandle* or *NewMsgHandle* fields of the MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established, or if the property pointed to by the property cursor has been deleted, the call fails with completion code MQCC\_FAILED and reason MQRC\_PROPERTY\_NOT\_AVAILABLE.

This option is not valid with either of the following options:

MQIMPO\_INQ\_FIRST

MQIMPO\_INQ\_NEXT

If none of the options previously described is required, the following option can be used:

#### **MQIMPO\_NONE**

Use this value to indicate that no other options have been specified; all options assume their default values.

MQIMPO\_NONE aids program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

This is always an input field. The initial value of this field is MQIMPO\_INQ\_FIRST.

*RequestedCCSID (MQLONG):*

Inquire message property options structure - RequestedCCSID field

The character set that the inquired property value is to be converted into if the value is a character string. This is also the character set into which the *ReturnedName* is to be converted when MQIMPO\_CONVERT\_VALUE or MQIMPO\_CONVERT\_TYPE is specified.

The initial value of this field is MQCCSI\_APPL.

*RequestedEncoding (MQLONG):*

Inquire message property options structure - RequestedEncoding field

This is the encoding into which the inquired property value is to be converted when MQIMPO\_CONVERT\_VALUE or MQIMPO\_CONVERT\_TYPE is specified.

The initial value of this field is MQENC\_NATIVE.

*Reserved1 (MQCHAR):*

This is a reserved field. The initial value of this field is a blank character (4 byte field).

*ReturnedCCSID (MQLONG):*

Inquire message property options structure - ReturnedCCSID field

On output, this is the character set of the value returned if the *Type* parameter of the MQINQMP call is MQTYPE\_STRING.

If the MQIMPO\_CONVERT\_VALUE option is specified and conversion was successful, the *ReturnedCCSID* field, on return, is the same value as the value passed in.

The initial value of this field is zero.

*ReturnedEncoding (MQLONG):*

Inquire message property options structure - ReturnedEncoding field

On output, this is the encoding of the value returned.

If the MQIMPO\_CONVERT\_VALUE option is specified and conversion was successful, the *ReturnedEncoding* field, on return, is the same value as the value passed in.

The initial value of this field is MQENC\_NATIVE.

*ReturnedName (MQCHARV):*

Inquire message property options structure - ReturnedName field

The actual name of the inquired property.

On input a string buffer can be passed in using the *VSPtr* or *VSoffset* field of the MQCHARV structure. The length of the string buffer is specified using the *VSBufsize* field of the MQCHARV structure.

On return from the MQINQMP call, the string buffer is completed with the name of the property that was inquired, provided the string buffer was long enough to fully contain the name. The *VSLength* field of the MQCHARV structure is filled in with the length of the property name. The *VSCCSID* field of the MQCHARV structure is filled in to indicate the character set of the returned name, whether or not conversion of the name failed.

This is an input/output field. The initial value of this field is MQCHARV\_DEFAULT.

*StrucId (MQCHAR4):*

Inquire message property options structure - StrucId field

This is the structure identifier. The value must be:

#### **MQIMPO\_STRUC\_ID**

Identifier for inquire message property options structure.

For the C programming language, the constant MQIMPO\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQIMPO\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQIMPO\_STRUC\_ID.

*TypeString (MQCHAR8):*

Inquire message property options structure - TypeString field

A string representation of the data type of the property.

If the property was specified in an MQRFH2 header and the MQRFH2 dt attribute is not recognized, this field can be used to determine the data type of the property. *TypeString* is returned in coded character set 1208 (UTF-8), and is the first eight bytes of the value of the dt attribute of the property that failed to be recognized

This is always an output field. The initial value of this field is the null string in the C programming language, and 8 blank characters in other programming languages.

Version (MQLONG):

Inquire message property options structure - Version field

This is the structure version number. The value must be:

**MQIMPO\_VERSION\_1**

Version number for inquire message property options structure.

The following constant specifies the version number of the current version:

**MQIMPO\_CURRENT\_VERSION**

Current version of inquire message property options structure.

This is always an input field. The initial value of this field is MQIMPO\_VERSION\_1.

*Initial values and language declarations for MQIMPO:*

Inquire message property options structure - Initial values

*Table 194. Initial values of fields in MQIPMO*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQIMPO_STRUC_ID	'IMPO'
<i>Version</i>	MQIMPO_VERSION_1	1
<i>Options</i>	MQIMPO_INQ_FIRST	
<i>RequestedEncoding</i>	MQENC_NATIVE	
<i>RequestedCCSID</i>	MQCCSI_APPL	
<i>ReturnedEncoding</i>	MQENC_NATIVE	
<i>ReturnedCCSID</i>	0	
<i>Reserved1</i>	0	
<i>ReturnedName</i>	MQCHARV_DEFAULT	
<i>TypeString</i>	Null string or blanks	

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQIMPO\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  
MQIMPO MyIMPO = {MQIMPO\_DEFAULT};

*C declaration:*

Inquire message property options structure - C language declaration

```
typedef struct tagMQIMPO MQIMPO;
struct tagMQIMPO {
    MQCHAR4  StructId;          /* Structure identifier */
    MQLONG   Version;          /* Structure version number */
    MQLONG   Options;          /* Options that control the action of
                               MQINQMP */
    MQLONG   RequestedEncoding; /* Requested encoding of Value */
    MQLONG   RequestedCCSID;    /* Requested character set identifier
                               of Value */
    MQLONG   ReturnedEncoding; /* Returned encoding of Value */
    MQLONG   ReturnedCCSID;     /* Returned character set identifier
                               of Value */
    MQCHAR   Reserved1         /* Reserved field */
    MQCHARV  ReturnedName;     /* Returned property name */
    MQCHAR8  TypeString;       /* Property data type as a string */
};
```

*COBOL declaration:*

Inquire message property options structure - COBOL language declaration

```
** MQIMPO structure
  10 MQIMPO.

## MQMD - Message descriptor:

The following table summarizes the fields in the structure.

Table 195. Fields in MQMD

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Report</i>	Options for report messages	Report
<i>MsgType</i>	Message type	MsgType
<i>Expiry</i>	Message lifetime	MQMD - Expiry field
<i>Feedback</i>	Feedback or reason code	MQMD - Feedback field
<i>Encoding</i>	Numeric encoding of message data	Encoding
<i>CodedCharSetId</i>	Character set identifier of message data	CodedCharSetId
<i>Format</i>	Format name of message data	Format
<i>Priority</i>	Message priority	Priority
<i>Persistence</i>	Message persistence	Persistence
<i>MsgId</i>	Message identifier	MQMD - MsgId field
<i>CorrelId</i>	Correlation identifier	CorrelId
<i>BackoutCount</i>	Backout counter	BackoutCount
<i>ReplyToQ</i>	Name of reply queue	ReplyToQ
<i>ReplyToQMgr</i>	Name of reply queue manager	ReplyToQMgr
<i>UserIdentifier</i>	User identifier	UserIdentifier
<i>AccountingToken</i>	Accounting token	AccountingToken
<i>ApplIdentityData</i>	Application data relating to identity	ApplIdentityData
<i>PutApplType</i>	Type of application that put the message	PutApplType
<i>PutApplName</i>	Name of application that put the message	PutApplName
<i>PutDate</i>	Date when message was put	PutDate
<i>PutTime</i>	Time when message was put	PutTime
<i>ApplOriginData</i>	Application data relating to origin	ApplOriginData
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQMD_VERSION_2.		
<i>GroupId</i>	Group identifier	GroupId
<i>MsgSeqNumber</i>	Sequence number of logical message within group	MsgSeqNumber
<i>Offset</i>	Offset of data in physical message from start of logical message	Offset
<i>MsgFlags</i>	Message flags	MQMD - MsgFlags field
<i>OriginalLength</i>	Length of original message	OriginalLength

Overview for MQMD:

**Availability:** All IBM MQ systems, plus IBM MQ MQI clients connected to these systems.

**Purpose:** The MQMD structure contains the control information that accompanies the application data when a message travels between the sending and receiving applications. The structure is an input/output parameter on the MQGET, MQPUT, and MQPUT1 calls.

**Version:** The current version of MQMD is MQMD\_VERSION\_2. Applications that are intended to be portable between several environments must ensure that the required version of MQMD is supported in all the environments concerned. Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions that follow.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQMD that is supported by the environment, but with the initial value of the *Version* field set to MQMD\_VERSION\_1. To use fields that are not present in the version-1 structure, the application must set the *Version* field to the version number of the version required.

A declaration for the version-1 structure is available with the name MQMD1.

**Character set and encoding:** Data in MQMD must be in the character set and encoding of the local queue manager; these are given by the *CodedCharSetId* queue-manager attribute and MQENC\_NATIVE. However, if the application is running as an IBM MQ MQI client, the structure must be in the character set and encoding of the client.

If the sending and receiving queue managers use different character sets or encodings, the data in MQMD is converted automatically. It is not necessary for the application to convert the MQMD.

**Using different versions of MQMD:** A version-2 MQMD is equivalent to using a version-1 MQMD and prefixing the message data with an MQMDE structure. However, if all the fields in the MQMDE structure have their default values, the MQMDE can be omitted. A version-1 MQMD plus MQMDE are used as described:

- On the MQPUT and MQPUT1 calls, if the application provides a version-1 MQMD, the application can optionally prefix the message data with an MQMDE, setting the *Format* field in MQMD to MQFMT\_MD\_EXTENSION to indicate that an MQMDE is present. If the application does not provide an MQMDE, the queue manager assumes default values for the fields in the MQMDE.

**Note:** Several of the fields that exist in the version-2 MQMD but not the version-1 MQMD are input/output fields on the MQPUT and MQPUT1 calls. However, the queue manager does *not* return any values in the equivalent fields in the MQMDE on output from the MQPUT and MQPUT1 calls; if the application requires those output values, it must use a version-2 MQMD.

- On the MQGET call, if the application provides a version-1 MQMD, the queue manager prefixes the message returned with an MQMDE, but only if one or more of the fields in the MQMDE has a non-default value. The *Format* field in MQMD will have the value MQFMT\_MD\_EXTENSION to indicate that an MQMDE is present.

The default values that the queue manager uses for the fields in the MQMDE are the same as the initial values of those fields, shown in Table 200 on page 2239.

When a message is on a transmission queue, some of the fields in MQMD are set to particular values; see “MQXQH - Transmission-queue header” on page 2404 for details.

**Message context:** Certain fields in MQMD contain the message context. There are two types of message context: *identity context* and *origin context*. Typically:

- Identity context relates to the application that *originally* put the message

- Origin context relates to the application that *most recently* put the message.

These two applications can be the same application, but they can also be different applications (for example, when a message is forwarded from one application to another).

Although identity and origin context typically have the meanings described, the content of both types of context fields in MQMD depends on the MQPMO\_\*\_CONTEXT options that are specified when the message is put. As a result, identity context does not necessarily relate to the application that originally put the message, and origin context does not necessarily relate to the application that most-recently put the message; it depends on the design of the application suite.

The message channel agent (MCA) never alters message context. MCAs that receive messages from remote queue managers use the context option MQPMO\_SET\_ALL\_CONTEXT on the MQPUT or MQPUT1 call. This allows the receiving MCA to preserve exactly the message context that traveled with the message from the sending MCA. However, the result is that the origin context does not relate to either of the MCAs that sent and received the message. The origin context refers to an earlier application that put the message. If all the intermediate applications have passed the message context, the origin context refers to the originating application itself.

In the descriptions, the context fields are described as though they are used as described previously. For more information about message context, see Message context.

*Fields for MQMD:*

The MQMD structure contains the following fields; the fields are described in **alphabetical order**:

*Table 196. Fields in MQMD*

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Report</i>	Options for report messages	Report
<i>MsgType</i>	Message type	MsgType
<i>Expiry</i>	Message lifetime	MQMD - Expiry field
<i>Feedback</i>	Feedback or reason code	MQMD - Feedback field
<i>Encoding</i>	Numeric encoding of message data	Encoding
<i>CodedCharSetId</i>	Character set identifier of message data	CodedCharSetId
<i>Format</i>	Format name of message data	Format
<i>Priority</i>	Message priority	Priority
<i>Persistence</i>	Message persistence	Persistence
<i>MsgId</i>	Message identifier	MQMD - MsgId field
<i>CorrelId</i>	Correlation identifier	CorrelId
<i>BackoutCount</i>	Backout counter	BackoutCount
<i>ReplyToQ</i>	Name of reply queue	ReplyToQ
<i>ReplyToQMgr</i>	Name of reply queue manager	ReplyToQMgr
<i>UserIdentifier</i>	User identifier	UserIdentifier
<i>AccountingToken</i>	Accounting token	AccountingToken
<i>ApplIdentityData</i>	Application data relating to identity	ApplIdentityData
<i>PutApplType</i>	Type of application that put the message	PutApplType
<i>PutApplName</i>	Name of application that put the message	PutApplName

Table 196. Fields in MQMD (continued)

Field	Description	Topic
<i>PutDate</i>	Date when message was put	PutDate
<i>PutTime</i>	Time when message was put	PutTime
<i>ApplOriginData</i>	Application data relating to origin	ApplOriginData
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQMD_VERSION_2.		
<i>GroupId</i>	Group identifier	GroupId
<i>MsgSeqNumber</i>	Sequence number of logical message within group	MsgSeqNumber
<i>Offset</i>	Offset of data in physical message from start of logical message	Offset
<i>MsgFlags</i>	Message flags	MQMD - MsgFlags field
<i>OriginalLength</i>	Length of original message	OriginalLength

*AccountingToken* (MQBYTE32):

This is the accounting token, part of the **identity context** of the message. For more information about message context, see “Overview for MQMD” on page 2180 ; also see Message context.

*AccountingToken* allows an application to charge appropriately for work done as a result of the message. The queue manager treats this information as a string of bits and does not check its content.

The queue manager generates this information as follows:

- The first byte of the field is set to the length of the accounting information present in the bytes that follow; this length is in the range zero through 30, and is stored in the first byte as a binary integer.
- The second and subsequent bytes (as specified by the length field) are set to the accounting information appropriate to the environment.
  - On z/OS the accounting information is set to:
    - For z/OS batch, the accounting information from the JES JOB card or from a JES ACCT statement in the EXEC card (comma separators are changed to X'FF'). This information is truncated, if necessary, to 31 bytes.
    - For TSO, the user's account number.
    - For CICS, the LU 6.2 unit of work identifier (UEPUOWDS) (26 bytes).
    - For IMS, the 8-character PSB name concatenated with the 16-character IMS recovery token.
  - On IBM i, the accounting information is set to the accounting code for the job.
  - On UNIX systems, the accounting information is set to the numeric user identifier, in ASCII characters.
  - On Windows, the accounting information is set to a Windows security identifier (SID) in a compressed format. The SID uniquely identifies the user identifier stored in the *UserIdentifier* field. When the SID is stored in the *AccountingToken* field, the 6-byte Identifier Authority (located in the third and subsequent bytes of the SID) is omitted. For example, if the Windows SID is 28 bytes long, 22 bytes of SID information are stored in the *AccountingToken* field.
- The last byte (byte 32) of the accounting field is set to the accounting token type (in this case MQACTT\_NT\_SECURITY\_ID, x '0b'):

**MQACTT\_CICS\_LUOW\_ID**  
CICS LUOW identifier.

**MQACTT\_NT\_SECURITY\_ID**  
Windows security identifier.

**MQACTT\_OS400\_ACCOUNT\_TOKEN**

IBM i accounting token.

**MQACTT\_UNIX\_NUMERIC\_ID**

UNIX systems numeric identifier.

**MQACTT\_USER**

User-defined accounting token.

**MQACTT\_UNKNOWN**

Unknown accounting-token type.

The accounting-token type is set to an explicit value only in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems. In other environments, the accounting-token type is set to the value MQACTT\_UNKNOWN. In these environments use the *PutApplType* field to deduce the type of accounting token received.

- All other bytes are set to binary zero.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO\_SET\_IDENTITY\_CONTEXT or MQPMO\_SET\_ALL\_CONTEXT is specified in the *PutMsgOpts* parameter. If neither MQPMO\_SET\_IDENTITY\_CONTEXT nor MQPMO\_SET\_ALL\_CONTEXT is specified, this field is ignored on input and is an output-only field. For more information about message context, see Message context.

After the successful completion of an MQPUT or MQPUT1 call, this field contains the *AccountingToken* that was transmitted with the message if it was put to a queue. This will be the value of *AccountingToken* that is kept with the message if it is retained (see description of MQPMO\_RETAIN in “MQPMO options (MQLONG)” on page 2276 for more details about retained publications) but is not used as the *AccountingToken* when the message is sent as a publication to subscribers since they provide a value to override *AccountingToken* in all publications sent to them. If the message has no context, the field is entirely binary zero.

This is an output field for the MQGET call.

This field is not subject to any translation based on the character set of the queue manager; the field is treated as a string of bits, and not as a string of characters.

The queue manager does nothing with the information in this field. The application must interpret the information if it wants to use the information for accounting purposes.

You can use the following special value for the *AccountingToken* field:

**MQACT\_NONE**

No accounting token is specified.

The value is binary zero for the length of the field.

For the C programming language, the constant MQACT\_NONE\_ARRAY is also defined; this has the same value as MQACT\_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ\_ACCOUNTING\_TOKEN\_LENGTH. The initial value of this field is MQACT\_NONE.

*ApplIdentityData* (MQCHAR32):

This is part of the **identity context** of the message. For more information about message context, see “Overview for MQMD” on page 2180 and Message context.

*ApplIdentityData* is information that is defined by the application suite, and can be used to provide additional information about the message or its originator. The queue manager treats this information as character data, but does not define the format of it. When the queue manager generates this information, it is entirely blank.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO\_SET\_IDENTITY\_CONTEXT or MQPMO\_SET\_ALL\_CONTEXT is specified in the *PutMsgOpts* parameter. If a null character is present, the null and any following characters are converted to blanks by the queue manager. If neither MQPMO\_SET\_IDENTITY\_CONTEXT nor MQPMO\_SET\_ALL\_CONTEXT is specified, this field is ignored on input and is an output-only field. For more information about message context, see Message context.

After the successful completion of an MQPUT or MQPUT1 call, this field contains the *ApplIdentityData* that was transmitted with the message if it was put to a queue. This will be the value of *ApplIdentityData* that is kept with the message if it is retained (see description of MQPMO\_RETAIN for more details about retained publications) but is not used as the *ApplIdentityData* when the message is sent as a publication to subscribers because they provide a value to override *ApplIdentityData* in all publications sent to them. If the message has no context, the field is entirely blank.

This is an output field for the MQGET call. The length of this field is given by MQ\_APPL\_IDENTITY\_DATA\_LENGTH. The initial value of this field is the null string in C, and 32 blank characters in other programming languages.

*ApplOriginData* (MQCHAR4):

This is part of the **origin context** of the message. For more information about message context, see “Overview for MQMD” on page 2180 and Message context.

*ApplOriginData* is information that is defined by the application suite that can be used to provide additional information about the origin of the message. For example, it could be set by applications running with suitable user authority to indicate whether the identity data is trusted.

The queue manager treats this information as character data, but does not define the format of it. When the queue manager generates this information, it is entirely blank.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO\_SET\_ALL\_CONTEXT is specified in the *PutMsgOpts* parameter. Any information following a null character within the field is discarded. The queue manager converts the null character and any following characters to blanks. If MQPMO\_SET\_ALL\_CONTEXT is not specified, this field is ignored on input and is an output-only field.

This is an output field for the MQGET call. The length of this field is given by MQ\_APPL\_ORIGIN\_DATA\_LENGTH. The initial value of this field is the null string in C, and 4 blank characters in other programming languages.

*BackoutCount* (MQLONG):

This is a count of the number of times that the message has been previously returned by the MQGET call as part of a unit of work, and subsequently backed out. It helps the application to detect processing errors that are based on message content. The count excludes MQGET calls that specify any of the MQGMO\_BROWSE\_\* options.

The accuracy of this count is affected by the *HardenGetBackout* queue attribute; see "Attributes for queues" on page 2625.

On z/OS, a value of 255 means that the message has been backed out 255 or more times; the value returned is never greater than 255.

This is an output field for the MQGET call. It is ignored for the MQPUT and MQPUT1 calls. The initial value of this field is 0.

*CodedCharSetId* (MQLONG):

This field specifies the character set identifier of character data within the message body.

**Note:** Character data in MQMD and the other MQ data structures that are parameters on calls must be in the character set of the queue manager. This is defined by the queue manager's *CodedCharSetId* attribute; see "Attributes for the queue manager" on page 2586 for details of this attribute.

If this field is set to MQCCSI\_Q\_MGR when calling MQGET with MQGMO\_CONVERT in the options, the behavior is different between client and server applications. For server applications, the code page used for character conversion is the *CodedCharSetId* of the queue manager; for client applications, the code page used for character conversion is the current locale code page.

For client applications, MQCCSI\_Q\_MGR is filled in, based on the locale of the client rather than the one on the queue manager. The exception to that rule is when you put a message to an IMS bridge queue; what is returned, in the *CodedCharSetId* field of MQMD, is the CCSID of the queue manager.

You must not use the following special value:

#### **MQCCSI\_APPL**

This results in an incorrect value in the *CodedCharSetId* field of the MQMD and causes a return code of MQRC\_SOURCE\_CCSID\_ERROR (or MQRC\_FORMAT\_ERROR for z/OS ) when the message is received using the MQGET call with the MQGMO\_CONVERT option.

You can use the following special values:

#### **MQCCSI\_Q\_MGR**

Character data in the message is in the queue manager's character set.

On the MQPUT and MQPUT1 calls, the queue manager changes this value in the MQMD that is sent with the message to the true character set identifier of the queue manager. As a result, the value MQCCSI\_Q\_MGR is never returned by the MQGET call.

#### **MQCCSI\_DEFAULT**

The *CodedCharSetId* of the data in the *String* field is defined by the *CodedCharSetId* field in the header structure that precedes the MQCFH structure, or by the *CodedCharSetId* field in the MQMD if the MQCFH is at the start of the message.

#### **MQCCSI\_INHERIT**

Character data in the message is in the same character set as this structure; this is the queue manager's character set. (For MQMD only, MQCCSI\_INHERIT has the same meaning as MQCCSI\_Q\_MGR).

The queue manager changes this value in the MQMD that is sent with the message to the actual character set identifier of MQMD. Provided no error occurs, the value MQCCSI\_INHERIT is not returned by the MQGET call.

Do not use MQCCSI\_INHERIT if the value of the *PutApplType* field in MQMD is MQAT\_BROKER.

### **MQCCSI\_EMBEDDED**

Character data in the message is in a character set with the identifier that is contained within the message data itself. There can be any number of character set identifiers embedded within the message data, applying to different parts of the data. This value must be used for PCF messages (with a format of MQFMT\_ADMIN, MQFMT\_EVENT, or MQFMT\_PCF) that contain data in a mixture of character sets. Each MQCFST, MQCFSL, and MQCFSF structure contained within the PCF message must have an explicit character set identifier specified and not MQCCSI\_DEFAULT.

If a message of format MQFMT\_EMBEDDED\_PCF is to contain data in a mixture of character sets, do not use MQCCSI\_EMBEDDED. Instead set MQEPH\_CCSDID\_EMBEDDED in the Flags field in the MQEPH structure. This is equivalent to setting MQCCSI\_EMBEDDED in the preceding structure. Each MQCFST, MQCFSL, and MQCFSF structure contained within the PCF message must then have an explicit character set identifier specified and not MQCCSI\_DEFAULT. For more information on the MQEPH structure, see “MQEPH - Embedded PCF header” on page 2122.

Specify this value only on the MQPUT and MQPUT1 calls. If it is specified on the MQGET call, it prevents conversion of the message.

On the MQPUT and MQPUT1 calls, the queue manager changes the values MQCCSI\_Q\_MGR and MQCCSI\_INHERIT in the MQMD that is sent with the message as described above, but does not change the MQMD specified on the MQPUT or MQPUT1 call. No other check is carried out on the value specified.

Applications that retrieve messages must compare this field against the value the application is expecting; if the values differ, the application might need to convert character data in the message.

If you specify the MQGMO\_CONVERT option on the MQGET call, this field is an input/output field. The value specified by the application is the coded character set identifier to which to convert the message data if necessary. If conversion is successful or unnecessary, the value is unchanged (except that the value MQCCSI\_Q\_MGR or MQCCSI\_INHERIT is converted to the actual value). If conversion is unsuccessful, the value after the MQGET call represents the coded character set identifier of the unconverted message that is returned to the application.

Otherwise, this is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQCCSI\_Q\_MGR.

*CorrelId* (MQBYTE24):

The *CorrelId* field is property in the message header that may be used to identify a specific message or group of messages.

This is a byte string that the application can use to relate one message to another, or to relate the message to other work that the application is performing. The correlation identifier is a permanent property of the message, and persists across restarts of the queue manager. Because the correlation identifier is a byte string and not a character string, the correlation identifier is *not* converted between character sets when the message flows from one queue manager to another.

For the MQPUT and MQPUT1 calls, the application can specify any value. The queue manager transmits this value with the message and delivers it to the application that issues the get request for the message.

If the application specifies MQPMO\_NEW\_CORREL\_ID, the queue manager generates a unique correlation identifier which is sent with the message, and also returned to the sending application on output from the MQPUT or MQPUT1 call.

A correlation identifier generated by the queue manager consists of a 3-byte product identifier (AMQ or CSQ in either ASCII or EBCDIC), followed by one reserved byte and a product-specific implementation of a unique string. In IBM MQ this product-specific implementation string contains the first 12 characters of the queue-manager name, and a value derived from the system clock. All queue managers that can intercommunicate must therefore have names that differ in the first 12 characters to ensure that message identifiers are unique. The ability to generate a unique string also depends on the system clock not being changed backward. To eliminate the possibility of a message identifier generated by the queue manager duplicating one generated by the application, the application must avoid generating identifiers with initial characters in the range A through I in ASCII or EBCDIC (X'41' through X'49' and X'C1' through X'C9'). However, the application is not prevented from generating identifiers with initial characters in these ranges.

This generated correlation identifier is kept with the message if it is retained, and is used as the correlation identifier when the message is sent as a publication to subscribers who specify MQCI\_NONE in the SubCorrelId field in the MQSD passed on the MQSUB call. See MQPMO options for more details about retained publications.

When the queue manager or a message channel agent generates a report message, it sets the *CorrelId* field in the way specified by the *Report* field of the original message, either MQRO\_COPY\_MSG\_ID\_TO\_CORREL\_ID or MQRO\_PASS\_CORREL\_ID. Applications that generate report messages must also do this.

For the MQGET call, *CorrelId* is one of the five fields that can be used to select a particular message to be retrieved from the queue. See the description of the *MsgId* field for details of how to specify values for this field.

Specifying MQCI\_NONE as the correlation identifier has the same effect as *not* specifying MQMO\_MATCH\_CORREL\_ID, that is, *any* correlation identifier will match.

If the MQGMO\_MSG\_UNDER\_CURSOR option is specified in the *GetMsgOpts* parameter on the MQGET call, this field is ignored.

On return from an MQGET call, the *CorrelId* field is set to the correlation identifier of the message returned (if any).

The following special values can be used:

## MQCI\_NONE

No correlation identifier is specified.

The value is binary zero for the length of the field.

For the C programming language, the constant `MQCI_NONE_ARRAY` is also defined; this has the same value as `MQCI_NONE`, but is an array of characters instead of a string.

## MQCI\_NEW\_SESSION

Message is the start of a new session.

This value is recognized by the CICS bridge as indicating the start of a new session, that is, the start of a new sequence of messages.

For the C programming language, the constant `MQCI_NEW_SESSION_ARRAY` is also defined; this has the same value as `MQCI_NEW_SESSION`, but is an array of characters instead of a string.

For the `MQGET` call, this is an input/output field. For the `MQPUT` and `MQPUT1` calls, this is an input field if `MQPMO_NEW_CORREL_ID` is *not* specified, and an output field if `MQPMO_NEW_CORREL_ID` is specified. The length of this field is given by `MQ_CORREL_ID_LENGTH`. The initial value of this field is `MQCI_NONE`.

### Note:

You cannot pass the correlation identifier of a publication in a hierarchy. The field is used by the queue manager.

### Encoding (MQLONG):

This specifies the numeric encoding of numeric data in the message; it does not apply to numeric data in the `MQMD` structure itself. The numeric encoding defines the representation used for binary integers, packed-decimal integers, and floating-point numbers.

On the `MQPUT` or `MQPUT1` call, the application must set this field to the value appropriate to the data. The queue manager does not check that the field is valid. The following special value is defined:

## MQENC\_NATIVE

The encoding is the default for the programming language and machine on which the application is running.

**Note:** The value of this constant depends on the programming language and environment. For this reason, applications must be compiled using the header, macro, `COPY`, or `INCLUDE` files appropriate to the environment in which the application will run.

Applications that put messages usually specify `MQENC_NATIVE`. Applications that retrieve messages must compare this field against the value `MQENC_NATIVE`; if the values differ, the application might need to convert numeric data in the message. Use the `MQGMO_CONVERT` option to request the queue manager to convert the message as part of the processing of the `MQGET` call. See “Machine encodings” on page 2694 for details of how the *Encoding* field is constructed.

If you specify the `MQGMO_CONVERT` option on the `MQGET` call, this field is an input/output field. The value specified by the application is the encoding to which to convert the message data if necessary. If conversion is successful or unnecessary, the value is unchanged. If conversion is unsuccessful, the value after the `MQGET` call represents the encoding of the unconverted message that is returned to the application.

In other cases, this is an output field for the `MQGET` call, and an input field for the `MQPUT` and `MQPUT1` calls. The initial value of this field is `MQENC_NATIVE`.

*Expiry (MQLONG):*

This is a period of time expressed in tenths of a second, set by the application that puts the message. The message becomes eligible to be discarded if it has not been removed from the destination queue before this period of time elapses.

The value is decremented to reflect the time that the message spends on the destination queue, and also on any intermediate transmission queues if the put is to a remote queue. It can also be decremented by message channel agents to reflect transmission times, if these are significant. Likewise, an application forwarding this message to another queue might decrement the value if necessary, if it has retained the message for a significant time. However, the expiration time is treated as approximate, and the value need not be decremented to reflect small time intervals.

When the message is retrieved by an application using the MQGET call, the *Expiry* field represents the expiry time that still remains.

After a message's expiry time has elapsed, it becomes eligible to be discarded by the queue manager. The message is discarded when a browse or nonbrowse MQGET call occurs that would have returned the message had it not already expired. For example, a nonbrowse MQGET call with the *MatchOptions* field in MQGMO set to MQMO\_NONE reading from a FIFO ordered queue discards all the expired messages up to the first unexpired message. With a priority ordered queue, the same call will discard expired messages of higher priority and messages of an equal priority that arrived on the queue before the first unexpired message.

A message that has expired is never returned to an application (either by a browse or a non-browse MQGET call), so the value in the *Expiry* field of the message descriptor after a successful MQGET call is either greater than zero, or the special value MQEI\_UNLIMITED.

If a message is put on a remote queue, the message might expire (and be discarded) while it is on an intermediate transmission queue, before the message reaches the destination queue.

A report is generated when an expired message is discarded, if the message specified one of the MQRO\_EXPIRATION\_\* report options. If none of these options is specified, no such report is generated; the message is assumed to be no longer relevant after this time period (perhaps because a later message has superseded it).

For a message put within syncpoint, the expiry interval begins at the time the message is put, not the time the syncpoint is committed. It is possible that the expiry interval can pass before the syncpoint is committed. In this case the message will be discarded at some time after the commit operation and the message will not be returned to an application in response to an MQGET operation.

Any other program that discards messages based on expiry time must also send an appropriate report message if one was requested.

**Notes:**

1. If a message is put with an *Expiry* time of zero or a number greater than 999 999 999, the MQPUT or MQPUT1 call fails with reason code MQRC\_EXPIRY\_ERROR; no report message is generated in this case.
2. Because a message with an expiry time that has elapsed might not be discarded until later, there might be messages on a queue that have passed their expiry time, and that are not therefore eligible for retrieval. These messages nevertheless count toward the number of messages on the queue for all purposes, including depth triggering.
3. An expiration report is generated, if requested, when the message is discarded, not when it becomes eligible for discarding.

4. Discarding an expired message, and generating an expiration report if requested, are never part of the application's unit of work, even if the message was scheduled for discarding as a result of an MQGET call operating within a unit of work.
5. If a nearly-expired message is retrieved by an MQGET call within a unit of work, and the unit of work is subsequently backed out, the message might become eligible to be discarded before it can be retrieved again.
6. If a nearly-expired message is locked by an MQGET call with MQGMO\_LOCK, the message might become eligible to be discarded before it can be retrieved by an MQGET call with MQGMO\_MSG\_UNDER\_CURSOR; reason code MQRC\_NO\_MSG\_UNDER\_CURSOR is returned on this subsequent MQGET call if that happens.
7. When a request message with an expiry time greater than zero is retrieved, the application can take one of the following actions when it sends the reply message:
  - Copy the remaining expiry time from the request message to the reply message.
  - Set the expiry time in the reply message to an explicit value greater than zero.
  - Set the expiry time in the reply message to MQEI\_UNLIMITED.

The action to take depends on the design of the application. However, the default action for putting messages to a dead-letter (undelivered-message) queue must be to preserve the remaining expiry time of the message, and to continue to decrement it.

8. Trigger messages are always generated with MQEI\_UNLIMITED.
9. A message (normally on a transmission queue) that has a *Format* name of MQFMT\_XMIT\_Q\_HEADER has a second message descriptor within the MQXQH. It therefore has two *Expiry* fields associated with it. The following additional points should be noted in this case:
  - When an application puts a message on a remote queue, the queue manager places the message initially on a local transmission queue, and prefixes the application message data with an MQXQH structure. The queue manager sets the values of the two *Expiry* fields to be the same as that specified by the application.  
 If an application puts a message directly on a local transmission queue, the message data must already begin with an MQXQH structure, and the format name must be MQFMT\_XMIT\_Q\_HEADER. In this case, the application need not set the values of these two *Expiry* fields to be the same. (The queue manager checks that the *Expiry* field within the MQXQH contains a valid value, and that the message data is long enough to include it). For an application that can write directly to the transmission queue, the application has to create a transmission queue header with the embedded message descriptor. However, if the expiry value in the message descriptor written to the transmission queue is inconsistent with the value in the embedded message descriptor, an expiry error rejection occurs.
  - When a message with a *Format* name of MQFMT\_XMIT\_Q\_HEADER is retrieved from a queue (whether this is a normal or a transmission queue), the queue manager decrements *both* these *Expiry* fields with the time spent waiting on the queue. No error is raised if the message data is not long enough to include the *Expiry* field in the MQXQH.
  - The queue manager uses the *Expiry* field in the separate message descriptor (that is, not the one in the message descriptor embedded within the MQXQH structure) to test whether the message is eligible for discarding.
  - If the initial values of the two *Expiry* fields are different, the *Expiry* time in the separate message descriptor when the message is retrieved might be greater than zero (so the message is not eligible for discarding), while the time according to the *Expiry* field in the MQXQH has elapsed. In this case the *Expiry* field in the MQXQH is set to zero.
10. The expiry time on a reply message returned from the IMS bridge is unlimited unless MQIIH\_PASS\_EXPIRATION is set in the Flags field of the MQIIH. See Flags for more information.

The following special value is recognized:

## MQEI\_UNLIMITED

The message has an unlimited expiration time.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQEI\_UNLIMITED.

*Expired messages on z/OS:*

On IBM MQ for z/OS, messages that have expired are discarded by the next appropriate MQGET call.

However, if no such call occurs, the expired message is not discarded, and, for some queues, a large number of expired messages can accumulate. To remedy this, set the queue manager to scan queues periodically and discard expired messages on one or more queues in one of the following ways:

### Periodic scan

You can specify a period using the EXPRYINT (expiry interval) queue manager attribute. Each time the expiry interval is reached, the queue manager looks for candidate queues that are worth scanning to discard expired messages.

The queue manager maintains information about the expired messages on each queue, and knows whether a scan for expired messages is worthwhile. So, only a selection of queues is scanned at any time.

Shared queues are scanned by only one queue manager in a queue-sharing group. Generally, it is the first queue manager to restart, or the first to have EXPRYINT set. If this queue manager terminates, another queue manager in the queue-sharing group takes over the queue scanning. Set the expiry interval value for all queue managers within a queue-sharing group to the same value.

Note that expiry processing takes place for every queue when a queue manager restarts, regardless of the EXPRYINT setting.

### Explicit request

Issue the REFRESH QMGR TYPE(EXPIRY) command, specifying the queue or queues that you want scanned.

*Enforcing lower expiration times:* 

Administrators can limit the expiry time of any message put to a queue or topic by using the CAPEXPY attribute specified in the **CUSTOM** attribute on the queue or topic.

 To enable this feature on z/OS, you must apply APAR PI50761 and enable the new feature with the MQSC command **RECOVER QMGR (TUNE CAPEXPY ON)**.

**Important:** The **RECOVER QMGR** command is reserved for use by IBM, and should normally only be used under guidance by IBM support.

 You can either enter the command at a console, or to the queue manager configuration, by adding to a file processed in the CSQINP2 concatenation during queue manager start up. Note that the effect of the command does not persist over a queue manager restart.

An expiry time specified in the **Expiry** field of the MQMD, by an application, which is greater than the CAPEXPY value specified in the **CUSTOM** attribute on the queue or topic will be replaced by that CAPEXPY value. An expiry time specified by an application, which is lower than the CAPEXPY value will be used.

If more than one object is used on the resolution path, for example, when a message is put to an alias or remote queue, then the lowest of all the CAPEXPY values is used as the upper limit for message expiry.

Changes to the *CAPEXPY* values take effect immediately. The expiry value is evaluated for each put to a queue or topic and so is sensitive to the object resolution, which may differ between each put operation.

However, note that existing messages in the queue, prior to a change in **CAPEXPY**, are not affected by the change (that is, their expiry time remains intact). Only new messages that are put into the queue after the change in **CAPEXPY** have the new expiry time.

For example, in a cluster where a put is performed to a queue opened with *MQOO\_BIND\_NOT\_FIXED*, messages can be assigned different expiry values on each put, depending on the *CAPEXPY* value set for the transmission queue, used by the channel, that sends the message to the selected target queue manager.

Note, that a put to a queue or topic by a JMS application specifying a delivery delay fails with *MQRC\_EXPIRY\_ERROR*, if the delivery delay is beyond the resolved expiry time for the target queue or topic. A *CAPEXPY* attribute set on a queue resolved for a JMS Destination can cause this error.

*Feedback (MQLONG):*

The Feedback field is used with a message of type *MQMT\_REPORT* to indicate the nature of the report, and is only meaningful with that type of message.

The field can contain one of the *MQFB\_\** values, or one of the *MQRC\_\** values. Feedback codes are grouped as follows:

**MQFB\_NONE**

No feedback provided.

**MQFB\_SYSTEM\_FIRST**

Lowest value for system-generated feedback.

**MQFB\_SYSTEM\_LAST**

Highest value for system-generated feedback.

The range of system-generated feedback codes *MQFB\_SYSTEM\_FIRST* through *MQFB\_SYSTEM\_LAST* includes the general feedback codes listed in this topic (*MQFB\_\**), and also the reason codes (*MQRC\_\**) that can occur when the message cannot be put on the destination queue.

**MQFB\_APPL\_FIRST**

Lowest value for application-generated feedback.

**MQFB\_APPL\_LAST**

Highest value for application-generated feedback.

Applications that generate report messages must not use feedback codes in the system range (other than *MQFB\_QUIT*), unless they want to simulate report messages generated by the queue manager or message channel agent.

On the *MQPUT* or *MQPUT1* calls, the value specified must either be *MQFB\_NONE*, or be within the system range or application range. This is checked whatever the value of *MsgType*.

**General feedback codes:**

**MQFB\_COA**

Confirmation of arrival on the destination queue (see *MQRO\_COA*).

**MQFB\_COD**

Confirmation of delivery to the receiving application (see *MQRO\_COD*).

**MQFB\_EXPIRATION**

Message was discarded because it had not been removed from the destination queue before its expiry time had elapsed.

**MQFB\_PAN**

Positive action notification (see MQRO\_PAN).

**MQFB\_NAN**

Negative action notification (see MQRO\_NAN).

**MQFB\_QUIT**

End application.

This can be used by a workload scheduling program to control the number of instances of an application program that are running. Sending an MQMT\_REPORT message with this feedback code to an instance of the application program indicates to that instance that it should stop processing. However, adherence to this convention is a matter for the application; it is not enforced by the queue manager.

**Channel feedback codes:****MQFB\_CHANNEL\_COMPLETED**

A channel ended normally.

**MQFB\_CHANNEL\_FAIL**

A channel ended abnormally and goes into STOPPED state.

**MQFB\_CHANNEL\_FAIL\_RETRY**

A channel ended abnormally and goes into RETRY state.

**IMS-bridge feedback codes**

These codes are used when an unexpected IMS-OTMA sense code is received. The sense code or, when the sense code is 0x1A the reason code associated with that sense code, is indicated in the *Feedback*.

1. For *Feedback* codes in range MQFB\_IMS\_FIRST (300) through MQFB\_IMS\_LAST (399), a sense code other than 0x1A was received. The *sense code* is given by the expression (*Feedback* - MQFB\_IMS\_FIRST+1)
2. For *Feedback* codes in range MQFB\_IMS\_NACK\_1A\_REASON\_FIRST (600) through MQFB\_IMS\_NACK\_1A\_REASON\_LAST (855), a sense code of 0x1A was received. The *reason code* associated with the sense code is given by the expression (*Feedback* - MQFB\_IMS\_NACK\_1A\_REASON\_FIRST)

The meaning of the IMS-OTMA sense codes and corresponding reason codes are described in *Open Transaction Manager Access Guide and Reference*.

The following feedback codes can be generated by the IMS bridge:

**MQFB\_DATA\_LENGTH\_ZERO**

A segment length was zero in the application data of the message.

**MQFB\_DATA\_LENGTH\_NEGATIVE**

A segment length was negative in the application data of the message.

**MQFB\_DATA\_LENGTH\_TOO\_BIG**

A segment length was too large in the application data of the message.

**MQFB\_BUFFER\_OVERFLOW**

The value of one of the length fields would cause the data to overflow the message buffer.

**MQFB\_LENGTH\_OFF\_BY\_ONE**

The value of one of the length fields was 1 byte too short.

**MQFB\_IIH\_ERROR**

The *Format* field in MQMD specifies MQFMT\_IMS, but the message does not begin with a valid MQIIH structure.

**MQFB\_NOT\_AUTHORIZED\_FOR\_IMS**

The user ID contained in the message descriptor MQMD, or the password contained in the *Authenticator* field in the MQIIH structure, failed the validation performed by the IMS bridge. As a result the message was not passed to IMS.

**MQFB\_IMS\_ERROR**

An unexpected error was returned by IMS. Consult the IBM MQ error log on the system on which the IMS bridge resides for more information about the error.

**MQFB\_IMS\_FIRST**

When the IMS-OTMA sense code is not 0x1A, IMS-generated feedback codes are in the range MQFB\_IMS\_FIRST (300) through MQFB\_IMS\_LAST (399). The IMS-OTMA sense code itself is *Feedback* minus MQFB\_IMS\_ERROR.

**MQFB\_IMS\_LAST**

Highest value for IMS-generated feedback when the sense code is not 0x1A.

**MQFB\_IMS\_NACK\_1A\_REASON\_FIRST**

When the sense code is 0x1A, IMS-generated feedback codes are in the range MQFB\_IMS\_NACK\_1A\_REASON\_FIRST (600) through MQFB\_IMS\_NACK\_1A\_REASON\_LAST (855).

**MQFB\_IMS\_NACK\_1A\_REASON\_LAST**

Highest value for IMS-generated feedback when the sense code is 0x1A

**CICS-bridge feedback codes:** The following feedback codes can be generated by the CICS bridge:

**MQFB\_CICS\_APPL\_ABENDED**

The application program specified in the message abnormally ended. This feedback code occurs only in the *Reason* field of the MQDLH structure.

**MQFB\_CICS\_APPL\_NOT\_STARTED**

The EXEC CICS LINK for the application program specified in the message failed. This feedback code occurs only in the *Reason* field of the MQDLH structure.

**MQFB\_CICS\_BRIDGE\_FAILURE**

CICS bridge terminated abnormally without completing normal error processing.

**MQFB\_CICS\_CCSID\_ERROR**

Character set identifier not valid.

**MQFB\_CICS\_CIH\_ERROR**

CICS information header structure missing or not valid.

**MQFB\_CICS\_COMMAREA\_ERROR**

Length of CICS COMMAREA not valid.

**MQFB\_CICS\_CORREL\_ID\_ERROR**

Correlation identifier not valid.

**MQFB\_CICS\_DLQ\_ERROR**

The CICS bridge task was unable to copy a reply to this request to the dead-letter queue. The request was backed out.

**MQFB\_CICS\_ENCODING\_ERROR**

Encoding not valid.

**MQFB\_CICS\_INTERNAL\_ERROR**

CICS bridge encountered an unexpected error.

This feedback code occurs only in the *Reason* field of the MQDLH structure.

**MQFB\_CICS\_NOT\_AUTHORIZED**

User identifier not authorized or password not valid.

This feedback code occurs only in the *Reason* field of the MQDLH structure.

**MQFB\_CICS\_UOW\_BACKED\_OUT**

The unit of work was backed out, for one of the following reasons:

- A failure was detected while processing another request within the same unit of work.
- A CICS abend occurred while the unit of work was in progress.

**MQFB\_CICS\_UOW\_ERROR**

Unit-of-work control field *UOWControl* not valid.

**Trace-route message feedback codes:**

**MQFB\_ACTIVITY**

Used with the MQFMT\_EMBEDDED\_PCF format to allow the option of user data following activity reports.

**MQFB\_MAX\_ACTIVITIES**

Returned when the trace-route message is discarded because the number of activities the message has been involved in exceeds the maximum activities limit.

**MQFB\_NOT\_FORWARDED**

Returned when the trace-route message is discarded because it is about to be sent to a remote queue manager that does not support trace-route messages.

**MQFB\_NOT\_DELIVERED**

Returned when the trace-route message is discarded because it is about to be put on a local queue.

**MQFB\_UNSUPPORTED\_FORWARDING**

Returned when the trace-route message is discarded because a value in the forwarding parameter is unrecognized, and is in the rejected bit mask.

**MQFB\_UNSUPPORTED\_DELIVERY**

Returned when the trace-route message is discarded because a value in the delivery parameter is unrecognized, and is in the rejected bit mask.

**IBM MQ reason codes:** For exception report messages, *Feedback* contains an IBM MQ reason code. Among possible reason codes are:

**MQRC\_PUT\_INHIBITED**

(2051, X'803') Put calls inhibited for the queue.

**MQRC\_Q\_FULL**

(2053, X'805') Queue already contains maximum number of messages.

**MQRC\_NOT\_AUTHORIZED**

(2035, X'7F3') Not authorized for access.

**MQRC\_Q\_SPACE\_NOT\_AVAILABLE**

(2056, X'808') No space available on disk for queue.

**MQRC\_PERSISTENT\_NOT\_ALLOWED**

(2048, X'800') Queue does not support persistent messages.

**MQRC\_MSG\_TOO\_BIG\_FOR\_Q\_MGR**

(2031, X'7EF') Message length greater than maximum for queue manager.

**MQRC\_MSG\_TOO\_BIG\_FOR\_Q**

(2030, X'7EE') Message length greater than maximum for queue.

For a full list of reason codes, see:

- For IBM MQ for z/OS, see API reason codes.
- For all other platforms, see API completion and reason codes.

This is an output field for the MQGET call, and an input field for MQPUT and MQPUT1 calls. The initial value of this field is MQFB\_NONE.

*Format (MQCHAR8):*

This is a name that the sender of the message uses to indicate to the receiver the nature of the data in the message. Any characters that are in the character set of the queue manager can be specified for the name, but you must restrict the name to the following:

- Uppercase A through Z
- Numeric digits 0 through 9

If other characters are used, it might not be possible to translate the name between the character sets of the sending and receiving queue managers.

Pad the name with blanks to the length of the field, or use a null character to terminate the name before the end of the field; the null and any subsequent characters are treated as blanks. Do not specify a name with leading or embedded blanks. For the MQGET call, the queue manager returns the name padded with blanks to the length of the field.

The queue manager does not check that the name complies with the recommendations described above.

Names beginning MQ in upper, lower, and mixed case have meanings that are defined by the queue manager; do not use names beginning with these letters for your own formats. The queue manager built-in formats are:

#### **MQFMT\_NONE**

The nature of the data is undefined: the data cannot be converted when the message is retrieved from a queue using the MQGMO\_CONVERT option.

If you specify MQGMO\_CONVERT on the MQGET call, and the character set or encoding of data in the message differs from that specified in the *MsgDesc* parameter, the message is returned with the following completion and reason codes (assuming no other errors):

- Completion code MQCC\_WARNING and reason code MQRC\_FORMAT\_ERROR if the MQFMT\_NONE data is at the beginning of the message.
- Completion code MQCC\_OK and reason code MQRC\_NONE if the MQFMT\_NONE data is at the end of the message (that is, preceded by one or more MQ header structures). The MQ header structures are converted to the requested character set and encoding in this case.

For the C programming language, the constant MQFMT\_NONE\_ARRAY is also defined; this has the same value as MQFMT\_NONE, but is an array of characters instead of a string.

#### **MQFMT\_ADMIN**

The message is a command-server request or reply message in programmable command format (PCF). Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call. See *Using Programmable Command Formats* for more information about using programmable command format messages.

For the C programming language, the constant MQFMT\_ADMIN\_ARRAY is also defined; this has the same value as MQFMT\_ADMIN, but is an array of characters instead of a string.

## **MQFMT\_CICS**

The message data begins with the CICS information header MQCIH, followed by the application data. The format name of the application data is given by the *Format* field in the MQCIH structure.

On z/OS, specify the MQGMO\_CONVERT option on the MQGET call to convert messages that have format MQFMT\_CICS.

For the C programming language, the constant MQFMT\_CICS\_ARRAY is also defined; this has the same value as MQFMT\_CICS, but is an array of characters instead of a string.

## **MQFMT\_COMMAND\_1**

The message is an MQSC command-server reply message containing the object count, completion code, and reason code. Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT\_COMMAND\_1\_ARRAY is also defined; this has the same value as MQFMT\_COMMAND\_1, but is an array of characters instead of a string.

## **MQFMT\_COMMAND\_2**

The message is an MQSC command-server reply message containing information about the objects requested. Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT\_COMMAND\_2\_ARRAY is also defined; this has the same value as MQFMT\_COMMAND\_2, but is an array of characters instead of a string.

## **MQFMT\_DEAD\_LETTER\_HEADER**

The message data begins with the dead-letter header MQDLH. The data from the original message immediately follows the MQDLH structure. The format name of the original message data is given by the *Format* field in the MQDLH structure; see "MQDLH - Dead-letter header" on page 2107 for details of this structure. Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

COA and COD reports are not generated for messages that have a *Format* of MQFMT\_DEAD\_LETTER\_HEADER.

For the C programming language, the constant MQFMT\_DEAD\_LETTER\_HEADER\_ARRAY is also defined; this has the same value as MQFMT\_DEAD\_LETTER\_HEADER, but is an array of characters instead of a string.

## **MQFMT\_DIST\_HEADER**

The message data begins with the distribution-list header MQDH; this includes the arrays of MQOR and MQPMR records. The distribution-list header can be followed by additional data. The format of the additional data (if any) is given by the *Format* field in the MQDH structure; see "MQDH - Distribution header" on page 2099 for details of this structure. Messages with format MQFMT\_DIST\_HEADER can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

This format is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

For the C programming language, the constant MQFMT\_DIST\_HEADER\_ARRAY is also defined; this has the same value as MQFMT\_DIST\_HEADER, but is an array of characters instead of a string.

## **MQFMT\_EMBEDDED\_PCF**

Format for a trace-route message, provided that the PCF command value is set to MQCMD\_TRACE\_ROUTE. Using this format allows user data to be sent along with the trace-route message, provided that their applications can cope with preceding PCF parameters.

The PCF header **must** be the first header, or the message will not be treated as a trace-route message. This means that the message cannot be in a group, and that trace-route messages cannot be segmented. If a trace-route message is sent in a group the message is rejected with reason code MQRC\_MSG\_NOT\_ALLOWED\_IN\_GROUP.

Note that MQFMT\_ADMIN can also be used for the format of a trace-route message, but in this case no user data can be sent along with the trace-route message.

### MQFMT\_EVENT

The message is an MQ event message that reports an event that occurred. Event messages have the same structure as programmable commands; see PCF command messages for more information about this structure, and Event monitoring for information about events.

Version-1 event messages can be converted in all environments if the MQGMO\_CONVERT option is specified on the MQGET call. Version-2 event messages can be converted only on z/OS.

For the C programming language, the constant MQFMT\_EVENT\_ARRAY is also defined; this has the same value as MQFMT\_EVENT, but is an array of characters instead of a string.

### MQFMT\_IMS

The message data begins with the IMS information header MQIIH, which is followed by the application data. The format name of the application data is given by the *Format* field in the MQIIH structure.

For details of how MQIIH structure is handled when using MQGET with MQGMO\_CONVERT, see “Format (MQCHAR8)” on page 2163 and “ReplyToFormat (MQCHAR8)” on page 2164.

For the C programming language, the constant MQFMT\_IMS\_ARRAY is also defined; this has the same value as MQFMT\_IMS, but is an array of characters instead of a string.

### MQFMT\_IMS\_VAR\_STRING

The message is an IMS variable string, which is a string of the form 11zzccc, where:

- 11** is a 2-byte length field specifying the total length of the IMS variable string item. This length is equal to the length of 11 (2 bytes), plus the length of zz (2 bytes), plus the length of the character string itself. 11 is a 2-byte binary integer in the encoding specified by the *Encoding* field.
- zz** is a 2-byte field containing flags that are significant to IMS. zz is a byte string consisting of two MQBYTE fields, and is transmitted without change from sender to receiver (that is, zz is not subject to any conversion).
- ccc** is a variable-length character string containing 11-4 characters. ccc is in the character set specified by the *CodedCharSetId* field.

On z/OS, the message data can consist of a sequence of IMS variable strings butted together, with each string being of the form 11zzccc. There must be no bytes skipped between successive IMS variable strings. This means that if the first string has an odd length, the second string will be misaligned, that is, it will not begin on a boundary that is a multiple of two. Take care when constructing such strings on machines that require alignment of elementary data types.

Use the MQGMO\_CONVERT option on the MQGET call to convert messages that have format MQFMT\_IMS\_VAR\_STRING.

For the C programming language, the constant MQFMT\_IMS\_VAR\_STRING\_ARRAY is also defined; this has the same value as MQFMT\_IMS\_VAR\_STRING, but is an array of characters instead of a string.

### MQFMT\_MD\_EXTENSION

The message data begins with the message-descriptor extension MQMDE, and is optionally followed by other data (usually the application message data). The format name, character set, and encoding of the data that follow the MQMDE are given by the *Format*, *CodedCharSetId*, and

*Encoding* fields in the MQMDE. See “MQMDE - Message descriptor extension” on page 2234 for details of this structure. Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT\_MD\_EXTENSION\_ARRAY is also defined; this has the same value as MQFMT\_MD\_EXTENSION, but is an array of characters instead of a string.

#### **MQFMT\_PCF**

The message is a user-defined message that conforms to the structure of a programmable command format (PCF) message. Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call. See Using Programmable Command Formats for more information about using programmable command format messages.

For the C programming language, the constant MQFMT\_PCF\_ARRAY is also defined; this has the same value as MQFMT\_PCF, but is an array of characters instead of a string.

#### **MQFMT\_REF\_MSG\_HEADER**

The message data begins with the reference message header MQRMH, and is optionally followed by other data. The format name, character set, and encoding of the data is given by the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQRMH. See “MQRMH - Reference message header” on page 2321 for details of this structure. Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

This format is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

For the C programming language, the constant MQFMT\_REF\_MSG\_HEADER\_ARRAY is also defined; this has the same value as MQFMT\_REF\_MSG\_HEADER, but is an array of characters instead of a string.

#### **MQFMT\_RF\_HEADER**

The message data begins with the rules and formatting header MQRFH, and is optionally followed by other data. The format name, character set, and encoding of the data (if any) are given by the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQRFH. Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT\_RF\_HEADER\_ARRAY is also defined; this has the same value as MQFMT\_RF\_HEADER, but is an array of characters instead of a string.

#### **MQFMT\_RF\_HEADER\_2**

The message data begins with the version-2 rules and formatting header MQRFH2, and is optionally followed by other data. The format name, character set, and encoding of the optional data (if any) are given by the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQRFH2. Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT\_RF\_HEADER\_2\_ARRAY is also defined; this has the same value as MQFMT\_RF\_HEADER\_2, but is an array of characters instead of a string.

#### **MQFMT\_STRING**

The application message data can be either an SBCS string (single-byte character set), or a DBCS string (double-byte character set). Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT\_STRING\_ARRAY is also defined; this has the same value as MQFMT\_STRING, but is an array of characters instead of a string.

#### **MQFMT\_TRIGGER**

The message is a trigger message, described by the MQTM structure; see “MQTM - Trigger

message” on page 2380 for details of this structure. Messages of this format can be converted if the MQGMO\_CONVERT option is specified on the MQGET call.

For the C programming language, the constant MQFMT\_TRIGGER\_ARRAY is also defined; this has the same value as MQFMT\_TRIGGER, but is an array of characters instead of a string.

### MQFMT\_WORK\_INFO\_HEADER

The message data begins with the work information header MQWIH, which is followed by the application data. The format name of the application data is given by the *Format* field in the MQWIH structure.

On z/OS, specify the MQGMO\_CONVERT option on the MQGET call to convert the *user data* in messages that have format MQFMT\_WORK\_INFO\_HEADER. However, the MQWIH structure itself is always returned in the queue-manager's character set and encoding (that is, the MQWIH structure is converted whether or not the MQGMO\_CONVERT option is specified).

For the C programming language, the constant MQFMT\_WORK\_INFO\_HEADER\_ARRAY is also defined; this has the same value as MQFMT\_WORK\_INFO\_HEADER, but is an array of characters instead of a string.

### MQFMT\_XMIT\_Q\_HEADER

The message data begins with the transmission queue header MQXQH. The data from the original message immediately follows the MQXQH structure. The format name of the original message data is given by the *Format* field in the MQMD structure, which is part of the transmission queue header MQXQH. See “MQXQH - Transmission-queue header” on page 2404 for details of this structure.

COA and COD reports are not generated for messages that have a *Format* of MQFMT\_XMIT\_Q\_HEADER.

For the C programming language, the constant MQFMT\_XMIT\_Q\_HEADER\_ARRAY is also defined; this has the same value as MQFMT\_XMIT\_Q\_HEADER, but is an array of characters instead of a string.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The length of this field is given by MQ\_FORMAT\_LENGTH. The initial value of this field is MQFMT\_NONE.

*GroupId* (MQBYTE24):

This is a byte string that is used to identify the particular message group or logical message to which the physical message belongs. *GroupId* is also used if segmentation is allowed for the message. In all these cases, *GroupId* has a non-null value, and one or more of the following flags is set in the *MsgFlags* field:

- MQMF\_MSG\_IN\_GROUP
- MQMF\_LAST\_MSG\_IN\_GROUP
- MQMF\_SEGMENT
- MQMF\_LAST\_SEGMENT
- MQMF\_SEGMENTATION\_ALLOWED

If none of these flags is set, *GroupId* has the special null value MQGI\_NONE.

The application does not need to set this field on the MQPUT or MQGET call if:

- On the MQPUT call, MQPMO\_LOGICAL\_ORDER is specified.
- On the MQGET call, MQMO\_MATCH\_GROUP\_ID is *not* specified.

These are the recommended ways of using these calls for messages that are not report messages. However, if the application requires more control, or the call is MQPUT1, the application must ensure that *GroupId* is set to an appropriate value.

Message groups and segments can be processed correctly only if the group identifier is unique. For this reason, *applications must not generate their own group identifiers* ; instead, applications must do one of the following:

- If MQPMO\_LOGICAL\_ORDER is specified, the queue manager automatically generates a unique group identifier for the first message in the group or segment of the logical message, and uses that group identifier for the remaining messages in the group or segments of the logical message, so the application does not need to take any special action. This is the recommended procedure.
- If MQPMO\_LOGICAL\_ORDER is *not* specified, the application must request the queue manager to generate the group identifier, by setting *GroupId* to MQGI\_NONE on the first MQPUT or MQPUT1 call for a message in the group or segment of the logical message. The group identifier returned by the queue manager on output from that call must then be used for the remaining messages in the group or segments of the logical message. If a message group contains segmented messages, the same group identifier must be used for all segments and messages in the group.

When MQPMO\_LOGICAL\_ORDER is not specified, messages in groups and segments of logical messages can be put in any order (for example, in reverse order), but the group identifier must be allocated by the *first* MQPUT or MQPUT1 call that is issued for any of those messages.

On input to the MQPUT and MQPUT1 calls, the queue manager uses the value described in Physical order on a queue. On output from the MQPUT and MQPUT1 calls, the queue manager sets this field to the value that was sent with the message if the object opened is a single queue and not a distribution list, but leaves it unchanged if the object opened is a distribution list. In the latter case, if the application needs to know the group identifiers generated, the application must provide MQPMR records containing the *GroupId* field.

On input to the MQGET call, the queue manager uses the value described in Table 188 on page 2147. On output from the MQGET call, the queue manager sets this field to the value for the message retrieved.

The following special value is defined:

#### **MQGI\_NONE**

No group identifier specified.

The value is binary zero for the length of the field. This is the value that is used for messages that are not in groups, not segments of logical messages, and for which segmentation is not allowed.

For the C programming language, the constant MQGI\_NONE\_ARRAY is also defined; this has the same value as MQGI\_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ\_GROUP\_ID\_LENGTH. The initial value of this field is MQGI\_NONE. This field is ignored if *Version* is less than MQMD\_VERSION\_2.

*MsgFlags (MQLONG):*

MsgFlags are flags that specify attributes of the message, or control its processing.

MsgFlags are divided into the following categories:

- Segmentation flags
- Status flags

**Segmentation flags:** When a message is too big for a queue, an attempt to put the message on the queue typically fails. Segmentation is a technique whereby the queue manager or application splits the message into smaller pieces called segments, and places each segment on the queue as a separate physical message. The application that retrieves the message can either retrieve the segments one by one, or request the queue manager to reassemble the segments into a single message that is returned by the MQGET call. The latter is achieved by specifying the MQGMO\_COMPLETE\_MSG option on the MQGET call, and supplying a buffer that is big enough to accommodate the complete message. (See “MQGMO - Get-message options” on page 2128 for details of the MQGMO\_COMPLETE\_MSG option.) A message can be segmented at the sending queue manager, at an intermediate queue manager, or at the destination queue manager.

You can specify one of the following to control the segmentation of a message:

#### **MQMF\_SEGMENTATION\_INHIBITED**

This option prevents the message being broken into segments by the queue manager. If specified for a message that is already a segment, this option prevents the segment being broken into smaller segments.

The value of this flag is binary zero. This is the default.

#### **MQMF\_SEGMENTATION\_ALLOWED**

This option allows the message to be broken into segments by the queue manager. If specified for a message that is already a segment, this option allows the segment to be broken into smaller segments. MQMF\_SEGMENTATION\_ALLOWED can be set without either MQMF\_SEGMENT or MQMF\_LAST\_SEGMENT being set.

- On z/OS, the queue manager does not support the segmentation of messages. If a message is too big for the queue, the MQPUT or MQPUT1 call fails with reason code MQRC\_MSG\_TOO\_BIG\_FOR\_Q. However, the MQMF\_SEGMENTATION\_ALLOWED option can still be specified, and allows the message to be segmented at a remote queue manager.

When the queue manager segments a message, the queue manager turns on the MQMF\_SEGMENT flag in the copy of the MQMD that is sent with each segment, but does not alter the settings of these flags in the MQMD provided by the application on the MQPUT or MQPUT1 call. For the last segment in the logical message, the queue manager also turns on the MQMF\_LAST\_SEGMENT flag in the MQMD that is sent with the segment.

**Note:** Take care when putting messages with MQMF\_SEGMENTATION\_ALLOWED but without MQPMO\_LOGICAL\_ORDER. If the message is:

- Not a segment, and
- Not in a group, and
- Not being forwarded,

the application must reset the *GroupId* field to MQGI\_NONE before *each* MQPUT or MQPUT1 call, so that the queue manager can generate a unique group identifier for each message. If this is not done, unrelated messages can have the same group identifier, which might lead to incorrect processing subsequently. See the descriptions of the *GroupId* field and the MQPMO\_LOGICAL\_ORDER option for more information about when to reset the *GroupId* field.

The queue manager splits messages into segments as necessary so that the segments (plus any required header data) fit on the queue. However, there is a lower limit for the size of a segment generated by the queue manager, and only the last segment created from a message can be smaller than this limit (the lower limit for the size of an application-generated segment is one byte). Segments generated by the queue manager might be of unequal length. The queue-manager processes the message as follows:

- User-defined formats are split on boundaries that are multiples of 16 bytes; the queue manager does not generate segments that are smaller than 16 bytes (other than the last segment).
- Built-in formats other than MQFMT\_STRING are split at points appropriate to the nature of the data present. However, the queue manager never splits a message in the middle of an IBM MQ header structure. This means that a segment containing a single MQ header structure cannot be split further by the queue manager, and as a result the minimum possible segment size for that message is greater than 16 bytes.

The second or later segment generated by the queue manager begins with one of the following:

- An MQ header structure
- The start of the application message data
- Part of the way through the application message data
- MQFMT\_STRING is split without regard for the nature of the data present (SBCS, DBCS, or mixed SBCS/DBCS). When the string is DBCS or mixed SBCS/DBCS, this might result in segments that cannot be converted from one character set to another. The queue manager never splits MQFMT\_STRING messages into segments that are smaller than 16 bytes (other than the last segment).
- The queue manager sets the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQMD of each segment to describe correctly the data present at the *start* of the segment; the format name is either the name of a built-in format, or the name of a user-defined format.
- The *Report* field in the MQMD of segments with *Offset* greater than zero is modified. For each report type, if the report option is MQRO\_\*\_WITH\_DATA, but the segment cannot contain any of the first 100 bytes of user data (that is, the data following any IBM MQ header structures that may be present), the report option is changed to MQRO\_\*.

The queue manager follows the above rules, but otherwise splits messages unpredictably; do not make assumptions about where a message is split.

For *persistent* messages, the queue manager can perform segmentation only within a unit of work:

- If the MQPUT or MQPUT1 call is operating within a user-defined unit of work, that unit of work is used. If the call fails during the segmentation process, the queue manager removes any segments that were placed on the queue as a result of the failing call. However, the failure does not prevent the unit of work being committed successfully.
- If the call is operating outside a user-defined unit of work, and there is no user-defined unit of work in existence, the queue manager creates a unit of work just for the duration of the call. If the call is successful, the queue manager commits the unit of work automatically. If the call fails, the queue manager backs out the unit of work.
- If the call is operating outside a user-defined unit of work, but a user-defined unit of work exists, the queue manager cannot perform segmentation. If the message does not require segmentation, the call can still succeed. But if the message requires segmentation, the call fails with reason code MQRC\_UOW\_NOT\_AVAILABLE.

For *nonpersistent* messages, the queue manager does not require a unit of work to be available in order to perform segmentation.

Take special care when converting data in messages that might be segmented:

- If the receiving application converts data on the MQGET call, and specifies the MQGMO\_COMPLETE\_MSG option, the data-conversion exit is passed the complete message for the exit to convert, and the fact that the message was segmented is apparent to the exit.

- If the receiving application retrieves one segment at a time, the data-conversion exit is invoked to convert one segment at a time. The exit must therefore convert the data in a segment independently of the data in any of the other segments.

If the nature of the data in the message is such that arbitrary segmentation of the data on 16-byte boundaries might result in segments that cannot be converted by the exit, or the format is MQFMT\_STRING and the character set is DBCS or mixed SBCS/DBCS, the sending application must create and put the segments, specifying MQMF\_SEGMENTATION\_INHIBITED to suppress further segmentation. In this way, the sending application can ensure that each segment contains sufficient information to allow the data-conversion exit to convert the segment successfully.

- If sender conversion is specified for a sending message channel agent (MCA), the MCA converts only messages that are not segments of logical messages; the MCA never attempts to convert messages that are segments.

This flag is an input flag on the MQPUT and MQPUT1 calls, and an output flag on the MQGET call. On the latter call, the queue manager also echoes the value of the flag to the *Segmentation* field in MQGMO.

The initial value of this flag is MQMF\_SEGMENTATION\_INHIBITED.

**Status flags:** These are flags that indicate whether the physical message belongs to a message group, is a segment of a logical message, both, or neither. One or more of the following can be specified on the MQPUT or MQPUT1 call, or returned by the MQGET call:

#### **MQMF\_MSG\_IN\_GROUP**

Message is a member of a group.

#### **MQMF\_LAST\_MSG\_IN\_GROUP**

Message is the last logical message in a group.

If this flag is set, the queue manager turns on MQMF\_MSG\_IN\_GROUP in the copy of MQMD that is sent with the message, but does not alter the settings of these flags in the MQMD provided by the application on the MQPUT or MQPUT1 call.

It is valid for a group to consist of only one logical message. If this is the case, MQMF\_LAST\_MSG\_IN\_GROUP is set, but the *MsgSeqNumber* field has the value one.

#### **MQMF\_SEGMENT**

Message is a segment of a logical message.

When MQMF\_SEGMENT is specified without MQMF\_LAST\_SEGMENT, the length of the application message data in the segment ( *excluding* the lengths of any IBM MQ header structures that might be present) must be at least one. If the length is zero, the MQPUT or MQPUT1 call fails with reason code MQRC\_SEGMENT\_LENGTH\_ZERO.

On z/OS, this option is not supported if the message is being put on a queue that has an index type of MQIT\_GROUP\_ID.

#### **MQMF\_LAST\_SEGMENT**

Message is the last segment of a logical message.

If this flag is set, the queue manager turns on MQMF\_SEGMENT in the copy of MQMD that is sent with the message, but does not alter the settings of these flags in the MQMD provided by the application on the MQPUT or MQPUT1 call.

A logical message can consist of only one segment. If so, MQMF\_LAST\_SEGMENT is set, but the *Offset* field has the value zero.

When MQMF\_LAST\_SEGMENT is specified, the length of the application message data in the segment ( *excluding* the lengths of any header structures that might be present) can be zero.

On z/OS, this option is not supported if the message is being put on a queue that has an index type of MQIT\_GROUP\_ID.

The application must ensure that these flags are set correctly when putting messages. If MQPMO\_LOGICAL\_ORDER is specified, or was specified on the preceding MQPUT call for the queue handle, the settings of the flags must be consistent with the group and segment information retained by the queue manager for the queue handle. The following conditions apply to *successive* MQPUT calls for the queue handle when MQPMO\_LOGICAL\_ORDER is specified:

- If there is no current group or logical message, all these flags (and combinations of them) are valid.
- Once MQMF\_MSG\_IN\_GROUP has been specified, it must remain on until MQMF\_LAST\_MSG\_IN\_GROUP is specified. The call fails with reason code MQRC\_INCOMPLETE\_GROUP if this condition is not satisfied.
- Once MQMF\_SEGMENT has been specified, it must remain on until MQMF\_LAST\_SEGMENT is specified. The call fails with reason code MQRC\_INCOMPLETE\_MSG if this condition is not satisfied.
- Once MQMF\_SEGMENT has been specified without MQMF\_MSG\_IN\_GROUP, MQMF\_MSG\_IN\_GROUP must remain *off* until after MQMF\_LAST\_SEGMENT has been specified. The call fails with reason code MQRC\_INCOMPLETE\_MSG if this condition is not satisfied.

Physical order on a queue shows the valid combinations of the flags, and the values used for various fields.

These flags are input flags on the MQPUT and MQPUT1 calls, and output flags on the MQGET call. On the latter call, the queue manager also echoes the values of the flags to the *GroupStatus* and *SegmentStatus* fields in MQGMO.

You cannot use grouped or segmented messages with Publish/Subscribe.

**Default flags:** The following can be specified to indicate that the message has default attributes:

#### **MQMF\_NONE**

No message flags (default message attributes).

This inhibits segmentation, and indicates that the message is not in a group and is not a segment of a logical message. MQMF\_NONE is defined to aid program documentation. It is not intended that this flag be used with any other, but as its value is zero, such use cannot be detected.

The *MsgFlags* field is partitioned into subfields; for details see “Report options and message flags” on page 2697.

The initial value of this field is MQMF\_NONE. This field is ignored if *Version* is less than MQMD\_VERSION\_2.

*MsgId* (MQBYTE24):

This is a byte string that is used to distinguish one message from another. Generally, no two messages should have the same message identifier, although this is not disallowed by the queue manager. The message identifier is a permanent property of the message, and persists across restarts of the queue manager. Because the message identifier is a byte string and not a character string, the message identifier is *not* converted between character sets when the message flows from one queue manager to another.

For the MQPUT and MQPUT1 calls, if MQMI\_NONE or MQPMO\_NEW\_MSG\_ID is specified by the application, the queue manager generates a unique message identifier<sup>1</sup> when the message is put, and places it in the message descriptor sent with the message. The queue manager also returns this message identifier in the message descriptor belonging to the sending application. The application can use this value to record information about particular messages, and to respond to queries from other parts of the application.

If the message is being put to a topic, the queue manager generates unique message identifiers as necessary for each message published. If MQPMO\_NEW\_MSG\_ID is specified by the application, the queue manager generates a unique message identifier to return on output. If MQMI\_NONE is specified by the application, the value of the *MsgId* field in the MQMD is unchanged on return from the call.

See the description of MQPMO\_RETAIN in “MQPMO options (MQLONG)” on page 2276 for more details about retained publications.

If the message is being put to a distribution list, the queue manager generates unique message identifiers as necessary, but the value of the *MsgId* field in MQMD is unchanged on return from the call, even if MQMI\_NONE or MQPMO\_NEW\_MSG\_ID was specified. If the application needs to know the message identifiers generated by the queue manager, the application must provide MQPMR records containing the *MsgId* field.

The sending application can also specify a value for the message identifier other than MQMI\_NONE; this stops the queue manager generating a unique message identifier. An application that is forwarding a message can use this to propagate the message identifier of the original message.

The queue manager does not use this field except to:

- Generate a unique value if requested, as described above
- Deliver the value to the application that issues the get request for the message
- Copy the value to the *CorrelId* field of any report message that it generates about this message (depending on the *Report* options)

When the queue manager or a message channel agent generates a report message, it sets the *MsgId* field in the way specified by the *Report* field of the original message, either MQRO\_NEW\_MSG\_ID or MQRO\_PASS\_MSG\_ID. Applications that generate report messages must also do this.

For the MQGET call, *MsgId* is one of the five fields that can be used to retrieve a particular message from the queue. Normally the MQGET call returns the next message on the queue, but a particular message can be obtained by specifying one or more of the five selection criteria, in any combination; these fields are:

---

1. A *MsgId* generated by the queue manager consists of a 4-byte product identifier (AMQ $\tau$  or CSQ $\tau$  in either ASCII or EBCDIC, where  $\tau$  represents a blank character), followed by a product-specific implementation of a unique string. In IBM MQ this contains the first 12 characters of the queue-manager name, and a value derived from the system clock. All queue managers that can intercommunicate must therefore have names that differ in the first 12 characters, in order to ensure that message identifiers are unique. The ability to generate a unique string also depends on the system clock not being changed backward. To eliminate the possibility of a message identifier generated by the queue manager duplicating one generated by the application, the application must avoid generating identifiers with initial characters in the range A through I in ASCII or EBCDIC (X'41' through X'49' and X'C1' through X'C9'). However, the application is not prevented from generating identifiers with initial characters in these ranges.

- *MsgId*
- *CorrelId*
- *GroupId*
- *MsgSeqNumber*
- *Offset*

The application sets one or more of these field to the values required, and then sets the corresponding MQMO\_\* match options in the *MatchOptions* field in MQGMO to use those fields as selection criteria. Only messages that have the specified values in those fields are candidates for retrieval. The default for the *MatchOptions* field (if not altered by the application) is to match both the message identifier and the correlation identifier.

On z/OS, the selection criteria that you can use are restricted by the type of index used for the queue. See the *IndexType* queue attribute for further details.

Normally, the message returned is the *first* message on the queue that satisfies the selection criteria. But if MQGMO\_BROWSE\_NEXT is specified, the message returned is the *next* message that satisfies the selection criteria; the scan for this message starts with the message *following* the current cursor position.

**Note:** The queue is scanned sequentially for a message that satisfies the selection criteria, so retrieval times are slower than if no selection criteria are specified, especially if many messages have to be scanned before a suitable one is found. The exceptions to this are:

- an MQGET call by *CorrelId* on 64-bit distributed platforms where the *CorrelId* index eliminates the need to perform a true sequential scan.
- an MQGET call by *IndexType* on z/OS.

In both these cases, retrieval performance is improved.

See Table 188 on page 2147 for more information about how selection criteria are used in various situations.

Specifying MQMI\_NONE as the message identifier has the same effect as *not* specifying MQMO\_MATCH\_MSG\_ID, that is, *any* message identifier matches.

This field is ignored if the MQGMO\_MSG\_UNDER\_CURSOR option is specified in the *GetMsgOpts* parameter on the MQGET call.

On return from an MQGET call, the *MsgId* field is set to the message identifier of the message returned (if any).

The following special value can be used:

#### **MQMI\_NONE**

No message identifier is specified.

The value is binary zero for the length of the field.

For the C programming language, the constant MQMI\_NONE\_ARRAY is also defined; this has the same value as MQMI\_NONE, but is an array of characters instead of a string.

This is an input/output field for the MQGET, MQPUT, and MQPUT1 calls. The length of this field is given by MQ\_MSG\_ID\_LENGTH. The initial value of this field is MQMI\_NONE.

### *MsgSeqNumber (MQLONG):*

This is the sequence number of a logical message within a group.

Sequence numbers start at 1, and increase by 1 for each new logical message in the group, up to a maximum of 999 999 999. A physical message that is not in a group has a sequence number of 1.

The application does not have to set this field on the MQPUT or MQGET call if:

- On the MQPUT call, MQPMO\_LOGICAL\_ORDER is specified.
- On the MQGET call, MQMO\_MATCH\_MSG\_SEQ\_NUMBER is *not* specified.

These are the recommended ways of using these calls for messages that are not report messages. However, if the application requires more control, or the call is MQPUT1, the application must ensure that *MsgSeqNumber* is set to an appropriate value.

On input to the MQPUT and MQPUT1 calls, the queue manager uses the value described in Physical order on a queue. On output from the MQPUT and MQPUT1 calls, the queue manager sets this field to the value that was sent with the message.

On input to the MQGET call, the queue manager uses the value shown in Table 188 on page 2147. On output from the MQGET call, the queue manager sets this field to the value for the message retrieved.

The initial value of this field is one. This field is ignored if *Version* is less than MQMD\_VERSION\_2.

### *MsgType (MQLONG):*

This indicates the type of the message. Message types are grouped as follows:

#### **MQMT\_SYSTEM\_FIRST**

Lowest value for system-defined message types.

#### **MQMT\_SYSTEM\_LAST**

Highest value for system-defined message types.

The following values are currently defined within the system range:

#### **MQMT\_DATAGRAM**

The message is one that does not require a reply.

#### **MQMT\_REQUEST**

The message is one that requires a reply.

Specify the name of the queue to which to send the reply in the *ReplyToQ* field. The *Report* field indicates how to set the *MsgId* and *CorrelId* of the reply.

#### **MQMT\_REPLY**

The message is the reply to an earlier request message (MQMT\_REQUEST). The message must be sent to the queue indicated by the *ReplyToQ* field of the request message. Use the *Report* field of the request to control how to set the *MsgId* and *CorrelId* of the reply.

**Note:** The queue manager does not enforce the request-reply relationship; this is an application responsibility.

#### **MQMT\_REPORT**

The message is reporting on some expected or unexpected occurrence, usually related to some other message (for example, a request message was received that contained data that was not valid). Send the message to the queue indicated by the *ReplyToQ* field of the message descriptor of the original message. Set the *Feedback* field s to indicate the nature of the report. Use the *Report* field of the original message to control how to set the *MsgId* and *CorrelId* of the report message.

Report messages generated by the queue manager or message channel agent are always sent to the *ReplyToQ* queue, with the *Feedback* and *CorrelId* fields set as described above.

Application-defined values can also be used. They must be within the following range:

**MQMT\_APPL\_FIRST**

Lowest value for application-defined message types.

**MQMT\_APPL\_LAST**

Highest value for application-defined message types.

For the MQPUT and MQPUT1 calls, the *MsgType* value must be within either the system-defined range or the application-defined range; if it is not, the call fails with reason code MQRC\_MSG\_TYPE\_ERROR.

This is an output field for the MQGET call, and an input field for MQPUT and MQPUT1 calls. The initial value of this field is MQMT\_DATAGRAM.

*Offset (MQLONG):*

This is the offset in bytes of the data in the physical message from the start of the logical message of which the data forms part. This data is called a *segment*. The offset is in the range 0 through 999 999 999. A physical message that is not a segment of a logical message has an offset of zero.

The application does not need to set this field on the MQPUT or MQGET call if:

- On the MQPUT call, MQPMO\_LOGICAL\_ORDER is specified.
- On the MQGET call, MQMO\_MATCH\_OFFSET is *not* specified.

These are the recommended ways of using these calls for messages that are not report messages. However, if the application does not comply with these conditions, or the call is MQPUT1, the application must ensure that *Offset* is set to an appropriate value.

On input to the MQPUT and MQPUT1 calls, the queue manager uses the value described in Physical order on a queue. On output from the MQPUT and MQPUT1 calls, the queue manager sets this field to the value that was sent with the message.

For a report message reporting on a segment of a logical message, the *OriginalLength* field (provided it is not MQOL\_UNDEFINED) is used to update the offset in the segment information retained by the queue manager.

On input to the MQGET call, the queue manager uses the value shown in Table 188 on page 2147. On output from the MQGET call, the queue manager sets this field to the value for the message retrieved.

The initial value of this field is zero. This field is ignored if *Version* is less than MQMD\_VERSION\_2.

*OriginalLength* (MQLONG):

This field is relevant only for report messages that are segments. It specifies the length of the message segment to which the report message relates; it does not specify the length of the logical message of which the segment forms part, or the length of the data in the report message.

**Note:** When generating a report message for a message that is a segment, the queue manager and message channel agent copy into the MQMD for the report message the *GroupId*, *MsgSeqNumber*, *Offset*, and *MsgFlags*, fields from the original message. As a result, the report message is also a segment. Applications that generate report messages must do the same, and set the *OriginalLength* field correctly.

The following special value is defined:

#### **MQOL\_UNDEFINED**

Original length of message not defined.

*OriginalLength* is an input field on the MQPUT and MQPUT1 calls, but the value that the application provides is accepted only in particular circumstances:

- If the message being put is a segment and is also a report message, the queue manager accepts the value specified. The value must be:
  - Greater than zero if the segment is not the last segment
  - Not less than zero if the segment is the last segment
  - Not less than the length of data present in the message

If these conditions are not satisfied, the call fails with reason code MQRC\_ORIGINAL\_LENGTH\_ERROR.

- If the message being put is a segment but not a report message, the queue manager ignores the field and uses the length of the application message data instead.
- In all other cases, the queue manager ignores the field and uses the value MQOL\_UNDEFINED instead.

This is an output field on the MQGET call.

The initial value of this field is MQOL\_UNDEFINED. This field is ignored if *Version* is less than MQMD\_VERSION\_2.

*Persistence* (MQLONG):

This indicates whether the message survives system failures and restarts of the queue manager. For the MQPUT and MQPUT1 calls, the value must be one of the following:

#### **MQPER\_PERSISTENT**

The message survives system failures and restarts of the queue manager. Once the message has been put, and the unit of work in which it was put has been committed (if the message is put as part of a unit of work), the message is preserved on auxiliary storage. It remains there until the message is removed from the queue, and the unit of work in which it was got has been committed (if the message is retrieved as part of a unit of work).

When a persistent message is sent to a remote queue, a store-and-forward mechanism holds the message at each queue manager along the route to the destination, until the message is known to have arrived at the next queue manager.

Persistent messages cannot be placed on:

- Temporary dynamic queues
- Shared queues that map to a CFSTRUCT object at CFLEVEL(2) or below, or where the CFSTRUCT object is defined as RECOVER(NO).

Persistent messages can be placed on permanent dynamic queues, and predefined queues.

#### **MQPER\_NOT\_PERSISTENT**

The message does not usually survive system failures or queue manager restarts. This applies even if an intact copy of the message is found on auxiliary storage when the queue manager restarts.

In the case of NPMCLASS (HIGH) queues nonpersistent messages survive a normal queue manager shutdown and restart.

In the case of shared queues, nonpersistent messages survive queue manager restarts in the queue-sharing group, but do not survive failures of the coupling facility used to store messages on the shared queues.

#### **MQPER\_PERSISTENCE\_AS\_Q\_DEF**

- If the queue is a cluster queue, the persistence of the message is taken from the *DefPersistence* attribute defined at the *destination* queue manager that owns the particular instance of the queue on which the message is placed. Usually, all instances of a cluster queue have the same value for the *DefPersistence* attribute, although this is not mandated.

The value of *DefPersistence* is copied into the *Persistence* field when the message is placed on the destination queue. If *DefPersistence* is changed subsequently, messages that have already been placed on the queue are not affected.

- If the queue is not a cluster queue, the persistence of the message is taken from the *DefPersistence* attribute defined at the *local* queue manager, even if the destination queue manager is remote.

If there is more than one definition in the queue-name resolution path, the default persistence is taken from the value of this attribute in the *first* definition in the path. This can be:

- An alias queue
- A local queue
- A local definition of a remote queue
- A queue-manager alias
- A transmission queue (for example, the *DefXmitQName* queue)

The value of *DefPersistence* is copied into the *Persistence* field when the message is put. If *DefPersistence* is changed subsequently, messages that have already been put are not affected.

Both persistent and nonpersistent messages can exist on the same queue.

When replying to a message, applications must use the persistence of the request message for the reply message.

For an MQGET call, the value returned is either MQPER\_PERSISTENT or MQPER\_NOT\_PERSISTENT.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQPER\_PERSISTENCE\_AS\_Q\_DEF.

*Priority (MQLONG):*

For the MQPUT and MQPUT1 calls, the value must be greater than or equal to zero; zero is the lowest priority. The following special value can also be used:

#### **MQPRI\_PRIORITY\_AS\_Q\_DEF**

- If the queue is a cluster queue, the priority for the message is taken from the *DefPriority* attribute as defined at the *destination* queue manager that owns the particular instance of the queue on which the message is placed. Usually, all instances of a cluster queue have the same value for the *DefPriority* attribute, although this is not mandated.

The value of *DefPriority* is copied into the *Priority* field when the message is placed on the destination queue. If *DefPriority* is changed subsequently, messages that have already been placed on the queue are not affected.

- If the queue is not a cluster queue, the priority for the message is taken from the *DefPriority* attribute as defined at the *local* queue manager, even if the destination queue manager is remote.

If there is more than one definition in the queue-name resolution path, the default priority is taken from the value of this attribute in the *first* definition in the path. This can be:

- An alias queue
- A local queue
- A local definition of a remote queue
- A queue-manager alias
- A transmission queue (for example, the *DefXmitQName* queue)

The value of *DefPriority* is copied into the *Priority* field when the message is put. If *DefPriority* is changed subsequently, messages that have already been put are not affected.

The value returned by the MQGET call is always greater than or equal to zero; the value MQPRI\_PRIORITY\_AS\_Q\_DEF is never returned.

If a message is put with a priority greater than the maximum supported by the local queue manager (this maximum is given by the *MaxPriority* queue-manager attribute), the message is accepted by the queue manager, but placed on the queue at the queue manager's maximum priority; the MQPUT or MQPUT1 call completes with MQCC\_WARNING and reason code MQRC\_PRIORITY\_EXCEEDS\_MAXIMUM. However, the *Priority* field retains the value specified by the application that put the message.

On z/OS, if a message with a *MsgSeqNumber* of 1 is put to a queue that has a message delivery sequence of MQMDS\_PRIORITY and an index type of MQIT\_GROUP\_ID, the queue might treat the message with a different priority. If the message was placed on the queue with a priority of 0 or 1, it is processed as though it has a priority of 2. This is because the order of messages placed on this type of queue is optimized to enable efficient group completeness tests. For more information on the message delivery sequence MQMDS\_PRIORITY and the index type MQIT\_GROUP\_ID, see *MsgDeliverySequence* attribute.

When replying to a message, applications must use the priority of the request message for the reply message. In other situations, specifying MQPRI\_PRIORITY\_AS\_Q\_DEF allows priority tuning to be carried out without changing the application.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQPRI\_PRIORITY\_AS\_Q\_DEF.

*PutApplName* (MQCHAR28):

This is the name of application that put the message, and is part of the *origin context* of the message. The contents differ between platforms, and might differ between releases.

For more information about message context, see “Overview for MQMD” on page 2180 and Message context.

The format of *PutApplName* depends on the value of *PutApplType* and can change from one release to another. Changes are rare, but do happen if the environment changes.

When the queue manager sets this field (that is, for all options except MQPMO\_SET\_ALL\_CONTEXT), it sets the field to a value that is determined by the environment:

-  On z/OS, the queue manager uses:
  - For z/OS batch, the 8-character job name from the JES JOB card
  - For TSO, the 7-character TSO user identifier
  - For CICS, the 8-character applid, followed by the 4-character tranid
  - For IMS, the 8-character IMS system identifier, followed by the 8-character PSB name
  - For XCF, the 8-character XCF group name, followed by the 16-character XCF member name
  - For a message generated by a queue manager, the first 28 characters of the queue manager name
  - For distributed queuing without CICS, the 8-character jobname of the channel initiator followed by the 8-character name of the module putting to the dead-letter queue followed by an 8-character task identifier.

The name or names are each padded to the right with blanks, as is any space in the remainder of the field. Where there is more than one name, there is no separator between them.

-  On Windows systems, the queue manager uses the following names:
  - For a CICS application, the CICS transaction name
  - For a non-CICS application, the rightmost 28 characters of the fully-qualified name of the executable
-  On IBM i, the queue manager uses the fully-qualified job name.
-  On UNIX systems, the queue manager uses the following names:
  - For a CICS application, the CICS transaction name
  - For a non-CICS application, MQ asks the operating system for the name of the process. This is returned as the program file name, without full path. Then MQ places this process name in the MQMD.PutApplName field as follows:

**AIX** If the name is less than or equal to 28 bytes, then the name is inserted, padded to the right with spaces.

If the name is greater than 28 bytes, then the leftmost 28 bytes of the name are inserted.

#### **Linux and Solaris**

If the name is less than or equal to 15 bytes, then the name is inserted, padded to the right with spaces.

If the name is greater than 15 bytes, then the leftmost 15 bytes of the name are inserted, padded to the right with spaces.

#### **HP-UX**

If the name is less than or equal to 14 bytes, then the name is inserted, padded to the right with spaces.

If the name is greater than 14 bytes, then the leftmost 14 bytes of the name are inserted, padded to the right with spaces.

For example, if you run `/opt/mqm/samp/bin/amqspout QNAME QMNAME`, then the `PutApplName` is `'amqspout'`. There are 21 space characters of padding in this `MQCHAR28` field. Note that the full path including `/opt/mqm/samp/bin` is not included in the `PutApplName`.

For the `MQPUT` and `MQPUT1` calls, this is an input/output field if `MQPMO_SET_ALL_CONTEXT` is specified in the `PutMsgOpts` parameter. Any information following a null character within the field is discarded. The null character and any following characters are converted to blanks by the queue manager. If `MQPMO_SET_ALL_CONTEXT` is not specified, this field is ignored on input and is an output-only field.

*PutApplType* (MQLONG):

This is the type of application that put the message, and is part of the **origin context** of the message. For more information about message context, see “Overview for MQMD” on page 2180 and Message context.

*PutApplType* can have one of the following standard types. You can also define your own types, but only with values in the range `MQAT_USER_FIRST` through `MQAT_USER_LAST`.

#### **MQAT\_AIX**

AIX application (same value as `MQAT_UNIX`).

#### **MQAT\_AMQP**

AMQP protocol application

#### **MQAT\_BROKER**

Broker.

#### **MQAT\_CICS**

CICS transaction.

#### **MQAT\_CICS\_BRIDGE**

CICS bridge.

#### **MQAT\_CICS\_VSE**

CICS/VSE transaction.

#### **MQAT\_DOS**

IBM MQ MQI client application on PC DOS.

#### **MQAT\_DQM**

Distributed queue manager agent.

#### **MQAT\_GUARDIAN**

Tandem Guardian application (same value as `MQAT_NSK`).

#### **MQAT\_IMS**

IMS application.

#### **MQAT\_IMS\_BRIDGE**

IMS bridge.

#### **MQAT\_JAVA**

Java.

#### **MQAT\_MVS**

MVS or TSO application (same value as `MQAT_ZOS`).

#### **MQAT\_NOTES\_AGENT**

Lotus Notes Agent application.

#### **MQAT\_NSK**

HP Integrity NonStop Server application.

**MQAT\_OS390**  
OS/390 application (same value as MQAT\_ZOS).

**MQAT\_OS400**  
IBM i application.

**MQAT\_QMGR**  
Queue manager.

**MQAT\_UNIX**  
UNIX application.

**MQAT\_VOS**  
Stratus VOS application.

**MQAT\_WINDOWS**  
16-bit Windows application.

**MQAT\_WINDOWS\_NT**  
32-bit Windows application.

**MQAT\_WLM**  
z/OS workload manager application.

**MQAT\_XCF**  
XCF.

**MQAT\_ZOS**  
z/OS application.

**MQAT\_DEFAULT**  
Default application type.

This is the default application type for the platform on which the application is running.

**Note:** The value of this constant is environment-specific. Because of this, always compile the application using the header, include, or COPY files that are appropriate to the platform on which the application will run.

**MQAT\_UNKNOWN**  
Use this value to indicate that the application type is unknown, even though other context information is present.

**MQAT\_USER\_FIRST**  
Lowest value for user-defined application type.

**MQAT\_USER\_LAST**  
Highest value for user-defined application type.

The following special value can also occur:

**MQAT\_NO\_CONTEXT**  
This value is set by the queue manager when a message is put with no context (that is, the MQPMO\_NO\_CONTEXT context option is specified).

When a message is retrieved, *PutApplType* can be tested for this value to decide whether the message has context (it is recommended that *PutApplType* is never set to MQAT\_NO\_CONTEXT, by an application using MQPMO\_SET\_ALL\_CONTEXT, if any of the other context fields are nonblank).

When the queue manager generates this information as a result of an application put, the field is set to a value that is determined by the environment. On IBM i, it is set to MQAT\_OS400; the queue manager never uses MQAT\_CICS on IBM i.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO\_SET\_ALL\_CONTEXT is specified in the *PutMsgOpts* parameter. If MQPMO\_SET\_ALL\_CONTEXT is not specified, this field is ignored on input and is an output-only field.

This is an output field for the MQGET call. The initial value of this field is MQAT\_NO\_CONTEXT.

*PutDate (MQCHAR8):*

This is the date when the message was put, and is part of the **origin context** of the message. For more information about message context, see "Overview for MQMD" on page 2180 and Message context.

The format used for the date when this field is generated by the queue manager is:

- YYYYMMDD

where the characters represent:

**YYYY** year (four numeric digits)

**MM** month of year (01 through 12)

**DD** day of month (01 through 31)

Greenwich Mean Time (GMT) is used for the *PutDate* and *PutTime* fields, subject to the system clock being set accurately to GMT.

If the message was put as part of a unit of work, the date is that when the message was put, and not the date when the unit of work was committed.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO\_SET\_ALL\_CONTEXT is specified in the *PutMsgOpts* parameter. The contents of the field are not checked by the queue manager, except that any information following a null character within the field is discarded. The queue manager converts the null character and any following characters to blanks. If MQPMO\_SET\_ALL\_CONTEXT is not specified, this field is ignored on input and is an output-only field.

This is an output field for the MQGET call. The length of this field is given by MQ\_PUT\_DATE\_LENGTH. The initial value of this field is the null string in C, and 8 blank characters in other programming languages.

*PutTime (MQCHAR8):*

This is the time when the message was put, and is part of the **origin context** of the message. For more information about message context, see "Overview for MQMD" on page 2180 and Message context.

The format used for the time when this field is generated by the queue manager is:

- HHMMSSTH

where the characters represent (in order):

**HH** hours (00 through 23)

**MM** minutes (00 through 59)

**SS** seconds (00 through 59; see note)

**T** tenths of a second (0 through 9)

**H** hundredths of a second (0 through 9)

**Note:** If the system clock is synchronized to a very accurate time standard, it is possible on rare occasions for 60 or 61 to be returned for the seconds in *PutTime*. This happens when leap seconds are inserted into the global time standard.

Greenwich Mean Time (GMT) is used for the *PutDate* and *PutTime* fields, subject to the system clock being set accurately to GMT.

If the message was put as part of a unit of work, the time is that when the message was put, and not the time when the unit of work was committed.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO\_SET\_ALL\_CONTEXT is specified in the *PutMsgOpts* parameter. The queue manager does not check the contents of the field, except that any information following a null character within the field is discarded. The queue manager converts the null character and any following characters to blanks. If MQPMO\_SET\_ALL\_CONTEXT is not specified, this field is ignored on input and is an output-only field.

This is an output field for the MQGET call. The length of this field is given by MQ\_PUT\_TIME\_LENGTH. The initial value of this field is the null string in C, and 8 blank characters in other programming languages.

*ReplyToQ* (MQCHAR48):

This is the name of the message queue to which the application that issued the get request for the message sends MQMT\_REPLY and MQMT\_REPORT messages. The name is the local name of a queue that is defined on the queue manager identified by *ReplyToQMgr*. This queue must not be a model queue, although the sending queue manager does not verify this when the message is put.

For the MQPUT and MQPUT1 calls, this field must not be blank if the *MsgType* field has the value MQMT\_REQUEST, or if any report messages are requested by the *Report* field. However, the value specified (or substituted) is passed on to the application that issues the get request for the message, whatever the message type.

If the *ReplyToQMgr* field is blank, the local queue manager looks up the *ReplyToQ* name in its own queue definitions. If a local definition of a remote queue exists with this name, the *ReplyToQ* value in the transmitted message is replaced by the value of the *RemoteQName* attribute from the definition of the remote queue, and this value is returned in the message descriptor when the receiving application issues an MQGET call for the message. If a local definition of a remote queue does not exist, *ReplyToQ* is unchanged.

If the name is specified, it can contain trailing blanks; the first null character and characters following it are treated as blanks. Otherwise no check is made that the name satisfies the naming rules for queues; this is also true for the name transmitted, if the *ReplyToQ* is replaced in the transmitted message. The only check made is that a name has been specified, if the circumstances require it.

If a reply-to queue is not required, set the *ReplyToQ* field to blanks, or (in the C programming language) to the null string, or to one or more blanks followed by a null character; do not leave the field uninitialized.

For the MQGET call, the queue manager always returns the name padded with blanks to the length of the field.

If a message that requires a report message cannot be delivered, and the report message also cannot be delivered to the queue specified, both the original message and the report message go to the dead-letter (undelivered-message) queue (see the *DeadLetterQName* attribute described in “Attributes for the queue manager” on page 2586).

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The length of this field is given by MQ\_Q\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

### *ReplyToQMgr (MQCHAR48):*

This is the name of the queue manager to which to send the reply message or report message. *ReplyToQ* is the local name of a queue that is defined on this queue manager.

If the *ReplyToQMgr* field is blank, the local queue manager looks up the *ReplyToQ* name in its queue definitions. If a local definition of a remote queue exists with this name, the *ReplyToQMgr* value in the transmitted message is replaced by the value of the *RemoteQMgrName* attribute from the definition of the remote queue, and this value is returned in the message descriptor when the receiving application issues an MQGET call for the message. If a local definition of a remote queue does not exist, the *ReplyToQMgr* that is transmitted with the message is the name of the local queue manager.

If the name is specified, it can contain trailing blanks; the first null character and characters following it are treated as blanks. Otherwise no check is made that the name satisfies the naming rules for queue managers, or that this name is known to the sending queue manager; this is also true for the name transmitted, if the *ReplyToQMgr* is replaced in the transmitted message.

If a reply-to queue is not required, set the *ReplyToQMgr* field to blanks, or (in the C programming language) to the null string, or to one or more blanks followed by a null character; do not leave the field uninitialized.

For the MQGET call, the queue manager always returns the name padded with blanks to the length of the field.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The length of this field is given by MQ\_Q\_MGR\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

### *Report (MQLONG):*

A report message is a message about another message, used to inform an application about expected or unexpected events that relate to the original message. The *Report* field enables the application sending the original message to specify which report messages are required, whether the application message data is to be included in them, and also (for both reports and replies) how the message and correlation identifiers in the report or reply message are to be set. Any or all (or none) of the following types of report message can be requested:

- Exception
- Expiration
- Confirm on arrival (COA)
- Confirm on delivery (COD)
- Positive action notification (PAN)
- Negative action notification (NAN)

You can specify one or more of these options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

The application that receives the report message can determine the reason that the report was generated by examining the *Feedback* field in the MQMD; see the *Feedback* field for more details.

The use of report options when putting a message to a topic can cause zero, one, or many report messages to be generated and sent to the application. This is because the publication message may be sent to zero, one, or many subscribing applications.

**Exception options:** Specify one of the options listed to request an exception report message.

## MQRO\_EXCEPTION

A message channel agent generates this type of report when a message is sent to another queue manager and the message cannot be delivered to the specified destination queue. For example, the destination queue or an intermediate transmission queue might be full, or the message might be too big for the queue.

Generation of the exception report message depends on the persistence of the original message, and the speed of the message channel (normal or fast) through which the original message travels:

- For all persistent messages, and for nonpersistent messages traveling through normal message channels, the exception report is generated *only* if the action specified by the sending application for the error condition can be completed successfully. The sending application can specify one of the following actions to control the disposition of the original message when the error condition arises:
  - MQRO\_DEAD\_LETTER\_Q (this places the original message on the dead-letter queue).
  - MQRO\_DISCARD\_MSG (this discards the original message).

If the action specified by the sending application cannot be completed successfully, the original message is left on the transmission queue, and no exception report message is generated.

- For nonpersistent messages traveling through fast message channels, the original message is removed from the transmission queue and the exception report generated *even if* the specified action for the error condition cannot be completed successfully. For example, if MQRO\_DEAD\_LETTER\_Q is specified, but the original message cannot be placed on the dead-letter queue because that queue is full, the exception report message is generated and the original message discarded.

For more information about normal and fast message channels, see Nonpersistent message speed (NPMSPEED).

An exception report is not generated if the application that put the original message can be notified synchronously of the problem by means of the reason code returned by the MQPUT or MQPUT1 call.

Applications can also send exception reports, to indicate that a message cannot be processed (for example, because it is a debit transaction that would cause the account to exceed its credit limit).

Message data from the original message is not included with the report message.

Do not specify more than one of MQRO\_EXCEPTION, MQRO\_EXCEPTION\_WITH\_DATA, and MQRO\_EXCEPTION\_WITH\_FULL\_DATA.

## MQRO\_EXCEPTION\_WITH\_DATA

This is the same as MQRO\_EXCEPTION, except that the first 100 bytes of the application message data from the original message are included in the report message. If the original message contains one or more MQ header structures, they are included in the report message, in addition to the 100 bytes of application data.

Do not specify more than one of MQRO\_EXCEPTION, MQRO\_EXCEPTION\_WITH\_DATA, and MQRO\_EXCEPTION\_WITH\_FULL\_DATA.

## MQRO\_EXCEPTION\_WITH\_FULL\_DATA

Exception reports with full data required.

This is the same as MQRO\_EXCEPTION, except that all the application message data from the original message is included in the report message.

Do not specify more than one of MQRO\_EXCEPTION, MQRO\_EXCEPTION\_WITH\_DATA, and MQRO\_EXCEPTION\_WITH\_FULL\_DATA.

**Expiration options:** Specify one of the options listed to request an expiration report message.

## **MQRO\_EXPIRATION**

This type of report is generated by the queue manager if the message is discarded before delivery to an application because its expiry time has passed (see the *Expiry* field). If this option is not set, no report message is generated if a message is discarded for this reason (even if you specify one of the MQRO\_EXCEPTION\_\* options).

Message data from the original message is not included with the report message.

Do not specify more than one of MQRO\_EXPIRATION, MQRO\_EXPIRATION\_WITH\_DATA, and MQRO\_EXPIRATION\_WITH\_FULL\_DATA.

## **MQRO\_EXPIRATION\_WITH\_DATA**

This is the same as MQRO\_EXPIRATION, except that the first 100 bytes of the application message data from the original message are included in the report message. If the original message contains one or more MQ header structures, they are included in the report message, in addition to the 100 bytes of application data.

Do not specify more than one of MQRO\_EXPIRATION, MQRO\_EXPIRATION\_WITH\_DATA, and MQRO\_EXPIRATION\_WITH\_FULL\_DATA.

## **MQRO\_EXPIRATION\_WITH\_FULL\_DATA**

This is the same as MQRO\_EXPIRATION, except that all the application message data from the original message is included in the report message.

Do not specify more than one of MQRO\_EXPIRATION, MQRO\_EXPIRATION\_WITH\_DATA, and MQRO\_EXPIRATION\_WITH\_FULL\_DATA.

**Confirm-on-arrival options:** Specify one of the options listed to request a confirm-on-arrival report message.

## **MQRO\_COA**

This type of report is generated by the queue manager that owns the destination queue when the message is placed on the destination queue. Message data from the original message is not included with the report message.

If the message is put as part of a unit of work, and the destination queue is a local queue, the COA report message generated by the queue manager can be retrieved only if the unit of work is committed.

A COA report is not generated if the *Format* field in the message descriptor is MQFMT\_XMIT\_Q\_HEADER or MQFMT\_DEAD\_LETTER\_HEADER. This prevents a COA report being generated if the message is put on a transmission queue, or is undeliverable and put on a dead-letter queue.

In the case of an IMS bridge queue, the COA report is generated when the message reaches the IMS queue (acknowledgment received from IMS ) and not when the message is put in the MQ bridge queue. That means that if IMS is not active, no COA report is generated until IMS is started and a message is queued on the IMS queue.

The user that runs a program that puts a message with MQMD.Report=MQRO\_COA must have +passid authority on the reply queue. If the user does not have +passid authority, the COA report message does not reach the reply queue. An attempt is made to put the report message on the dead letter queue.

Do not specify more than one of MQRO\_COA, MQRO\_COA\_WITH\_DATA, and MQRO\_COA\_WITH\_FULL\_DATA.

## **MQRO\_COA\_WITH\_DATA**

This is the same as MQRO\_COA, except that the first 100 bytes of the application message data from the original message are included in the report message. If the original message contains one or more MQ header structures, they are included in the report message, in addition to the 100 bytes of application data.

Do not specify more than one of MQRO\_COA, MQRO\_COA\_WITH\_DATA, and MQRO\_COA\_WITH\_FULL\_DATA.

#### **MQRO\_COA\_WITH\_FULL\_DATA**

This is the same as MQRO\_COA, except that all the application message data from the original message is included in the report message.

Do not specify more than one of MQRO\_COA, MQRO\_COA\_WITH\_DATA, and MQRO\_COA\_WITH\_FULL\_DATA.

**Confirm-on-delivery options:** Specify one of the options listed to request a confirm-on-delivery report message.

#### **MQRO\_COD**

This type of report is generated by the queue manager when an application retrieves the message from the destination queue in a way that deletes the message from the queue. Message data from the original message is not included with the report message.

If the message is retrieved as part of a unit of work, the report message is generated within the same unit of work, so that the report is not available until the unit of work is committed. If the unit of work is backed out, the report is not sent.

A COD report is not always generated if a message is retrieved with the MQGMO\_MARK\_SKIP\_BACKOUT option. If the primary unit of work is backed out but the secondary unit of work is committed, the message is removed from the queue, but a COD report is not generated.

A COD report is not generated if the *Format* field in the message descriptor is MQFMT\_DEAD\_LETTER\_HEADER. This prevents a COD report being generated if the message is undeliverable and put on a dead-letter queue.

MQRO\_COD is not valid if the destination queue is an XCF queue.

Do not specify more than one of MQRO\_COD, MQRO\_COD\_WITH\_DATA, and MQRO\_COD\_WITH\_FULL\_DATA.

#### **MQRO\_COD\_WITH\_DATA**

This is the same as MQRO\_COD, except that the first 100 bytes of the application message data from the original message are included in the report message. If the original message contains one or more MQ header structures, they are included in the report message, in addition to the 100 bytes of application data.

If MQGMO\_ACCEPT\_TRUNCATED\_MSG is specified on the MQGET call for the original message, and the message retrieved is truncated, the amount of application message data placed in the report message depends on the environment:

- On z/OS, it is the minimum of:
  - The length of the original message
  - The length of the buffer used to retrieve the message
  - 100 bytes.
- In other environments, it is the minimum of:
  - The length of the original message
  - 100 bytes.

MQRO\_COD\_WITH\_DATA is not valid if the destination queue is an XCF queue.

Do not specify more than one of MQRO\_COD, MQRO\_COD\_WITH\_DATA, and MQRO\_COD\_WITH\_FULL\_DATA.

#### **MQRO\_COD\_WITH\_FULL\_DATA**

This is the same as MQRO\_COD, except that all the application message data from the original message is included in the report message.

MQRO\_COD\_WITH\_FULL\_DATA is not valid if the destination queue is an XCF queue.

Do not specify more than one of MQRO\_COD, MQRO\_COD\_WITH\_DATA, and MQRO\_COD\_WITH\_FULL\_DATA.

**Action-notification options:** Specify one or both of the options listed to request that the receiving application send a positive-action or negative-action report message.

#### **MQRO\_PAN**

This type of report is generated by the application that retrieves the message and acts upon it. It indicates that the action requested in the message has been performed successfully. The application generating the report determines whether any data is to be included with the report.

Other than conveying this request to the application retrieving the message, the queue manager takes no action based on this option. The retrieving application must generate the report if appropriate.

#### **MQRO\_NAN**

This type of report is generated by the application that retrieves the message and acts upon it. It indicates that the action requested in the message has *not* been performed successfully. The application generating the report determines whether any data is to be included with the report. For example, you might want to include some data indicating why the request could not be performed.

Other than conveying this request to the application retrieving the message, the queue manager takes no action based on this option. The retrieving application must generate the report if appropriate.

The application must determine which conditions correspond to a positive action and which correspond to a negative action. However, if the request has been only partially performed, generate a NAN report rather than a PAN report if requested. Every possible condition must correspond to either a positive action, or a negative action, but not both.

**Message-identifier options:** Specify one of the options listed to control how the *MsgId* of the report message (or of the reply message) is to be set.

#### **MQRO\_NEW\_MSG\_ID**

This is the default action, and indicates that if a report or reply is generated as a result of this message, a new *MsgId* is generated for the report or reply message.

#### **MQRO\_PASS\_MSG\_ID**

If a report or reply is generated as a result of this message, the *MsgId* of this message is copied to the *MsgId* of the report or reply message.

The *MsgId* of a publication message will be different for each subscriber that receives a copy of the publication and therefore the *MsgId* copied into the report or reply message will be different for each one.

If this option is not specified, MQRO\_NEW\_MSG\_ID is assumed.

**Correlation-identifier options:** Specify one of the options listed to control how the *CorrelId* of the report message (or of the reply message) is to be set.

#### **MQRO\_COPY\_MSG\_ID\_TO\_CORREL\_ID**

This is the default action, and indicates that if a report or reply is generated as a result of this message, the *MsgId* of this message is copied to the *CorrelId* of the report or reply message.

The *MsgId* of a publication message will be different for each subscriber that receives a copy of the publication and therefore the *MsgId* copied into the *CorrelId* of the report or reply message will be different for each one.

## **MQRO\_PASS\_CORREL\_ID**

If a report or reply is generated as a result of this message, the *CorrelId* of this message is copied to the *CorrelId* of the report or reply message.

The *CorrelId* of a publication message will be specific to a subscriber unless it uses the MQSO\_SET\_CORREL\_ID option and sets the SubCorrelId field in the MQSD to MQCL\_NONE. Therefore it is possible that the *CorrelId* copied into the *CorrelId* of the report or reply message will be different for each one.

If this option is not specified, MQRO\_COPY\_MSG\_ID\_TO\_CORREL\_ID is assumed.

Servers replying to requests or generating report messages must check whether the MQRO\_PASS\_MSG\_ID or MQRO\_PASS\_CORREL\_ID options were set in the original message. If they were, the servers must take the action described for those options. If neither is set, the servers must take the corresponding default action.

**Disposition options:** Specify one of the options listed to control the disposition of the original message when it cannot be delivered to the destination queue. The application can set the disposition options independently of requesting exception reports.

## **MQRO\_DEAD\_LETTER\_Q**

This is the default action, and places the message on the dead-letter queue if the message cannot be delivered to the destination queue. This happens in the following situations:

- When the application that put the original message cannot be notified synchronously of the problem by means of the reason code returned by the MQPUT or MQPUT1 call. An exception report message is generated, if one was requested by the sender.
- When the application that put the original message was putting to a topic

## **MQRO\_DISCARD\_MSG**

This discards the message if it cannot be delivered to the destination queue. This happens in the following situations:

- When the application that put the original message cannot be notified synchronously of the problem by means of the reason code returned by the MQPUT or MQPUT1 call. An exception report message is generated, if one was requested by the sender.
- When the application that put the original message was putting to a topic

If you want to return the original message to the sender, without the original message being placed on the dead-letter queue, the sender must specify MQRO\_DISCARD\_MSG with MQRO\_EXCEPTION\_WITH\_FULL\_DATA.

## **MQRO\_PASS\_DISCARD\_AND\_EXPIRY**

If this option is set on a message, and a report or reply is generated because of it, the message descriptor of the report inherits:

- MQRO\_DISCARD\_MSG if it was set.
- The remaining expiry time of the message (if this is not an expiry report). If this is an expiry report the expiry time is set to 60 seconds.

## **Activity option**

### **MQRO\_ACTIVITY**

Using this value allows the route of **any** message to be traced throughout a queue manager network. The report option can be specified on any current user message, instantly allowing you to begin calculating the route of the message through the network.

If the application generating the message cannot switch on activity reports, reports can be turned on using an API crossing exit supplied by queue manager administrators.

**Note:**

1. The fewer the queue managers in the network that are able to generate activity reports, the less detailed the route.
2. The activity reports might be difficult to place in the correct order to determine the route taken.
3. The activity reports might not be able to find a route to their requested destination.
4. Messages with this report option set must be accepted by any queue manager, even if they do not understand the option. This allows the report option to be set on any user message, even if they are processed by a non Version 6.0 or later queue manager.
5. If a process, either a queue manager or a user process, performs an activity on a message with this option set it can choose to generate and put an activity report.

**Default option:** Specify the following if no report options are required:

#### **MQRO\_NONE**

Use this value to indicate that no other options have been specified. MQRO\_NONE is defined to aid program documentation. It is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

#### **General information:**

1. All report types required must be specifically requested by the application sending the original message. For example, if a COA report is requested but an exception report is not, a COA report is generated when the message is placed on the destination queue, but no exception report is generated if the destination queue is full when the message arrives there. If no *Report* options are set, no report messages are generated by the queue manager or message channel agent (MCA).

Some report options can be specified even though the local queue manager does not recognize them; this is useful when the option is to be processed by the *destination* queue manager. See "Report options and message flags" on page 2697 for more details.

If a report message is requested, the name of the queue to which to send the report must be specified in the *ReplyToQ* field. When a report message is received, the nature of the report can be determined by examining the *Feedback* field in the message descriptor.

2. If the queue manager or MCA that generates a report message cannot put the report message on the reply queue (for example, because the reply queue or transmission queue is full), the report message is placed instead on the dead-letter queue. If that *also* fails, or there is no dead-letter queue, the action taken depends on the type of the report message:
  - If the report message is an exception report, the message that generated the exception report is left on its transmission queue; this ensures that the message is not lost.
  - For all other report types, the report message is discarded and processing continues normally. This is done because either the original message has already been delivered safely (for COA or COD report messages), or is no longer of any interest (for an expiration report message).

Once a report message has been placed successfully on a queue (either the destination queue or an intermediate transmission queue), the message is no longer subject to special processing; it is treated just like any other message.

3. When the report is generated, the *ReplyToQ* queue is opened and the report message put using the authority of the *UserIdentifier* in the MQMD of the message causing the report, except in the following cases:
  - Exception reports generated by a receiving MCA are put with whatever authority the MCA used when it tried to put the message causing the report.
  - COA reports generated by the queue manager are put with whatever authority was used when the message causing the report was put on the queue manager generating the report. For example, if the message was put by a receiving MCA using the MCA's user identifier, the queue manager puts the COA report using the MCA's user identifier.

Applications generating reports must use the same authority as they use to generate a reply; this is usually the authority of the user identifier in the original message.

If the report has to travel to a remote destination, senders and receivers can decide whether to accept it, in the same way as they do for other messages.

4. If a report message with data is requested:
  - The report message is always generated with the amount of data requested by the sender of the original message. If the report message is too big for the reply queue, the processing described above occurs; the report message is never truncated to fit on the reply queue.
  - If the *Format* of the original message is MQFMT\_XMIT\_Q\_HEADER, the data included in the report does not include the MQXQH. The report data starts with the first byte of the data beyond the MQXQH in the original message. This occurs whether or not the queue is a transmission queue.
5. If a COA, COD, or expiration report message is received at the reply queue, it is guaranteed that the original message arrived, was delivered, or expired, as appropriate. However, if one or more of these report messages is requested and is *not* received, the reverse cannot be assumed, because one of the following might have occurred:
  - a. The report message is held up because a link is down.
  - b. The report message is held up because a blocking condition exists at an intermediate transmission queue or at the reply queue (for example, the queue is full or inhibited for puts).
  - c. The report message is on a dead-letter queue.
  - d. When the queue manager was attempting to generate the report message, it could neither put it on the appropriate queue, nor on the dead-letter queue, so the report message could not be generated.
  - e. A failure of the queue manager occurred between the action being reported (arrival, delivery, or expiry), and generation of the corresponding report message. (This does not happen for COD report messages if the application retrieves the original message within a unit of work, as the COD report message is generated within the same unit of work.)

Exception report messages can be held up in the same way for reasons 1, 2, and 3 above. However, when an MCA cannot generate an exception report message (the report message cannot be put either on the reply queue or the dead-letter queue), the original message remains on the transmission queue at the sender, and the channel is closed. This occurs irrespective of whether the report message was to be generated at the sending or the receiving end of the channel.

6. If the original message is temporarily blocked (resulting in an exception report message being generated and the original message being put on a dead-letter queue), but the blockage clears and an application then reads the original message from the dead-letter queue and puts it again to its destination, the following might occur:
  - Even though an exception report message has been generated, the original message eventually arrives successfully at its destination.
  - More than one exception report message is generated in respect of a single original message, because the original message might encounter another blockage later.

#### **Report messages when putting to a topic:**

1. Reports can be generated when putting a message to a topic. This message will be sent to all subscribers to the topic, which could be zero, one, or many. This should be taken into account when choosing to use report options as many report messages could be generated as a result.
2. When putting a message to a topic, there may be many destination queues that are to be given a copy of the message. If some of these destination queues have a problem, such as queue full, then the successful completion of the MQPUT depends on the setting of NPMSGDLV or PMSGDLV (depending on the persistence of the message). If the setting is such that message delivery to the destination queue must be successful (for example, it is a persistent message to a durable subscriber and PMSGDLV is set to ALL or ALLDUR), then success is defined as one of the following criteria being met:
  - Successful put to the subscriber queue

- Use of MQRO\_DEAD\_LETTER\_Q and a successful put to the Dead-letter queue if the subscriber queue cannot take the message
- Use of MQRO\_DISCARD\_MSG if the subscriber queue cannot take the message.

#### Report messages for message segments:

1. Report messages can be requested for messages that have segmentation allowed (see the description of the MQMF\_SEGMENTATION\_ALLOWED flag). If the queue manager finds it necessary to segment the message, a report message can be generated for each of the segments that subsequently encounters the relevant condition. Applications must be prepared to receive multiple report messages for each type of report message requested. Use the *GroupId* field in the report message to correlate the multiple reports with the group identifier of the original message, and the *Feedback* field identify the type of each report message.
2. If MQGMO\_LOGICAL\_ORDER is used to retrieve report messages for segments, be aware that reports of *different types* might be returned by the successive MQGET calls. For example, if both COA and COD reports are requested for a message that is segmented by the queue manager, the MQGET calls for the report messages might return the COA and COD report messages interleaved in an unpredictable fashion. Avoid this by using the MQGMO\_COMPLETE\_MSG option (optionally with MQGMO\_ACCEPT\_TRUNCATED\_MSG). MQGMO\_COMPLETE\_MSG causes the queue manager to reassemble report messages that have the same report type. For example, the first MQGET call might reassemble all the COA messages relating to the original message, and the second MQGET call might reassemble all the COD messages. Which is reassembled first depends on which type of report message occurs first on the queue.
3. Applications that themselves put segments can specify different report options for each segment. However, note the following points:
  - If the segments are retrieved using the MQGMO\_COMPLETE\_MSG option, only the report options in the *first* segment are honored by the queue manager.
  - If the segments are retrieved one by one, and most of them have one of the MQRO\_COD\_\* options, but at least one segment does not, you cannot use the MQGMO\_COMPLETE\_MSG option to retrieve the report messages with a single MQGET call, or use the MQGMO\_ALL\_SEGMENTS\_AVAILABLE option to detect when all the report messages have arrived.
4. In an MQ network, the queue managers can have different capabilities. If a report message for a segment is generated by a queue manager or MCA that does not support segmentation, the queue manager or MCA does not by default include the necessary segment information in the report message, and this might make it difficult to identify the original message that caused the report to be generated. Avoid this difficulty by requesting data with the report message, that is, by specifying the appropriate MQRO\*\_WITH\_DATA or MQRO\*\_WITH\_FULL\_DATA options. However, be aware that if MQRO\*\_WITH\_DATA is specified, *less than* 100 bytes of application message data might be returned to the application that retrieves the report message, if the report message is generated by a queue manager or MCA that does not support segmentation.

**Contents of the message descriptor for a report message:** When the queue manager or message channel agent (MCA) generates a report message, it sets the fields in the message descriptor to the following values, and then puts the message in the normal way.

Field in MQMD	Value used
<i>StrucId</i>	MQMD_STRUC_ID
<i>Version</i>	MQMD_VERSION_2
<i>Report</i>	MQRO_NONE
<i>MsgType</i>	MQMT_REPORT
<i>Expiry</i>	MQEI_UNLIMITED
<i>Feedback</i>	As appropriate for the nature of the report (MQFB_COA, MQFB_COD, MQFB_EXPIRATION, or an MQRC_* value)
<i>Encoding</i>	Copied from the original message descriptor
<i>CodedCharSetId</i>	Copied from the original message descriptor
<i>Format</i>	Copied from the original message descriptor
<i>Priority</i>	Copied from the original message descriptor
<i>Persistence</i>	Copied from the original message descriptor
<i>MsgId</i>	As specified by the report options in the original message descriptor
<i>CorrelId</i>	As specified by the report options in the original message descriptor
<i>BackoutCount</i>	0
<i>ReplyToQ</i>	Blanks
<i>ReplyToQMgr</i>	Name of queue manager
<i>UserIdentifier</i>	As set by the MQPMO_PASS_IDENTITY_CONTEXT option
<i>AccountingToken</i>	As set by the MQPMO_PASS_IDENTITY_CONTEXT option
<i>ApplIdentityData</i>	As set by the MQPMO_PASS_IDENTITY_CONTEXT option
<i>PutApplType</i>	MQAT_QMGR, or as appropriate for the message channel agent
<i>PutApplName</i>	First 28 bytes of the queue-manager name or message channel agent name. For report messages generated by the IMS bridge, this field contains the XCF group name and XCF member name of the IMS system to which the message relates.
<i>PutDate</i>	Date when report message is sent
<i>PutTime</i>	Time when report message is sent
<i>ApplOriginData</i>	Blanks
<i>GroupId</i>	Copied from the original message descriptor
<i>MsgSeqNumber</i>	Copied from the original message descriptor
<i>Offset</i>	Copied from the original message descriptor
<i>MsgFlags</i>	Copied from the original message descriptor
<i>OriginalLength</i>	Copied from the original message descriptor if not MQOL_UNDEFINED, and set to the length of the original message data otherwise

An application generating a report is recommended to set similar values, except for the following:

- The *ReplyToQMgr* field can be set to blanks (the queue manager changes this to the name of the local queue manager when the message is put).
- Set the context fields using the option that would have been used for a reply, normally MQPMO\_PASS\_IDENTITY\_CONTEXT.

**Analyzing the report field:** The *Report* field contains subfields; because of this, applications that need to check whether the sender of the message requested a particular report must use one of the techniques described in “Analyzing the report field” on page 2699.

This is an output field for the MQGET call, and an input field for the MQPUT and MQPUT1 calls. The initial value of this field is MQRO\_NONE.

*StrucId (MQCHAR4):*

This is the structure identifier, and must be:

#### **MQMD\_STRUC\_ID**

Identifier for message descriptor structure.

For the C programming language, the constant MQMD\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQMD\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQMD\_STRUC\_ID.

*UserIdentifier (MQCHAR12):*

This is part of the **identity context** of the message. For more information about message context, see “Overview for MQMD” on page 2180 and Message context.

*UserIdentifier* specifies the user identifier of the application that originated the message. The queue manager treats this information as character data, but does not define the format of it.

After a message has been received, use *UserIdentifier* in the *AlternateUserId* field of the *ObjDesc* parameter of a subsequent MQOPEN or MQPUT1 call to perform the authorization check for the *UserIdentifier* user instead of the application performing the open.

When the queue manager generates this information for an MQPUT or MQPUT1 call:

- On z/OS, the queue manager uses the *AlternateUserId* from the *ObjDesc* parameter of the MQOPEN or MQPUT1 call if the MQOO\_ALTERNATE\_USER\_AUTHORITY or MQPMO\_ALTERNATE\_USER\_AUTHORITY option was specified. If the relevant option was not specified, the queue manager uses a user identifier determined from the environment.
- In other environments, the queue manager always uses a user identifier determined from the environment.

When the user identifier is determined from the environment:

- On z/OS, the queue manager uses:
  - For MVS (batch), the user identifier from the JES JOB card or started task
  - For TSO, the user identifier propagated to the job during job submission
  - For CICS, the user identifier associated with the task
  - For IMS, the user identifier depends on the type of application:
    - For:
      - Nonmessage BMP regions
      - Nonmessage IFP regions
      - Message BMP and message IFP regions that have *not* issued a successful GU callthe queue manager uses the user identifier from the region JES JOB card or the TSO user identifier. If these are blank or null, it uses the name of the program specification block (PSB).
    - For:
      - Message BMP and message IFP regions that *have* issued a successful GU call
      - MPP regionsthe queue manager uses one of:
      - The signed-on user identifier associated with the message
      - The logical terminal (LTERM) name
      - The user identifier from the region JES JOB card
      - The TSO user identifier

- The PSB name
- On IBM i, the queue manager uses the name of the user profile associated with the application job.
- On UNIX systems, the queue manager uses:
  - The application's logon name
  - The effective user identifier of the process if no logon is available
  - The user identifier associated with the transaction, if the application is a CICS transaction
- On Windows systems, the queue manager uses the first 12 characters of the logged-on user name.

This field is normally an output field generated by the queue manager but for an MQPUT or MQPUT1 call you can make this field an input/output field and specify the *UserIdentifier* field instead of letting the queue manager generate this information. Specify either MQPMO\_SET\_IDENTITY\_CONTEXT or MQPMO\_SET\_ALL\_CONTEXT in the *PutMsgOpts* parameter and specify a user ID in the *UserIdentifier* field if you do not want the queue manager to generate the *UserIdentifier* field for an MQPUT or MQPUT1 call.

For the MQPUT and MQPUT1 calls, this is an input/output field if MQPMO\_SET\_IDENTITY\_CONTEXT or MQPMO\_SET\_ALL\_CONTEXT is specified in the *PutMsgOpts* parameter. Any information following a null character within the field is discarded. The queue manager converts the null character and any following characters to blanks. If MQPMO\_SET\_IDENTITY\_CONTEXT or MQPMO\_SET\_ALL\_CONTEXT is not specified, this field is ignored on input and is an output-only field.

After the successful completion of an MQPUT or MQPUT1 call, this field contains the *UserIdentifier* that was transmitted with the message if it was put to a queue. This will be the value of *UserIdentifier* that is kept with the message if it is retained (see description of MQPMO\_RETAIN for more details about retained publications) but is not used as the *UserIdentifier* when the message is sent as a publication to subscribers because they provide a value to override *UserIdentifier* in all publications sent to them. If the message has no context, the field is entirely blank.

This is an output field for the MQGET call. The length of this field is given by MQ\_USER\_ID\_LENGTH. The initial value of this field is the null string in C, and 12 blank characters in other programming languages.

*Version (MQLONG):*

This is the structure version number, and must be one of the following:

#### **MQMD\_VERSION\_1**

Version-1 message descriptor structure.

This version is supported in all environments.

#### **MQMD\_VERSION\_2**

Version-2 message descriptor structure.

This version is supported in all IBM MQ V6.0 and later environments, plus IBM MQ MQI clients connected to these systems.

**Note:** When a version-2 MQMD is used, the queue manager performs additional checks on any MQ header structures that might be present at the beginning of the application message data; for further details see the usage notes for the MQPUT call.

Fields that exist only in the more-recent version of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

#### **MQMD\_CURRENT\_VERSION**

Current version of message descriptor structure.

This is always an input field. The initial value of this field is MQMD\_VERSION\_1.

Initial values and language declarations for MQMD:

Table 197. Initial values of fields in MQMD for MQMD

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQMD_STRUC_ID	'MD'
<i>Version</i>	MQMD_VERSION_1	1
<i>Report</i>	MQRO_NONE	0
<i>MsgType</i>	MQMT_DATAGRAM	8
<i>Expiry</i>	MQEI_UNLIMITED	-1
<i>Feedback</i>	MQFB_NONE	0
<i>Encoding</i>	MQENC_NATIVE	Depends on environment
<i>CodedCharSetId</i>	MQCCSI_Q_MGR	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>Priority</i>	MQPRI_PRIORITY_AS_Q_DEF	-1
<i>Persistence</i>	MQPER_PERSISTENCE_AS_Q_DEF	2
<i>MsgId</i>	MQMI_NONE	Nulls
<i>CorrelId</i>	MQCI_NONE	Nulls
<i>BackoutCount</i>	None	0
<i>ReplyToQ</i>	None	Null string or blanks
<i>ReplyToQMgr</i>	None	Null string or blanks
<i>UserIdentifier</i>	None	Null string or blanks
<i>AccountingToken</i>	MQACT_NONE	Nulls
<i>ApplIdentityData</i>	None	Null string or blanks
<i>PutApplType</i>	MQAT_NO_CONTEXT	0
<i>PutApplName</i>	None	Null string or blanks
<i>PutDate</i>	None	Null string or blanks
<i>PutTime</i>	None	Null string or blanks
<i>ApplOriginData</i>	None	Null string or blanks
<i>GroupId</i>	MQGI_NONE	Nulls
<i>MsgSeqNumber</i>	None	1
<i>Offset</i>	None	0
<i>MsgFlags</i>	MQMF_NONE	0
<i>OriginalLength</i>	MQOL_UNDEFINED	-1

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQMD\_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:  

```
MQMD MyMD = {MQMD_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQMD MQMD;
struct tagMQMD {
    MQCHAR4  StrucId;           /* Structure identifier */

**MQMDE - Message descriptor extension:**

The following table summarizes the fields in the structure.

Table 198. Fields in MQMDE

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>StrucLength</i>	Length of MQMDE structure	StrucLength
<i>Encoding</i>	Numeric encoding of data that follows MQMDE	Encoding
<i>CodedCharSetId</i>	Character set identifier of data that follows MQMDE	CodedCharSetId
<i>Format</i>	Format name of data that follows MQMDE	Format
<i>Flags</i>	General flags	Flags
<i>GroupId</i>	Group identifier	GroupId
<i>MsgSeqNumber</i>	Sequence number of logical message within group	MsgSeqNumber
<i>Offset</i>	Offset of data in physical message from start of logical message	Offset
<i>MsgFlags</i>	Message flags	MsgFlags
<i>OriginalLength</i>	Length of original message	OriginalLength

*Overview for MQMDE:*

**Availability:** All IBM MQ systems, plus IBM MQ clients connected to these systems.

**Purpose:** The MQMDE structure describes the data that sometimes occurs preceding the application message data. The structure contains those MQMD fields that exist in the version-2 MQMD, but not in the version-1 MQMD.

**Format name:** MQFMT\_MD\_EXTENSION.

**Character set and encoding:** Data in MQMDE must be in the character set and encoding of the local queue manager; these are given by the *CodedCharSetId* queue-manager attribute and MQENC\_NATIVE for the C programming language.

Set the character set and encoding of the MQMDE into the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQMDE structure is at the start of the message data), or
- The header structure that precedes the MQMDE structure (all other cases).

If the MQMDE is not in the queue manager's character set and encoding, the MQMDE is accepted but not honored, that is, the MQMDE is treated as message data.

**Note:** On Windows, applications compiled with Micro Focus COBOL use a value of MQENC\_NATIVE that is different from the queue-manager's encoding. Although numeric fields in the MQMD structure on the MQPUT, MQPUT1, and MQGET calls must be in the Micro Focus COBOL encoding, numeric fields in the MQMDE structure must be in the queue-manager's encoding. This latter is given by MQENC\_NATIVE for the C programming language, and has the value 546.

**Usage:** Applications that use a version-2 MQMD will not encounter an MQMDE structure. However, specialized applications, and applications that continue to use a version-1 MQMD, might encounter an MQMDE in some situations. The MQMDE structure can occur in the following circumstances:

- Specified on the MQPUT and MQPUT1 calls
- Returned by the MQGET call
- In messages on transmission queues

**MQMDE specified on MQPUT and MQPUT1 calls:** On the MQPUT and MQPUT1 calls, if the application provides a version-1 MQMD, the application can optionally prefix the message data with an MQMDE, setting the *Format* field in MQMD to MQFMT\_MD\_EXTENSION to indicate that an MQMDE is present. If the application does not provide an MQMDE, the queue manager assumes default values for the fields in the MQMDE. The default values that the queue manager uses are the same as the initial values for the structure; see Table 200 on page 2239.

If the application provides a version-2 MQMD *and* prefixes the application message data with an MQMDE, the structures are processed as shown in Table 199 on page 2236.

Table 199. Queue-manager action when MQMDE specified on MQPUT or MQPUT1 for MQMDE

MQMD version	Values of version-2 fields	Values of corresponding fields in MQMDE	Action taken by queue manager
1	-	Valid	MQMDE is honored
2	Default	Valid	MQMDE is honored
2	Not default	Valid	MQMDE is treated as message data
1 or 2	Any	Not valid	Call fails with an appropriate reason code
1 or 2	Any	MQMDE is in the wrong character set or encoding, or is an unsupported version	MQMDE is treated as message data

**Note:** On z/OS, if the application specifies a version-1 MQMD with an MQMDE, the queue manager validates the MQMDE only if the queue has an *IndexType* of MQIT\_GROUP\_ID.

There is one special case. If the application uses a version-2 MQMD to put a message that is a segment (that is, the MQMF\_SEGMENT or MQMF\_LAST\_SEGMENT flag is set), and the format name in the MQMD is MQFMT\_DEAD\_LETTER\_HEADER, the queue manager generates an MQMDE structure and inserts it *between* the MQDLH structure and the data that follows it. In the MQMD that the queue manager retains with the message, the version-2 fields are set to their default values.

Several of the fields that exist in the version-2 MQMD but not the version-1 MQMD are input/output fields on MQPUT and MQPUT1. However, the queue manager does *not* return any values in the equivalent fields in the MQMDE on output from the MQPUT and MQPUT1 calls; if the application requires those output values, it must use a version-2 MQMD.

**MQMDE returned by MQGET call:** On the MQGET call, if the application provides a version-1 MQMD, the queue manager prefixes the message returned with an MQMDE, but only if one or more of the fields in the MQMDE has a nondefault value. The queue manager sets the *Format* field in MQMD to the value MQFMT\_MD\_EXTENSION to indicate that an MQMDE is present.

If the application provides an MQMDE at the start of the *Buffer* parameter, the MQMDE is ignored. On return from the MQGET call, it is replaced by the MQMDE for the message (if one is needed), or overwritten by the application message data (if the MQMDE is not needed).

If the MQGET call returns an MQMDE, the data in the MQMDE is usually in the queue manager's character set and encoding. However the MQMDE might be in some other character set and encoding if:

- The MQMDE was treated as data on the MQPUT or MQPUT1 call (see Table 199 for the circumstances that can cause this).
- The message was received from a remote queue manager connected by a TCP connection, and the receiving message channel agent (MCA) was not set up correctly.

**Note:** On Windows, applications compiled with Micro Focus COBOL use a value of MQENC\_NATIVE that is different from the queue-manager's encoding (see above).

**MQMDE in messages on transmission queues:** Messages on transmission queues are prefixed with the MQXQH structure, which contains within it a version-1 MQMD. An MQMDE might also be present, positioned between the MQXQH structure and application message data, but it is usually present only if one or more of the fields in the MQMDE has a nondefault value.

Other MQ header structures can also occur between the MQXQH structure and the application message data. For example, when the dead-letter header MQDLH is present, and the message is not a segment, the order is:

- MQXQH (containing a version-1 MQMD)
- MQMDE
- MQDLH
- application message data

*Fields for MQMDE:*

The MQMDE structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG):*

This specifies the character set identifier of the data that follows the MQMDE structure; it does not apply to character data in the MQMDE structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The queue manager does not check that this field is valid. The following special value can be used:

#### **MQCCSI\_INHERIT**

Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI\_INHERIT is not returned by the MQGET call.

MQCCSI\_INHERIT cannot be used if the value of the *PutApplType* field in MQMD is MQAT\_BROKER.

This value is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

The initial value of this field is MQCCSI\_UNDEFINED.

*Encoding (MQLONG):*

This specifies the numeric encoding of the data that follows the MQMDE structure; it does not apply to numeric data in the MQMDE structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The queue manager does not check that the field is valid. See the *Encoding* field described in “MQMD - Message descriptor” on page 2179 for more information about data encodings.

The initial value of this field is MQENC\_NATIVE.

*Flags (MQLONG):*

The following flag can be specified:

**MQMDEF\_NONE**

No flags.

The initial value of this field is MQMDEF\_NONE.

*Format (MQCHAR8):*

This specifies the format name of the data that follows the MQMDE structure.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The queue manager does not check that this field is valid. See the *Format* field described in “MQMD - Message descriptor” on page 2179 for more information about format names.

The initial value of this field is MQFMT\_NONE.

*GroupId (MQBYTE24):*

See the *GroupId* field described in “MQMD - Message descriptor” on page 2179. The initial value of this field is MQGI\_NONE.

*MsgFlags (MQLONG):*

See the *MsgFlags* field described in “MQMD - Message descriptor” on page 2179. The initial value of this field is MQMF\_NONE.

*MsgSeqNumber (MQLONG):*

See the *MsgSeqNumber* field described in “MQMD - Message descriptor” on page 2179. The initial value of this field is 1.

*Offset (MQLONG):*

See the *Offset* field described in “MQMD - Message descriptor” on page 2179. The initial value of this field is 0.

*OriginalLength (MQLONG):*

See the *OriginalLength* field described in “MQMD - Message descriptor” on page 2179. The initial value of this field is MQOL\_UNDEFINED.

*StrucId* (MQCHAR4):

The value must be:

**MQMDE\_STRUC\_ID**

Identifier for message descriptor extension structure.

For the C programming language, the constant MQMDE\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQMDE\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQMDE\_STRUC\_ID.

*StrucLength* (MQLONG):

This is the length of the MQMDE structure; the following value is defined:

**MQMDE\_LENGTH\_2**

Length of version-2 message descriptor extension structure.

The initial value of this field is MQMDE\_LENGTH\_2.

*Version* (MQLONG):

This is the structure version number; the value must be:

**MQMDE\_VERSION\_2**

Version-2 message descriptor extension structure.

The following constant specifies the version number of the current version:

**MQMDE\_CURRENT\_VERSION**

Current version of message descriptor extension structure.

The initial value of this field is MQMDE\_VERSION\_2.

*Initial values and language declarations for MQMDE:*

Table 200. Initial values of fields in MQMDE for MQMDE

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQMDE_STRUC_ID	'MDE-'
<i>Version</i>	MQMDE_VERSION_2	2
<i>StrucLength</i>	MQMDE_LENGTH_2	72
<i>Encoding</i>	MQENC_NATIVE	Depends on environment
<i>CodedCharSetId</i>	MQCCSI_UNDEFINED	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>Flags</i>	MQMDEF_NONE	0
<i>GroupId</i>	MQGI_NONE	Nulls
<i>MsgSeqNumber</i>	None	1
<i>Offset</i>	None	0
<i>MsgFlags</i>	MQMF_NONE	0
<i>OriginalLength</i>	MQOL_UNDEFINED	-1

Table 200. Initial values of fields in MQMDE for MQMDE (continued)

Field name	Name of constant	Value of constant
<b>Notes:</b>		
1. The symbol <code>␣</code> represents a single blank character.		
2. In the C programming language, the macro variable <code>MQMDE_DEFAULT</code> contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:		
<pre>MQMDE MyMDE = {MQMDE_DEFAULT};</pre>		

*C declaration:*

```
typedef struct tagMQMDE MQMDE;
struct tagMQMDE {

## MQMHBO - Message handle to buffer options:

The following table summarizes the fields in the structure. MQMHBO structure - message handle to buffer options

Table 201. Fields in MQMHBO

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options controlling the action of MQMHBUF	Options

*Overview for MQMHBO:*

**Availability:** All IBM MQ systems and IBM MQ MQI clients.

**Purpose:** The MQMHBO structure allows applications to specify options that control how buffers are produced from message handles. The structure is an input parameter on the MQMHBUF call.

**Character set and encoding:** Data in MQMHBO must be in the character set of the application and encoding of the application (MQENC\_NATIVE).

*Fields for MQMHBO:*

Message handle to buffer options structure - fields

The MQMHBO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG):*

Message handle to buffer options structure - Options field

These options control the action of MQMHBUF.

You must specify the following option:

### **MQMHBO\_PROPERTIES\_IN\_MQRFH2**

When converting properties from a message handle into a buffer, convert them into the MQRFH2 format.

Optionally, you can also specify the following option. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

### **MQMHBO\_DELETE\_PROPERTIES**

Properties that are added to the buffer are deleted from the message handle. If the call fails no properties are deleted.

This is always an input field. The initial value of this field is MQMHBO\_PROPERTIES\_IN\_MQRFH2.

*StrucId* (MQCHAR4):

Message handle to buffer options structure - *StrucId* field

This is the structure identifier. The value must be:

**MQMHBO\_STRUC\_ID**

Identifier for message handle to buffer options structure.

For the C programming language, the constant MQMHBO\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQMHBO\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQMHBO\_STRUC\_ID.

*Version* (MQLONG):

Message handle to buffer options structure - *Version* field

This is the structure version number. The value must be:

**MQMHBO\_VERSION\_1**

Version number for message handle to buffer options structure.

The following constant specifies the version number of the current version:

**MQMHBO\_CURRENT\_VERSION**

Current version of message handle to buffer options structure.

This is always an input field. The initial value of this field is MQMHBO\_VERSION\_1.

*Initial values and language declarations for MQMHBO:*

Message handle to buffer structure - Initial values

*Table 202. Initial values of fields in MQMHBO*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQMHBO_STRUC_ID	'MHBO'
<i>Version</i>	MQMHBO_VERSION_1	1
<i>Options</i>	MQMHBO_PROPERTIES_IN_MQRFH2	

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQMHBO\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  
MQMHBO MyMHBO = {MQMHBO\_DEFAULT};

*C declaration:*

Message handle to buffer options structure - C language declaration

```
typedef struct tagMQMHBO MQMHBO;
struct tagMQMHBO {
    MQCHAR4  StrucId;          /* Structure identifier */
    MQLONG   Version;         /* Structure version number */
    MQLONG   Options;        /* Options that control the action of
                             MQMHBUF */
};
```

*COBOL declaration:*

Message handle to buffer options structure - COBOL language declaration

```
** MQMHBO structure
   10 MQMHBO.
**   Structure identifier
   15 MQMHBO-STRUCID          PIC X(4).
**   Structure version number
   15 MQMHBO-VERSION        PIC S9(9) BINARY.
**   Options that control the action of MQMHBUF
   15 MQMHBO-OPTIONS        PIC S9(9) BINARY.
```

*PL/I declaration:*

Message handle to buffer options structure - PL/I language declaration

```
Dcl
  1 MQMHBO based,
  3 StrucId      char(4),      /* Structure identifier */
  3 Version      fixed bin(31), /* Structure version number */
  3 Options      fixed bin(31), /* Options that control the action
                               of MQMHBUF */
```

*High Level Assembler declaration:*

Message handle to buffer options structure - Assembler language declaration

```
MQMHBO          DSECT
MQMHBO_STRUCID  DS   CL4  Structure identifier
MQMHBO_VERSION  DS   F    Structure version number
MQMHBO_OPTIONS  DS   F    Options that control the
*                action of MQMHBUF
MQMHBO_LENGTH   EQU  *-MQMHBO
MQMHBO_AREA     DS   CL(MQMHBO_LENGTH)
```

## MQOD - Object descriptor:

The following table summarizes the fields in the structure.

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>ObjectType</i>	Object type	ObjectType
<i>ObjectName</i>	Object name	ObjectName
<i>ObjectQMgrName</i>	Object queue manager name	ObjectQMgrName
<i>DynamicQName</i>	Dynamic queue name	DynamicQName
<i>AlternateUserId</i>	Alternate user identifier	AlternateUserId
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQOD_VERSION_2.		
<i>RecsPresent</i>	Number of object records present	RecsPresent
<i>KnownDestCount</i>	Number of local queues opened successfully	KnownDestCount
<i>UnknownDestCount</i>	Number of remote queues opened successfully	UnknownDestCount
<i>InvalidDestCount</i>	Number of queues that failed to open	InvalidDestCount
<i>ObjectRecOffset</i>	Offset of first object record from start of MQOD	ObjectRecOffset
<i>ResponseRecOffset</i>	Offset of first response record from start of MQOD	ResponseRecOffset
<i>ObjectRecPtr</i>	Address of first object record	ObjectRecPtr
<i>ResponseRecPtr</i>	Address of first response record	ResponseRecPtr
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQOD_VERSION_3.		
<i>AlternateSecurityId</i>	Alternate security identifier	AlternateSecurityId
<i>ResolvedQName</i>	Resolved queue name	ResolvedQName
<i>ResolvedQMgrName</i>	Resolved queue manager name	ResolvedQMgrName
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQOD_VERSION_4.		
<i>ObjectString</i>	Long object name	ObjectString
<i>SelectionString</i>	Selection string	SelectionString
<i>ResObjectString</i>	Resolved long object name	ResObjectString
<i>ResolvedType</i>	Resolved object type	ResolvedType

*Overview for MQOD:*

**Availability:** All IBM MQ systems, plus IBM MQ MQI clients connected to those systems.

**Purpose:** The MQOD structure is used to specify an object by name. The following types of object are valid:

- Queue or distribution list
- Namelist
- Process definition
- Queue manager
- Topic

The structure is an input/output parameter on the MQOPEN and MQPUT1 calls.

**Version:** The current version of MQOD is MQOD\_VERSION\_4. Applications that you want to port between several environments must ensure that the required version of MQOD is supported in all the environments concerned. Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions that follow.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQOD that is supported by the environment, but with the initial value of the *Version* field set to MQOD\_VERSION\_1. To use fields that are not present in the version-1 structure, the application must set the *Version* field to the version number of the version required.

To open a distribution list, *Version* must be MQOD\_VERSION\_2 or greater.

**Character set and encoding:** Data in MQOD must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

*Fields for MQOD:*

The MQOD structure contains the following fields; the fields are described in **alphabetical order**:

*AlternateSecurityId (MQBYTE40):*

This is a security identifier that is passed with the *AlternateUserId* to the authorization service to allow appropriate authorization checks to be performed. *AlternateSecurityId* is used only if:

- MQOO\_ALTERNATE\_USER\_AUTHORITY is specified on the MQOPEN call, or
- MQPMO\_ALTERNATE\_USER\_AUTHORITY is specified on the MQPUT1 call,

and the *AlternateUserId* field is not entirely blank up to the first null character or the end of the field.

On Windows, *AlternateSecurityId* can be used to supply the Windows security identifier (SID) that uniquely identifies the *AlternateUserId*. The SID for a user can be obtained from the Windows system by use of the LookupAccountName() Windows API call.

On z/OS, this field is ignored.

The *AlternateSecurityId* field has the following structure:

- The first byte is a binary integer containing the length of the significant data that follows; the value excludes the length byte itself. If no security identifier is present, the length is zero.
- The second byte indicates the type of security identifier that is present; the following values are possible:

### **MQSIDT\_NT\_SECURITY\_ID**

Windows security identifier.

### **MQSIDT\_NONE**

No security identifier.

- The third and subsequent bytes up to the length defined by the first byte contain the security identifier itself.
- Remaining bytes in the field are set to binary zero.

You can use the following special value:

### **MQSID\_NONE**

No security identifier specified.

The value is binary zero for the length of the field.

For the C programming language, the constant `MQSID_NONE_ARRAY` is also defined; this has the same value as `MQSID_NONE`, but is an array of characters instead of a string.

This is an input field. The length of this field is given by `MQ_SECURITY_ID_LENGTH`. The initial value of this field is `MQSID_NONE`. This field is ignored if *Version* is less than `MQOD_VERSION_3`.

*AlternateUserId* (MQCHAR12):

If you specify `MQOO_ALTERNATE_USER_AUTHORITY` for the `MQOPEN` call, or `MQPMO_ALTERNATE_USER_AUTHORITY` for the `MQPUT1` call, this field contains an alternative user identifier that is used to check the authorization for the open, in place of the user identifier that the application is currently running under. Some checks, however, are still carried out with the current user identifier (for example, context checks).

If `MQOO_ALTERNATE_USER_AUTHORITY` or `MQPMO_ALTERNATE_USER_AUTHORITY` is specified and this field is entirely blank up to the first null character or the end of the field, the open can succeed only if no user authorization is needed to open this object with the options specified.

If neither `MQOO_ALTERNATE_USER_AUTHORITY` nor `MQPMO_ALTERNATE_USER_AUTHORITY` is specified, this field is ignored.

The following differences exist in the environments indicated:

- On z/OS, only the first 8 characters of *AlternateUserId* are used to check the authorization for the open. However, the current user identifier must be authorized to specify this particular alternative user identifier; all 12 characters of the alternative user identifier are used for this check. The user identifier must contain only characters allowed by the external security manager.  
If *AlternateUserId* is specified for a queue, the value can be used subsequently by the queue manager when messages are put. If the `MQPMO_*_CONTEXT` options specified on the `MQPUT` or `MQPUT1` call cause the queue manager to generate the identity context information, the queue manager places the *AlternateUserId* into the *UserIdentifier* field in the MQMD of the message, in place of the current user identifier.
- In other environments, *AlternateUserId* is used only for access control checks on the object being opened. If the object is a queue, *AlternateUserId* does not affect the content of the *UserIdentifier* field in the MQMD of messages sent using that queue handle.

This is an input field. The length of this field is given by `MQ_USER_ID_LENGTH`. The initial value of this field is the null string in C, and 12 blank characters in other programming languages.

*DynamicQName (MQCHAR48):*

This is the name of a dynamic queue that is to be created by the MQOPEN call. This is of relevance only when *ObjectName* specifies the name of a model queue; in all other cases *DynamicQName* is ignored.

The characters that are valid in the name are the same as those for *ObjectName*, except that an asterisk is also valid. A name that is blank (or one in which only blanks occur before the first null character) is not valid if *ObjectName* is the name of a model queue.

If the last nonblank character in the name is an asterisk ( \* ), the queue manager replaces the asterisk with a string of characters that guarantees that the name generated for the queue is unique at the local queue manager. To allow a sufficient number of characters for this, the asterisk is valid only in positions 1 through 33. There must be no characters other than blanks or a null character following the asterisk.

It is valid for the asterisk to occur in the first character position, in which case the name consists solely of the characters generated by the queue manager.

On z/OS, do not use a name with the asterisk in the first character position, as there can be no security checks made on a queue with a full name that is generated automatically.

This is an input field. The length of this field is given by MQ\_Q\_NAME\_LENGTH. The initial value of this field is determined by the environment:

- On z/OS, the value is 'CSQ.\*'.
- On other platforms, the value is 'AMQ.\*'.

The value is a null-terminated string in C, and a blank-padded string in other programming languages.

*InvalidDestCount (MQLONG):*

This is the number of queues in the distribution list that failed to open successfully. If present, this field is also set when opening a single queue that is not in a distribution list.

**Note:** If present, this field is set *only* if the *CompCode* parameter on the MQOPEN or MQPUT1 call is MQCC\_OK or MQCC\_WARNING; it is *not* set if the *CompCode* parameter is MQCC\_FAILED.

This is an output field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD\_VERSION\_1.

*KnownDestCount (MQLONG):*

This is the number of queues in the distribution list that resolve to local queues and that were opened successfully. The count does not include queues that resolve to remote queues (even though a local transmission queue is used initially to store the message). If present, this field is also set when opening a single queue that is not in a distribution list.

This is an output field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD\_VERSION\_1.

*ObjectName* (MQCHAR48):

This is the local name of the object as defined on the queue manager identified by *ObjectQMgrName*. The name can contain the following characters:

- Uppercase alphabetic characters (A through Z)
- Lowercase alphabetic characters (a through z)
- Numeric digits (0 through 9)
- Period (.), forward slash (/), underscore (\_), percent (%)

The name must not contain leading or embedded blanks, but can contain trailing blanks. Use a null character to indicate the end of significant data in the name; the null and any characters following it are treated as blanks. The following restrictions apply in the environments indicated:

- On systems that use EBCDIC Katakana, lowercase characters cannot be used.
- On z/OS:
  - Avoid names that begin or end with an underscore; they cannot be processed by the operations and control panels.
  - The percent character has a special meaning to RACF. If RACF is used as the external security manager, names must not contain the percent. If they do, those names are not included in any security checks when RACF generic profiles are used.
- On IBM i, names containing lowercase characters, forward slash, or percent, must be enclosed in quotation marks when specified on commands. These quotation marks must not be specified for names that occur as fields in structures or as parameters on calls.

The full topic name can be built from two different fields: *ObjectName* and *ObjectString*. For details of how these two fields are used, see “Using topic strings” on page 2358.

The following points apply to the types of object indicated:

- If *ObjectName* is the name of a model queue, the queue manager creates a dynamic queue with the attributes of the model queue, and returns in the *ObjectName* field the name of the queue created. A model queue can be specified only on the MQOPEN call; a model queue is not valid on the MQPUT1 call.
- If *ObjectName* is the name of an alias queue with TARGTYPE(TOPIC), a security check is first made on the named alias queue; this is normal when alias queues are used. When the security check completes successfully, the MQOPEN call will continue and will behave like an MQOPEN call on an MQOT\_TOPIC; this includes making a security check against the administrative topic object.
- If *ObjectName* and *ObjectQMgrName* identify a shared queue owned by the queue-sharing group to which the local queue manager belongs, there must not also be a queue definition of the same name on the local queue manager. If there is such a definition (a local queue, alias queue, remote queue, or model queue), the call fails with reason code MQRC\_OBJECT\_NOT\_UNIQUE.
- If the object being opened is a distribution list (that is, *RecsPresent* is present and greater than zero), *ObjectName* must be blank or the null string. If this condition is not satisfied, the call fails with reason code MQRC\_OBJECT\_NAME\_ERROR.
- If *ObjectType* is MQOT\_Q\_MGR, special rules apply; in this case the name must be entirely blank up to the first null character or the end of the field.

This is an input/output field for the MQOPEN call when *ObjectName* is the name of a model queue, and an input-only field in all other cases. The length of this field is given by MQ\_Q\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ObjectQMgrName* (MQCHAR48):

This is the name of the queue manager on which the *ObjectName* object is defined. The characters that are valid in the name are the same as those for *ObjectName* (see “ObjectName (MQCHAR48)” on page 2249 ). A name that is entirely blank up to the first null character or the end of the field denotes the queue manager to which the application is connected (the local queue manager).

The following points apply to the types of object indicated:

- If *ObjectType* is MQOT\_TOPIC, MQOT\_NAMELIST, MQOT\_PROCESS, or MQOT\_Q\_MGR, *ObjectQMgrName* must be blank or the name of the local queue manager.
- If *ObjectName* is the name of a model queue, the queue manager creates a dynamic queue with the attributes of the model queue, and returns in the *ObjectQMgrName* field the name of the queue manager on which the queue is created; this is the name of the local queue manager. A model queue can be specified only on the MQOPEN call; a model queue is not valid on the MQPUT1 call.
- If *ObjectName* is the name of a cluster queue, and *ObjectQMgrName* is blank, the destination of messages sent using the queue handle returned by the MQOPEN call is chosen by the queue manager (or cluster workload exit, if one is installed) as follows:
  - If MQOO\_BIND\_ON\_OPEN is specified, the queue manager selects a particular instance of the cluster queue while processing the MQOPEN call, and all messages put using this queue handle are sent to that instance.
  - If MQOO\_BIND\_NOT\_FIXED is specified, the queue manager can choose a different instance of the destination queue (residing on a different queue manager in the cluster) for each successive MQPUT call that uses this queue handle.

If the application needs to send a message to a *specific* instance of a cluster queue (that is, a queue instance that resides on a particular queue manager in the cluster), the application must specify the name of that queue manager in the *ObjectQMgrName* field. This forces the local queue manager to send the message to the specified destination queue manager.

- If *ObjectName* is the name of a shared queue that is owned by the queue-sharing group to which the local queue manager belongs, *ObjectQMgrName* can be the name of the queue-sharing group, the name of the local queue manager, or blank; the message is placed on the same queue whichever of these values is specified.

Queue-sharing groups are supported only on z/OS.

- If *ObjectName* is the name of a shared queue that is owned by a remote queue-sharing group (that is, a queue-sharing group to which the local queue manager does *not* belong), *ObjectQMgrName* must be the name of the queue-sharing group. You can use the name of a queue manager that belongs to that group, but this can delay the message if that particular queue manager is not available when the message arrives at the queue-sharing group.
- If the object being opened is a distribution list (that is, *RecsPresent* is greater than zero), *ObjectQMgrName* must be blank or the null string. If this condition is not satisfied, the call fails with reason code MQRC\_OBJECT\_Q\_MGR\_NAME\_ERROR.

This is an input/output field for the MQOPEN call when *ObjectName* is the name of a model queue, and an input-only field in all other cases. The length of this field is given by MQ\_Q\_MGR\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ObjectRecOffset* (MQLONG):

This is the offset in bytes of the first MQOR object record from the start of the MQOD structure. The offset can be positive or negative. *ObjectRecOffset* is used only when a distribution list is being opened. The field is ignored if *RecsPresent* is zero.

When a distribution list is being opened, an array of one or more MQOR object records must be provided in order to specify the names of the destination queues in the distribution list. This can be done in one of two ways:

- By using the offset field *ObjectRecOffset*.

In this case, the application must declare its own structure containing an MQOD followed by the array of MQOR records (with as many array elements as are needed), and set *ObjectRecOffset* to the offset of the first element in the array from the start of the MQOD. Ensure that this offset is correct and has a value that can be accommodated within an MQLONG (the most restrictive programming language is COBOL, for which the valid range is -999 999 999 through +999 999 999).

Use *ObjectRecOffset* for programming languages that do not support the pointer data type, or that implement the pointer data type in a way that is not portable to different environments (for example, the COBOL programming language).

- By using the pointer field *ObjectRecPtr*.

In this case, the application can declare the array of MQOR structures separately from the MQOD structure, and set *ObjectRecPtr* to the address of the array.

Use *ObjectRecPtr* for programming languages that support the pointer data type in a way that is portable to different environments (for example, the C programming language).

Whatever technique you choose, use one of *ObjectRecOffset* and *ObjectRecPtr*; the call fails with reason code MQRC\_OBJECT\_RECORDS\_ERROR if both are zero, or both are nonzero.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD\_VERSION\_2.

*ObjectRecPtr* (MQPTR):

This is the address of the first MQOR object record. *ObjectRecPtr* is used only when a distribution list is being opened. The field is ignored if *RecsPresent* is zero.

You can use either *ObjectRecPtr* or *ObjectRecOffset* to specify the object records, but not both; for the description of the *ObjectRecOffset* field, see "ObjectRecOffset (MQLONG)." If you do not use *ObjectRecPtr*, set it to the null pointer or null bytes.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQOD\_VERSION\_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*ObjectString* (MQCHARV):

The *ObjectString* field specifies the long object name.

This specifies the long object name to be used. This field is only referenced for certain values of *ObjectType*, and is ignored for all other values. See the description of *ObjectType* for details of which values indicate that this field is used.

If *ObjectString* is specified incorrectly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC\_OBJECT\_STRING\_ERROR.

This is an input field. The initial values of the fields in this structure are the same as those in the MQCHARV structure.

The full topic name can be built from two different fields: *ObjectName* and *ObjectString*. For details of how these two fields are used, see "Using topic strings" on page 2358.

*ObjectType* (MQLONG):

The type of object being named in the object descriptor. Possible values are:

**MQOT\_CLNTCONN\_CHANNEL**

Client connection channel. The name of the object is found in the *ObjectName* field.

**MQOT\_Q**

Queue. The name of the object is found in the *ObjectName* field.

**MQOT\_NAMELIST**

Namelist. The name of the object is found in the *ObjectName* field

**MQOT\_PROCESS**

Process definition. The name of the object is found in the *ObjectName* field

**MQOT\_Q\_MGR**

Queue manager. The name of the object is found in the *ObjectName* field

**MQOT\_TOPIC**

Topic. The full topic name can be built from two different fields: *ObjectName* and *ObjectString*. For details of how those two fields are used, see "Using topic strings" on page 2358.

This is always an input field. The initial value of this field is MQOT\_Q.

*RecsPresent* (MQLONG):

This is the number of MQOR object records that have been provided by the application. If this number is greater than zero, it indicates that a distribution list is being opened, with *RecsPresent* being the number of destination queues in the list. A distribution list can contain only one destination.

The value of *RecsPresent* must not be less than zero, and if it is greater than zero *ObjectType* must be MQOT\_Q; the call fails with reason code MQRC\_RECS\_PRESENT\_ERROR if these conditions are not satisfied.

On z/OS, this field must be zero.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD\_VERSION\_2.

*ResObjectString* (MQCHARV):

The *ResObjectString* field is the long object name after the queue manager resolves the name provided in the *ObjectName* field.

This field is returned only for topics and queue aliases that reference a topic object.

If the long object name is provided in *ObjectString* and nothing is provided in *ObjectName*, then the value returned in this field is the same as provided in *ObjectString*.

If this field is omitted (that is *ResObjectString.VSBufSize* is zero) then the *ResObjectString* will not be returned, but the length will be returned in *ResObjectString.VSLength*.

If the buffer length (provided in *ResObjectString.VSBufSize*) is shorter than the full *ResObjectString*, the string will be truncated and will return as many of the rightmost characters as can fit in the provided buffer.

If *ResObjectString* is specified incorrectly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC\_RES\_OBJECT\_STRING\_ERROR.

*ResolvedQMgrName* (MQCHAR48):

This is the name of the destination queue manager after the local queue manager resolves the name. The name returned is the name of the queue manager that owns the queue identified by *ResolvedQName*. *ResolvedQMgrName* can be the name of the local queue manager.

If *ResolvedQName* is a shared queue that is owned by the queue-sharing group to which the local queue manager belongs, *ResolvedQMgrName* is the name of the queue-sharing group. If the queue is owned by some other queue-sharing group, *ResolvedQName* can be the name of the queue-sharing group or the name of a queue manager that is a member of the queue-sharing group (the nature of the value returned is determined by the queue definitions that exist at the local queue manager).

A nonblank value is returned only if the object is a single queue opened for browse, input, or output (or any combination). If the object opened is any of the following, *ResolvedQMgrName* is set to blanks:

- Not a queue
- A queue, but not opened for browse, input, or output
- A cluster queue with MQOO\_BIND\_NOT\_FIXED specified (or with MQOO\_BIND\_AS\_Q\_DEF in effect when the *DefBind* queue attribute has the value MQBND\_BIND\_NOT\_FIXED)
- A distribution list

This is an output field. The length of this field is given by MQ\_Q\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages. This field is ignored if *Version* is less than MQOD\_VERSION\_3.

*ResolvedQName* (MQCHAR48):

This is the name of the destination queue after the local queue manager resolves the name. The name returned is the name of a queue that exists on the queue manager identified by *ResolvedQMGrName*.

A nonblank value is returned only if the object is a single queue opened for browse, input, or output (or any combination). If the object opened is any of the following, *ResolvedQName* is set to blanks:

- Not a queue
- A queue, but not opened for browse, input, or output
- A distribution list
- An alias queue that references a topic object (refer to *ResObjectString* instead).
- An alias queue that resolves to a topic object.

This is an output field. The length of this field is given by *MQ\_Q\_NAME\_LENGTH*. The initial value of this field is the null string in C, and 48 blank characters in other programming languages. This field is ignored if *Version* is less than *MQOD\_VERSION\_3*.

*ResolvedType* (MQLONG):

The type of the resolved (base) object being opened.

The possible values are:

**MQOT\_Q**

The resolved object is a queue. This value applies when a queue is opened directly or when an alias queue pointing to a queue is opened.

**MQOT\_TOPIC**

The resolved object is a topic. This value applies when a topic is opened directly or when an alias queue pointing to a topic object is opened.

**MQOT\_NONE**

The resolved type is neither a queue nor a topic.

*ResponseRecOffset* (MQLONG):

This is the offset in bytes of the first MQRR response record from the start of the MQOD structure. The offset can be positive or negative. *ResponseRecOffset* is used only when a distribution list is being opened. The field is ignored if *RecsPresent* is zero.

When a distribution list is being opened, you can provide an array of one or more MQRR response records in order to identify the queues that failed to open (*CompCode* field in MQRR), and the reason for each failure (*Reason* field in MQRR). The data is returned in the array of response records in the same order as the queue names occur in the array of object records. The queue manager sets the response records only when the outcome of the call is mixed (that is, some queues were opened successfully while others failed, or all failed but for different reasons); reason code MQRC\_MULTIPLE\_REASONS from the call indicates this case. If the same reason code applies to all queues, that reason is returned in the *Reason* parameter of the MQOPEN or MQPUT1 call, and the response records are not set. Response records are optional, but if they are supplied there must be *RecsPresent* of them.

The response records can be provided in the same way as the object records, either by specifying an offset in *ResponseRecOffset*, or by specifying an address in *ResponseRecPtr*; for details of how to do this, see "ObjectRecOffset (MQLONG)" on page 2251. However, no more than one of *ResponseRecOffset* and *ResponseRecPtr* can be used; the call fails with reason code MQRC\_RESPONSE\_RECORDS\_ERROR if both are nonzero.

For the MQPUT1 call, these response records are used to return information about errors that occur when the message is sent to the queues in the distribution list, as well as errors that occur when the queues are opened. The completion code and reason code from the put operation for a queue replace those from the open operation for that queue only if the completion code from the latter was MQCC\_OK or MQCC\_WARNING.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD\_VERSION\_2.

*ResponseRecPtr* (MQPTR):

This is the address of the first MQRR response record. *ResponseRecPtr* is used only when a distribution list is being opened. The field is ignored if *RecsPresent* is zero.

Use either *ResponseRecPtr* or *ResponseRecOffset* to specify the response records, but not both; for details, see “ResponseRecOffset (MQLONG)” on page 2254. If you do not use *ResponseRecPtr*, set it to the null pointer or null bytes.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQOD\_VERSION\_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*SelectionString* (MQCHARV):

This is the string used to provide the selection criteria used when retrieving messages off a queue.

*SelectionString* must not be provided in the following cases:

- If *ObjectType* is not MQOT\_Q
- If the queue being opened is not being opened using one of the MQOO\_BROWSE, or MQOO\_INPUT\_\* options

If *SelectionString* is provided in these cases, the call fails with reason code MQRC\_SELECTOR\_INVALID\_FOR\_TYPE.

If *SelectionString* is specified incorrectly, according to the description of how to use the “MQCHARV - Variable Length String” on page 2050 structure, or if it exceeds the maximum length, the call fails with reason code MQRC\_SELECTION\_STRING\_ERROR. The maximum length of *SelectionString* is MQ\_SELECTOR\_LENGTH.

*SelectionString* usage is described in Selectors.

*StrucId* (MQCHAR4):

This is the structure identifier; the value must be:

**MQOD\_STRUC\_ID**

Identifier for object descriptor structure.

For the C programming language, the constant MQOD\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQOD\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQOD\_STRUC\_ID.

*UnknownDestCount* (MQLONG):

This is the number of queues in the distribution list that resolve to remote queues and that were opened successfully. If present, this field is also set when opening a single queue that is not in a distribution list.

This is an output field. The initial value of this field is 0. This field is ignored if *Version* is less than MQOD\_VERSION\_1.

*Version* (MQLONG):

This is the structure version number; the value must be one of the following:

**MQOD\_VERSION\_1**

Version-1 object descriptor structure.

**MQOD\_VERSION\_2**

Version-2 object descriptor structure.

**MQOD\_VERSION\_3**

Version-3 object descriptor structure.

**MQOD\_VERSION\_4**

Version-4 object descriptor structure.

All versions are supported in all IBM MQ V7.0 environments.

Fields that exist only in the more-recent versions of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQOD\_CURRENT\_VERSION**

Current version of object descriptor structure.

This is always an input field. The initial value of this field is MQOD\_VERSION\_1.

Initial values and language declarations for MQOD:

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQOD_STRUC_ID	'0D↵↵'
<i>Version</i>	MQOD_VERSION_1	1
<i>ObjectType</i>	MQOT_Q	1
<i>ObjectName</i>	None	Null string or blanks
<i>ObjectQMgrName</i>	None	Null string or blanks
<i>DynamicQName</i>	None	'CSQ.*' on z/OS ; 'AMQ.*' otherwise
<i>AlternateUserId</i>	None	Null string or blanks
<i>RecsPresent</i>	None	0
<i>KnownDestCount</i>	None	0
<i>UnknownDestCount</i>	None	0
<i>InvalidDestCount</i>	None	0
<i>ObjectRecOffset</i>	None	0
<i>ResponseRecOffset</i>	None	0
<i>ObjectRecPtr</i>	None	Null pointer or null bytes
<i>ResponseRecPtr</i>	None	Null pointer or null bytes
<i>AlternateSecurityId</i>	MQSID_NONE	Nulls
<i>ResolvedQName</i>	None	Null string or blanks
<i>ResolvedQMgrName</i>	None	Null string or blanks
<i>ObjectString</i>	MQCHARV_DEFAULT	As defined for MQCHARV
<i>SelectionString</i>	MQCHARV_DEFAULT	As defined for MQCHARV
<i>ResObjectString</i>	MQCHARV_DEFAULT	As defined for MQCHARV
<i>ResolvedType</i>	MQOT_NONE	0
<p><b>Notes:</b></p> <ol style="list-style-type: none"> <li>1. The symbol ↵ represents a single blank character.</li> <li>2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.</li> <li>3. In the C programming language, the macro variable MQOD_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:  <pre>MQOD MyOD = {MQOD_DEFAULT};</pre> </li> </ol>		

*C declaration:*

```
typedef struct tagMQOD MQOD;
struct tagMQOD {
    MQCHAR4    StructId;           /* Structure identifier */
    MQLONG     Version;           /* Structure version number */
    MQLONG     ObjectType;        /* Object type */
    MQCHAR48   ObjectName;        /* Object name */
    MQCHAR48   ObjectQMgrName;    /* Object queue manager name */

**MQOR - Object record:**

The following table summarizes the fields in the structure.

*Table 203. Fields in MQOR*

Field	Description	Topic
<i>ObjectName</i>	Object name	ObjectName
<i>ObjectQMgrName</i>	Object queue manager name	ObjectQMgrName

*Overview for MQOR:*

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

**Purpose:** Use the MQOR structure to specify the queue name and queue-manager name of a single destination queue. MQOR is an input structure for the MQOPEN and MQPUT1 calls.

**Character set and encoding:** Data in MQOR must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

**Usage:** By providing an array of these structures on the MQOPEN call, you can open a list of queues; this list is called a *distribution list*. Each message put using the queue handle returned by that MQOPEN call is placed on each of the queues in the list, provided that the queue was opened successfully.

*Fields for MQOR:*

The MQOR structure contains the following fields; the fields are described in **alphabetical order**:

*ObjectName (MQCHAR48):*

This is the same as the *ObjectName* field in the MQOD structure (see MQOD for details), except that:

- It must be the name of a queue.
- It must not be the name of a model queue.

This is always an input field. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ObjectQMgrName (MQCHAR48):*

This is the same as the *ObjectQMgrName* field in the MQOD structure (see MQOD for details).

This is always an input field. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*Initial values and language declarations for MQOR:*

*Table 204. Initial values of fields in MQOR for MQOR*

Field name	Name of constant	Value of constant
<i>ObjectName</i>	None	Null string or blanks
<i>ObjectQMgrName</i>	None	Null string or blanks

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQOR\_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:  
MQOR MyOR = {MQOR\_DEFAULT};

*C declaration:*

```
typedef struct tagMQOR MQOR;
struct tagMQOR {
    MQCHAR48 ObjectName;    /* Object name */
    MQCHAR48 ObjectQMgrName; /* Object queue manager name */
};
```

COBOL declaration:

```
** MQOR structure
  10 MQOR.
**   Object name
  15 MQOR-OBJECTNAME    PIC X(48).
**   Object queue manager name
  15 MQOR-OBJECTQMGRNAME PIC X(48).
```

PL/I declaration:

```
dc1
  1 MQOR based,
  3 ObjectName      char(48), /* Object name */
  3 ObjectQMgrName char(48); /* Object queue manager name */
```

Visual Basic declaration:

```
Type MQOR
  ObjectName      As String*48 'Object name'
  ObjectQMgrName As String*48 'Object queue manager name'
End Type
```

### MQPD - Property descriptor:

The following table summarizes the fields in the structure.

Table 205. Fields in MQPD

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options	Options
<i>Support</i>	Required support for message property	Support
<i>Context</i>	Message context to which property belongs	Context
<i>CopyOptions</i>	Copy options to which property belongs	CopyOptions

Overview for MQPD:

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS and IBM MQ MQI clients.

**Purpose:** The **MQPD** is used to define the attributes of a property. The structure is an input/output parameter on the MQSETMP call and an output parameter on the MQINQMP call.

**Character set and encoding:** Data in **MQPD** must be in the character set of the application and encoding of the application ( **MQENC\_NATIVE** ).

*Fields for MQPD:*

The MQPD structure contains the following fields; the fields are described in **alphabetical order**:

*Context (MQLONG):*

This describes what message context the property belongs to.

When a queue manager receives a message containing an IBM MQ-defined property that the queue manager recognizes as being incorrect, the queue manager corrects the value of the *Context* field.

The following option can be specified:

#### **MQPD\_USER\_CONTEXT**

The property is associated with the user context.

No special authorization is required to be able to set a property associated with the user context using the MQSETMP call.

On a IBM WebSphere MQ Version 7.0 queue manager, a property associated with the user context is saved as described for MQOO\_SAVE\_ALL\_CONTEXT. An MQPUT call with MQPMO\_PASS\_ALL\_CONTEXT specified, causes the property to be copied from the saved context into the new message.

If the option previously described is not required, the following option can be used:

#### **MQPD\_NO\_CONTEXT**

The property is not associated with a message context.

An unrecognized value is rejected with a *Reason* code of MQRC\_PD\_ERROR

This is an input/output field to the MQSETMP call and an output field from the MQINQMP call. The initial value of this field is MQPD\_NO\_CONTEXT.

*CopyOptions (MQLONG):*

This describes which type of messages the property should be copied into. This is an output only field for recognized IBM MQ defined properties; IBM MQ sets the appropriate value.

When a queue manager receives a message containing an IBM MQ defined property that the queue manager recognizes as being incorrect, the queue manager corrects the value of the *CopyOptions* field.

You can specify one or more of these options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

#### **MQCOPY\_FORWARD**

This property is copied into a message being forwarded.

#### **MQCOPY\_PUBLISH**

This property is copied into the message received by a subscriber when a message is being published.

#### **MQCOPY\_REPLY**

This property is copied into a reply message.

#### **MQCOPY\_REPORT**

This property is copied into a report message.

#### **MQCOPY\_ALL**

This property is copied into all types of subsequent messages.

**Default option:** The following option can be specified to supply the default set of copy options:

#### **MQCOPY\_DEFAULT**

This property is copied into a message being forwarded, into a report message, or into a message received by a subscriber when a message is being published.

This is equivalent to specifying the combination of options MQCOPY\_FORWARD, plus MQCOPY\_REPORT, plus MQCOPY\_PUBLISH.

If none of the options that are described previously is required, use the following option:

#### **MQCOPY\_NONE**

Use this value to indicate that no other copy options are specified; programmatically no relationship exists between this property and subsequent messages. This is always returned for message descriptor properties.

This is an input/output field to the MQSETMP call and an output field from the MQINQMP call. The initial value of this field is MQCOPY\_DEFAULT.

*Options (MQLONG):*

The value must be:

#### **MQPD\_NONE**

No options specified

This is always an input field. The initial value of this field is MQPD\_NONE.

*StrucId (MQCHAR4):*

This is the structure identifier; the value must be:

#### **MQPD\_STRUC\_ID**

Identifier for property descriptor structure.

For the C programming language, the constant **MQPD\_STRUC\_ID\_ARRAY** is also defined; this has the same value as **MQPD\_STRUC\_ID**, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is **MQPD\_STRUC\_ID**.

*Support (MQLONG):*

This field describes what level of support for the message property is required of the queue manager, in order for the message containing this property to be put to a queue. This applies only to IBM MQ-defined properties; support for all other properties is optional.

The field is automatically set to the correct value when the IBM MQ-defined property is known by the queue manager. If the property is not recognized, MQPD\_SUPPORT\_OPTIONAL is assigned. When a queue manager receives a message containing an IBM MQ-defined property that the queue manager recognizes as being incorrect, the queue manager corrects the value of the *Support* field.

When setting an IBM MQ-defined property using the MQSETMP call on a message handle where the MQCMHO\_NO\_VALIDATION option was set, *Support* becomes an input field. This allows an application to put an IBM MQ-defined property, with the correct value, where the property is unsupported by the connected queue manager, but where the message is intended to be processed on another queue manager.

The value MQPD\_SUPPORT\_OPTIONAL is always assigned to properties that are not IBM MQ-defined properties.

If a IBM WebSphere MQ Version 7.0 queue manager, that supports message properties, receives a property that contains an unrecognized *Support* value, the property is treated as if:

- MQPD\_SUPPORT\_REQUIRED was specified if any of the unrecognized values are contained in the MQPD\_REJECT\_UNSUP\_MASK.
- MQPD\_SUPPORT\_REQUIRED\_IF\_LOCAL was specified if any of the unrecognized values are contained in the MQPD\_ACCEPT\_UNSUP\_IF\_XMIT\_MASK
- MQPD\_SUPPORT\_OPTIONAL was specified otherwise.

One of the following values is returned by the MQINQMP call, or one of the values can be specified, when using the MQSETMP call on a message handle where the MQCMHO\_NO\_VALIDATION option is set:

#### **MQPD\_SUPPORT\_OPTIONAL**

The property is accepted by a queue manager even if it is not supported. The property can be discarded in order for the message to flow to a queue manager that does not support message properties. This value is also assigned to properties that are not IBM MQ-defined.

#### **MQPD\_SUPPORT\_REQUIRED**

Support for the property is required. The message is rejected by a queue manager that does not support the IBM MQ-defined property. The MQPUT or MQPUT1 call fails with completion code MQCC\_FAILED and reason code MQRC\_UNSUPPORTED\_PROPERTY.

#### **MQPD\_SUPPORT\_REQUIRED\_IF\_LOCAL**

The message is rejected by a queue manager that does not support the IBM MQ-defined property if the message is destined for a local queue. The MQPUT or MQPUT1 call fails with completion code MQCC\_FAILED and reason code MQRC\_UNSUPPORTED\_PROPERTY.

The MQPUT or MQPUT1 call succeeds if the message is destined for a remote queue manager.

This is an output field on the MQINQMP call and an input field on the MQSETMP call if the message handle was created with the MQCMHO\_NO\_VALIDATION option set. The initial value of this field is MQPD\_SUPPORT\_OPTIONAL.

*Version (MQLONG):*

This is the structure version number; the value must be:

#### **MQPD\_VERSION\_1**

Version-1 property descriptor structure.

The following constant specifies the version number of the current version:

#### **MQPD\_CURRENT\_VERSION**

Current version of property descriptor structure.

This is always an input field. The initial value of this field is **MQPD\_VERSION\_1**.

Initial values and language declarations for MQPD:

Table 206. Initial values of fields in MQPD

Field name	Name of constant	Value of constant
StrucId	MQPD_STRUC_ID	'PD'
Version	MQPD_VERSION_1	1
Options	MQPD_NONE	0
Support	MQPD_SUPPORT_OPTIONAL	0
Context	MQPD_NO_CONTEXT	0
CopyOptions	MQCOPY_DEFAULT	0

**Notes:**

1. In the C programming language, the macro variable MQPD\_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:

```
MQPD MyPD = {MQPD_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQPD MQPD;
struct tagMQPD {
    MQCHAR4  StrucId;    /* Structure identifier */
    MQLONG   Version;   /* Structure version number */
    MQLONG   Options;   /* Options that control the action of
                        MQSETMP and MQINQMP */
    MQLONG   Support;   /* Property support option */
    MQLONG   Context;   /* Property context */
    MQLONG   CopyOptions; /* Property copy options */
};
```

*COBOL declaration:*

```
** MQPD structure
 10 MQPD.
**   Structure identifier
 15 MQPD-STRUCID PIC X(4).
**   Structure version number
 15 MQPD-VERSION PIC S9(9) BINARY.
**   Options that control the action of MQSETMP and
**   MQINQMP
 15 MQPD-OPTIONS PIC S9(9) BINARY.
**   Property support option
 15 MQPD-SUPPORT PIC S9(9) BINARY.
**   Property context
 15 MQPD-CONTEXT PIC S9(9) BINARY.
**   Property copy options
 15 MQPD-COPYOPTIONS PIC S9(9) BINARY.
```

PL/I declaration:

```

dcl
  1 MQPD based,
  3 StrucId   char(4),      /* Structure identifier */
  3 Version   fixed bin(31), /* Structure version number */
  3 Options   fixed bin(31), /* Options that control the action
                             of MQSETMP and MQINQMP */
  3 Support   fixed bin(31), /* Property support option */
  3 Context   fixed bin(31), /* Property context */
  3 CopyOptions fixed bin(31); /* Property copy options */

```

High Level Assembler declaration:

```

MQPD          DSECT
MQPD_STRUCID  DS   CL4   Structure identifier
MQPD_VERSION  DS   F     Structure version number
MQPD_OPTIONS  DS   F     Options that control the
*              action of MQSETMP and MQINQMP
MQPD_SUPPORT  DS   F     Property support option
MQPD_CONTEXT  DS   F     Property context
MQPD_COPYOPTIONS DS   F   Property copy options
MQPD_LENGTH   EQU  *-MQPD
MQPD_AREA     DS   CL(MQPD_LENGTH)

```

### MQPMO - Put-message options:

The following table summarizes the fields in the structure.

Table 207. MQPMO structure

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options that control the action of MQPUT and MQPUT1	Options
<i>Timeout</i>	Reserved	Timeout
<i>Context</i>	Object handle of input queue	Context
<i>KnownDestCount</i>	Number of messages sent successfully to local queues	KnownDestCount
<i>UnknownDestCount</i>	Number of messages sent successfully to remote queues	UnknownDestCount
<i>InvalidDestCount</i>	Number of messages that could not be sent	InvalidDestCount
<i>ResolvedQName</i>	Resolved name of destination queue	ResolvedQName
<i>ResolvedQMgrName</i>	Resolved name of destination queue manager	ResolvedQMgrName
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQPMO_VERSION_2.		
<i>RecsPresent</i>	Number of put message records or response records present	RecsPresent
<i>PutMsgRecFields</i>	Flags indicating which MQPMR fields are present	PutMsgRecFields
<i>PutMsgRecOffset</i>	Offset of first put-message record from start of MQPMO	PutMsgRecOffset
<i>ResponseRecOffset</i>	Offset of first response record from start of MQPMO	ResponseRecOffset
<i>PutMsgRecPtr</i>	Address of first put message record	PutMsgRecPtr
<i>ResponseRecPtr</i>	Address of first response record	ResponseRecPtr
<b>Note:</b> The remaining fields are ignored if <i>Version</i> is less than MQPMO_VERSION_3.		

Table 207. MQPMO structure (continued)

Field	Description	Topic
<i>OriginalMsgHandle</i>	Original message handle	OriginalMsgHandle
<i>NewMsgHandle</i>	New message handle	NewMsgHandle
<i>Action</i>	Type of put being performed and the relationship between the original message specified by the <i>OriginalMsgHandle</i> field and the new message specified by the <i>NewMsgHandle</i> field	Action
<i>PubLevel</i>	Level of subscription targeted by the publication	PubLevel

Overview for MQPMO:

**Availability:** All IBM MQ systems, plus IBM MQ clients connected to these systems.

**Purpose:** The MQPMO structure allows the application to specify options that control how messages are placed on queues, or published to topics. The structure is an input/output parameter on the MQPUT and MQPUT1 calls.

**Version:** The current version of MQPMO is MQPMO\_VERSION\_3. Certain fields are available only in certain versions of MQPMO. If you need to port applications between several environments, you must ensure that the version of MQPMO is consistent across all environments. Fields that exist only in particular versions of the structure are identified as such in “MQPMO - Put-message options” on page 2269 and in the field descriptions.

The header, COPY, and INCLUDE files provided for the supported programming languages contain the most-recent version of MQPMO that is supported by the environment, but with the initial value of the *Version* field set to MQPMO\_VERSION\_1. To use fields that are not present in the version-1 structure, the application must set the *Version* field to the version number of the version required.

**Character set and encoding:** Data in MQPMO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

Fields for MQPMO:

The MQPMO structure contains the following fields; the fields are described in **alphabetical order**:

*Action (MQLONG):*

This specifies the type of put being performed and the relationship between the original message specified by the *OriginalMsgHandle* field and the new message specified by the *NewMsgHandle* field. The properties of the message are chosen by the queue manager according to the value of the *Action* specified.

You can choose to supply the contents of the message descriptor using the *MsgDesc* parameter on the MQPUT or MQPUT1 calls. Alternatively it is possible not to supply the *MsgDesc* parameter, or to specify that it is output-only by including MQPMO\_MD\_FOR\_OUTPUT\_ONLY in the *Options* field of the MQPMO structure.

If the *MsgDesc* parameter is not supplied, or if it is specified to be output-only, then the message descriptor for the new message is populated from the message handle fields of the MQPMO, according to the rules described in this topic.

The context setting and passing activities described in Controlling context information take effect after the message descriptor has been composed.

If an incorrect action value is specified, the call fails with the reason code MQRC\_ACTION\_ERROR.

Any one of the following actions can be specified:

#### **MQACTP\_NEW**

A new message is being put, and no relationship to a previous message is being specified by the program. The message descriptor is composed as follows:

- If a MsgDesc is supplied on the MQPUT or MQPUT1 call, and MQPMO\_MD\_FOR\_OUTPUT\_ONLY is not in the MQPMO.Options, this is used as the message descriptor unmodified.
- If a MsgDesc is not supplied, or MQPMO\_MD\_FOR\_OUTPUT\_ONLY is in the MQPMO.Options then the queue manager generates the message descriptor using a combination of properties from OriginalMsgHandle and NewMsgHandle. Any message descriptor fields explicitly set on the new message handle take precedence over those in the original message handle.

Message data is taken from the MQPUT or MQPUT1 Buffer parameter.

#### **MQACTP\_FORWARD**

A previously retrieved message is being forwarded. The original message handle specifies the message that was previously retrieved.

The new message handle specifies any modifications to the properties (including any in the message descriptor) in the original message handle.

The message descriptor is composed as follows:

- If a MsgDesc is supplied on the MQPUT or MQPUT1 call, and MQPMO\_MD\_FOR\_OUTPUT\_ONLY is not in the MQPMO.Options, this is used as the message descriptor unmodified.
- If a MsgDesc is not supplied, or MQPMO\_MD\_FOR\_OUTPUT\_ONLY is in the MQPMO.Options then the queue manager generates the message descriptor using a combination of properties from OriginalMsgHandle and NewMsgHandle. Any message descriptor fields explicitly set on the new message handle take precedence over those in the original message handle.
- If MQPMO\_NEW\_MSG\_ID or MQPMO\_NEW\_CORREL\_ID are specified in the MQPMO.Options, then these are honoured.

The message properties are composed as follows:

- All properties from the original message handle which have MQCOPY\_FORWARD in the MQPD.CopyOptions
- All properties from the new message handle. For each property in the new message handle that has the same name as a property in the original message handle, the value is taken from the new message handle. The only exception to this rule is the special case when the property in the new message handle has the same name as a property in the original message handle, but the value of the property is null. In this case the property is removed from the message.

The message data to be forwarded is taken from the MQPUT or MQPUT1 Buffer parameter.

#### **MQACTP\_REPLY**

A reply is being made to a previously retrieved message. The original message handle specifies the message that was previously retrieved.

The new message handle specifies any modifications to the properties (including any in the message descriptor) in the original message handle.

The message descriptor is composed as follows:

- If a MsgDesc is supplied on the MQPUT or MQPUT1 call, and MQPMO\_MD\_FOR\_OUTPUT\_ONLY is not in the MQPMO.Options, this is used as the message descriptor unmodified.
- If a MsgDesc is not supplied, or MQPMO\_MD\_FOR\_OUTPUT\_ONLY is in the MQPMO.Options then initial message descriptor fields are chosen as follows:

Table 208. Reply message handle transformation

Field in MQMD	Value used
Report	If MQRO_PASS_DISCARD_AND_EXPIRY and MQRO_DISCARD_MSG are set: MQRO_DISCARD_MSG otherwise MQRO_NONE
MsgType	MQMT_REPLY
Expiry	If MQRO_PASS_DISCARD_AND_EXPIRY is set: Copied from the input message otherwise MQEI_UNLIMITED
Feedback	MQFB_NONE
MsgId	If MQPMO_NEW_MSG_ID is set: A new message identifier is generated else if MQRO_PASS_MSG_ID is set: Copied from the input message otherwise MQMI_NONE
CorrelId	If MQPMO_NEW_CORREL_ID is set: A new correlation identifier is generated else if MQRO_COPY_MSG_ID_TO_CORREL_ID is set: Copied from the MsgId field of the input message else if MQRO_PASS_CORREL_ID is set: Copied from the CorrelId field of the input message otherwise MQCI_NONE
BackoutCount	0
ReplyToQ	Blanks
ReplyToQMgr	Blanks
GroupId	MQGI_NONE
MsgSeqNumber	1
Offset	0
MsgFlags	MQMF_NONE
OriginalLength	MQOL_UNDEFINED

- The message descriptor is then modified by the new message handle - any message descriptor fields explicitly set as properties in the new message handle take precedence over the message descriptor fields as described previously.

The message properties are composed as follows:

- All properties from the original message handle which have MQCOPY\_REPLY in the MQPD.CopyOptions

- All properties from the new message handle. For each property in the new message handle that has the same name as a property in the original message handle, the value is taken from the new message handle. The only exception to this rule is the special case when the property in the new message handle has the same name as a property in the original message handle, but the value of the property is null. In this case the property is removed from the message.

The message data to be forwarded is taken from the MQPUT/MQPUT1 Buffer parameter.

#### MQACTP\_REPORT

A report is being generated as a result of a previously retrieved message. The original message handle specifies the message causing the report to be generated.

The new message handle specifies any modifications to the properties (including any in the message descriptor) in the original message handle.

The message descriptor is composed as follows:

- If a MsgDesc is supplied on the MQPUT or MQPUT1 call, and MQPMO\_MD\_FOR\_OUTPUT\_ONLY is not in the MQPMO.Options, this is used as the message descriptor unmodified.
- If a MsgDesc is not supplied, or MQPMO\_MD\_FOR\_OUTPUT\_ONLY is in the MQPMO.Options then initial message descriptor fields are chosen as follows:

Table 209. Report message handle transformation

Field in MQMD	Value used
Report	If MQRO_PASS_DISCARD_AND_EXPIRY and MQRO_DISCARD_MSG are set: MQRO_DISCARD_MSG otherwise MQRO_NONE
MsgType	MQMT_REPORT
Expiry	If MQRO_PASS_DISCARD_AND_EXPIRY is set: Copied from the input message otherwise MQEI_UNLIMITED
MsgId	If MQPMO_NEW_MSG_ID is set: A new message identifier is generated else if MQRO_PASS_MSG_ID is set: Copied from the input message otherwise MQMI_NONE
CorrelId	If MQPMO_NEW_CORREL_ID is set: A new correlation identifier is generated else if MQRO_COPY_MSG_ID_TO_CORREL_ID is set: Copied from the MsgId field of the input message else if MQRO_PASS_CORREL_ID is set: Copied from the CorrelId field of the input message otherwise MQCI_NONE
BackoutCount	0
ReplyToQ	Blanks
ReplyToQMgr	Blanks
OriginalLength	Set to the <i>BufferLength</i>

- The message descriptor is then modified by the new message handle - any message descriptor fields explicitly set as properties in the new message handle take precedence over the message descriptor fields as described previously.

The message properties are composed as follows:

- All properties from the original message handle which have MQCOPY\_REPORT in the MQPD.CopyOptions
- All properties from the new message handle. For each property in the new message handle that has the same name as a property in the original message handle, the value is taken from the new message handle. The only exception to this rule is the special case when the property in the new message handle has the same name as a property in the original message handle, but the value of the property is null. In this case the property is removed from the message.

The Feedback field in the resultant MQMD represents the report that is to be generated. A Feedback value of MQFB\_NONE causes the MQPUT or MQPUT1 call to fail with reason code MQRC\_FEEDBACK\_ERROR.

To choose the user data of the report message, IBM MQ consults the Report and Feedback fields in the resultant MQMD, and the Buffer and BufferLength parameters of the MQPUT or MQPUT1 call.

- If Feedback is MQFB\_COA, MQFB\_COD or MQFB\_EXPIRATION then the value of Report is inspected.
- If any of the following cases is true, the full message data from Buffer for a length of BufferLength is used.
  - Feedback is MQFB\_EXPIRATION and Report contains MQRO\_EXPIRATION\_WITH\_FULL\_DATA
  - Feedback is MQFB\_COD and Report contains MQRO\_COD\_WITH\_FULL\_DATA
  - Feedback is MQFB\_COA and Report contains MQRO\_COA\_WITH\_FULL\_DATA
- If any of the following cases is true, the first 100 bytes of the message (or BufferLength if this is less than 100) from Buffer are used
  - Feedback is MQFB\_EXPIRATION and Report contains MQRO\_EXPIRATION\_WITH\_DATA
  - Feedback is MQFB\_COD and Report contains MQRO\_COD\_WITH\_DATA
  - Feedback is MQFB\_COA and Report contains MQRO\_COA\_WITH\_DATA
- If Feedback is MQFB\_EXPIRATION, MQFB\_COD or MQFB\_COA, and Report does not contain the \*\_WITH\_FULL\_DATA or \*\_WITH\_DATA options relevant to that Feedback value, then no user data is included with the message.
- If Feedback takes a different value from those listed above, then Buffer and BufferLength are used as normal.

The derivation of the user data is shown in the following table:

*Context (MQHOBJ):*

If MQPMO\_PASS\_IDENTITY\_CONTEXT or MQPMO\_PASS\_ALL\_CONTEXT is specified, this field must contain the input queue handle from which context information to be associated with the message being put is taken.

If neither MQPMO\_PASS\_IDENTITY\_CONTEXT nor MQPMO\_PASS\_ALL\_CONTEXT is specified, this field is ignored.

This is an input field. The initial value of this field is 0.

*InvalidDestCount (MQLONG):*

This is the number of messages that could not be sent to queues in the distribution list. The count includes queues that failed to open, as well as queues that were opened successfully but for which the put operation failed. This field is also set when putting a message to a single queue that is not in a distribution list.

**Note:** This field is set if the *CompCode* parameter on the MQPUT or MQPUT1 call is MQCC\_OK or MQCC\_WARNING; it might be set if the *CompCode* parameter is MQCC\_FAILED, but do not rely on this in application code.

This is an output field. The initial value of this field is 0. This field is not set if *Version* is less than MQPMO\_VERSION\_1.

This field is undefined on z/OS because distribution lists are not supported.

*KnownDestCount (MQLONG):*

This is the number of messages that the current MQPUT or MQPUT1 call has sent successfully to queues in the distribution list that are local queues. The count does not include messages sent to queues that resolve to remote queues (even though a local transmission queue is used initially to store the message). This field is also set when putting a message to a single queue that is not in a distribution list.

This is an output field. The initial value of this field is 0. This field is not set if *Version* is less than MQPMO\_VERSION\_1.

This field is undefined on z/OS because distribution lists are not supported.

*NewMsgHandle (MQHMSG):*

This is an optional handle to the message being put subject to the value of the Action field. It defines the properties of the message and overrides the values of the *OriginalMsgHandle*, if specified.

On return from the **MQPUT** or **MQPUT1** call, the contents of the handle reflect the message that was actually put.

This is an input field. The initial value of this field is **MQHM\_NONE**. This field is ignored if *Version* is less than **MQPMO\_VERSION\_3**.

*MQPMO options (MQLONG):*

The Options field controls the operation of **MQPUT** and **MQPUT1** calls.

**Scope option.** You can specify any or none of the MQPMO options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations). Combinations that are not valid are noted; any other combinations are valid.

The following option controls the scope of the publications sent:

#### **MQPMO\_SCOPE\_QMGR**

The publication is sent only to subscribers that have subscribed on this queue manager. The publication is not forwarded to any remote publish/subscribe queue managers that have made a subscription to this queue manager, which overrides any behavior that has been set using the PUBSCOPE topic attribute.

**Note:** If not set, the publication scope is determined by the PUBSCOPE topic attribute.

**Publishing options.** The following options control the way messages are published to a topic:

#### **MQPMO\_SUPPRESS\_REPLYTO**

Any information specified in the *ReplyToQ* and *ReplyToQMGR* fields of the MQMD of this publication is not passed on to subscribers. If this option is used with a report option that requires a *ReplyToQ*, the call fails with MQRC\_MISSING\_REPLY\_TO\_Q.

#### **MQPMO\_RETAIN**

The publication being sent is to be retained by the queue manager. This retention allows a subscriber to request a copy of this publication after the time it was published, by using the MQSUBRQ call. It also allows a publication to be sent to applications which make their subscription after the time this publication was made (unless they choose not to be sent it by using the option MQSO\_NEW\_PUBLICATIONS\_ONLY). If an application is sent a publication which was retained, it is indicated by the MQIsRetained message property of that publication.

Only one publication can be retained at each node of the topic tree. Therefore, if there already is a retained publication for this topic, published by any other application, it is replaced with this publication. It is therefore better to avoid having more than one publisher retaining messages on the same topic.

When retained publications are requested by a subscriber, the subscription used might contain a wildcard in the topic, in which case a number of retained publications might match (at various nodes in the topic tree) and several publications might be sent to the requesting application. See the description of the "MQSUBRQ - Subscription request" on page 2583 call for more details.

For information about how retained publications interact with subscription levels, see Intercepting publications.

If this option is used and the publication cannot be retained, the message is not published and the call fails with MQRC\_PUT\_NOT\_RETAINED.

#### **MQPMO\_NOT\_OWN\_SUBS**

Tells the queue manager that the application does not want to send any of its publications to subscriptions it owns. Subscriptions are considered to be owned by the same application if the connection handles are the same.

#### **MQPMO\_WARN\_IF\_NO\_SUBS\_MATCHED**

If no subscription matches the publication, return a completion code (*CompCode*) of MQCC\_WARNING and reason code MQRC\_NO\_SUBS\_MATCHED.

If MQRC\_NO\_SUBS\_MATCHED is returned by the put operation, the publication was not delivered to any subscriptions. However, if the MQPMO\_RETAIN option is specified on the put operation, the message is retained and delivered to any subsequently defined matching subscription.

A subscription on the topic matches the publication if any of the following conditions are met:

- The message is delivered to the subscription queue
- The message would have been delivered to the subscription queue but a problem with the queue means that the message cannot be put to the queue, and it was consequently placed on the dead letter queue or discarded.
- A routing exit is defined that suppresses delivery of the message to the subscription

A subscription on the topic does not match the publication if any of the following conditions are met:

- The subscription has a selection string that does not match the publication
- The subscription specified the MQSO\_PUBLICATION\_ON\_REQUEST option
- The publication is not delivered because the MQPMO\_NOT\_OWN\_SUBS option was specified on the put operation and the subscription matches the identity of the publisher

**Syncpoint options.** The following options relate to the participation of the MQPUT or MQPUT1 call within a unit of work:

#### **MQPMO\_SYNCPOINT**

The request is to operate within the normal unit-of-work protocols. The message is not visible outside the unit of work until the unit of work is committed. If the unit of work is backed out, the message is deleted.

If MQPMO\_SYNCPOINT and MQPMO\_NO\_SYNCPOINT are not specified, the inclusion of the put request in unit-of-work protocols is determined by the environment running the queue manager and not the environment running the application. On z/OS, the put request is within a unit of work. In all other environments, the put request is not within a unit of work.

Because of these differences, an application that you want to port must not allow this option to default; specify either MQPMO\_SYNCPOINT or MQPMO\_NO\_SYNCPOINT explicitly.

Do not specify MQPMO\_SYNCPOINT with MQPMO\_NO\_SYNCPOINT.

#### **MQPMO\_NO\_SYNCPOINT**

The request is to operate outside the normal unit-of-work protocols. The message is available immediately, and it cannot be deleted by backing out a unit of work.

If MQPMO\_NO\_SYNCPOINT and MQPMO\_SYNCPOINT are not specified, the inclusion of the put request in unit-of-work protocols is determined by the environment running the queue manager and not the environment running the application. On z/OS, the put request is within a unit of work. In all other environments, the put request is not within a unit of work.

Because of these differences, an application that you want to port must not allow this option to default; specify either MQPMO\_SYNCPOINT or MQPMO\_NO\_SYNCPOINT explicitly.

Do not specify MQPMO\_NO\_SYNCPOINT with MQPMO\_SYNCPOINT.

**Message-identifier and correlation-identifier options.** The following options request the queue manager to generate a new message identifier or correlation identifier:

#### **MQPMO\_NEW\_MSG\_ID**

The queue manager replaces the contents of the *MsgId* field in MQMD with a new message identifier. This message identifier is sent with the message, and returned to the application on output from the MQPUT or MQPUT1 call.

The MQPMO\_NEW\_MSG\_ID option can also be specified when the message is being put to a distribution list; see the description of the *MsgId* field in the MQPMR structure for details.

Using this option relieves the application of the need to reset the *MsgId* field to MQMI\_NONE before each MQPUT or MQPUT1 call.

### MQPMO\_NEW\_CORREL\_ID

The queue manager replaces the contents of the *CorrelId* field in MQMD with a new correlation identifier. This correlation identifier is sent with the message, and returned to the application on output from the MQPUT or MQPUT1 call.

The MQPMO\_NEW\_CORREL\_ID option can also be specified when the message is being put to a distribution list; see the description of the *CorrelId* field in the MQPMR structure for details.

MQPMO\_NEW\_CORREL\_ID is useful in situations where the application requires a unique correlation identifier.

**Group and segment options.** The following options relate to the processing of messages in groups and segments of logical messages. Read the definitions that follow to help you to understand the option.

#### Physical message

This is the smallest unit of information that can be placed on or removed from a queue; it often corresponds to the information specified or retrieved on a single MQPUT, MQPUT1, or MQGET call. Every physical message has its own message descriptor (MQMD). Generally, physical messages are distinguished by differing values for the message identifier (*MsgId* field in MQMD), although this is not enforced by the queue manager.

#### Logical message

A logical message is a single unit of application information for non- z/OS platforms only. In the absence of system constraints, a logical message is the same as a physical message. But where logical messages are extremely large, system constraints might make it advisable or necessary to split a logical message into two or more physical messages, called *segments*.

A logical message that has been segmented consists of two or more physical messages that have the same non-null group identifier (*GroupId* field in MQMD), and the same message sequence number (*MsgSeqNumber* field in MQMD). The segments are distinguished by differing values for the segment offset (*Offset* field in MQMD), which gives the offset of the data in the physical message from the start of the data in the logical message. Because each segment is a physical message, the segments in a logical message usually have differing message identifiers.

A logical message that has not been segmented, but for which segmentation has been permitted by the sending application, also has a non-null group identifier, although in this case there is only one physical message with that group identifier if the logical message does not belong to a message group. Logical messages for which segmentation has been inhibited by the sending application have a null group identifier (MQGI\_NONE), unless the logical message belongs to a message group.

#### Message group

A message group is a set of one or more logical messages that have the same non-null group identifier. The logical messages in the group are distinguished by differing values for the message sequence number, which is an integer in the range 1 through *n*, where *n* is the number of logical messages in the group. If one or more of the logical messages is segmented, there are more than *n* physical messages in the group.

### MQPMO\_LOGICAL\_ORDER

This option tells the queue manager how the application puts messages in groups and segments of logical messages. It can be specified only on the MQPUT call; it is not valid on the MQPUT1 call.

If MQPMO\_LOGICAL\_ORDER is specified, it indicates that the application uses successive MQPUT calls to:

1. Put the segments in each logical message in the order of increasing segment offset, starting from 0, with no gaps.
2. Put all the segments in one logical message before putting the segments in the next logical message.
3. Put the logical messages in each message group in the order of increasing message sequence number, starting from 1, with no gaps. IBM MQ increments the message sequence number automatically.
4. Put all the logical messages in one message group before putting logical messages in the next message group.

For detailed information about MQPMO\_LOGICAL\_ORDER, see Logical and physical ordering

**Context options.** The following options control the processing of message context:

#### **MQPMO\_NO\_CONTEXT**

Both identity and origin context are set to indicate no context. This means that the context fields in MQMD are set to:

- Blanks for character fields
- Nulls for byte fields
- Zeros for numeric fields

#### **MQPMO\_DEFAULT\_CONTEXT**

The message is to have default context information associated with it, for both identity and origin. The queue manager sets the context fields in the message descriptor as follows:

<b>Field in MQMD</b>	<b>Value used</b>
<i>UserIdentifier</i>	Determined from the environment if possible; set to blanks otherwise.
<i>AccountingToken</i>	Determined from the environment if possible; set to MQACT_NONE otherwise.
<i>ApplIdentityData</i>	Set to blanks.
<i>PutApplType</i>	Determined from the environment.
<i>PutApplName</i>	Determined from the environment if possible; set to blanks otherwise.
<i>PutDate</i>	Set to the date when message is put.
<i>PutTime</i>	Set to the time when message is put.
<i>ApplOriginData</i>	Set to blanks.

For more information about message context, see Message context.

These are the default values and actions if no context options are specified.

#### **MQPMO\_PASS\_IDENTITY\_CONTEXT**

The message is to have context information associated with it. Identity context is taken from the queue handle specified in the *Context* field. Origin context information is generated by the queue manager in the same way that it is for MQPMO\_DEFAULT\_CONTEXT (see the preceding table for values). For more information about message context, see Message context.

For the MQPUT call, the queue must have been opened with the MQOO\_PASS\_IDENTITY\_CONTEXT option (or an option that implies it). For the MQPUT1 call, the same authorization check is carried out as for the MQOPEN call with the MQOO\_PASS\_IDENTITY\_CONTEXT option.

#### **MQPMO\_PASS\_ALL\_CONTEXT**

The message is to have context information associated with it. Context is taken from the queue handle specified in the *Context* field. For more information about message context, see Controlling context information.

For the MQPUT call, the queue must have been opened with the MQOO\_PASS\_ALL\_CONTEXT option (or an option that implies it). For the MQPUT1 call, the same authorization check is carried out as for the MQOPEN call with the MQOO\_PASS\_ALL\_CONTEXT option.

### **MQPMO\_SET\_IDENTITY\_CONTEXT**

The message is to have context information associated with it. The application specifies the identity context in the MQMD structure. Origin context information is generated by the queue manager in the same way that it is for MQPMO\_DEFAULT\_CONTEXT (see the preceding table for values). For more information about message context, see Message context.

For the MQPUT call, the queue must have been opened with the MQOO\_SET\_IDENTITY\_CONTEXT option (or an option that implies it). For the MQPUT1 call, the same authorization check is carried out as for the MQOPEN call with the MQOO\_SET\_IDENTITY\_CONTEXT option.

### **MQPMO\_SET\_ALL\_CONTEXT**

The message is to have context information associated with it. The application specifies the identity, origin, and user context in the MQMD structure. For more information about message context, see Message context.

For the MQPUT call, the queue must have been opened with the MQOO\_SET\_ALL\_CONTEXT option. For the MQPUT1 call, the same authorization check is carried out as for the MQOPEN call with the MQOO\_SET\_ALL\_CONTEXT option.

You can specify only one of the MQPMO\_\*\_CONTEXT context options. If you specify none, MQPMO\_DEFAULT\_CONTEXT is assumed.

**Property options.** The following option relates to the properties of the message:

### **MQPMO\_MD\_FOR\_OUTPUT\_ONLY**

The message descriptor parameter must only be used for output to return the message descriptor of the message that was put. The message descriptor fields associated with the *NewMsgHandle*, *OriginalMsgHandle*, or both fields, of the **MQPMO** structure must be used for input.

If a valid message handle is not provided then the call fails with reason code **MQRC\_MD\_ERROR**.

**Put response options.** The following options control the response returned to an MQPUT or MQPUT1 call. You can specify only one of these options. If MQPMO\_ASYNC\_RESPONSE and MQPMO\_SYNC\_RESPONSE are not specified, MQPMO\_RESPONSE\_AS\_Q\_DEF or MQPMO\_RESPONSE\_AS\_TOPIC\_DEF is assumed.

### **MQPMO\_ASYNC\_RESPONSE**

The MQPMO\_ASYNC\_RESPONSE option requests that an MQPUT or MQPUT1 operation is completed without the application waiting for the queue manager to complete the call. Using this option can improve messaging performance, particularly for applications using client bindings. An application can periodically check, using the MQSTAT verb, whether an error has occurred during any previous asynchronous calls.

With this option, only the following fields are guaranteed to be completed in the MQMD;

- ApplIdentityData
- PutApplType
- PutApplName
- ApplOriginData

Additionally, if either or both of MQPMO\_NEW\_MSG\_ID or MQPMO\_NEW\_CORREL\_ID are specified as options, the MsgId and CorrelId returned are also completed. (MQPMO\_NEW\_MSG\_ID can be implicitly specified by specifying a blank MsgId field).

Only the preceding specified fields are completed. Other information that would normally be returned in the MQMD or MQPMO structure is undefined.

When requesting asynchronous put response for MQPUT1, the ResolvedQName and ResolvedQMgrName returned in the MQOD structure are undefined.

When requesting asynchronous put response for MQPUT or MQPUT1, a CompCode and Reason of MQCC\_OK and MQRC\_NONE does not necessarily mean that the message was successfully put to a queue. When developing an MQI application that uses asynchronous put response and requires confirmation that messages have been put to a queue you must check both CompCode and Reason codes from the put operations and also use MQSTAT to query asynchronous error information.

Although the success or failure of each individual MQPUT or MQPUT1 call might not be returned immediately, the first error that occurred under an asynchronous call can be determined later through a call to MQSTAT.

If a persistent message under syncpoint fails to be delivered using asynchronous put response, and you attempt to commit the transaction, the commit fails and the transaction is backed out with a completion code of MQCC\_FAILED and a reason of MQRC\_BACKED\_OUT. The application can make a call to MQSTAT to determine the cause of a previous MQPUT or MQPUT1 failure.

### **MQPMO\_SYNC\_RESPONSE**

Specifying this put response type ensures that the MQPUT or MQPUT1 operation is always issued synchronously. If the put operation is successful, all fields in the MQMD and MQPMO are completed.

This option ensures a synchronous response irrespective of the default put response value defined on the queue or topic object.

### **MQPMO\_RESPONSE\_AS\_Q\_DEF**

If this value is specified for an MQPUT call, the put response type used is taken from the DEFPRESP value specified on the queue when it was first opened by the application. If a client application is connected to a queue manager at a level earlier than Version 7.0, it behaves as if MQPMO\_SYNC\_RESPONSE was specified.

If this option is specified for an MQPUT1 call, the value of the DEFPRESP attribute is not known before the request is sent to the server. By default, if the MQPUT1 call is using MQPMO\_SYNCPOINT it behaves as for MQPMO\_ASYNC\_RESPONSE, and if it is using MQPMO\_NO\_SYNCPOINT it behaves as for MQPMO\_SYNC\_RESPONSE. However, you can override this default behavior by setting the Put1DefaultAlwaysSync property in the client configuration file, see CHANNELS stanza of the client configuration file.

### **MQPMO\_RESPONSE\_AS\_TOPIC\_DEF**

MQPMO\_RESPONSE\_AS\_TOPIC\_DEF is a synonym for MQPMO\_RESPONSE\_AS\_Q\_DEF for use with topic objects.

**Other options.** The following options control authorization checking, what happens when the queue manager is quiescing, and resolving queue and queue manager names:

### **MQPMO\_ALTERNATE\_USER\_AUTHORITY**

MQPMO\_ALTERNATE\_USER\_AUTHORITY indicates that the *AlternateUserId* field in the *ObjDesc* parameter of the MQPUT1 call contains a user identifier that is to be used to validate authority to put messages on the queue. The call can succeed only if *AlternateUserId* is authorized to open the queue with the specified options, regardless of whether the user identifier under which the application is running is authorized to do so. (This does not apply to the context options specified, however, which are always checked against the user identifier under which the application is running.)

This option is valid only with the MQPUT1 call.

### **MQPMO\_FAIL\_IF QUIESCING**

This option forces the MQPUT or MQPUT1 call to fail if the queue manager is in the quiescing state.

On z/OS, this option also forces the MQPUT or MQPUT1 call to fail if the connection (for a CICS or IMS application) is in the quiescing state.

The call returns completion code MQCC\_FAILED with reason code MQRC\_Q\_MGR QUIESCING or MQRC\_CONNECTION QUIESCING.

### **MQPMO\_RESOLVE\_LOCAL\_Q**

Use this option to fill *ResolvedQName* in the MQPMO structure with the name of the local queue to which the message is put, and *ResolvedQMgrName* with the name of the local queue manager that hosts the local queue. For more information about MQPMO\_RESOLVE\_LOCAL\_Q, see topic MQOO\_RESOLVE\_LOCAL\_Q.

If you are authorized to put to a queue, you have the required authority to specify this flag on the MQPUT call; no special authority is needed.

**Default option.** If you need none of the options described, use the following option:

### **MQPMO\_NONE**

Use this value to indicate that no other options have been specified; all options assume their default values. MQPMO\_NONE is defined to aid program documentation; it is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

MQPMO\_NONE is an input field. The initial value of the *Options* field is MQPMO\_NONE.

#### *OriginalMsgHandle (MQHMSG):*

This is an optional handle to a message. It might have been previously retrieved from a queue. The use of this handle is subject to the value of the *Action* field; see also *NewMsgHandle*.

The contents of the original message handle will not be altered by the **MQPUT** or **MQPUT1** call.

This is an input field. The initial value of this field is **MQHM\_NONE**. This field is ignored if *Version* is less than **MQPMO\_VERSION\_3**.

#### *PubLevel (MQLONG):*

The initial value of this field is 9. The level of subscription targeted by this publication. Only those subscriptions with the highest *SubLevel* less than or equal to this value receive this publication. This value must be in the range zero to 9; zero is the lowest level. However, if a publication has been retained, it is no longer available to subscribers at higher levels because it is republished at *PubLevel* 1.

For information, see *Intercepting publications*.

#### *PutMsgRecFields (MQLONG):*

This field contains flags that indicate which MQPMR fields are present in the put message records provided by the application. Use *PutMsgRecFields* only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero, or both *PutMsgRecOffset* and *PutMsgRecPtr* are zero.

For fields that are present, the queue manager uses for each destination the values from the fields in the corresponding put message record. For fields that are absent, the queue manager uses the values from the MQMD structure.

Use one or more of the following flags to indicate which fields are present in the put message records:

### **MQPMRF\_MSG\_ID**

Message-identifier field is present.

**MQPMRF\_CORREL\_ID**

Correlation-identifier field is present.

**MQPMRF\_GROUP\_ID**

Group-identifier field is present.

**MQPMRF\_FEEDBACK**

Feedback field is present.

**MQPMRF\_ACCOUNTING\_TOKEN**

Accounting-token field is present.

If you specify this flag, specify either `MQPMO_SET_IDENTITY_CONTEXT` or `MQPMO_SET_ALL_CONTEXT` in the *Options* field; if this condition is not satisfied, the call fails with reason code `MQRC_PMO_RECORD_FLAGS_ERROR`.

If no MQPMR fields are present, the following can be specified:

**MQPMRF\_NONE**

No put-message record fields are present.

If this value is specified, either *RecsPresent* must be zero, or both *PutMsgRecOffset* and *PutMsgRecPtr* must be zero.

`MQPMRF_NONE` is defined to aid program documentation. It is not intended that this constant be used with any other, but as its value is zero, such use cannot be detected.

If *PutMsgRecFields* contains flags that are not valid, or put message records are provided but *PutMsgRecFields* has the value `MQPMRF_NONE`, the call fails with reason code `MQRC_PMO_RECORD_FLAGS_ERROR`.

This is an input field. The initial value of this field is `MQPMRF_NONE`. This field is ignored if *Version* is less than `MQPMO_VERSION_2`.

*PutMsgRecOffset* (MQLONG):

This is the offset in bytes of the first MQPMR put message record from the start of the MQPMO structure. The offset can be positive or negative. *PutMsgRecOffset* is used only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero.

When the message is being put to a distribution list, an array of one or more MQPMR put message records can be provided in order to specify certain properties of the message for each destination individually; these properties are:

- Message identifier
- Correlation identifier
- Group identifier
- Feedback value
- Accounting token

You do not need to specify all these properties, but whatever subset you choose, specify the fields in the correct order. See the description of the MQPMR structure for further details.

Usually, there must be as many put message records as there are object records specified by MQOD when the distribution list is opened; each put message record supplies the message properties for the queue identified by the corresponding object record. Queues in the distribution list that fail to open must still have put message records allocated for them at the appropriate positions in the array, although the message properties are ignored in this case.

The number of put message records can differ from the number of object records. If there are fewer put message records than object records, the message properties for the destinations that do not have put message records are taken from the corresponding fields in the message descriptor MQMD. If there are more put message records than object records, the excess are not used (although it must still be possible to access them). Put message records are optional, but if they are supplied there must be *RecsPresent* of them.

Provide the put message records in a similar way to the object records in MQOD, either by specifying an offset in *PutMsgRecOffset*, or by specifying an address in *PutMsgRecPtr*; for details of how to do this, see the *ObjectRecOffset* field described in "MQOD - Object descriptor" on page 2245.

No more than one of *PutMsgRecOffset* and *PutMsgRecPtr* can be used; the call fails with reason code MQRC\_PUT\_MSG\_RECORDS\_ERROR if both are nonzero.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQPMO\_VERSION\_2.

*PutMsgRecPtr* (MQPTR):

This is the address of the first MQPMR put message record. Use *PutMsgRecPtr* only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero.

You can use either *PutMsgRecPtr* or *PutMsgRecOffset* can be used to specify the put message records, but not both; for details, see "PutMsgRecOffset (MQLONG)" on page 2283. If you do not use *PutMsgRecPtr*, set it to the null pointer or null bytes.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQPMO\_VERSION\_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*RecsPresent* (MQLONG):

This is the number of MQPMR put message records or MQRR response records that have been provided by the application. This number can be greater than zero only if the message is being put to a distribution list. Put message records and response records are optional; the application need not provide any records, or it can choose to provide records of only one type. However, if the application provides records of both types, it must provide *RecsPresent* records of each type.

The value of *RecsPresent* need not be the same as the number of destinations in the distribution list. If too many records are provided, the excess are not used; if too few records are provided, default values are used for the message properties for those destinations that do not have put message records (see *PutMsgRecOffset*).

If *RecsPresent* is less than zero, or is greater than zero but the message is not being put to a distribution list, the call fails with reason code MQRC\_RECS\_PRESENT\_ERROR.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQPMO\_VERSION\_2.

*ResolvedQMgrName* (MQCHAR48):

This is the name of the destination queue manager after name resolution has been performed by the local queue manager. The name returned is the name of the queue manager that owns the queue identified by *ResolvedQName*, and can be the name of the local queue manager.

If *ResolvedQName* is a shared queue that is owned by the queue-sharing group to which the local queue manager belongs, *ResolvedQMgrName* is the name of the queue-sharing group. If the queue is owned by some other queue-sharing group, *ResolvedQName* can be the name of the queue-sharing group or the name of a queue manager that is a member of the queue-sharing group (the nature of the value returned is determined by the queue definitions that exist at the local queue manager).

A nonblank value is returned only if the object is a single queue; if the object is a distribution list or a topic, the value returned is undefined.

This is an output field. The length of this field is given by MQ\_Q\_MGR\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ResolvedQName* (MQCHAR48):

This is the name of the destination queue after name resolution has been performed by the local queue manager. The name returned is the name of a queue that exists on the queue manager identified by *ResolvedQMgrName*.

A nonblank value is returned only if the object is a single queue; if the object is a distribution list or a topic, the value returned is undefined.

This is an output field. The length of this field is given by MQ\_Q\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*ResponseRecOffset* (MQLONG):

This is the offset in bytes of the first MQRR response record from the start of the MQPMO structure. The offset can be positive or negative. *ResponseRecOffset* is used only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero.

When putting the message to a distribution list, you can provide an array of one or more MQRR response records to identify the queues to which the message was not sent successfully (*CompCode* field in MQRR), and the reason for each failure (*Reason* field in MQRR). The message might not have been sent either because the queue failed to open, or because the put operation failed. The queue manager sets the response records only when the outcome of the call is mixed (that is, some messages were sent successfully while others failed, or all failed but for differing reasons); reason code MQRC\_MULTIPLE\_REASONS from the call indicates this case. If the same reason code applies to all queues, that reason is returned in the *Reason* parameter of the MQPUT or MQPUT1 call, and the response records are not set.

Usually, there are as many response records as there are object records specified by MQOD when the distribution list is opened; when necessary, each response record is set to the completion code and reason code for the put to the queue identified by the corresponding object record. Queues in the distribution list that fail to open must still have response records allocated for them at the appropriate positions in the array, although they are set to the completion code and reason code resulting from the open operation, rather than the put operation.

The number of response records can differ from the number of object records. If there are fewer response records than object records, the application might not be able to identify all the destinations for which the put operation failed, or the reasons for the failures. If there are more response records than object records,

the excess are not used (although it must still be possible to access them). Response records are optional, but if they are supplied there must be *RecsPresent* of them.

Provide the response records in a similar way to the object records in MQOD, either by specifying an offset in *ResponseRecOffset*, or by specifying an address in *ResponseRecPtr*; for details of how to do this, see the *ObjectRecOffset* field described in “MQOD - Object descriptor” on page 2245. However, use no more than one of *ResponseRecOffset* and *ResponseRecPtr*; the call fails with reason code MQRC\_RESPONSE\_RECORDS\_ERROR if both are nonzero.

For the MQPUT1 call, this field must be zero. This is because the response information (if requested) is returned in the response records specified by the object descriptor MQOD.

This is an input field. The initial value of this field is 0. This field is ignored if *Version* is less than MQPMO\_VERSION\_2.

*ResponseRecPtr* (MQPTR):

This is the address of the first MQRR response record. *ResponseRecPtr* is used only when the message is being put to a distribution list. The field is ignored if *RecsPresent* is zero.

Use either *ResponseRecPtr* or *ResponseRecOffset* to specify the response records, but not both; for details, see “ResponseRecOffset (MQLONG)” on page 2285. If you do not use *ResponseRecPtr* set it to the null pointer or null bytes.

For the MQPUT1 call, this field must be the null pointer or null bytes. This is because the response information (if requested) is returned in the response records specified by the object descriptor MQOD.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise. This field is ignored if *Version* is less than MQPMO\_VERSION\_2.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length, with the initial value being the all-null byte string.

*StrucId* (MQCHAR4):

This is the structure identifier; the value must be:

#### **MQPMO\_STRUC\_ID**

Identifier for put-message options structure.

For the C programming language, the constant MQPMO\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQPMO\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQPMO\_STRUC\_ID.

*Timeout (MQLONG):*

This is a reserved field; its value is not significant. The initial value of this field is -1.

*UnknownDestCount (MQLONG):*

This is the number of messages that the current MQPUT or MQPUT1 call has sent successfully to queues in the distribution list that resolve to remote queues. Messages that the queue manager retains temporarily in distribution-list form count as the number of individual destinations that those distribution lists contain. This field is also set when putting a message to a single queue that is not in a distribution list.

This is an output field. The initial value of this field is 0. This field is not set if *Version* is less than MQPMO\_VERSION\_1.

This field is undefined on z/OS because distribution lists are not supported.

*Version (MQLONG):*

Structure version number.

The value must be one of the following:

**MQPMO\_VERSION\_1**

Version-1 put-message options structure.

This version is supported in all environments.

**MQPMO\_VERSION\_2**

Version-2 put-message options structure.

This version is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

**MQPMO\_VERSION\_3**

Version-3 put-message options structure.

This version is supported in all environments.

Fields that exist only in the more-recent version of the structure are identified as such in the descriptions of the fields. The following constant specifies the version number of the current version:

**MQPMO\_CURRENT\_VERSION**

Current version of put-message options structure.

This is always an input field. The initial value of this field is MQPMO\_VERSION\_1.

Initial values and language declarations for MQPMO:

Table 210. Initial values of fields in MQPMO

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQPMO_STRUC_ID	'PMO~'
<i>Version</i>	MQPMO_VERSION_1	1
<i>Options</i>	MQPMO_NONE	0
<i>Timeout</i>	None	-1
<i>Context</i>	None	0
<i>KnownDestCount</i>	None	0
<i>UnknownDestCount</i>	None	0
<i>InvalidDestCount</i>	None	0
<i>ResolvedQName</i>	None	Null string or blanks
<i>ResolvedQMgrName</i>	None	Null string or blanks
<i>RecsPresent</i>	None	0
<i>PutMsgRecFields</i>	MQPMRF_NONE	0
<i>PutMsgRecOffset</i>	None	0
<i>ResponseRecOffset</i>	None	0
<i>PutMsgRecPtr</i>	None	Null pointer or null bytes
<i>ResponseRecPtr</i>	None	Null pointer or null bytes
<i>OriginalMsgHandle</i>	MQHM_NONE	0
<i>NewMsgHandle</i>	MQHM_NONE	0
<i>Action</i>	MQACTP_NEW	0
<i>PubLevel</i>	None	9

**Notes:**

1. The symbol ~ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQPMO\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQPMO MyPMO = {MQPMO_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQPMO MQPMO;
struct tagMQPMO {
    MQCHAR4  StrucId;           /* Structure identifier */
    MQLONG   Version;          /* Structure version number */
    MQLONG   Options;          /* Options that control the action of
                               MQPUT and MQPUT1 */

    MQLONG   Timeout;          /* Reserved */
    MQHOBJS Context;           /* Object handle of input queue */
    MQLONG   KnownDestCount;   /* Number of messages sent
                               successfully to local queues */
    MQLONG   UnknownDestCount; /* Number of messages sent
                               successfully to remote queues */
    MQLONG   InvalidDestCount; /* Number of messages that could not
                               be sent */
    MQCHAR48 ResolvedQName;    /* Resolved name of destination
                               queue */
    MQCHAR48 ResolvedQMgrName; /* Resolved name of destination queue
                               manager */

    /* Ver:1 */
    MQLONG   RecsPresent;      /* Number of put message records or
                               response records present */
    MQLONG   PutMsgRecFields;  /* Flags indicating which MQPMR fields
                               are present */

## MQPMR - Put-message record:

The following table summarizes the fields in the structure.

Table 211. Fields in MQPMR

Field	Description	Topic
<i>MsgId</i>	Message identifier	MsgId
<i>CorrelId</i>	Correlation identifier	CorrelId
<i>GroupId</i>	Group identifier	GroupId
<i>Feedback</i>	Feedback or reason code	Feedback
<i>AccountingToken</i>	Accounting token	AccountingToken

Overview for MQPMR:

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

**Purpose:** Use the MQPMR structure to specify various message properties for a single destination when putting a message to a distribution list. MQPMR is an input/output structure for the MQPUT and MQPUT1 calls.

**Character set and encoding:** Data in MQPMR must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ client, the structure must be in the character set and encoding of the client.

**Usage:** By providing an array of these structures on the MQPUT or MQPUT1 call, you can specify different values for each destination queue in a distribution list. Some of the fields are input only, others are input/output.

**Note:** This structure is unusual in that it does not have a fixed layout. The fields in this structure are optional, and the presence or absence of each field is indicated by the flags in the *PutMsgRecFields* field in MQPMO. Fields that are present *must occur in the following order* :

- *MsgId*
- *CorrelId*
- *GroupId*
- *Feedback*
- *AccountingToken*

Fields that are absent occupy no space in the record.

Because MQPMR does not have a fixed layout, no definition of it is provided in the header, COPY, and INCLUDE files for the supported programming languages. The application programmer must create a declaration containing the fields that are required by the application, and set the flags in *PutMsgRecFields* to indicate the fields that are present.

*Fields for MQPMR:*

The MQPMR structure contains the following fields; the fields are described in **alphabetical order**:

*AccountingToken (MQBYTE32):*

This is the accounting token to be used for the message sent to the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *AccountingToken* field in MQMD for a put to a single queue. See the description of *AccountingToken* in “MQMD - Message descriptor” on page 2179 for information about the content of this field.

If this field is not present, the value in MQMD is used.

This is an input field.

*CorrelId (MQBYTE24):*

This is the correlation identifier to be used for the message sent to the queue with a name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *CorrelId* field in MQMD for a put to a single queue.

If this field is not present in the MQPMR record, or there are fewer MQPMR records than destinations, the value in MQMD is used for those destinations that do not have an MQPMR record containing a *CorrelId* field.

If MQPMO\_NEW\_CORREL\_ID is specified, a *single* new correlation identifier is generated and used for all the destinations in the distribution list, regardless of whether they have MQPMR records. This is different from the way that MQPMO\_NEW\_MSG\_ID is processed (see *MsgId* field).

This is an input/output field.

*Feedback (MQLONG):*

This is the feedback code to be used for the message sent to the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *Feedback* field in MQMD for a put to a single queue.

If this field is not present, the value in MQMD is used.

This is an input field.

*GroupId (MQBYTE24):*

GroupId is the group identifier to be used for the message sent to the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *GroupId* field in MQMD for a put to a single queue.

If this field is not present in the MQPMR record, or there are fewer MQPMR records than destinations, the value in MQMD is used for those destinations that do not have an MQPMR record containing a *GroupId* field. The value is processed as documented in Physical order on a queue, but with the following differences:

- GroupId is created from the QMName and a timestamp. Therefore to keep a GroupId unique keep queue manager names unique too. Also do not set the clocks back on the queue managers machine.
- In those cases where a new group identifier would be used, the queue manager generates a different group identifier for each destination (that is, no two destinations have the same group identifier).
- In those cases where the value in the field would be used, the call fails with reason code MQRC\_GROUP\_ID\_ERROR

This is an input/output field.

*MsgId (MQBYTE24):*

This is the message identifier to be used for the message sent to the queue with a name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call. It is processed in the same way as the *MsgId* field in MQMD for a put to a single queue.

If this field is not present in the MQPMR record, or there are fewer MQPMR records than destinations, the value in MQMD is used for those destinations that do not have an MQPMR record containing a *MsgId* field. If that value is MQMI\_NONE, a new message identifier is generated for *each* of those destinations (that is, no two of those destinations have the same message identifier).

If MQPMO\_NEW\_MSG\_ID is specified, new message identifiers are generated for all the destinations in the distribution list, regardless of whether they have MQPMR records. This is different from the way that MQPMO\_NEW\_CORREL\_ID is processed (see *CorrelId* field).

This is an input/output field.

*Initial values and language declarations for MQPMR:*

There are no initial values defined for this structure, as no structure declarations are provided in the header, COPY, and INCLUDE files for the supported programming languages. The sample declarations show how to declare the structure if all the fields are required.

*C declaration:*

```
typedef struct tagMQPMR MQPMR;
struct tagMQPMR {
    MQBYTE24  MsgId;           /* Message identifier */
    MQBYTE24  CorrelId;       /* Correlation identifier */
    MQBYTE24  GroupId;       /* Group identifier */
    MQLONG    Feedback;      /* Feedback or reason code */
    MQBYTE32  AccountingToken; /* Accounting token */
};
```

*COBOL declaration:*

```
** MQPMR structure
10 MQPMR.
** Message identifier
15 MQPMR-MSGID PIC X(24).
** Correlation identifier
15 MQPMR-CORRELID PIC X(24).
** Group identifier
15 MQPMR-GROUPID PIC X(24).
** Feedback or reason code
15 MQPMR-FEEDBACK PIC S9(9) BINARY.
** Accounting token
15 MQPMR-ACCOUNTINGTOKEN PIC X(32).
```

*PL/I declaration:*

```
dc1
1 MQPMR based,
3 MsgId char(24), /* Message identifier */
3 CorrelId char(24), /* Correlation identifier */
3 GroupId char(24), /* Group identifier */
3 Feedback fixed bin(31), /* Feedback or reason code */
3 AccountingToken char(32); /* Accounting token */
```

*Visual Basic declaration:*

```
Type MQPMR
MsgId As MQBYTE24 'Message identifier'
CorrelId As MQBYTE24 'Correlation identifier'
GroupId As MQBYTE24 'Group identifier'
Feedback As Long 'Feedback or reason code'
AccountingToken As MQBYTE32 'Accounting token'
End Type
```

**MQRFH - Rules and formatting header:**

This section describes the rules and formatting header, what fields it contains, and initial values of those fields.

*Overview for MQRFH:*

**Availability:** All IBM MQ systems, plus IBM MQ MQI clients connected to these systems.

**Purpose:** The MQRFH structure defines the layout of the rules and formatting header. Use this header to send string data in the form of name/value pairs.

**Format name:** MQFMT\_RF\_HEADER.

**Character set and encoding:** The fields in the MQRFH structure (including *NameValueString*) are in the character set and encoding given by the *CodedCharSetId* and *Encoding* fields in the header structure that precedes the MQRFH, or by those fields in the MQMD structure if the MQRFH is at the start of the application message data.

The character set must be one that has single-byte characters for the characters that are valid in queue names.

*Fields for MQRFH:*

The MQRFH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId* (MQLONG):

This specifies the character set identifier of the data that follows *NameValueString* ; it does not apply to character data in the MQRFH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The following special value can be used:

**MQCCSI\_INHERIT**

Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI\_INHERIT is not returned by the MQGET call.

MQCCSI\_INHERIT cannot be used if the value of the *PutApplType* field in MQMD is MQAT\_BROKER.

The initial value of this field is MQCCSI\_UNDEFINED.

*Encoding* (MQLONG):

This specifies the numeric encoding of the data that follows *NameValueString* ; it does not apply to numeric data in the MQRFH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is MQENC\_NATIVE.

*Flags (MQLONG):*

The following can be specified:

**MQRFH\_NONE**

No flags.

The initial value of this field is MQRFH\_NONE.

*Format (MQCHAR8):*

This specifies the format name of the data that follows *NameValueString*.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The initial value of this field is MQFMT\_NONE.

*NameValueString (MQCHARn):*

This is a variable-length character string containing name/value pairs in the form:

```
name1 value1 name2 value2 name3 value3 ...
```

Each name or value must be separated from the adjacent name or value by one or more blank characters; these blanks are not significant. A name or value can contain significant blanks by prefixing and suffixing the name or value with double quotation marks; all characters between the open double quotation mark and the matching closing double quotation mark are treated as significant. In the following example, the name is FAMOUS\_WORDS, and the value is Hello World:

```
FAMOUS_WORDS "Hello World"
```

A name or value can contain any characters other than the null character (which acts as a delimiter for *NameValueString*). However, to assist interoperability an application can restrict names to the following characters:

- First character: upper or lowercase alphabetic (A through Z, or a through z), or underscore.
- Subsequent characters: upper or lowercase alphabetic, decimal digit (0 through 9), underscore, hyphen, or dot.

If a name or value contains one or more double quotation marks, the name or value must be enclosed in double quotation marks, and each double quotation mark within the string must be doubled:

```
Famous_Words "The program displayed ""Hello World"""
```

Names and values are case sensitive, that is, lowercase letters are not considered to be the same as uppercase letters. For example, FAMOUS\_WORDS and Famous\_Words are two different names.

The length in bytes of *NameValueString* is equal to *StrucLength* minus MQRFH\_STRUC\_LENGTH\_FIXED. To avoid problems converting the user data in some environments, make this length a multiple of four. Pad *NameValueString* with blanks to this length, or terminate it earlier by placing a null character following the last significant character in the string. The null character and the bytes following it, up to the specified length of *NameValueString*, are ignored.

**Note:** Because the length of this field is not fixed, the field is omitted from the declarations of the structure that are provided for the supported programming languages.

*StrucId* (MQCHAR4):

This is the structure identifier; the value must be:

**MQRFH\_STRUC\_ID**

Identifier for rules and formatting header structure.

For the C programming language, the constant MQRFH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQRFH\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQRFH\_STRUC\_ID.

*StrucLength* (MQLONG):

This is the length in bytes of the MQRFH structure, including the *NameValueString* field at the end of the structure. The length does *not* include any user data that follows the *NameValueString* field.

To avoid problems converting the user data in some environments, *StrucLength* must be a multiple of four.

The following constant gives the length of the *fixed* part of the structure, that is, the length excluding the *NameValueString* field:

**MQRFH\_STRUC\_LENGTH\_FIXED**

Length of fixed part of MQRFH structure.

The initial value of this field is MQRFH\_STRUC\_LENGTH\_FIXED.

*Version* (MQLONG):

This is the structure version number; the value must be:

**MQRFH\_VERSION\_1**

Version-1 rules and formatting header structure.

The initial value of this field is MQRFH\_VERSION\_1.

*Initial values and language declarations for MQRFH:*

Table 212. Initial values of fields in MQRFH for MQRFH

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQRFH_STRUC_ID	'RFH~'
<i>Version</i>	MQRFH_VERSION_1	1
<i>StrucLength</i>	MQRFH_STRUC_LENGTH_FIXED	32
<i>Encoding</i>	MQENC_NATIVE	Depends on environment
<i>CodedCharSetId</i>	MQCCSI_UNDEFINED	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>Flags</i>	MQRFH_NONE	0
<b>Notes:</b> 1. The symbol ~ represents a single blank character. 2. In the C programming language, the macro variable MQRFH_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure: MQRFH MyRFH = {MQRFH_DEFAULT};		

*C declaration:*

```
typedef struct tagMQRFH MQRFH;
struct tagMQRFH {
    MQCHAR4  StrucId;          /* Structure identifier */
    MQLONG   Version;         /* Structure version number */
    MQLONG   StrucLength;     /* Total length of MQRFH including
                             NameValueString */
    MQLONG   Encoding;       /* Numeric encoding of data that follows
                             NameValueString */
    MQLONG   CodedCharSetId; /* Character set identifier of data that
                             follows NameValueString */
    MQCHAR8  Format;          /* Format name of data that follows
                             NameValueString */
    MQLONG   Flags;          /* Flags */
};
```

*COBOL declaration:*

```
** MQRFH structure
10 MQRFH.
** Structure identifier
15 MQRFH-STRUCID PIC X(4).
** Structure version number
15 MQRFH-VERSION PIC S9(9) BINARY.
** Total length of MQRFH including NAMEVALUESTRING

                'NameValueString'
  Encoding     As Long     'Numeric encoding of data that follows'
                'NameValueString'
  CodedCharSetId As Long   'Character set identifier of data that'
                'follows NameValueString'
  Format        As String*8 'Format name of data that follows'
                'NameValueString'
  Flags        As Long     'Flags'
End Type
```

## **MQRFH2 - Rules and formatting header 2:**

This section describes the rules and formatting header 2, what fields it contains, and initial values of those fields.

*Overview for MQRFH2:*

### **Availability**

All IBM MQ systems, plus IBM MQ MQI clients connected to these systems.

### **Purpose**

The MQRFH2 header is based on the MQRFH header, but it allows Unicode strings to be transported without translation, and it can carry numeric data types.

The MQRFH2 structure defines the format of the version-2 rules and formatting header. Use this header to send data that has been encoded using an XML-like syntax. A message can contain two or more MQRFH2 structures in series, with user data optionally following the last MQRFH2 structure in the series.

### **Format name**

MQFMT\_RF\_HEADER\_2

### **Syntax**

## IBM MQ Message

### MQRFH2 header:

### Standard part:

### Special part:

## Character set and encoding

Special rules apply to the character set and encoding used for the MQRFH2 structure:

- Fields other than *NameValueData* are in the character set and encoding given by the *CodedCharSetId* and *Encoding* fields in the header structure that precedes MQRFH2, or by those fields in the MQMD structure if the MQRFH2 is at the start of the application message data.

The character set must be one that has single-byte characters for the characters that are valid in queue names.

When MQGMO\_CONVERT is specified on the MQGET call, the queue manager converts the MQRFH2 fields, other than *NameValueData*, to the requested character set and encoding.

- NameValueData* is in the character set given by the *NameValueCCSID* field. Only the listed Unicode character sets are valid for *NameValueCCSID*; see the description of *NameValueCCSID* for details.

Some character sets have a representation that depends on the encoding. If *NameValueCCSID* is one of these character sets, *NameValueData* must be in the same encoding as the other fields in the MQRFH2.

When MQGMO\_CONVERT is specified on the MQGET call, the queue manager converts *NameValueData* to the requested encoding, but does not change its character set.

*Fields for MQRFH2:*

The MQRFH2 structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG):*

This specifies the character set identifier of the data that follows the last *NameValueData* field; it does not apply to character data in the MQRFH2 structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The following special value can be used:

**MQCCSI\_INHERIT**

Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI\_INHERIT is not returned by the MQGET call.

MQCCSI\_INHERIT cannot be used if the value of the *PutApplType* field in MQMD is MQAT\_BROKER.

The initial value of this field is MQCCSI\_INHERIT.

*Encoding (MQLONG):*

This specifies the numeric encoding of the data that follows the last *NameValueData* field; it does not apply to numeric data in the MQRFH2 structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is MQENC\_NATIVE.

*Flags (MQLONG):*

The initial value of this field is MQRFH\_NONE. MQRFH\_NONE must be specified.

**MQRFH\_NONE**

No flags.

**MQRFH\_INTERNAL**

The MQRFH2 header contains internally set properties.

MQRFH\_INTERNAL is for queue manager use.

The top 16 bits, MQRFH\_FLAGS\_RESTRICTED\_MASK, are reserved for flags the queue manager sets. Flags that a user might set are defined in the bottom 16 bits.

*Format (MQCHAR8):*

This specifies the format name of the data that follows the last *NameValueData* field.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The initial value of this field is MQFMT\_NONE.

*NameValueCCSID (MQLONG):*

This specifies the coded character set identifier of the data in the *NameValueData* field. This is different from the character set of the other strings in the MQRFH2 structure, and can be different from the character set of the data (if any) that follows the last *NameValueData* field at the end of the structure.

*NameValueCCSID* must have one of the following values:

CCSID	Meaning
1200	UCS-2 open-ended
13488	UCS-2 2.0 subset
17584	UCS-2 2.1 subset (includes the Euro symbol)
1208	UTF-8

For the UCS-2 character sets, the encoding (byte order) of the *NameValueData* must be the same as the encoding of the other fields in the MQRFH2 structure. Surrogate characters (X'D800' through X'DFFF') are not supported.

**Note:** If *NameValueCCSID* does not have one of the values listed above, and the MQRFH2 structure requires conversion on the MQGET call, the call completes with reason code MQRC\_SOURCE\_CCSSID\_ERROR and the message is returned unconverted.

The initial value of this field is 1208.

*NameValueData (MQCHARn):*

*NameValueData* is a variable length field that contains a folder containing name/value pairs or message properties. A folder is a variable-length character string containing data encoded using an XML-like syntax. The length in bytes of the character string is given by the *NameValueLength* field that precedes the *NameValueData* field. The length must be a multiple of four.

The *NameValueLength* and *NameValueData* fields are optional, but if present they must occur as a pair and be adjacent. The pair of fields can be repeated as many times as required, for example:

length1 data1 length2 data2 length3 data3

*NameValueData* is *not* converted to the character set specified on the MQGET call. Even if the message is retrieved with the MQGMO\_CONVERT option in effect *NameValueData* remains in its original character set. However, *NameValueData* is converted to the encoding specified on the MQGET call.

**Note:**

- Because these fields are optional, they are omitted from the declarations of the structure that are provided for the various programming languages supported.
- The terms “defined” and “reserved” are used in the syntax diagram. “Defined” means that the name is used by IBM MQ. “Reserved” means that the name is reserved for future use by IBM MQ.

*NameValueData* syntax

**Folder name:**

**Defined folder name:**

**Defined property folder name:**

**Ungrouped property folder name:**

**Name:**

**Name/value pairs:**

**Group name:**

**Element name:**

**Element value:**

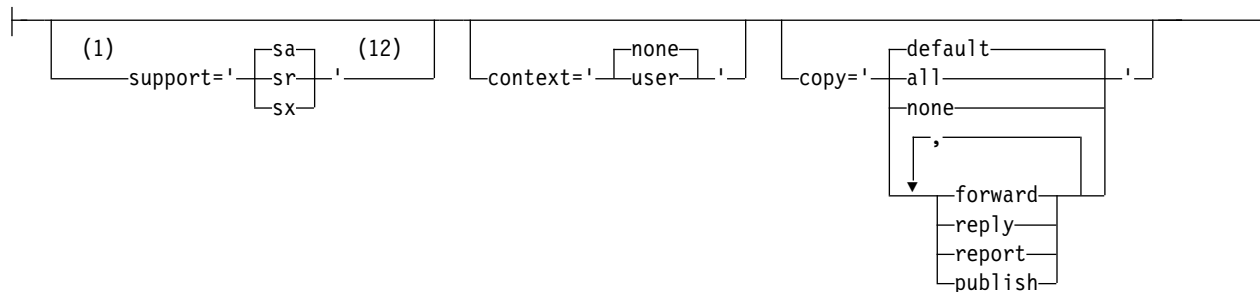

**Properties:**

## Property:

## Property attribute:

## Data types:

## Notes:

- 1 Double quotation marks or single quotation marks are valid.
- 2 Do not use an invalid property name; see "Invalid property name" on page 2317. Use a reserved property name only for its defined purpose; see "Defined property names" on page 2317.
- 3 Do not use an invalid or reserved folder name; see "Invalid path name" on page 2316 and "Reserved folder or property folder name" on page 2316. Use a defined folder name only for its defined purpose; see "Defined folder name" on page 2308.
- 4 The name must be in lowercase.
- 5 Only one **psc** and **pscr** folder is supported.
- 6 Only properties in the first MQRFH2 header are significant. WebSphere Application Server Service Integration Bus ignores sib, sib\_context, and sib\_usr folders in subsequent MQRFH2 headers.
- 7 Not more than one **usr** folder must be present in an MQRFH2. Properties in the **usr** folder must occur no more than once.
- 8 Only properties in the first **mq** folder are significant. If the folder is UTF-8, only single byte UTF-8 characters are supported. The only white space character is Unicode U+0020.

- 9 Valid characters are defined in the W3C XML specification, and consist essentially of Unicode categories Ll, Lu, Lo, Lt, Nl, Mc, Mn, Lm, and Nd ; see Unicode character categories.
- 10 All characters are significant. Leading and trailing blanks are part of the element value.
- 11 Do not use an invalid character; see “Invalid characters” on page 2317. Use an escape sequence, rather than these invalid characters.
- 12 The support property attribute is only valid on the **mq** folder

### Folder name

*NameValueData* contains a single folder. To create multiple folders, create multiple *NameValueData* fields. You can create multiple *NameValueData* fields in a single MQRFH2 header within a message. Alternatively you can create multiple chained MQRFH2 headers, each containing multiple *NameValueData* fields.

The order of MQRFH2 headers, and the order of *NameValueData* fields makes no difference to the logical contents of a folder. If the same folder is present more than once in a message the folder is parsed as a whole. If the same property occurs in multiple instances of the same folder, it is parsed as a list.

A correct parse of an MQRFH2 is not affected by the alternative ways a folder can be physically stored in a message.

Four folders do not follow this rule. Only the first instance of the **mq**, **sib**, **sib\_context**, and **sib\_usr** folder are parsed.

If the same property occurs more than once in the combined contents of the chained MQRFH2 headers, only the first instance of the property is parsed. If a property is set using an API call, such as MQSETMP, and added to an MQRFH2 directly by an application, the API call takes precedence.

A folder name is the name of a folder containing name/value pairs or groups. Groups and name/value pairs can be mixed at the same level in the folder tree; see Figure 51. Do not combine a group name and an element name; see Figure 52

---

```
<group1><nvp1>value</nvp1></group1><group2><nvp2>value</nvp2></group2>
<group3><nvp1> value </nvp1></group3><nvp3> value </nvp3>
```

---

Figure 51. Correct uses of groups and name/value pairs

---

```
<group1><nvp1>value</nvp1>value</group1>
```

---

Figure 52. Incorrect use of groups and name/value pairs

Do not use an invalid or reserved folder name; see “Invalid path name” on page 2316 and “Reserved folder or property folder name” on page 2316. Use a defined folder name only for its defined purpose; see “Defined folder name” on page 2308.

If you add the attribute 'content=properties' to the folder name tag, the folder becomes a property folder; see Figure 53 on page 2308.

---

```
<myFolder></myFolder>
<myPropertyFolder contents='properties'></myPropertyFolder>
```

---

*Figure 53. Example of a folder and a property folder*

Folder names are case-sensitive. Folder names and property folder names share the same namespace. They must have different names. Folder1 in Figure 54 must be a different name to Folder2 in Figure 55.

---

```
<Folder1><NVP1>value</NVP1></Folder1>
```

---

*Figure 54. Folder1 namespace*

```
<Folder2 content='properties'><Property1>value</Property1></Folder2>
```

---

*Figure 55. Folder2 namespace*

Groups, properties, and name/value pairs in different folders have different namespaces. Property1 in Figure 55 is a different property to Property1 in Figure 56.

---

```
<Folder3 content='properties'><Property1>value</Property1></Folder3>
```

---

*Figure 56. Folder3 namespace*

Property folders are different to non-property folders in two important respects:

1. Property folders contain properties, and non-property folders contain name/value pairs. The folders differ slightly, syntactically.
2. Use the defined interfaces, such as the properties MQI, or JMS message properties, to access message properties. The interfaces ensure the property folders in the MQRFH2 are well-formed. A well-formed property folder is interoperable between queue managers on different platforms and different releases.

The message property MQI is a robust way to read and write an MQRFH2, and avoids the difficulties of parsing an MQRFH2 correctly.

### Defined folder name

A defined folder name is the name of a folder that is reserved for use by IBM MQ, or another product. Do not create a folder of the same name, and do not add your own name/value pairs to the folders. The defined folders are **psc** and **pscr**.

**psc** and **pscr** are used by queued publish/subscribe.

A segmented message put with either MQMF\_SEGMENT or MQMF\_SEGMENTATION\_ALLOWED cannot contain an MQRFH2 with a defined folder name. The MQPUT fails with reason code 2443, MQRC\_SEGMENTATION\_NOT\_ALLOWED.

## Defined property folder name

A defined property folder name is the name of a property folder that is used by IBM MQ, or another product. For the names of the folders and their contents, see Property folders. Defined property folder names are a subset of all the folder names reserved by IBM MQ; see “Reserved folder or property folder name” on page 2316.

Any element stored in a defined property folder is a property. An element stored in a defined property folder must not have a content='properties' attribute.

You can add properties only to the defined property folders **usr** , **mq\_usr** , and **sib\_usr** . In other property folders, such as **mq** and **sib** , IBM MQ ignores or throws away properties it does not recognize.

The description of each defined property folder lists the properties that IBM MQ has defined that can be used by application programs. Some of the properties are accessed indirectly by setting or getting a JMS property, and some are accessed directly using the MQSETMP and MQINQMP MQI calls.

The defined property folders also contain other properties that IBM MQ has reserved, but which applications do not have access to. The names of the reserved properties are not listed. No reserved properties are present in the **usr** , **mq\_usr** , and **sib\_usr** property folders. But do not create properties with invalid property names; see “Invalid property name” on page 2317.

## Property folders

### jms

jms contains JMS header fields, and JMSX properties that cannot be fully expressed in the MQMD. The **jms** folder is always present in a JMS MQRFH2.

Table 213. *jms* property name, synonym, data type, and folder

Property synonym	Property name	Data type	Folder
JMSDestination	jms.Dst	string	<jms><Dst>destination</Dst></jms>
JMSExpiration	jms.Exp	i8	<jms><Exp>expiration</Exp></jms>
JMSCorrelation	jms.Cid	string	<jms><Cid>correlationId</Cid></jms>
JMSDelivery	jms.Dlv	i4	<jms><Dlv>delivery</Dlv></jms>
JMSPriority	jms.Pri	i4	<jms><Pri>priority</Pri></jms>
JMSReplyTo	jms.Rto	string	<jms><Rto>replyToURI</Rto></jms>
JMSTimeStamp	jms.Tms	i8	<jms><Tms>timestamp</Tms></jms>
JMSXGroupID	jms.Gid	string	<jms><Gid>groupId</Gid></jms>
JMSXGroupSeq	jms.Seq	i4	<jms><Seq>messageSequenceNo</Seq></jms>

Do not add your own properties in the **jms** folder.

### mcd

mcd contains properties that describe the format of the message. For example, the message service domain Msd property identifies a JMS message as being JMSTextMessage, JMSBytesMessage, JMSStreamMessage, JMSMapMessage, JMSObjectMessage, or null.

The **mcd** folder is always present in a JMS message containing an MQRFH2.

It is always present in a message containing an MQRFH2 sent from IBM Integration Bus. It describes the domain, format, type, and message set of a message.

Table 214. mcd property name, synonym, data type, and folder

Property synonym	Property name	Data type	Folder
	mcd.Msd	string	<mcd><Msd>messageDomain</Msd></mcd>
	mcd.Set	string	<mcd><Set>messageDomain</Set></mcd>
	mcd.Type	string	<mcd><Type>messageDomain</Type></mcd>
	mcd.Fmt	string	<mcd><Fmt>messageDomain</Fmt></mcd>

Do not add your own properties in the mcd folder.

#### mq\_usr

mq\_usr contains application-defined properties that are not exposed as JMS user-defined properties. Properties that do not meet JMS requirements can be placed in this folder.

You can create properties in the mq\_usr folder. Properties you create in the mq\_usr are like properties you create in new folders with the content='properties' attribute.

#### sib

sib contains WebSphere Application Server service integration bus (WAS/SIB) system message properties. sib properties are not exposed as JMS properties to IBM MQ JMS applications because they are not of the supported types. For example, some sib properties cannot be exposed as JMS properties because they are byte arrays. Some sib properties are exposed to WAS/SIB applications as JMS\_IBM\_\* properties; these include forward and reverse routing paths properties.

Do not add your own properties in the sib folder.

#### sib\_context

sib\_context contains WAS/SIB system message properties that are not exposed to WAS/SIB user applications or as JMS properties. sib\_context contains security and transactional properties that are used for web services.

Do not add your own properties in the sib\_context folder.

#### sib\_usr

sib\_usr contains WAS/SIB user message properties that are not exposed as JMS user properties because they are not of supported types. sib\_usr is exposed to WAS/SIB applications in the SIMessage interface. See Developing Service Integration.

The type of a sib\_usr property must be bin.hex, and the value must be in the correct format. If an IBM MQ application writes a bin.hex typed element to the folder in the wrong format, the application receives an IOException. If the data type of the property is not bin.hex the application receives a ClassCastException.

Do not attempt to make JMS user properties available to WAS/SIB by using this folder; instead use the usr folder.

You can create properties in the sib\_usr folder.

#### usr

usr contains application-defined JMS properties associated with the message. The usr folder is present only if an application has set an application-defined property.

usr is the default property folder. If a property is set without a folder name, it is placed in the usr folder.

Table 215. *usr* property name, synonym, data type, and folder.

The web services property values are described in MQRFH2 SOAP settings

Property synonym	Property name	Data type	Folder
	usr.contentType	string	<usr><contentType>text/xml; charset=utf-8</contentType></usr>
	usr.endPointURL	string	<usr><endPointURL>URI</endPointURL></usr>
	usr.targetService	string	<usr><targetService>serviceName</targetService></usr>
	usr.soapAction	string	<usr><soapAction>name</soapAction></usr>
	usr.transportVersion	string	<usr><transportVersion>version</transportVersion></usr>

You can create properties in the *usr* folder.

A segmented message put with either MQMF\_SEGMENT or MQMF\_SEGMENTATION\_ALLOWED cannot contain an MQRFH2 with a defined property folder name. The MQPUT fails with reason code 2443, MQRC\_SEGMENTATION\_NOT\_ALLOWED.

### Ungrouped property folder name

#### **ibm**

*ibm* contains properties that are used only by IBM MQ.

Table 216. *ibm* property name, synonym, data type, and folder

Property synonym	Property name	Data type	Folder
	ibm.rfp	string	<ibm><rfp>fingerprint</rfp></ibm>

Do not add your own properties in the *ibm* folder.

#### **mq**

*mq* contains properties that are used only by IBM MQ.

The following restrictions apply to properties in the *mq* folder:

- Only properties in the first significant *mq* folder in the message are acted upon by MQ; properties in any other *mq* folder in the message are ignored.
- Only single-byte UTF-8 characters are allowed in the folder. A multi-byte character in the folder, can cause parsing to fail, and the message to be rejected.
- Do not use escape strings in the folder. An escape string is treated as the actual value of the element.
- Only Unicode character U+0020 is treated as white space within the folder. All other characters are treated as significant and can cause parsing of the folder to fail, and the message to be rejected.

If parsing of the *mq* folder fails, or if the folder does not observe these restrictions, the message is rejected with reason code 2527, MQRC\_RFH\_RESTRICTED\_FORMAT\_ERR.

Do not add your own properties in the *mq* folder.

#### **mqema**

*mqema* contains properties that are used only by WebSphere Application Server. The folder has been replaced by *mqext*.

Do not add your own properties in the *mqema* folder.

#### **mqext**

mqext contains the following types of property:

- Properties that are used only by WebSphere Application Server.
- Properties relating to delayed delivery of messages.

The folder is present if the application has either set at least one of the IBM defined properties or used delivery delay.

Table 217. mqext property name, synonym, data type, and folder

Property synonym	Property name	Data type	Folder
JMSArmCorrelator	mqext.Arm	string	<mqext><Arm>armCorrelator</Arm></mqext>
JMSRMCorrelator	mqext.Wrm	string	<mqext><Wrm>wrmCorrelator</Wrm></mqext>
JMSDeliveryTime	mqext.Dlt	i8	<mqext><Dlt>DeliveryTime</Dlt></mqext>
JMSDeliveryDelay	mqext.Dly	i8	<mqext><Dly>DeliveryTime</Dly></mqext>

Do not add your own properties in the mqext folder.

### mqps

mqps contains properties that are used only by IBM MQ publish/subscribe. The folder is present only if the application has set at least one of the integrated publish/subscribe properties.

Table 218. mqps property name, synonym, data type, and folder

Property synonym	Property name	Data type	Folder
MQTopicString	mqps.Top	string	<mqps><Top>topicString</Top></mqps>
MQSubUserData	mqps.Sud	string	<mqps><Sud>subscriberUserData</Sud></mqps>
MQIsRetained	mqps.Ret	boolean	<mqps><Ret>isRetained</Ret></mqps>
MQPubOptions	mqps.Pub	i8	<mqps><Pub>publicationOptions</Pub></mqps>
MQPubLevel	mqps.Pbl	i8	<mqps><Pbl>publicationLevel</Pbl></mqps>
MQPubTime	mqpse.Pts	string	<mqps><Pts>publicationTime</Pts></mqps>
MQPubSeqNum	mqpse.Seq	i8	<mqps><Seq>publicationSequenceNumber</Seq></mqps>
MQPubStrIntData	mqpse.Sid	string	<mqps><Sid>publicationData</Sid></mqps>
MQPubFormat	mqpse.Pfmt	i8	<mqps><Pfmt>messageFormat</Pfmt></mqps>

Do not add your own properties in the mqps folder.

### mq\_svc

mq\_svc contains properties used by SupportPac MA93.

Do not add your own properties in the mq\_svc folder.

### mqtt

mqtt contains properties use by IBM MQ Telemetry

Table 219. *mqtt* property name, synonym, data type, and folder

Property synonym	Property name	Data type	Folder
	mqtt.clientId	string	<mqtt><clientId>topicString</clientId></mqtt>
	mqtt.qos	i4	<mqtt><qos>qualityOfService</qos></mqtt>
	mqtt.msgid	string	<mqtt><msgid>messageIdentifier</msgid></mqtt>

Do not add your own properties in the *mqtt* folder.

A segmented message put with either MQMF\_SEGMENT or MQMF\_SEGMENTATION\_ALLOWED cannot contain an MQRFH2 with an ungrouped property folder name. The MQPUT fails with reason code 2443, MQRC\_SEGMENTATION\_NOT\_ALLOWED.

### Name/value pairs

In the syntax diagram, “Name/value pairs” describes the content of an ordinary folder. An ordinary folder contains groups, and elements. An element is a name/value pair. A group contains elements and other groups.

In terms of trees, elements are leaf nodes, and groups are internal nodes. An internal node, and the folder, which is the root node, can contain a mixture of internal nodes and leaf nodes. A node cannot be both an internal node and a leaf node at the same time; see Figure 52 on page 2307.

### Properties

In the syntax diagram, “Properties” describes the content of a property folder. A property folder contains groups, and properties. A property is a name/value pair with an optional data type attribute. A group contains properties and other groups.

In terms of trees, properties are leaf nodes, and groups are internal nodes. An internal node, and the property folder, which is the root node, can contain a mixture of internal nodes and leaf nodes. A node cannot be both an internal node and a leaf node at the same time; see Figure 52 on page 2307.

### Property

A message property is a name/value pair in a property folder. It can optionally include a data type attribute and a property attribute; for an example, see Figure 57. If the data type attribute is omitted, the property type is string.

---

```
<pf><p1 dt='i8' > value </p1></pf>
```

---

Figure 57. Data type attribute

The name of a message property is its full path name, with the XML-like, <> syntax, replaced by dots. For example, myPropertyFolder1.myGroup1.myGroup2.myProperty1 is mapped to a *NameValueData* string in Figure 58 on page 2314. The string is formatted for easier reading.

---

```
<myPropertyFolder1>
  <myGroup1>
    <myGroup2>
      <myProperty1>value</myProperty1>
    </myGroup2>
  </myGroup1>
</myPropertyFolder1>
```

---

Figure 58. Single property name mapping

A property folder can contain multiple properties. For example the properties in Figure 59 are mapped to the property folder in Figure 60

---

```
myPropertyFolder1.myProperty4
myPropertyFolder1.myGroup1.myGroup2.myProperty1
myPropertyFolder1.myGroup1.myGroup2.myProperty2
myPropertyFolder1.myGroup1.myProperty3
```

---

Figure 59. Multiple properties with the same root name

---

```
<myPropertyFolder1>
  <myProperty4>value</myProperty4>
  <myGroup1>
    <myGroup2>
      <myProperty1>value</myProperty1>
      <myProperty2>value</myProperty2>
    </myGroup2>
    <myProperty3>value</myProperty3>
  </myGroup1>
</myPropertyFolder1>
```

---

Figure 60. Multiple property name mapping

## Name

A name must begin with a *Letter* or an *Underscore*. It must not contain a *Colon*, not end in a *Period* and contain only *Letters*, *Numerals*, *Underscores*, *Hyphens*, and *Dots*. Valid characters are defined in the W3C XML specification, and consist essentially of Unicode categories L1, Lu, Lo, Lt, N1, Mc, Mn, Lm, and Nd ; see Unicode character categories.

The complete path of a property or name/value pair must not break the rule described in “Invalid path name” on page 2316. Paths are restricted to 4095 bytes, must not contain Unicode compatibility characters, and must not start with the string XML.

## Group name

A group name has the same syntax as a name. Group names are optional. Properties and name/value pairs can be placed in the root of a folder. Use groups if it helps to organize properties and name/value pairs.

## Element name

An element name has the same syntax as a name.

## Element value

An element value includes all the white space between the `< Element name >` tag and the `< /Element name >`. Do not use the two characters `<` and `&` in a value. Replace them with `<` and `&amp;`;

## Property attributes

The property attributes map property descriptor fields: The mappings are as follows:

### Support

**sa** MQPD\_SUPPORT\_OPTIONAL  
**sr** MQPD\_SUPPORT\_REQUIRED  
**sx** MQPD\_SUPPORT\_REQUIRED\_IF\_LOCAL

### Context

**none**  
MQPD\_NO\_CONTEXT  
**user**  
MQPD\_USER\_CONTEXT

### CopyOptions

**forward**  
MQPD\_COPY\_FORWARD

**reply**  
MQPD\_COPY\_REPLY

**report**  
MQPD\_COPY\_REPORT

**publish**  
MQPD\_COPY\_PUBLISH

**all**  
MQPD\_COPY\_ALL

Do not use **all** in combination with other options.

**default**  
MQPD\_COPY\_DEFAULT

Do not use **default** in combination with other options. **default** is the same as **forward** + **report** + **publish**

**none**  
MQPD\_COPY\_NONE

Do not use **none** in combination with other options.

The Support property attributes are only applicable to properties in the **mq** folder.

The Context and CopyOptions property attributes are applicable to all property folders.

## Data types

MQRFH2 data types map to message property types as follows:

Table 220. Data type mappings

MQRFH2 data type	Message property type
bin.hex	MQBYTE[]
boolean	MQBOOL
i1	MQINT8
i2	MQINT16
i4	MQINT32
i8	MQINT64
r4	MQFLOAT32
r8	MQFLOAT64
string	MQCHAR[]

Any element without a data type is assumed to be of type string.

A null value is indicated by the element attribute `xsi:nil='true'`. Do not use the attribute `xsi:nil='false'` for non-null values. For example, the following property has a null value:

```
<NullProperty
xsi:nil='true'></NullProperty>
```

A byte or character string property can have an empty value. An empty value is represented by an MQRFH2 element with a zero length element value. For example, the following property has an empty value:

```
<EmptyProperty></EmptyProperty>
```

### Reserved folder or property folder name

Restrict the name of a folder or property folder not to start with any of the following strings. The prefixes are reserved for folder or property names created by IBM.

### Notes:

- 1 A reserved folder or property name contains any mixture of lower and uppercase letters.

### Invalid path name

Restrict the complete path of a name/value pair or a property not to include any of the following strings.

### Invalid characters

Always use the escape sequences `&#amp;` and `<` instead of the literals `"&"` and `"<"`.

### Defined property names

Defined property names are the names of properties that are defined by IBM MQ, or other products, and used by IBM MQ and user applications. Defined properties exist only in defined property folders. Defined property names are described in the description of property folders; see Property folders.

### Invalid property name

Do not construct property names that match the following rule. The rule applies to the full property path that names a property, and not only to the property element name.

(1)

### Notes:

- 1 An invalid property name can contain any combination of upper and lowercase.

### Invalid attributes

Property folders and properties can include only supported "Property attributes" on page 2315 and "Data types" on page 2315.

Any non-supported XML-like attributes, for example, names with quoted string values, that are included in property folders or properties might be removed.

XML-like attributes included in non-property folders or non-property elements that remain in MQRFH2 headers.

*NameValueLength* (MQLONG):

The length of the corresponding NameValueData field

This specifies the length in bytes of the data in the *NameValueData* field. *NameValueLength* must be a multiple of four.

**Note:** The *NameValueLength* and *NameValueData* fields are optional, but if present they must occur as a pair and be adjacent. The pair of fields can be repeated as many times as required, for example:

length1 data1 length2 data2 length3 data3

Because these fields are optional, they are omitted from the declarations of the structure that are provided for the various programming languages supported.

*StrucId* (MQCHAR4):

This is the structure identifier; the value must be:

#### **MQRFH\_STRUC\_ID**

Identifier for rules and formatting header structure.

For the C programming language, the constant MQRFH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQRFH\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQRFH\_STRUC\_ID.

*StrucLength* (MQLONG):

This is the length in bytes of the MQRFH2 structure, including the *NameValueLength* and *NameValueData* fields at the end of the structure. It is valid for there to be multiple pairs of *NameValueLength* and *NameValueData* fields at the end of the structure, in the sequence:

length1, data1, length2, data2, ...

*StrucLength* does *not* include any user data that might follow the last *NameValueData* field at the end of the structure.

To avoid problems with converting the user data in some environments, *StrucLength* must be a multiple of four.

The following constant gives the length of the *fixed* part of the structure, that is, the length excluding the *NameValueLength* and *NameValueData* fields:

#### **MQRFH\_STRUC\_LENGTH\_FIXED\_2**

Length of fixed part of MQRFH2 structure.

The initial value of this field is MQRFH\_STRUC\_LENGTH\_FIXED\_2.

Version (MQLONG):

This is the structure version number; the value must be:

### **MQRFH\_VERSION\_2**

Version-2 rules and formatting header structure.

The initial value of this field is MQRFH\_VERSION\_2.

Initial values and language declarations for MQRFH2:

Table 221. Initial values of fields in MQRFH2 for MQRFH2

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQRFH_STRUC_ID	'RFH~'
<i>Version</i>	MQRFH_VERSION_2	2
<i>StrucLength</i>	MQRFH_STRUC_LENGTH_FIXED_2	36
<i>Encoding</i>	MQENC_NATIVE	Depends on environment
<i>CodedCharSetId</i>	MQCCSI_INHERIT	-2
<i>Format</i>	MQFMT_NONE	Blanks
<i>Flags</i>	MQRFH_NONE	0
<i>NameValueCCSID</i>	None	1208

**Notes:**

1. The symbol ~ represents a single blank character.
2. In the C programming language, the macro variable MQRFH2\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  
MQRFH2 MyRFH2 = {MQRFH2\_DEFAULT};

C declaration:

```
typedef struct tagMQRFH2 MQRFH2;
struct tagMQRFH2 {
    MQCHAR4  StrucId;          /* Structure identifier */
    MQLONG   Version;         /* Structure version number */
    MQLONG   StrucLength;     /* Total length of MQRFH2 including all
                             NameValueLength and NameValueData
                             fields */
    MQLONG   Encoding;       /* Numeric encoding of data that follows
                             last NameValueData field */
    MQLONG   CodedCharSetId; /* Character set identifier of data that
                             follows last NameValueData field */
    MQCHAR8  Format;         /* Format name of data that follows last
                             NameValueData field */
    MQLONG   Flags;         /* Flags */
    MQLONG   NameValueCCSID; /* Character set identifier of
                             NameValueData */
};
```

*COBOL declaration:*

```
** MQRFH2 structure
 10 MQRFH2.
**   Structure identifier
 15 MQRFH2-STRUCID      PIC X(4).
**   Structure version number
 15 MQRFH2-VERSION     PIC S9(9) BINARY.
**   Total length of MQRFH2 including all NAMEVALUELENGTH and
**   NAMEVALUEDATA fields
 15 MQRFH2-STRUCLNGTH PIC S9(9) BINARY.
**   Numeric encoding of data that follows last NAMEVALUEDATA field
 15 MQRFH2-ENCODING    PIC S9(9) BINARY.
**   Character set identifier of data that follows last NAMEVALUEDATA
**   field
 15 MQRFH2-CODEDCHARSETID PIC S9(9) BINARY.
**   Format name of data that follows last NAMEVALUEDATA field
 15 MQRFH2-FORMAT      PIC X(8).
**   Flags
 15 MQRFH2-FLAGS       PIC S9(9) BINARY.
**   Character set identifier of NAMEVALUEDATA
 15 MQRFH2-NAMEVALUECCSID PIC S9(9) BINARY.
```

*PL/I declaration:*

```
dc1
 1 MQRFH2 based,
 3 StrucId      char(4),      /* Structure identifier */
 3 Version      fixed bin(31), /* Structure version number */
 3 StrucLength  fixed bin(31), /* Total length of MQRFH2 including
                               all NameValueLength and
                               NameValueData fields */
 3 Encoding     fixed bin(31), /* Numeric encoding of data that
                               follows last NameValueData field */
 3 CodedCharSetId fixed bin(31), /* Character set identifier of data
                               that follows last NameValueData
                               field */
 3 Format        char(8),      /* Format name of data that follows
                               last NameValueData field */
 3 Flags        fixed bin(31), /* Flags */
 3 NameValueCCSID fixed bin(31); /* Character set identifier of
                               NameValueData */
```

*High Level Assembler declaration:*

```
MQRFH          DSECT
MQRFH_STRUCID  DS   CL4  Structure identifier
MQRFH_VERSION  DS   F    Structure version number
MQRFH_STRUCLNGTH DS   F    Total length of MQRFH2 including all
*                NAMEVALUELENGTH and NAMEVALUEDATA fields
MQRFH_ENCODING DS   F    Numeric encoding of data that follows
*                last NAMEVALUEDATA field
MQRFH_CODEDCHARSETID DS   F    Character set identifier of data that
*                follows last NAMEVALUEDATA field
MQRFH_FORMAT   DS   CL8  Format name of data that follows last
*                NAMEVALUEDATA field
MQRFH_FLAGS    DS   F    Flags
MQRFH_NAMEVALUECCSID DS   F    Character set identifier of
*                NAMEVALUEDATA
*
MQRFH_LENGTH   EQU   *-MQRFH
               ORG   MQRFH
MQRFH_AREA     DS   CL(MQRFH_LENGTH)
```

*Visual Basic declaration:*

```

Type MQRFH2
  StrucId      As String*4 'Structure identifier'
  Version      As Long     'Structure version number'
  StrucLength  As Long     'Total length of MQRFH2 including all'
                                'NameValueLength and NameValueData fields'
  Encoding     As Long     'Numeric encoding of data that follows'
                                'last NameValueData field'
  CodedCharSetId As Long   'Character set identifier of data that'
                                'follows last NameValueData field'
  Format       As String*8 'Format name of data that follows last'
                                'NameValueData field'
  Flags       As Long     'Flags'
  NameValueCCSID As Long   'Character set identifier of NameValueData'
End Type

```

**MQRMH - Reference message header:**

The following table summarizes the fields in the structure.

*Table 222. Fields in MQRMH*

<b>Field</b>	<b>Description</b>	<b>Topic</b>
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>StrucLength</i>	Total length of MQRMH, including strings at end of fixed fields, but not the bulk data	StrucLength
<i>Encoding</i>	Numeric encoding of bulk data	Encoding
<i>CodedCharSetId</i>	Character set identifier of bulk data	CodedCharSetId
<i>Format</i>	Format name of bulk data	Format
<i>Flags</i>	Reference message flags	Flags
<i>ObjectType</i>	Object type	ObjectType
<i>ObjectInstanceId</i>	Object instance identifier	ObjectInstanceId
<i>SrcEnvLength</i>	Length of source environment data	SrcEnvLength
<i>SrcEnvOffset</i>	Offset of source environment data	SrcEnvOffset
<i>SrcNameLength</i>	Length of source object name	SrcNameLength
<i>SrcNameOffset</i>	Offset of source object name	SrcNameOffset
<i>DestEnvLength</i>	Length of destination environment data	DestEnvLength
<i>DestEnvOffset</i>	Offset of destination environment data	DestEnvOffset
<i>DestNameLength</i>	Length of destination object name	DestNameLength
<i>DestNameOffset</i>	Offset of destination object name	DestNameOffset
<i>DataLogicalLength</i>	Length of bulk data	DataLogicalLength
<i>DataLogicalOffset</i>	Low offset of bulk data	DataLogicalOffset
<i>DataLogicalOffset2</i>	High offset of bulk data	DataLogicalOffset2

Overview for MQRMH:

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

**Purpose:** The MQRMH structure defines the format of a reference message header. This header is used with user-written message channel exits to send extremely large amounts of data (called *bulk data*) from one queue manager to another. The difference compared to normal messaging is that the bulk data is not stored on a queue; instead, only a *reference* to the bulk data is stored on the queue. This reduces the possibility of MQ resources being exhausted by a small number of extremely large messages.

**Format name:** MQFMT\_REF\_MSG\_HEADER.

**Character set and encoding:** Character data in MQRMH, and the strings addressed by the offset fields, must be in the character set of the local queue manager; this is given by the *CodedCharSetId* queue-manager attribute. Numeric data in MQRMH must be in the native machine encoding; this is given by the value of MQENC\_NATIVE for the C programming language.

Set the character set and encoding of the MQRMH into the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQRMH structure is at the start of the message data), or
- The header structure that precedes the MQRMH structure (all other cases).

**Usage:** An application puts a message consisting of an MQRMH, but omitting the bulk data. When a message channel agent (MCA) reads the message from the transmission queue, a user-supplied message exit is invoked to process the reference message header. The exit can append to the reference message the bulk data identified by the MQRMH structure, before the MCA sends the message through the channel to the next queue manager.

At the receiving end, a message exit that waits for reference messages must exist. When a reference message is received, the exit must create the object from the bulk data that follows the MQRMH in the message, and then pass on the reference message without the bulk data. The reference message can later be retrieved by an application reading the reference message (without the bulk data) from a queue.

Normally, the MQRMH structure is all that is in the message. However, if the message is on a transmission queue, one or more additional headers precede the MQRMH structure.

A reference message can also be sent to a distribution list. In this case, the MQDHL structure and its related records precede the MQRMH structure when the message is on a transmission queue.

**Note:** Do not send a reference message as a segmented message, because the message exit cannot process it correctly.

**Data conversion:** For data conversion purposes, converting the MQRMH structure includes conversion of the source environment data, source object name, destination environment data, and destination object name. Any other bytes within *StrucLength* bytes of the start of the structure are either discarded or have undefined values after data conversion. The bulk data is converted provided that all the following are true:

- The bulk data is present in the message when the data conversion is performed.
- The *Format* field in MQRMH has a value other than MQFMT\_NONE.
- A user-written data-conversion exit exists with the format name specified.

Be aware, however, that usually the bulk data is *not* present in the message when the message is on a queue, and that as a result the bulk data is converted by the MQGMO\_CONVERT option.

*Fields for MQRMH:*

The MQRMH structure contains the following fields; the fields are described in **alphabetical order**:

*CodedCharSetId (MQLONG):*

This specifies the character set identifier of the bulk data; it does not apply to character data in the MQRMH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The following special value can be used:

#### **MQCCSI\_INHERIT**

Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI\_INHERIT is not returned by the MQGET call.

Do not use MQCCSI\_INHERIT if the value of the *PutApplType* field in MQMD is MQAT\_BROKER.

This value is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

The initial value of this field is MQCCSI\_UNDEFINED.

*DataLogicalLength (MQLONG):*

The *DataLogicalLength* field specifies the length of the bulk data referenced by the MQRMH structure.

If the bulk data is actually present in the message, the data begins at an offset of *StrucLength* bytes from the start of the MQRMH structure. The length of the entire message minus *StrucLength* gives the length of the bulk data present.

If data is present in the message, *DataLogicalLength* specifies the amount of that data that is relevant. The normal case is for *DataLogicalLength* to have the same value as the length of data present in the message.

If the MQRMH structure represents the remaining data in the object (starting from the specified logical offset), you can use the value zero for *DataLogicalLength*, provided that the bulk data is not actually present in the message.

If no data is present, the end of MQRMH coincides with the end of the message.

The initial value of this field is 0.

*DataLogicalOffset* (MQLONG):

This field specifies the low offset of the bulk data from the start of the object of which the bulk data forms part. The offset of the bulk data from the start of the object is called the *logical offset*. This is *not* the physical offset of the bulk data from the start of the MQRMH structure; that offset is given by *StrucLength*.

To allow large objects to be sent using reference messages, the logical offset is divided into two fields, and the actual logical offset is given by the sum of these two fields:

- *DataLogicalOffset* represents the remainder obtained when the logical offset is divided by 1 000 000 000. It is thus a value in the range 0 through 999 999 999.
- *DataLogicalOffset2* represents the result obtained when the logical offset is divided by 1 000 000 000. It is thus the number of complete multiples of 1 000 000 000 that exist in the logical offset. The number of multiples is in the range 0 through 999 999 999.

The initial value of this field is 0.

*DataLogicalOffset2* (MQLONG):

This field specifies the high offset of the bulk data from the start of the object of which the bulk data forms part. It is a value in the range 0 through 999 999 999. See *DataLogicalOffset* for details.

The initial value of this field is 0.

*DestEnvLength* (MQLONG):

This is the length of the destination environment data. If this field is zero, there is no destination environment data, and *DestEnvOffset* is ignored.

*DestEnvOffset* (MQLONG):

This field specifies the offset of the destination environment data from the start of the MQRMH structure. Destination environment data can be specified by the creator of the reference message, if that data is known to the creator. For example, on Windows the destination environment data might be the directory path of the object where the bulk data is to be stored. However, if the creator does not know the destination environment data, it is the responsibility of the user-supplied message exit to determine any environment information needed.

The length of the destination environment data is given by *DestEnvLength* ; if this length is zero, there is no destination environment data, and *DestEnvOffset* is ignored. If present, the destination environment data must reside completely within *StrucLength* bytes from the start of the structure.

Applications must not assume that the destination environment data is contiguous with any of the data addressed by the *SrcEnvOffset*, *SrcNameOffset*, and *DestNameOffset* fields.

The initial value of this field is 0.

*DestNameLength* (MQLONG):

The length of the destination object name. If this field is zero, there is no destination object name, and *DestNameOffset* is ignored.

*DestNameOffset* (MQLONG):

This field specifies the offset of the destination object name from the start of the MQRMH structure. The destination object name can be specified by the creator of the reference message, if that data is known to the creator. However, if the creator does not know the destination object name, it is the responsibility of the user-supplied message exit to identify the object to be created or modified.

The length of the destination object name is given by *DestNameLength* ; if this length is zero, there is no destination object name, and *DestNameOffset* is ignored. If present, the destination object name must reside completely within *StrucLength* bytes from the start of the structure.

Applications must not assume that the destination object name is contiguous with any of the data addressed by the *SrcEnvOffset*, *SrcNameOffset*, and *DestEnvOffset* fields.

The initial value of this field is 0.

*Encoding* (MQLONG):

This specifies the numeric encoding of the bulk data; it does not apply to numeric data in the MQRMH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is MQENC\_NATIVE.

*Flags* (MQLONG):

These are reference message flags. The following flags are defined:

**MQRMHF\_LAST**

This flag indicates that the reference message represents or contains the last part of the referenced object.

**MQRMHF\_NOT\_LAST**

Reference message does not contain or represent last part of object. MQRMHF\_NOT\_LAST aids program documentation. It is not intended that this option be used with any other, but as its value is zero, such use cannot be detected.

The initial value of this field is MQRMHF\_NOT\_LAST.

*Format (MQCHAR8):*

This specifies the format name of the bulk data.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The initial value of this field is MQFMT\_NONE.

*ObjectInstanceId (MQBYTE24):*

Use this field to identify a specific instance of an object. If it is not needed, set it to the following value:

**MQOII\_NONE**

No object instance identifier specified. The value is binary zero for the length of the field.

For the C programming language, the constant MQOII\_NONE\_ARRAY is also defined; this has the same value as MQOII\_NONE, but is an array of characters instead of a string.

The length of this field is given by MQ\_OBJECT\_INSTANCE\_ID\_LENGTH. The initial value of this field is MQOII\_NONE.

*ObjectType (MQCHAR8):*

This is a name that the message exit can use to recognize types of reference message that it supports. The name must conform to the same rules as the *Format* field, see "Format (MQCHAR8)."

The initial value of this field is 8 blanks.

*SrcEnvLength (MQLONG):*

The length of the source environment data. If this field is zero, there is no source environment data, and *SrcEnvOffset* is ignored.

The initial value of this field is 0.

*SrcEnvOffset (MQLONG):*

This field specifies the offset of the source environment data from the start of the MQRMH structure. Source environment data can be specified by the creator of the reference message, if that data is known to the creator. For example, on Windows the source environment data might be the directory path of the object containing the bulk data. However, if the creator does not know the source environment data, the user-supplied message exit must determine any environment information needed.

The length of the source environment data is given by *SrcEnvLength* ; if this length is zero, there is no source environment data, and *SrcEnvOffset* is ignored. If present, the source environment data must reside completely within *StrucLength* bytes from the start of the structure.

Applications must not assume that the environment data starts immediately after the last fixed field in the structure or that it is contiguous with any of the data addressed by the *SrcNameOffset*, *DestEnvOffset*, and *DestNameOffset* fields.

The initial value of this field is 0.

*SrcNameLength* (MQLONG):

The length of the source object name. If this field is zero, there is no source object name, and *SrcNameOffset* is ignored.

The initial value of this field is 0.

*SrcNameOffset* (MQLONG):

This field specifies the offset of the source object name from the start of the MQRMH structure. The source object name can be specified by the creator of the reference message, if that data is known to the creator. However, if the creator does not know the source object name, the user-supplied message exit must identify the object to be accessed.

The length of the source object name is given by *SrcNameLength* ; if this length is zero, there is no source object name, and *SrcNameOffset* is ignored. If present, the source object name must reside completely within *StrucLength* bytes from the start of the structure.

Applications must not assume that the source object name is contiguous with any of the data addressed by the *SrcEnvOffset*, *DestEnvOffset*, and *DestNameOffset* fields.

The initial value of this field is 0.

*StrucId* (MQCHAR4):

This is the structure identifier; the value must be:

**MQRMH\_STRUC\_ID**

Identifier for reference message header structure.

For the C programming language, the constant MQRMH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQRMH\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQRMH\_STRUC\_ID.

*StrucLength* (MQLONG):

The total length of MQRMH, including strings at the end of fixed fields, but not the bulk data.

The initial value of this field is zero.

*Version* (MQLONG):

The structure version number. The value must be:

**MQRMH\_VERSION\_1**

Version-1 reference message header structure.

The following constant specifies the version number of the current version:

**MQRMH\_CURRENT\_VERSION**

Current version of reference message header structure.

The initial value of this field is MQRMH\_VERSION\_1.

Initial values and language declarations for MQRMH:

Table 223. Initial values of fields in MQRMH for MQRMH

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQRMH_STRUC_ID	'RMH¬'
<i>Version</i>	MQRMH_VERSION_1	1
<i>StrucLength</i>	None	0
<i>Encoding</i>	MQENC_NATIVE	Depends on environment
<i>CodedCharSetId</i>	MQCCSI_UNDEFINED	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>Flags</i>	MQRMHF_NOT_LAST	0
<i>ObjectType</i>	None	Blanks
<i>ObjectInstanceId</i>	MQOII_NONE	Nulls
<i>SrcEnvLength</i>	None	0
<i>SrcEnvOffset</i>	None	0
<i>SrcNameLength</i>	None	0
<i>SrcNameOffset</i>	None	0
<i>DestEnvLength</i>	None	0
<i>DestEnvOffset</i>	None	0
<i>DestNameLength</i>	None	0
<i>DestNameOffset</i>	None	0
<i>DataLogicalLength</i>	None	0
<i>DataLogicalOffset</i>	None	0
<i>DataLogicalOffset2</i>	None	0

**Notes:**

1. The symbol ¬ represents a single blank character.
2. In the C programming language, the macro variable MQRMH\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQRMH MyRMH = {MQRMH_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQRMH MQRMH;
struct tagMQRMH {
    MQCHAR4   StructId;           /* Structure identifier */
    MQLONG    Version;           /* Structure version number */
    MQLONG    StruLength;        /* Total length of MQRMH, including
                                strings at end of fixed fields, but
                                not the bulk data */

    MQLONG    Encoding;         /* Numeric encoding of bulk data */
    MQLONG    CodedCharSetId;   /* Character set identifier of bulk
                                data */

    MQCHAR8   Format;           /* Format name of bulk data */
    MQLONG    Flags;           /* Reference message flags */
    MQCHAR8   ObjectType;       /* Object type */
    MQBYTE24  ObjectInstanceId; /* Object instance identifier */
    MQLONG    SrcEnvLength;     /* Length of source environment data */
    MQLONG    SrcEnvOffset;     /* Offset of source environment data */
    MQLONG    SrcNameLength;    /* Length of source object name */
    MQLONG    SrcNameOffset;    /* Offset of source object name */
    MQLONG    DestEnvLength;    /* Length of destination environment
                                data */
    MQLONG    DestEnvOffset;    /* Offset of destination environment
                                data */

    MQLONG    DestNameLength;   /* Length of destination object name */
    MQLONG    DestNameOffset;   /* Offset of destination object name */
    MQLONG    DataLogicalLength; /* Length of bulk data */
    MQLONG    DataLogicalOffset; /* Low offset of bulk data */
    MQLONG    DataLogicalOffset2; /* High offset of bulk data */
};
```

**MQRR - Response record:**

The following table summarizes the fields in the structure.

*Table 224. Fields in MQRR*

Field	Description	Topic
<i>CompCode</i>	Completion code for queue	CompCode
<i>Reason</i>	Reason code for queue	Reason

*Overview for MQRR:*

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

**Purpose:** Use the MQRR structure to receive the completion code and reason code resulting from the open or put operation for a single destination queue, when the destination is a distribution list. MQRR is an output structure for the MQOPEN, MQPUT, and MQPUT1 calls.

**Character set and encoding:** Data in MQRR must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

**Usage:** By providing an array of these structures on the MQOPEN and MQPUT calls, or on the MQPUT1 call, you can determine the completion codes and reason codes for all the queues in a distribution list when the outcome of the call is mixed, that is, when the call succeeds for some queues in the list but fails for others. Reason code MQRC\_MULTIPLE\_REASONS from the call indicates that the response records (if provided by the application) have been set by the queue manager.

*Fields for MQRR:*

The MQRR structure contains the following fields; the fields are described in **alphabetical order**:

*CompCode (MQLONG):*

This is the completion code resulting from the open or put operation for the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call.

This is always an output field. The initial value of this field is MQCC\_OK.

*Reason (MQLONG):*

This is the reason code resulting from the open or put operation for the queue with the name that was specified by the corresponding element in the array of MQOR structures provided on the MQOPEN or MQPUT1 call.

This is always an output field. The initial value of this field is MQRC\_NONE.

*Initial values and language declarations for MQRR:*

*Table 225. Initial values of fields in MQRR for MQRR*

Field name	Name of constant	Value of constant
<i>CompCode</i>	MQCC_OK	0
<i>Reason</i>	MQRC_NONE	0

**Notes:**

1. In the C programming language, the macro variable MQRR\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  

```
MQRR MyRR = {MQRR_DEFAULT};
```

C declaration:

```
typedef struct tagMQRR MQRR;
struct tagMQRR {
    MQLONG  CompCode; /* Completion code for queue */
    MQLONG  Reason;   /* Reason code for queue */
};
```

COBOL declaration:

```
** MQRR structure
10 MQRR.
** Completion code for queue
15 MQRR-COMPCODE PIC S9(9) BINARY.
** Reason code for queue
15 MQRR-REASON PIC S9(9) BINARY.
```

PL/I declaration:

```
dc1
1 MQRR based,
3 CompCode fixed bin(31), /* Completion code for queue */
3 Reason fixed bin(31); /* Reason code for queue */
```

Visual Basic declaration:

```
Type MQRR
    CompCode As Long 'Completion code for queue'
    Reason As Long 'Reason code for queue'
End Type
```

## MQSCO - SSL configuration options:

The following table summarizes the fields in the structure.

Table 226. Fields in MQSCO

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>KeyRepository</i>	Location of key repository	KeyRepository
<i>CryptoHardware</i>	Details of cryptographic hardware	CryptoHardware
<i>AuthInfoRecCount</i>	Number of MQAIR records present	AuthInfoRecCount
<i>AuthInfoRecOffset</i>	Offset of first MQAIR record from start of MQSCO	AuthInfoRecOffset
<i>AuthInfoRecPtr</i>	Address of first MQAIR record	AuthInfoRecPtr
<b>Note:</b> The following two fields are ignored if <i>Version</i> is less than MQSCO_VERSION_2.		
<i>KeyResetCount</i>	SSL secret key reset count	KeyResetCount
<i>FipsRequired</i>	Use FIPS-certified cryptographic algorithms in IBM MQ	"FipsRequired (MQLONG)" on page 2337
<b>Note:</b> The following field is ignored if <i>Version</i> is less than MQSCO_VERSION_3.		
<i>EncryptionPolicySuiteB</i>	Use only Suite B cryptographic algorithms	EncryptionPolicySuiteB
<b>Note:</b> The following field is ignored if <i>Version</i> is less than MQSCO_VERSION_4.		
<i>CertificateValPolicy</i>	Certificate validation policy	CertificateValPolicy
<b>Note:</b> The following field is ignored if <i>Version</i> is less than MQSCO_VERSION_5.		
<i>CertificateLabel</i>	Details the certificate label that is being used.	CertificateLabel

**Related reference:**

“MQCNO - Connect options” on page 2076

The following table summarizes the fields in the structure.

“Overview for MQSCO”

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux and Windows clients.

“Fields for MQSCO”

“Initial values and language declarations for MQSCO” on page 2339

*Overview for MQSCO:*

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux and Windows clients.

**Purpose:** The MQSCO structure (in conjunction with the SSL fields in the MQCD structure) allows an application running as an IBM MQ MQI client to specify configuration options that control the use of SSL for the client connection when the channel protocol is TCP/IP. The structure is an input parameter on the MQCONN call.

If the channel protocol for the client channel is not TCP/IP, the MQSCO structure is ignored.

**Character set and encoding:** Data in MQSCO must be in the character set given by the *CodedCharSetId* queue-manager attribute, and encoding of the local queue manager given by MQENC\_NATIVE.

*Fields for MQSCO:*

The MQSCO structure contains the following fields; the fields are described in **alphabetical order**:

*AuthInfoRecCount* (MQLONG):

This is the number of authentication information (MQAIR) records addressed by the *AuthInfoRecPtr* or *AuthInfoRecOffset* fields. For more information, see “MQAIR - Authentication information record” on page 2024. The value must be zero or greater. If the value is not valid, the call fails with reason code MQRC\_AUTH\_INFO\_REC\_COUNT\_ERROR.

This is an input field. The initial value of this field is 0.

*AuthInfoRecOffset* (MQLONG):

This is the offset in bytes of the first authentication information record from the start of the MQSCO structure. The offset can be positive or negative. The field is ignored if *AuthInfoRecCount* is zero.

You can use either *AuthInfoRecOffset* or *AuthInfoRecPtr* to specify the MQAIR records, but not both; see the description of the *AuthInfoRecPtr* field for details.

This is an input field. The initial value of this field is 0.

*AuthInfoRecPtr (PMQAIR):*

This is the address of the first authentication information record. The field is ignored if *AuthInfoRecCount* is zero.

You can provide the array of MQAIR records in one of two ways:

- By using the pointer field *AuthInfoRecPtr*

In this case, the application can declare an array of MQAIR records that is separate from the MQSCO structure, and set *AuthInfoRecPtr* to the address of the array.

Consider using *AuthInfoRecPtr* for programming languages that support the pointer data type in a fashion that is portable to different environments (for example, the C programming language).

- By using the offset field *AuthInfoRecOffset*

In this case, the application must declare a compound structure containing an MQSCO followed by the array of MQAIR records, and set *AuthInfoRecOffset* to the offset of the first record in the array from the start of the MQSCO structure. Ensure that this value is correct, and has a value that can be accommodated within an MQLONG (the most restrictive programming language is COBOL, for which the valid range is -999 999 999 through +999 999 999).

Consider using *AuthInfoRecOffset* for programming languages that do not support the pointer data type, or that implement the pointer data type in a fashion that is not portable to different environments (for example, the COBOL programming language).

Whatever technique you choose, only one of *AuthInfoRecPtr* and *AuthInfoRecOffset* can be used; the call fails with reason code MQRC\_AUTH\_INFO\_REC\_ERROR if both are nonzero.

This is an input field. The initial value of this field is the null pointer in those programming languages that support pointers, and an all-null byte string otherwise.

**Note:** On platforms where the programming language does not support the pointer data type, this field is declared as a byte string of the appropriate length.

*CertificateLabel (MQCHAR64):*

This field gives details of the certificate label being used.

IBM MQ initializes the default value for the *CertificateLabel* field as blanks.

This is interpreted at runtime as the default value, and is backwards compatible.

For example, specifying a MQSCO version less than 5.0, or using the default value of blanks for the *CertificateLabel* field, uses the preexisting default value of `ibmwebsphermq<user_id>`.

*CertificateValPolicy (MQLONG):*

This field specifies what type of certificate validation policy is used. The field can be set to one of the following values:

**MQ\_CERT\_VAL\_POLICY\_ANY**

Apply each of the certificate validation policies supported by the secure sockets library. Accept the certificate chain if any of the policies considers the certificate chain valid.

**MQ\_CERT\_VAL\_POLICY\_RFC5280**

Apply only the RFC5280 compliant certificate validation policy. This setting provides stricter validation than the ANY setting, but rejects some older digital certificates.

The initial value of this field is MQ\_CERT\_VAL\_POLICY\_ANY

*CryptoHardware (MQCHAR256):*

This field gives configuration details for cryptographic hardware connected to the client system.

Set the field to a string of the following format, or leave it blank or null:

*GSK\_PKCS11=< the PKCS #11 driver path and file name >;< the PKCS #11 token label >;< the PKCS #11 token password >; <symmetric cipher setting>;*

To use cryptographic hardware which conforms to the PKCS #11 interface, for example, the IBM 4960 or IBM 4764, the PKCS #11 driver path, PKCS #11 token label, and PKCS #11 token password strings must be specified, each terminated by a semi-colon.

The PKCS #11 driver path is an absolute path to the shared library providing support for the PKCS #11 card. The PKCS #11 driver file name is the name of the shared library. An example of the value required for the PKCS #11 path and file name is:

*/usr/lib/pkcs11/PKCS11\_API.so*

The PKCS #11 token label must be entirely in lowercase. If you have configured your hardware with a mixed case or uppercase token label, re-configure it with this lowercase label.

If no cryptographic hardware configuration is required, set the field to blank or null.

If the value is shorter than the length of the field, terminate the value with a null character, or pad it with blanks to the length of the field. If the value is not valid, or leads to a failure when used to configure the cryptographic hardware, the call fails with reason code MQRC\_CRYPTO\_HARDWARE\_ERROR.

This is an input field. The length of this field is given by MQ\_SSL\_CRYPTO\_HARDWARE\_LENGTH. The initial value of this field is the null string in C, and blank characters in other programming languages.

### *EncryptionPolicySuiteB(MQLONG):*

This field Specifies whether Suite B compliant cryptography is used and what level of strength is employed. The value can be one or more of:

- MQ\_SUITE\_B\_NONE  
Suite B compliant cryptography is not used.
- MQ\_SUITE\_B\_128\_BIT  
Suite B 128-bit strength security is used.
- MQ\_SUITE\_B\_192\_BIT  
Suite B 192-bit strength security is used.

**Note:** Using the MQ\_SUITE\_B\_NONE with any other value in this field is invalid.

### *FipsRequired (MQLONG):*

IBM MQ can be configured with cryptographic hardware so that the cryptography modules used are those provided by the hardware product; these can be FIPS-certified to a particular level depending on the cryptographic hardware product in use. Use this field to specify that only FIPS-certified algorithms are used if the cryptography is provided in IBM MQ-provided software.

When IBM MQ is installed an implementation of SSL cryptography is also installed which provides some FIPS-certified modules.

The values can be:

#### **MQSSL\_FIPS\_NO**

This is the default value. When set to this value:

- Any CipherSpec supported on a particular platform can be used.
- If run without use of cryptographic hardware, the following CipherSpecs run using FIPS 140-2 certified cryptography on the IBM MQ platforms:
  - TLS\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA
  - TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA
  - TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA

#### **MQSSL\_FIPS\_YES**

When set to this value, unless you are using cryptographic hardware to perform the cryptography, you can be sure that

- Only FIPS-certified cryptographic algorithms can be used in the CipherSpec applying to this client connection.
- Inbound and outbound SSL channel connections only succeed if one of the following CipherSpecs are used:
  - TLS\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA
  - TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA
  - TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA

#### **Notes:**

1. CipherSpec TLS\_RSA\_WITH\_3DES\_EDE\_CBC\_SHA is deprecated.
2. Where possible, if FIPS-only CipherSpecs are configured then the MQI client rejects connections which specify a non-FIPS CipherSpec with MQRC\_SSL\_INITIALIZATION\_ERROR. IBM MQ does not guarantee to reject all such connections and it is your responsibility to determine whether your IBM MQ configuration is FIPS-compliant.

### *KeyRepository* (MQCHAR256):

This field is relevant only for IBM MQ MQI clients running on UNIX systems and Windows systems. It specifies the location of the key database file in which keys and certificates are stored. The key database file must have a file name of the form *zzz.kdb*, where *zzz* is user-selectable. The *KeyRepository* field contains the path to this file, along with the file name stem (all characters in the file name up to but not including the final *.kdb*). The *.kdb* file suffix is added automatically.

Each key database file has an associated *password stash file*. This holds encoded passwords that are used to allow programmatic access to the key database. The password stash file must reside in the same directory and have the same file stem as the key database, and must end with the suffix *.sth*.

For example, if the *KeyRepository* field has the value */xxx/yyy/key*, the key database file must be */xxx/yyy/key.kdb*, and the password stash file must be */xxx/yyy/key.sth*, where *xxx* and *yyy* represent directory names.

If the value is shorter than the length of the field, terminate the value with a null character, or pad it with blanks to the length of the field. The value is not checked; if there is an error in accessing the key repository, the call fails with reason code *MQRC\_KEY\_REPOSITORY\_ERROR*.

To run an SSL connection from an IBM MQ MQI client, set *KeyRepository* to a valid key database file name.

This is an input field. The length of this field is given by *MQ\_SSL\_KEY\_REPOSITORY\_LENGTH*. The initial value of this field is the null string in C, and blank characters in other programming languages.

### *KeyResetCount* (MQLONG):

This represents the total number of unencrypted bytes sent and received within an SSL or TLS conversation before the secret key is renegotiated.

The number of bytes includes control information sent by the MCA.

If you specify an SSL or TLS secret key reset count in the range 1 byte through 32 KB, SSL or TLS channels will use a secret key reset count of 32 KB. This is to avoid the processing cost of excessive key resets which would occur for small SSL or TLS secret key reset values.

This is an input field. The value is a number in the range 0 through 999 999 999, with a default value of 0. Use a value of 0 to indicate that secret keys are never renegotiated.

### *StrucId* (MQCHAR4):

This is the structure identifier; the value must be:

#### **MQSCO\_STRUC\_ID**

Identifier for SSL configuration options structure.

For the C programming language, the constant *MQSCO\_STRUC\_ID\_ARRAY* is also defined; this has the same value as *MQSCO\_STRUC\_ID*, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is *MQSCO\_STRUC\_ID*.

Version (MQLONG):

This is the structure version number; the value must be:

**MQSCO\_VERSION\_1**

Version-1 SSL configuration options structure.

**MQSCO\_VERSION\_2**

Version-2 SSL configuration options structure.

**MQSCO\_VERSION\_3**

Version-3 SSL configuration options structure.

**MQSCO\_VERSION\_4**

Version-4 SSL configuration options structure.

**MQSCO\_VERSION\_5**

Version-5 SSL configuration options structure.

The following constant specifies the version number of the current version:

**MQSCO\_CURRENT\_VERSION**

Current version of SSL configuration options structure.

This is always an input field. The initial value of this field is MQSCO\_VERSION\_1.

Initial values and language declarations for MQSCO:

Table 227. Initial values of fields in MQSCO

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQSCO_STRUC_ID	'SCO~'
<i>Version</i>	MQSCO_CURRENT_VERSION	1
<i>KeyRepository</i>	None	Null string or blanks
<i>CryptoHardware</i>	None	Null string or blanks
<i>AuthInfoRecCount</i>	None	0
<i>AuthInfoRecOffset</i>	None	0
<i>AuthInfoRecPtr</i>	None	Null pointer or null bytes
<i>KeyResetCount</i>	MQSCO_RESET_COUNT_DEFAULT	0
<i>FipsRequired</i>	MQSSL_FIPS_NO	0
<i>EncryptionPolicySuiteB</i>	MQ_SUITE_B_NONE, MQ_SUITE_B_NOT_AVAILABLE, MQ_SUITE_B_NOT_AVAILABLE, MQ_SUITE_B_NOT_AVAILABLE	1, 0, 0, 0
<i>CertificateValPolicy</i>	MQ_CERT_VAL_POLICY_DEFAULT	0

**Notes:**

1. The symbol ~ represents a single blank character.
2. In the C programming language, the macro variable MQSCO\_DEFAULT contains the values listed in the table. Use it in the following way to provide initial values for the fields in the structure:

```
MQSCO MySCO = {MQSCO_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQSCO MQSCO;
struct tagMQSCO {
    MQCHAR4    StructId;           /* Structure identifier */
    MQLONG     Version;           /* Structure version number */
    MQCHAR256  KeyRepository;     /* Location of SSL key */
                                   /* repository */
    MQCHAR256  CryptoHardware;    /* Cryptographic hardware */
                                   /* configuration string */
    MQLONG     AuthInfoRecCount;  /* Number of MQAIR records */
                                   /* present */

**MQSD - Subscription descriptor:**

The following table summarizes the fields in the structure.

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options	Options
<i>ObjectName</i>	Object name	ObjectName
<i>AlternateUserId</i>	Alternate User Id	AlternateUserId
<i>AlternateSecurityId</i>	Alternate Security ID	AlternateSecurityId
<i>SubExpiry</i>	Subscription Expiry	SubExpiry
<i>ObjectString</i>	Object String	ObjectString
<i>SubName</i>	Subscription Name	SubName
<i>SubUserData</i>	Subscription user data	SubUserData
<i>SubCorrelId</i>	Subscription Correlation ID	SubCorrelId
<i>PubPriority</i>	Publication priority	PubPriority

Field	Description	Topic
<i>PubAccountingToken</i>	Publication Accounting Token	PubAccountingToken
<i>PubAppIdentityData</i>	Publication application identity data	PubAppIdentityData
<i>SelectionString</i>	String providing selection criteria	SelectionString
<i>SubLevel</i>	Subscription Level	SubLevel
<i>ResObjectString</i>	Long object name	ResObjectString

*Overview for MQSD:*

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS, plus IBM MQ MQI clients connected to these systems.

**Purpose:** The MQSD structure is used to specify details about the subscription being made.

The structure is an input/output parameter on the MQSUB call. For more information, see MQSUB usage notes.

**Managed subscriptions:** If an application has no specific need to use a particular queue as the destination for those publications that match its subscription, it can use the managed subscription feature. If an application elects to use a managed subscription, the queue manager informs the subscriber about the destination where published messages are sent, by providing an object handle as an output from the MQSUB call. For more information, see Hobj (MQHOBJ) - input/output.

When the subscription is removed, the queue manager also undertakes to clean up messages that have not been retrieved from the managed destination, in the following situations:

- When the subscription is removed - by use of MQCLOSE with MQCO\_REMOVE\_SUB - and the managed Hobj is closed.
- By implicit means when the connection is lost to an application using a non-durable subscription (MQSO\_NON\_DURABLE)
- By expiration when a subscription is removed because it has expired and the managed Hobj is closed.

You must use managed subscriptions with non-durable subscriptions, so that this clean up can occur, and so that messages for closed non-durable subscriptions do not take up space in your queue manager. Durable subscriptions can also use managed destinations.

**Version:** The current version of MQSD is MQSD\_VERSION\_1.

**Character set and encoding:** Data in MQSD must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

*Fields for MQSD:*

The MQSD structure contains the following fields; the fields are described in alphabetical order:

*AlternateSecurityId (MQBYTE40):*

This is a security identifier that is passed with the AlternateUserId to the authorization service to allow appropriate authorization checks to be performed.

AlternateSecurityId is used only if MQSO\_ALTERNATE\_USER\_AUTHORITY is specified, and the AlternateUserId field is not entirely blank up to the first null character or the end of the field.

On return from an MQSUB call using MQSO\_RESUME, this field is unchanged.

See the description of “AlternateSecurityId (MQBYTE40)” on page 2246 in the MQOD data type for more information.

*AlternateUserId (MQCHAR12):*

If you specify MQSO\_ALTERNATE\_USER\_AUTHORITY, this field contains an alternative user identifier that is used to check the authorization for the subscription and for output to the destination queue (specified in the *Hobj* parameter of the MQSUB call), in place of the user identifier that the application is currently running under.

If successful, the user identifier specified in this field is recorded as the subscription owning user identifier in place of the user identifier that the application is currently running under.

If MQSO\_ALTERNATE\_USER\_AUTHORITY is specified and this field is entirely blank up to the first null character or the end of the field, the subscription can succeed only if no user authorization is needed to subscribe to this topic with the options specified or the destination queue for output.

If MQSO\_ALTERNATE\_USER\_AUTHORITY is not specified, this field is ignored.

The following differences exist in the environments indicated:

- On z/OS, only the first 8 characters of AlternateUserId are used to check the authorization for the subscription. However, the current user identifier must be authorized to specify this particular alternative user identifier; all 12 characters of the alternative user identifier are used for this check. The user identifier must contain only characters allowed by the external security manager.

On return from an MQSUB call using MQSO\_RESUME, this field is unchanged.

This is an input field. The length of this field is given by MQ\_USER\_ID\_LENGTH. The initial value of this field is the null string in C, and 12 blank characters in other programming languages.

*ObjectName* (MQCHAR48):

This is the name of the topic object as defined on the local queue manager.

The name can contain the following characters:

- Uppercase alphabetic characters (A through Z)
- Lowercase alphabetic characters (a through z)
- Numeric digits (0 through 9)
- Period (.), forward slash (/), underscore (\_), percent (%)

The name must not contain leading or embedded blanks, but can contain trailing blanks. Use a null character to indicate the end of significant data in the name; the null and any characters following it are treated as blanks. The following restrictions apply in the environments indicated:

- On systems that use EBCDIC Katakana, lowercase characters cannot be used.
- On z/OS:
  - Avoid names that begin or end with an underscore; they cannot be processed by the operations and control panels.
  - The percent character has a special meaning to RACF. If RACF is used as the external security manager, names must not contain the percent. If they do, those names are not included in any security checks when RACF generic profiles are used.
- On IBM i, names containing lowercase characters, forward slash, or percent, must be enclosed in quotation marks when specified on commands. These quotation marks must not be specified for names that occur as fields in structures or as parameters on calls.

The *ObjectName* is used to form the full topic name.

The full topic name can be built from two different fields: *ObjectName* and *ObjectString*. For details of how these two fields are used, see “Using topic strings” on page 2358.

If the object identified by the *ObjectName* field cannot be found, the call fails with reason code MQRC\_UNKNOWN\_OBJECT\_NAME even if there is a string specified in *ObjectString*.

On return from an MQSUB call using the MQSO\_RESUME option this field is unchanged.

The length of this field is given by MQ\_TOPIC\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

If altering an existing subscription using the MQSO\_ALTER option, the name of the topic object subscribed to cannot be changed. This field and the *ObjectString* field can be omitted. If they are provided, they must resolve to the same full topic name. If they do not, the call fails with MQRC\_TOPIC\_NOT\_ALTERABLE.

*ObjectString* (MQCHARV):

This is the long object name to be used.

The *ObjectString* is used to form the Full topic name.

The full topic name can be built from two different fields: *ObjectName* and *ObjectString*. For details of how these two fields are used, see “Using topic strings” on page 2358.

The maximum length of *ObjectString* is 10240.

If *ObjectString* is not specified correctly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC\_OBJECT\_STRING\_ERROR.

This is an input field. The initial values of the fields in this structure are the same as those in the MQCHARV structure.

If there are wildcards in the *ObjectString* the interpretation of those wildcards can be controlled using the Wildcard options specified in the Options field of the MQSD.

On return from an MQSUB call using the MQSO\_RESUME option this field is unchanged. The full topic name used is returned in the *ResObjectString* field if a buffer is provided.

If altering an existing subscription using the MQSO\_ALTER option, the long name of the topic object subscribed to cannot be changed. This field and the *ObjectName* field can be omitted. If they are provided they must resolve to the same full topic name or the call fails with MQRC\_TOPIC\_NOT\_ALTERABLE.

*Options* (MQLONG):

This provides options to control the action of the MQSUB call.

You must specify at least one of the following options:

- MQSO\_ALTER
- MQSO\_RESUME
- MQSO\_CREATE

To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

Combinations that are not valid are noted in this topic; any other combinations are valid.

**Access or creation options:** Access and creation options control whether a subscription is created, or whether an existing subscription is returned or altered. You must specify at least one of these options. The table displays valid combinations of access and creation options.

Combination of options	Notes
MQSO_CREATE	Creates a subscription if one does not exist. This combination fails if the subscription exists.
MQSO_RESUME	Resumes an existing subscription. This combination fails if no subscription exists.
MQSO_CREATE + MQSO_RESUME	Creates a subscription if one does not exist and resumes a matching one, if it does exist. This combination is useful when it is used in an application that is run a number of times.
MQSO_ALTER (see note)	Resumes an existing subscription, altering any fields to match that specified in the MQSD. This combination fails if no subscription exists.
MQSO_CREATE + MQSO_ALTER (see note)	Creates a subscription if one does not exist and resumes a matching one, if it does exist, altering any fields to match that specified in the MQSD. This combination is useful combination when used in an application that wants to ensure that its subscription is in a certain state before proceeding.

**Note:**

Options specifying MQSO\_ALTER can also specify MQSO\_RESUME, but this combination has no additional effect to specifying MQSO\_ALTER alone. MQSO\_ALTER implies MQSO\_RESUME, because calling MQSUB to alter a subscription implies that the subscription will also be resumed. The opposite is not true, however: resuming a subscription does not imply it is to be altered.

**MQSO\_CREATE**

Create a new subscription for the topic specified. If a subscription using the same *SubName* exists, the call fails with MQRC\_SUB\_ALREADY\_EXISTS. This failure can be avoided by combining the MQSO\_CREATE option with MQSO\_RESUME. The *SubName* is not always necessary. For more details, see the description of that field.

Combining MQSO\_CREATE with MQSO\_RESUME returns a handle to a pre-existing subscription for the specified *SubName* if one is found; if there is no existing subscription, a new one is created using all the fields provided in the MQSD.

MQSO\_CREATE can also be combined with MQSO\_ALTER to similar effect.

**MQSO\_RESUME**

Return a handle to a pre-existing subscription which matches that specified by *SubName*. No changes are made to the matching subscriptions attributes and they are returned on output in the MQSD structure. Only the following MQSD fields are used: StrucId, Version, Options, AlternateUserId and AlternateSecurityId, and SubName.

The call fails with reason code MQRC\_NO\_SUBSCRIPTION if a subscription does not exist matching the full subscription name. This failure can be avoided by combining the MQSO\_CREATE option with MQSO\_RESUME.

The user ID of the subscription is the user ID that created the subscription, or if it has been later altered by a different user ID, it is the user ID of the most recent successful alteration. If an AlternateUserId is used, and use of alternate user IDs is allowed for that user, the alternate user ID is recorded as the user ID that created the subscription instead of the user ID under which the subscription was made.

If a matching subscription exists that was created without the MQSO\_ANY\_USERID option, and the user ID of the subscription is different from that of the application requesting a handle to the subscription, the call fails with reason code MQRC\_IDENTITY\_MISMATCH.

If a matching subscription exists and is currently in use, the call fails with MQRC\_SUBSCRIPTION\_IN\_USE.

If the subscription named in SubName is not a valid subscription to resume or alter from an application, the call fails with MQRC\_INVALID\_SUBSCRIPTION.

MQSO\_RESUME is implied by MQSO\_ALTER so you do not need to combine it with that option. However, combining the two options does not cause an error.

## MQSO\_ALTER

Return a handle to a pre-existing subscription with the full subscription name matching that specified by the name in *SubName*. Any attributes of the subscription that are different from that specified in the MQSD are altered in the subscription unless alteration is disallowed for that attribute. Details are noted in the description of each attribute and are summarized in the following table. If you try to alter an attribute that cannot be changed, or to alter a subscription that has set the MQSO\_IMMUTABLE option, the call fails with the reason code shown in the following table.

The call fails with reason code MQRC\_NO\_SUBSCRIPTION if a subscription matching the full subscription name does not exist. You can avoid this failure by combining the MQSO\_CREATE option with MQSO\_ALTER.

Combining MQSO\_CREATE with MQSO\_ALTER returns a handle to a pre-existing subscription for the specified *SubName* if one is found; if there is no existing subscription, a new one is created using all the fields provided in the MQSD.

The user ID of the subscription is the user ID that created the subscription, or if it is later altered by a different user ID, it is the user ID of the most recent, successful alteration. If an AlternateUserId is used, and use of alternate user IDs is allowed for that user, then the alternate user ID is recorded as the user ID that created the subscription instead of the user ID under which the subscription was made.

If a matching subscription exists that was created without the option MQSO\_ANY\_USERID and the user ID of the subscription is different from that of the application requesting a handle to the subscription, the call fails with reason code MQRC\_IDENTITY\_MISMATCH.

If a matching subscription exists and is currently in use, the call fails with MQRC\_SUBSCRIPTION\_IN\_USE.

If the subscription named in SubName is not a valid subscription to resume or alter from an application, the call fails with MQRC\_INVALID\_SUBSCRIPTION.

The following table shows the ability of MQSO\_ALTER to alter attribute values in MQSD and MQSUB.

*Table 228. Attributes in MQSD and MQSUB that can be altered*

Data type descriptor or function call	Field name	Can this attribute be altered using MQSO_ALTER	Reason Code
MQSD	Durability options	No	MQRC_DURABILITY_NOT_ALTERABLE
MQSD	Destination Options	Yes	None
MQSD	Registration options	Yes (see note 1 on page 2348)	MQRC_GROUPING_NOT_ALTERABLE if you try to alter MQSO_GROUP_SUB
MQSD	Publication options	Yes (see note 2 on page 2348)	None
MQSD	Wildcard options	No	MQRC_TOPIC_NOT_ALTERABLE
MQSD	Other options	No (see note 3 on page 2348)	None
MQSD	ObjectName	No	MQRC_TOPIC_NOT_ALTERABLE
MQSD	AlternateUserId	No (see note 4 on page 2348)	None

Table 228. Attributes in MQSD and MQSUB that can be altered (continued)

Data type descriptor or function call	Field name	Can this attribute be altered using MQSO ALTER	Reason Code
MQSD	AlternateSecurityId	No (see note 4)	None
MQSD	SubExpiry	Yes	None
MQSD	ObjectString	No	MQRC_TOPIC_NOT_ALTERABLE
MQSD	SubName	No (see note 5 )	None
MQSD	SubUserData	Yes	None
MQSD	SubCorrelId	Yes (see note 6)	MQRC_GROUPING_NOT_ALTERABLE when in a grouped subscription
MQSD	PubPriority	Yes	None
MQSD	PubAccountingToken	Yes	None
MQSD	PubAppIdentityData	Yes	None
MQSD	SubLevel	No	MQRC_SUBLEVEL_NOT_ALTERABLE
MQSUB	Hobj	Yes (see note 6)	MQRC_GROUPING_NOT_ALTERABLE when in a grouped subscription

**Notes:**

1. MQSO\_GROUP\_SUB cannot be altered.
2. MQSO\_NEW\_PUBLICATIONS\_ONLY cannot be altered because it is not part of the subscription
3. These options are not part of the subscription
4. This attribute is not part of the subscription
5. This attribute is the identity of the subscription being altered
6. Alterable except when part of a grouped sub (MQSO\_GROUP\_SUB)

**Durability options:** The following options control how durable the subscription is. You can specify only one of these options. If you are altering an existing subscription using the MQSO ALTER option, you cannot change the durability of the subscription. On return from an MQSUB call using MQSO\_RESUME, the appropriate durability option is set.

**MQSO\_DURABLE**

Request that the subscription to this topic remains until it is explicitly removed using MQCLOSE with the MQCO\_REMOVE\_SUB option. If this subscription is not explicitly removed it will remain even after this applications connection to the queue manager is closed.

If a durable subscription is requested to a topic that is defined as not allowing durable subscriptions, the call fails with MQRC\_DURABILITY\_NOT\_ALLOWED.

**MQSO\_NON\_DURABLE**

Request that the subscription to this topic is removed when the applications connection to the queue manager is closed, if it is not already explicitly removed. MQSO\_NON\_DURABLE is the opposite of the MQSO\_DURABLE option, and is defined to aid program documentation. It is the default if neither is specified.

**Destination options:** The following option controls the destination that publications for a topic that has been subscribed to are sent to. If altering an existing subscription using the MQSO ALTER option, the destination used for publications for the subscription can be changed. On return from an MQSUB call using MQSO\_RESUME, this option is set if appropriate.

**MQSO\_MANAGED**

Request that the destination that the publications are sent to is managed by the queue manager.

The object handle returned in *Hobj* represents a queue manager managed queue and is for use with subsequent MQGET, MQCB, MQINQ, or MQCLOSE calls.

An object handle returned from a previous MQSUB call cannot be provided in the *Hobj* parameter when MQSO\_MANAGED is not specified.

### MQSO\_NO\_MULTICAST

Request that the destination that the publications are sent to is not a multicast group address. This option is only valid when combined with the MQSO\_MANAGED option. When a handle to a queue is provided in the *Hobj* parameter, multicast cannot be used for this subscription, and the option is not valid.

If the topic is defined to only allow multicast subscriptions, using the MCAST(ONLY) setting, then the call fails with reason code MQRC\_MULTICAST\_REQUIRED.

**Scope Option:** The following option controls the scope of the subscription being made. If altering an existing subscription using the MQSO\_ALTER option, this subscription scope option cannot be changed. On returning from an MQSUB call using MQSO-RESUME, the appropriate scope option is set.

### MQSO\_SCOPE\_QMGR

This subscription is made only on the local queue manager. No proxy subscription is distributed to other queue managers in the network. Only publications that are published at this queue manager are sent to this subscriber. This overrides any behavior set using the SUBSCOPE topic attribute.

**Note:** If not set, the subscription scope is determined by the SUBSCOPE topic attribute.

**Registration options:** The following options control the details of the registration that is made to the queue manager for this subscription. If altering an existing subscription using the MQSO\_ALTER option, these registration options can be changed. On return from an MQSUB call using MQSO-RESUME the appropriate registration options is set.

### MQSO\_GROUP\_SUB

This subscription is to be grouped with other subscriptions of the same SubLevel using the same queue and specifying the same correlation ID so that any publications to topics that would cause more than one publication message to be provided to the group of subscriptions, due to an overlapping set of topic strings being used, only causes one message to be delivered to the queue. If this option is not used, then each unique subscription (identified by SubName) that matches is provided with a copy of the publication which could mean more than one copy of the publication may be placed on the queue shared by a number of subscriptions.

Only the most significant subscription in the group is provided with a copy of the publication. The most significant subscription is based on the Full topic name up to the point where a wildcard is found. If a mixture of wildcard schemes is used within the group, only the position of the wildcard is important. You are advised not to combine different wildcard schemes within a group of subscriptions that share the same queue.

When creating a new grouped subscription it must still have a unique SubName, but if it matches the full topic name of an existing subscription in the group, the call fails with MQRC\_DUPLICATE\_GROUP\_SUB.

If the most significant subscription in group also specifies MQSO\_NOT\_OWN\_PUBS and this is a publication from the same application, then no publication is delivered to the queue.

When altering a subscription made with this option, the fields which imply the grouping, *Hobj* on the MQSUB call (representing the queue and queue manager name), and the SubCorrelId cannot be changed. Attempting to alter them causes the call to fail with MQRC\_GROUPING\_NOT\_ALTERABLE.

This option must be combined with MQSO\_SET\_CORREL\_ID with a SubCorrelId that is not set to MQCI\_NONE, and cannot be combined with MQSO\_MANAGED.

### MQSO\_ANY\_USERID

When MQSO\_ANY\_USERID is specified, the identity of the subscriber is not restricted to a single user ID. This allows any user to alter or resume the subscription when they have suitable authority. Only a single user may have the subscription at any one time. An attempt to resume use of a subscription currently in use by another application causes the call to fail with MQRC\_SUBSCRIPTION\_IN\_USE.

To add this option to an existing subscription the MQSUB call (using MQSO\_ALTER) must come from the same user ID as the original subscription itself.

If an MQSUB call refers to an existing subscription with MQSO\_ANY\_USERID set, and the user ID differs from the original subscription, the call succeeds only if the new user ID has authority to subscribe to the topic. On successful completion, future publications to this subscriber are put to the subscribers queue with the new user ID set in the publication message.

Do not specify both MQSO\_ANY\_USERID and MQSO\_FIXED\_USERID. If neither is specified, the default is MQSO\_FIXED\_USERID.

### **MQSO\_FIXED\_USERID**

When MQSO\_FIXED\_USERID is specified, the subscription can be altered or resumed by only the last user ID to alter the subscription. If the subscription has not been altered, it is the user ID that created the subscription.

If an MQSUB verb refers to an existing subscription with MQSO\_ANY\_USERID set and alters the subscription using MQSO\_ALTER to use option MQSO\_FIXED\_USERID, the user ID of the subscription is now fixed at this new user ID. The call succeeds only if the new user ID has authority to subscribe to the topic.

If a user ID other than the one recorded as owning a subscription tries to resume or alter an MQSO\_FIXED\_USERID subscription, the call fails with MQRC\_IDENTITY\_MISMATCH. The owning user ID of a subscription can be viewed using the DISPLAY SBSTATUS command.

Do not specify both MQSO\_ANY\_USERID and MQSO\_FIXED\_USERID. If neither is specified, the default is MQSO\_FIXED\_USERID.

**Publication options:** The following options control the way publications are sent to this subscriber. If altering an existing subscription using the MQSO\_ALTER option, these publication options can be changed.

### **MQSO\_NOT\_OWN\_PUBS**

Tells the broker that the application does not want to see any of its own publications. Publications are considered to originate from the same application if the connection handles are the same. On return from an MQSUB call using MQSO\_RESUME, this option is set if appropriate.

### **MQSO\_NEW\_PUBLICATIONS\_ONLY**

No currently retained publications are to be sent, when this subscription is created, only new publications. This option only applies when MQSO\_CREATE is specified. Any subsequent changes to a subscription do not alter the flow of publications and so any publications retained on a topic, will have already been sent to the subscriber as new publications.

If this option is specified without MQSO\_CREATE the call fails with MQRC\_OPTIONS\_ERROR. On return from an MQSUB call using MQSO\_RESUME, this option is not set even if the subscription was created using this option.

If this option is not used, previously retained messages are sent to the destination queue provided. If this action fails due to an error, either MQRC\_RETAINED\_MSG\_Q\_ERROR or MQRC\_RETAINED\_NOT\_DELIVERED, the creation of the subscription fails.

### **MQSO\_PUBLICATIONS\_ON\_REQUEST**

Setting this option indicates that the subscriber will request information specifically when required. The queue manager does not send unsolicited messages to the subscriber. The retained publication (or possibly multiple publications if a wildcard is specified in the topic) is sent to the

subscriber each time an MQSUBRQ call is made using the Hsub handle from a previous MQSUB call. No publications are sent as a result of the MQSUB call using this option. On return from an MQSUB call using MQSO\_RESUME, this option is set if appropriate.

This option is not valid in combination with a SubLevel greater than 1.

**Read ahead options:** The following options control whether non-persistent messages are sent to an application ahead of the application requesting them.

**MQSO\_READ\_AHEAD\_AS\_Q\_DEF**

If the MQSUB call uses a managed handle, the default read ahead attribute of the model queue associated with the topic subscribed to determines whether messages are sent to the application before the application requests them.

This is the default value.

**MQSO\_NO\_READ\_AHEAD**

If the MQSUB call uses a managed handle, messages are not sent to the application before the application requests them.

**MQSO\_READ\_AHEAD**

If the MQSUB call uses a managed handle, messages might be sent to the application before the application requests them.

**Note:**

The following notes apply to the read ahead options:

1. Only one of these options can be specified. If both MQOO\_READ\_AHEAD and MQOO\_NO\_READ\_AHEAD are specified, reason code MQRC\_OPTIONS\_ERROR is returned. These options are only applicable if MQSO\_MANAGED is specified.
2. They are not applicable for MQSUB when a queue is passed which has been opened previously. Read ahead might not be enabled when requested. The MQGET options used on the first MQGET call might prevent read ahead from being enabled. Also, read ahead is disabled when the client is connecting to a queue manager where read ahead is not supported. If the application is not running as an IBM MQ client, these options are ignored.

**Wildcard options:** The following options control how wildcards are interpreted in the string provided in the ObjectString field of the MQSD. You can specify only one of these options. If altering an existing subscription using the MQSO\_ALTER option, these wildcard options cannot be changed. On return from an MQSUB call using MQSO\_RESUME, the appropriate wildcard option is set.

**MQSO\_WILDCARD\_CHAR**

Wildcards only operate on characters within the topic string.

The behavior defined by MQSO\_WILDCARD\_CHAR is shown in the following table.

Special Character	Behavior
Forward slash (/)	No significance, just another character
Asterisk (*)	Wildcard, zero or more characters
Question mark (?)	Wildcard, 1 character
Percent sign (%)	Escape character to allow the characters (*), (?) or (%) to be used in a string and not be interpreted as a special character, for example, (%*), (%?) or (%%).

For example, publishing on the following topic:

/level0/level1/level2/level3/level4

matches subscribers using the following topics:

```

*
/*
/ level0/level1/level2/level3/*
/ level0/level1/*/level3/level4
/ level0/level1/le?e12/level3/level4

```

**Note:** This use of wildcards supplies exactly the meaning provided in IBM MQ V6 and WebSphere MB V6 when using MQRFH1 formatted messages for publish/subscribe. It is recommended that this is not used for newly written applications and is only used for applications that were previously running against that version and have not been changed to use the default wildcard behavior as described in MQSO\_WILDCARD\_TOPIC.

## MQSO\_WILDCARD\_TOPIC

Wildcards only operate on topic elements within the topic string. This is the default behavior if none is chosen.

The behavior required by MQSO\_WILDCARD\_TOPIC is shown in the following table:

Special Character	Behavior
(/)	Topic level separator
Number sign (#)	Wildcard: multiple topic level
Plus sign (+)	Wildcard: single topic level

### Notes:

The (+) and (#) are not treated as wildcards if they are mixed in with other characters (including themselves) within a topic level. In the following string, the (#) and (+) characters are treated as ordinary characters.

```
level0/level1/#+/level3/level#
```

For example, publishing on the following topic:

```
/level0/level1/level2/level3/level4
```

matches subscribers using the following topics:

```

#
/#
/ level0/level1/level2/level3/#
/ level0/level1+/level3/level4

```

**Other options:** The following options control the way the API call is issued rather than the subscription. On return from an MQSUB call using MQSO\_RESUME, these options are unchanged. See “AlternateUserId (MQCHAR12)” on page 2343 for more details.

## MQSO\_ALTERNATE\_USER\_AUTHORITY

The AlternateUserId field contains a user identifier to use to validate this MQSUB call. The call can succeed only if this AlternateUserId is authorized to open the object with the specified access options, regardless of whether the user identifier under which the application is running is authorized to do so.

## MQSO\_SET\_CORREL\_ID

The subscription is to use the correlation identifier supplied in the *SubCorrelId* field. If this option is not specified, a correlation identifier is automatically created by the queue manager at subscription time and is returned to the application in the *SubCorrelId* field. For more information, see “SubCorrelId (MQBYTE24)” on page 2356 for more information.

This option cannot be combined with MQSO\_MANAGED.

## MQSO\_SET\_IDENTITY\_CONTEXT

The subscription is to use the accounting token and application identity data supplied in the *PubAccountingToken* and *PubApplIdentityData* fields.

If this option is specified, the same authorization check is carried out as if the destination queue was accessed using an MQOPEN call with MQOO\_SET\_IDENTITY\_CONTEXT, except in the case where the MQSO\_MANAGED option is also used in which case there is no authorization check on the destination queue.

If this option is not specified, the publications sent to this subscriber have default context information associated with them as follows:

Field in MQMD	Value used
<i>UserIdentifier</i>	The user ID associated with the subscription at the time the subscription was made.
<i>AccountingToken</i>	Determined from the environment if possible; Set to MQACT_NONE if not.
<i>ApplIdentityData</i>	Set to blanks

This option is only valid with MQSO\_CREATE and MQSO\_ALTER. If used with MQSO\_RESUME, the *PubAccountingToken* and *PubApplIdentityData* fields are ignored, so this option has no effect.

If a subscription is altered without using this option where previously the subscription supplied identity context information, default context information is generated for the altered subscription.

If a subscription allowing different user IDs to use it with option MQSO\_ANY\_USERID, is resumed by a different user ID, default identity context is generated for the new user ID now owning the subscription and any subsequent publications are delivered containing the new identity context.

## MQSO\_FAIL\_IF QUIESCING

The MQSUB call fails if the queue manager is in quiescing state. On z/OS, for a CICS or IMS application, this option also forces the MQSUB call to fail if the connection is in quiescing state.

*PubAccountingToken* (MQBYTE32):

This is the value that will be in the *AccountingToken* field of the Message Descriptor (MQMD) of all publication messages matching this subscription. *AccountingToken* is part of the identity context of the message. For more information about message context, see Message context. For more information about the *AccountingToken* field in the MQMD, see "AccountingToken (MQBYTE32)" on page 2182

You can use the following special value for the *PubAccountingToken* field:

### MQACT\_NONE

No accounting token is specified.

The value is binary zero for the length of the field.

For the C programming language, the constant MQACT\_NONE\_ARRAY is also defined; this has the same value as MQACT\_NONE, but is an array of characters instead of a string.

If the option MQSO\_SET\_IDENTITY\_CONTEXT is not specified, the accounting token is generated by the queue manager as default context information and this field is an output field which contains the *AccountingToken* which will be set in each message published for this subscription.

If the option `MQSO_SET_IDENTITY_CONTEXT` is specified, the accounting token is being generated by the user and this field is an input field which contains the *AccountingToken* to be set in each publication for this subscription.

The length of this field is given by `MQ_ACCOUNTING_TOKEN_LENGTH`. The initial value of this field is `MQACT_NONE`.

If altering an existing subscription using the `MQSO_ALTER` option, the value of *AccountingToken* in any future publication messages can be changed.

On return from an `MQSUB` call using `MQSO_RESUME`, this field is set to the current *AccountingToken* being used for the subscription.

*PubApplIdentityData* (MQCHAR32):

This is the value that is in the *ApplIdentityData* field of the Message Descriptor (MQMD) of all publication messages matching this subscription. *ApplIdentityData* is part of the identity context of the message. For more information about message context, see Message context. For more information about the *ApplIdentityData* field in the MQMD, see “*ApplIdentityData* (MQCHAR32)” on page 2184

If the option `MQSO_SET_IDENTITY_CONTEXT` is not specified, the *ApplIdentityData* which is set in each message published for this subscription is blanks, as default context information.

If the option `MQSO_SET_IDENTITY_CONTEXT` is specified, the *PubApplIdentityData* is being generated by the user and this field is an input field which contains the *ApplIdentityData* to be set in each publication for this subscription.

The length of this field is given by `MQ_APPL_IDENTITY_DATA_LENGTH`. The initial value of this field is the null string in C, and 32 blank characters in other programming languages.

If altering an existing subscription using the `MQSO_ALTER` option, the *ApplIdentityData* of any future publication messages can be changed.

On return from an `MQSUB` call using `MQSO_RESUME`, this field is set to the current *ApplIdentityData* being used for the subscription.

*PubPriority* (MQLONG):

This is the value that will be in the *Priority* field of the Message Descriptor (MQMD) of all publication messages matching this subscription. For more information about the *Priority* field in the MQMD, see “*Priority* (MQLONG)” on page 2212.

The value must be greater than or equal to zero; zero is the lowest priority. The following special values can also be used:

#### **MQPRI\_PRIORITY\_AS\_Q\_DEF**

When a subscription queue is provided in the *Hobj* field in the `MQSUB` call, and is not a managed handle, then the priority for the message is taken from the *DefPriority* attribute of this queue. If the queue is a cluster queue or there is more than one definition in the queue-name resolution path then the priority is determined when the publication message is put to the queue as described for “*Priority* (MQLONG)” on page 2212.

If the `MQSUB` call uses a managed handle, the priority for the message is taken from the *DefPriority* attribute of the model queue associated with the topic subscribed to.

#### **MQPRI\_PRIORITY\_AS\_PUBLISHED**

The priority for the message is the priority of the original publication. This is the initial value of the field.

If altering an existing subscription using the MQSO\_ALTER option, the *Priority* of any future publication messages can be changed.

On return from an MQSUB call using MQSO\_RESUME, this field is set to the current priority being used for the subscription.

*ResObjectString* (MQCHARV):

This is the long object name after the queue manager resolves the name provided in *ObjectName*.

If the long object name is provided in *ObjectString* and nothing is provided in *ObjectName*, then the value returned in this field is the same as provided in *ObjectString*.

If this field is omitted (that is *ResObjectString.VSBufSize* is zero) then the *ResObjectString* is not returned, but the length is returned in *ResObjectString.VSLength*. If the length is shorter than the full *ResObjectString* then it is truncated and returns as many of the rightmost characters as can fit in the provided length.

If *ResObjectString* is specified incorrectly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC\_RES\_OBJECT\_STRING\_ERROR.

*SelectionString* (MQCHARV):

This is the string used to provide the selection criteria used when subscribing for messages from a topic.

This variable length field will be returned on output from an MQSUB call using the MQSO\_RESUME option, if a buffer is provided, and also there is a positive buffer length in *VSBufSize*. If no buffer is provided on the call, only the length of the selection string will be returned in the *VSLength* field of the MQCHARV. If the buffer provided is smaller than the space required to return the field, only *VSBufSize* bytes are returned in the provided buffer.

If *SelectionString* is specified incorrectly, according to the description of how to use the “MQCHARV - Variable Length String” on page 2050 structure, or if it exceeds the maximum length, the call fails with reason code MQRC\_SELECTION\_STRING\_ERROR.

*SelectionString* usage is described in Selectors.

*StrucId* (MQCHAR4):

This is the structure identifier; the value must be:

#### **MQSD\_STRUC\_ID**

Identifier for Subscription Descriptor structure.

For the C programming language, the constant MQSD\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQSD\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQSD\_STRUC\_ID.

*SubCorrelId (MQBYTE24):*

This field contains a correlation identifier common to all publications matching this subscription.

**Attention:** a correlation identifier can only be passed between queue managers in a publish/subscribe cluster, not a hierarchy.

All publications sent to match this subscription contain this correlation identifier in the message descriptor. If multiple subscriptions get their publications from the same queue, using MQGET by correlation identifier allows only publications for a specific subscription to be obtained. This correlation identifier can either be generated by the queue manager or by the user.

If the option MQSO\_SET\_CORREL\_ID is not specified, the correlation identifier is generated by the queue manager and this field is an output field containing the correlation identifier that will be set in each message published for this subscription. The generated correlation identifier consists of a 4-byte product identifier (AMQX or CSQM in either ASCII or EBCDIC) followed by a product specific implementation of a unique string.

If the option MQSO\_SET\_CORREL\_ID is specified, the correlation identifier is generated by the user and this field is an input field containing the correlation identifier to be set in each publication for this subscription. In this case, if the field contains MQCI\_NONE, the correlation identifier that is set in each message published for this subscription is the correlation identifier created by the original put of the message.

If the option MQSO\_GROUP\_SUB is specified and the correlation identifier specified is the same as an existing grouped subscription using the same queue and an overlapping topic string, only the most significant subscription in the group is provided with a copy of the publication.

The length of this field is given by MQ\_CORREL\_ID\_LENGTH. The initial value of this field is MQCI\_NONE.

If you are altering an existing subscription using the MQSO\_ALTER option, and this field is an input field, then the subscription correlation identifier can be changed, unless the subscription is a grouped subscription, that is, it has been created using the option MQSO\_GROUP\_SUB, in which case the subscription correlation identifier cannot be changed.

On return from an MQSUB call using MQSO\_RESUME, this field is set to the current correlation identifier for the subscription.

*SubExpiry (MQLONG):*

This is the time expressed in tenths of a second after which the subscription expires. No more publications will match this subscription after this interval has passed. As soon as a subscription expires, publications are no longer sent to the queue. However, the publications that are already there are not affected in any way. *SubExpiry* has no effect on publication expiry.

The following special value is recognized:

**MQEI\_UNLIMITED**

The subscription has an unlimited expiration time.

If altering an existing subscription using the MQSO\_ALTER option, the expiry of the subscription can be changed.

On return from an MQSUB call using the MQSO\_RESUME option this field is set to the original expiry of the subscription and not the remaining expiry time.

*SubLevel (MQLONG):*

This is the level associated with the subscription. Publications are only delivered to this subscription if it is in the set of subscriptions with the highest SubLevel value less than or equal to the PubLevel used at publication time. However, if a publication has been retained, it is no longer available to subscribers at higher levels because it is republished at PubLevel 1.

The value must be in the range zero to 9. Zero is the lowest level.

The initial value of this field is 1.

For more information see Intercepting publications.

If altering an existing subscription using the MQSO\_ALTER option, then the SubLevel cannot be changed.

Combining a SubLevel with a value greater than 1 with the option MQSO\_PUBLICATIONS\_ON\_REQUEST is not allowed.

On return from an MQSUB call using MQSO\_RESUME, this field is set to the current level being used for the subscription.

*SubUserData (MQCHARV):*

This specifies the subscription user data. The data provided on the subscription in this field will be included as the MQSubUserData message property of every publication sent to this subscription.

The maximum length of *SubUserData* is 10240.

If *SubUserData* is specified incorrectly, according to the description of how to use the MQCHARV structure, or if it exceeds the maximum length, the call fails with reason code MQRC\_SUB\_USER\_DATA\_ERROR.

This is an input field. The initial values of the fields in this structure are the same as those in the MQCHARV structure.

If altering an existing subscription using the MQSO\_ALTER option, the subscription user data can be changed.

This variable length field is returned on output from an MQSUB call using the MQSO\_RESUME option, if a buffer is provided and there is a positive buffer length in *VSBuflen*. If no buffer is provided on the call, only the length of the subscription user data is returned in the *VSLength* field of the MQCHARV. If the buffer provided is smaller than the space required to return the field, only *VSBuflen* bytes are returned in the provided buffer.

*SubName* (MQCHARV):

This specifies the subscription name. This field is only required if *Options* specifies the option MQSO\_DURABLE, but if provided will be used by the queue manager for MQSO\_NON\_DURABLE as well.

If specified, *SubName* must be unique within the queue manager, because it is the method used to identify the subscription.

The maximum length of *SubName* is 10240.

This field serves two purposes. For an MQSO\_DURABLE subscription, you use this field to identify a subscription so you can resume it after it has been created if you have either closed the handle to the subscription (using the MQCO\_KEEP\_SUB option) or have been disconnected from the queue manager. This is done using the MQSUB call with the MQSO\_RESUME option. It is also displayed in the administrative view of subscriptions in the SUBNAME field in DISPLAY SBSTATUS.

If *SubName* is specified incorrectly, according to the description of how to use the MQCHARV structure, is left out when it is required (that is *SubName.VSLength* is zero), or if it exceeds the maximum length, the call fails with reason code MQRC\_SUB\_NAME\_ERROR.

This is an input field. The initial values of the fields in this structure are the same as those in the MQCHARV structure.

If altering an existing subscription using the MQSO\_ALTER option, the subscription name cannot be changed, because it is the identifying field used to find the referenced subscription. It is not changed on output from an MQSUB call with the MQSO\_RESUME option.

*Version* (MQLONG):

This is the structure version number; the value must be:

#### **MQSD\_VERSION\_1**

Version-1 Subscription Descriptor structure.

The following constant specifies the version number of the current version:

#### **MQSD\_CURRENT\_VERSION**

Current version of Subscription Descriptor structure.

This is always an input field. The initial value of this field is MQSD\_VERSION\_1.

*Using topic strings:*

A topic is constructed from the subtopic identified in a topic object, and a subtopic provided by an application. You can use either subtopic as the topic name, or combine them to form a new topic name.

In an MQI program the full topic name is created by MQOPEN. It is composed of two fields used in publish/subscribe MQI calls, in the order listed:

1. The **TOPICSTR** attribute of the topic object, named in the **ObjectName** field.
2. The **ObjectString** parameter defining the subtopic provided by the application.

The resulting topic string is returned in the **ResObjectString** parameter.

These fields are considered to be present if the first character of each field is not a blank or null character, and the field length is greater than zero. If only one of the fields is present, it is used unchanged as the

topic name. If neither field has a value, the call fails with reason code MQRC\_UNKNOWN\_OBJECT\_NAME, or MQRC\_TOPIC\_STRING\_ERROR if the full topic name is not valid.

If both fields are present, a ' / ' character is inserted between the two elements of the resultant combined topic name.

Table 229 shows examples of topic string concatenation:

Table 229. Topic string concatenation examples

TOPICSTR	ObjectString	Full topic name	Comment
Football/Scores	''	Football/Scores	The TOPICSTR is used alone
''	Football/Scores	Football/Scores	The ObjectString is used alone
Football	Scores	Football/Scores	A '/' character is added at the concatenation point
Football	/Scores	Football//Scores	An 'empty node' is produced between the two strings
/Football	Scores	/Football/Scores	The topic starts with an 'empty node'

The ' / ' character is considered as a special character, providing structure to the full topic name in Topic trees, and must not be used for any other reason as the structure of the topic tree is affected. The topic " /Football " is not the same as the topic " Football ".

The following wildcard characters are special characters:

- plus sign ' + '
- number sign ' # '
- asterisk ' \* '
- question mark ' ? '

These characters are not considered as invalid, however you must ensure to understand how they are used. You might prefer not to use these characters in your topic strings when publishing. Publishing on a topic string with ' # ' or ' + ' mixed in with other characters (including themselves) within a topic level, can be subscribed to with either wildcard scheme. Publishing on a topic string with ' # ' or ' + ' as the only character between two ' / ' characters produces a topic string that cannot be subscribed to explicitly by an application using the wildcard scheme MQSO\_WILDCARD\_TOPIC. This situation results in the application getting more publications than expected.

### Example code snippet

This code snippet, extracted from the example program Example 2: Publisher to a variable topic, combines a topic object with a variable topic string.

```
MQOD      td = {MQOD_DEFAULT}; /* Object Descriptor      */
td.ObjectType = MQOT_TOPIC; /* Object is a topic      */
td.Version = MQOD_VERSION_4; /* Descriptor needs to be V4 */
strncpy(td.ObjectName, topicName, MQ_TOPIC_NAME_LENGTH);
td.ObjectString.VSPtr = topicString;
td.ObjectString.VSLength = (MQLONG)strlen(topicString);
td.ResObjectString.VSPtr = resTopicStr;
td.ResObjectString.VSBufSize = sizeof(resTopicStr)-1;
MQOPEN(Hconn, &td, MQOO_OUTPUT | MQOO_FAIL_IF QUIESCING, &Hobj, &CompCode, &Reason);
```

Initial values and language declarations for MQSD:

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQSD_STRUC_ID	'SD↯'
<i>Version</i>	MQSD_VERSION_1	1
<i>Options</i>	MQSO_NON_DURABLE	0
<i>ObjectName</i>	None	Null string or blanks
<i>AlternateUserId</i>	None	Null string or blanks
<i>AlternateSecurityId</i>	MQSID_NONE	Nulls
<i>SubExpiry</i>	MQEI_UNLIMITED	-1
<i>ObjectString</i>	None	Names and values as defined for MQCHARV
<i>SubName</i>	None	Names and values as defined for MQCHARV
<i>SubUserData</i>	None	Names and values as defined for MQCHARV
<i>SubCorrelId</i>	MQCI_NONE	Nulls
<i>PubPriority</i>	MQPRI_PRIORITY_AS_Q_DEF	-3
<i>PubAccountingToken</i>	MQACT_NONE	Nulls
<i>PubApplIdentityData</i>	None	Null string or blanks
<i>SelectionString</i>	None	Names and values as defined for MQCHARV
<i>SubLevel</i>	None	1
<i>ResObjectString</i>	None	Names and values as defined for MQCHARV

**Notes:**

1. The symbol ↯ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQSD\_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:  

```
MQSD MySD = {MQSD_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQSD MQSD;
struct tagMQSD {
    MQCHAR4   StructId;           /* Structure identifier */
    MQLONG    Version;           /* Structure version number */
    MQLONG    Options;           /* Options associated with subscribing */
    MQCHAR48  ObjectName;        /* Object name */
    MQCHAR12  AlternateUserId;    /* Alternate user identifier */
    MQBYTE40  AlternateSecurityId; /* Alternate security identifier */
    MQLONG    SubExpiry;         /* Expiry of Subscription */
    MQCHARV   ObjectString;      /* Object Long name */
    MQCHARV   SubName;           /* Subscription name */
    MQCHARV   SubUserData;       /* Subscription User data */
    MQBYTE24  SubCorrelId;       /* Correlation Id related to this subscription */
    MQLONG    PubPriority;        /* Priority set in publications */
    MQBYTE32  PubAccountingToken; /* Accounting Token set in publications */
    MQCHAR32  PubAppIdentityData; /* Appl Identity Data set in publications */
    MQCHARV   SelectionString;   /* Message selector structure */
    MQLONG    SubLevel;          /* Subscription level */
    MQCHARV   ResObjectString;   /* Resolved Long object name*/
    /* Ver:1 */
};
```

## MQSMPO - Set message property options:

The following table summarizes the fields in the structure.

Table 230. Fields in MQSMPO

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options	Options
<i>ValueEncoding</i>	Property value encoding	ValueEncoding
<i>ValueCCSID</i>	Property value character set	ValueCCSID

Overview for MQSMPO:

**Availability:** All IBM MQ systems and IBM MQ clients.

**Purpose:** The **MQSMPO** structure allows applications to specify options that control how properties of messages are set. The structure is an input parameter on the **MQSETMP** call.

**Character set and encoding:** Data in **MQSMPO** must be in the character set of the application and encoding of the application ( **MQENC\_NATIVE** ).

Fields for MQSMPO:

The MQSMPO structure contains the following fields; the fields are described in **alphabetical order**:

*Options (MQLONG):*

**Location options:** The following options relate to the relative location of the property compared to the property cursor:

### **MQSMPO\_SET\_FIRST**

Sets the value of the first property that matches the specified name, or if it does not exist, adds a new property after all other properties with a matching hierarchy.

### **MQSMPO\_SET\_PROP\_UNDER\_CURSOR**

Sets the value of the property pointed to by the property cursor. The property pointed to by the property cursor is the one that was last inquired using either the MQIMPO\_INQ\_FIRST or the MQIMPO\_INQ\_NEXT option.

The property cursor is reset when the message handle is reused on an MQGET call, or when the message handle is specified in the *MsgHandle* field of the MQGMO or MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established or if the property pointer to by the property cursor has been deleted, the call fails with completion code MQCC\_FAILED and reason code MQRC\_PROPERTY\_NOT\_AVAILABLE.

### **MQSMPO\_SET\_PROP\_BEFORE\_CURSOR**

Sets a new property before the property pointed to by the property cursor. The property pointed to by the property cursor is the one that was last inquired using either the MQIMPO\_INQ\_FIRST or the MQIMPO\_INQ\_NEXT option.

The property cursor is reset when the message handle is reused on an MQGET call, or when the message handle is specified in the *MsgHandle* field of the MQGMO or MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established or if the property pointer to by the property cursor has been deleted, the call fails with completion code MQCC\_FAILED and reason code MQRC\_PROPERTY\_NOT\_AVAILABLE.

#### **MQSMPO\_SET\_PROP\_AFTER\_CURSOR**

Sets a new property after the property pointed to by the property cursor. The property pointed to by the property cursor is the one that was last inquired using either the MQIMPO\_INQ\_FIRST or the MQIMPO\_INQ\_NEXT option.

The property cursor is reset when the message handle is reused on an MQGET call, or when the message handle is specified in the *MsgHandle* field of the MQGMO or MQPMO structure on an MQPUT call.

If this option is used when the property cursor has not yet been established or if the property pointer to by the property cursor has been deleted, the call fails with completion code MQCC\_FAILED and reason code MQRC\_PROPERTY\_NOT\_AVAILABLE.

If you need none of the options described, use the following option:

#### **MQSMPO\_NONE**

No options specified.

This is always an input field. The initial value of this field is MQSMPO\_SET\_FIRST.

*StrucId* (MQCHAR4):

This is the structure identifier; the value must be:

#### **MQSMPO\_STRUC\_ID**

Identifier for set message property options structure.

For the C programming language, the constant **MQSMPO\_STRUC\_ID\_ARRAY** is also defined; this has the same value as **MQSMPO\_STRUC\_ID**, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is **MQSMPO\_STRUC\_ID**.

*ValueCCSID* (MQLONG):

The character set of the property value to be set if the value is a character string.

This is always an input field. The initial value of this field is **MQCCSI\_APPL**.

*ValueEncoding* (MQLONG):

The encoding of the property value to be set if the value is numeric.

This is always an input field. The initial value of this field is **MQENC\_NATIVE**.

Version (MQLONG):

This is the structure version number; the value must be:

**MQSMPO\_VERSION\_1**

Version-1 set message property options structure.

The following constant specifies the version number of the current version:

**MQSMPO\_CURRENT\_VERSION**

Current version of set message property options structure.

This is always an input field. The initial value of this field is **MQSMPO\_VERSION\_1**.

Initial values and language declarations for MQSMPO:

Table 231. Initial values of fields in MQSMPO

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQSMPO_STRUC_ID	'SMPO'
<i>Version</i>	MQSMPO_VERSION_1	1
<i>Options</i>	MQSMPO_NONE	0
<i>ValueEncoding</i>	MQENC_NATIVE	Depends on environment
<i>ValueCCSID</i>	MQCCSI_APPL	-3

**Notes:**

1. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
2. In the C programming language, the macro variable MQSMPO\_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:  
MQSMPO MySMPO = {MQSMPO\_DEFAULT};

C declaration:

```
typedef struct tagMQSMPO MQSMPO;
struct tagMQSMPO {
    MQCHAR4  StrucId;          /* Structure identifier */
    MQLONG   Version;         /* Structure version number */
    MQLONG   Options;         /* Options that control the action of MQSETMP */
    MQLONG   ValueEncoding;   /* Encoding of Value */
    MQLONG   ValueCCSID;     /* Character set identifier of Value */
};
```

*COBOL declaration:*

```
** MQSMPO structure
  10 MQSMPO.
**   Structure identifier
  15 MQSMPO-STRUCID    PIC X(4).
**   Structure version number
  15 MQSMPO-VERSION    PIC S9(9) BINARY.
**   Options that control the action of MQSETMP
  15 MQSMPO-OPTIONS    PIC S9(9) BINARY.
**   Encoding of VALUE
  15 MQSMPO-VALUEENCODING PIC S9(9) BINARY.
**   Character set identifier of VALUE
  15 MQSMPO-VALUECCSID  PIC S9(9) BINARY.
```

*PL/I declaration:*

```
dcl
  1 MQSMPO based,
  3 StrucId      char(4),          /* Structure identifier */
  3 Version      fixed bin(31),   /* Structure version number */
  3 Options      fixed bin(31),   /* Options that control the action of MQSETMP */
  3 ValueEncoding fixed bin(31), /* Encoding of Value */
  3 ValueCCSID   fixed bin(31), /* Character set identifier of Value */
```

*High Level Assembler declaration:*

```
MQSMPO          DSECT
MQSMPO_STRUCID  DS   CL4   Structure identifier
MQSMPO_VERSION  DS   F     Structure version number

*                               MQSETMP
MQSMPO_VALUEENCODING DS   F     Encoding of VALUE
MQSMPO_VALUECCSID DS   F     Character set identifier of VALUE
MQSMPO_LENGTH   EQU   *-MQSMPO
MQSMPO_AREA     DS   CL(MQSMPO_LENGTH)
```

**MQSRO - Subscription request options:**

This section describes subscription request options, what fields it contains, and initial values of those fields.

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>Options</i>	Options	Options
<i>NumPubs</i>	Number of publications	NumPubs

*Overview for MQSRO:*

**Availability:** AIX, HP-UX, IBM i, Solaris, Linux, Windows, z/OS plus IBM MQ MQI clients connected to these systems.

**Purpose:** The MQSRO structure allows the application to specify options that control how a subscription request is made. The structure is an input/output parameter on the MQSUBRQ call.

**Version:** The current version of MQSRO is MQSRO\_VERSION\_1.

**Character set and encoding:** Data in MQSRO must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE. However, if the application is running as an MQ MQI client, the structure must be in the character set and encoding of the client.

*Fields for MQSRO:*

The MQSRO structure contains the following fields; the fields are described in alphabetical order:

*NumPubs (MQLONG):*

This is an output field, returned to the application to indicate the number of publications sent to the subscription queue as a result of this call. Although this number of publications have been sent as a result of this call, there is no guarantee that this many messages will be available for the application to get, especially if they are non-persistent messages.

There might be more than one publication if the topic subscribed to contained a wildcard. If no wildcards were present in the topic string when the subscription represented by *Hsub* was created, then at most one publication is sent as a result of this call.

*Options (MQLONG):*

One of the following options must be specified. Only one option can be specified.

#### **MQSRO\_FAIL\_IF QUIESCING**

The MQSUBRQ call fails if the queue manager is in the quiescing state. On z/OS, for a CICS or IMS application, this option also forces the MQSUBRQ call to fail if the connection is in a quiescing state.

**Default option:** If the option described previously is not required, the following option must be used:

#### **MQSRO\_NONE**

Use this value to indicate that no other options have been specified; all options assume their default values.

MQSRO\_NONE helps program documentation. Although it is not intended that this option be used with any other, because its value is zero, this use cannot be detected.

*StrucId* (MQCHAR4):

This is the structure identifier; the value must be:

**MQSRO\_STRUC\_ID**

Identifier for Subscription Request Options structure.

For the C programming language, the constant MQSRO\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQSRO\_STRUC\_ID, but is an array of characters instead of a string.

This is always an input field. The initial value of this field is MQSRO\_STRUC\_ID.

*Version* (MQLONG):

This is the structure version number; the value must be:

**MQSRO\_VERSION\_1**

Version-1 Subscription Request Options structure.

The following constant specifies the version number of the current version:

**MQSRO\_CURRENT\_VERSION**

Current version of Subscription Request Options structure.

This is always an input field. The initial value of this field is MQSRO\_VERSION\_1.

*Initial values and language declarations for MQSRO:*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQSRO_STRUC_ID	'SRO-'
<i>Version</i>	MQSRO_VERSION_1	1
<i>Options</i>	MQSRO_NONE	0
<i>NumPubs</i>	None	0

**Notes:**

1. The symbol `␣` represents a single blank character.
2. In the C programming language, the macro variable MQSRO\_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:  
`MQSRO MySRO = {MQSRO_DEFAULT};`

*C declaration:*

```
typedef struct tagMQSRO MQSRO;
struct tagMQSRO {
    MQCHAR4   StrucId;           /* Structure identifier */
    MQLONG    Version;          /* Structure version number */
    MQLONG    Options;          /* Options that control the action of MQSUBRQ */
    MQLONG    NumPubs;          /* Number of publications sent */
    /* Ver:1 */
};
```

*COBOL declaration:*

```
** MQSRO structure
 10 MQSRO.
** Structure identifier
 15 MQSRO-STRUCID          PIC X(4).
** Structure version number
 15 MQSRO-VERSION          PIC S9(9) BINARY.
** Options that control the action of MQSUBRQ
 15 MQSRO-OPTIONS          PIC S9(9) BINARY.
** Number of publications sent
 15 MQSRO-NUMPUBS          PIC S9(9) BINARY.
```

*PL/I declaration:*

```
dc1
 1 MQSRO based,
 3 StrucId          char(4),          /* Structure identifier */
 3 Version          fixed bin(31),    /* Structure version number */
 3 Options          fixed bin(31),    /* Options that control the action of MQSUBRQ */
 3 NumPubs          fixed bin(31);    /* Number of publications sent */
```

*High Level Assembler declaration:*

```
MQSRO          DSECT
MQSRO_STRUCID  DS   CL4  Structure identifier
MQSRO_VERSION  DS   F    Structure version number
MQSRO_OPTIONS  DS   F    Options that control the action of MQSUBRQ
MQSRO_NUMPUBS  DS   F    Number of publications sent
*
MQSRO_LENGTH   EQU   *-MQSRO
               ORG   MQSRO
MQSRO_AREA     DS   CL(MQSRO_LENGTH)
```

**MQSTS - Status reporting structure:**

The following table summarizes the fields in the structure.

*Table 232. Fields in MQSTS*

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>CompCode</i>	Completion code of first error	CompCode
<i>Reason</i>	Reason code of first error	Reason
<i>PutSuccessCount</i>	Number of successful asynchronous put calls	SuccessCount
<i>PutWarningcount</i>	Number of asynchronous put calls which had warnings	WarningCount
<i>PutFailureCount</i>	Number of failed asynchronous put calls	FailureCount
<i>ObjectType</i>	Type of failing object	ObjectType
<i>ObjectName</i>	Name of failing object	ObjectName

Table 232. Fields in MQSTS (continued)

Field	Description	Topic
<i>ObjectQMgrName</i>	Name of queue manager owning the failing object	ObjectQMgrName
<i>ResolvedObjectName</i>	Resolved name of destination queue	ResolvedObjectName
<i>ResolvedQMgrName</i>	Resolved name of destination queue manager	ResolvedQMgrName
<b>Note:</b> The remaining fields are ignored if Version is less than MQSTS_VERSION_2.		
<i>ObjectString</i>	Long object name of failing object	ObjectString
<i>SubName</i>	Subscription name of failing subscription	SubName
<i>OpenOptions</i>	Open options associated with the failure	OpenOptions
<i>SubOptions</i>	Subscription options associated with the failure	SubOptions

Overview for MQSTS:

**Purpose:** The MQSTS structure is an output parameter from the MQSTAT command.

**Character set and encoding:** Character data in MQSTS is in the character set of the local queue manager; this is given by the *CodedCharSetId* queue-manager attribute. Numeric data in MQSTS is in the native machine encoding; this is given by *Encoding*.

**Usage:** The MQSTAT command is used to retrieve status information. This information is returned in an MQSTS structure. For information about MQSTAT, see “MQSTAT - Retrieve status information” on page 2572.

Fields for MQSTS:

The MQSTS structure contains the following fields; the fields are described in **alphabetical order**:

*CompCode* (MQLONG):

The completion code of the operation being reported on.

The interpretation of *CompCode* depends on the value of the MQSTAT Type parameter.

#### **MQSTAT\_TYPE\_ASYNC\_ERROR**

This is the completion code resulting from a previous asynchronous put operation on the object specified in *ObjectName*.

#### **MQSTAT\_TYPE\_RECONNECTION**

If the connection is reconnecting or failed to reconnect this is the completion code that caused the connection to begin reconnecting.

If the connection is currently connected the value is MQCC\_OK.

#### **MQSTAT\_TYPE\_RECONNECTION\_ERROR**

If the connection failed to reconnect this is the completion code that caused the reconnection to fail.

If the connection is currently connected, or reconnecting, the value is MQCC\_OK.

*CompCode* is always an output field. Its initial value is MQCC\_OK.

*ObjectName* (MQCHAR48):

The name of the object being reported on.

The interpretation of *ObjectName* depends on the value of the MQSTAT Type parameter.

#### **MQSTAT\_TYPE\_ASYNC\_ERROR**

This is the name of the queue or topic used in the put operation, the failure of which is reported in the *CompCode* and *Reason* fields in the MQSTS structure.

#### **MQSTAT\_TYPE\_RECONNECTION**

If the connection is reconnecting, this is the name of the queue manager associated with the connection.

#### **MQSTAT\_TYPE\_RECONNECTION\_ERROR**

If the connection failed to reconnect, this is the name of the object which caused reconnection to fail. The reason for the failure is reported in the *CompCode* and *Reason* fields in the MQSTS structure.

*ObjectName* is an output field. Its initial value is the null string in C, and 48 blank characters in other programming languages.

*ObjectQMgrName* (MQCHAR48):

The name of the queue manager being reported on.

The interpretation of *ObjectQMgrName* depends on the value of the MQSTAT Type parameter.

#### **MQSTAT\_TYPE\_ASYNC\_ERROR**

This is the name of the queue manager on which the *ObjectName* object is defined. A name that is entirely blank up to the first null character or the end of the field denotes the queue manager to which the application is connected (the local queue manager).

#### **MQSTAT\_TYPE\_RECONNECTION**

Blank.

#### **MQSTAT\_TYPE\_RECONNECTION\_ERROR**

If the connection failed to reconnect, this is the name of the object which caused reconnection to fail. The reason for the failure is reported in the *CompCode* and *Reason* fields in the MQSTS structure.

*ObjectQMgrName* is an output field. Its value is the null string in C, and 48 blank characters in other programming languages.

*ObjectString* (MQCHARV):

Long object name of failing object being reported on. Present only in Version 2 of MQSTS or higher.

The interpretation of *ObjectString* depends on the value of the MQSTAT Type parameter.

**MQSTAT\_TYPE\_ASYNC\_ERROR**

This is the long object name of the queue or topic used in the MQPUT operation, which failed.

**MQSTAT\_TYPE\_RECONNECTION**

Zero length string

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

This is the long object name of the object that caused the reconnection to fail.

*ObjectString* is an output field. Its initial value is a zero length string.

*ObjectType* (MQLONG):

The type of the object named in *ObjectName* being reported on.

Possible values of *ObjectType* are listed in “MQOT\_\* (Object Types and Extended Object Types)” on page 1936.

*ObjectType* is an output field. Its initial value is MQOT\_Q.

*OpenOptions* (MQLONG):

The *OpenOptions* used to open the object being reported upon. Present only in Version 2 of MQSTS or higher.

The value of *OpenOptions* depends on the value of the MQSTAT Type parameter.

**MQSTAT\_TYPE\_ASYNC\_ERROR**

Zero.

**MQSTAT\_TYPE\_RECONNECTION**

Zero.

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

The *OpenOptions* used when the failure occurred. The reason for the failure is reported in the *CompCode* and *Reason* fields in the MQSTS structure.

*OpenOptions* is an output field. Its initial value is zero.

*PutFailureCount (MQLONG):*

The number of asynchronous put operations that failed.

The value of PutFailureCount depends on the value of the MQSTAT Type parameter.

**MQSTAT\_TYPE\_ASYNC\_ERROR**

The number of asynchronous put operations to the object named in the MQSTS structure that completed with MQCC\_FAILED.

**MQSTAT\_TYPE\_RECONNECTION**

Zero.

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

Zero.

PutFailureCount is an output field. Its initial value is zero.

*PutSuccessCount (MQLONG):*

The number of asynchronous put operations that succeeded.

The value of PutSuccessCount depends on the value of the MQSTAT Type parameter.

**MQSTAT\_TYPE\_ASYNC\_ERROR**

The number of asynchronous put operations to the object named in the MQSTS structure that completed with MQCC\_OK.

**MQSTAT\_TYPE\_RECONNECTION**

Zero.

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

Zero.

PutSuccessCount is an output field. Its initial value is zero.

*PutWarningCount (MQLONG):*

The number of asynchronous put operations that ended with a warning.

The value of PutWarningCount depends on the value of the MQSTAT Type parameter.

**MQSTAT\_TYPE\_ASYNC\_ERROR**

The number of asynchronous put operations to the object named in the MQSTS structure that completed with MQCC\_WARNING.

**MQSTAT\_TYPE\_RECONNECTION**

Zero.

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

Zero.

PutWarningCount is an output field. Its initial value is zero.

*SubName (MQCHARV):*

The name of the failing subscription. Present only in Version 2 of MQSTS or higher.

The interpretation of SubName depends on the value of the MQSTAT Type parameter.

**MQSTAT\_TYPE\_ASYNC\_ERROR**

Zero length string.

**MQSTAT\_TYPE\_RECONNECTION**

Zero length string.

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

The name of the subscription that caused reconnection to fail. If no subscription name is available, or the failure is not related to a subscription, this is a zero-length string.

SubName is an output field. Its initial value is a zero length string.

*SubOptions (MQLONG):*

The SubOptions used to open the failing subscription. Present only in Version 2 of MQSTS or higher.

The interpretation of SubOptions depends on the value of the MQSTAT Type parameter.

**MQSTAT\_TYPE\_ASYNC\_ERROR**

Zero.

**MQSTAT\_TYPE\_RECONNECTION**

Zero.

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

The SubOptions used when the failure occurred. If the failure is not related to subscribing to a topic, the value returned is zero.

SubOptions is an output field. Its initial value is zero.

*Reason (MQLONG):*

The reason code of the operation being reported on.

The interpretation of Reason depends on the value of the MQSTAT Type parameter.

**MQSTAT\_TYPE\_ASYNC\_ERROR**

This is the reason code resulting from a previous asynchronous put operation on the object specified in ObjectName.

**MQSTAT\_TYPE\_RECONNECTION**

If the connection is reconnecting or failed to reconnect this is the reason code that caused the reconnection to begin reconnecting.

If the connection is currently connected the value is MQRC\_NONE.

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

If the connection failed to reconnect this is the reason code that caused the reconnection to fail.

If the connection is currently connected, or reconnecting, the value is MQRC\_NONE.

Reason is an output field. Its initial value is MQRC\_NONE.

*ResolvedObjectName* (MQCHAR48):

The name of the object named in *ObjectName* after the local queue manager resolves the name.

The interpretation of *ResolvedObjectName* depends on the value of the MQSTAT Type parameter.

#### **MQSTAT\_TYPE\_ASYNC\_ERROR**

*ResolvedObjectName* is the name of the object named in *ObjectName* after the local queue manager resolves the name. The name returned is the name of an object that exists on the queue manager identified by *ResolvedQMgrName*.

#### **MQSTAT\_TYPE\_RECONNECTION**

Blank.

#### **MQSTAT\_TYPE\_RECONNECTION\_ERROR**

Blank.

*ResolvedObjectName* is an output field. Its initial value is the null string in C, and 48 blank characters in other programming languages.

*ResolvedQMgrName* (MQCHAR48):

The name of the destination queue manager after the local queue manager resolves the name.

The interpretation of *ResolvedQMgrName* depends on the value of the MQSTAT Type parameter.

#### **MQSTAT\_TYPE\_ASYNC\_ERROR**

*ResolvedQMgrName* is the name of the destination queue manager after the local queue manager resolves the name. The name returned is the name of the queue manager that owns the object identified by *ResolvedObjectName*. *ResolvedQMgrName* might be the name of the local queue manager.

#### **MQSTAT\_TYPE\_RECONNECTION**

Blank.

#### **MQSTAT\_TYPE\_RECONNECTION\_ERROR**

Blank.

*ResolvedQMgrName* is always an output field. Its initial value is the null string in C, and 48 blank characters in other programming languages.

*StrucId* (MQCHAR4):

The identifier for the status reporting structure, MQSTS.

StrucId is the structure identifier. The value must be:

**MQSTS\_STRUC\_ID**

Identifier for status reporting structure.

For the C programming language, the constant MQSTS\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQSTS\_STRUC\_ID, but is an array of characters instead of a string.

StrucId is always an input field. Its initial value is MQSTS\_STRUC\_ID.

*Version* (MQLONG):

The structure version number.

The value must be either:

**MQSTS\_VERSION\_1**

Version 1 status reporting structure.

**MQSTS\_VERSION\_2**

Version 2 status reporting structure.

The following constant specifies the version number of the current version:

**MQSTS\_CURRENT\_VERSION**

Current version of status reporting structure. The current version is MQSTS\_VERSION\_2.

Version is always an input field. Its initial value is MQSTS\_VERSION\_1.

*Initial values and language declarations for MQSTS:*

Table 233. Initial values of fields in MQSTS

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQSTS_STRUC_ID	'STAT-'
<i>Version</i>	MQSTS_VERSION_1	1
<i>CompCode</i>	MQCC_OK	0
<i>Reason</i>	MQRC_NONE	0
<i>PutSuccessCount</i>	None	0
<i>PutWarningCount</i>	None	0
<i>PutFailureCount</i>	None	0
<i>ObjectType</i>	MQOT_Q	1
<i>ObjectName</i>	None	Null string or blanks
<i>ObjectQMgrName</i>	None	Null string or blanks
<i>ResolvedObjectName</i>	None	Null string or blanks
<i>ResolvedQMgrName</i>	None	Null string or blanks
<i>ObjectString</i>	MQCHARV_DEFAULT	{NULL,0,0,0,-3}
<i>SubName</i>	MQCHARV_DEFAULT	{NULL,0,0,0,-3}
<i>OpenOptions</i>	None	0
<i>SubOptions</i>	None	0

Table 233. Initial values of fields in MQSTS (continued)

Field name	Name of constant	Value of constant
<b>Notes:</b>		
1. The symbol <code>␣</code> represents a single blank character.		
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.		
3. In the C programming language, the macro variable MQSTS_DEFAULT contains the values that are listed in the table. It can be used in the following way to provide initial values for the fields in the structure:		
<pre>MQSTS MySTS = {MQSTS_DEFAULT};</pre>		

*C declaration:*

```
typedef struct tagMQSTS MQSTS;
struct tagMQSTS {
  MQCHAR4  StrucId;          /* Structure identifier */
  MQLONG   Version;         /* Structure version number */
  MQLONG   CompCode;       /* Completion Code of first error */
  MQLONG   Reason;        /* Reason Code of first error */
  MQLONG   PutSuccessCount; /* Number of Async calls succeeded */
  MQLONG   PutWarningCount; /* Number of Async calls had warnings */
  MQLONG   PutFailureCount; /* Number of Async calls had failures */
  MQLONG   ObjectType;     /* Failing object type */
  MQCHAR48  ObjectName;    /* Failing object name */
  MQCHAR48  ObjectQMgrName; /* Failing object queue manager name */
  MQCHAR48  ResolvedObjectName; /* Resolved name of destination queue */
  MQCHAR48  ResolvedQMgrName; /* Resolved name of destination qmgr */
  /* Ver:1 */
  MQCHARV  ObjectString;   /* Failing object long name */
  MQCHARV  SubName;       /* Failing subscription name */
  MQLONG   OpenOptions;   /* Failing open options */
  MQLONG   SubOptions;    /* Failing subscription options */
  /* Ver:2 */
};
```

*COBOL declaration:*

```

**MQTM - Trigger message:**

The following table summarizes the fields in the structure.

Table 234. Fields in MQTM

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>QName</i>	Name of triggered queue	QName
<i>ProcessName</i>	Name of process object	ProcessName
<i>TriggerData</i>	Trigger data	TriggerData
<i>ApplType</i>	Application type	ApplType
<i>ApplId</i>	Application identifier	ApplId
<i>EnvData</i>	Environment data	EnvData
<i>UserData</i>	User data	UserData

## Overview for MQTM:

**Purpose:** The MQTM structure describes the data in the trigger message that is sent by the queue manager to a trigger-monitor application when a trigger event occurs for a queue.

This structure is part of the IBM MQ Trigger Monitor Interface (TMI), which is one of the IBM MQ framework interfaces.

**Format name:** MQFMT\_TRIGGER.

**Character set and encoding:** Character data in MQTM is in the character set of the queue manager that generates the MQTM. Numeric data in MQTM is in the machine encoding of the queue manager that generates the MQTM.

The character set and encoding of the MQTM are given by the *CodedCharSetId* and *Encoding* fields in:

- The MQMD (if the MQTM structure is at the start of the message data), or
- The header structure that precedes the MQTM structure (all other cases).

**Usage:** A trigger-monitor application might need to pass some or all of the information in the trigger message to the application that the trigger-monitor application starts. Information that might be needed by the started application includes *QName*, *TriggerData*, and *UserData*. The trigger-monitor application can pass the MQTM structure directly to the started application, or pass an MQTMC2 structure instead, depending on what is permitted by the environment and convenient for the started application. For information about MQTMC2, see “MQTMC2 - Trigger message 2 (character format)” on page 2388.

- On z/OS, for an MQAT\_CICS application that is started using the CKTI transaction, the entire trigger message structure MQTM is made available to the started transaction; the information can be retrieved by using the EXEC CICS RETRIEVE command.
- On IBM i, the trigger-monitor application provided with IBM MQ passes an MQTMC2 structure to the started application.

For information about using triggers, see Starting IBM MQ applications using triggers.

**MQMD for a trigger message:** The fields in the MQMD of a trigger message generated by the queue manager are set as follows:

Field in MQMD	Value used
<i>StrucId</i>	MQMD_STRUC_ID
<i>Version</i>	MQMD_VERSION_1
<i>Report</i>	MQRO_NONE
<i>MsgType</i>	MQMT_DATAGRAM
<i>Expiry</i>	MQEI_UNLIMITED
<i>Feedback</i>	MQFB_NONE
<i>Encoding</i>	MQENC_NATIVE
<i>CodedCharSetId</i>	Queue manager's <i>CodedCharSetId</i> attribute
<i>Format</i>	MQFMT_TRIGGER
<i>Priority</i>	Initiation queue's <i>DefPriority</i> attribute
<i>Persistence</i>	MQPER_NOT_PERSISTENT
<i>MsgId</i>	A unique value
<i>CorrelId</i>	MQCI_NONE
<i>BackoutCount</i>	0
<i>ReplyToQ</i>	Blanks
<i>ReplyToQMGr</i>	Name of queue manager
<i>UserIdentifier</i>	Blanks
<i>AccountingToken</i>	MQACT_NONE
<i>ApplIdentityData</i>	Blanks

Field in MQMD	Value used
<i>PutApplType</i>	MQAT_QMGR, or as appropriate for the message channel agent
<i>PutApplName</i>	First 28 bytes of the queue-manager name
<i>PutDate</i>	Date when trigger message is sent
<i>PutTime</i>	Time when trigger message is sent
<i>ApplOriginData</i>	Blanks

An application that generates a trigger message is recommended to set similar values, except for the following:

- The *Priority* field can be set to MQPRI\_PRIORITY\_AS\_Q\_DEF (the queue manager will change this to the default priority for the initiation queue when the message is put).
- The *ReplyToQMGr* field can be set to blanks (the queue manager will change this to the name of the local queue manager when the message is put).
- Set the context fields as appropriate for the application.

*Fields for MQTM:*

The MQTM structure contains the following fields; the fields are described in **alphabetical order**:

*ApplId* (MQCHAR256):

This is a character string that identifies the application to be started, and is used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *ApplId* attribute of the process object identified by the *ProcessName* field; see “Attributes for process definitions” on page 2664 for details of this attribute. The content of this data is of no significance to the queue manager.

The meaning of *ApplId* is determined by the trigger-monitor application. The trigger monitor provided by IBM MQ requires *ApplId* to be the name of an executable program. The following notes apply to the environments indicated:

- On z/OS, *ApplId* is:
  - A CICS transaction identifier, for applications started using the CICS trigger-monitor transaction CKTI
  - An IMS transaction identifier, for applications started using the IMS trigger monitor CSQQTRMN
- On Windows systems, the program name can be prefixed with a drive and directory path.
- On IBM i, the program name can be prefixed with a library name and / character.
- On UNIX systems, the program name can be prefixed with a directory path.

The length of this field is given by MQ\_PROCESS\_APPL\_ID\_LENGTH. The initial value of this field is the null string in C, and 256 blank characters in other programming languages.

*ApplType* (MQLONG):

This identifies the nature of the program to be started, and is used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *ApplType* attribute of the process object identified by the *ProcessName* field; see “Attributes for process definitions” on page 2664 for details of this attribute. The content of this data is of no significance to the queue manager.

*ApplType* can have one of the following standard values. User-defined types can also be used, but should be restricted to values in the range MQAT\_USER\_FIRST through MQAT\_USER\_LAST:

**MQAT\_AIX**

AIX application (same value as MQAT\_UNIX).

**MQAT\_BATCH**

Batch application

**MQAT\_BROKER**

Broker application

**MQAT\_CICS**

CICS transaction.

**MQAT\_CICS\_BRIDGE**

CICS bridge application.

**MQAT\_CICS\_VSE**

CICS/VSE transaction.

**MQAT\_DOS**

IBM MQ MQI client application on PC DOS.

**MQAT\_IMS**

IMS application.

**MQAT\_IMS\_BRIDGE**

IMS bridge application.

**MQAT\_JAVA**

Java application.

**MQAT\_MVS**

MVS or TSO application (same value as MQAT\_ZOS).

**MQAT\_NOTES\_AGENT**

Lotus Notes Agent application.

**MQAT\_NSK**

HP Integrity NonStop Server application.

**MQAT\_OS390**

OS/390 application (same value as MQAT\_ZOS).

**MQAT\_OS400**

IBM i application.

**MQAT\_RRS\_BATCH**

RRS batch application.

**MQAT\_UNIX**

UNIX application.

**MQAT\_UNKNOWN**

Application of unknown type.

- MQAT\_USER**  
User-defined application type.
- MQAT\_VOS**  
Stratus VOS application.
- MQAT\_WINDOWS**  
16-bit Windows application.
- MQAT\_WINDOWS\_NT**  
32-bit Windows application.
- MQAT\_WLM**  
z/OS workload manager application.
- MQAT\_XCF**  
XCF.
- MQAT\_ZOS**  
z/OS application.
- MQAT\_USER\_FIRST**  
Lowest value for user-defined application type.
- MQAT\_USER\_LAST**  
Highest value for user-defined application type.

The initial value of this field is 0.

*EnvData (MQCHAR128):*

This is a character string that contains environment-related information pertaining to the application to be started, and is used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *EnvData* attribute of the process object identified by the *ProcessName* field; see “Attributes for process definitions” on page 2664 for details of this attribute. The content of this data is of no significance to the queue manager.

On z/OS, for a CICS application started using the CKTI transaction, or an IMS application to be started using the CSQQTRMN transaction, this information is not used.

The length of this field is given by MQ\_PROCESS\_ENV\_DATA\_LENGTH. The initial value of this field is the null string in C, and 128 blank characters in other programming languages.

*ProcessName (MQCHAR48):*

This is the name of the queue-manager process object specified for the triggered queue, and can be used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *ProcessName* attribute of the queue identified by the *QName* field; see “Attributes for queues” on page 2625 for details of this attribute.

Names that are shorter than the defined length of the field are always padded to the right with blanks; they are not ended prematurely by a null character.

The length of this field is given by MQ\_PROCESS\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*QName (MQCHAR48):*

This is the name of the queue for which a trigger event occurred, and is used by the application started by the trigger-monitor application. The queue manager initializes this field with the value of the *QName* attribute of the triggered queue; see “Attributes for queues” on page 2625 for details of this attribute.

Names that are shorter than the defined length of the field are padded to the right with blanks; they are not ended prematurely by a null character.

The length of this field is given by MQ\_Q\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*StrucId (MQCHAR4):*

This is the structure identifier. The value must be:

**MQTM\_STRUC\_ID**

Identifier for trigger message structure.

For the C programming language, the constant MQTM\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQTM\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQTM\_STRUC\_ID.

*TriggerData (MQCHAR64):*

This is free-format data for use by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *TriggerData* attribute of the queue identified by the *QName* field; see “Attributes for queues” on page 2625 for details of this attribute. The content of this data is of no significance to the queue manager.

On z/OS, for a CICS application started using the CKTI transaction, this information is not used.

The length of this field is given by MQ\_TRIGGER\_DATA\_LENGTH. The initial value of this field is the null string in C, and 64 blank characters in other programming languages.

*UserData (MQCHAR128):*

This is a character string that contains user information relevant to the application to be started, and is used by the trigger-monitor application that receives the trigger message. The queue manager initializes this field with the value of the *UserData* attribute of the process object identified by the *ProcessName* field; see “Attributes for process definitions” on page 2664 for details of this attribute. The content of this data is of no significance to the queue manager.

For Microsoft Windows, the character string must not contain double quotation marks if the process definition is going to be passed to **runmqtrm**.

The length of this field is given by MQ\_PROCESS\_USER\_DATA\_LENGTH. The initial value of this field is the null string in C, and 128 blank characters in other programming languages.

Version (MQLONG):

This is the structure version number. The value must be:

**MQTM\_VERSION\_1**

Version number for trigger message structure.

The following constant specifies the version number of the current version:

**MQTM\_CURRENT\_VERSION**

Current version of trigger message structure.

The initial value of this field is MQTM\_VERSION\_1.

*Initial values and language declarations for MQTM:*

*Table 235. Initial values of fields in MQTM for MQTM*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQTM_STRUC_ID	'TM↵↵'
<i>Version</i>	MQTM_VERSION_1	1
<i>QName</i>	None	Null string or blanks
<i>ProcessName</i>	None	Null string or blanks
<i>TriggerData</i>	None	Null string or blanks
<i>ApplType</i>	None	0
<i>ApplId</i>	None	Null string or blanks
<i>EnvData</i>	None	Null string or blanks
<i>UserData</i>	None	Null string or blanks

**Notes:**

1. The symbol ↵ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQTM\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  
MQTM MyTM = {MQTM\_DEFAULT};

*C declaration:*

```
typedef struct tagMQTM MQTM;
struct tagMQTM {
    MQCHAR4   StrucId;      /* Structure identifier */
    MQLONG    Version;     /* Structure version number */
    MQCHAR48  QName;       /* Name of triggered queue */
    MQCHAR48  ProcessName; /* Name of process object */
    MQCHAR64  TriggerData; /* Trigger data */
    MQLONG    ApplType;    /* Application type */
    MQCHAR256 ApplId;      /* Application identifier */
    MQCHAR128 EnvData;     /* Environment data */
    MQCHAR128 UserData;    /* User data */
};
```

*COBOL declaration:*

```
** MQTM structure
10 MQTM.
** Structure identifier
15 MQTM-STRUCID PIC X(4).
** Structure version number
15 MQTM-VERSION PIC S9(9) BINARY.
** Name of triggered queue
15 MQTM-QNAME PIC X(48).
** Name of process object
15 MQTM-PROCESSNAME PIC X(48).
** Trigger data
15 MQTM-TRIGGERDATA PIC X(64).
** Application type
15 MQTM-APPLTYPE PIC S9(9) BINARY.
** Application identifier
15 MQTM-APPLID PIC X(256).

### MQTMC2 - Trigger message 2 (character format):

The following table summarizes the fields in the structure.

Table 236. Fields in MQTMC2

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>QName</i>	Name of triggered queue	QName
<i>ProcessName</i>	Name of process object	ProcessName
<i>TriggerData</i>	Trigger data	TriggerData
<i>ApplType</i>	Application type	ApplType
<i>ApplId</i>	Application identifier	ApplId
<i>EnvData</i>	Environment data	EnvData
<i>UserData</i>	User data	UserData
<i>QMgrName</i>	Queue manager name	QMgrName

### *Overview for MQTMC2:*

**Purpose:** When a trigger-monitor application retrieves a trigger message (MQTM) from an initiation queue, the trigger monitor might need to pass some or all of the information in the trigger message to the application that the trigger monitor starts.

Information that the started application might need includes *QName*, *TriggerData*, and *UserData*. The trigger monitor application can pass the MQTM structure directly to the started application, or pass an MQTMC2 structure instead, depending on what is permitted by the environment and convenient for the started application.

This structure is part of the IBM MQ Trigger Monitor Interface (TMI), which is one of the IBM MQ framework interfaces.

**Character set and encoding:** Character data in MQTMC2 is in the character set of the local queue manager; this is given by the *CodedCharSetId* queue-manager attribute.

**Usage:** The MQTMC2 structure is very similar to the format of the MQTM structure. The difference is that the non-character fields in MQTM are changed in MQTMC2 to character fields of the same length, and the queue manager name is added at the end of the structure.

- On z/OS, for an MQAT\_IMS application that is started using the CSQQTRMN application, an MQTMC2 structure is made available to the started application.
- On IBM i, the trigger monitor application provided with IBM MQ passes an MQTMC2 structure to the started application.

### *Fields for MQTMC2:*

The MQTMC2 structure contains the following fields; the fields are described in **alphabetical order**:

#### *ApplId (MQCHAR256):*

Application identifier.

See the *ApplId* field in the MQTM structure.

#### *ApplType (MQCHAR4):*

Application type.

This field always contains blanks, whatever the value in the *ApplType* field in the MQTM structure of the original trigger message.

*EnvData* (MQCHAR128):

Environment data.

See the *EnvData* field in the MQTM structure.

*ProcessName* (MQCHAR48):

Name of process object.

See the *ProcessName* field in the MQTM structure.

*QMgrName* (MQCHAR48):

Queue manager name.

This is the name of the queue manager at which the trigger event occurred.

*QName* (MQCHAR48):

Name of triggered queue.

See the *QName* field in the MQTM structure.

*StrucId* (MQCHAR4):

Structure identifier.

The value must be:

**MQTMC\_STRUC\_ID**

Identifier for trigger message (character format) structure.

For the C programming language, the constant MQTMC\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQTMC\_STRUC\_ID, but is an array of characters instead of a string.

*TriggerData* (MQCHAR64):

Trigger data.

See the *TriggerData* field in the MQTM structure.

*UserData* (MQCHAR128):

User data.

See the *UserData* field in the MQTM structure.

Version (MQCHAR4):

Structure version number.

The value must be:

### **MQTMC\_VERSION\_2**

Version 2 trigger message (character format) structure.

For the C programming language, the constant MQTMC\_VERSION\_2\_ARRAY is also defined; this has the same value as MQTMC\_VERSION\_2, but is an array of characters instead of a string.

The following constant specifies the version number of the current version:

### **MQTMC\_CURRENT\_VERSION**

Current version of trigger message (character format) structure.

*Initial values and language declarations for MQTMC2:*

*Table 237. Initial values of fields in MQTMC2 for MQTMC2*

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQTMC_STRUC_ID	'TMC△'
<i>Version</i>	MQTMC_VERSION_2	'△△△2'
<i>QName</i>	None	Null string or blanks
<i>ProcessName</i>	None	Null string or blanks
<i>TriggerData</i>	None	Null string or blanks
<i>ApplType</i>	None	Blanks
<i>ApplId</i>	None	Null string or blanks
<i>EnvData</i>	None	Null string or blanks
<i>UserData</i>	None	Null string or blanks
<i>QMgrName</i>	None	Null string or blanks

**Notes:**

1. The symbol △ represents a single blank character.
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.
3. In the C programming language, the macro variable MQTMC2\_DEFAULT contains the values listed above. Use it in the following way to provide initial values for the fields in the structure:  

```
MQTMC2 MyTMC = {MQTMC2_DEFAULT};
```

*C declaration:*

```
typedef struct tagMQTMC2 MQTMC2;
struct tagMQTMC2 {
    MQCHAR4   StrucId;      /* Structure identifier */
    MQCHAR4   Version;     /* Structure version number */
    MQCHAR48  QName;       /* Name of triggered queue */
    MQCHAR48  ProcessName; /* Name of process object */
    MQCHAR64  TriggerData; /* Trigger data */
    MQCHAR4   ApplType;    /* Application type */
    MQCHAR256 ApplId;      /* Application identifier */
    MQCHAR128 EnvData;     /* Environment data */
    MQCHAR128 UserData;    /* User data */
    MQCHAR48  QMgrName;    /* Queue manager name */
};
```

*COBOL declaration:*

```
** MQTMC2 structure
 10 MQTMC2.
**   Structure identifier
 15 MQTMC2-STRUCID PIC X(4).
**   Structure version number
 15 MQTMC2-VERSION PIC X(4).
**   Name of triggered queue
 15 MQTMC2-QNAME PIC X(48).
**   Name of process object
 15 MQTMC2-PROCESSNAME PIC X(48).
**   Trigger data
 15 MQTMC2-TRIGGERDATA PIC X(64).
**   Application type
 15 MQTMC2-APPLTYPE PIC X(4).
**   Application identifier
 15 MQTMC2-APPLID PIC X(256).
**   Environment data
 15 MQTMC2-ENVDATA PIC X(128).
**   User data
 15 MQTMC2-USERDATA PIC X(128).
**   Queue manager name
 15 MQTMC2-QMGRNAME PIC X(48).
```

*PL/I declaration:*

```
dc1
 1 MQTMC2 based,
 3 StrucId char(4), /* Structure identifier */
 3 Version char(4), /* Structure version number */
 3 QName char(48), /* Name of triggered queue */
 3 ProcessName char(48), /* Name of process object */
 3 TriggerData char(64), /* Trigger data */
 3 ApplType char(4), /* Application type */
 3 ApplId char(256), /* Application identifier */
 3 EnvData char(128), /* Environment data */
 3 UserData char(128), /* User data */
 3 QMgrName char(48); /* Queue manager name */
```

High Level Assembler declaration:

```

MQTMC          DSECT
MQTMC_STRUCID  DS   CL4   Structure identifier
MQTMC_VERSION  DS   CL4   Structure version number
MQTMC_QNAME    DS  CL48   Name of triggered queue
MQTMC_PROCESSNAME DS  CL48   Name of process object
MQTMC_TRIGGERDATA DS  CL64   Trigger data
MQTMC_APPLTYPE DS   CL4   Application type
MQTMC_APPLID   DS  CL256  Application identifier
MQTMC_ENVDATA  DS  CL128  Environment data
MQTMC_USERDATA DS  CL128  User data
MQTMC_QMGRNAME DS  CL48   Queue manager name
*
MQTMC_LENGTH   EQU  *-MQTMC
               ORG  MQTMC
MQTMC_AREA     DS   CL(MQTMC_LENGTH)

```

Visual Basic declaration:

```

Type MQTMC2
  StrucId    As String*4  'Structure identifier'
  Version    As String*4  'Structure version number'
  QName      As String*48 'Name of triggered queue'
  ProcessName As String*48 'Name of process object'
  TriggerData As String*64 'Trigger data'
  ApplType   As String*4  'Application type'
  ApplId     As String*256 'Application identifier'
  EnvData    As String*128 'Environment data'
  UserData   As String*128 'User data'
  QMgrName   As String*48 'Queue manager name'
End Type

```

### MQWIH - Work information header:

The following table summarizes the fields in the structure.

Table 238. Fields in MQWIH

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>StrucLength</i>	Length of MQWIH structure	StrucLength
<i>Encoding</i>	Numeric encoding of data that follows MQWIH	Encoding
<i>CodedCharSetId</i>	Character-set identifier of data that follows MQWIH	CodedCharSetId
<i>Format</i>	Format name of data that follows MQWIH	Format
<i>Flags</i>	Flags	Flags
<i>ServiceName</i>	Service name	ServiceName
<i>ServiceStep</i>	Service step name	ServiceStep
<i>MsgToken</i>	Message token	MsgToken
<i>Reserved</i>	Reserved	Reserved

### Overview for MQWIH:

The MQWIH structure describes the header information for a message sent to z/OS workload management (WLM). For any IBM MQ supported platform you can create and transmit a message that includes the MQWIH structure, but only an IBM MQ for z/OS queue manager can interact with WLM. Therefore, for the message to get to WLM from a non-z/OS queue manager, your queue manager network must include at least one z/OS queue manager through which the message can be routed.

**Availability:** All IBM MQ systems, plus IBM MQ clients connected to these systems.

**Purpose:** The MQWIH structure describes the information that must be present at the start of a message that is to be handled by the z/OS workload manager.

**Format name:** MQFMT\_WORK\_INFO\_HEADER.

**Character set and encoding:** The fields in the MQWIH structure are in the character set and encoding given by the *CodedCharSetId* and *Encoding* fields in the header structure that precedes MQWIH, or by those fields in the MQMD structure if the MQWIH is at the start of the application message data.

The character set must be one that has single-byte characters for the characters that are valid in queue names.

**Usage:** If a message is to be processed by the z/OS workload manager, the message must begin with an MQWIH structure.

### Fields for MQWIH:

The MQWIH structure contains the following fields; the fields are described in **alphabetical order**:

#### *CodedCharSetId* (MQLONG):

This specifies the character set identifier of the data that follows the MQWIH structure; it does not apply to character data in the MQWIH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. You can use the following special value:

#### **MQCCSI\_INHERIT**

Character data in the data *following* this structure is in the same character set as this structure.

The queue manager changes this value in the structure sent in the message to the actual character-set identifier of the structure. Provided no error occurs, the value MQCCSI\_INHERIT is not returned by the MQGET call.

MQCCSI\_INHERIT cannot be used if the value of the *PutApplType* field in MQMD is MQAT\_BROKER.

The initial value of this field is MQCCSI\_UNDEFINED.

*Encoding (MQLONG):*

This specifies the numeric encoding of the data that follows the MQWIH structure; it does not apply to numeric data in the MQWIH structure itself.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data.

The initial value of this field is 0.

*Flags (MQLONG):*

The value must be:

**MQWIH\_NONE**

No flags.

The initial value of this field is MQWIH\_NONE.

*Format (MQCHAR8):*

This specifies the format name of the data that follows the MQWIH structure.

On the MQPUT or MQPUT1 call, the application must set this field to the value appropriate to the data. The rules for coding this field are the same as those for the *Format* field in MQMD.

The length of this field is given by MQ\_FORMAT\_LENGTH. The initial value of this field is MQFMT\_NONE.

*MsgToken (MQBYTE16):*

This is a message token that uniquely identifies the message.

For the MQPUT and MQPUT1 calls, this field is ignored. The length of this field is given by MQ\_MSG\_TOKEN\_LENGTH. The initial value of this field is MQMTOK\_NONE.

*Reserved (MQCHAR32):*

This is a reserved field; it must be blank.

*ServiceName (MQCHAR32):*

This is the name of the service that is to process the message.

The length of this field is given by MQ\_SERVICE\_NAME\_LENGTH. The initial value of this field is 32 blank characters.

*ServiceStep* (MQCHAR8):

This is the name of the step of *ServiceName* to which the message relates.

The length of this field is given by MQ\_SERVICE\_STEP\_LENGTH. The initial value of this field is 8 blank characters.

*StrucId* (MQCHAR4):

This is the structure identifier. The value must be:

**MQWIH\_STRUC\_ID**

Identifier for work information header structure.

For the C programming language, the constant MQWIH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQWIH\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQWIH\_STRUC\_ID.

*StrucLength* (MQLONG):

This is the length of the MQWIH structure. The value must be:

**MQWIH\_LENGTH\_1**

Length of version-1 work information header structure.

The following constant specifies the length of the current version:

**MQWIH\_CURRENT\_LENGTH**

Length of current version of work information header structure.

The initial value of this field is MQWIH\_LENGTH\_1.

*Version* (MQLONG):

This is the structure version number. The value must be:

**MQWIH\_VERSION\_1**

Version-1 work information header structure.

The following constant specifies the version number of the current version:

**MQWIH\_CURRENT\_VERSION**

Current version of work information header structure.

The initial value of this field is MQWIH\_VERSION\_1.

Initial values and language declarations for MQWIH:

Table 239. Initial values of fields in MQWIH for MQWIH

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQWIH_STRUC_ID	'WIH~'
<i>Version</i>	MQWIH_VERSION_1	1
<i>StrucLength</i>	MQWIH_LENGTH_1	120
<i>Encoding</i>	None	0
<i>CodedCharSetId</i>	MQCCSI_UNDEFINED	0
<i>Format</i>	MQFMT_NONE	Blanks
<i>Flags</i>	MQWIH_NONE	0
<i>ServiceName</i>	None	Blanks
<i>ServiceStep</i>	None	Blanks
<i>MsgToken</i>	MQMTOK_NONE	Nulls
<i>Reserved</i>	None	Blanks

**Notes:**

1. The symbol ~ represents a single blank character.
2. In the C programming language, the macro variable MQWIH\_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure:  

```
MQWIH MyWIH = {MQWIH_DEFAULT};
```

C declaration:

```
typedef struct tagMQWIH MQWIH;
struct tagMQWIH {
    MQCHAR4   StrucId;           /* Structure identifier */
    MQLONG    Version;          /* Structure version number */
    MQLONG    StrucLength;      /* Length of MQWIH structure */
    MQLONG    Encoding;        /* Numeric encoding of data that follows
                               MQWIH */
    MQLONG    CodedCharSetId;   /* Character-set identifier of data that
                               follows MQWIH */
    MQCHAR8   Format;           /* Format name of data that follows
                               MQWIH */
    MQLONG    Flags;           /* Flags */
    MQCHAR32  ServiceName;     /* Service name */
    MQCHAR8   ServiceStep;     /* Service step name */
    MQBYTE16  MsgToken;        /* Message token */
    MQCHAR32  Reserved;        /* Reserved */
};
```

*COBOL declaration:*

```
** MQWIH structure
  10 MQWIH.
**   Structure identifier
  15 MQWIH-STRUCID      PIC X(4).
**   Structure version number
  15 MQWIH-VERSION     PIC S9(9) BINARY.
**   Length of MQWIH structure
  15 MQWIH-STRUCLNGTH  PIC S9(9) BINARY.
**   Numeric encoding of data that follows MQWIH
  15 MQWIH-ENCODING    PIC S9(9) BINARY.
**   Character-set identifier of data that follows MQWIH
  15 MQWIH-CODEDCHARSETID PIC S9(9) BINARY.
**   Format name of data that follows MQWIH
  15 MQWIH-FORMAT      PIC X(8).
**   Flags
  15 MQWIH-FLAGS       PIC S9(9) BINARY.
**   Service name
  15 MQWIH-SERVICENAME PIC X(32).
**   Service step name
  15 MQWIH-SERVICESTEP PIC X(8).
**   Message token
  15 MQWIH-MSGTOKEN    PIC X(16).
**   Reserved
  15 MQWIH-RESERVED    PIC X(32).
```

*PL/I declaration:*

```
dc1
  1 MQWIH based,
  3 StrucId      char(4),      /* Structure identifier */
  3 Version      fixed bin(31), /* Structure version number */
  3 StrucLength  fixed bin(31), /* Length of MQWIH structure */
  3 Encoding     fixed bin(31), /* Numeric encoding of data that
                                follows MQWIH */
  3 CodedCharSetId fixed bin(31), /* Character-set identifier of data
                                that follows MQWIH */
  3 Format        char(8),      /* Format name of data that follows
                                MQWIH */
  3 Flags        fixed bin(31), /* Flags */
  3 ServiceName  char(32),     /* Service name */
  3 ServiceStep  char(8),     /* Service step name */
  3 MsgToken     char(16),     /* Message token */
  3 Reserved     char(32);    /* Reserved */
```

*High Level Assembler declaration:*

```
MQWIH          DSECT
MQWIH_STRUCID  DS   CL4  Structure identifier

  Reserved    As String*32  'Reserved'
End Type
```

### MQXP - Exit parameter block:

The following table summarizes the fields in the structure.

Table 240. Fields in MQXP

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>ExitId</i>	Exit identifier	ExitId
<i>ExitReason</i>	Reason for invocation of exit	ExitReason
<i>ExitResponse</i>	Response from exit	ExitResponse
<i>ExitCommand</i>	API call code	ExitCommand
<i>ExitParmCount</i>	Parameter count	ExitParmCount
<i>ExitUserArea</i>	User area	ExitUserArea

Overview for MQXP: 

**Availability:** z/OS.

**Purpose:** The MQXP structure is used as an input/output parameter to the API-crossing exit. For more information about this exit, see The API-crossing exit.

**Character set and encoding:** Character data in MQXP is in the character set of the local queue manager; this is given by the *CodedCharSetId* queue-manager attribute. Numeric data in MQXP is in the native machine encoding; this is given by MQENC\_NATIVE.

*Fields for MQXP:*

The MQXP structure contains the following fields; the fields are described in **alphabetical order**:

*ExitCommand (MQLONG):*

This field is set on entry to the exit routine. It identifies the API call that caused the exit to be invoked:

**MQXC\_CALLBACK**

The CALLBACK call.

**MQXC\_MQBACK**

The MQBACK call.

**MQXC\_MQCB**

The MQCB call.

**MQXC\_MQCLOSE**

The MQCLOSE call.

**MQXC\_MQCMIT**

The MQCMIT call.

**MQXC\_MQCTL**

The MQCTL call.

**MQXC\_MQGET**

The MQGET call.

**MQXC\_MQINQ**

The MQINQ call.

**MQXC\_MQOPEN**

The MQOPEN call.

**MQXC\_MQPUT**

The MQPUT call.

**MQXC\_MQPUT1**

The MQPUT1 call.

**MQXC\_MQSET**

The MQSET call.

**MQXC\_MQSTAT**

The MQSTAT call.

**MQXC\_MQSUB**

The MQSUB call.

**MQXC\_MQSUBRQ**

The MQSUBRQ call.

This is an input field to the exit.

*ExitId (MQLONG):*

This is set on entry to the exit routine, and indicates the type of exit:

**MQXT\_API\_CROSSING\_EXIT**  
API-crossing exit for CICS.

This is an input field to the exit.

*ExitParmCount (MQLONG):*

This field is set on entry to the exit routine. It contains the number of parameters that the MQ call takes. These are:

Call name	Number of parameters
MQBACK	3
MQCLOSE	5
MQCMIT	3
MQGET	9
MQINQ	10
MQOPEN	6
MQPUT	8
MQPUT1	8
MQSET	10

This is an input field to the exit.

*ExitReason (MQLONG):*

This is set on entry to the exit routine. For the API-crossing exit it indicates whether the routine is called before or after execution of the API call:

**MQXR\_BEFORE**  
Before API execution.

**MQXR\_AFTER**  
After API execution.

This is an input field to the exit.

*ExitResponse (MQLONG):*

The value is set by the exit to communicate with the caller. The following values are defined:

**MQXCC\_OK**  
Exit completed successfully.

**MQXCC\_SUPPRESS\_FUNCTION**  
Suppress function.

When this value is set by an API-crossing exit called *before* the API call, the API call is not performed. The *CompCode* for the call is set to MQCC\_FAILED, the *Reason* is set to MQRC\_SUPPRESSED\_BY\_EXIT, and all other parameters remain as the exit left them.

When this value is set by an API-crossing exit called *after* the API call, it is ignored by the queue manager.

**MQXCC\_SKIP\_FUNCTION**  
Skip function.

When this value is set by an API-crossing exit called *before* the API call, the API call is not performed; the *CompCode* and *Reason* and all other parameters remain as the exit left them.

When this value is set by an API-crossing exit called *after* the API call, it is ignored by the queue manager.

This is an output field from the exit.

*ExitUserArea (MQBYTE16):*

This is a field that is available for the exit to use. It is initialized to binary zero for the length of the field before the first invocation of the exit for the task, and thereafter any changes made to this field by the exit are preserved across invocations of the exit. The following value is defined:

**MQXUA\_NONE**

No user information.

The value is binary zero for the length of the field.

For the C programming language, the constant `MQXUA_NONE_ARRAY` is also defined; this has the same value as `MQXUA_NONE`, but is an array of characters instead of a string.

The length of this field is given by `MQ_EXIT_USER_AREA_LENGTH`. This is an input/output field to the exit.

*Reserved (MQLONG):*

This is a reserved field. Its value is not significant to the exit.

*StrucId (MQCHAR4):*

This is the structure identifier. The value must be:

**MQXP\_STRUC\_ID**

Identifier for exit parameter structure.

For the C programming language, the constant `MQXP_STRUC_ID_ARRAY` is also defined; this has the same value as `MQXP_STRUC_ID`, but is an array of characters instead of a string.

This is an input field to the exit.

*Version (MQLONG):*

This is the structure version number. The value must be:

**MQXP\_VERSION\_1**

Version number for exit parameter-block structure.

**Note:** When a new version of this structure is introduced, the layout of the existing part is not changed. The exit must therefore check that the version number is equal to or greater than the lowest version that contains the fields that the exit needs to use.

This is an input field to the exit.

### Language declarations:

This structure is supported in the following programming languages.

#### C declaration:

```
typedef struct tagMQXP MQXP;
struct tagMQXP {
    MQCHAR4  StrucId;      /* Structure identifier */
    MQLONG   Version;     /* Structure version number */
    MQLONG   ExitId;      /* Exit identifier */
    MQLONG   ExitReason;  /* Reason for invocation of exit */
    MQLONG   ExitResponse; /* Response from exit */

### MQXQH - Transmission-queue header:

The following table summarizes the fields in the structure.

Table 241. Fields in MQXQH

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>RemoteQName</i>	Name of destination queue	RemoteQName
<i>RemoteQMgrName</i>	Name of destination queue manager	RemoteQMgrName
<i>MsgDesc</i>	Original message descriptor	MsgDesc

Overview for MQXQH:

**Availability:** All IBM MQ systems and IBM MQ clients.

**Purpose:** The MQXQH structure describes the information that is prefixed to the application message data of messages when they are on transmission queues. A transmission queue is a special type of local queue that temporarily holds messages destined for remote queues (that is, destined for queues that do not belong to the local queue manager). A transmission queue is denoted by the *usage* queue attribute having the value MQUS\_TRANSMISSION.

**Format name:** MQFMT\_XMIT\_Q\_HEADER.

**Character set and encoding:** Data in MQXQH must be in the character set given by the *CodedCharSetId* queue-manager attribute and encoding of the local queue manager given by MQENC\_NATIVE.

Set the character set and encoding of the MQXQH into the *CodedCharSetId* and *Encoding* fields in:

- The separate MQMD (if the MQXQH structure is at the start of the message data), or
- The header structure that precedes the MQXQH structure (all other cases).

**Usage:** A message that is on a transmission queue has *two* message descriptors:

- One message descriptor is stored separately from the message data; this is called the *separate message descriptor*, and is generated by the queue manager when the message is placed on the transmission queue. Some of the fields in the separate message descriptor are copied from the message descriptor provided by the application on the MQPUT or MQPUT1 call.

The separate message descriptor is the one that is returned to the application in the *MsgDesc* parameter of the MQGET call when the message is removed from the transmission queue.

- A second message descriptor is stored within the MQXQH structure as part of the message data; this is called the *embedded message descriptor*, and is a copy of the message descriptor that was provided by the application on the MQPUT or MQPUT1 call (with minor variations).

The embedded message descriptor is always a version-1 MQMD. If the message put by the application has nondefault values for one or more of the version-2 fields in the MQMD, an MQMDE structure follows the MQXQH, and is in turn followed by the application message data (if any). The MQMDE is either:

- Generated by the queue manager (if the application uses a version-2 MQMD to put the message), or
- Already present at the start of the application message data (if the application uses a version-1 MQMD to put the message).

The embedded message descriptor is the one that is returned to the application in the *MsgDesc* parameter of the MQGET call when the message is removed from the final destination queue.

**Fields in the separate message descriptor:** The fields in the separate message descriptor are set by the queue manager as shown. If the queue manager does not support the version-2 MQMD, a version-1 MQMD is used without loss of function.

Field in separate MQMD	Value used
<i>StrucId</i>	MQMD_STRUC_ID
<i>Version</i>	MQMD_VERSION_2
<i>Report</i>	Copied from the embedded message descriptor, but with the bits identified by MQRO_ACCEPT_UNSUP_IF_XMIT_MASK set to zero. (This prevents a COA or COD report message being generated when a message is placed on or removed from a transmission queue.)
<i>MsgType</i>	Copied from the embedded message descriptor.
<i>Expiry</i>	Copied from the embedded message descriptor.
<i>Feedback</i>	Copied from the embedded message descriptor.
<i>Encoding</i>	MQENC_NATIVE (see note)
<i>CodedCharSetId</i>	Queue manager's <i>CodedCharSetId</i> attribute.
<i>Format</i>	MQFMT_XMIT_Q_HEADER
<i>Priority</i>	Copied from the embedded message descriptor.
<i>Persistence</i>	Copied from the embedded message descriptor.
<i>MsgId</i>	A new value is generated by the queue manager. This message identifier is different from the <i>MsgId</i> that the queue manager may have generated for the embedded message descriptor described previously.
<i>CorrelId</i>	The <i>MsgId</i> from the embedded message descriptor. For messages being put to the SYSTEM.CLUSTER.TRANSMIT.QUEUE, <i>CorrelId</i> is reserved for internal use.
<i>BackoutCount</i>	0
<i>ReplyToQ</i>	Copied from the embedded message descriptor.
<i>ReplyToQMgr</i>	Copied from the embedded message descriptor.
<i>UserIdentifier</i>	Copied from the embedded message descriptor.
<i>AccountingToken</i>	Copied from the embedded message descriptor. For messages being put to the SYSTEM.CLUSTER.TRANSMIT.QUEUE, <i>AccountingToken</i> is reserved for internal use.
<i>ApplIdentityData</i>	Copied from the embedded message descriptor.
<i>PutApplType</i>	MQAT_QMGR
<i>PutApplName</i>	First 28 bytes of the queue-manager name.
<i>PutDate</i>	Date when message was put on transmission queue.
<i>PutTime</i>	Time when message was put on transmission queue.
<i>ApplOriginData</i>	Blanks
<i>GroupId</i>	MQGI_NONE
<i>MsgSeqNumber</i>	1
<i>Offset</i>	0
<i>MsgFlags</i>	MQMF_NONE
<i>OriginalLength</i>	MQOL_UNDEFINED

- On Windows, the value of MQENC\_NATIVE for Micro Focus COBOL differs from the value for C. The value in the *Encoding* field in the separate message descriptor is always the value for C in these environments; this value is 546 in decimal. Also, the integer fields in the MQXQH structure are in the encoding that corresponds to this value (the native Intel encoding).

**Fields in the embedded message descriptor:** The fields in the embedded message descriptor have the same values as those in the *MsgDesc* parameter of the MQPUT or MQPUT1 call, except for the following:

- The *Version* field always has the value MQMD\_VERSION\_1.
- If the *Priority* field has the value MQPRI\_PRIORITY\_AS\_Q\_DEF, it is replaced by the value of the queue's *DefPriority* attribute.
- If the *Persistence* field has the value MQPER\_PERSISTENCE\_AS\_Q\_DEF, it is replaced by the value of the queue's *DefPersistence* attribute.
- If the *MsgId* field has the value MQMI\_NONE, or the MQPMO\_NEW\_MSG\_ID option was specified, or the message is a distribution-list message, *MsgId* is replaced by a new message identifier generated by the queue manager.

When a distribution-list message is split into smaller distribution-list messages placed on different transmission queues, the *MsgId* field in each of the new embedded message descriptors is the same as that in the original distribution-list message.

- If the MQPMO\_NEW\_CORREL\_ID option was specified, *CorrelId* is replaced by a new correlation identifier generated by the queue manager.
- The context fields are set as indicated by the MQPMO\_\*\_CONTEXT options specified in the *PutMsgOpts* parameter; the context fields are:
  - *AccountingToken*
  - *ApplIdentityData*
  - *ApplOriginData*
  - *PutApplName*
  - *PutApplType*
  - *PutDate*
  - *PutTime*
  - *UserIdentifier*
- The version-2 fields (if they were present) are removed from the MQMD, and moved into an MQMDE structure, if one or more of the version-2 fields has a nondefault value.

**Putting messages on remote queues:** When an application puts a message on a remote queue (either by specifying the name of the remote queue directly, or by using a local definition of the remote queue), the local queue manager:

- Creates an MQXQH structure containing the embedded message descriptor
- Appends an MQMDE if one is needed and is not already present
- Appends the application message data
- Places the message on an appropriate transmission queue

**Putting messages directly on transmission queues:** An application can also put a message directly on a transmission queue. In this case the application must prefix the application message data with an MQXQH structure, and initialize the fields with appropriate values. In addition, the *Format* field in the *MsgDesc* parameter of the MQPUT or MQPUT1 call must have the value MQFMT\_XMIT\_Q\_HEADER.

Character data in the MQXQH structure created by the application must be in the character set of the local queue manager (defined by the *CodedCharSetId* queue-manager attribute), and integer data must be in the native machine encoding. In addition, character data in the MQXQH structure must be padded

with blanks to the defined length of the field; the data must not be ended prematurely by using a null character, because the queue manager does not convert the null and subsequent characters to blanks in the MQXQH structure.

However, the queue manager does not check that an MQXQH structure is present, or that valid values have been specified for the fields.

Applications should not put their messages directly to the SYSTEM.CLUSTER.TRANSMIT.QUEUE.

**Getting messages from transmission queues:** Applications that get messages from a transmission queue must process the information in the MQXQH structure in an appropriate fashion. The presence of the MQXQH structure at the beginning of the application message data is indicated by the value MQFMT\_XMIT\_Q\_HEADER being returned in the *Format* field in the *MsgDesc* parameter of the MQGET call. The values returned in the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter indicate the character set and encoding of the character and integer data in the MQXQH structure. The character set and encoding of the application message data are defined by the *CodedCharSetId* and *Encoding* fields in the embedded message descriptor.

*Fields for MQXQH:*

The MQXQH structure contains the following fields; the fields are described in **alphabetical order**:

*MsgDesc (MQMD1):*

This is the embedded message descriptor, and is a close copy of the message descriptor MQMD that was specified as the *MsgDesc* parameter on the MQPUT or MQPUT1 call when the message was originally put to the remote queue.

**Note:** This is a version-1 MQMD.

The initial values of the fields in this structure are the same as those in the MQMD structure.

*RemoteQMgrName (MQCHAR48):*

This is the name of the queue manager or queue-sharing group that owns the queue that is the apparent eventual destination for the message.

If the message is a distribution-list message, *RemoteQMgrName* is blank.

The length of this field is given by MQ\_Q\_MGR\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*RemoteQName* (MQCHAR48):

This is the name of the message queue that is the apparent eventual destination for the message (this might prove not to be the eventual destination if, for example, this queue is defined at *RemoteQMgrName* to be a local definition of another remote queue).

If the message is a distribution-list message (that is, the *Format* field in the embedded message descriptor is MQFMT\_DIST\_HEADER), *RemoteQName* is blank.

The length of this field is given by MQ\_Q\_NAME\_LENGTH. The initial value of this field is the null string in C, and 48 blank characters in other programming languages.

*StrucId* (MQCHAR4):

This is the structure identifier. The value must be:

**MQXQH\_STRUC\_ID**

Identifier for transmission-queue header structure.

For the C programming language, the constant MQXQH\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQXQH\_STRUC\_ID, but is an array of characters instead of a string.

The initial value of this field is MQXQH\_STRUC\_ID.

*Version* (MQLONG):

This is the structure version number. The value must be:

**MQXQH\_VERSION\_1**

Version number for transmission-queue header structure.

The following constant specifies the version number of the current version:

**MQXQH\_CURRENT\_VERSION**

Current version of transmission-queue header structure.

The initial value of this field is MQXQH\_VERSION\_1.

*Initial values and language declarations for MQXQH:*

Table 242. Initial values of fields in MQXQH for MQXQH

Field name	Name of constant	Value of constant
<i>StrucId</i>	MQXQH_STRUC_ID	'XQH'
<i>Version</i>	MQXQH_VERSION_1	1
<i>RemoteQName</i>	None	Null string or blanks
<i>RemoteQMgrName</i>	None	Null string or blanks
<i>MsgDesc</i>	Same names and values as MQMD; see Table 197 on page 2230	-

Table 242. Initial values of fields in MQXQH for MQXQH (continued)

Field name	Name of constant	Value of constant
<b>Notes:</b>		
1. The symbol <code>␣</code> represents a single blank character.		
2. The value Null string or blanks denotes the null string in C, and blank characters in other programming languages.		
3. In the C programming language, the macro variable MQXQH_DEFAULT contains the values that are listed in the table. Use it in the following way to provide initial values for the fields in the structure: MQXQH MyXQH = {MQXQH_DEFAULT};		

*C declaration:*

```
typedef struct tagMQXQH MQXQH;
struct tagMQXQH {
    MQCHAR4   StrucId;           /* Structure identifier */
    MQLONG    Version;          /* Structure version number */
    MQCHAR48  RemoteQName;      /* Name of destination queue */
    MQCHAR48  RemoteQMGrName;   /* Name of destination queue manager */
    MQMD1     MsgDesc;          /* Original message descriptor */
};
```

*COBOL declaration:*

Type MQXQH
  StrucId      As String*4  'Structure identifier'
  Version      As Long      'Structure version number'
  RemoteQName  As String*48 'Name of destination queue'
  RemoteQMgrName As String*48 'Name of destination queue manager'
  MsgDesc      As MQMD1    'Original message descriptor'
End Type
```

## Function calls

This section gives information on all of the MQI calls that are possible. Descriptions, syntax, parameter information, usage notes, and language invocations for each possible language are given for each of the different calls.

### Call descriptions:

This section describes MQI calls.

- “MQBACK - Back out changes” on page 2414
- “MQBEGIN - Begin unit of work” on page 2418
- “MQBUFMH - Convert buffer into message handle” on page 2422
- “MQCB - Manage callback” on page 2425
- “MQCB\_FUNCTION - Callback function” on page 2435
- “MQCLOSE - Close object” on page 2437
- “MQCMIT - Commit changes” on page 2445
- “MQCONN - Connect queue manager” on page 2449
- “MQCONNEX - Connect queue manager (extended)” on page 2457
- “MQCRTMH - Create message handle” on page 2462
- “MQCTL - Control callbacks” on page 2466
- “MQDISC - Disconnect queue manager” on page 2473
- “MQDLTMH - Delete message handle” on page 2476
- “MQDLTMP - Delete message property” on page 2479
- “MQGET - Get message” on page 2481
- “MQINQ - Inquire object attributes” on page 2494
- “MQINQMP - Inquire message property” on page 2509
- “MQMHBUF - Convert message handle into buffer” on page 2515
- “MQOPEN - Open object” on page 2519
- “MQPUT - Put message” on page 2537
- “MQPUT1 - Put one message” on page 2551
- “MQSET - Set object attributes” on page 2561
- “MQSETMP - Set message property” on page 2568
- “MQSTAT - Retrieve status information” on page 2572
- “MQMHBUF - Convert message handle into buffer” on page 2515
- “MQSUB - Register subscription” on page 2576
- “MQSUBRQ - Subscription request” on page 2583

Online help on the UNIX platforms, in the form of *man* pages, is available for these calls.

**Note:** The calls associated with data conversion, MQXCNVC and MQ\_DATA\_CONV\_EXIT, are in “Data conversion” on page 2701.

*Conventions used in the call descriptions:*

For each call, this collection of topics gives a description of the parameters and usage of the call in a format that is independent of programming language. This is followed by typical invocations of the call, and typical declarations of its parameters, in each of the supported programming languages.

**Important:** When coding IBM MQ API calls you must ensure that all relevant parameters (as described in the following sections) are provided. Failure to do so can produce unpredictable results.

The description of each call contains the following sections:

**Call name**

The call name, followed by a brief description of the purpose of the call.

**Parameters**

For each parameter, the name is followed by its data type in parentheses ( ) and one of the following:

**input** You supply information in the parameter when you make the call.

**output**

The queue manager returns information in the parameter when the call completes or fails.

**input/output**

You supply information in the parameter when you make the call, and the queue manager changes the information when the call completes or fails.

For example:

*Compcode* (MQLONG) - output

In some cases, the data type is a structure. In all cases, there is more information about the data type or structure in "Elementary data types" on page 1996.

The last two parameters in each call are a completion code and a reason code. The completion code indicates whether the call completed successfully, partially, or not at all. Further information about the partial success or the failure of the call is given in the reason code. For more information about each completion and reason code, see "Return codes" on page 2668.

**Usage notes**

Additional information about the call, describing how to use it and any restrictions on its use.

**Assembler language invocation**

Typical invocation of the call, and declaration of its parameters, in assembler language.

**C invocation**

Typical invocation of the call, and declaration of its parameters, in C.

**COBOL invocation**

Typical invocation of the call, and declaration of its parameters, in COBOL.

**PL/I invocation**

Typical invocation of the call, and declaration of its parameters, in PL/I.

All parameters are passed by reference.

**Visual Basic invocation**

Typical invocation of the call, and declaration of its parameters, in Visual Basic.

Other notation conventions are:

## Constants

Names of constants are shown in uppercase; for example, MQOO\_OUTPUT. A set of constants having the same prefix is shown as follows: MQIA\_\*. See "Constants" on page 1856 for the value of a constant.

## Arrays

In some calls, parameters are arrays of character strings that do not have fixed sizes. In the descriptions of these parameters, a lowercase *n* represents a numeric constant. When you code the declaration for that parameter, replace the *n* with the numeric value that you require.

*Using the calls in the C language:*

Parameters that are *input only* and of type MQHCONN, MQHOBJ, MQHMSG, or MQLONG are passed by value. For all other parameters, the *address* of the parameter is passed by value.

You do not need to specify all parameters that are passed by address every time that you invoke a function. Where you do not need a particular parameter, specify a null pointer as the parameter on the function invocation, in place of the address of parameter data. Parameters for which this is possible are identified in the call descriptions.

No parameter is returned as the value of the call; in C terminology, this means that all calls return **void**.

*Declaring the Buffer parameter:*

The **MQGET**, **MQPUT**, and **MQPUT1** calls each have one parameter that has an undefined data type: the *Buffer* parameter. Use this parameter to send and receive the application's message data.

Parameters of this sort are shown in the C examples as arrays of MQBYTE. You can declare the parameters in this way, but it is usually more convenient to declare them as the particular structure that describes the layout of the data in the message. The function prototype declares the parameter as a pointer-to-void, so that you can specify the address of any sort of data as the parameter on the call invocation.

Pointer-to-void is a pointer to data of undefined format. It is defined as:

```
typedef void *PMQVOID;
```

## MQBACK - Back out changes:

The MQBACK call indicates to the queue manager that all the message gets and puts that have occurred since the last sync point are to be backed out.

Messages put as part of a unit of work are deleted; messages retrieved as part of a unit of work are reinstated on the queue.

- On z/OS, this call is used only by batch programs (including IMS batch DL/I programs).
- On IBM i, this call is not supported for applications running in compatibility mode.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

## Syntax

MQBACK (*Hconn*, *Compcode*, *Reason*)

## Parameters

### ***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

### ***Compcode***

Type: MQLONG - output

The completion code; it is one of the following:

#### **MQCC\_OK**

Successful completion.

#### **MQCC\_WARNING**

Warning (partial completion).

#### **MQCC\_FAILED**

Call failed.

### ***Reason***

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

#### **MQRC\_OUTCOME\_PENDING**

(2124, X'84C') Result of back-out operation is pending.

If *CompCode* is MQCC\_FAILED:

#### **MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

#### **MQRC\_API\_EXIT\_ERROR**

(2374, X'946') API exit failed.

#### **MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

#### **MQRC\_CALL\_IN\_PROGRESS**

(2219, X'8AB') MQI call entered before previous call complete.

#### **MQRC\_CF\_STRUC\_IN\_USE**

(2346, X'92A') Coupling-facility structure in use.

#### **MQRC\_CONNECTION\_BROKEN**

(2009, X'7D9') Connection to queue manager lost.

#### **MQRC\_ENVIRONMENT\_ERROR**

(2012, X'7DC') Call not valid in environment.

#### **MQRC\_HCONN\_ERROR**

(2018, X'7E2') Connection handle not valid.

#### **MQRC\_OBJECT\_DAMAGED**

(2101, X'835') Object damaged.

#### **MQRC\_OUTCOME\_MIXED**

(2123, X'84B') Result of commit or back-out operation is mixed.

**MQRC\_Q\_MGR\_STOPPING**

(2162, X'872') Queue manager shutting down.

**MQRC\_RESOURCE\_PROBLEM**

(2102, X'836') Insufficient system resources available.

**MQRC\_STORAGE\_MEDIUM\_FULL**

(2192, X'890') External storage medium is full.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes

**Usage notes**

1. You can use this call only when the queue manager itself coordinates the unit of work. This can be:
  - A local unit of work, where the changes affect only MQ resources.
  - A global unit of work, where the changes can affect resources belonging to other resource managers, as well as affecting MQ resources.

For further details about local and global units of work, see “MQBEGIN - Begin unit of work” on page 2418.

2. In environments where the queue manager does not coordinate the unit of work, use the appropriate back-out call instead of MQBACK. The environment might also support an implicit back out caused by the application terminating abnormally.
  - On z/OS, use the following calls:
    - Batch programs (including IMS batch DL/I programs) can use the MQBACK call if the unit of work affects only MQ resources. However, if the unit of work affects both MQ resources and resources belonging to other resource managers (for example, Db2), use the SRRBACK call provided by the z/OS Recoverable Resource Service (RRS). The SRRBACK call backs out changes to resources belonging to the resource managers that have been enabled for RRS coordination.
    - CICS applications must use the EXEC CICS SYNCPOINT ROLLBACK command to back out the unit of work. Do not use the MQBACK call for CICS applications.
    - IMS applications (other than batch DL/I programs) must use IMS calls such as R0LB to back out the unit of work. Do not use the MQBACK call for IMS applications (other than batch DL/I programs).
  - On IBM i, use this call for local units of work coordinated by the queue manager. This means that a commitment definition must not exist at job level, that is, the STRCMTCTL command with the CMTSCOPE(\*JOB) parameter must not have been issued for the job.
3. If an application ends with uncommitted changes in a unit of work, the disposition of those changes depends on whether the application ends normally or abnormally. See the usage notes in “MQDISC - Disconnect queue manager” on page 2473 for further details.
4. When an application puts or gets messages in groups or segments of logical messages, the queue manager retains information relating to the message group and logical message for the last successful MQPUT and MQGET calls. This information is associated with the queue handle, and includes such things as:
  - The values of the *GroupId*, *MsgSeqNumber*, *Offset*, and *MsgFlags* fields in MQMD.
  - Whether the message is part of a unit of work.
  - For the MQPUT call: whether the message is persistent or nonpersistent.

The queue manager keeps *three* sets of group and segment information, one set for each of the following:

- The last successful MQPUT call (this can be part of a unit of work).
  - The last successful MQGET call that removed a message from the queue (this can be part of a unit of work).
  - The last successful MQGET call that browsed a message on the queue (this *cannot* be part of a unit of work).
5. The information associated with the MQGET call is restored to the value that it had before the first successful MQGET call for that queue handle in the current unit of work.

Queues that were updated by the application after the unit of work started, but outside the scope of the unit of work, do not have their group and segment information restored if the unit of work is backed out.

Restoring the group and segment information to its previous value when a unit of work is backed out allows the application to spread a large message group or large logical message consisting of many segments across several units of work, and to restart at the correct point in the message group or logical message if one of the units of work fails.

Using several units of work might be advantageous if the local queue manager has only limited queue storage. However, the application must maintain sufficient information to be able to restart putting or getting messages at the correct point if a system failure occurs.

For details of how to restart at the correct point after a system failure, see the MQPMO\_LOGICAL\_ORDER option described in “MQPMO - Put-message options” on page 2269, and the MQGMO\_LOGICAL\_ORDER option described in “MQGMO - Get-message options” on page 2128.

The remaining usage notes apply only when the queue manager coordinates the units of work.

6. A unit of work has the same scope as a connection handle. All MQ calls that affect a particular unit of work must be performed using the same connection handle. Calls issued using a different connection handle (for example, calls issued by another application) affect a different unit of work. See the *Hconn* parameter described in “MQCONN - Connect queue manager” on page 2449 for information about the scope of connection handles.
7. Only messages that were put or retrieved as part of the current unit of work are affected by this call.
8. A long-running application that issues MQGET, MQPUT, or MQPUT1 calls within a unit of work, but that never issues a commit or backout call, can fill queues with messages that are not available to other applications. To guard against this possibility, the administrator must set the *MaxUncommittedMsgs* queue-manager attribute to a value that is low enough to prevent runaway applications filling the queues, but high enough to allow the expected messaging applications to work correctly.

### C invocation

```
MQBACK (Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;      /* Connection handle */
MQLONG   CompCode;  /* Completion code */
MQLONG   Reason;    /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQBACK' USING HCONN, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN    PIC S9(9) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON   PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQBACK (Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn      fixed bin(31); /* Connection handle */
dc1 CompCode   fixed bin(31); /* Completion code */
dc1 Reason     fixed bin(31); /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

```
CALL MQBACK, (HCONN,COMP CODE,REASON)
```

Declare the parameters as follows:

```
HCONN      DS  F  Connection handle
COMP CODE  DS  F  Completion code
REASON     DS  F  Reason code qualifying COMP CODE
```

## Visual Basic invocation

```
MQBACK Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn    As Long 'Connection handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## MQBEGIN - Begin unit of work:

The MQBEGIN call begins a unit of work that is coordinated by the queue manager, and that can involve external resource managers.

### Syntax

```
MQBEGIN (Hconn, BeginOptions, Compcode, Reason)
```

### Parameters

#### ***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

*Hconn* must be a nonshared connection handle. If a shared connection handle is specified, the call fails with reason code MQRC\_HCONN\_ERROR. See the description of the MQCNO\_HANDLE\_SHARE\_\* options in "MQCNO - Connect options" on page 2076 for more information about shared and nonshared handles.

#### ***BeginOptions***

Type: MQBO - input/output

These are options that control the action of MQBEGIN, as described in "MQBEGIN - Begin unit of work."

If no options are required, programs written in C or S/390 assembler can specify a null parameter address, instead of specifying the address of an MQBO structure.

#### ***CompCode***

Type: MQLONG - output

The completion code; it is one of the following:

**MQCC\_OK**  
Successful completion.

**MQCC\_WARNING**  
Warning (partial completion).

**MQCC\_FAILED**  
Call failed.

**Reason**

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**  
(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_NO\_EXTERNAL\_PARTICIPANTS**  
(2121, X'849') No participating resource managers registered.

**MQRC\_PARTICIPANT\_NOT\_AVAILABLE**  
(2122, X'84A') Participating resource manager not available.

If *CompCode* is MQCC\_FAILED:

**MQRC\_API\_EXIT\_ERROR**  
(2374, X'946') API exit failed.

**MQRC\_BO\_ERROR**  
(2134, X'856') Begin-options structure not valid.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_ENVIRONMENT\_ERROR**  
(2012, X'7DC') Call not valid in environment.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_OPTIONS\_ERROR**  
(2046, X'7FE') Options not valid or not consistent.

**MQRC\_Q\_MGR\_STOPPING**  
(2162, X'872') Queue manager shutting down.

**MQRC\_RESOURCE\_PROBLEM**  
(2102, X'836') Insufficient system resources available.

**MQRC\_STORAGE\_NOT\_AVAILABLE**  
(2071, X'817') Insufficient storage available.

**MQRC\_UNEXPECTED\_ERROR**  
(2195, X'893') Unexpected error occurred.

**MQRC\_UOW\_IN\_PROGRESS**  
(2128, X'850') Unit of work already started.

For more information about these reason codes, see Reason codes.

## Usage notes

1. Use the MQBEGIN call to start a unit of work that is coordinated by the queue manager and that might involve changes to resources owned by other resource managers. The queue manager supports three types of unit-of-work:
  - **Queue-manager-coordinated local unit of work:** A unit of work in which the queue manager is the only resource manager participating, and so the queue manager acts as the unit-of-work coordinator.
    - To start this type of unit of work, specify the MQPMO\_SYNCPOINT or MQGMO\_SYNCPOINT option on the first MQPUT, MQPUT1, or MQGET call in the unit of work.
    - To commit or back out this type of unit of work, use the MQCMIT or MQBACK call.
  - **Queue-manager-coordinated global unit of work:** A unit of work in which the queue manager acts as the unit-of-work coordinator, both for MQ resources *and* for resources belonging to other resource managers. Those resource managers cooperate with the queue manager to ensure that all changes to resources in the unit of work are committed or backed out together.
    - To start this type of unit of work, use the MQBEGIN call.
    - To commit or back out this type of unit of work, use the MQCMIT and MQBACK calls.
  - **Externally-coordinated global unit of work:** A unit of work in which the queue manager is a participant, but the queue manager does not act as the unit-of-work coordinator. Instead, there is an external unit-of-work coordinator with which the queue manager cooperates.
    - To start this type of unit of work, use the relevant call provided by the external unit-of-work coordinator.

If the MQBEGIN call is used to try to start the unit of work, the call fails with reason code MQRC\_ENVIRONMENT\_ERROR.
    - To commit or back out this type of unit of work, use the commit and back-out calls provided by the external unit-of-work coordinator.

If you use the MQCMIT or MQBACK call to commit or back out the unit of work, the call fails with reason code MQRC\_ENVIRONMENT\_ERROR.
2. If the application ends with uncommitted changes in a unit of work, the disposition of those changes depends on whether the application ends normally or abnormally. See the usage notes in “MQDISC - Disconnect queue manager” on page 2473 for further details.
3. An application can participate in only one unit of work at a time. The MQBEGIN call fails with reason code MQRC\_UOW\_IN\_PROGRESS if there is already a unit of work in existence for the application, regardless of which type of unit of work it is.
4. The MQBEGIN call is not valid in an MQ MQI client environment. An attempt to use the call fails with reason code MQRC\_ENVIRONMENT\_ERROR.
5. When the queue manager is acting as the unit-of-work coordinator for global units of work, the resource managers that can participate in the unit of work are defined in the queue manager configuration file.
6. On IBM i, the three types of unit of work are supported as follows:
  - **Queue-manager-coordinated local unit of work** can be used only when a commitment definition does not exist at the job level, that is, the STRCMTCTL command with the CMTSCOPE(\*JOB) parameter must not have been issued for the job.
  - **Queue-manager-coordinated global unit of work** is not supported.
  - **Externally-coordinated global unit of work** can be used only when a commitment definition exists at job level, that is, the STRCMTCTL command with the CMTSCOPE(\*JOB) parameter must have been issued for the job. If this has been done, the IBM i COMMIT and ROLLBACK operations apply to MQ resources as well as to resources belonging to other participating resource managers.

## C invocation

```
MQBEGIN (Hconn, &BeginOptions, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;          /* Connection handle */
MQB0     BeginOptions; /* Options that control the action of MQBEGIN */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQBEGIN' USING HCONN, BEGINOPTIONS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN          PIC S9(9) BINARY.
** Options that control the action of MQBEGIN
01 BEGINOPTIONS.
   COPY CMQBOV.
** Completion code
01 COMPCODE       PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON         PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQBEGIN (Hconn, BeginOptions, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn          fixed bin(31); /* Connection handle */
dc1 BeginOptions   like MQB0;     /* Options that control the action of
                                   MQBEGIN */
dc1 CompCode       fixed bin(31); /* Completion code */
dc1 Reason         fixed bin(31); /* Reason code qualifying CompCode */
```

## Visual Basic invocation

```
MQBEGIN Hconn, BeginOptions, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn          As Long 'Connection handle'
Dim BeginOptions   As MQB0 'Options that control the action of MQBEGIN'
Dim CompCode       As Long 'Completion code'
Dim Reason         As Long 'Reason code qualifying CompCode'
```

## MQBUFMH - Convert buffer into message handle:

The MQBUFMH function call converts a buffer into a message handle and is the inverse of the MQMHBUF call.

This call takes a message descriptor and MQRFH2 properties in the buffer and makes them available through a message handle. The MQRFH2 properties in the message data are, optionally, removed. The *Encoding*, *CodedCharSetId*, and *Format* fields of the message descriptor are updated, if necessary, to correctly describe the contents of the buffer after the properties have been removed.

### Syntax

MQBUFMH (*Hconn*, *Hmsg*, *BufMsgHOpts*, *MsgDesc*, *BufferLength*, *Buffer*, *DataLength*, *Compcode*, *Reason*)

### Parameters

#### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC\_UNASSOCIATED\_HCONN, a valid connection must be established on the thread converting a buffer into a message handle. If a valid connection is not established, the call fails with MQRC\_CONNECTION\_BROKEN.

#### **Hmsg**

Type: MQHMQSG - input

This is the message handle for which a buffer is required. The value was returned by a previous MQCRTMH call.

#### **BufMsgHOpts**

Type: MQBMHO - input

The MQBMHO structure allows applications to specify options that control how message handles are produced from buffers.

See “MQBMHO - Buffer to message handle options” on page 2029 for details.

#### **MsgDesc**

Type: MQMD - input/output

The *MsgDesc* structure contains the message descriptor properties and describes the contents of the buffer area.

On output from the call, the properties are optionally removed from the buffer area and, in this case, the message descriptor is updated to correctly describe the buffer area.

Data in this structure must be in the character set and encoding of the application.

#### **BufferLength**

Type: MQLONG - input

*BufferLength* is the length of the Buffer area, in bytes.

A *BufferLength* of zero bytes is valid, and indicates that the buffer area contains no data.

#### **Buffer**

Type: MQBYTExBufferLength - input/output

These are options that control the action of MQBEGIN, as described in “MQBEGIN - Begin unit of work” on page 2418.

*Buffer* defines the area containing the message buffer. For most data, you should align the buffer on a 4-byte boundary.

If *Buffer* contains character or numeric data, set the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to the values appropriate to the data; this enables the data to be converted, if necessary.

If properties are found in the message buffer they are optionally removed; they later become available from the message handle on return from the call.

In the C programming language, the parameter is declared as a pointer-to-void, which means the address of any type of data can be specified as the parameter.

If the *BufferLength* parameter is zero, *Buffer* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler can be null.

### **DataLength**

Type: MQLONG - output

The length, in bytes, of the buffer which might have the properties removed.

### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

#### **MQCC\_OK**

Successful completion.

#### **MQCC\_FAILED**

Call failed.

### **Reason**

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED:

#### **MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'089C') Adapter not available.

#### **MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

#### **MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

#### **MQRC\_BMHO\_ERROR**

(2489, X'09B9') Buffer to message handle options structure not valid.

#### **MQRC\_BUFFER\_ERROR**

(2004, X'07D4') Buffer parameter not valid.

#### **MQRC\_BUFFER\_LENGTH\_ERROR**

(2005, X'07D5') Buffer length parameter not valid.

#### **MQRC\_CALL\_IN\_PROGRESS**

(2219, X'08AB') MQI call entered before previous call completed.

#### **MQRC\_CONNECTION\_BROKEN**

(2009, X'07D9') Connection to queue manager lost.

**MQRC\_HMSG\_ERROR**

(2460, X'099C') Message handle not valid.

**MQRC\_MD\_ERROR**

(2026, X'07EA') Message descriptor not valid.

**MQRC\_MSG\_HANDLE\_IN\_USE**

(2499, X'09C3') Message handle already in use.

**MQRC\_OPTIONS\_ERROR**

(2046, X'07FE') Options not valid or not consistent.

**MQRC\_RFH\_ERROR**

(2334, X'091E') MQRFH2 structure not valid.

**MQRC\_RFH\_FORMAT\_ERROR**

(2421, X'0975') An MQRFH2 folder containing properties could not be parsed.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

**Usage notes**

MQBUFMH calls cannot be intercepted by API exits - a buffer is converted into a message handle in the application space; the call does not reach the queue manager.

**C invocation**

```
MQBUFMH (Hconn, Hmsg, &BufMsgHOpts, &MsgDesc, BufferLength, Buffer,
        &DataLength, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN Hconn;          /* Connection handle */
MQHMSG  Hmsg;           /* Message handle */
MQBMHO  BufMsgHOpts;   /* Options that control the action of MQBUFMH */
MQMD    MsgDesc;       /* Message descriptor */
MQLONG  BufferLength;   /* Length in bytes of the Buffer area */
MQBYTE  Buffer[n];      /* Area to contain the message buffer */
MQLONG  DataLength;    /* Length of the output buffer */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */
```

**COBOL invocation**

```
CALL 'MQBUFMH' USING HCONN, HMSG, BUFMSGHOPTS, MSGDESC, BUFFERLENGTH,
                    BUFFER, DATALENGTH, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN      PIC S9(9) BINARY.
** Message handle
01 HMSG       PIC S9(18) BINARY.
** Options that control the action of MQBUFMH
01 BUFMSGHOPTS.
   COPY CMQBMHOV.
** Message descriptor
01 MSGDESC.
   COPY CMQMD.
** Length in bytes of the Buffer area
01 BUFFERLENGTH PIC S9(9) BINARY.
** Area to contain the message buffer
01 BUFFER      PIC X(n).
** Length of the output buffer
```

```

01 DATALENGTH PIC S9(9) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON PIC S9(9) BINARY.

```

### PL/I invocation

```
call MQBUFMH (Hconn, Hmsg, BufMsgHOpts, MsgDesc, BufferLength, Buffer,
DataLength, CompCode, Reason);
```

Declare the parameters as follows:

```

dcl Hconn      fixed bin(31); /* Connection handle */
dcl Hmsg       fixed bin(63); /* Message handle */
dcl BufMsgHOpts like MQBMHO; /* Options that control the action of
                             MQBUFMH */
dcl MsgDesc    like MQMD; /* Message descriptor */
dcl BufferLength fixed bin(31); /* Length in bytes of the Buffer area */
dcl Buffer      char(n); /* Area to contain the message buffer */
dcl DataLength fixed bin(31); /* Length of the output buffer */
dcl CompCode   fixed bin(31); /* Completion code */
dcl Reason     fixed bin(31); /* Reason code qualifying CompCode */

```

### High Level Assembler invocation

```
CALL MQBUFMH, (HCONN,HMSG,BUFMSGHOPTS,MSGDESC,BUFFERLENGTH,BUFFER,
DATALENGTH,COMPCODE,REASON)
```

Declare the parameters as follows:

HCONN	DS	F	Connection handle
HMSG	DS	D	Message handle
BUFMSGHOPTS	CMQBMHOA	,	Options that control the action of MQBUFMH
MSGDESC	CMQMDA	,	Message descriptor
BUFFERLENGTH	DS	F	Length in bytes of the BUFFER area
BUFFER	DS	CL(n)	Area to contain the properties
DATALENGTH	DS	F	Length of the output buffer
COMPCODE	DS	F	Completion code
REASON	DS	F	Reason code qualifying COMPCODE

### MQCB - Manage callback:

The MQCB call registers a callback for the specified object handle and controls activation and changes to the callback.

A callback is a piece of code (specified as either the name of a function that can be dynamically linked or as function pointer) that is called by IBM MQ when certain events occur.

To use MQCB and MQCTL on a V7 client you must be connected to a V7 server and the **SHARECNV** parameter of the channel must have a non-zero value.

The types of callback that can be defined are:

#### Message consumer

A message consumer callback function is called when a message, meeting the selection criteria specified, is available on an object handle.

Only one callback function can be registered against each object handle. If a single queue is to be read with multiple selection criteria then the queue must be opened multiple times and a consumer function registered on each handle.

#### Event handler

The event handler is called for conditions that affect the whole callback environment.

The function is called when an event condition occurs, for example, a queue manager or connection stopping or quiescing.

The function is not called for conditions that are specific to a single message consumer, for example `MQRC_GET_INHIBITED`; it is called however if a callback function does not end normally.

## Syntax

`MQCB (Hconn, Operation, CallbackDesc, Hobj, MsgDesc, GetMsgOpts, CompCode, Reason)`

## Parameters

### *Hconn*

Type: `MQHCONN` - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous `MQCONN` or `MQCONNX` call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, you can specify the following special value for `MQHC_DEF_HCONN` to use the connection handle associated with this execution unit.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See *Compatibility mode for RPG applications on IBM i*

### *Operation*

Type: `MQLONG` - input

The operation being processed on the callback defined for the specified object handle. You must specify one of the following options. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

#### **MQOP\_REGISTER**

Define the callback function for the specified object handle. This operation defines the function to be called and the selection criteria to be used.

If a callback function is already defined for the object handle the definition is replaced. If an error is detected while replacing the callback, the function is deregistered.

If a callback is registered in the same callback function in which it was previously deregistered, this is treated as a replace operation; any initial or final calls are not invoked.

You can use `MQOP_REGISTER` with `MQOP_SUSPEND` or `MQOP_RESUME`.

#### **MQOP\_DEREGISTER**

Stop the consuming of messages for the object handle and removes the handle from those eligible for a callback.

A callback is automatically deregistered if the associated handle is closed.

If `MQOP_DEREGISTER` is called from within a consumer, and the callback has a stop call defined, it is invoked upon return from the consumer.

If this operation is issued against an *Hobj* with no registered consumer, the call returns with `MQRC_CALLBACK_NOT_REGISTERED`.

#### **MQOP\_SUSPEND**

Suspends the consuming of messages for the object handle.

If this operation is applied to an event handler, the event handler does not get events while suspended, and any events missed while in the suspended state are not provided to the operation when it is resumed.

While suspended, the consumer function continues to get the control type callbacks.

### **MQOP\_RESUME**

Resume the consuming of messages for the object handle.

If this operation is applied to an event handler, the event handler does not get events while suspended, and any events missed while in the suspended state are not provided to the operation when it is resumed.

### ***CallbackDesc***

Type: MQCBD - input

This is a structure that identifies the callback function that is being registered by the application and the options used when registering it.

See MQCBD for details of the structure.

Callback descriptor is required only for the MQOP\_REGISTER option; if the descriptor is not required, the parameter address passed can be null.

### ***Hobj***

Type: MQHOBJ - input

This handle represents the access that has been established to the object from which a message is to be consumed. This is a handle that has been returned from a previous MQOPEN or MQSUB call (in the *Hobj* parameter).

*Hobj* is not required when defining an event handler routine (MQCBT\_EVENT\_HANDLER) and should be specified as MQHO\_NONE.

If *Hobj* has been returned from an MQOPEN call, the queue must have been opened with one or more of the following options:

- MQOO\_INPUT\_SHARED
- MQOO\_INPUT\_EXCLUSIVE
- MQOO\_INPUT\_AS\_Q\_DEF
- MQOO\_BROWSE

### ***MsgDesc***

Type: MQMD - input

This structure describes the attributes of the message required, and the attributes of the message retrieved.

The *MsgDesc* parameter defines the attributes of the messages required by the consumer, and the version of the MQMD to be passed to the message consumer.

The *MsgId*, *CorrelId*, *GroupId*, *MsgSeqNumber*, and *Offset* in the MQMD are used for message selection, depending on the options specified in the *GetMsgOpts* parameter.

The *Encoding* and *CodedCharSetId* are used for message conversion if you specify the MQGMO\_CONVERT option.

See MQMD for details.

*MsgDesc* is used for MQOP\_REGISTER and if you require values other than the default for any fields. *MsgDesc* is not used for an event handler.

If the descriptor is not required the parameter address passed can be null.

Note, that if multiple consumers are registered against the same queue with overlapping selectors, the chosen consumer for each message is undefined.

## ***GetMsgOpts***

Type: MQGMO - input

The *GetMsgOpts* parameter controls how the message consumer gets messages. All options of this parameter have meanings as described in "MQGMO - Get-message options" on page 2128, when used on an MQGET call, except:

### **MQGMO\_SET\_SIGNAL**

This option is not permitted.

### **MQGMO\_BROWSE\_FIRST, MQGMO\_BROWSE\_NEXT, MQGMO\_MARK\_\***

The order of messages delivered to a browsing consumer is dictated by the combinations of these options. Significant combinations are:

#### **MQGMO\_BROWSE\_FIRST**

The first message on the queue is delivered repeatedly to the consumer. This is useful when the consumer destructively consumes the message in the callback. Use this option with care.

#### **MQGMO\_BROWSE\_NEXT**

The consumer is given each message on the queue, from the current cursor position until the end of the queue is reached.

#### **MQGMO\_BROWSE\_FIRST + MQGMO\_BROWSE\_NEXT**

The cursor is reset to the start of the queue. The consumer is then given each message until the cursor reaches the end of the queue.

#### **MQGMO\_BROWSE\_FIRST + MQGMO\_MARK\_\***

Starting at the beginning of the queue, the consumer is given the first nonmarked message on the queue, which is then marked for this consumer. This combination ensures that the consumer can receive new messages added behind the current cursor point.

#### **MQGMO\_BROWSE\_NEXT + MQGMO\_MARK\_\***

Starting at the cursor position, the consumer is given the next nonmarked message on the queue, which is then marked for this consumer. Use this combination with care because messages can be added to the queue behind the current cursor position.

#### **MQGMO\_BROWSE\_FIRST + MQGMO\_BROWSE\_NEXT + MQGMO\_MARK\_\***

This combination is not permitted. If used the call returns MQRC\_OPTIONS\_ERROR.

### **MQGMO\_NO\_WAIT, MQGMO\_WAIT, and WaitInterval**

These options control how the consumer is invoked.

#### **MQGMO\_NO\_WAIT**

The consumer is never called with MQRC\_NO\_MSG\_AVAILABLE. The consumer is only called for messages and events.

#### **MQGMO\_WAIT with a zero WaitInterval**

The MQRC\_NO\_MSG\_AVAILABLE code is passed to the consumer when there are no messages available and either the consumer has been started or the consumer has been delivered at least one message since the last "no messages" reason code.

This prevents the consumer from polling in a busy loop when a zero wait interval is specified.

#### **MQGMO\_WAIT and a positive WaitInterval**

The consumer is called after the specified wait interval with reason code MQRC\_NO\_MSG\_AVAILABLE. This call is made regardless of whether any messages have been delivered to the consumer. This allows the user to perform heartbeat or batch type processing.

### **MQGMO\_WAIT and WaitInterval of MQWI\_UNLIMITED**

This specifies an infinite wait before returning MQRC\_NO\_MSG\_AVAILABLE. The consumer is never called with MQRC\_NO\_MSG\_AVAILABLE.

*GetMsgOpts* is used only for MQOP\_REGISTER and if you require values other than the default for any fields. *GetMsgOpts* is not used for an event handler.

If the *GetMsgOpts* are not required, the parameter address passed can be null. Using this parameter is the same as specifying MQGMO\_DEFAULT together with MQGMO\_FAIL\_IF QUIESCING.

If a message properties handle is provided in the MQGMO structure, a copy is provided in the MQGMO structure that is passed into the consumer callback. On return from the MQCB call, the application can delete the message properties handle.

#### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

#### **MQCC\_OK**

Successful completion.

#### **MQCC\_WARNING**

Warning (partial completion).

#### **MQCC\_FAILED**

Call failed.

#### **Reason**

Type: MQLONG - output

The reason codes in the following list are the ones that the queue manager can return for the *Reason* parameter.

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED:

#### **MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'89C') Adapter not available.

#### **MQRC\_ADAPTER\_CONV\_LOAD\_ERROR**

(2133, X'855') Unable to load data conversion services modules.

#### **MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

#### **MQRC\_API\_EXIT\_ERROR**

(2374, X'946') API exit failed.

#### **MQRC\_API\_EXIT\_LOAD\_ERROR**

(2183, X'887') Unable to load API exit.

#### **MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

#### **MQRC\_BUFFER\_LENGTH\_ERROR**

(2005, X'7D5') Buffer length parameter not valid.

#### **MQRC\_CALL\_IN\_PROGRESS**

(2219, X'8AB') MQI call entered before previous call complete.

#### **MQRC\_CALLBACK\_LINK\_ERROR**

(2487, X'9B7') Incorrect callback type field.

**MQRC\_CALLBACK\_NOT\_REGISTERED**  
(2448, X'990') Unable to unregister, suspend, or resume because there is no registered callback.

**MQRC\_CALLBACK\_ROUTINE\_ERROR**  
(2486, X'9B6') Either *CallbackFunction* or *CallbackName* must be specified but not both.

**MQRC\_CALLBACK\_TYPE\_ERROR**  
(2483, X'9B3') Incorrect callback type field.

**MQRC\_CBD\_OPTIONS\_ERROR**  
(2484, X'9B4') Incorrect MQCBD options field.

**MQRC\_CICS\_WAIT\_FAILED**  
(2140, X'85C') Wait request rejected by CICS.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_NOT\_AUTHORIZED**  
(2217, X'8A9') Not authorized for connection.

**MQRC\_CONNECTION\_QUIESCING**  
(2202, X'89A') Connection quiescing.

**MQRC\_CONNECTION\_STOPPING**  
(2203, X'89B') Connection shutting down.

**MQRC\_CORREL\_ID\_ERROR**  
(2207, X'89F') Correlation-identifier error.

**MQRC\_DATA\_LENGTH\_ERROR**  
(2010, X'7DA') Data length parameter not valid.

**MQRC\_FUNCTION\_NOT\_SUPPORTED**  
(2298, X'8FA') The function requested is not available in the current environment.

**MQRC\_GET\_INHIBITED**  
(2016, X'7E0') Gets inhibited for the queue.

**MQRC\_GLOBAL\_UOW\_CONFLICT**  
(2351, X'92F') Global units of work conflict.

**MQRC\_GMO\_ERROR**  
(2186, X'88A') Get-message options structure not valid.

**MQRC\_HANDLE\_IN\_USE\_FOR\_UOW**  
(2353, X'931') Handle in use for global unit of work.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_HOBJ\_ERROR**  
(2019, X'7E3') Object handle not valid.

**MQRC\_INCONSISTENT\_BROWSE**  
(2259, X'8D3') Inconsistent browse specification.

**MQRC\_INCONSISTENT\_UOW**  
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC\_INVALID\_MSG\_UNDER\_CURSOR**  
(2246, X'8C6') Message under cursor not valid for retrieval.

**MQRC\_LOCAL\_UOW\_CONFLICT**  
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC\_MATCH\_OPTIONS\_ERROR**  
(2247, X'8C7') Match options not valid.

**MQRC\_MAX\_MSG\_LENGTH\_ERROR**  
(2485, X'9B4') Incorrect *MaxMsgLength* field.

**MQRC\_MD\_ERROR**  
(2026, X'7EA') Message descriptor not valid.

**MQRC\_MODULE\_ENTRY\_NOT\_FOUND**  
(2497, X'9C1') The specified function entry point could not be found in the module.

**MQRC\_MODULE\_INVALID**  
(2496, X'9C0') Module found, however it is of the wrong type; not 32 bit, 64 bit, or a valid dynamic link library.

**MQRC\_MODULE\_NOT\_FOUND**  
(2495, X'9BF') Module not found in the search path or not authorized to load.

**MQRC\_MSG\_SEQ\_NUMBER\_ERROR**  
(2250, X'8CA') Message sequence number not valid.

**MQRC\_MSG\_TOKEN\_ERROR**  
(2331, X'91B') Use of message token not valid.

**MQRC\_NO\_MSG\_AVAILABLE**  
(2033, X'7F1') No message available.

**MQRC\_NO\_MSG\_UNDER\_CURSOR**  
(2034, X'7F2') Browse cursor not positioned on message.

**MQRC\_NOT\_OPEN\_FOR\_BROWSE**  
(2036, X'7F4') Queue not open for browse.

**MQRC\_NOT\_OPEN\_FOR\_INPUT**  
(2037, X'7F5') Queue not open for input.

**MQRC\_OBJECT\_CHANGED**  
(2041, X'7F9') Object definition changed since opened.

**MQRC\_OBJECT\_DAMAGED**  
(2101, X'835') Object damaged.

**MQRC\_OPERATION\_ERROR**  
(2206, X'89E') Incorrect operation code on API Call.

**MQRC\_OPTIONS\_ERROR**  
(2046, X'7FE') Options not valid or not consistent.

**MQRC\_PAGESET\_ERROR**  
(2193, X'891') Error accessing page-set data set.

**MQRC\_Q\_DELETED**  
(2052, X'804') Queue has been deleted.

**MQRC\_Q\_INDEX\_TYPE\_ERROR**  
(2394, X'95A') Queue has wrong index type.

**MQRC\_Q\_MGR\_NAME\_ERROR**  
(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**  
(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR QUIESCING**  
(2161, X'871') Queue manager quiescing.

**MQRC\_Q\_MGR\_STOPPING**

(2162, X'872') Queue manager shutting down.

**MQRC\_RESOURCE\_PROBLEM**

(2102, X'836') Insufficient system resources available.

**MQRC\_SIGNAL\_OUTSTANDING**

(2069, X'815') Signal outstanding for this handle.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

**MQRC\_SUPPRESSED\_BY\_EXIT**

(2109, X'83D') Call suppressed by exit program.

**MQRC\_SYNCPOINT\_LIMIT\_REACHED**

(2024, X'7E8') No more messages can be handled within current unit of work.

**MQRC\_SYNCPOINT\_NOT\_AVAILABLE**

(2072, X'818') Sync point support not available.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

**MQRC\_UOW\_ENLISTMENT\_ERROR**

(2354, X'932') Enlistment in global unit of work failed.

**MQRC\_UOW\_MIX\_NOT\_SUPPORTED**

(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC\_UOW\_NOT\_AVAILABLE**

(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC\_WAIT\_INTERVAL\_ERROR**

(2090, X'82A') Wait interval in MQGMO not valid.

**MQRC\_WRONG\_GMO\_VERSION**

(2256, X'8D0') Wrong version of MQGMO supplied.

**MQRC\_WRONG\_MD\_VERSION**

(2257, X'8D1') Wrong version of MQMD supplied.

For detailed information about these codes, see Reason codes.

**Usage notes**

1. MQCB is used to define the action to be invoked for each message, matching the specified criteria, available on the queue. When the action is processed, either the message is removed from the queue and passed to the defined message consumer, or a message token is provided, which is used to retrieve the message.
2. MQCB can be used to define callback routines before starting consumption with MQCTL or it can be used from within a callback routine.
3. To use MQCB from outside of a callback routine, you must first suspend message consumption by using MQCTL and resume consumption afterward.
4. MQCB is not supported within the IMS adapter.

**Message consumer callback sequence**

You can configure a consumer to invoke callback at key points during the lifecycle of the consumer. For example:

- when the consumer is first registered,
- when the connection is started,

- when the connection is stopped and
- when the consumer is deregistered, either explicitly, or implicitly by an MQCLOSE.

Table 243. MQCTL verb definitions

Verb	Meaning
MQCTL(START)	MQCTL call using the MQOP_START Operation
MQCTL(STOP)	MQCTL call using the MQOP_STOP Operation
MQCTL(WAIT)	MQCTL call using the MQOP_START_WAIT Operation

This allows the consumer to maintain state associated with the consumer. When a callback is requested by an application, the rules for consumer invocation are as follows:

#### REGISTER

Is always the first type of invocation of the callback.

Is always called on the same thread, as the MQCB(REGISTER) call.

#### START

Is always called synchronously with the MQCTL(START) verb.

- All START callbacks are completed before the MQCTL(START) verb returns.

Is on the same thread as the message delivery if THREAD\_AFFINITY is requested.

The call with start is not guaranteed if, for example, a previous callback issues MQCTL(STOP) during the MQCTL(START).

**STOP** No further messages or events are delivered after this call until the connection is restarted.

A STOP is guaranteed if the application was previously called for START, or a message, or an event.

#### DEREGISTER

Is always the last type of invocation of the callback.

Ensure that your application performs thread-based initialization and cleanup in the START and STOP callbacks. You can do non-thread based initialization and cleanup with REGISTER and DEREGISTER callbacks.

Do not make any assumptions about the life and availability of the thread other than what is stated. For example, do not rely on a thread staying alive beyond the last call to DEREGISTER. Similarly, when you have chosen not to use THREAD\_AFFINITY, do not assume that the thread exists whenever the connection is started.

If your application has particular requirements for thread characteristics, it can always create a thread accordingly, then use MQCTL(WAIT). This has the effect of 'donating' the thread to IBM MQ for asynchronous message delivery.

#### Message consumer connection usage

You can configure a consumer to invoke callback at key points during the lifecycle of the consumer. For example:

- when the consumer is first registered,
- when the connection is started,
- when the connection is stopped and
- when the consumer is deregistered, either explicitly, or implicitly by an MQCLOSE.

Table 244. MQCTL verb definitions

Verb	Meaning
MQCTL(START)	MQCTL call using the MQOP_START Operation
MQCTL(STOP)	MQCTL call using the MQOP_STOP Operation
MQCTL(WAIT)	MQCTL call using the MQOP_START_WAIT Operation

This allows the consumer to maintain state associated with the consumer. When a callback is requested by an application, the rules for consumer invocation are as follows:

#### REGISTER

Is always the first type of invocation of the callback.

Is always called on the same thread, as the MQCB(REGISTER) call.

#### START

Is always called synchronously with the MQCTL(START) verb.

- All START callbacks are completed before the MQCTL(START) verb returns.

Is on the same thread as the message delivery if THREAD\_AFFINITY is requested.

The call with start is not guaranteed if, for example, a previous callback issues MQCTL(STOP) during the MQCTL(START).

**STOP** No further messages or events are delivered after this call until the connection is restarted.

A STOP is guaranteed if the application was previously called for START, or a message, or an event.

#### DEREGISTER

Is always the last type of invocation of the callback.

Ensure that your application performs thread-based initialization and cleanup in the START and STOP callbacks. You can do non-thread based initialization and cleanup with REGISTER and DEREGISTER callbacks.

Do not make any assumptions about the life and availability of the thread other than what is stated. For example, do not rely on a thread staying alive beyond the last call to DEREGISTER. Similarly, when you have chosen not to use THREAD\_AFFINITY, do not assume that the thread exists whenever the connection is started.

If your application has particular requirements for thread characteristics, it can always create a thread accordingly, then use MQCTL(WAIT). This has the effect of 'donating' the thread to IBM MQ for asynchronous message delivery.

#### C invocation

```
MQCB (Hconn, Operation, CallbackDesc, Hobj, MsgDesc,
GetMsgOpts, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN Hconn;          /* Connection handle */
MQLONG  Operation;      /* Operation being processed */
MQCBD   CallbackDesc;  /* Callback descriptor */
MQHOBJ  Hobj;           /* Object handle */
MQMD    MsgDesc         /* Message descriptor attributes */
MQGMO   GetMsgOpts      /* Message options */
MQLONG  CompCode;       /* Completion code */
MQLONG  Reason;         /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQCB' USING HCONN, OPERATION, CBDESC, HOBJ, MSGDESC,  
                GETMSGOPTS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle  
01 HCONN    PIC S9(9) BINARY.  
** Operation  
01 OPERATION PIC S9(9) BINARY.  
** Callback Descriptor  
01 CBDESC.  
   COPY CMQCBDV.  
01 HOBJ     PIC S9(9) BINARY.  
** Message Descriptor  
01 MSGDESC.  
   COPY CMQMDV.  
** Get Message Options  
01 GETMSGOPTS.  
   COPY CMQGMV.  
** Completion code  
01 COMPCODE PIC S9(9) BINARY.  
** Reason code qualifying COMPCODE  
01 REASON   PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQCB(Hconn, Operation, CallbackDesc, Hobj, MsgDesc, GetMsgOpts,  
          CompCode, Reason)
```

Declare the parameters as follows:

```
dc1 Hconn      fixed bin(31); /* Connection handle */  
dc1 Operation  fixed bin(31); /* Operation */  
dc1 CallbackDesc like MQCBD; /* Callback Descriptor */  
dc1 Hobj       fixed bin(31); /* Object Handle */  
dc1 MsgDesc    like MQMD; /* Message Descriptor */  
dc1 GetMsgOpts like MQGMO; /* Get Message Options */  
dc1 CompCode   fixed bin(31); /* Completion code */  
dc1 Reason     fixed bin(31); /* Reason code qualifying CompCode */
```

## MQCB\_FUNCTION - Callback function:

The MQCB\_FUNCTION function call is the callback function for event handling and asynchronous message consumption.

The MQCB\_FUNCTION call definition is provided solely to describe the parameters that are passed to the callback function. No entry point called MQCB\_FUNCTION is provided by the queue manager.

The specification of the actual function to be called is an input to the MQCB call and is passed in through the MQCBD structure.

## Syntax

MQCB\_FUNCTION (*Hconn*, *MsgDesc*, *GetMsgOpts*, *Buffer*, *Context*)

## Parameters

### *Hconn*

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call. On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for Hconn:

#### **MQHC\_DEF\_CONN**

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See *Compatibility mode for RPG applications on IBM i*

#### ***MsgDesc***

Type: MQMD - input

This structure describes the attributes of the message retrieved.

See “MQMD - Message descriptor” on page 2179 for details.

The version of MQMD passed is the same version as passed on the MQCB call that defined the consumer function.

The address of the MQMD is passed as null characters if a version 4 MQGMO was used to request that a Message Handle be returned instead of an MQMD.

This is an input field to the message consumer function; it is not relevant to an event handler function.

#### ***GetMsgOpts***

Type: MQGMO - input

Options used to control the actions of the message consumer. This parameter also contains additional information about the message returned.

See MQGMO for details.

The version of MQGMO passed is the latest version supported.

This is an input field to the message consumer function; it is not relevant to an event handler function.

#### ***Buffer***

Type: MQBYTE×BufferLength - input

This is the area containing the message data.

If no message is available for this call, or if the message contains no message data, the address of the *Buffer* is passed as nulls.

This is an input field to the message consumer function; it is not relevant to an event handler function.

#### ***Context***

Type: MQCBC - input/output

This structure provides context information to the callback functions. See “MQCBC - Callback context” on page 2035 for details.

#### **Usage notes**

1. Be aware that if your callback routines use services that could delay or block the thread, for example, MQGET with wait, could delay the dispatch of other callbacks.

2. A separate unit of work is not automatically established for each invocation of a callback routine, so routines can either issue a commit call, or defer committing, until a logical batch of work has been processed. When the batch of work is committed, it commits the messages for all callback functions that have been invoked since the last sync point.
3. Programs invoked by CICS LINK or CICS START retrieve parameters using CICS services through named objects known as channel containers. The container names are the same as the parameter names. For more information, see your CICS documentation.
4. Callback routines can issue an MQDISC call, but not for their own connection. For example, if a callback routine has created a connection, then it can also disconnect the connection.
5. A callback routine should not, in general, rely on being invoked from the same thread each time. If required, use the MQCTLO\_THREAD\_AFFINITY when the connection is started.
6. When a callback routine receives a nonzero reason code, it must take appropriate action.
7. MQCB\_FUNCTION is not supported within the IMS adapter.

### **MQCLOSE - Close object:**

The MQCLOSE call relinquishes access to an object, and is the inverse of the MQOPEN and MQSUB calls.

### **Syntax**

MQCLOSE (*Hconn*, *Hobj*, *Options*, *CompCode*, *Reason*)

### **Parameters**

#### ***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, you can omit the MQCONN call, and specify the following value for *Hconn*:

**MQHC\_DEF\_HCONN**

Default connection handle.

#### ***Hobj***

Type: MQHOBJ - input/output

This handle represents the object that is being closed. The object can be of any type. The value of *Hobj* was returned by a previous MQOPEN call.

On successful completion of the call, the queue manager sets this parameter to a value that is not a valid handle for the environment. This value is:

**MQHO\_UNUSABLE\_HOBJ**

Unusable object handle.

On z/OS, *Hobj* is set to a value that is undefined.

#### ***Options***

Type: MQLONG - input

This parameter controls how the object is closed.

Only permanent dynamic queues and subscriptions can be closed in more than one way, because they must be either retained or deleted; these are queues with the *DefinitionType* attribute that has the value MQQDT\_PERMANENT\_DYNAMIC (see the *DefinitionType* attribute described in "Attributes for queues" on page 2625 ). The close options are summarized in this topic.

Durable subscriptions can either be kept or removed; these are created using the MQSUB call with the MQSO\_DURABLE option.

When closing the handle to a managed destination (that is the *Hobj* parameter returned on an MQSUB call which used the MQSO\_MANAGED option) the queue manager cleans up any publications that have not been retrieved when the associated subscription has also been removed. The subscription is removed using the MQCO\_REMOVE\_SUB option on the *Hsub* parameter returned on an MQSUB call. Note MQCO\_REMOVE\_SUB is the default behavior on MQCLOSE for a non-durable subscription.

When closing a handle to a non-managed destination you are responsible for cleaning up the queue where publications are sent. Close the subscription using MQCO\_REMOVE\_SUB first and then process messages off the queue until none remain.

You must specify one option only from the following:

**Dynamic queue options:** These options control how permanent dynamic queues are closed.

### MQCO\_DELETE

The queue is deleted if either of the following is true:

- It is a permanent dynamic queue, created by a previous MQOPEN call, and there are no messages on the queue and no uncommitted get or put requests outstanding for the queue (either for the current task or any other task).
- It is the temporary dynamic queue that was created by the MQOPEN call that returned *Hobj*. In this case, all the messages on the queue are purged.

In all other cases, including the case where the *Hobj* was returned on an MQSUB call, the call fails with reason code MQRC\_OPTION\_NOT\_VALID\_FOR\_TYPE, and the object is not deleted.

On z/OS, if the queue is a dynamic queue that has been logically deleted, and this is the last handle for it, the queue is physically deleted. See “Usage notes” on page 2442 for further details.

### MQCO\_DELETE\_PURGE

The queue is deleted, and any messages on it purged, if either of the following is true:

- It is a permanent dynamic queue, created by a previous MQOPEN call, and there are no uncommitted get or put requests outstanding for the queue (either for the current task or any other task).
- It is the temporary dynamic queue that was created by the MQOPEN call that returned *Hobj*.

In all other cases, including the case where the *Hobj* was returned on an MQSUB call, the call fails with reason code MQRC\_OPTION\_NOT\_VALID\_FOR\_TYPE, and the object is not deleted.

The table shows which close options are valid, and whether the object is retained or deleted.

Type of object or queue	MQCO_NONE	MQCO_DELETE	MQCO_DELETE_PURGE
Object other than a queue	Retained	Not valid	Not valid
Predefined queue	Retained	Not valid	Not valid
Permanent dynamic queue	Retained	Deleted if empty and no pending updates	Messages deleted; queue deleted if no pending updates
Temporary dynamic queue (call issued by creator of queue)	Deleted	Deleted	Deleted
Temporary dynamic queue (call not issued by creator of queue)	Retained	Not valid	Not valid
Distribution list	Retained	Not valid	Not valid

The table shows which close options are valid, and whether the object is retained or deleted.

Type of object or queue	MQCO_NONE	MQCO_DELETE	MQCO_DELETE_PURGE
Managed subscription destination	Retained	Not valid	Not valid
Distribution list (subscription has been removed)	Messages deleted; queue deleted	Not valid	Not valid

**Subscription closure options:** These options control whether durable subscriptions are removed when the handle is closed, and whether publications still waiting to be read by the application are cleaned up. These options are only valid for use with an object handle returned in the *Hsub* parameter of an MQSUB call.

#### MQCO\_KEEP\_SUB

The handle to the subscription is closed but the subscription made is kept. Publications continue to be sent to the destination specified in the subscription. This option is only valid if the subscription was made with the option MQSO\_DURABLE.

MQCO\_KEEP\_SUB is the default if the subscription is durable

#### MQCO\_REMOVE\_SUB

The subscription is removed and the handle to the subscription is closed.

The *Hobj* parameter of the MQSUB call is not invalidated by closure of the *Hsub* parameter and might continue to be used for MQGET or MQCB to receive the remaining publications. When the *Hobj* parameter of the MQSUB call is also closed, if it was a managed destination any unretrieved publications are removed.

MQCO\_REMOVE\_SUB is the default if the subscription is non-durable.

Successful completion of MQCO\_REMOVE\_SUB does not mean that the action completed. To check that this call has completed, see the DELETE SUB step in Checking that async commands for distributed networks have finished.

These subscription closure options are summarized in the following tables.

To close a durable subscription handle but retain the subscription, use the following subscription closure options:

Task	Subscription closure option
Keep publications on an MQOPENed handle	MQCO_KEEP_SUB
Remove publications on an MQOPENed handle	Action not allowed
Keep publications on an MQSO_MANAGED handle	MQCO_KEEP_SUB
Remove publications on an MQSO_MANAGED handle	Action not allowed

To unsubscribe, either by closing a durable subscription handle and unsubscribing it or closing a non-durable subscription handle, use the following subscription closure options:

Task	Subscription closure option
Keep publications on an MQOPENed handle	MQCO_REMOVE_SUB
Remove publications on an MQOPENed handle	Action not allowed
Keep publications on an MQSO_MANAGED handle	MQCO_REMOVE_SUB

**Read ahead options:** The following options control what happens to non-persistent messages which have been sent to the client before an application requested them and have not yet been consumed by the application. These messages are stored in the client read ahead buffer waiting to be requested by the application and can either be discarded or consumed from the queue before the MQCLOSE is completed.

## MQCO\_IMMEDIATE

The object is closed immediately and any messages which have been sent to the client before an application requested them are discarded and are not available to be consumed by any application. This is the default value.

## MQCO\_QUIESCE

A request to close the object is made, but if any messages which have been sent to the client before an application requested them, still reside in the client read ahead buffer, the MQCLOSE call returns with a warning of MQRC\_READ\_AHEAD\_MSGS and the object handle remains valid.

The application can then continue to use the object handle to retrieve messages until no more are available, and then close the object again. No more messages are sent to the client ahead of an application requesting them, read ahead is now turned off.

Applications are advised to use MQCO\_QUIESCE rather than trying to reach a point where there are no more messages in the client read ahead buffer, because a message could arrive between the last MQGET call and the following MQCLOSE which would be discarded if MQCO\_IMMEDIATE was used.

If an MQCLOSE with MQCO\_QUIESCE is issued from within an asynchronous callback function, the same behavior of reading ahead messages applies. If the warning MQRC\_READ\_AHEAD\_MSGS is returned, then the callback function is called at least one more time. When the last remaining message that was read ahead has been passed to the callback function the MQCBC ConsumerFlags field is set to MQCBCF\_READA\_BUFFER\_EMPTY.

**Default option:** If you require none of the options described previously, you can use the following option:

## MQCO\_NONE

No optional close processing required.

This *must* be specified for:

- Objects other than queues
- Predefined queues
- Temporary dynamic queues (but only in those cases where *Hobj* is *not* the handle returned by the MQOPEN call that created the queue).
- Distribution lists

In all the above cases, the object is retained and not deleted.

If this option is specified for a temporary dynamic queue:

- The queue is deleted, if it was created by the MQOPEN call that returned *Hobj* ; any messages that are on the queue are purged.
- In all other cases the queue (and any messages on it) are retained.

If this option is specified for a permanent dynamic queue, the queue is retained and not deleted.

On z/OS, if the queue is a dynamic queue that has been logically deleted, and this is the last handle for it, the queue is physically deleted. See "Usage notes" on page 2442 for further details.

## CompCode

Type: MQLONG - output

The completion code; it is one of the following:

## MQCC\_OK

Successful completion.

**MQCC\_WARNING**

Warning (partial completion).

**MQCC\_FAILED**

Call failed.

**Reason**

Type: MQLONG - output

The reason codes listed are the ones that the queue manager can return for the *Reason* parameter.

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_INCOMPLETE\_GROUP**

(2241, X'8C1') Message group not complete.

**MQRC\_INCOMPLETE\_MSG**

(2242, X'8C2') Logical message not complete.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'89C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

**MQRC\_API\_EXIT\_ERROR**

(2374, X'946') API exit failed.

**MQRC\_API\_EXIT\_LOAD\_ERROR**

(2183, X'887') Unable to load API exit.

**MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_CALL\_IN\_PROGRESS**

(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CF\_NOT\_AVAILABLE**

(2345, X'929') Coupling facility not available.

**MQRC\_CF\_STRUC\_FAILED**

(2373, X'945') Coupling-facility structure failed.

**MQRC\_CF\_STRUC\_IN\_USE**

(2346, X'92A') Coupling-facility structure in use.

**MQRC\_CICS\_WAIT\_FAILED**

(2140, X'85C') Wait request rejected by CICS.

**MQRC\_CONNECTION\_BROKEN**

(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_NOT\_AUTHORIZED**

(2217, X'8A9') Not authorized for connection.

**MQRC\_CONNECTION\_STOPPING**

(2203, X'89B') Connection shutting down.

**MQRC\_DB2\_NOT\_AVAILABLE**

(2342, X'926') Db2 subsystem not available.

**MQRC\_HCONN\_ERROR**

(2018, X'7E2') Connection handle not valid.

**MQRC\_HOBJ\_ERROR**

(2019, X'7E3') Object handle not valid.

**MQRC\_NOT\_AUTHORIZED**

(2035, X'7F3') Not authorized for access.

**MQRC\_OBJECT\_DAMAGED**

(2101, X'835') Object damaged.

**MQRC\_OPTION\_NOT\_VALID\_FOR\_TYPE**

(2045, X'7FD') On an MQOPEN or MQCLOSE call: option not valid for object type.

**MQRC\_OPTIONS\_ERROR**

(2046, X'7FE') Options not valid or not consistent.

**MQRC\_PAGESET\_ERROR**

(2193, X'891') Error accessing page-set data set.

**MQRC\_Q\_MGR\_NAME\_ERROR**

(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**

(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR\_STOPPING**

(2162, X'872') Queue manager shutting down.

**MQRC\_Q\_NOT\_EMPTY**

(2055, X'807') Queue contains one or more messages or uncommitted put or get requests.

**MQRC\_READ\_AHEAD\_MSGS**

(nnnn, X'xxx') The client has read ahead messages that have not yet been consumed by the application.

**MQRC\_RESOURCE\_PROBLEM**

(2102, X'836') Insufficient system resources available.

**MQRC\_SECURITY\_ERROR**

(2063, X'80F') Security error occurred.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

**MQRC\_SUPPRESSED\_BY\_EXIT**

(2109, X'83D') Call suppressed by exit program.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

**Usage notes**

1. When an application issues the MQDISC call, or ends either normally or abnormally, any objects that were opened by the application and are still open are closed automatically with the MQCO\_NONE option.
2. The following points apply if the object being closed is a *queue*:
  - If operations on the queue are performed as part of a unit of work, the queue can be closed before or after the sync point occurs without affecting the outcome of the sync point. If the queue is triggered, performing a rollback before closing the queue can cause a trigger message to be issued. For more information about trigger messages, see Properties of trigger messages.

- If the queue was opened with the MQOO\_BROWSE option, the browse cursor is destroyed. If the queue is then reopened with the MQOO\_BROWSE option, a new browse cursor is created (see MQOO\_BROWSE ).
  - If a message is currently locked for this handle at the time of the MQCLOSE call, the lock is released (see MQGMO\_LOCK ).
  - On z/OS, if there is an MQGET request with the MQGMO\_SET\_SIGNAL option outstanding against the queue handle being closed, the request is canceled (see MQGMO\_SET\_SIGNAL ). Signal requests for the same queue but lodged against different handles (*Hobj*) are not affected (unless a dynamic queue is being deleted, in which case they are also canceled).
3. The following points apply if the object being closed is a *dynamic queue* (either permanent or temporary):

- For a dynamic queue, you can specify the MQCO\_DELETE and MQCO\_DELETE\_PURGE options regardless of the options specified on the corresponding MQOPEN call.
- When a dynamic queue is deleted, all MQGET calls with the MQGMO\_WAIT option that are outstanding against the queue are canceled and reason code MQRC\_Q\_DELETED is returned. See MQGMO\_WAIT.

Although applications cannot access a deleted queue, the queue is not removed from the system, and associated resources are not freed, until all handles that reference the queue have been closed, and all units of work that affect the queue have been either committed or backed out.

On z/OS, a queue that has been logically deleted but not yet removed from the system prevents the creation of a new queue with the same name as the deleted queue; the MQOPEN call fails with reason code MQRC\_NAME\_IN\_USE in this case. Also, such a queue can still be displayed using MQSC commands, even though it cannot be accessed by applications.

- When a permanent dynamic queue is deleted, if the *Hobj* handle specified on the MQCLOSE call is *not* the one that was returned by the MQOPEN call that created the queue, a check is made that the user identifier that was used to validate the MQOPEN call is authorized to delete the queue. If the MQOO\_ALTERNATE\_USER\_AUTHORITY option was specified on the MQOPEN call, the user identifier checked is the *AlternateUserId*.

This check is not performed if:

- The handle specified is the one returned by the MQOPEN call that created the queue.
- The queue being deleted is a temporary dynamic queue.

- When a temporary dynamic queue is closed, if the *Hobj* handle specified on the MQCLOSE call is the one that was returned by the MQOPEN call that created the queue, the queue is deleted. This occurs regardless of the close options specified on the MQCLOSE call. If there are messages on the queue, they are discarded; no report messages are generated.

If there are uncommitted units of work that affect the queue, the queue and its messages are still deleted, but the units of work do not fail. However, as described previously, the resources associated with the units of work are not freed until each of the units of work has been either committed or backed out.

4. The following points apply if the object being closed is a *distribution list*:

- The only valid close option for a distribution list is MQCO\_NONE; the call fails with reason code MQRC\_OPTIONS\_ERROR or MQRC\_OPTION\_NOT\_VALID\_FOR\_TYPE if any other options are specified.
- When a distribution list is closed, individual completion codes and reason codes are not returned for the queues in the list; only the *CompCode* and *Reason* parameters of the call are available for diagnostic purposes.

If a failure occurs closing one of the queues, the queue manager continues processing and attempts to close the remaining queues in the distribution list. The *CompCode* and *Reason* parameters of the call are set to return information describing the failure. It is possible for the completion code to be MQCC\_FAILED, even though most of the queues were closed successfully. The queue that encountered the error is not identified.

If there is a failure on more than one queue, it is not defined which failure is reported in the *CompCode* and *Reason* parameters.

5. On IBM i, if the application was connected implicitly when the first MQOPEN call was issued, an implicit MQDISC occurs when the last MQCLOSE is issued.

Only applications running in compatibility mode can be connected implicitly; other applications must issue the MQCONN or MQCONNEX call to connect to the queue manager explicitly.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

### C invocation

```
MQCLOSE (Hconn, &Hobj, Options, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;    /* Connection handle */
MQHOBJ   Hobj;     /* Object handle */
MQLONG   Options;  /* Options that control the action of MQCLOSE */
MQLONG   CompCode; /* Completion code */
MQLONG   Reason;   /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQCLOSE' USING HCONN, HOBJ, OPTIONS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN    PIC S9(9) BINARY.
** Object handle
01 HOBJ     PIC S9(9) BINARY.
** Options that control the action of MQCLOSE
01 OPTIONS  PIC S9(9) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON   PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQCLOSE (Hconn, Hobj, Options, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn    fixed bin(31); /* Connection handle */
dc1 Hobj     fixed bin(31); /* Object handle */
dc1 Options  fixed bin(31); /* Options that control the action of
                             MQCLOSE */
dc1 CompCode fixed bin(31); /* Completion code */
dc1 Reason   fixed bin(31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQCLOSE,(HCONN,HOBJ,OPTIONS,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN     DS  F  Connection handle
HOBJ      DS  F  Object handle
OPTIONS   DS  F  Options that control the action of MQCLOSE
COMPCODE  DS  F  Completion code
REASON    DS  F  Reason code qualifying COMPCODE
```

## Visual Basic invocation

MQCLOSE Hconn, Hobj, Options, CompCode, Reason

Declare the parameters as follows:

```
Dim Hconn As Long 'Connection handle'  
Dim Hobj As Long 'Object handle'  
Dim Options As Long 'Options that control the action of MQCLOSE'  
Dim CompCode As Long 'Completion code'  
Dim Reason As Long 'Reason code qualifying CompCode'
```

## MQCMIT - Commit changes:

The MQCMIT call indicates to the queue manager that the application has reached a sync point, and that all the message gets and puts that have occurred since the last sync point are to be made permanent.

Messages put as part of a unit of work are made available to other applications; messages retrieved as part of a unit of work are deleted.

- ▶ **z/OS** On z/OS, the call is used only by batch programs (including IMS batch DL/I programs).
- ▶ **IBM i** On IBM i, this call is not supported for applications running in compatibility mode.

**Important:** ▶ **IBM i** If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

## Syntax

MQCMIT (*Hconn*, *CompCode*, *Reason*)

### Parameters

#### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

#### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

#### **MQCC\_OK**

Successful completion.

#### **MQCC\_WARNING**

Warning (partial completion).

#### **MQCC\_FAILED**

Call failed.

#### **Reason**

Type: MQLONG - output

The reason codes listed are the ones that the queue manager can return for the *Reason* parameter.

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_BACKED\_OUT**

(2003, X'7D3') Unit of work backed out.

**MQRC\_OUTCOME\_PENDING**

(2124, X'84C') Result of commit operation is pending.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

**MQRC\_API\_EXIT\_ERROR**

(2374, X'946') API exit failed.

**MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_CALL\_IN\_PROGRESS**

(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CALL\_INTERRUPTED**

(2549, X'9F5') MQPUT or MQCMIT was interrupted and reconnection processing cannot reestablish a definite outcome.

**MQRC\_CF\_STRUC\_IN\_USE**

(2346, X'92A') Coupling-facility structure in use.

**MQRC\_CONNECTION\_BROKEN**

(2009, X'7D9') Connection to queue manager lost.

**MQRC\_ENVIRONMENT\_ERROR**

(2012, X'7DC') Call not valid in environment.

**MQRC\_HCONN\_ERROR**

(2018, X'7E2') Connection handle not valid.

**MQRC\_OBJECT\_DAMAGED**

(2101, X'835') Object damaged.

**MQRC\_OUTCOME\_MIXED**

(2123, X'84B') Result of commit or back-out operation is mixed.

**MQRC\_Q\_MGR\_STOPPING**

(2162, X'872') Queue manager shutting down.

**MQRC\_RECONNECT\_FAILED**

(2548, X'9F4') After reconnecting, an error occurred reinstating the handles for a reconnectable connection.

**MQRC\_RESOURCE\_PROBLEM**

(2102, X'836') Insufficient system resources available.

**MQRC\_STORAGE\_MEDIUM\_FULL**

(2192, X'890') External storage medium is full.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

## Usage notes

1. Use this call only when the queue manager itself coordinates the unit of work. This can be:
  - A local unit of work, where the changes affect only IBM MQ resources.
  - A global unit of work, where the changes can affect resources belonging to other resource managers, as well as affecting IBM MQ resources.

For further details about local and global units of work, see “MQBEGIN - Begin unit of work” on page 2418.

2. In environments where the queue manager does not coordinate the unit of work, the appropriate commit call must be used instead of MQCMIT. The environment might also support an implicit commit caused by the application terminating normally.
  - On z/OS, use the following calls:
    - Batch programs (including IMS batch DL/I programs) can use the MQCMIT call if the unit of work affects only IBM MQ resources. However, if the unit of work affects both IBM MQ resources and resources belonging to other resource managers (for example, Db2 ), use the SRRRCMIT call provided by the z/OS Recoverable Resource Service (RRS). The SRRRCMIT call commits changes to resources belonging to the resource managers that have been enabled for RRS coordination.
    - CICS applications must use the EXEC CICS SYNCPOINT command to commit the unit of work explicitly. Alternatively, ending the transaction results in an implicit commit of the unit of work. The MQCMIT call cannot be used for CICS applications.
    - IMS applications (other than batch DL/I programs) must use IMS calls such as GU and CHKP to commit the unit of work. The MQCMIT call cannot be used for IMS applications (other than batch DL/I programs).
  - On IBM i, use this call for local units of work coordinated by the queue manager. This means that a commitment definition must not exist at job level, that is, the STRCMTCTL command with the CMTSCOPE(\*JOB) parameter must not have been issued for the job.
3. If an application ends with uncommitted changes in a unit of work, the disposition of those changes depends on whether the application ends normally or abnormally. See MQDISC usage notes for further details.
4. When an application puts or gets messages in groups or segments of logical messages, the queue manager retains information relating to the message group and logical message for the last successful MQPUT and MQGET calls. This information is associated with the queue handle, and includes such things as:
  - The values of the *GroupId*, *MsgSeqNumber*, *Offset*, and *MsgFlags* fields in MQMD.
  - Whether the message is part of a unit of work.
  - For the MQPUT call: whether the message is persistent or nonpersistent.

When a unit of work is committed, the queue manager retains the group and segment information, and the application can continue putting or getting messages in the current message group or logical message.

Retaining the group and segment information when a unit of work is committed allows the application to spread a large message group or large logical message consisting of many segments across several units of work. Using several units of work is advantageous if the local queue manager has only limited queue storage. However, the application must maintain sufficient information to restart putting or getting messages at the correct point if a system failure occurs. For details of how to restart at the correct point after a system failure, see MQPMO\_LOGICAL\_ORDER and MQGMO\_LOGICAL\_ORDER.

The remaining usage notes apply only when the queue manager coordinates the units of work:

5. A unit of work has the same scope as a connection handle; all IBM MQ calls that affect a particular unit of work must be performed using the same connection handle. Calls issued using a different

connection handle (for example, calls issued by another application) affect a different unit of work. See the *Hconn* parameter described in MQCONN for information about the scope of connection handles.

6. Only messages that were put or retrieved as part of the current unit of work are affected by this call.
7. A long-running application that issues MQGET, MQPUT, or MQPUT1 calls within a unit of work, but that never issues a commit or back-out call, can fill queues with messages that are not available to other applications. To guard against this, the administrator must set the *MaxUncommittedMsgs* queue-manager attribute to a value that is low enough to prevent runaway applications filling the queues, but high enough to allow the expected messaging applications to work correctly.
8. On UNIX and Windows systems, if the *Reason* parameter is MQRC\_CONNECTION\_BROKEN (with a *CompCode* of MQCC\_FAILED), or MQRC\_UNEXPECTED\_ERROR it is possible that the unit of work was successfully committed.

### C invocation

```
MQCMIT (Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;    /* Connection handle */
MQLONG   CompCode; /* Completion code */
MQLONG   Reason;   /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQCMIT' USING HCONN, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN    PIC S9(9) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON   PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQCMIT (Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dcl Hconn    fixed bin(31); /* Connection handle */
dcl CompCode fixed bin(31); /* Completion code */
dcl Reason   fixed bin(31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQCMIT,(HCONN,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN     DS F Connection handle
COMPCODE  DS F Completion code
REASON    DS F Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQCMIT Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn    As Long 'Connection handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## MQCONN - Connect queue manager:

The MQCONN call connects an application program to a queue manager.

It provides a queue manager connection handle, which the application uses on subsequent message queuing calls.

- On z/OS, CICS applications do not have to issue this call. These applications are connected automatically to the queue manager to which the CICS system is connected. However, the MQCONN and MQDISC calls are still accepted from CICS applications.
- On IBM i, applications running in compatibility mode do not have to issue this call. These applications are connected automatically to the queue manager when they issue the first MQOPEN call. However, the MQCONN and MQDISC calls are still accepted from IBM i applications.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i. Other applications (that is, applications not running in compatibility mode) must use the MQCONN or MQCONNX call to connect to the queue manager, and the MQDISC call to disconnect from the queue manager. This is the recommended style of programming.

A client connection cannot be made on a server only installation, and a local connection cannot be made on a client only installation.

### Syntax

MQCONN (*QMgrName*, *Hconn*, *CompCode*, *Reason*)

### Parameters

#### *QMgrName*

Type: MQCHAR48 - input

This is the name of the queue manager to which the application wants to connect. The name can contain the following characters:

- Uppercase alphabetic characters (A through Z)
- Lowercase alphabetic characters (a through z)
- Numeric digits (0 through 9)
- Period (.), forward slash (/), underscore (\_), percent (%)

The name must not contain leading or embedded blanks, but can contain trailing blanks. A null character can be used to indicate the end of significant data in the name; the null and any characters following it are treated as blanks. The following restrictions apply in the environments indicated:

- On systems that use EBCDIC Katakana, lowercase characters cannot be used.
- On z/OS, names that begin or end with an underscore cannot be processed by the operations and control panels. For this reason, avoid such names.
- On IBM i, enclose names containing lowercase characters, forward slash, or percent in quotation marks when specified on commands. Do not specify these quotation marks in the *QMgrName* parameter.

If the name consists entirely of blanks, the name of the *default* queue manager is used.

The name specified for *QMgrName* must be the name of a *connectable* queue manager.

On z/OS, the queue managers to which it is possible to connect are determined by the environment:

- For CICS, you can use only the queue manager to which the CICS system is connected. The *QMgrName* parameter must still be specified, but its value is ignored; blank characters are a suitable option.

- For IMS, only queue managers that are listed in the subsystem definition table (CSQQDEFV), and listed in the SSM table in IMS, are connectable (see usage note 6 ).
- For z/OS batch and TSO, only queue managers that reside on the same system as the application are connectable (see usage note 6 ).

**Queue-sharing groups:** On systems where several queue managers exist and are configured to form a queue-sharing group, the name of the queue-sharing group can be specified for *QMgrName* in place of the name of a queue manager. This allows the application to connect to *any* queue manager that is available in the queue-sharing group and that is on the same z/OS image as the application. The system can also be configured so that using a blank *QMgrName* connects to the queue-sharing group instead of to the default queue manager.

If *QMgrName* specifies the name of the queue-sharing group, but there is also a queue manager with that name on the system, connection is made to the latter in preference to the former. Only if that connection fails is connection to one of the queue managers in the queue-sharing group attempted.

If the connection is successful, you can use the handle returned by the MQCONN or MQCONNX call to access *all* the resources (both shared and nonshared) that belong to the queue manager to which connection has been made. Access to these resources is subject to the typical authorization controls.

If the application issues two MQCONN or MQCONNX calls to establish concurrent connections, and one or both calls specifies the name of the queue-sharing group, the second call returns completion code MQCC\_WARNING and reason code MQRC\_ALREADY\_CONNECTED when it connects to the same queue manager as the first call.

Queue-sharing groups are supported only on z/OS. Connection to a queue-sharing group is supported only in the batch, RRS batch, CICS, and TSO environments. For CICS, you can use only the queue sharing group to which the CICS system is connected. You must still specify the **QMgrName** parameter, but its value is ignored; blank characters are a suitable option.

**IBM MQ MQI client applications:** For IBM MQ MQI client applications, a connection is attempted for each client-connection channel definition with the specified queue-manager name, until one is successful. The queue manager, however, must have the same name as the specified name. If an all-blank name is specified, each client-connection channel with an all-blank queue-manager name is tried until one is successful; in this case there is no check against the actual name of the queue manager.

IBM MQ client applications are not supported in z/OS, but z/OS can act as an IBM MQ server, to which IBM MQ client applications can connect.

**IBM MQ MQI client queue-manager groups:** If the specified name starts with an asterisk (\*), the queue manager to which connection is made might have a different name from that specified by the application. The specified name (without the asterisk) defines a *group* of queue managers that are eligible for connection. The implementation selects one from the group by trying each one in turn until one is found to which a connection can be made. The order in which connections are attempted is influenced by the client channel weight and connection affinity values of the candidate channels. If none of the queue managers in the group is available for connection, the call fails. Each queue manager is tried once only. If an asterisk alone is specified for the name, an implementation-defined default queue-manager group is used.

Queue-manager groups are supported only for applications running in an MQ-client environment; the call fails if a non-client application specifies a queue-manager name beginning with an asterisk. A group is defined by providing several client connection channel definitions with the same queue-manager name (the specified name without the asterisk), to communicate with each of the queue managers in the group. The default group is defined by providing one or more client connection channel definitions, each with a blank queue-manager name (specifying an all-blank name therefore has the same effect as specifying a single asterisk for the name for a client application).

After connecting to one queue manager of a group, an application can specify blanks in the typical way in the queue-manager name fields in the message and object descriptors to mean the name of

the queue manager to which the application has connected (the *local queue manager* ). If the application needs to know this name, use the MQINQ call to inquire the *QMGrName* queue-manager attribute.

Prefixing an asterisk to the connection name implies that the application does not depend on connecting to a particular queue manager in the group. Suitable applications are:

- Applications that put messages but do not get messages.
- Applications that put request messages and then get the reply messages from a *temporary dynamic* queue.

Unsuitable applications are ones that need to get messages from a particular queue at a particular queue manager; such applications must not prefix the name with an asterisk.

If you specify an asterisk, the maximum length of the remainder of the name is 47 characters.

Queue-manager groups are not supported on z/OS.

The length of this parameter is given by MQ\_Q\_MGR\_NAME\_LENGTH.

### **Hconn**

Type: MQHCONN - output

This handle represents the connection to the queue manager. Specify it on all subsequent message queuing calls issued by the application. It ceases to be valid when the MQDISC call is issued, or when the unit of processing that defines the scope of the handle terminates.

IBM MQ now supplies the mqm library with client packages as well as server packages. This means that when an MQI call that is found in the mqm library is made, the connection type is checked to see if it is a client or server connection, and then the correct underlying call is made. Therefore an exit which is passed an *Hconn* can now be linked against the mqm library, but used on a client installation.

*Handle scope:* The scope of the handle returned depends on the call used to connect to the queue manager (MQCONN or MQCONNX). If the call used is MQCONNX, the scope of the handle also depends on the MQCNO\_HANDLE\_SHARE\_\* option specified in the *Options* field of the MQCNO structure.

- If the call is MQCONN, or the MQCNO\_HANDLE\_SHARE\_NONE option is specified, the handle returned is a *nonshared* handle.

The scope of a nonshared handle is the smallest unit of parallel processing supported by the platform on which the application is running (see Table 245 on page 2452 for details); the handle is not valid outside the unit of parallel processing from which the call was issued.

- If you specify the MQCNO\_HANDLE\_SHARE\_BLOCK or MQCNO\_HANDLE\_SHARE\_NO\_BLOCK option, the handle returned is a *shared* handle.

The scope of a shared handle is the process that owns the thread from which the call was issued; the handle can be used from any thread that belongs to that process. Not all platforms support threads.

- If the MQCONN or MQCONNX call fails with completion code equal to MQCC\_FAILED, then the Hconn value is undefined.

Table 245. Scope of nonshared handles on various platforms

Platform	Scope of nonshared handle
z/OS	<ul style="list-style-type: none"> <li>• CICS: the CICS task</li> <li>• IMS: the task, up to the next sync point (excluding subtasks of the task)</li> <li>• z/OS batch and TSO: the task (excluding subtasks of the task)</li> </ul>
IBM i	Job
UNIX systems	Thread
16 bit Windows applications	Process
32 bit Windows applications	Thread

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the value returned is:

**MQHC\_DEF\_HCONN**  
Default connection handle.

**CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

**MQCC\_OK**  
Successful completion.

**MQCC\_WARNING**  
Warning (partial completion).

**MQCC\_FAILED**  
Call failed.

**Reason**

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**  
(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_ALREADY\_CONNECTED**  
(2002, X'7D2') Application already connected.

**MQRC\_CLUSTER\_EXIT\_LOAD\_ERROR**  
(2267, X'8DB') Unable to load cluster workload exit.

**MQRC\_SSL\_ALREADY\_INITIALIZED**  
(2391, X'957') SSL already initialized.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_CONN\_LOAD\_ERROR**  
(2129, X'851') Unable to load adapter connection module.

**MQRC\_ADAPTER\_DEFS\_ERROR**  
(2131, X'853') Adapter subsystem definition module not valid.

**MQRC\_ADAPTER\_DEFS\_LOAD\_ERROR**  
(2132, X'854') Unable to load adapter subsystem definition module.

**MQRC\_ADAPTER\_NOT\_AVAILABLE**  
(2204, X'89C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**  
(2130, X'852') Unable to load adapter service module.

**MQRC\_ADAPTER\_STORAGE\_SHORTAGE**  
(2127, X'84F') Insufficient storage for adapter.

**MQRC\_ANOTHER\_Q\_MGR\_CONNECTED**  
(2103, X'837') Another queue manager already connected.

**MQRC\_API\_EXIT\_ERROR**  
(2374, X'946') API exit failed.

**MQRC\_API\_EXIT\_INIT\_ERROR**  
(2375, X'947') API exit initialization failed.

**MQRC\_API\_EXIT\_TERM\_ERROR**  
(2376, X'948') API exit termination failed.

**MQRC\_ASID\_MISMATCH**  
(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_BUFFER\_LENGTH\_ERROR**  
(2005, X'7D5') Buffer length parameter not valid.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CONN\_ID\_IN\_USE**  
(2160, X'870') Connection identifier already in use.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_ERROR**  
(2273, X'8E1') Error processing MQCONN call.

**MQRC\_CONNECTION\_NOT\_AVAILABLE**  
(2568, X'A08') Occurs on an MQCONN or MQCONNX call when the queue manager is unable to provide a connection of the requested connection type on the current installation. A client connection cannot be made on a server only installation. A local connection cannot be made on a client only installation.

**MQRC\_CONNECTION QUIESCING**  
(2202, X'89A') Connection quiescing.

**MQRC\_CONNECTION\_STOPPING**  
(2203, X'89B') Connection shutting down.

**MQRC\_CRYPTO\_HARDWARE\_ERROR**  
(2382, X'94E') Cryptographic hardware configuration error.

**MQRC\_DUPLICATE\_RECOV\_COORD**  
(2163, X'873') Recovery coordinator exists.

**MQRC\_ENVIRONMENT\_ERROR**  
(2012, X'7DC') Call not valid in environment.

Additionally, on the MQCONNX call, passing the "MQCSP - Security parameters" on page 2091 control block from a CICS or IMS application.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_HOST\_NOT\_AVAILABLE**

(2538, X'9EA') An MQCONN call was issued from a client to connect to a queue manager but the attempt to allocate a conversation to the remote system failed.

**MQRC\_INSTALLATION\_MISMATCH**

(2583, X'A17') Mismatch between queue manager installation and selected library.

**MQRC\_KEY\_REPOSITORY\_ERROR**

(2381, X'94D') Key repository not valid.

**MQRC\_MAX\_CONNS\_LIMIT\_REACHED**

(2025, X'7E9') Maximum number of connections reached.

**MQRC\_NOT\_AUTHORIZED**

(2035, X'7F3') Not authorized for access.

**MQRC\_OPEN\_FAILED**

(2137, X'859') Object not opened successfully.

**MQRC\_Q\_MGR\_NAME\_ERROR**

(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**

(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR QUIESCING**

(2161, X'871') Queue manager quiescing.

**MQRC\_Q\_MGR STOPPING**

(2162, X'872') Queue manager shutting down.

**MQRC\_RESOURCE\_PROBLEM**

(2102, X'836') Insufficient system resources available.

**MQRC\_SECURITY\_ERROR**

(2063, X'80F') Security error occurred.

**MQRC\_SSL\_INITIALIZATION\_ERROR**

(2393, X'959') SSL initialization error.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

**Usage notes**

1. The queue manager to which connection is made using the MQCONN call is called the *local queue manager*.
2. Queues that are owned by the local queue manager appear to the application as local queues. It is possible to put messages on and get messages from these queues.  
Shared queues that are owned by the queue-sharing group to which the local queue manager belongs appear to the application as local queues. It is possible to put messages on and get messages from these queues.  
Queues that are owned by remote queue managers appear as remote queues. It is possible to put messages on these queues, but not to get messages from these queues.
3. If the queue manager fails while an application is running, the application must issue the MQCONN call again to obtain a new connection handle to use on subsequent IBM MQ calls. The application can issue the MQCONN call periodically until the call succeeds.

If an application is not sure whether it is connected to the queue manager, the application can safely issue an MQCONN call to obtain a connection handle. If the application is already connected, the handle returned is the same as that returned by the previous MQCONN call, but with completion code MQCC\_WARNING and reason code MQRC\_ALREADY\_CONNECTED.

4. When the application has finished using IBM MQ calls, the application must use the MQDISC call to disconnect from the queue manager.
5. If the MQCONN call fails with completion code equal to MQCC\_FAILED, then the Hconn value is undefined.
6. On z/OS:

- Batch, TSO, and IMS applications must issue the MQCONN call to use the other IBM MQ calls. These applications can connect to more than one queue manager concurrently.

If the queue manager fails, the application must issue the call again after the queue manager has restarted to obtain a new connection handle.

Although IMS applications can issue the MQCONN call repeatedly, even when already connected, this is not recommended for online message processing programs (MPPs).

- CICS applications do not have to issue the MQCONN call to use the other IBM MQ calls, but can do so if they want; both the MQCONN call and the MQDISC call are accepted. However, it is not possible to connect to more than one queue manager concurrently.

If the queue manager fails, these applications are automatically reconnected when the queue manager restarts, and so do not need to issue the MQCONN call.

7. On z/OS, to define the available queue managers:

- For batch applications, system programmers can use the CSQBDEF macro to create a module (CSQBDEFV) that defines the default queue-manager name, or queue-sharing group name.
- For IMS applications, system programmers can use the CSQQDEFX macro to create a module (CSQQDEFV) that defines the names of the available queue managers and specifies the default queue manager.

In addition, each queue manager must be defined to the IMS control region and to each dependent region accessing that queue manager. To do this, you must create a subsystem member in the IMS.PROCLIB library and identify the subsystem member to the applicable IMS regions. If an application attempts to connect to a queue manager that is not defined in the subsystem member for its IMS region, the application abends.

► **z/OS** For more information about using these macros, see Macros intended for customer use.

8. On IBM i, applications written for previous releases of the queue manager can run without recompiling. This is called *compatibility mode*. This mode of operation provides a compatible runtime environment for applications. It comprises the following:

- The service program AMQZSTUB residing in the library QMQM.  
AMQZSTUB provides the same public interface as previous releases, and has the same signature. Use this service program to access the MQI through bound procedure calls.
- The program QMQM residing in the library QMQM.  
QMQM provides a means of accessing the MQI through dynamic program calls.
- Programs MQCLOSE, MQCONN, MQDISC, MQGET, MQINQ, MQOPEN, MQPUT, MQPUT1, and MQSET residing in the library QMQM.

These programs also provide a means of accessing the MQI through dynamic program calls, but with a parameter list that corresponds to the standard descriptions of the IBM MQ calls.

These three interfaces do not include capabilities that were introduced in IBM MQ Version 5.1. For example, the MQBACK, MQCMIT, and MQCONNX calls are not supported. The support provided by these interfaces is for single-threaded applications only.

Support for the new IBM MQ calls in single-threaded applications, and for all IBM MQ calls in multi-threaded applications, is provided through the service programs LIBMQM and LIBMQM\_R.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

9. On IBM i, programs that end abnormally are not automatically disconnected from the queue manager. Write applications to allow for the possibility of the MQCONN or MQCONNX call returning completion code MQCC\_WARNING and reason code MQRC\_ALREADY\_CONNECTED. Use the connection handle returned in this situation as normal.

### C invocation

```
MQCONN (QMgrName, &Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQCHAR48 QMgrName; /* Name of queue manager */
MQHCONN Hconn; /* Connection handle */
MQLONG CompCode; /* Completion code */
MQLONG Reason; /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQCONN' USING QMGRNAME, HCONN, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Name of queue manager
01 QMGRNAME PIC X(48).
** Connection handle
01 HCONN PIC S9(9) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQCONN (QMgrName, Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 QMgrName char(48); /* Name of queue manager */
dc1 Hconn fixed bin(31); /* Connection handle */
dc1 CompCode fixed bin(31); /* Completion code */
dc1 Reason fixed bin(31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQCONN,(QMGRNAME,HCONN,COMPCODE,REASON)
```

Declare the parameters as follows:

```
QMGRNAME DS CL48 Name of queue manager
HCONN DS F Connection handle
COMPCODE DS F Completion code
REASON DS F Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQCONN QMgrName, Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim QMgrName As String*48 'Name of queue manager'
Dim Hconn As Long 'Connection handle'
Dim CompCode As Long 'Completion code'
Dim Reason As Long 'Reason code qualifying CompCode'
```

## MQCONN - Connect queue manager (extended):

The MQCONN call connects an application program to a queue manager. It provides a queue manager connection handle, which is used by the application on subsequent IBM MQ calls.

The MQCONN call is like the MQCONN call, except that MQCONN allows options to be specified to control the way that the call works.

- This call is supported on all IBM MQ systems, and IBM MQ clients connected to these systems.
- On IBM i, this call is not supported for applications running in compatibility mode.

A client connection cannot be made on a server only installation, and a local connection cannot be made on a client only installation.

### Syntax

MQCONN (*QMgrName*, *ConnectOpts*, *Hconn*, *CompCode*, *Reason*)

### Parameters

#### ***QMgrName***

Type: MQCHAR48 - input

See the *QMgrName* parameter described in “MQCONN - Connect queue manager” on page 2449 for details.

#### ***ConnectOpts***

Type: MQCNO - input/output

See “MQCNO - Connect options” on page 2076 for details.

#### ***Hconn***

Type: MQHCONN - output

This handle represents the connection to the queue manager. Specify it on all subsequent message queuing calls issued by the application. It ceases to be valid when the MQDISC call is issued, or when the unit of processing that defines the scope of the handle terminates.

IBM MQ now supplies the mqm library with client packages as well as server packages. This means that when an MQI call that is found in the mqm library is made, the connection type is checked to see if it is a client or server connection, and then the correct underlying call is made. Therefore an exit which is passed an *Hconn* can now be linked against the mqm library, but used on a client installation.

*Handle scope:* The scope of the handle returned depends on the call used to connect to the queue manager (MQCONN or MQCONN). If the call used is MQCONN, the scope of the handle also depends on the MQCNO\_HANDLE\_SHARE\_\* option specified in the *Options* field of the MQCNO structure.

- If the call is MQCONN, or the MQCNO\_HANDLE\_SHARE\_NONE option is specified, the handle returned is a *nonshared* handle.

The scope of a nonshared handle is the smallest unit of parallel processing supported by the platform on which the application is running (see Table 246 on page 2458 for details); the handle is not valid outside the unit of parallel processing from which the call was issued.

- If you specify the MQCNO\_HANDLE\_SHARE\_BLOCK or MQCNO\_HANDLE\_SHARE\_NO\_BLOCK option, the handle returned is a *shared* handle.

The scope of a shared handle is the process that owns the thread from which the call was issued; the handle can be used from any thread that belongs to that process. Not all platforms support threads.

- If the MQCONN or MQCONN call fails with completion code equal to MQCC\_FAILED, then the *Hconn* value is undefined.

Table 246. Scope of nonshared handles on various platforms

Platform	Scope of nonshared handle
z/OS	<ul style="list-style-type: none"> <li>• CICS: the CICS task</li> <li>• IMS: the task, up to the next sync point (excluding subtasks of the task)</li> <li>• z/OS batch and TSO: the task (excluding subtasks of the task)</li> </ul>
IBM i	Job
UNIX systems	Thread
16 bit Windows applications	Process
32 bit Windows applications	Thread

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the value returned is:

**MQHC\_DEF\_HCONN**  
Default connection handle.

**CompCode**

Type: MQLONG - output

See the *CompCode* parameter described in “MQCONN - Connect queue manager” on page 2449 for details.

**Reason**

Type: MQLONG - output

The following codes can be returned by the MQCONN and MQCONNX calls. For a list of additional codes that can be returned by the MQCONNX call, see the following codes.

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**  
(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_ALREADY\_CONNECTED**  
(2002, X'7D2') Application already connected.

**MQRC\_CLUSTER\_EXIT\_LOAD\_ERROR**  
(2267, X'8DB') Unable to load cluster workload exit.

**MQRC\_SSL\_ALREADY\_INITIALIZED**  
(2391, X'957') SSL already initialized.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_CONN\_LOAD\_ERROR**  
(2129, X'851') Unable to load adapter connection module.

**MQRC\_ADAPTER\_DEFS\_ERROR**  
(2131, X'853') Adapter subsystem definition module not valid.

**MQRC\_ADAPTER\_DEFS\_LOAD\_ERROR**  
(2132, X'854') Unable to load adapter subsystem definition module.

**MQRC\_ADAPTER\_NOT\_AVAILABLE**  
(2204, X'89C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**  
(2130, X'852') Unable to load adapter service module.

**MQRC\_ADAPTER\_STORAGE\_SHORTAGE**  
(2127, X'84F') Insufficient storage for adapter.

**MQRC\_ANOTHER\_Q\_MGR\_CONNECTED**  
(2103, X'837') Another queue manager already connected.

**MQRC\_API\_EXIT\_ERROR**  
(2374, X'946') API exit failed.

**MQRC\_API\_EXIT\_INIT\_ERROR**  
(2375, X'947') API exit initialization failed.

**MQRC\_API\_EXIT\_TERM\_ERROR**  
(2376, X'948') API exit termination failed.

**MQRC\_ASID\_MISMATCH**  
(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_BUFFER\_LENGTH\_ERROR**  
(2005, X'7D5') Buffer length parameter not valid.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CONN\_ID\_IN\_USE**  
(2160, X'870') Connection identifier already in use.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_ERROR**  
(2273, X'8E1') Error processing MQCONN call.

**MQRC\_CONNECTION\_NOT\_AVAILABLE**  
(2568, X'A08') Occurs on an MQCONN or MQCONNX call when the queue manager is unable to provide a connection of the requested connection type on the current installation. A client connection cannot be made on a server only installation. A local connection cannot be made on a client only installation.

**MQRC\_CONNECTION QUIESCING**  
(2202, X'89A') Connection quiescing.

**MQRC\_CONNECTION\_STOPPING**  
(2203, X'89B') Connection shutting down.

**MQRC\_CRYPTO\_HARDWARE\_ERROR**  
(2382, X'94E') Cryptographic hardware configuration error.

**MQRC\_DUPLICATE\_RECOV\_COORD**  
(2163, X'873') Recovery coordinator exists.

**MQRC\_ENVIRONMENT\_ERROR**  
(2012, X'7DC') Call not valid in environment.  
  
Additionally, on the MQCONNX call, passing the "MQCSP - Security parameters" on page 2091 control block from a CICS or IMS application.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_HOST\_NOT\_AVAILABLE**  
(2538, X'9EA') An MQCONN call was issued from a client to connect to a queue manager but the attempt to allocate a conversation to the remote system failed.

**MQRC\_INSTALLATION\_MISMATCH**  
(2583, X'A17') Mismatch between queue manager installation and selected library.

**MQRC\_KEY\_REPOSITORY\_ERROR**  
(2381, X'94D') Key repository not valid.

**MQRC\_MAX\_CONNS\_LIMIT\_REACHED**  
(2025, X'7E9') Maximum number of connections reached.

**MQRC\_NOT\_AUTHORIZED**  
(2035, X'7F3') Not authorized for access.

**MQRC\_OPEN\_FAILED**  
(2137, X'859') Object not opened successfully.

**MQRC\_Q\_MGR\_NAME\_ERROR**  
(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**  
(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR QUIESCING**  
(2161, X'871') Queue manager quiescing.

**MQRC\_Q\_MGR STOPPING**  
(2162, X'872') Queue manager shutting down.

**MQRC\_RESOURCE\_PROBLEM**  
(2102, X'836') Insufficient system resources available.

**MQRC\_SECURITY\_ERROR**  
(2063, X'80F') Security error occurred.

**MQRC\_SSL\_INITIALIZATION\_ERROR**  
(2393, X'959') SSL initialization error.

**MQRC\_STORAGE\_NOT\_AVAILABLE**  
(2071, X'817') Insufficient storage available.

**MQRC\_UNEXPECTED\_ERROR**  
(2195, X'893') Unexpected error occurred.

The following additional reason codes can be returned by the MQCONN call:  
If *CompCode* is MQCC\_FAILED:

**MQRC\_AIR\_ERROR**  
(2385, X'951') Authentication information record not valid.

**MQRC\_AUTH\_INFO\_CONN\_NAME\_ERROR**  
(2387, X'953') Authentication information connection name not valid.

**MQRC\_AUTH\_INFO\_REC\_COUNT\_ERROR**  
(2383, X'94F') Authentication information record count not valid.

**MQRC\_AUTH\_INFO\_REC\_ERROR**  
(2384, X'950') Authentication information record fields not valid.

**MQRC\_AUTH\_INFO\_TYPE\_ERROR**  
(2386, X'952') Authentication information type not valid.

**MQRC\_CD\_ERROR**  
(2277, X'8E5') Channel definition not valid.

**MQRC\_CLIENT\_CONN\_ERROR**  
(2278, X'8E6') Client connection fields not valid.

**MQRC\_CNO\_ERROR**  
(2139, X'85B') Connect-options structure not valid.

- MQRC\_CONN\_TAG\_IN\_USE**  
(2271, X'8DF') Connection tag in use.
- MQRC\_CONN\_TAG\_NOT\_USABLE**  
(2350, X'92E') Connection tag not usable.
- MQRC\_LDAP\_PASSWORD\_ERROR**  
(2390, X'956') LDAP password not valid.
- MQRC\_LDAP\_USER\_NAME\_ERROR**  
(2388, X'954') LDAP user name fields not valid.
- MQRC\_LDAP\_USER\_NAME\_LENGTH\_ERR**  
(2389, X'955') LDAP user name length not valid.
- MQRC\_OPTIONS\_ERROR**  
(2046, X'7FE') Options not valid or not consistent.
- MQRC\_SCO\_ERROR**  
(2380, X'94C') SSL configuration options structure not valid.
- MQRC\_SSL\_CONFIG\_ERROR**  
(2392, X'958') SSL configuration error.

For detailed information about these codes, see Reason codes.

### Usage notes

For the Visual Basic programming language, the following point applies:

- The *ConnectOpts* parameter is declared as being of type MQCNO. If the application is running as an IBM MQ MQI client, and you want to specify the parameters of the client-connection channel, declare the *ConnectOpts* parameter as being of type Any, so that the application can specify an MQCNOCD structure on the call in place of an MQCNO structure. However, this means that the *ConnectOpts* parameter cannot be checked to ensure that it is the correct data type.

### C invocation

```
MQCONN (QMGrName, &ConnectOpts, &Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQCHAR48 QMGrName; /* Name of queue manager */
MQCNO ConnectOpts; /* Options that control the action of MQCONN */
MQHCONN Hconn; /* Connection handle */
MQLONG CompCode; /* Completion code */
MQLONG Reason; /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQCONN' USING QMGRNAME, CONNECTOPTS, HCONN, COMPCODE,
REASON.
```

Declare the parameters as follows:

```
** Name of queue manager
01 QMGRNAME PIC X(48).
** Options that control the action of MQCONN
01 CONNECTOPTS.
COPY CMQCNOV.
** Connection handle
01 HCONN PIC S9(9) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQCONNX (QMGrName, ConnectOpts, Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 QMGrName   char(48);      /* Name of queue manager */
dc1 ConnectOpts like MQCNO;   /* Options that control the action of
                               MQCONNX */
dc1 Hconn      fixed bin(31); /* Connection handle */
dc1 CompCode   fixed bin(31); /* Completion code */
dc1 Reason     fixed bin(31); /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

```
CALL MQCONNX,(QMGRNAME,CONNECTOPTS,HCONN,COMPCODE,REASON)
```

Declare the parameters as follows:

```
QMGRNAME    DS      CL48  Name of queue manager
CONNECTOPTS CMQCNOA  ,     Options that control the action of MQCONNX
HCONN       DS      F      Connection handle
COMPCODE    DS      F      Completion code
REASON      DS      F      Reason code qualifying COMPCODE
```

## Visual Basic invocation

```
MQCONNX QMGrName, ConnectOpts, Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim QMGrName As String*48 'Name of queue manager'
Dim ConnectOpts As MQCNO 'Options that control the action of'
                          'MQCONNX'
Dim Hconn As Long 'Connection handle'
Dim CompCode As Long 'Completion code'
Dim Reason As Long 'Reason code qualifying CompCode'
```

## MQCRTMH - Create message handle:

The MQCRTMH call returns a message handle.

An application can use the MQCRTMH call on subsequent message queuing calls:

- Use the MQSETMP call to set a property of the message handle.
- Use the MQINQMP call to inquire on the value of a property of the message handle.
- Use the MQDLTMP call to delete a property of the message handle.

The message handle can be used on the MQPUT and MQPUT1 calls to associate the properties of the message handle with those of the message being put. Similarly by specifying a message handle on the MQGET call, the properties of the message being retrieved can be accessed using the message handle when the MQGET call completes.

Use MQDLTMH to delete the message handle.

## Syntax

```
MQCRTMH (Hconn, CrtMsgHOpts, Hmsg, CompCode, Reason)
```

## Parameters

### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call. If the connection to the queue manager ceases to be valid and no IBM MQ call is operating on the message handle, MQDLTMH is implicitly called to delete the message.

Alternatively, you can specify the following value:

#### **MQHC\_UNASSOCIATED\_HCONN**

The connection handle does not represent a connection to any particular queue manager.

When this value is used, the message handle must be deleted with an explicit call to MQDLTMH in order to release any storage allocated to it; IBM MQ never implicitly deletes the message handle.

There must be at least one valid connection to a queue manager established on the thread creating the message handle, otherwise the call fails with MQRC\_HCONN\_ERROR.

In an environment with multiple installations on a single system, the MQHC\_UNASSOCIATED\_HCONN value is limited to use with the first installation loaded into the process. The reason code MQRC\_HMSG\_NOT\_AVAILABLE is returned if the message handle is supplied to a different installation.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and you can specify the following value for *Hconn*:

#### **MQHC\_DEF\_CONN**

Default connection handle

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

#### ***CrtMsgHOpts***

Type: MQCMHO - input

The options that control the action of MQCRTMH. See MQCMHO for details.

#### ***Hmsg***

Type: MQHMSG - output

On output a message handle is returned that can be used to set, inquire, and delete properties of the message handle. Initially the message handle contains no properties.

A message handle also has an associated message descriptor. Initially this contains the default values. The values of the associated message descriptor fields can be set and inquired using the MQSETMP and MQINQMP calls. The MQDLTMP call resets a field of the message descriptor back to its default value.

If the *Hconn* parameter is specified as the value MQHC\_UNASSOCIATED\_HCONN then the returned message handle can be used on MQGET, MQPUT, or MQPUT1 calls with any connection within the unit of processing, but can only be in use by one IBM MQ call at a time. If the handle is in use when a second IBM MQ call attempts to use the same message handle, the second IBM MQ call fails with reason code MQRC\_MSG\_HANDLE\_IN\_USE.

If the *Hconn* parameter is not MQHC\_UNASSOCIATED\_HCONN then the returned message handle can only be used on the specified connection.

The same *Hconn* parameter value must be used on the subsequent MQI calls where this message handle is used:

- MQDLTMH
- MQSETMP
- MQINQMP

- MQDLTMP
- MQMHBUF
- MQBUFMH

The returned message handle ceases to be valid when the MQDLTMH call is issued for the message handle, or when the unit of processing that defines the scope of the handle terminates. MQDLTMH is called implicitly if a specific connection is supplied when the message handle is created and the connection to the queue manager ceases to be valid, for example, if MQDBC is called.

#### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

##### **MQCC\_OK**

Successful completion.

##### **MQCC\_FAILED**

Call failed.

#### **Reason**

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

##### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED:

##### **MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'089C') Adapter not available.

##### **MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

##### **MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

##### **MQRC\_CALL\_IN\_PROGRESS**

(2219, X'08AB') MQI call entered before previous call completed.

##### **MQRC\_CMHO\_ERROR**

(2461, X'099D') Create message handle options structure not valid.

##### **MQRC\_CONNECTION\_BROKEN**

(2273, X'7D9') Connection to queue manager lost.

##### **MQRC\_HANDLE\_NOT\_AVAILABLE**

(2017, X'07E1') No more handles available.

##### **MQRC\_HCONN\_ERROR**

(2018, X'7E2') Connection handle not valid.

##### **MQRC\_HMSG\_ERROR**

(2460, X'099C') Message handle pointer not valid.

##### **MQRC\_OPTIONS\_ERROR**

(2046, X'07FE') Options not valid or not consistent.

##### **MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

##### **MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

## C

```
MQCRTMH (Hconn, &CrtMsgHOpts, &Hmsg, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;      /* Connection handle */
MQCMHO   CrtMsgHOpts; /* Options that control the action of MQCRTMH */
MQHMSG   Hmsg;       /* Message handle */
MQLONG   CompCode;   /* Completion code */
MQLONG   Reason;     /* Reason code qualifying CompCode */
```

## COBOL

```
CALL 'MQCRTMH' USING HCONN, CRTMSGOPTS, HMSG, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN    PIC S9(9) BINARY.
** Options that control the action of MQCRTMH
01 CRTMSGHOPTS.
   COPY CMQCMHOV.
** Message handle
01 HMSG     PIC S9(18) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON   PIC S9(9) BINARY.
```

## PL/I

```
call MQCRTMH (Hconn, CrtMsgHOpts, Hmsg, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn      fixed bin(31); /* Connection handle */
dc1 CrtMsgHOpts like MQCMHO;  /* Options that control the action of MQCRTMH */
dc1 Hmsg       fixed bin(63); /* Message handle */
dc1 CompCode   fixed bin(31); /* Completion code */
dc1 Reason     fixed bin(31); /* Reason code qualifying CompCode */
```

## High Level Assembler

```
CALL MQCRTMH, (HCONN, CRTMSGHOPTS, HMSG, COMPCODE, REASON)
```

Declare the parameters as follows:

```
HCONN      DS      F  Connection handle
CRTMSGHOPTS CMQCMHOA , Options that control the action of MQCRTMH
HMSG       DS      D  Message handle
COMPCODE   DS      F  Completion code
REASON     DS      F  Reason code qualifying COMPCODE
```

## MQCTL - Control callbacks:

The MQCTL call performs controlling actions on callbacks and the object handles opened for a connection.

### Syntax

MQCTL (*Hconn*, *Operation*, *ControlOpts*, *CompCode*, *Reason*)

### Parameters

#### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and you can specify the following special value for *Hconn*:

#### **MQHC\_DEF\_HCONN**

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

#### **Operation**

Type: MQLONG - input

The operation being processed on the callback defined for the specified object handle. You must specify one, and one only, of the following options:

#### **MQOP\_START**

Start the consuming of messages for all defined message consumer functions for the specified connection handle.

Callbacks run on a thread started by the system, which is different from any of the application threads.

This operation gives control of the provided connection handle to system. The only MQI calls which can be issued by a thread other than the consumer thread are:

- MQCTL with Operation MQOP\_STOP
- MQCTL with Operation MQOP\_SUSPEND
- MQDISC - Performs MQCTL with Operation MQOP\_STOP before disconnection the HConn.

MQRC\_HCONN\_ASYNC\_ACTIVE is returned if an IBM MQ API call is issued while the connection handle is started, and the call does not originate from a message consumer function.

If a message consumer stops the connection during the MQCBCT\_START\_CALL then the MQCTL call returns with a failure reason code of MQRC\_CONNECTION\_STOPPED.

This can be issued in a consumer function. For the same connection as the callback routine, its only purpose is to cancel a previously issued MQOP\_STOP operation.

This option is not supported in the following environments: CICS on z/OS or if the application is bound with a nonthreaded IBM MQ library.

## **MQOP\_START\_WAIT**

Start the consuming of messages for all defined message consumer functions for the specified connection handle.

Message consumers run on the same thread and control is not returned to the caller of MQCTL until:

- Released by the use of the MQCTL MQOP\_STOP or MQOP\_SUSPEND operations, or
- All consumer routines have been deregistered or suspended.

If all consumers are deregistered or suspended, an implicit MQOP\_STOP operation is issued.

This option cannot be used from within a callback routine, either for the current connection handle or any other connection handle. If the call is attempted it returns with MQRC\_ENVIRONMENT\_ERROR.

If, at any time during an MQOP\_START\_WAIT operation there are no registered, non-suspended consumers the call fails with a reason code of MQRC\_NO\_CALLBACKS\_ACTIVE.

If, during an MQOP\_START\_WAIT operation, the connection is suspended, the MQCTL call returns a warning reason code of MQRC\_CONNECTION\_SUSPENDED; the connection remains 'started'.

The application can choose to issue MQOP\_STOP or MQOP\_RESUME. In this instance, the MQOP\_RESUME operation blocks.

This option is not supported in a single threaded client.

## **MQOP\_STOP**

Stop the consuming of messages, and wait for all consumers to complete their operations before this option completes. This operation releases the connection handle.

If issued from within a callback routine, this option does not take effect until the routine exits. No more message consumer routines are called after the consumer routines for messages already read have completed, and after stop calls (if requested) to callback routines have been made.

If issued outside a callback routine, control does not return to the caller until the consumer routines for messages already read have completed, and after stop calls (if requested) to callbacks have been made. The callbacks themselves, however, remain registered.

This function has no effect on read ahead messages. You must ensure that consumers run MQCLOSE(MQCO\_QUIESCE), from within the callback function, to determine whether there are any further messages available to be delivered.

## **MQOP\_SUSPEND**

Pause the consuming of messages. This operation releases the connection handle.

This does not have any effect on the reading ahead of messages for the application. If you intend to stop consuming messages for a long time, consider closing the queue and reopening it when consumption continues.

If issued from within a callback routine, it does not take effect until the routine exits. No more message consumer routines will be called after the current routine exits.

If issued outside a callback, control does not return to the caller until the current consumer routine has completed and no more are called.

## **MQOP\_RESUME**

Resume the consuming of messages.

This option is normally issued from the main application thread, but it can also be used from within a callback routine to cancel an earlier suspension request issued in the same routine.

If the MQOP\_RESUME is used to resume an MQOP\_START\_WAIT then the operation blocks.

### **ControlOpts**

Type: MQCTLO - input

Options that control the action of MQCTL

See MQCTLO for details of the structure.

### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

#### **MQCC\_OK**

Successful completion.

#### **MQCC\_WARNING**

Warning (partial completion).

#### **MQCC\_FAILED**

Call failed.

### **Reason**

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED:

#### **MQRC\_ADAPTER\_CONV\_LOAD\_ERROR**

(2133, X'855') Unable to load data conversion services modules.

#### **MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'89C') Adapter not available.

#### **MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

#### **MQRC\_API\_EXIT\_ERROR**

(2374, X'946') API exit failed.

#### **MQRC\_API\_EXIT\_LOAD\_ERROR**

(2183, X'887') Unable to load API exit.

#### **MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

#### **MQRC\_BUFFER\_LENGTH\_ERROR**

(2005, X'7D5') Buffer length parameter not valid.

#### **MQRC\_CALLBACK\_LINK\_ERROR**

(2487, X'9B7') Unable to call the callback routine

#### **MQRC\_CALLBACK\_NOT\_REGISTERED**

(2448, X'990') Unable to Deregister, Suspend, or Resume because there is no registered callback

#### **MQRC\_CALLBACK\_ROUTINE\_ERROR**

(2486, X'9B6') Either, both CallbackFunction and CallbackName have been specified on an MQOP\_REGISTER call.

Or either CallbackFunction or CallbackName have been specified but does not match the currently registered callback function.

**MQRC\_CALLBACK\_TYPE\_ERROR**  
(2483, X'9B3') Incorrect CallBackType field.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CBD\_ERROR**  
(2444, X'98C') Option block is incorrect.

**MQRC\_CBD\_OPTIONS\_ERROR**  
(2484, X'9B4') Incorrect MQCBD options field.

**MQRC\_CICS\_WAIT\_FAILED**  
(2140, X'85C') Wait request rejected by CICS.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_NOT\_AUTHORIZED**  
(2217, X'8A9') Not authorized for connection.

**MQRC\_CONNECTION\_QUIESCING**  
(2202, X'89A') Connection quiescing.

**MQRC\_CONNECTION\_STOPPING**  
(2203, X'89B') Connection shutting down.

**MQRC\_CORREL\_ID\_ERROR**  
(2207, X'89F') Correlation-identifier error.

**MQRC\_FUNCTION\_NOT\_SUPPORTED**  
(2298, X'8FA') The function requested is not available in the current environment.

**MQRC\_GET\_INHIBITED**  
(2016, X'7E0') Gets inhibited for the queue.

**MQRC\_GLOBAL\_UOW\_CONFLICT**  
(2351, X'92F') Global units of work conflict.

**MQRC\_GMO\_ERROR**  
(2186, X'88A') Get-message options structure not valid.

**MQRC\_HANDLE\_IN\_USE\_FOR\_UOW**  
(2353, X'931') Handle in use for global unit of work.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_HOBJ\_ERROR**  
(2019, X'7E3') Object handle not valid.

**MQRC\_INCONSISTENT\_BROWSE**  
(2259, X'8D3') Inconsistent browse specification.

**MQRC\_INCONSISTENT\_UOW**  
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC\_INVALID\_MSG\_UNDER\_CURSOR**  
(2246, X'8C6') Message under cursor not valid for retrieval.

**MQRC\_LOCAL\_UOW\_CONFLICT**  
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC\_MATCH\_OPTIONS\_ERROR**  
(2247, X'8C7') Match options not valid.

**MQRC\_MAX\_MSG\_LENGTH\_ERROR**  
(2485, X'9B5') Incorrect MaxMsgLength field

**MQRC\_MD\_ERROR**  
(2026, X'7EA') Message descriptor not valid.

**MQRC\_MODULE\_ENTRY\_NOT\_FOUND**  
(2497, X'9C1')The specified function entry point could not be found in the module.

**MQRC\_MODULE\_INVALID**  
(2496, X'9C0') Module is found but is of the wrong type (32 bit/64 bit) or is not a valid dll.

**MQRC\_MODULE\_NOT\_FOUND**  
(2495, X'9BF') Module not found in the search path or not authorized to load.

**MQRC\_MSG\_ID\_ERROR**  
(2206, X'89E') Message-identifier error.

**MQRC\_MSG\_SEQ\_NUMBER\_ERROR**  
(2250, X'8CA') Message sequence number not valid.

**MQRC\_MSG\_TOKEN\_ERROR**  
(2331, X'91B') Use of message token not valid.

**MQRC\_NOT\_OPEN\_FOR\_BROWSE**  
(2036, X'7F4') Queue not open for browse.

**MQRC\_NOT\_OPEN\_FOR\_INPUT**  
(2037, X'7F5') Queue not open for input.

**MQRC\_OBJECT\_CHANGED**  
(2041, X'7F9') Object definition changed since opened.

**MQRC\_OBJECT\_DAMAGED**  
(2101, X'835') Object damaged.

**MQRC\_OPERATION\_ERROR**  
(2488, X'9B8') Incorrect Operation code on API Call

**MQRC\_OPTIONS\_ERROR**  
(2046, X'7FE') Options not valid or not consistent.

**MQRC\_PAGESET\_ERROR**  
(2193, X'891') Error accessing page-set data set.

**MQRC\_Q\_DELETED**  
(2052, X'804') Queue has been deleted.

**MQRC\_Q\_INDEX\_TYPE\_ERROR**  
(2394, X'95A') Queue has wrong index type.

**MQRC\_Q\_MGR\_NAME\_ERROR**  
(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**  
(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR QUIESCING**  
(2161, X'871') Queue manager quiescing.

**MQRC\_Q\_MGR STOPPING**  
(2162, X'872') Queue manager shutting down.

**MQRC\_RESOURCE\_PROBLEM**  
(2102, X'836') Insufficient system resources available.

**MQRC\_SIGNAL\_OUTSTANDING**

(2069, X'815') Signal outstanding for this handle.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

**MQRC\_SUPPRESSED\_BY\_EXIT**

(2109, X'83D') Call suppressed by exit program.

**MQRC\_SYNCPOINT\_NOT\_AVAILABLE**

(2072, X'818') Syncpoint support not available.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

**MQRC\_UOW\_ENLISTMENT\_ERROR**

(2354, X'932') Enlistment in global unit of work failed.

**MQRC\_UOW\_MIX\_NOT\_SUPPORTED**

(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC\_UOW\_NOT\_AVAILABLE**

(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC\_WAIT\_INTERVAL\_ERROR**

(2090, X'82A') Wait interval in MQGMO not valid.

**MQRC\_WRONG\_GMO\_VERSION**

(2256, X'8D0') Wrong version of MQGMO supplied.

**MQRC\_WRONG\_MD\_VERSION**

(2257, X'8D1') Wrong version of MQMD supplied.

For detailed information about these codes, see Reason codes.

**Usage notes**

1. Callback routines must check the responses from all services they invoke, and if the routine detects a condition that cannot be resolved, it must issue an MQCB MQOP\_DEREGISTER command to prevent repeated calls to the callback routine.
2. If you are using asynchronous consume in an application where an XA Transaction Manager is managing global transactions, including updates to IBM MQ, you need to consider the following additional points:
  - a. It is not valid to call MQCTL(MQOP\_START) for an **HConn**, after it has been created, after calling **xa\_open**.  
The reason is, that the **HConn** has become attached to an XA context, and so cannot then be accessed on the separate thread, or threads, in use by the asynchronous consume mechanism.
  - b. If you call MQCTL(MQOP\_START) in that scenario the call fails with reason code MQRC\_ASYNC\_XA\_CONFLICT (2350).
  - c. It is valid to call MQCTL(MQOP\_START\_WAIT) for an **HConn**, after it has been created, after calling **xa\_open**.  
The reason is, that this method of starting the asynchronous consume mechanism causes all further callbacks for the **HConn** to run on the thread where the MQCTL call is made. Therefore, the link between the **HConn** and the thread is not lost.
3.  On z/OS, when Operation is MQOP\_START:
  - Programs which use asynchronous callback routines must be authorized to use z/OS UNIX System Services (USS).
  - Language Environment (LE) programs which use asynchronous callback routines must use the LE runtime option POSIX(ON).

- Non-LE programs which use asynchronous callback routines must not use the USS pthread\_create interface (callable service BPX1PTC).

4.  MQCTL is not supported within the IMS adapter.

**Note:** In CICS, MQOP\_START is not supported. Instead, use the MQOP\_START\_WAIT function call.

### C invocation

MQCTL (Hconn, Operation, &ControlOpts, &CompCode, &Reason)

Declare the parameters as follows:

```
MQHCONN  Hconn;          /* Connection handle */
MQLONG   Operation;     /* Operation being processed */
MQCTLO   ControlOpts   /* Options that control the action of MQCTL */
MQLONG   CompCode;     /* Completion code */
MQLONG   Reason;       /* Reason code qualifying CompCode */
```

### COBOL invocation

CALL 'MQCTL' USING HCONN, OPERATION, CTLOPTS, COMPCODE, REASON.

Declare the parameters as follows:

```
** Connection handle
01 HCONN    PIC S9(9) BINARY.
** Operation
01 OPERATION PIC S9(9) BINARY.
** Control Options
01 CTLOPTS.
   COPY CMQCTLOV.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON   PIC S9(9) BINARY.
```

### PL/I invocation

call MQCTL(Hconn, Operation, Ct10pts, CompCode, Reason)

Declare the parameters as follows:

```
dc1 Hconn      fixed bin(31); /* Connection handle */
dc1 Operation  fixed bin(31); /* Operation */
dc1 Ct10pts like MQCTLO;     /* Options that control the action of MQCTL */
dc1 CompCode   fixed bin(31); /* Completion code */
dc1 Reason     fixed bin(31); /* Reason code qualifying CompCode */
```

## MQDISC - Disconnect queue manager:

The MQDISC call breaks the connection between the queue manager and the application program, and is the inverse of the MQCONN or MQCONNX call.

- On z/OS, all applications that use asynchronous message consumption, event handling or callback, the main control thread must issue an MQDISC call before ending. See Asynchronous consumption of IBM MQ messages for more details.
- On z/OS, CICS applications do not need to issue this call to disconnect from the queue manager, but might need to issue it to end the use of a connection tag.
- On IBM i, applications running in compatibility mode do not need to issue this call. See “MQCONN - Connect queue manager” on page 2449 for more information.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

## Syntax

MQDISC (*Hconn*, *CompCode*, *Reason*)

## Parameters

### *Hconn*

Type: MQHCONN - input/output

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, you can omit the MQCONN call, and specify the following value for *Hconn*:

#### **MQHC\_DEF\_HCONN**

Default connection handle.

On successful completion of the call, the queue manager sets *Hconn* to a value that is not a valid handle for the environment. This value is:

#### **MQHC\_UNUSABLE\_HCONN**

Unusable connection handle.

On z/OS, *Hconn* is set to a value that is undefined.

### *CompCode*

Type: MQLONG - output

The completion code; it is one of the following codes:

#### **MQCC\_OK**

Successful completion.

#### **MQCC\_WARNING**

Warning (partial completion).

#### **MQCC\_FAILED**

Call failed.

### *Reason*

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_BACKED\_OUT**

(2003, X'7D3') Unit of work backed out.

**MQRC\_CONN\_TAG\_NOT\_RELEASED**

(2344, X'928') Connection tag not released.

**MQRC\_OUTCOME\_PENDING**

(2124, X'84C') Result of commit operation is pending.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_DISC\_LOAD\_ERROR**

(2138, X'85A') Unable to load adapter disconnection module.

**MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'89C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

**MQRC\_API\_EXIT\_ERROR**

(2374, X'946') API exit failed.

**MQRC\_API\_EXIT\_INIT\_ERROR**

(2375, X'947') API exit initialization failed.

**MQRC\_API\_EXIT\_TERM\_ERROR**

(2376, X'948') API exit termination failed.

**MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_CALL\_IN\_PROGRESS**

(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CONNECTION\_BROKEN**

(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_STOPPING**

(2203, X'89B') Connection shutting down.

**MQRC\_HCONN\_ERROR**

(2018, X'7E2') Connection handle not valid.

**MQRC\_OUTCOME\_MIXED**

(2123, X'84B') Result of commit or back-out operation is mixed.

**MQRC\_PAGESET\_ERROR**

(2193, X'891') Error accessing page-set data set.

**MQRC\_Q\_MGR\_NAME\_ERROR**

(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**

(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR\_STOPPING**

(2162, X'872') Queue manager shutting down.

**MQRC\_RESOURCE\_PROBLEM**

(2102, X'836') Insufficient system resources available.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

## MQRC\_UNEXPECTED\_ERROR

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

### Usage notes

1. If an MQDISC call is issued when the connection still has objects open under that connection, the queue manager closes those objects, with the close options set to MQCO\_NONE.
2. If the application ends with uncommitted changes in a unit of work, the disposition of those changes depends on how the application ends:
  - a. If the application issues the MQDISC call before ending:
    - For a queue-manager-coordinated unit of work, the queue manager issues the MQCMIT call on behalf of the application. The unit of work is committed if possible, and backed out if not.
    - For an externally coordinated unit of work, there is no change in the status of the unit of work; however, the queue manager typically indicates that the unit of work must be committed when asked by the unit-of-work coordinator.  
On z/OS, CICS, IMS (other than batch DL/1 programs), and RRS applications are like this.
  - b. If the application ends normally but without issuing the MQDISC call, the action taken depends on the environment:
    - On z/OS, except for MQ Java or MQ JMS applications, the actions described in note 2a occur.
    - In all other cases, the actions described in note 2c occur.  
Because of the differences between environments, ensure that applications that you want to port either commit or back out the unit of work before they end.
  - c. If the application ends *abnormally* without issuing the MQDISC call, the unit of work is backed out.
3. On z/OS, the following points apply:
  - CICS applications do not have to issue the MQDISC call to disconnect from the queue manager, because the CICS system itself connects to the queue manager, and the MQDISC call has no effect on this connection.
  - CICS, IMS (other than batch DL/1 programs), and RRS applications use units of work that are coordinated by an external unit-of-work coordinator. As a result, the MQDISC call does not affect the status of the unit of work (if any) that exists when the call is issued.  
However the MQDISC call *does* indicate the end of use of the connection tag *ConnTag* that was associated with the connection by an earlier MQCONN call issued by the application. If there is an active unit of work that references the connection tag when the MQDISC call is issued, the call completes with completion code MQCC\_WARNING and reason code MQRC\_CONN\_TAG\_NOT\_RELEASED. The connection tag does not become available for reuse until the external unit-of-work coordinator has resolved the unit of work.
4. On IBM i, applications running in compatibility mode do not have to issue this call; see the MQCONN call for more details.

**Note:** In CICS, MQOP\_START is not supported. Instead, use the MQOP\_START\_WAIT function call.

### C invocation

```
MQDISC (&Hconn, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;      /* Connection handle */
MQLONG   CompCode;   /* Completion code */
MQLONG   Reason;     /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQDISC' USING HCONN, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN    PIC S9(9) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON   PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQDISC (Hconn, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn    fixed bin(31); /* Connection handle */
dc1 CompCode fixed bin(31); /* Completion code */
dc1 Reason   fixed bin(31); /* Reason code qualifying CompCode */
```

## System/390 assembler invocation

```
CALL MQDISC, (HCONN, COMPCODE, REASON)
```

Declare the parameters as follows:

```
HCONN    DS F Connection handle
COMPCODE DS F Completion code
REASON   DS F Reason code qualifying COMPCODE
```

## Visual Basic invocation

```
MQDISC Hconn, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn    As Long 'Connection handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## MQDLTMH - Delete message handle:

The MQDLTMH call deletes a message handle and is the inverse of the MQCRTMH call.

## Syntax

```
MQDLTMH (Hconn, Hmsg, DltMsgHOpts, CompCode, Reason)
```

## Parameters

### ***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager.

The value must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC\_UNASSOCIATED\_HCONN then a valid connection must be established on the thread deleting the message handle, otherwise the call fails with MQRC\_CONNECTION\_BROKEN.

### ***Hmsg***

Type: MQHMSG - input/output

This is the message handle to be deleted. The value was returned by a previous MQCRTMH call. On successful completion of the call, the handle is set to an invalid value for the environment. This value is:

**MQHM\_UNUSABLE\_HMSG**  
Unusable message handle.

The message handle cannot be deleted if another IBM MQ call is in progress that was passed the same message handle.

***DltMsgHOpts***

Type: MQDMHO - input

See MQDMHO for details.

***CompCode***

Type: MQLONG - output

The completion code; it is one of the following:

**MQCC\_OK**  
Successful completion.

**MQCC\_FAILED**  
Call failed.

***Reason***

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**  
(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_NOT\_AVAILABLE**  
(2204, X'089C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**  
(2130, X'852') Unable to load adapter service module.

**MQRC\_ASID\_MISMATCH**  
(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'08AB') MQI call entered before previous call completed.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'07D9') Connection to queue manager lost.

**MQRC\_DMHO\_ERROR**  
(2462, X'099E') Delete message handle options structure not valid.

**MQRC\_HMSG\_ERROR**  
(2460, X'099C') Message handle pointer not valid.

**MQRC\_MSG\_HANDLE\_IN\_USE**  
(2499, X'09C3') Message handle already in use.

**MQRC\_OPTIONS\_ERROR**  
(2046, X'07FE') Options not valid or not consistent.

**MQRC\_STORAGE\_NOT\_AVAILABLE**  
(2071, X'817') Insufficient storage available.

## MQRC\_UNEXPECTED\_ERROR

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

### C invocation

```
MQDLTMH (Hconn, &Hmsg, &DltMsgHOpts, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;      /* Connection handle */
MQHMSG   Hmsg;       /* Message handle */
MQDMHO   DltMsgHOpts; /* Options that control the action of MQDLTMH */
MQLONG   CompCode;   /* Completion code */
MQLONG   Reason;     /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQDLTMH' USING HCONN, HMSG, DLTMSGHOPTS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01  HCONN  PIC S9(9) BINARY.

** Options that control the action of MQDLTMH
01  DLTMSGHOPTS.
COPY CMQDLMHOV.

** Completion code
01  COMPCODE  PIC S9(9) BINARY.

** Reason code qualifying COMPCODE
01  REASON    PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQDLTMH (Hconn, Hmsg, DltMsgHOpts, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn          /* Connection handle */
dc1 Hmsg           /* Message handle */
dc1 DltMsgHOpts like MQDMHO; /* Options that control the action of MQDLTMH */
dc1 CompCode       /* Completion code */
dc1 Reason         /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQDLTMH,(HCONN,HMSG,DLTMSGHOPTS,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN      DS      F  Connection handle
HMSG       DS      D  Message handle
DLTMSGHOPTS  CMQDMHOA , Options that control the action of MQDLTMH
COMPCODE   DS      F  Completion code
REASON     DS      F  Reason code qualifying COMPCODE
```

## **MQDLTMP - Delete message property:**

The MQDLTMP call deletes a property from a message handle and is the inverse of the MQSETMP call.

### **Syntax**

MQDLTMP (*Hconn, Hmsg, DltPropOpts, Name, CompCode, Reason*)

### **Parameters**

#### ***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC\_UNASSOCIATED\_HCONN then a valid connection must be established on the thread deleting the message handle otherwise the call fails with MQRC\_CONNECTION\_BROKEN.

#### ***Hmsg***

Type: MQHMSG - input

This is the message handle containing the property to be deleted. The value was returned by a previous MQCRTMH call.

#### ***DltPropOpts***

Type: MQDMPO - input

See the MQDMPO data type for details.

#### ***Name***

Type: MQCHARV - input

The name of the property to delete. See Property names for further information about property names.

Wildcards are not allowed in the property name.

#### ***CompCode***

Type: MQLONG - output

The completion code; it is one of the following:

##### **MQCC\_OK**

Successful completion.

##### **MQCC\_WARNING**

Warning (partial completion).

##### **MQCC\_FAILED**

Call failed.

#### ***Reason***

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

##### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

##### **MQRC\_PROPERTY\_NOT\_AVAILABLE**

(2471, X'09A7') Property not available.

**MQRC\_RFH\_FORMAT\_ERROR**

(2421, X'0975') An MQRFH2 folder containing properties could not be parsed.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'089C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'0852') Unable to load adapter service module.

**MQRC\_ASID\_MISMATCH**

(2157, X'086D') Primary and home ASIDs differ.

**MQRC\_CALL\_IN\_PROGRESS**

(2219, X'08AB') MQI call entered before previous call completed.

**MQRC\_CONNECTION\_BROKEN**

(2009, X'07D9') Connection to queue manager lost.

**MQRC\_DMPO\_ERROR**

(2481, X'09B1') Delete message property options structure not valid.

**MQRC\_HMSG\_ERROR**

(2460, X'099C') Message handle not valid.

**MQRC\_MSG\_HANDLE\_IN\_USE**

(2499, X'09C3') Message handle already in use.

**MQRC\_OPTIONS\_ERROR**

(2046, X'07FE') Options not valid or not consistent.

**MQRC\_PROPERTY\_NAME\_ERROR**

(2442, X'098A') Invalid property name.

**MQRC\_SOURCE\_CCSID\_ERROR**

(2111, X'083F') Property name coded character set identifier not valid.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'0893') Unexpected error occurred.

For detailed information about these codes, see:

- Reason codes for IBM MQ for z/OS
- API reason codes for other IBM MQ platforms

**C invocation**

MQDLTMP (Hconn, Hmsg, &DltPropOpts, &Name, &CompCode, &Reason)

Declare the parameters as follows:

```

MQHCONN Hconn;      /* Connection handle */
MQHMSG  Hmsg;       /* Message handle */
MQDMPO  DltPropOpts; /* Options that control the action of MQDLTMP */
MQCHARV Name;       /* Property name */
MQLONG  CompCode;   /* Completion code */
MQLONG  Reason;     /* Reason code qualifying CompCode */

```

**COBOL invocation**

CALL 'MQDLTMP' USING HCONN, HMSG, DLTPROPOPTS, NAME, COMPCODE, REASON.

Declare the parameters as follows:

```

** Connection handle
01 HCONN PIC S9(9) BINARY.
** Message handle
01 HMSG PIC S9(18) BINARY.
** Options that control the action of MQDLTMP
01 DLTPROPOPTS.
COPY CMQDMPOV.
** Property name
01 NAME
COPY CMQCHRVA.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON PIC S9(9) BINARY.

```

### PL/I invocation

```
call MQDLTMP (Hconn, Hmsg, DltPropOpts, Name, CompCode, Reason);
```

Declare the parameters as follows:

```

dcl Hconn      fixed bin(31); /* Connection handle */
dcl Hmsg       fixed bin(63); /* Message handle */
dcl DltPropOpts like MQDMPO; /* Options that control the action of MQDLTMP */
dcl Name       like MQCHARV; /* Property name */
dcl CompCode   fixed bin(31); /* Completion code */
dcl Reason     fixed bin(31); /* Reason code qualifying CompCode */

```

### High Level Assembler invocation

```
CALL MQDLTMP,(HCONN,HMSG,DLTPROPOPTS,NAME,COMPCODE,REASON)
```

Declare the parameters as follows:

HCONN	DS	F	Connection handle
HMSG	DS	D	Message handle
DLTPROPOPTS	CMQDMPOA	,	Options that control the action of MQDLTMP
NAME	CMQCHRVA	,	Property name
COMPCODE	DS	F	Completion code
REASON	DS	F	Reason code qualifying COMPCODE

### MQGET - Get message:

The MQGET call retrieves a message from a local queue that has been opened using the MQOPEN call.

#### Syntax

```
MQGET (Hconn, Hobj, MsgDesc, GetMsgOpts, BufferLength, Buffer, DataLength, CompCode, Reason)
```

#### Parameters

##### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn*:

##### **MQHC\_DEF\_HCONN**

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

### **Hobj**

Type: MQHOBJ - input

This handle represents the queue from which a message is to be retrieved. The value of *Hobj* was returned by a previous MQOPEN call. The queue must have been opened with one or more of the following options (see “MQOPEN - Open object” on page 2519 for details):

- MQOO\_INPUT\_SHARED
- MQOO\_INPUT\_EXCLUSIVE
- MQOO\_INPUT\_AS\_Q\_DEF
- MQOO\_BROWSE

### **MsgDesc**

Type: MQMD - input/output

This structure describes the attributes of the message required, and the attributes of the message retrieved. See “MQMD - Message descriptor” on page 2179 for details.

If *BufferLength* is less than the message length, *MsgDesc* is filled by the queue manager, whether MQGMO\_ACCEPT\_TRUNCATED\_MSG is specified on the *GetMsgOpts* parameter (see MQGMO - Options field ).

If the application provides a version-1 MQMD, the message returned has an MQMDE prefixed to the application message data, but *only* if one or more of the fields in the MQMDE has a nondefault value. If all the fields in the MQMDE have default values, the MQMDE is omitted. A format name of MQFMT\_MD\_EXTENSION in the *Format* field in MQMD indicates that an MQMDE is present.

The application does not need to provide an MQMD structure if a valid message handle is supplied in the *MsgHandle* field. If nothing is provided in this field, the descriptor of the message is taken from the descriptor associated with the message handles.

If the application provides a message handle rather than an MQMD structure, and specifies MQGMO\_PROPERTIES\_FORCE\_MQRFH2, the call fails with reason code MQRC\_MD\_ERROR. The call also fails, with reason code MQRC\_MD\_ERROR, if the application does not provide an MQMD structure and specifies MQGMO\_PROPERTIES\_AS\_Q\_DEF, and the *PropertyControl* queue attribute is MQPROP\_FORCE\_MQRFH2.

If match options are specified and the message descriptor associated with the message handle is being used, the input fields used for matching come from the message handle.

### **GetMsgOpts**

Type: MQGMO - input/output

See “MQGMO - Get-message options” on page 2128 for details.

### **BufferLength**

Type: MQLONG - input

This is the length in bytes of the *Buffer* area. Specify zero for messages that have no data, or if the message is to be removed from the queue and the data discarded (you must specify MQGMO\_ACCEPT\_TRUNCATED\_MSG in this case).

**Note:** The length of the longest message that it is possible to read from the queue is given by the *MaxMsgLength* queue attribute; see “Attributes for queues” on page 2625.

### **Buffer**

Type: MQBYTE×BufferLength - output

This is the area to contain the message data. Align the buffer on a boundary appropriate to the nature of the data in the message. 4 byte alignment is suitable for most messages (including messages containing IBM MQ header structures), but some messages might require more stringent alignment. For example, a message containing a 64 bit binary integer might require 8-byte alignment.

If *BufferLength* is less than the message length, as much of the message as possible is moved into *Buffer* ; this happens whether MQGMO\_ACCEPT\_TRUNCATED\_MSG is specified on the *GetMsgOpts* parameter (see MQGMO - Options field for more information).

The character set and encoding of the data in *Buffer* are given by the *CodedCharSetId* and *Encoding* fields returned in the *MsgDesc* parameter. If these values are different from the values required by the receiver, the receiver must convert the application message data to the character set and encoding required. The MQGMO\_CONVERT option can be used (with a user-written exit if necessary) to convert the message data; see "MQGMO - Get-message options" on page 2128 for details of this option.

**Note:** All the other parameters on the MQGET call are in the character set and encoding of the local queue manager (given by the *CodedCharSetId* queue-manager attribute and MQENC\_NATIVE).

If the call fails, the contents of the buffer might still have changed.

In the C programming language, the parameter is declared as a pointer-to-void: the address of any type of data can be specified as the parameter.

If the *BufferLength* parameter is zero, *Buffer* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler can be null.

#### **DataLength**

Type: MQLONG - output

This is the length in bytes of the application data *in the message*. If this value is greater than *BufferLength*, only *BufferLength* bytes are returned in the *Buffer* parameter (that is, the message is truncated). If the value is zero, the message contains no application data.

If *BufferLength* is less than the message length, *DataLength* is still completed by the queue manager, whether MQGMO\_ACCEPT\_TRUNCATED\_MSG is specified on the *GetMsgOpts* parameter (see MQGMO - Options field for more information). This allows the application to determine the size of the buffer required to accommodate the message data, and then reissue the call with a buffer of the appropriate size.

However, if the MQGMO\_CONVERT option is specified, and the converted message data is too long to fit in *Buffer*, the value returned for *DataLength* is:

- The length of the *unconverted* data, for queue-manager defined formats.  
In this case, if the nature of the data causes it to expand during conversion, the application must allocate a buffer bigger than the value returned by the queue manager for *DataLength*.
- The value returned by the data-conversion exit, for application-defined formats.

#### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

##### **MQCC\_OK**

Successful completion.

##### **MQCC\_WARNING**

Warning (partial completion).

##### **MQCC\_FAILED**

Call failed.

#### **Reason**

Type: MQLONG - output

The reason codes listed are the ones that the queue manager can return for the *Reason* parameter. If the application specifies the MQGMO\_CONVERT option, and a user-written exit is invoked to convert some or all the message data, the exit decides what value is returned for the *Reason* parameter. As a result, values other than those values documented are possible.

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_CONVERTED\_MSG\_TOO\_BIG**

(2120, X'848') Converted data too large for buffer.

**MQRC\_CONVERTED\_STRING\_TOO\_BIG**

(2190, X'88E') Converted string too large for field.

**MQRC\_DBCS\_ERROR**

(2150, X'866') DBCS string not valid.

**MQRC\_FORMAT\_ERROR**

(2110, X'83E') Message format not valid.

**MQRC\_INCOMPLETE\_GROUP**

(2241, X'8C1') Message group not complete.

**MQRC\_INCOMPLETE\_MSG**

(2242, X'8C2') Logical message not complete.

**MQRC\_INCONSISTENT\_CCSDS**

(2243, X'8C3') Message segments have differing CCSIDs.

**MQRC\_INCONSISTENT\_ENCODINGS**

(2244, X'8C4') Message segments have differing encodings.

**MQRC\_INCONSISTENT\_UOW**

(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC\_MSG\_TOKEN\_ERROR**

(2331, X'91B') Invalid use of message token.

**MQRC\_NO\_MSG\_LOCKED**

(2209, X'8A1') No message locked.

**MQRC\_NOT\_CONVERTED**

(2119, X'847') Message data not converted.

**MQRC\_OPTIONS\_CHANGED**

(nnnn, X'xxx') Options that were required to be consistent have been changed.

**MQRC\_PARTIALLY\_CONVERTED**

(2272, X'8E0') Message data partially converted.

**MQRC\_SIGNAL\_REQUEST\_ACCEPTED**

(2070, X'816') No message returned (but signal request accepted).

**MQRC\_SOURCE\_BUFFER\_ERROR**

(2145, X'861') Source buffer parameter not valid.

**MQRC\_SOURCE\_CCSDS\_ERROR**

(2111, X'83F') Source coded character set identifier not valid.

**MQRC\_SOURCE\_DECIMAL\_ENC\_ERROR**

(2113, X'841') Packed-decimal encoding in message not recognized.

**MQRC\_SOURCE\_FLOAT\_ENC\_ERROR**  
(2114, X'842') Floating-point encoding in message not recognized.

**MQRC\_SOURCE\_INTEGER\_ENC\_ERROR**  
(2112, X'840') Source integer encoding not recognized.

**MQRC\_SOURCE\_LENGTH\_ERROR**  
(2143, X'85F') Source length parameter not valid.

**MQRC\_TARGET\_BUFFER\_ERROR**  
(2146, X'862') Target buffer parameter not valid.

**MQRC\_TARGET\_CCSDID\_ERROR**  
(2115, X'843') Target coded character set identifier not valid.

**MQRC\_TARGET\_DECIMAL\_ENC\_ERROR**  
(2117, X'845') Packed-decimal encoding specified by receiver not recognized.

**MQRC\_TARGET\_FLOAT\_ENC\_ERROR**  
(2118, X'846') Floating-point encoding specified by receiver not recognized.

**MQRC\_TARGET\_INTEGER\_ENC\_ERROR**  
(2116, X'844') Target integer encoding not recognized.

**MQRC\_TRUNCATED\_MSG\_ACCEPTED**  
(2079, X'81F') Truncated message returned (processing completed).

**MQRC\_TRUNCATED\_MSG\_FAILED**  
(2080, X'820') Truncated message returned (processing not completed).

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_NOT\_AVAILABLE**  
(2204, X'89C') Adapter not available.

**MQRC\_ADAPTER\_CONV\_LOAD\_ERROR**  
(2133, X'855') Unable to load data conversion services modules.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**  
(2130, X'852') Unable to load adapter service module.

**MQRC\_API\_EXIT\_ERROR**  
(2374, X'946') API exit failed.

**MQRC\_API\_EXIT\_LOAD\_ERROR**  
(2183, X'887') Unable to load API exit.

**MQRC\_ASID\_MISMATCH**  
(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_BACKED\_OUT**  
(2003, X'7D3') Unit of work backed out.

**MQRC\_BUFFER\_ERROR**  
(2004, X'7D4') Buffer parameter not valid.

**MQRC\_BUFFER\_LENGTH\_ERROR**  
(2005, X'7D5') Buffer length parameter not valid.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CF\_NOT\_AVAILABLE**  
(2345, X'929') Coupling facility not available.

**MQRC\_CF\_STRUC\_FAILED**  
(2373, X'945') Coupling-facility structure failed.

**MQRC\_CF\_STRUC\_IN\_USE**  
(2346, X'92A') Coupling-facility structure in use.

**MQRC\_CF\_STRUC\_LIST\_HDR\_IN\_USE**  
(2347, X'92B') Coupling-facility structure list-header in use.

**MQRC\_CICS\_WAIT\_FAILED**  
(2140, X'85C') Wait request rejected by CICS.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_NOT\_AUTHORIZED**  
(2217, X'8A9') Not authorized for connection.

**MQRC\_CONNECTION\_QUIESCING**  
(2202, X'89A') Connection quiescing.

**MQRC\_CONNECTION\_STOPPING**  
(2203, X'89B') Connection shutting down.

**MQRC\_CORREL\_ID\_ERROR**  
(2207, X'89F') Correlation-identifier error.

**MQRC\_DATA\_LENGTH\_ERROR**  
(2010, X'7DA') Data length parameter not valid.

**MQRC\_DB2\_NOT\_AVAILABLE**  
(2342, X'926') Db2 subsystem not available.

**MQRC\_GET\_INHIBITED**  
(2016, X'7E0') Gets inhibited for the queue.

**MQRC\_GLOBAL\_UOW\_CONFLICT**  
(2351, X'92F') Global units of work conflict.

**MQRC\_GMO\_ERROR**  
(2186, X'88A') Get-message options structure not valid.

**MQRC\_HANDLE\_IN\_USE\_FOR\_UOW**  
(2353, X'931') Handle in use for global unit of work.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_HOBJ\_ERROR**  
(2019, X'7E3') Object handle not valid.

**MQRC\_INCONSISTENT\_BROWSE**  
(2259, X'8D3') Inconsistent browse specification.

**MQRC\_INCONSISTENT\_UOW**  
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC\_INVALID\_MSG\_UNDER\_CURSOR**  
(2246, X'8C6') Message under cursor not valid for retrieval.

**MQRC\_LOCAL\_UOW\_CONFLICT**  
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC\_MATCH\_OPTIONS\_ERROR**  
(2247, X'8C7') Match options not valid.

**MQRC\_MD\_ERROR**  
(2026, X'7EA') Message descriptor not valid.

**MQRC\_MSG\_ID\_ERROR**  
(2206, X'89E') Message-identifier error.

**MQRC\_MSG\_SEQ\_NUMBER\_ERROR**  
(2250, X'8CA') Message sequence number not valid.

**MQRC\_MSG\_TOKEN\_ERROR**  
(2331, X'91B') Use of message token not valid.

**MQRC\_NO\_MSG\_AVAILABLE**  
(2033, X'7F1') No message available.

**MQRC\_NO\_MSG\_UNDER\_CURSOR**  
(2034, X'7F2') Browse cursor not positioned on message.

**MQRC\_NOT\_OPEN\_FOR\_BROWSE**  
(2036, X'7F4') Queue not open for browse.

**MQRC\_NOT\_OPEN\_FOR\_INPUT**  
(2037, X'7F5') Queue not open for input.

**MQRC\_OBJECT\_CHANGED**  
(2041, X'7F9') Object definition changed since opened.

**MQRC\_OBJECT\_DAMAGED**  
(2101, X'835') Object damaged.

**MQRC\_OPTIONS\_ERROR**  
(2046, X'7FE') Options not valid or not consistent.

**MQRC\_PAGESET\_ERROR**  
(2193, X'891') Error accessing page-set data set.

**MQRC\_Q\_DELETED**  
(2052, X'804') Queue has been deleted.

**MQRC\_Q\_INDEX\_TYPE\_ERROR**  
(2394, X'95A') Queue has wrong index type.

**MQRC\_Q\_MGR\_NAME\_ERROR**  
(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**  
(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR QUIESCING**  
(2161, X'871') Queue manager quiescing.

**MQRC\_Q\_MGR STOPPING**  
(2162, X'872') Queue manager shutting down.

**MQRC\_RESOURCE PROBLEM**  
(2102, X'836') Insufficient system resources available.

**MQRC\_SECOND\_MARK\_NOT\_ALLOWED**  
(2062, X'80E') A message is already marked.

**MQRC\_SIGNAL\_OUTSTANDING**  
(2069, X'815') Signal outstanding for this handle.

**MQRC\_SIGNAL1\_ERROR**  
(2099, X'833') Signal field not valid.

**MQRC\_STORAGE\_MEDIUM\_FULL**  
(2192, X'890') External storage medium is full.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

**MQRC\_SUPPRESSED\_BY\_EXIT**

(2109, X'83D') Call suppressed by exit program.

**MQRC\_SYNCPOINT\_LIMIT\_REACHED**

(2024, X'7E8') No more messages can be handled within current unit of work.

**MQRC\_SYNCPOINT\_NOT\_AVAILABLE**

(2072, X'818') sync point support not available.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

**MQRC\_UOW\_ENLISTMENT\_ERROR**

(2354, X'932') Enlistment in global unit of work failed.

**MQRC\_UOW\_MIX\_NOT\_SUPPORTED**

(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC\_UOW\_NOT\_AVAILABLE**

(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC\_WAIT\_INTERVAL\_ERROR**

(2090, X'82A') Wait interval in MQGMO not valid.

**MQRC\_WRONG\_GMO\_VERSION**

(2256, X'8D0') Wrong version of MQGMO supplied.

**MQRC\_WRONG\_MD\_VERSION**

(2257, X'8D1') Wrong version of MQMD supplied.

For detailed information about these codes, see Reason codes.

**Usage notes**

1. The message retrieved is normally deleted from the queue. This deletion can occur as part of the MQGET call itself, or as part of a sync point.  
The browse options are: MQGMO\_BROWSE\_FIRST, MQGMO\_BROWSE\_NEXT, and MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR.
2. If the MQGMO\_LOCK option is specified with one of the browse options, the browsed message is locked so that it is visible only to this handle.  
If the MQGMO\_UNLOCK option is specified, a previously locked message is unlocked. No message is retrieved in this case, and the *MsgDesc*, *BufferLength*, *Buffer*, and *DataLength* parameters are not checked or altered.
3. For applications issuing an MQGET call, the message retrieved can be lost if the application terminates abnormally or the connection is severed while processing the call. This issue arises because the surrogate running on the same platform as the queue manager that issues the MQGET call on behalf of the application cannot detect the loss of the application until the surrogate is about to return the message to the application, *after* the message has been removed from the queue. This issue can occur for both persistent messages and nonpersistent messages.  
To eliminate the risk of losing messages in this way, always retrieve messages within units of work. That is, by specifying the MQGMO\_SYNCPOINT option on the MQGET call, and using the MQCMIT or MQBACK calls to commit or back out the unit of work when message processing is complete. If MQGMO\_SYNCPOINT is specified, and the client terminates abnormally or the connection is severed, the surrogate backs out the unit of work on the queue manager and the message is reinstated on the queue. For more information about sync points, see Syncpoint considerations in IBM MQ applications.  
This situation can arise with IBM MQ clients as well as with applications that are running on the same platform as the queue-manager.

4. If an application puts a sequence of messages on a particular queue within a single unit of work, and then commits that unit of work successfully, the messages become available for retrieval as follows:
  - If the queue is a *nonshared* queue (that is, a local queue), all messages within the unit of work become available at the same time.
  - If the queue is a *shared* queue, messages within the unit of work become available in the order in which they were put, but not all at the same time. When the system is heavily laden, it is possible for the first message in the unit of work to be retrieved successfully, but for the MQGET call for the second or subsequent message in the unit of work to fail with MQRC\_NO\_MSG\_AVAILABLE. If this issue occurs, the application must wait a short while and then try the operation again.
5. If an application puts a sequence of messages on the same queue without using message groups, the order of those messages is preserved if certain conditions are satisfied. See MQPUT usage notes for details. If the conditions are satisfied, the messages are presented to the receiving application in the order in which they were sent, if:
  - Only one receiver is getting messages from the queue.
 

If there are two or more applications getting messages from the queue, they must agree with the sender the mechanism to be used to identify messages that belong to a sequence. For example, the sender might set all the *CorrelId* fields in the messages in a sequence to a value that was unique to that sequence of messages.
  - The receiver does not deliberately change the order of retrieval, for example by specifying a particular *MsgId* or *CorrelId*.

If the sending application puts the messages as a message group, the messages are presented to the receiving application in the correct order if the receiving application specifies the MQGMO\_LOGICAL\_ORDER option on the MQGET call. For more information about message groups, see:

- MQMD - MsgFlags field
- MQPMO\_LOGICAL\_ORDER
- MQGMO\_LOGICAL\_ORDER

If the user is getting messages in a group under sync point, they must ensure that the complete group is processed before attempting to finish the transaction.

6. Applications must test for the feedback code MQFB\_QUIT in the *Feedback* field of the *MsgDesc* parameter, and end if they find this value. See MQMD - Feedback field for more information.
7. If the queue identified by *Hobj* was opened with the MQOO\_SAVE\_ALL\_CONTEXT option, and the completion code from the MQGET call is MQCC\_OK or MQCC\_WARNING, the context associated with the queue handle *Hobj* is set to the context of the message that has been retrieved (unless the MQGMO\_BROWSE\_FIRST, MQGMO\_BROWSE\_NEXT, or MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR option is set, in which case the context is marked as not available).
 

You can use the saved context on a subsequent MQPUT or MQPUT1 call by specifying the MQPMO\_PASS\_IDENTITY\_CONTEXT or MQPMO\_PASS\_ALL\_CONTEXT options. This enables the context of the message received to be transferred in whole or in part to another message (for example, when the message is forwarded to another queue). For more information about message context, see Message context.
8. If you include the MQGMO\_CONVERT option in the *GetMsgOpts* parameter, the application message data is converted to the representation requested by the receiving application, before the data is placed in the *Buffer* parameter:
  - The *Format* field in the control information in the message identifies the structure of the application data, and the *CodedCharSetId* and *Encoding* fields in the control information in the message specify its character-set identifier and encoding.
  - The application issuing the MQGET call specifies in the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter the character-set identifier and encoding to which to convert the application message data.

When conversion of the message data is necessary, the conversion is performed either by the queue manager itself or by a user-written exit, depending on the value of the *Format* field in the control information in the message:

- The following format names are formats that are converted by the queue manager; these formats are called "built-in" formats:
  - MQFMT\_ADMIN
  - MQFMT\_CICS ( z/OS only)
  - MQFMT\_COMMAND\_1
  - MQFMT\_COMMAND\_2
  - MQFMT\_DEAD\_LETTER\_HEADER
  - MQFMT\_DIST\_HEADER
  - MQFMT\_EVENT version 1
  - MQFMT\_EVENT version 2 ( z/OS only)
  - MQFMT\_IMS
  - MQFMT\_IMS\_VAR\_STRING
  - MQFMT\_MD\_EXTENSION
  - MQFMT\_PCF
  - MQFMT\_REF\_MSG\_HEADER
  - MQFMT\_RF\_HEADER
  - MQFMT\_RF\_HEADER\_2
  - MQFMT\_STRING
  - MQFMT\_TRIGGER
  - MQFMT\_WORK\_INFO\_HEADER ( z/OS only)
  - MQFMT\_XMIT\_Q\_HEADER
- The format name MQFMT\_NONE is a special value that indicates that the nature of the data in the message is undefined. As a consequence, the queue manager does not attempt conversion when the message is retrieved from the queue.

**Note:** If MQGMO\_CONVERT is specified on the MQGET call for a message that has a format name of MQFMT\_NONE, and the character set or encoding of the message differs from that specified in the *MsgDesc* parameter, the message is returned in the *Buffer* parameter (assuming no other errors), but the call completes with completion code MQCC\_WARNING and reason code MQRC\_FORMAT\_ERROR.

You can use MQFMT\_NONE either when the nature of the message data means that it does not require conversion, or when the sending and receiving applications have agreed between themselves the form in which to send the message data.

- All other format names pass the message to a user-written exit for conversion. The exit has the same name as the format, apart from environment-specific additions. User-specified format names must not begin with the letters IBM MQ.

See "Data conversion" on page 2701 for details of the data-conversion exit.

User data in the message can be converted between any supported character sets and encodings. However, be aware that, if the message contains one or more IBM MQ header structures, the message cannot be converted from or to a character set that has double-byte or multi-byte characters for any of the characters that are valid in queue names. Reason code MQRC\_SOURCE\_CCSID\_ERROR or MQRC\_TARGET\_CCSID\_ERROR results if this is attempted, and the message is returned unconverted. Unicode character set UCS-2 is an example of such a character set.

On return from MQGET, the following reason code indicates that the message was converted successfully:

- MQRC\_NONE

The following reason code indicates that the message *might* have been converted successfully; the application must check the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to find out:

- MQRC\_TRUNCATED\_MSG\_ACCEPTED

All other reason codes indicate that the message was not converted.

**Note:** The interpretation of this reason code is true for conversions performed by a user-written exit *only* if the exit conforms to the processing guidelines described in “Data conversion” on page 2701.

9. When using the object-oriented interface to get messages, you can choose not to specify a buffer to hold the message data for an MQGET call. However, in versions of IBM MQ, prior to version 7, it was possible for MQGET to fail with reason code MQRC\_CONVERTED\_MSG\_TOO\_BIG, even when a buffer was not specified. From IBM MQ Version 7, when you get a message using an object-oriented application without restricting the size of the receive message buffer, the application does not fail with MQRC\_CONVERTED\_MSG\_TOO\_BIG, and receives the converted message. This is true of the following environments:
  - .NET, including fully managed applications
  - C++
  - Java ( IBM MQ classes for Java )

**Note:** For all clients, if the value of *sharingConversations* is zero, the channel operates as it did before IBM WebSphere MQ Version 7.0, and message handling reverts to Version 6 behavior. In this situation, if the buffer is too small to receive the converted message, the unconverted message is returned, with reason code MQRC\_CONVERTED\_MSG\_TOO\_BIG. For more information about *sharingConversations*, see Using sharing conversations in a client application.

10. For the built-in formats, the queue manager can perform *default conversion* of character strings in the message when the MQGMO\_CONVERT option is specified. Default conversion allows the queue manager to use an installation-specified default character set that approximates the actual character set, when converting string data. As a result, the MQGET call can succeed with completion code MQCC\_OK, instead of completing with MQCC\_WARNING and reason code MQRC\_SOURCE\_CCSID\_ERROR or MQRC\_TARGET\_CCSID\_ERROR.

**Note:** The result of using an approximate character set to convert string data is that some characters might be converted incorrectly. To avoid this, use characters in the string that are common to both the actual character set and the default character set.

Default conversion applies both to the application message data and to character fields in the MQMD and MQMDE structures:

- Default conversion of the application message data occurs only when *all* the following are true:
    - The application specifies MQGMO\_CONVERT.
    - The message contains data that must be converted either from or to a character set that is not supported.
    - Default conversion was enabled when the queue manager was installed or restarted.
  - Default conversion of the character fields in the MQMD and MQMDE structures occurs as necessary, if default conversion is enabled for the queue manager. The conversion is performed even if the MQGMO\_CONVERT option is not specified by the application on the MQGET call.
11. For the Visual Basic programming language, the following points apply:
    - If the size of the *Buffer* parameter is less than the length specified by the *BufferLength* parameter, the call fails with reason code MQRC\_STORAGE\_NOT\_AVAILABLE.
    - The *Buffer* parameter is declared as being of type String. If the data to be retrieved from the queue is not of type String, use the MQGETAny call in place of MQGET.

The MQGETAny call has the same parameters as the MQGET call, except that the *Buffer* parameter is declared as being of type Any, allowing any type of data to be retrieved. However, this means that *Buffer* cannot be checked to ensure that it is at least *BufferLength* bytes in size.

12. Not all MQGET options are supported when read ahead is enabled. The following table indicated which options are allowed and whether they can be altered between MQGET calls.

Table 247. MQGET options permitted when read ahead is enabled

	Permitted when read ahead is enabled and can be altered between MQGET calls	Permitted when read ahead is enabled but cannot be altered between MQGET calls <sup>a</sup>	MQGET options that are not permitted when read ahead is enabled <sup>b</sup>
MQGET MD values	MsgId <sup>c</sup> CorrelId <sup>c</sup>	Encoding CodedCharSetId	
MQGET MQGMO options	MQGMO_WAIT MQGMO_NO_WAIT MQGMO_FAIL_IF QUIESCING MQGMO_BROWSE_FIRST <sup>d</sup> MQGMO_BROWSE_NEXT <sup>d</sup> MQGMO_BROWSE_MESSAGE _UNDER_CURSOR <sup>d</sup>	MQGMO_SYNCPOINT_IF_PERSISTENT MQGMO_NO_SYNCPOINT MQGMO_ACCEPT_TRUNCATED_MSG MQGMO_CONVERT MQGMO_LOGICAL_ORDER MQGMO_COMPLETE_MSG MQGMO_ALL_MSGS_AVAILABLE MQGMO_ALL_SEGMENTS_AVAILABLE MQGMO_MARK_BROWSE_HANDLE MQGMO_MARK_BROWSE_CO_OP MQGMO_UNMARK_BROWSE_CO_OP MQGMO_UNMARK_BROWSE_HANDLE MQGMO_UNMARKED_BROWSE_MSG MQGMO_PROPERTIES_FORCE_MQRFH2 MQGMO_NO_PROPERTIES MQGMO_PROPERTIES_IN_HANDLE MQGMO_PROPERTIES_COMPATIBILITY	MQGMO_SET_SIGNAL MQGMO_SYNCPOINT MQGMO_MARK_SKIP _BACKOUT MQGMO_MSG_UNDER _CURSOR <sup>d</sup> MQGMO_LOCK MQGMO_UNLOCK
MQGMO values		MsgHandle	

- a. If these options are altered between MQGET calls an MQRC\_OPTIONS\_CHANGED reason code is returned.
  - b. If these options are specified on the first MQGET call then read ahead is disabled. If these options are specified on a subsequent MQGET call a reason code MQRC\_OPTIONS\_ERROR is returned.
  - c. The client applications need to be aware that if the MsgId and CorrelId values are altered between MQGET calls messages with the previous values might have already been sent to the client and remain in the client read ahead buffer until consumed (or automatically purged).
  - d. The first MQGET call determines whether messages are to be browsed or got from a queue when read ahead is enabled. If the application attempts to use a combination of browse and get an MQRC\_OPTIONS\_CHANGED reason code is returned.
  - e. MQGMO\_MSG\_UNDER\_CURSOR is not possible with read ahead. Messages can be browsed or got when read ahead is enabled but not a combination of both.
13. Applications can destructively get uncommitted messages only if those messages are put in the same local unit of work as the get. Applications cannot get uncommitted messages nondestructively.
14. Messages under a browse cursor can be retrieved in a unit of work. It is not possible to retrieve an uncommitted message in this way.

### C invocation

```
MQGET (Hconn, Hobj, &MsgDesc, &GetMsgOpts, BufferLength, Buffer,
      &DataLength, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;          /* Connection handle */
MQHOBJ   Hobj;           /* Object handle */
MQMD     MsgDesc;        /* Message descriptor */
MQGMO    GetMsgOpts;     /* Options that control the action of MQGET */
MQLONG   BufferLength;    /* Length in bytes of the Buffer area */
MQBYTE   Buffer[n];      /* Area to contain the message data */
MQLONG   DataLength;     /* Length of the message */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQGET' USING HCONN, HOBJ, MSGDESC, GETMSGOPTS, BUFFERLENGTH,
BUFFER, DATALENGTH, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN          PIC S9(9) BINARY.
** Object handle
01 HOBJ          PIC S9(9) BINARY.
** Message descriptor
01 MSGDESC.
   COPY CMQMDV.
** Options that control the action of MQGET
01 GETMSGOPTS.
   COPY CMQGMV.
** Length in bytes of the BUFFER area
01 BUFFERLENGTH PIC S9(9) BINARY.
** Area to contain the message data
01 BUFFER        PIC X(n).
** Length of the message
01 DATALENGTH  PIC S9(9) BINARY.
** Completion code
01 COMPCODE     PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON       PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQGET (Hconn, Hobj, MsgDesc, GetMsgOpts, BufferLength, Buffer,
           DataLength, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn          fixed bin(31); /* Connection handle */
dc1 Hobj           fixed bin(31); /* Object handle */
dc1 MsgDesc        like MQMD;    /* Message descriptor */
dc1 GetMsgOpts     like MQGMO;   /* Options that control the action of
                                MQGET */
dc1 BufferLength    fixed bin(31); /* Length in bytes of the Buffer
                                area */
dc1 Buffer          char(n);      /* Area to contain the message data */
dc1 DataLength     fixed bin(31); /* Length of the message */
dc1 CompCode       fixed bin(31); /* Completion code */
dc1 Reason         fixed bin(31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQGET, (HCONN,HOBJ,MSGDESC,GETMSGOPTS,BUFFERLENGTH,
            BUFFER,DATALENGTH,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN          DS      F      Connection handle
HOBJ           DS      F      Object handle
MSGDESC        CMQMDA   ,      Message descriptor
GETMSGOPTS     CMQGMOA  ,      Options that control the action of MQGET
BUFFERLENGTH   DS      F      Length in bytes of the BUFFER area
BUFFER         DS      CL(n)  Area to contain the message data
DATALENGTH     DS      F      Length of the message
COMPCODE       DS      F      Completion code
REASON         DS      F      Reason code qualifying COMPCODE
```

### Visual Basic invocation

```
MQGET Hconn, Hobj, MsgDesc, GetMsgOpts, BufferLength, Buffer,
DataLength, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn      As Long 'Connection handle'
Dim Hobj       As Long 'Object handle'
Dim MsgDesc    As MQMD 'Message descriptor'
```

```

Dim GetMsgOpts As MQGMO 'Options that control the action of MQGET'
Dim BufferLength As Long 'Length in bytes of the Buffer area'
Dim Buffer As String 'Area to contain the message data'
Dim DataLength As Long 'Length of the message'
Dim CompCode As Long 'Completion code'
Dim Reason As Long 'Reason code qualifying CompCode'

```

### MQINQ - Inquire object attributes:

The MQINQ call returns an array of integers and a set of character strings containing the attributes of an object.

The following types of object are valid:

- Queue manager
- Queue
- Namelist
- Process definition

### Syntax

MQINQ (*Hconn*, *Hobj*, *SelectorCount*, *Selectors*, *IntAttrCount*, *IntAttrs*, *CharAttrLength*, *CharAttrs*, *CompCode*, *Reason*)

### Parameters

#### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn*:

#### **MQHC\_DEF\_HCONN**

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

#### **Hobj**

Type: MQHOBJ - input

This handle represents the object (of any type) with attributes that are required. The handle must be returned by a previous MQOPEN call that specified the MQ00\_INQUIRE option.

#### **SelectorCount**

Type: MQLONG - input

This is the count of selectors that are supplied in the *Selectors* array. It is the number of attributes that are to be returned. Zero is a valid value. The maximum number allowed is 256.

#### **Selectors**

Type: MQLONG x *SelectorCount* - input

This is an array of *SelectorCount* attribute selectors; each selector identifies an attribute (integer or character) with a value that is required.

Each selector must be valid for the type of object that *Hobj* represents, otherwise the call fails with completion code MQCC\_FAILED and reason code MQRC\_SELECTOR\_ERROR.

In the special case of queues:

- If the selector is not valid for queues of any type, the call fails with completion code MQCC\_FAILED and reason code MQRC\_SELECTOR\_ERROR.
- If the selector applies only to queues of types other than the type of the object, the call succeeds with completion code MQCC\_WARNING and reason code MQRC\_SELECTOR\_NOT\_FOR\_TYPE.
- If the queue being inquired is a cluster queue, the selectors that are valid depend on how the queue was resolved; see “Usage notes” on page 2506 for further details.

You can specify selectors in any order. Attribute values that correspond to integer attribute selectors (MQIA\_\* selectors) are returned in *IntAttrs* in the same order in which these selectors occur in *Selectors*. Attribute values that correspond to character attribute selectors (MQCA\_\* selectors) are returned in *CharAttrs* in the same order in which those selectors occur. MQIA\_\* selectors can be interleaved with the MQCA\_\* selectors; only the relative order within each type is important.

**Note:**

1. The integer and character attribute selectors are allocated within two different ranges; the MQIA\_\* selectors reside within the range MQIA\_FIRST through MQIA\_LAST, and the MQCA\_\* selectors within the range MQCA\_FIRST through MQCA\_LAST.  
For each range, the constants MQIA\_LAST\_USED and MQCA\_LAST\_USED define the highest value that the queue manager accepts.
2. If all the MQIA\_\* selectors occur first, the same element numbers can be used to address corresponding elements in the *Selectors* and *IntAttrs* arrays.
3. If the *SelectorCount* parameter is zero, *Selectors* is not referred to. In this case, the parameter address passed by programs written in C or S/390 assembler might be null.

The attributes that can be inquired are listed in the following tables. For the MQCA\_\* selectors, the constant that defines the length in bytes of the resulting string in *CharAttrs* is provided in parentheses.

The tables that follow list the selectors, by object, in alphabetical order, as follows:

- Table 248 MQINQ attribute selectors for queues
- Table 249 on page 2497 MQINQ attribute selectors for namelists
- Table 250 on page 2498 MQINQ attribute selectors for process definitions
- Table 251 on page 2498 MQINQ attribute selectors for the queue manager

All selectors are supported on all IBM MQ platforms, except where indicated in the **Note** column as follows:

**Not z/OS**

Supported on all platforms **except** z/OS

**z/OS** Supported **only** on z/OS

Table 248. MQINQ attribute selectors for queues

Selector	Length of field	Description	Note
MQCA_ALTERATION_DATE	MQ_DATE_LENGTH	Date of most-recent alteration	
MQCA_ALTERATION_TIME	MQ_TIME_LENGTH	Time of most-recent alteration	
MQCA_BACKOUT_REQ_Q_NAME	MQ_Q_NAME_LENGTH	Excessive backout requeue name	
MQCA_BASE_Q_NAME	MQ_Q_NAME_LENGTH	Name of queue that alias resolves to	
MQCA_CF_STRUC_NAME	MQ_CF_STRUC_NAME_LENGTH	Coupling-facility structure name	z/OS
MQCA_CLUS_CHL_NAME	MQ_CHANNEL_NAME_LENGTH	Name of the cluster-sender channel that uses this queue as a transmission queue.	
MQCA_CLUSTER_NAME	MQ_CLUSTER_NAME_LENGTH	Cluster name	

Table 248. MQINQ attribute selectors for queues (continued)

Selector	Length of field	Description	Note
MQCA_CLUSTER_NAMELIST	MQ_NAMELIST_NAME_LENGTH	Cluster namelist	
MQCA_CREATION_DATE	MQ_CREATION_DATE_LENGTH	Queue creation date	
MQCA_CREATION_TIME	MQ_CREATION_TIME_LENGTH	Queue creation time	
MQCA_INITIATION_Q_NAME	MQ_Q_NAME_LENGTH	Initiation queue name	
MQCA_PROCESS_NAME	MQ_PROCESS_NAME_LENGTH	Name of process definition	
MQCA_Q_DESC	MQ_Q_DESC_LENGTH	Queue description	
MQCA_Q_NAME	MQ_Q_NAME_LENGTH	Queue name	
MQCA_REMOTE_Q_MGR_NAME	MQ_Q_MGR_NAME_LENGTH	Name of remote queue manager	
MQCA_REMOTE_Q_NAME	MQ_Q_NAME_LENGTH	Name of remote queue as known on remote queue manager	
MQCA_STORAGE_CLASS	MQ_STORAGE_CLASS_LENGTH	Name of storage class	z/OS
MQCA_TRIGGER_DATA	MQ_TRIGGER_DATA_LENGTH	Trigger data	
MQCA_XMIT_Q_NAME	MQ_Q_NAME_LENGTH	Transmission queue name	
MQIA_ACCOUNTING_Q	MQLONG	Controls collection of accounting data for queue	Not z/OS
MQIA_BACKOUT_THRESHOLD	MQLONG	Backout threshold	
MQIA_CLWL_Q_PRIORITY	MQLONG	Priority of queue	
MQIA_CLWL_Q_RANK	MQLONG	Rank of queue	
MQIA_CLWL_USEQ	MQLONG	Use remote queues	
MQIA_CURRENT_Q_DEPTH	MQLONG	Number of messages on queue	
MQIA_DEF_BIND	MQLONG	Default binding	
MQIA_DEF_INPUT_OPEN_OPTION	MQLONG	Default open-for-input option	
MQIA_DEF_PERSISTENCE	MQLONG	Default message persistence	
MQIA_DEF_PRIORITY	MQLONG	Default message priority	
MQIA_DEFINITION_TYPE	MQLONG	Queue definition type	
MQIA_DIST_LISTS	MQLONG	Distribution list support	Not z/OS
MQIA_HARDEN_GET_BACKOUT	MQLONG	Whether to harden backout count	
MQIA_INDEX_TYPE	MQLONG	Type of index maintained for queue	z/OS
MQIA_INHIBIT_GET	MQLONG	Whether get operations are allowed	
MQIA_INHIBIT_PUT	MQLONG	Whether put operations are allowed	
MQIA_MAX_MSG_LENGTH	MQLONG	Maximum message length	
MQIA_MAX_Q_DEPTH	MQLONG	Maximum number of messages allowed on queue	
MQIA_MSG_DELIVERY_SEQUENCE	MQLONG	Whether message priority is relevant	
MQIA_NPM_CLASS	MQLONG	Level of reliability for nonpersistent messages	
MQIA_OPEN_INPUT_COUNT	MQLONG	Number of MQOPEN calls that have the queue open for input	
MQIA_OPEN_OUTPUT_COUNT	MQLONG	Number of MQOPEN calls that have the queue open for output	
MQIA_PROPERTY_CONTROL	MQLONG	Property control attribute	

Table 248. MQINQ attribute selectors for queues (continued)

Selector	Length of field	Description	Note
MQIA_Q_DEPTH_HIGH_EVENT	MQLONG	Control attribute for queue depth high events	Not z/OS
MQIA_Q_DEPTH_HIGH_LIMIT	MQLONG	High limit for queue depth	Not z/OS
MQIA_Q_DEPTH_LOW_EVENT	MQLONG	Control attribute for queue depth low events	Not z/OS
MQIA_Q_DEPTH_LOW_LIMIT	MQLONG	Low limit for queue depth	Not z/OS
MQIA_Q_DEPTH_MAX_EVENT	MQLONG	Control attribute for queue depth max events	Not z/OS
MQIA_Q_SERVICE_INTERVAL	MQLONG	Limit for queue service interval	Not z/OS
MQIA_Q_SERVICE_INTERVAL_EVENT	MQLONG	Control attribute for queue service interval events	Not z/OS
MQIA_Q_TYPE	MQLONG	Queue type	
MQIA_QSG_DISP	MQLONG	Queue-sharing group disposition	z/OS
MQIA_RETENTION_INTERVAL	MQLONG	Queue retention interval	
MQIA_SCOPE	MQLONG	Queue definition scope	Not z/OS
MQIA_SHAREABILITY	MQLONG	Whether queue can be shared for input	
MQIA_STATISTICS_Q	MQLONG	Controls collection of statistics data for queue	Not z/OS
MQIA_TRIGGER_CONTROL	MQLONG	Trigger control	
MQIA_TRIGGER_DEPTH	MQLONG	Trigger depth	
MQIA_TRIGGER_MSG_PRIORITY	MQLONG	Threshold message priority for triggers	
MQIA_TRIGGER_TYPE	MQLONG	Trigger type	
MQIA_USAGE	MQLONG	Usage	

Table 249. MQINQ attribute selectors for namelists

Selector	Length of field	Description	Note
MQCA_ALTERATION_DATE	MQ_DATE_LENGTH	Date of most-recent alteration	
MQCA_ALTERATION_TIME	MQ_TIME_LENGTH	Time of most-recent alteration	
MQCA_NAMELIST_DESC	MQ_NAMELIST_DESC_LENGTH	Namelist description	
MQCA_NAMELIST_NAME	MQ_NAMELIST_NAME_LENGTH	Name of namelist object	
MQIA_NAMELIST_TYPE	MQLONG	Namelist type	z/OS
MQCA_NAMES	MQ_Q_NAME_LENGTH x Number of names in the list	Names in the namelist	
MQIA_NAME_COUNT	MQLONG	Number of names in the namelist	
MQIA_QSG_DISP	MQLONG	Queue-sharing group disposition	z/OS

Table 250. MQINQ attribute selectors for process definitions

Selector	Length of field	Description	Note
MQCA_ALTERATION_DATE	MQ_DATE_LENGTH	Date of most-recent alteration	
MQCA_ALTERATION_TIME	MQ_TIME_LENGTH	Time of most-recent alteration	
MQCA_APPL_ID	MQ_PROCESS_APPL_ID_LENGTH	Application identifier	
MQCA_ENV_DATA	MQ_PROCESS_ENV_DATA_LENGTH	Environment data	
MQCA_PROCESS_DESC	MQ_PROCESS_DESC_LENGTH	Description of process definition	
MQCA_PROCESS_NAME	MQ_PROCESS_NAME_LENGTH	Name of process definition	
MQCA_USER_DATA	MQ_PROCESS_USER_DATA_LENGTH	User data	
MQIA_APPL_TYPE	MQLONG	Application type	
MQIA_QSG_DISP	MQLONG	Queue-sharing group disposition	z/OS

Table 251. MQINQ attribute selectors for the queue manager

Selector	Length of field	Description	Note
MQCA_ALTERATION_DATE	MQ_DATE_LENGTH	Date of most-recent alteration	
MQCA_ALTERATION_TIME	MQ_TIME_LENGTH	Time of most-recent alteration	
MQCA_CHANNEL_AUTO_DEF_EXIT	MQ_EXIT_NAME_LENGTH	Automatic channel definition exit name	
MQCA_CHINIT_SERVICE_PARM		Reserved for use by IBM	
MQCA_CLUSTER_WORKLOAD_DATA	MQ_EXIT_DATA_LENGTH	Data passed to cluster workload exit	
MQCA_CLUSTER_WORKLOAD_EXIT	MQ_EXIT_NAME_LENGTH	Name of cluster workload exit	
MQCA_COMMAND_INPUT_Q_NAME	MQ_Q_NAME_LENGTH	System command input queue name	
MQCA_DEAD_LETTER_Q_NAME	MQ_Q_NAME_LENGTH	Name of dead-letter queue	
MQCA_DEF_XMIT_Q_NAME	MQ_Q_NAME_LENGTH	Default transmission queue name	
MQCA_DNS_GROUP	MQ_DNS_GROUP_NAME_LENGTH	Name of the group for the TCP listener that handles inbound transmissions for the queue-sharing group to join. The name applies when using Workload Manager Dynamic Domain Name Services.	z/OS
MQCA_IGQ_USER_ID	MQ_USER_ID_LENGTH	Intra-group queuing user identifier	z/OS
MQCA_INSTALLATION_DESC	MQ_INSTALLATION_DESC_LENGTH	Description of the associated installation	Not z/OS. Not IBM i
MQCA_INSTALLATION_NAME	MQ_INSTALLATION_NAME_LENGTH	Name of the installation associated with the queue manager	Not z/OS. Not IBM i
MQCA_INSTALLATION_PATH	MQ_INSTALLATION_PATH_LENGTH	Path where the associated IBM MQ is installed	Not z/OS. Not IBM i
MQCA_LU_GROUP_NAME	MQ_LU_NAME_LENGTH	Generic LU name for the LU 6.2 listener that handles inbound transmissions for the queue-sharing group to use	z/OS

Table 251. MQINQ attribute selectors for the queue manager (continued)

Selector	Length of field	Description	Note
MQCA_LU_NAME	MQ_LU_NAME_LENGTH	Name of the LU to use for outbound LU 6.2 transmissions. Set this name to the same LU that the listener uses for inbound transmissions	z/OS
MQCA_LU62_ARM_SUFFIX	MQ_ARM_SUFFIX_LENGTH	Suffix of the SYS1.PARMLIB member APPCPM <i>xx</i> , that nominates the LUADD for this channel initiator	z/OS
MQCA_PARENT	MQ_Q_MGR_NAME_LENGTH	Name of a hierarchically connected queue manager that is nominated as the parent of this queue manager	
MQCA_Q_MGR_DESC	MQ_Q_MGR_DESC_LENGTH	Queue manager description	
MQCA_Q_MGR_IDENTIFIER	MQ_Q_MGR_IDENTIFIER_LENGT	Queue-manager identifier (H)	
MQCA_Q_MGR_NAME	MQ_Q_MGR_NAME_LENGTH	Name of local queue manager	
MQCA_QSG_NAME	MQ_QSG_NAME_LENGTH	Queue-sharing group name	z/OS
MQCA_REPOSITORY_NAME	MQ_CLUSTER_NAME_LENGTH	Name of cluster for which queue manager provides repository services	
MQCA_REPOSITORY_NAMELIST	MQ_NAMELIST_NAME_LENGTH	Name of namelist object containing names of clusters for which queue manager provides repository services	
MQCA_TCP_NAME	MQ_TCP_NAME_LENGTH	Name of the TCP/IP system that you are using	z/OS
MQIA_ACCOUNTING_CONN_OVERRIDE	MQLONG	Override accounting settings	Not z/OS
MQIA_ACCOUNTING_INTERVAL	MQLONG	How often to write intermediate accounting records	Not z/OS
MQIA_ACCOUNTING_MQI	MQLONG	Controls collection of accounting information for MQI data	Not z/OS
MQIA_ACCOUNTING_Q	MQLONG	Controls collection of accounting information for queues	Not z/OS
MQIA_ACTIVE_CHANNELS	MQLONG	Maximum number of channels that can be active at any time	z/OS
MQIA_ADOPTNEWMCA_CHECK	MQLONG	Elements that are checked to determine whether to adopt an MCA. The check is performed when a new inbound channel is detected that has the same name as an MCA that is already active.	z/OS
MQIA_ADOPTNEWMCA_INTERVAL	MQLONG	Amount of time, in seconds, that the new channel waits for the orphaned channel to end	Not z/OS
MQIA_ADOPTNEWMCA_TYPE	MQLONG	Whether to restart an orphaned instance of an MCA of a particular channel type automatically when a new inbound channel request matching the AdoptNewMCACheck parameters is detected	z/OS
MQIA_AUTHORITY_EVENT	MQLONG	Control attribute for authority events	Not z/OS
MQIA_BRIDGE_EVENT	MQLONG	Control attribute for IMS bridge events	z/OS

Table 251. MQINQ attribute selectors for the queue manager (continued)

Selector	Length of field	Description	Note
MQIA_CHANNEL_AUTO_DEF	MLONG	Control attribute for automatic channel definition	Not z/OS
MQIA_CHANNEL_AUTO_DEF_EVENT	MLONG	Control attribute for automatic channel definition events	Not z/OS
MQIA_CHANNEL_EVENT	MLONG	Control attribute for channel events	
MQIA_CHINIT_ADAPTERS	MLONG	Number of adapter subtasks to use for processing IBM MQ calls	z/OS
MQIA_CHINIT_DISPATCHERS	MLONG	Number of dispatchers to use for the channel initiator	z/OS
MQIA_CHINIT_TRACE_AUTO_START	MLONG	Whether to start channel initiator trace automatically	z/OS
MQIA_CHINIT_TRACE_TABLE_SIZE	MLONG	Size of the trace data space (in MB) of the channel initiator	z/OS
MQIA_CLUSTER_WORKLOAD_LENGTH	MLONG	Cluster workload length.	
MQIA_CLWL_MRU_CHANNELS	MLONG	Number of most recently used channels for cluster workload balancing	
MQIA_CLWL_USEQ	MLONG	Use remote queues	
MQIA_CODED_CHAR_SET_ID	MLONG	Coded character set identifier	
MQIA_COMMAND_EVENT	MLONG	Control attribute for command events	
MQIA_COMMAND_LEVEL	MLONG	Command level supported by queue manager	
MQIA_CONFIGURATION_EVENT	MLONG	Control attribute for configuration events	Not z/OS
MQIA_DEF_CLUSTER_XMIT_Q_TYPE	MLONG	Default transmission queue type to be used for cluster-sender channels.	
MQIA_DIST_LISTS	MLONG	Distribution list support	Not z/OS
MQIA_DNS_WLM	MLONG	Whether the TCP listener that handles inbound transmissions for the queue-sharing group registers with Workload Manager for Dynamic Domain Name Services	z/OS
MQIA_EXPIRY_INTERVAL	MLONG	Interval between scans for expired messages	z/OS
MQIA_GROUP_UR	MLONG	Control attribute for whether GROUP units of recovery are enabled for this queue manager. The GROUP unit of recovery disposition is only available if the queue manager is a member of a queue-sharing group	z/OS
MQIA_IGQ_PUT_AUTHORITY	MLONG	Intra-group queuing put authority	z/OS
MQIA_INHIBIT_EVENT	MLONG	Control attribute for inhibit events	Not z/OS
MQIA_INTRA_GROUP_queuing	MLONG	Intra-group queuing support	z/OS
MQIA_LISTENER_TIMER	MLONG	Time interval (in seconds) between IBM MQ attempts to restart the listener if APPC or TCP/IP failed.	z/OS

Table 251. MQINQ attribute selectors for the queue manager (continued)

Selector	Length of field	Description	Note
MQIA_LOCAL_EVENT	MLONG	Control attribute for local events	Not z/OS
MQIA_LOGGER_EVENT	MLONG	Control attribute for inhibit events	Not z/OS
MQIA_LU62_CHANNELS	MLONG	Maximum number of channels that can be current, or clients that can be connected, using the LU 6.2 transmission protocol	z/OS
MQIA_MSG_MARK_BROWSE_INTERVAL	MLONG	Time interval (in milliseconds) after which the queue manager can automatically remove a mark from browse messages	
MQIA_MAX_CHANNELS	MLONG	Maximum number of channels that can be current (including server-connection channels with connected clients)	z/OS
MQIA_MAX_HANDLES	MLONG	Maximum number of handles	
MQIA_MAX_MSG_LENGTH	MLONG	Maximum message length	
MQIA_MAX_PRIORITY	MLONG	Maximum priority	
MQIA_MAX_UNCOMMITTED_MSGS	MLONG	Maximum number of uncommitted messages within a unit of work	
MQIA_OUTBOUND_PORT_MAX	MLONG	With MQIA_OUTBOUND_PORT_MIN, defines range of port numbers to use when binding outgoing channels	z/OS
MQIA_OUTBOUND_PORT_MIN	MLONG	With MQIA_OUTBOUND_PORT_MAX, defines range of port numbers to use when binding outgoing channels	z/OS
MQIA_PERFORMANCE_EVENT	MLONG	Control attribute for performance events	Not z/OS
MQIA_PLATFORM	MLONG	Platform on which the queue manager resides	
MQIA_PROT_POLICY_CAPABILITY	MLONG	Indicates whether security capabilities of IBM MQ Advanced Message Security are available for a queue manager.	
MQIA_PUBSUB_MAXMSG_RETRY_COUNT	MLONG	The number of attempts to reprocess a failed command message under sync point	
MQIA_PUBSUB_MODE	MLONG	Whether the publish/subscribe engine and the queued publish/subscribe interface are running. Applications to publish or subscribe using the application programming interface require the publish/subscribe engine. Queues that are monitored by the queued publish/subscribe interface require the queued publish/subscribe interface to be running.	
MQIA_PUBSUB_NP_MSG	MLONG	Whether to discard (or keep) an undelivered input message	
MQIA_PUBSUB_NP_RESP	MLONG	Controls the behavior of undelivered response messages	

Table 251. MQINQ attribute selectors for the queue manager (continued)

Selector	Length of field	Description	Note
MQIA_PUBSUB_SYNC_PT	MLONG	Whether only persistent (or all) messages are processed under sync point	
MQIA_QMGR_CFCNLOS	MLONG	Specifies the action to be taken when the queue manager loses connectivity to the administration structure or any CF structures with CFCNLOS set to ASQMGR	z/OS
MQIA_RECEIVE_TIMEOUT	MLONG	Approximately how long a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state. The value is numeric, qualified by MQIA_RECEIVE_TIMEOUT_TYPE.	z/OS
MQIA_RECEIVE_TIMEOUT_MIN	MLONG	Minimum time that a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state	z/OS
MQIA_RECEIVE_TIMEOUT_TYPE	MLONG	Approximately how long a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state. MQIA_RECEIVE_TIMEOUT_TYPE is the qualifier applied to MQIA_RECEIVE_TIMEOUT.	z/OS
MQIA_REMOTE_EVENT	MLONG	Control attribute for remote events	Not z/OS
MQIA_SECURITY_CASE	MLONG	Case of security profiles	z/OS
MQIA_SSL_EVENT	MLONG	Control attribute for channel events	
MQIA_SSL_FIPS_REQUIRED	MLONG	Use only FIPS-certified algorithms for cryptography	
MQIA_SSL_RESET_COUNT	MLONG	SSL key reset count	
MQIA_START_STOP_EVENT	MLONG	Control attribute for start stop events	Not z/OS
MQIA_STATISTICS_AUTO_CLUSSDR	MLONG	Controls collection of statistics monitoring information for cluster sender channels	
MQIA_STATISTICS_CHANNEL	MLONG	Controls collection of statistics data for channels	
MQIA_STATISTICS_INTERVAL	MLONG	How often to write statistics monitoring data	Not z/OS
MQIA_STATISTICS_MQI	MLONG	Controls collection of statistics monitoring information for queue manager	Not z/OS
MQIA_STATISTICS_Q	MLONG	Controls collection of statistics data for queues	Not z/OS
MQIA_SYNCPOINT	MLONG	sync point availability	
MQIA_TCP_CHANNELS	MLONG	Maximum number of channels that can be current, or clients that can be connected, using the TCP/IP transmission protocol	z/OS

Table 251. MQINQ attribute selectors for the queue manager (continued)

Selector	Length of field	Description	Note
MQIA_TCP_KEEP_ALIVE	MLONG	Whether to use the TCP KEEPALIVE facility to check that the other end of the connection is still available	z/OS
MQIA_TCP_STACK_TYPE	MLONG	Whether the channel initiator can use only the TCP/IP address space specified in TCPNAME, or can optionally bind to any selected TCP/IP address	z/OS
MQIA_TRACE_ROUTE_RECORDING	MLONG	Controls recording of trace-route information	z/OS
MQIA_TREE_LIFE_TIME	MLONG	Lifetime of unused non-administrative topics	
MQIA_TRIGGER_INTERVAL	MLONG	Trigger interval	

### **IntAttrCount**

Type: MLONG - input

This is the number of elements in the *IntAttrs* array. Zero is a valid value.

If *IntAttrCount* is at least the number of MQIA\_\* selectors in the *Selectors* parameter, all integer attributes requested are returned.

### **IntAttrs**

Type: MLONG x *IntAttrCount* - output

This is an array of *IntAttrCount* integer attribute values.

Integer attribute values are returned in the same order as the MQIA\_\* selectors in the *Selectors* parameter. If the array contains more elements than the number of MQIA\_\* selectors, the excess elements are unchanged.

If *Hobj* represents a queue, but an attribute selector does not apply to that type of queue, the specific value MQIAV\_NOT\_APPLICABLE is returned. It is returned for the corresponding element in the *IntAttrs* array.

If the *IntAttrCount* or *SelectorCount* parameter is zero, *IntAttrs* is not referred to. In this case, the parameter address passed by programs written in C or S/390 assembler might be null.

### **CharAttrLength**

Type: MLONG - input

This is the length in bytes of the *CharAttrs* parameter.

*CharAttrLength* must be at least the sum of the lengths of the requested character attributes (see *Selectors* ). Zero is a valid value.

### **CharAttrs**

Type: MQCHAR x *CharAttrLength* - output

This is the buffer in which the character attributes are returned, concatenated together. The length of the buffer is given by the *CharAttrLength* parameter.

Character attributes are returned in the same order as the MQCA\_\* selectors in the *Selectors* parameter. The length of each attribute string is fixed for each attribute (see *Selectors* ), and the value in it is padded to the right with blanks if necessary. You can provide a buffer larger than needed to contain all the requested character attributes and padding. The bytes beyond the last attribute value returned are unchanged.

If *Hobj* represents a queue, but an attribute selector does not apply to that type of queue, a character string consisting entirely of asterisks (\*) is returned. The asterisk is returned as the value of that attribute in *CharAttrs*.

If the *CharAttrLength* or *SelectorCount* parameter is zero, *CharAttrs* is not referred to. In this case, the parameter address passed by programs written in C or S/390 assembler might be null.

### **CompCode**

Type: MQLONG - output

The completion code:

#### **MQCC\_OK**

Successful completion.

#### **MQCC\_WARNING**

Warning (partial completion).

#### **MQCC\_FAILED**

Call failed.

### **Reason**

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

( 0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

#### **MQRC\_CHAR\_ATTRS\_TOO\_SHORT**

( 2008, X'7D8') Not enough space allowed for character attributes.

#### **MQRC\_INT\_ATTR\_COUNT\_TOO\_SMALL**

( 2022, X'7E6') Not enough space allowed for integer attributes.

#### **MQRC\_SELECTOR\_NOT\_FOR\_TYPE**

( 2068, X'814') Selector not applicable to queue type.

If *CompCode* is MQCC\_FAILED:

#### **MQRC\_ADAPTER\_NOT\_AVAILABLE**

( 2204, X'89C') Adapter not available.

#### **MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

( 2130, X'852') Unable to load adapter service module.

#### **MQRC\_API\_EXIT\_ERROR**

( 2374, X'946') API exit failed.

#### **MQRC\_API\_EXIT\_LOAD\_ERROR**

( 2183, X'887') Unable to load API exit.

#### **MQRC\_ASID\_MISMATCH**

( 2157, X'86D') Primary and home ASIDs differ.

#### **MQRC\_CALL\_IN\_PROGRESS**

( 2219, X'8AB') MQI call entered before previous call complete.

#### **MQRC\_CF\_STRUC\_FAILED**

( 2373, X'945') Coupling-facility structure failed.

#### **MQRC\_CF\_STRUC\_IN\_USE**

( 2346, X'92A') Coupling-facility structure in use.

**MQRC\_CHAR\_ATTR\_LENGTH\_ERROR**  
( 2006, X'7D6' ) Length of character attributes not valid.

**MQRC\_CHAR\_ATTRS\_ERROR**  
( 2007, X'7D7' ) Character attributes string not valid.

**MQRC\_CICS\_WAIT\_FAILED**  
( 2140, X'85C' ) Wait request rejected by CICS.

**MQRC\_CONNECTION\_BROKEN**  
( 2009, X'7D9' ) Connection to queue manager lost.

**MQRC\_CONNECTION\_NOT\_AUTHORIZED**  
( 2217, X'8A9' ) Not authorized for connection.

**MQRC\_CONNECTION\_STOPPING**  
( 2203, X'89B' ) Connection shutting down.

**MQRC\_HCONN\_ERROR**  
( 2018, X'7E2' ) Connection handle not valid.

**MQRC\_HOBJ\_ERROR**  
( 2019, X'7E3' ) Object handle not valid.

**MQRC\_INT\_ATTR\_COUNT\_ERROR**  
( 2021, X'7E5' ) Count of integer attributes not valid.

**MQRC\_INT\_ATTRS\_ARRAY\_ERROR**  
( 2023, X'7E7' ) Integer attributes array not valid.

**MQRC\_NOT\_OPEN\_FOR\_INQUIRE**  
( 2038, X'7F6' ) Queue not open for inquire.

**MQRC\_OBJECT\_CHANGED**  
( 2041, X'7F9' ) Object definition changed since opened.

**MQRC\_OBJECT\_DAMAGED**  
( 2101, X'835' ) Object damaged.

**MQRC\_PAGESET\_ERROR**  
( 2193, X'891' ) Error accessing page-set data set.

**MQRC\_Q\_DELETED**  
( 2052, X'804' ) Queue deleted.

**MQRC\_Q\_MGR\_NAME\_ERROR**  
( 2058, X'80A' ) Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**  
( 2059, X'80B' ) Queue manager not available for connection.

**MQRC\_Q\_MGR\_STOPPING**  
( 2162, X'872' ) Queue manager shutting down.

**MQRC\_RESOURCE\_PROBLEM**  
( 2102, X'836' ) Insufficient system resources available.

**MQRC\_SELECTOR\_COUNT\_ERROR**  
( 2065, X'811' ) Count of selectors not valid.

**MQRC\_SELECTOR\_ERROR**  
( 2067, X'813' ) Attribute selector not valid.

**MQRC\_SELECTOR\_LIMIT\_EXCEEDED**  
( 2066, X'812' ) Count of selectors too large.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

( 2071, X'817') Insufficient storage available.

**MQRC\_SUPPRESSED\_BY\_EXIT**

( 2109, X'83D') Call suppressed by exit program.

**MQRC\_UNEXPECTED\_ERROR**

( 2195, X'893') Unexpected error occurred.

For detailed information about these codes; see Reason codes

**Usage notes**

1. The values returned are a snapshot of the selected attributes. There is no guarantee that the attributes remain the same before the application can act upon the returned values.

2. When you open a model queue, a dynamic local queue is created. A dynamic local queue is created even if you open the model queue to inquire about its attributes.

The attributes of the dynamic queue are largely the same as the attributes of the model queue at the time that the dynamic queue is created. If you then use the MQINQ call on this queue, the queue manager returns the attributes of the dynamic queue, and not the attributes of the model queue. See Table 254 on page 2627 for details of which attributes of the model queue are inherited by the dynamic queue.

3. If the object being inquired is an alias queue, the attribute values returned by the MQINQ call are the attributes of the alias queue. They are not the attributes of the base queue or topic to which the alias resolves.

4. If the object being inquired is a cluster queue, the attributes that can be inquired depend on how the queue is opened:

- You can open a cluster queue for inquire plus one or more of the input, browse, or set operations. To do so, there must be a local instance of the cluster queue for the open to succeed. In this case, the attributes that can be inquired are the attributes that are valid for local queues.
- If the cluster queue is opened for inquire alone, or inquire and output, only the attributes listed can be inquired. The *QType* attribute has the value MQQT\_CLUSTER in this case:

- MQCA\_Q\_DESC
- MQCA\_Q\_NAME
- MQIA\_DEF\_BIND
- MQIA\_DEF\_PERSISTENCE
- MQIA\_DEF\_PRIORITY
- MQIA\_INHIBIT\_PUT
- MQIA\_Q\_TYPE

You can open the cluster queue with no fixed binding. You can open it with MQ00\_BIND\_NOT\_FIXED specified on the MQOPEN call. Alternatively, specify MQ00\_BIND\_AS\_Q\_DEF, and set the *DefBind* attribute of the queue to MQBND\_BIND\_NOT\_FIXED. If you open a cluster queue with no fixed binding, successive MQINQ calls for the queue might inquire different instances of the cluster queue. However, it is typical for all the instances have the same attribute values.

- An alias queue object can be defined for a cluster. Because TARGTYPE and TARGET are not cluster attributes, the process performing an MQOPEN process on the alias queue is not aware of the object to which the alias resolves.

During the initial MQOPEN, the alias queue resolves to a queue manager and a queue in the cluster. Name resolution takes place again at the remote queue manager and it is here that the TARGTYPE of the alias queue is resolved.

If the alias queue resolves to a topic alias, then publication of messages put to the alias queue takes place at this remote queue manager.

See Cluster queues

5. You might want to inquire a number of attributes, and then set some of them using the MQSET call. To program inquire and set efficiently, position the attributes to be set at the beginning of the selector arrays. If you do so, the same arrays with reduced counts can be used for MQSET.
6. If more than one of the warning situations arise (see the *CompCode* parameter), the reason code returned is the first one in the following list that applies:
  - a. MQRC\_SELECTOR\_NOT\_FOR\_TYPE
  - b. MQRC\_INT\_ATTR\_COUNT\_TOO\_SMALL
  - c. MQRC\_CHAR\_ATTRS\_TOO\_SHORT
7. The following topic have information about object attributes:
  - “Attributes for queues” on page 2625
  - “Attributes for namelists” on page 2661
  - “Attributes for process definitions” on page 2664
  - “Attributes for the queue manager” on page 2586

### C invocation

```
MQINQ (Hconn, Hobj, SelectorCount, Selectors, IntAttrCount, IntAttrs,
      CharAttrLength, CharAttrs, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;           /* Connection handle */
MQHOBJ   Hobj;           /* Object handle */
MQLONG   SelectorCount;  /* Count of selectors */
MQLONG   Selectors[n];   /* Array of attribute selectors */
MQLONG   IntAttrCount;   /* Count of integer attributes */
MQLONG   IntAttrs[n];    /* Array of integer attributes */
MQLONG   CharAttrLength; /* Length of character attributes buffer */
MQCHAR   CharAttrs[n];   /* Character attributes */
MQLONG   CompCode;       /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQINQ' USING HCONN, HOBJ, SELECTORCOUNT, SELECTORS-TABLE,
                  INTATTRCOUNT, INTATTRS-TABLE, CHARATTRLENGTH,
                  CHARATTRS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN          PIC S9(9) BINARY.
** Object handle
01 HOBJ          PIC S9(9) BINARY.
** Count of selectors
01 SELECTORCOUNT PIC S9(9) BINARY.
** Array of attribute selectors
01 SELECTORS-TABLE.
02 SELECTORS     PIC S9(9) BINARY OCCURS n TIMES.
** Count of integer attributes
01 INTATTRCOUNT PIC S9(9) BINARY.
** Array of integer attributes
01 INTATTRS-TABLE.
02 INTATTRS     PIC S9(9) BINARY OCCURS n TIMES.
** Length of character attributes buffer
01 CHARATTRLENGTH PIC S9(9) BINARY.
** Character attributes
01 CHARATTRS     PIC X(n).
** Completion code
01 COMPCODE      PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON        PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQINQ (Hconn, Hobj, SelectorCount, Selectors, IntAttrCount,  
           IntAttrs, CharAttrLength, CharAttrs, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn          fixed bin(31); /* Connection handle */  
dc1 Hobj           fixed bin(31); /* Object handle */  
dc1 SelectorCount  fixed bin(31); /* Count of selectors */  
dc1 Selectors(n)   fixed bin(31); /* Array of attribute selectors */  
dc1 IntAttrCount   fixed bin(31); /* Count of integer attributes */  
dc1 IntAttrs(n)    fixed bin(31); /* Array of integer attributes */  
dc1 CharAttrLength fixed bin(31); /* Length of character attributes  
                                buffer */  
  
dc1 CharAttrs      char(n);      /* Character attributes */  
dc1 CompCode       fixed bin(31); /* Completion code */  
dc1 Reason         fixed bin(31); /* Reason code qualifying  
                                CompCode */
```

## High Level Assembler invocation

```
CALL MQINQ,(HCONN,HOBJ,SELETCOUNT,SELECTORS,INTATTRCOUNT, X  
           INTATTRS,CHARATTRLENGTH,CHARATTRS,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN      DS F      Connection handle  
HOBJ       DS F      Object handle  
SELETCOUNT DS F      Count of selectors  
SELECTORS  DS (n)F   Array of attribute selectors  
INTATTRCOUNT DS F   Count of integer attributes  
INTATTRS   DS (n)F   Array of integer attributes  
CHARATTRLENGTH DS F   Length of character attributes buffer  
CHARATTRS  DS CL(n)  Character attributes  
COMPCODE   DS F      Completion code  
REASON     DS F      Reason code qualifying COMPCODE
```

## Visual Basic invocation

```
MQINQ Hconn, Hobj, SelectorCount, Selectors, IntAttrCount, IntAttrs,  
      CharAttrLength, CharAttrs, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn          As Long 'Connection handle'  
Dim Hobj           As Long 'Object handle'  
Dim SelectorCount  As Long 'Count of selectors'  
Dim Selectors      As Long 'Array of attribute selectors'  
Dim IntAttrCount   As Long 'Count of integer attributes'  
Dim IntAttrs       As Long 'Array of integer attributes'  
Dim CharAttrLength As Long 'Length of character attributes buffer'  
Dim CharAttrs      As String 'Character attributes'  
Dim CompCode       As Long 'Completion code'  
Dim Reason         As Long 'Reason code qualifying CompCode'
```

## MQINQMP - Inquire message property:

The MQINQMP call returns the value of a property of a message.

### Syntax

MQINQMP (*Hconn*, *Hmsg*, *InqPropOpts*, *Name*, *PropDesc*, *Type*, *ValueLength*, *Value*, *DataLength*, *CompCode*, *Reason*)

### Parameters

#### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC\_UNASSOCIATED\_HCONN then a valid connection must be established on the thread inquiring a property of the message handle otherwise the call fails with MQRC\_CONNECTION\_BROKEN.

#### **Hmsg**

Type: MQHMSG - input

This is the message handle to be inquired. The value was returned by a previous MQCRTMH call.

#### **InqPropOpts**

Type: MQIMPO - input/output

See the MQIMPO data type for details.

#### **Name**

Type: MQCHARV - input/output

The name of the property to inquire.

If no property with this name can be found, the call fails with reason MQRC\_PROPERTY\_NOT\_AVAILABLE.

You can use the wildcard character percent sign (%) at the end of the property name. The wildcard matches zero or more characters, including the period (.) character. This allows an application to inquire the value of many properties. Call MQINQMP with option MQIMPO\_INQ\_FIRST to get the first matching property and again with the option MQIMPO\_INQ\_NEXT to get the next matching property. When no more matching properties are available, the call fails with MQRC\_PROPERTY\_NOT\_AVAILABLE. If the *ReturnedName* field of the InqPropOpts structure is initialized with an address or offset for the returned name of the property, this is completed on return from MQINQMP with the name of the property that has been matched. If the *VSBufSize* field of the *ReturnedName* in the InqPropOpts structure is less than the length of the returned property name the completion code is set MQCC\_FAILED with reason MQRC\_PROPERTY\_NAME\_TOO\_BIG.

Properties that have known synonyms are returned as follows:

1. Properties with the prefix "mqps." are returned as the IBM MQ property name. For example, "MQTopicString" is the returned name rather than "mqps.Top"
2. Properties with the prefix "jms." or "mcd." are returned as the JMS header field name, for example, "JMSExpiration" is the returned name rather than "jms.Exp".
3. Properties with the prefix "usr." are returned without that prefix, for example, "Color" is returned rather than "usr.Color".

Properties with synonyms are only returned once.

In the C programming language, the following macro variables are defined for inquiring on all properties and then all properties that begin "usr.":

## **MQPROP\_INQUIRE\_ALL**

Inquire on all properties of the message.

MQPROP\_INQUIRE\_ALL can be used in the following way:

```
MQCHARV Name = {MQPROP_INQUIRE_ALL};
```

## **MQPROP\_INQUIRE\_ALL\_USR**

Inquire on all properties of the message that start "usr.". The returned name is returned without the "usr." prefix.

If MQIMP\_INQ\_NEXT is specified but Name has changed since the previous call or this is the first call, then MQIMPO\_INQ\_FIRST is implied.

See Property names and Property name restrictions for further information about the use of property names.

### **PropDesc**

Type: MQPD - output

This structure is used to define the attributes of a property, including what happens if the property is not supported, what message context the property belongs to, and what messages the property should be copied into. See MQPD for details of this structure.

### **Type**

Type: MQLONG - input/output

On return from the MQINQMP call this parameter is set to the data type of *Value*. The data type can be any of the following:

#### **MQTYPE\_BOOLEAN**

A boolean.

#### **MQTYPE\_BYTE\_STRING**

a byte string.

#### **MQTYPE\_INT8**

An 8-bit signed integer.

#### **MQTYPE\_INT16**

A 16-bit signed integer.

#### **MQTYPE\_INT32**

A 32-bit signed integer.

#### **MQTYPE\_INT64**

A 64-bit signed integer.

#### **MQTYPE\_FLOAT32**

A 32-bit floating-point number.

#### **MQTYPE\_FLOAT64**

A 64-bit floating-point number.

#### **MQTYPE\_STRING**

A character string.

#### **MQTYPE\_NULL**

The property exists but has a null value.

If the data type of the property value is not recognized then MQTYPE\_STRING is returned and a string representation of the value is placed into the *Value* area. A string representation of the data type can be found in the *TypeString* field of the *InqPropOpts* parameter. A warning completion code is returned with reason MQRC\_PROP\_TYPE\_NOT\_SUPPORTED.

Additionally, if the option `MQIMPO_CONVERT_TYPE` is specified, conversion of the property value is requested. Use *Type* as an input to specify the data type that you want the property to be returned as. See the description of the `MQIMPO_CONVERT_TYPE` option of the `MQIMPO` structure for details of data type conversion.

If you do not request type conversion, you can use the following value on input:

**MQTYPE\_AS\_SET**

The value of the property is returned without converting its data type.

**ValueLength**

Type: `MQLONG` - input

The length in bytes of the Value area. Specify zero for properties that you do not require the value returned for. These could be properties which are designed by an application to have a null value or an empty string. Also specify zero if the `MQIMPO_QUERY_LENGTH` option has been specified; in this case no value is returned.

**Value**

Type: `MQBYTE` × *ValueLength* - output

This is the area to contain the inquired property value. The buffer should be aligned on a boundary appropriate for the value being returned. Failure to do so can result in an error when the value is later accessed.

If *ValueLength* is less than the length of the property value, as much of the property value as possible is moved into *Value* and the call fails with completion code `MQCC_FAILED` and reason `MQRC_PROPERTY_VALUE_TOO_BIG`.

The character set of the data in *Value* is given by the `ReturnedCCSID` field in the `InqPropOpts` parameter. The encoding of the data in *Value* is given by the `ReturnedEncoding` field in the `InqPropOpts` parameter.

In the C programming language, the parameter is declared as a pointer-to-void; the address of any type of data can be specified as the parameter.

If the *ValueLength* parameter is zero, *Value* is not referred to and its value passed by programs written in C or System/390 assembler can be null.

**DataLength**

Type: `MQLONG` - output

This is the length in bytes of the actual property value as returned in the *Value* area.

If *DataLength* is less than the property value length, *DataLength* is still filled in on return from the `MQINQMP` call. This allows the application to determine the size of the buffer required to accommodate the property value, and then reissue the call with a buffer of the appropriate size.

The following values can also be returned.

If the *Type* parameter is set to `MQTYPE_STRING` or `MQTYPE_BYTE_STRING`:

**MQVL\_EMPTY\_STRING**

The property exists but contains no characters or bytes.

**CompCode**

Type: `MQLONG` - output

The completion code; it is one of the following:

**MQCC\_OK**

Successful completion.

**MQCC\_WARNING**

Warning (partial completion).

**MQCC\_FAILED**  
Call failed.

**Reason**

Type: MQLONG - output

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**  
(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_PROP\_NAME\_NOT\_CONVERTED**  
(2492, X'09BC') Returned property name not converted.

**MQRC\_PROP\_VALUE\_NOT\_CONVERTED**  
(2466, X'09A2') Property value not converted.

**MQRC\_PROP\_TYPE\_NOT\_SUPPORTED**  
(2467, X'09A3') Property data type is not supported.

**MQRC\_RFH\_FORMAT\_ERROR**  
(2421, X'0975') An MQRFH2 folder containing properties could not be parsed.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_NOT\_AVAILABLE**  
(2204, X'089C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**  
(2130, X'0852') Unable to load adapter service module.

**MQRC\_ASID\_MISMATCH**  
(2157, X'086D') Primary and home ASIDs differ.

**MQRC\_BUFFER\_ERROR**  
(2004, X'07D4') Value parameter not valid.

**MQRC\_BUFFER\_LENGTH\_ERROR**  
(2005, X'07D5') Value length parameter not valid.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'08AB') MQI call entered before previous call completed.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'07D9') Connection to queue manager lost.

**MQRC\_DATA\_LENGTH\_ERROR**  
(2010, X'07DA') Data length parameter not valid.

**MQRC\_IMPO\_ERROR**  
(2464, X'09A0') Inquire message property options structure not valid.

**MQRC\_HMSG\_ERROR**  
(2460, X'099C') Message handle not valid.

**MQRC\_MSG\_HANDLE\_IN\_USE**  
(2499, X'09C3') Message handle already in use.

**MQRC\_OPTIONS\_ERROR**  
(2046, X'07F8') Options not valid or not consistent.

**MQRC\_PD\_ERROR**  
(2482, X'09B2') Property descriptor structure not valid.

**MQRC\_PROP\_CONV\_NOT\_SUPPORTED**  
(2470, X'09A6') Conversion from the actual to requested data type not supported.

**MQRC\_PROPERTY\_NAME\_ERROR**  
(2442, X'098A') Invalid property name.

**MQRC\_PROPERTY\_NAME\_TOO\_BIG**  
(2465, X'09A1') Property name too large for returned name buffer.

**MQRC\_PROPERTY\_NOT\_AVAILABLE**  
(2471, X'09A7) Property not available.

**MQRC\_PROPERTY\_VALUE\_TOO\_BIG**  
(2469, X'09A5') Property value too large for the Value area.

**MQRC\_PROP\_NUMBER\_FORMAT\_ERROR**  
(2472, X'09A8') Number format error encountered in value data.

**MQRC\_PROPERTY\_TYPE\_ERROR**  
(2473, X'09A9') Invalid requested property type.

**MQRC\_SOURCE\_CCSID\_ERROR**  
(2111, X'083F') Property name coded character set identifier not valid.

**MQRC\_STORAGE\_NOT\_AVAILABLE**  
(2071, X'0871') Insufficient storage available.

**MQRC\_UNEXPECTED\_ERROR**  
(2195, X'0893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

### C invocation

MQINQMP (Hconn, Hmsg, &InqPropOpts, &Name, &PropDesc, &Type, ValueLength, Value, &DataLength, &CompCode, &Reason);

Declare the parameters as follows:

```

MQHCONN Hconn;      /* Connection handle */
MQHMSG  Hmsg;       /* Message handle */
MQIMPO  InqPropOpts; /* Options that control the action of MQINQMP */
MQCHARV Name;      /* Property name */
MQPD    PropDesc;   /* Property descriptor */
MQLONG  Type;       /* Property data type */
MQLONG  ValueLength; /* Length in bytes of the Value area */
MQBYTE  Value[n];   /* Area to contain the property value */
MQLONG  DataLength; /* Length of the property value */
MQLONG  CompCode;   /* Completion code */
MQLONG  Reason;     /* Reason code qualifying CompCode */

```

### COBOL invocation

CALL 'MQINQMP' USING HCONN, HMSG, INQMSGOPTS, NAME, PROPDESC, TYPE, VALULENGTH, VALUE, DATALENGTH, COMPCODE, REASON.

Declare the parameters as follows:

```

** Connection handle
01 HCONN      PIC S9(9) BINARY.
** Message handle
01 HMSG       PIC S9(18) BINARY.
** Options that control the action of MQINQMP
01 INQMSGOPTS.
   COPY CMQIMPOV.
** Property name
01 NAME.
   COPY CMQCHRVV.

```

```

** Property descriptor
01 PROPDESC.
   COPY CMQPDV.
** Property data type
01 TYPE      PIC S9(9) BINARY.
** Length in bytes of the VALUE area
01 VALUELENGTH PIC S9(9) BINARY.
** Area to contain the property value
01 VALUE      PIC X(n).
** Length of the property value
01 DATALENGTH PIC S9(9) BINARY.
** Completion code
01 COMPCODE    PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON      PIC S9(9) BINARY.

```

### PL/I invocation

```
call MQINQMP (Hconn, Hmsg, InqPropOpts, Name, PropDesc, Type,
ValueLength, Value, DataLength, CompCode, Reason);
```

Declare the parameters as follows:

```

dc1 Hconn      fixed bin(31); /* Connection handle */
dc1 Hmsg       fixed bin(63); /* Message handle */
dc1 InqPropOpts like MQIMPO; /* Options that control the action of MQINQMP */
dc1 Name       like MQCHARV; /* Property name */
dc1 PropDesc   like MQPD;    /* Property descriptor */
dc1 Type       fixed bin (31); /* Property data type */
dc1 ValueLength fixed bin (31); /* Length in bytes of the Value area */
dc1 Value      char (n);      /* Area to contain the property value */
dc1 DataLength fixed bin (31); /* Length of the property value */
dc1 CompCode   fixed bin (31); /* Completion code */
dc1 Reason     fixed bin (31); /* Reason code qualifying CompCode */

```

### High Level Assembler invocation

```
CALL MQINQMP, (HCONN,HMSG,INQMSGOPTS,NAME,PROPDESC,TYPE,
VALUELENGTH,VALUE,DATALLENGTH,COMPCODE,REASON)
```

Declare the parameters as follows:

HCONN	DS	F	Connection handle
HMSG	DS	D	Message handle
INQMSGOPTS	CMQIMPOA	,	Options that control the action of MQINQMP
NAME	CMQCHRVA	,	Property name
PROPDESC	CMQPDA	,	Property descriptor
TYPE	DS	F	Property data type
VALUELENGTH	DS	F	Length in bytes of the VALUE area
VALUE	DS	CL(n)	Area to contain the property value
DATALLENGTH	DS	F	Length of the property value
COMPCODE	DS	F	Completion code
REASON	DS	F	Reason code qualifying COMPCODE

## **MQMHBUF - Convert message handle into buffer:**

The MQMHBUF call converts a message handle into a buffer and is the inverse of the MQBUFMH call.

### **Syntax**

MQMHBUF (*Hconn*, *Hmsg*, *MsgHBufOpts*, *Name*, *MsgDesc*, *BufferLength*, *Buffer*, *DataLength*, *CompCode*, *Reason*)

### **Parameters**

#### ***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter.

If the message handle was created using MQHC\_UNASSOCIATED\_HCONN, a valid connection must be established on the thread deleting the message handle. If a valid connection is not established, the call fails with MQRC\_CONNECTION\_BROKEN.

#### ***Hmsg***

Type: MQHMSG - input

This is the message handle for which a buffer is required. The value was returned by a previous MQCRTMH call.

#### ***MsgHBufOpts***

Type: MQMHBO - input

The MQMHBO structure allows applications to specify options that control how buffers are produced from message handles.

See “MQMHBO - Message handle to buffer options” on page 2242 for details.

#### ***Name***

Type: MQCHARV - input

The name of the property or properties to put into the buffer.

If no property matching the name can be found, the call fails with MQRC\_PROPERTY\_NOT\_AVAILABLE.

You can use a wildcard to put more than one property into the buffer. To do this, use the wildcard character '%' at the end of the property name. This wildcard matches zero or more characters, including the '.' character.

In the C programming language, the following macro variables are defined for inquiring on all properties and all properties that begin 'usr':

#### **MQPROP\_INQUIRE\_ALL**

Put all properties of the message into the buffer

#### **MQPROP\_INQUIRE\_ALL\_USR**

Put all properties of the message that start with the characters 'usr.' into the buffer.

See Property names and Property name restrictions for further information about the use of property names.

#### ***MsgDesc***

Type: MQMD - input/output

The *MsgDesc* structure describes the contents of the buffer area.

On output, the *Encoding*, *CodedCharSetId* and *Format* fields are set to correctly describe the encoding, character set identifier, and format of the data in the buffer area as written by the call.

Data in this structure is in the character set and encoding of the application.

### **BufferLength**

Type: MQLONG - input

*BufferLength* is the length of the Buffer area, in bytes.

### **Buffer**

Type: MQBYTE×*BufferLength* - output

*Buffer* defines the area to contain the message properties. You must align the buffer on a 4-byte boundary.

If *BufferLength* is less than the length required to store the properties in *Buffer*, MQMHBUF fails with MQRC\_PROPERTY\_VALUE\_TOO\_BIG.

The contents of the buffer can change even if the call fails.

### **DataLength**

Type: MQLONG - output

*DataLength* is the length, in bytes, of the returned properties in the buffer. If the value is zero, no properties matched the value given in *Name* and the call fails with reason code MQRC\_PROPERTY\_NOT\_AVAILABLE.

If *BufferLength* is less than the length required to store the properties in the buffer, the MQMHBUF call fails with MQRC\_PROPERTY\_VALUE\_TOO\_BIG, but a value is still entered into *DataLength*. This allows the application to determine the size of the buffer required to accommodate the properties, and then reissue the call with the required *BufferLength*.

### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

#### **MQCC\_OK**

Successful completion.

#### **MQCC\_FAILED**

Call failed.

### **Reason**

Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED:

#### **MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'089C') Adapter not available.

#### **MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

#### **MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

#### **MQRC\_MHBO\_ERROR**

(2501, X'095C') Message handle to buffer options structure not valid.

- MQRC\_BUFFER\_ERROR**  
(2004, X'07D4') Buffer parameter not valid.
- MQRC\_BUFFER\_LENGTH\_ERROR**  
(2005, X'07D5') Buffer length parameter not valid.
- MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'08AB') MQI call entered before previous call completed.
- MQRC\_CONNECTION\_BROKEN**  
(2009, X'07D9') Connection to queue manager lost.
- MQRC\_DATA\_LENGTH\_ERROR**  
(2010, X'07DA') Data length parameter not valid.
- MQRC\_HMSG\_ERROR**  
(2460, X'099C') Message handle not valid.
- MQRC\_MD\_ERROR**  
(2026, X'07EA') Message descriptor not valid.
- MQRC\_MSG\_HANDLE\_IN\_USE**  
(2499, X'09C3') Message handle already in use.
- MQRC\_OPTIONS\_ERROR**  
(2046, X'07FE') Options not valid or not consistent.
- MQRC\_PROPERTY\_NAME\_ERROR**  
(2442, X'098A') Property name is not valid.
- MQRC\_PROPERTY\_NOT\_AVAILABLE**  
(2471, X'09A7') Property not available.
- MQRC\_PROPERTY\_VALUE\_TOO\_BIG**  
(2469, X'09A5') BufferLength value is too small to contain specified properties.
- MQRC\_UNEXPECTED\_ERROR**  
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

## C invocation

```
MQMHBUF (Hconn, Hmsg, &MsgHBufOpts, &Name, &MsgDesc, BufferLength, Buffer,
        &DataLength, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN Hconn;      /* Connection handle */
MQHMSG  Hmsg;       /* Message handle */
MQMHBO  MsgHBufOpts; /* Options that control the action of MQMHBUF */
MQCHARV Name;      /* Property name */
MQMD    MsgDesc;   /* Message descriptor */
MQLONG  BufferLength; /* Length in bytes of the Buffer area */
MQBYTE  Buffer[n];  /* Area to contain the properties */
MQLONG  DataLength; /* Length of the properties */
MQLONG  CompCode;  /* Completion code */
MQLONG  Reason;    /* Reason code qualifying CompCode */
```

## Usage notes

MQMHBUF converts a message handle into a buffer.

You can use it with an MQGET API exit to access certain properties, using the message property APIs, and then pass these in a buffer back to an application designed to use MQRFH2 headers rather than message handles.

This call is the inverse of the MQBUFMH call, which you can use to parse message properties from a buffer into a message handle.

### COBOL invocation

```
CALL 'MQMHBUF' USING HCONN, HMSG, MSGHBUFOPTS, NAME, MSGDESC,  
                   BUFFERLENGTH, BUFFER, DATALENGTH, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle  
01 HCONN          PIC S9(9) BINARY.  
** Message handle  
01 HMSG          PIC S9(18) BINARY.  
** Options that control the action of MQMHBUF  
01 MSGHBUFOPTS.  
   COPY CMQMHBV.  
** Property name  
01 NAME  
   COPY CMQCHRVA.  
** Message descriptor  
01 MSGDESC  
   COPY CMQMDA.  
** Length in bytes of the Buffer area */  
01 BUFFERLENGTH PIC S9(9) BINARY.  
** Area to contain the properties  
01 BUFFER        PIC X(n).  
** Length of the properties  
01 DATALENGTH  PIC S9(9) BINARY.  
** Completion code  
01 COMPCODE     PIC S9(9) BINARY.  
** Reason code qualifying COMPCODE  
01 REASON       PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQMHBUF (Hconn, Hmsg, MsgHBufOpts, Name, MsgDesc, BufferLength, Buffer,  
DataLength, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn          fixed bin(31); /* Connection handle */  
dc1 Hmsg           fixed bin(63); /* Message handle */  
dc1 MsgHBufOpts   like MQMHBO; /* Options that control the action of MQMHBUF */  
dc1 Name          like MQCHARV; /* Property name */  
dc1 MsgDesc       like MQMD; /* Message descriptor */  
dc1 BufferLength   fixed bin(31); /* Length in bytes of the Buffer area */  
dc1 Buffer         char(n); /* Area to contain the properties */  
dc1 DataLength    fixed bin(31); /* Length of the properties */  
dc1 CompCode      fixed bin(31); /* Completion code */  
dc1 Reason        fixed bin(31); /* Reason code qualifying CompCode */
```

### High Level Assembler invocation

```
CALL MQMHBUF, (HCONN,HMSG,MSGHBUFOPTS,NAME,MSGDESC,BUFFERLENGTH,  
              BUFFER,DATALENGTH,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN      DS      F      Connection handle  
HMSG       DS      D      Message handle  
MSGHBUFOPTS CMQMHBV ,    Options that control the action of MQMHBUF  
NAME       CMQCHRVA ,    Property name  
MSGDESC    CMQMDA ,      Message descriptor  
BUFFERLENGTH DS      F      Length in bytes of the BUFFER area  
BUFFER     DS      CL(n) Area to contain the properties
```

DATALENGTH	DS	F	Length of the properties
COMPCODE	DS	F	Completion code
REASON	DS	F	Reason code qualifying COMPCODE

## MQOPEN - Open object:

The MQOPEN call establishes access to an object.

The following types of object are valid:

- Queue (including distribution lists)
- Namelist
- Process definition
- Queue manager
- Topic

## Syntax

MQOPEN (*Hconn*, *ObjDesc*, *Options*, *Hobj*, *CompCode*, *Reason*)

## Parameters

### *Hconn*

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn*:

### MQHC\_DEF\_HCONN

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

### *ObjDesc*

Type: MQOD - input/output

This is a structure that identifies the object to be opened; see “MQOD - Object descriptor” on page 2245 for details.

If the *ObjectName* field in the *ObjDesc* parameter is the name of a model queue, a dynamic local queue is created with the attributes of the model queue; this happens whatever options you specify on the *Options* parameter. Subsequent operations using the *Hobj* returned by the MQOPEN call are performed on the new dynamic queue, and not on the model queue. This is true even for the MQINQ and MQSET calls. The name of the model queue in the *ObjDesc* parameter is replaced with the name of the dynamic queue created. The type of the dynamic queue is determined by the value of the *DefinitionType* attribute of the model queue (see “Attributes for queues” on page 2625 ). For information about the close options applicable to dynamic queues, see the description of the MQCLOSE call.

### *Options*

Type: MQLONG - input

You must specify at least one of the following options:

- MQOO\_BROWSE
- MQOO\_INPUT\_\* (only one of these)

- MQOO\_INQUIRE
- MQOO\_OUTPUT
- MQOO\_SET
- MQOO\_BIND\_\* (only one of these)

See the following table for details of these options; other options can be specified as required. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations). Combinations that are not valid are noted; all other combinations are valid. Only options that are applicable to the type of object specified by *ObjDesc* are allowed. The following table shows valid MQOPEN options for queries and topics.

Option	Alias <sup>1</sup>	Local and Model	Remote	Nonlocal Cluster	Distribution list	Topic
MQOO_INPUT_AS_Q_DEF	Yes	Yes	No	No	No	No
MQOO_INPUT_SHARED	Yes	Yes	No	No	No	No
MQOO_INPUT_EXCLUSIVE	Yes	Yes	No	No	No	No
MQOO_OUTPUT	Yes	Yes	Yes	Yes	Yes	Yes
MQOO_BROWSE	Yes	Yes	No	No	No	No
MQOO_CO_OP	Yes	Yes	No	No	No	No
MQOO_INQUIRE	Yes	Yes	<sup>2</sup>	Yes	No	No
MQOO_SET	Yes	Yes	<sup>2</sup>	No	No	No
MQOO_BIND_ON_OPEN <sup>3</sup>	Yes	Yes	Yes	Yes	Yes	No
MQOO_BIND_NOT_FIXED <sup>3</sup>	Yes	Yes	Yes	Yes	Yes	No
MQOO_BIND_ON_GROUP <sup>3</sup>	Yes	Yes	Yes	Yes	Yes	No
MQOO_BIND_AS_Q_DEF <sup>3</sup>	Yes	Yes	Yes	Yes	Yes	No
MQOO_SAVE_ALL_CONTEXT	Yes	Yes	No	No	No	No
MQOO_PASS_IDENTITY_CONTEXT	Yes	Yes	Yes	Yes	Yes	<sup>4</sup>
MQOO_PASS_ALL_CONTEXT	Yes	Yes	Yes	Yes	Yes	Yes
MQOO_SET_IDENTITY_CONTEXT	Yes	Yes	Yes	Yes	Yes	<sup>4</sup>
MQOO_SET_ALL_CONTEXT	Yes	Yes	Yes	Yes	Yes	Yes
MQOO_NO_READ_AHEAD	Yes	Yes	No	No	No	No
MQOO_READ_AHEAD	Yes	Yes	No	No	No	No
MQOO_READ_AHEAD_AS_Q_DEF	Yes	Yes	No	No	No	No
MQOO_ALTERNATE_USER_AUTHORITY	Yes	Yes	Yes	Yes	Yes	Yes
MQOO_FAIL_IF QUIESCING	Yes	Yes	Yes	Yes	Yes	Yes
MQOO_RESOLVE_LOCAL_Q	Yes	Yes	Yes	Yes	No	No
MQOO_RESOLVE_LOCAL_TOPIC	No	No	No	No	No	Yes
MQOO_NO_MULTICAST	No	No	No	No	No	Yes

**Notes:**

1. The validity of options for aliases depends on the validity of the option for the queue to which the alias resolves.
2. This option is valid only for the local definition of a remote queue.
3. This option can be specified for any queue type, but is ignored if the queue is not a cluster queue. However, the *DefBind* queue attribute overrides the base queue even when the alias queue is not in a cluster.
4. These attributes can be used with a topic, but affect only the context set for the retained message, not the context fields sent to any subscriber.

**Access options:** The following options control the type of operations that can be performed on the object:

#### **MQOO\_INPUT\_AS\_Q\_DEF**

Open queue to get messages using queue-defined default.

The queue is opened for use with subsequent MQGET calls. The type of access is either shared or exclusive, depending on the value of the *DefInputOpenOption* queue attribute; see “Attributes for queues” on page 2625 for details.

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues.

#### **MQOO\_INPUT\_SHARED**

Open queue to get messages with shared access.

The queue is opened for use with subsequent MQGET calls. The call can succeed if the queue is currently open by this or another application with MQOO\_INPUT\_SHARED, but fails with reason code MQRC\_OBJECT\_IN\_USE if the queue is currently open with MQOO\_INPUT\_EXCLUSIVE.

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues.

#### **MQOO\_INPUT\_EXCLUSIVE**

Open queue to get messages with exclusive access.

The queue is opened for use with subsequent MQGET calls. The call fails with reason code MQRC\_OBJECT\_IN\_USE if the queue is currently open by this or another application for input of any type (MQOO\_INPUT\_SHARED or MQOO\_INPUT\_EXCLUSIVE).

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues.

#### **MQOO\_OUTPUT**

Open queue to put messages, or a topic or topic string to publish messages.

The queue or topic is opened for use with subsequent MQPUT calls.

An MQOPEN call with this option can succeed even if the *InhibitPut* queue attribute is set to MQQA\_PUT\_INHIBITED (although subsequent MQPUT calls fail while the attribute is set to this value).

This option is valid for all types of queue, including distribution lists, and topics.

The following notes apply to these options:

- Only one of these options can be specified.
- An MQOPEN call with one of these options can succeed even if the *InhibitGet* queue attribute is set to MQQA\_GET\_INHIBITED (although subsequent MQGET calls fail while the attribute is set to this value).
- If the queue is defined as not being shareable (that is, the *Shareability* queue attribute has the value MQQA\_NOT\_SHAREABLE), attempts to open the queue for shared access are treated as attempts to open the queue with exclusive access.
- If an alias queue is opened with one of these options, the test for exclusive use (or for whether another application has exclusive use) is against the base queue to which the alias resolves.
- These options are not valid if *ObjectQMgrName* is the name of a queue manager alias; this is true even if the value of the *RemoteQMgrName* attribute in the local definition of a remote queue used for queue-manager aliasing is the name of the local queue manager.

#### **MQOO\_BROWSE**

Open queue to browse messages.

The queue is opened for use with subsequent MQGET calls with one of the following options:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_NEXT
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR

This is allowed even if the queue is currently open for MQOO\_INPUT\_EXCLUSIVE. An MQOPEN call with the MQOO\_BROWSE option establishes a browse cursor, and positions it logically before the first message on the queue; see MQGMO - Options field for further information.

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues. It is also not valid if *ObjectQMgrName* is the name of a queue manager alias; this is true even if the value of the *RemoteQMgrName* attribute in the local definition of a remote queue used for queue-manager aliasing is the name of the local queue manager.

### MQOO\_CO\_OP

Open as a cooperating member of the set of handles.

This option is valid only with the MQOO\_BROWSE option. If it is specified without MQOO\_BROWSE, MQOPEN returns with MQRC\_OPTIONS\_ERROR.

The handle returned is considered to be a member of a cooperating set of handles for subsequent MQGET calls with one of the following options:

- MQGMO\_MARK\_BROWSE\_CO\_OP
- MQGMO\_UNMARKED\_BROWSE\_MSG
- MQGMO\_UNMARK\_BROWSE\_CO\_OP

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues.

### MQOO\_INQUIRE

Open object to inquire attributes.

The queue, namelist, process definition, or queue manager is opened for use with subsequent MQINQ calls.

This option is valid for all types of object other than distribution lists. It is not valid if *ObjectQMgrName* is the name of a queue manager alias; this is true even if the value of the *RemoteQMgrName* attribute in the local definition of a remote queue used for queue-manager aliasing is the name of the local queue manager.

### MQOO\_SET

Open queue to set attributes.

The queue is opened for use with subsequent MQSET calls.

This option is valid for all types of queue other than distribution lists. It is not valid if *ObjectQMgrName* is the name of a local definition of a remote queue; this is true even if the value of the *RemoteQMgrName* attribute in the local definition of a remote queue used for queue-manager aliasing is the name of the local queue manager.

**Binding options:** The following options apply when the object being opened is a cluster queue; these options control the binding of the queue handle to an instance of the cluster queue:

### MQOO\_BIND\_ON\_OPEN

The local queue manager binds the queue handle to an instance of the destination queue when the queue is opened. As a result, all messages put using this handle are sent to the same instance of the destination queue, and by the same route.

This option is valid only for queues, and affects only cluster queues. If specified for a queue that is not a cluster queue, the option is ignored.

#### **MQOO\_BIND\_NOT\_FIXED**

This stops the local queue manager binding the queue handle to an instance of the destination queue. As a result, successive MQPUT calls using this handle send the messages to *different* instances of the destination queue, or to the same instance but by different routes. It also allows the instance selected to be changed later by the local queue manager, by a remote queue manager, or by a message channel agent (MCA), according to network conditions.

**Note:** Client and server applications that need to exchange a *series* of messages to complete a transaction must not use MQOO\_BIND\_NOT\_FIXED (or MQOO\_BIND\_AS\_Q\_DEF when *DefBind* has the value MQBND\_BIND\_NOT\_FIXED), because successive messages in the series might be sent to different instances of the server application.

If MQOO\_BROWSE or one of the MQOO\_INPUT\_\* options is specified for a cluster queue, the queue manager is forced to select the local instance of the cluster queue. As a result, the binding of the queue handle is fixed, even if MQOO\_BIND\_NOT\_FIXED is specified.

If MQOO\_INQUIRE is specified with MQOO\_BIND\_NOT\_FIXED, successive MQINQ calls using that handle might inquire different instances of the cluster queue, although typically all the instances have the same attribute values.

MQOO\_BIND\_NOT\_FIXED is valid only for queues, and affects only cluster queues. If specified for a queue that is not a cluster queue, the option is ignored.

#### **MQOO\_BIND\_ON\_GROUP**

Allows an application to request that a group of messages are all allocated to the same destination instance.

This option is valid only for queues, and affects only cluster queues. If specified for a queue that is not a cluster queue, the option is ignored.

#### **MQOO\_BIND\_AS\_Q\_DEF**

The local queue manager binds the queue handle in the way defined by the *DefBind* queue attribute. The value of this attribute is either MQBND\_BIND\_ON\_OPEN, MQBND\_BIND\_NOT\_FIXED, or MQBND\_BIND\_ON\_GROUP.

MQOO\_BIND\_AS\_Q\_DEF is the default when MQOO\_BIND\_ON\_OPEN, MQOO\_BIND\_NOT\_FIXED, or MQOO\_BIND\_ON\_GROUP is not specified.

MQOO\_BIND\_AS\_Q\_DEF aids program documentation. It is not intended that this option is used with either of the other two bind options, but because its value is zero such use cannot be detected.

**Context options:** The following options control the processing of message context:

#### **MQOO\_SAVE\_ALL\_CONTEXT**

Context information is associated with this queue handle. This information is set from the context of any message retrieved using this handle. For more information about message context, see Message context and Controlling context information.

This context information can be passed to a message that is then put on a queue using the MQPUT or MQPUT1 calls. See the MQPMO\_PASS\_IDENTITY\_CONTEXT and MQPMO\_PASS\_ALL\_CONTEXT options described in “MQPMO - Put-message options” on page 2269.

Until a message has been successfully retrieved, context cannot be passed to a message being put on a queue.

A message retrieved using one of the MQGMO\_BROWSE\_\* browse options does not have its context information saved (although the context fields in the *MsgDesc* parameter are set after a browse).

This option is valid only for local, alias, and model queues; it is not valid for remote queues, distribution lists, and objects that are not queues. One of the MQOO\_INPUT\_\* options must be specified.

#### **MQOO\_PASS\_IDENTITY\_CONTEXT**

This allows the MQPMO\_PASS\_IDENTITY\_CONTEXT option to be specified in the *PutMsgOpts* parameter when a message is put on a queue; this gives the message the identity context information from an input queue that was opened with the MQOO\_SAVE\_ALL\_CONTEXT option. For more information about message context, see Message context and Controlling context information.

The MQOO\_OUTPUT option must be specified.

This option is valid for all types of queue, including distribution lists.

#### **MQOO\_PASS\_ALL\_CONTEXT**

This allows the MQPMO\_PASS\_ALL\_CONTEXT option to be specified in the *PutMsgOpts* parameter when a message is put on a queue; this gives the message the identity and origin context information from an input queue that was opened with the MQOO\_SAVE\_ALL\_CONTEXT option. For more information about message context, see Message context and Controlling context information.

This option implies MQOO\_PASS\_IDENTITY\_CONTEXT, which need not therefore be specified. The MQOO\_OUTPUT option must be specified.

This option is valid for all types of queue, including distribution lists.

#### **MQOO\_SET\_IDENTITY\_CONTEXT**

This allows the MQPMO\_SET\_IDENTITY\_CONTEXT option to be specified in the *PutMsgOpts* parameter when a message is put on a queue; this gives the message the identity context information contained in the *MsgDesc* parameter specified on the MQPUT or MQPUT1 call. For more information about message context, see Message context and Controlling context information.

This option implies MQOO\_PASS\_IDENTITY\_CONTEXT, which need not therefore be specified. The MQOO\_OUTPUT option must be specified.

This option is valid for all types of queue, including distribution lists.

#### **MQOO\_SET\_ALL\_CONTEXT**

This allows the MQPMO\_SET\_ALL\_CONTEXT option to be specified in the *PutMsgOpts* parameter when a message is put on a queue; this gives the message the identity and origin context information contained in the *MsgDesc* parameter specified on the MQPUT or MQPUT1 call. For more information about message context, see Message context and Controlling context information.

This option implies the following options, which need not therefore be specified:

- MQOO\_PASS\_IDENTITY\_CONTEXT
- MQOO\_PASS\_ALL\_CONTEXT
- MQOO\_SET\_IDENTITY\_CONTEXT

The MQOO\_OUTPUT option must be specified.

This option is valid for all types of queue, including distribution lists.

#### **Read ahead options:**

When you call MQOPEN with MQOO\_READ\_AHEAD, the IBM MQ client only enables read-ahead if certain conditions are met. These conditions include:

- Both the client and remote queue manager must be at WebSphere MQ Version 7 or later.
- The client application must be compiled and linked against the threaded IBM MQ MQI client libraries.
- The client channel must be using TCP/IP protocol
- The channel must have a non-zero SharingConversations (SHARECNV) setting in both the client and server channel definitions.

The following options control whether non-persistent messages are sent to the client before an application requests them. The following notes apply to the read ahead options:

- Only one of these options can be specified.
- These options are valid only for local, alias, and model queues. They are not valid for remote queues, distribution lists, topics or queue managers.
- These options are only applicable when one of MQOO\_BROWSE, MQOO\_INPUT\_SHARED and MQOO\_INPUT\_EXCLUSIVE are also specified although it is not an error to specify these options with MQOO\_INQUIRE or MQOO\_SET.
- If the application is not running as an IBM MQ client, these options are ignored.

#### **MQOO\_NO\_READ\_AHEAD**

Non-persistent messages are not sent the client before an application requests them.

#### **MQOO\_READ\_AHEAD**

Non-persistent messages are sent to the client before an application requests them.

#### **MQOO\_READ\_AHEAD\_AS\_Q\_DEF**

Read ahead behavior is determined by the default read ahead attribute of the queue being opened. This is the default value.

**Other options:** The following options control authorization checking, what happens when the queue manager is quiescing, whether to resolve the local queue name, and multicast:

#### **MQOO\_ALTERNATE\_USER\_AUTHORITY**

The *AlternateUserId* field in the *ObjDesc* parameter contains a user identifier to use to validate this MQOPEN call. The call can succeed only if this *AlternateUserId* is authorized to open the object with the specified access options, regardless of whether the user identifier under which the application is running is authorized to do so. This does not apply to any context options specified, however, which are always checked against the user identifier under which the application is running.

This option is valid for all types of object.

#### **MQOO\_FAIL\_IF QUIESCING**

The MQOPEN call fails if the queue manager is in quiescing state.

On z/OS, for a CICS or IMS application, this option also forces the MQOPEN call to fail if the connection is in quiescing state.

This option is valid for all types of object.

For information about client channels see Overview of IBM MQ MQI clients.

#### **MQOO\_RESOLVE\_LOCAL\_Q**

Fill the ResolvedQName in the MQOD structure with the name of the local queue that was opened. Similarly, the ResolvedQMgrName is filled with the name of the local queue manager hosting the local queue. If the MQOD structure is less than Version 3, MQOO\_RESOLVE\_LOCAL\_Q is ignored with no error being returned.

The local queue is always returned when either a local, alias, or model queue is opened, but this is not the case when, for example, a remote queue or a non-local cluster queue is opened without the MQOO\_RESOLVE\_LOCAL\_Q option; the ResolvedQName and ResolvedQMgrName are filled with the RemoteQName and RemoteQMgrName found in the remote queue definition, or similarly with the chosen remote cluster queue.

If you specify `MQOO_RESOLVE_LOCAL_Q` when opening, for example, a remote queue, `ResolvedQName` is the transmission queue to which messages are put. The `ResolvedQMgrName` is filled with the name of the local queue manager hosting the transmission queue.

If you are authorized for browse, input, or output on a queue, you have the required authority to specify this flag on the `MQOPEN` call. No special authority is needed.

This option is valid only for queues and queue managers.

#### **MQOO\_RESOLVE\_LOCAL\_TOPIC**

Fill the `ResolvedQName` in the `MQOD` structure with the name of the administrative topic opened.

#### **MQOO\_NO\_MULTICAST**

Publication messages are not sent using multicast.

This option is valid only with the `MQOO_OUTPUT` option. If it is specified without `MQOO_OUTPUT`, `MQOPEN` returns with `MQRC_OPTIONS_ERROR`.

This option is valid only for a topic.

#### **Hobj**

Type: `MQHOBJ` - output

This handle represents the access that has been established to the object. It must be specified on subsequent IBM MQ calls that operate on the object. It ceases to be valid when the `MQCLOSE` call is issued, or when the unit of processing that defines the scope of the handle terminates.

The scope of the object handle returned is the same as the scope of the connection handle specified on the call. See `MQCONN` - `Hconn` parameter for information about handle scope.

#### **CompCode**

Type: `MQLONG` - output

The completion code; it is one of the following:

##### **MQCC\_OK**

Successful completion.

##### **MQCC\_WARNING**

Warning (partial completion).

##### **MQCC\_FAILED**

Call failed.

#### **Reason**

Type: `MQLONG` - output

The reason code qualifying *CompCode*.

If *CompCode* is `MQCC_OK`:

##### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is `MQCC_WARNING`:

##### **MQRC\_MULTIPLE\_REASONS**

(2136, X'858') Multiple reason codes returned.

If *CompCode* is `MQCC_FAILED`:

##### **MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'89C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**  
(2130, X'852') Unable to load adapter service module.

**MQRC\_ALIAS\_BASE\_Q\_TYPE\_ERROR**  
(2001, X'7D1') Alias base queue not a valid type.

**MQRC\_API\_EXIT\_ERROR**  
(2374, X'946') API exit failed.

**MQRC\_API\_EXIT\_LOAD\_ERROR**  
(2183, X'887') Unable to load API exit.

**MQRC\_ASID\_MISMATCH**  
(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CF\_NOT\_AVAILABLE**  
(2345, X'929') Coupling facility not available.

**MQRC\_CF\_STRUC\_AUTH\_FAILED**  
(2348, X'92C') Coupling-facility structure authorization check failed.

**MQRC\_CF\_STRUC\_ERROR**  
(2349, X'92D') Coupling-facility structure not valid.

**MQRC\_CF\_STRUC\_FAILED**  
(2373, X'945') Coupling-facility structure failed.

**MQRC\_CF\_STRUC\_IN\_USE**  
(2346, X'92A') Coupling-facility structure in use.

**MQRC\_CF\_STRUC\_LIST\_HDR\_IN\_USE**  
(2347, X'92B') Coupling-facility structure list-header in use.

**MQRC\_CICS\_WAIT\_FAILED**  
(2140, X'85C') Wait request rejected by CICS.

**MQRC\_CLUSTER\_EXIT\_ERROR**  
(2266, X'8DA') Cluster workload exit failed.

**MQRC\_CLUSTER\_PUT\_INHIBITED**  
(2268, X'8DC') Put calls inhibited for all queues in cluster.

**MQRC\_CLUSTER\_RESOLUTION\_ERROR**  
(2189, X'88D') Cluster name resolution failed.

**MQRC\_CLUSTER\_RESOURCE\_ERROR**  
(2269, X'8DD') Cluster resource error.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_NOT\_AUTHORIZED**  
(2217, X'8A9') Not authorized for connection.

**MQRC\_CONNECTION QUIESCING**  
(2202, X'89A') Connection quiescing.

**MQRC\_CONNECTION\_STOPPING**  
(2203, X'89B') Connection shutting down.

**MQRC\_DB2\_NOT\_AVAILABLE**  
(2342, X'926') Db2 subsystem not available.

**MQRC\_DEF\_XMIT\_Q\_TYPE\_ERROR**  
(2198, X'896') Default transmission queue not local.

**MQRC\_DEF\_XMIT\_Q\_USAGE\_ERROR**  
(2199, X'897') Default transmission queue usage error.

**MQRC\_DYNAMIC\_Q\_NAME\_ERROR**  
(2011, X'7DB') Name of dynamic queue not valid.

**MQRC\_HANDLE\_NOT\_AVAILABLE**  
(2017, X'7E1') No more handles available.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_HOBJ\_ERROR**  
(2019, X'7E3') Object handle not valid.

**MQRC\_MULTIPLE\_REASONS**  
(2136, X'858') Multiple reason codes returned.

**MQRC\_NAME\_IN\_USE**  
(2201, X'899') Name in use.

**MQRC\_NAME\_NOT\_VALID\_FOR\_TYPE**  
(2194, X'892') Object name not valid for object type.

**MQRC\_NOT\_AUTHORIZED**  
(2035, X'7F3') Not authorized for access.

**MQRC\_OBJECT\_ALREADY\_EXISTS**  
(2100, X'834') Object exists.

**MQRC\_OBJECT\_DAMAGED**  
(2101, X'835') Object damaged.

**MQRC\_OBJECT\_IN\_USE**  
(2042, X'7FA') Object already open with conflicting options.

**MQRC\_OBJECT\_LEVEL\_INCOMPATIBLE**  
(2360, X'938') Object level not compatible.

**MQRC\_OBJECT\_NAME\_ERROR**  
(2152, X'868') Object name not valid.

**MQRC\_OBJECT\_NOT\_UNIQUE**  
(2343, X'927') Object not unique.

**MQRC\_OBJECT\_Q\_MGR\_NAME\_ERROR**  
(2153, X'869') Object queue-manager name not valid.

**MQRC\_OBJECT\_RECORDS\_ERROR**  
(2155, X'86B') Object records not valid.

**MQRC\_OBJECT\_STRING\_ERROR**  
(2441, X'0989') Objectstring field not valid

**MQRC\_OBJECT\_TYPE\_ERROR**  
(2043, X'7FB') Object type not valid.

**MQRC\_OD\_ERROR**  
(2044, X'7FC') Object descriptor structure not valid.

**MQRC\_OPTION\_NOT\_VALID\_FOR\_TYPE**  
(2045, X'7FD') Option not valid for object type.

**MQRC\_OPTIONS\_ERROR**  
(2046, X'7FE') Options not valid or not consistent.

**MQRC\_PAGESET\_ERROR**  
(2193, X'891') Error accessing page-set data set.

**MQRC\_PAGESET\_FULL**  
(2192, X'890') External storage medium is full.

**MQRC\_Q\_DELETED**  
(2052, X'804') Queue has been deleted.

**MQRC\_Q\_MGR\_NAME\_ERROR**  
(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**  
(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR QUIESCING**  
(2161, X'871') Queue manager quiescing.

**MQRC\_Q\_MGR STOPPING**  
(2162, X'872') Queue manager shutting down.

**MQRC\_Q\_TYPE\_ERROR**  
(2057, X'809') Queue type not valid.

**MQRC\_RECS\_PRESENT\_ERROR**  
(2154, X'86A') Number of records present not valid.

**MQRC\_REMOTE\_Q\_NAME\_ERROR**  
(2184, X'888') Remote queue name not valid.

**MQRC\_RESOURCE\_PROBLEM**  
(2102, X'836') Insufficient system resources available.

**MQRC\_RESPONSE\_RECORDS\_ERROR**  
(2156, X'86C') Response records not valid.

**MQRC\_SECURITY\_ERROR**  
(2063, X'80F') Security error occurred.

**MQRC\_SELECTOR\_SYNTAX\_ERROR**  
2459 (X'099B') An MQOPEN, MQPUT1 or MQSUB call was issued but a selection string was specified which contained a syntax error.

**MQRC\_STOPPED\_BY\_CLUSTER\_EXIT**  
(2188, X'88C') Call rejected by cluster workload exit.

**MQRC\_STORAGE\_MEDIUM\_FULL**  
(2192, X'890') External storage medium is full.

**MQRC\_STORAGE\_NOT\_AVAILABLE**  
(2071, X'817') Insufficient storage available.

**MQRC\_SUPPRESSED\_BY\_EXIT**  
(2109, X'83D') Call suppressed by exit program.

**MQRC\_UNEXPECTED\_ERROR**  
(2195, X'893') Unexpected error occurred.

**MQRC\_UNKNOWN\_ALIAS\_BASE\_Q**  
(2082, X'822') Unknown alias base queue.

**MQRC\_UNKNOWN\_DEF\_XMIT\_Q**  
(2197, X'895') Unknown default transmission queue.

**MQRC\_UNKNOWN\_OBJECT\_NAME**  
(2085, X'825') Unknown object name.

**MQRC\_UNKNOWN\_OBJECT\_Q\_MGR**  
(2086, X'826') Unknown object queue manager.

**MQRC\_UNKNOWN\_REMOTE\_Q\_MGR**  
(2087, X'827') Unknown remote queue manager.

**MQRC\_UNKNOWN\_XMIT\_Q**  
(2196, X'894') Unknown transmission queue.

**MQRC\_WRONG\_CF\_LEVEL**  
(2366, X'93E') Coupling-facility structure is wrong level.

**MQRC\_XMIT\_Q\_TYPE\_ERROR**  
(2091, X'82B') Transmission queue not local.

**MQRC\_XMIT\_Q\_USAGE\_ERROR**  
(2092, X'82C') Transmission queue with wrong usage.

For detailed information about these codes, see:

-  IBM MQ for z/OS messages, completion, and reason codes for IBM MQ for z/OS.
- Reason codes for all other IBM MQ platforms except z/OS.

### General usage notes

1. The object opened is one of the following:

- A queue to:
  - Get or browse messages (using the MQGET call)
  - Put messages (using the MQPUT call)
  - Inquire about the attributes of the queue (using the MQINQ call)
  - Set the attributes of the queue (using the MQSET call)

If the queue named is a model queue, a dynamic local queue is created. See the *ObjDesc* parameter described in “MQOPEN - Open object” on page 2519.

A distribution list is a special type of queue object that contains a list of queues. It can be opened to put messages, but not to get or browse messages, or to inquire or set attributes. See usage note 8 for further details.

A queue that has QSGDISP(GROUP) is a special type of queue definition that cannot be used with the MQOPEN or MQPUT1 calls.

- A namelist to inquire about the names of the queues in the list (using the MQINQ call).
- A process definition to inquire about the process attributes (using the MQINQ call).
- The queue manager to inquire about the attributes of the local queue manager (using the MQINQ call).
- A topic to publish a message (using the MQPUT call)

2. An application can open the same object more than once. A different object handle is returned for each open. Each handle that is returned can be used for the functions for which the corresponding open was performed.

3. If the object being opened is a queue other than a cluster queue, all name resolution within the local queue manager takes place at the time of the MQOPEN call. This can include:

- Resolution of the name of a local definition of a remote queue to the name of the remote queue manager, and the name by which the queue is known at the remote queue manager
- Resolution of the remote queue-manager name to the name of a local transmission queue
- ( z/OS only) Resolution of the remote queue-manager name to the name of the shared transmission queue used by the IGQ agent (applies only if the local and remote queue managers belong to the same queue-sharing group)

- Alias resolution to the name of a base queue or a topic object.

However, be aware that subsequent MQINQ or MQSET calls for the handle relate solely to the name that has been opened, and not to the object resulting after name resolution has occurred. For example, if the object opened is an alias, the attributes returned by the MQINQ call are the attributes of the alias, not the attributes of the base queue or a topic object to which the alias resolves.

If the object being opened is a cluster queue, name resolution can occur at the time of the MQOPEN call, or be deferred until later. The point at which resolution occurs is controlled by the MQOO\_BIND\_\* options specified on the MQOPEN call:

- MQOO\_BIND\_ON\_OPEN
- MQOO\_BIND\_NOT\_FIXED
- MQOO\_BIND\_AS\_Q\_DEF
- MQOO\_BIND\_ON\_GROUP

See Name resolution for more information about name resolution for cluster queues.

4. An MQOPEN call with the MQOO\_BROWSE option establishes a browse cursor, for use with MQGET calls that specify the object handle and one of the browse options. This allows the queue to be scanned without altering its contents. A message that has been found by browsing can be removed from the queue by using the MQGMO\_MSG\_UNDER\_CURSOR option.

Multiple browse cursors can be active for a single application by issuing several MQOPEN requests for the same queue.

5. Applications started by a trigger monitor are passed the name of the queue that is associated with the application when the application is started. This queue name can be specified in the *ObjDesc* parameter to open the queue. See “MQTMC2 - Trigger message 2 (character format)” on page 2388 for further details.
6. On IBM i, applications running in compatibility mode are connected automatically to the queue manager by the first MQOPEN call issued by the application (if the application has not already connected to the queue manager by using the MQCONN call).

Applications not running in compatibility mode must issue the MQCONN or MQCONNX call to connect to the queue manager explicitly, before using the MQOPEN call to open an object.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

## Read ahead options

When you call MQOPEN with MQOO\_READ\_AHEAD, the IBM MQ client only enables read-ahead if certain conditions are met. These conditions include:

- Both the client and remote queue manager must be at WebSphere MQ Version 7 or later.
- The client application must be compiled and linked against the threaded IBM MQ MQI client libraries.
- The client channel must be using TCP/IP protocol
- The channel must have a non-zero SharingConversations (SHARECNV) setting in both the client and server channel definitions.

The following notes apply to the use of read ahead options.

1. The read ahead options are applicable only when one, and only one, of the MQOO\_BROWSE, MQOO\_INPUT\_SHARED and MQOO\_INPUT\_EXCLUSIVE options are also specified. An error is not thrown if a read ahead options are specified with the MQOO\_INQUIRE or MQOO\_SET options.
2. Read ahead is not enabled when requested if the options used on the first MQGET call are not supported for use with read ahead. Also, read ahead is disabled when the client is connecting to a queue manager that does not support read ahead.
3. If the application is not running as an IBM MQ client, read ahead options are ignored.

## Cluster queues

The following notes apply to the use of cluster queues.

1. When a cluster queue is opened for the first time, and the local queue manager is not a full repository queue manager, the local queue manager obtains information about the cluster queue from a full repository queue manager. When the network is busy, it can take several seconds for the local queue manager to receive the needed information from the repository queue manager. As a result, the application issuing the MQOPEN call might have to wait for up to 10 seconds before control returns from the MQOPEN call. If the local queue manager does not receive the needed information about the cluster queue within this time, the call fails with reason code `MQRC_CLUSTER_RESOLUTION_ERROR`.
2. When a cluster queue is opened and there are multiple instances of the queue in the cluster, the instance opened depends on the options specified on the MQOPEN call:
  - If the options specified include any of the following:
    - `MQOO_BROWSE`
    - `MQOO_INPUT_AS_Q_DEF`
    - `MQOO_INPUT_EXCLUSIVE`
    - `MQOO_INPUT_SHARED`
    - `MQOO_SET`the instance of the cluster queue opened must be the local instance. If there is no local instance of the queue, the MQOPEN call fails.
  - If the options specified include none of the options described previously, but include one or both of the following:
    - `MQOO_INQUIRE`
    - `MQOO_OUTPUT`the instance opened is the local instance if there is one, and a remote instance otherwise (if using the `CLWLUSEQ` defaults). The instance chosen by the queue manager can, however, be altered by a cluster workload exit (if there is one).
3. If there is a subscription for the queue, but it is not acknowledged by a full repository, the object is not present in the cluster and the call fails with reason code `MQRC_OBJECT_NAME`.

For more information about cluster queues, see [Cluster queues](#).

## Distribution lists

The following notes apply to the use of distribution lists.

Distribution lists are supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

1. Fields in the MQOD structure must be set as follows when opening a distribution list:
  - *Version* must be `MQOD_VERSION_2` or greater.
  - *ObjectType* must be `MQOT_Q`.
  - *ObjectName* must be blank or the null string.
  - *ObjectQMgrName* must be blank or the null string.
  - *RecsPresent* must be greater than zero.
  - One of *ObjectRecOffset* and *ObjectRecPtr* must be zero and the other nonzero.
  - No more than one of *ResponseRecOffset* and *ResponseRecPtr* can be nonzero.
  - There must be *RecsPresent* object records, addressed by either *ObjectRecOffset* or *ObjectRecPtr*. The object records must be set to the names of the destination queues to be opened.

- If one of *ResponseRecOffset* and *ResponseRecPtr* is nonzero, there must be *RecsPresent* response records present. They are set by the queue manager if the call completes with reason code MQRC\_MULTIPLE\_REASONS.

A version-2 MQOD can also be used to open a single queue that is not in a distribution list, by ensuring that *RecsPresent* is zero.

2. Only the following open options are valid in the *Options* parameter:
  - MQOO\_OUTPUT
  - MQOO\_PASS\_\*\_CONTEXT
  - MQOO\_SET\_\*\_CONTEXT
  - MQOO\_ALTERNATE\_USER\_AUTHORITY
  - MQOO\_FAIL\_IF QUIESCING
3. The destination queues in the distribution list can be local, alias, or remote queues, but they cannot be model queues. If a model queue is specified, that queue fails to open, with reason code MQRC\_Q\_TYPE\_ERROR. However, this does not prevent other queues in the list being opened successfully.
4. The completion code and reason code parameters are set as follows:
  - If the open operations for the queues in the distribution list all succeed or fail in the same way, the completion code and reason code parameters are set to describe the common result. The MQRR response records (if provided by the application) are not set in this case.  
For example, if every open succeeds, the completion code is set to MQCC\_OK and the reason code is set to MQRC\_NONE; if every open fails because none of the queues exists, the parameters are set to MQCC\_FAILED and MQRC\_UNKNOWN\_OBJECT\_NAME.
  - If the open operations for the queues in the distribution list do not all succeed or fail in the same way:
    - The completion code parameter is set to MQCC\_WARNING if at least one open succeeded, and to MQCC\_FAILED if all failed.
    - The reason code parameter is set to MQRC\_MULTIPLE\_REASONS.
    - The response records (if provided by the application) are set to the individual completion codes and reason codes for the queues in the distribution list.
5. When a distribution list has been opened successfully, the handle *Hobj* returned by the call can be used on subsequent MQPUT calls to put messages to queues in the distribution list, and on an MQCLOSE call to relinquish access to the distribution list. The only valid close option for a distribution list is MQCO\_NONE.  
The MQPUT1 call can also be used to put a message to a distribution list; the MQOD structure defining the queues in the list is specified as a parameter on that call.
6. Each successfully opened destination in the distribution list counts as a separate handle when checking whether the application has exceeded the permitted maximum number of handles (see the *MaxHandles* queue-manager attribute). This is true even when two or more of the destinations in the distribution list resolve to the same physical queue. If the MQOPEN or MQPUT1 call for a distribution list would cause the number of handles in use by the application to exceed *MaxHandles*, the call fails with reason code MQRC\_HANDLE\_NOT\_AVAILABLE.
7. Each destination that is opened successfully has the value of its *OpenOutputCount* attribute incremented by one. If two or more of the destinations in the distribution list resolve to the same physical queue, that queue has its *OpenOutputCount* attribute incremented by the number of destinations in the distribution list that resolve to that queue.
8. Any change to the queue definitions that would have caused a handle to become invalid had the queues been opened individually (for example, a change in the resolution path), does not cause the distribution-list handle to become invalid. However, it does result in a failure for that particular queue when the distribution-list handle is used on a subsequent MQPUT call.
9. A distribution list can contain only one destination.

## Remote queues

The following notes apply to the use of remote queues.

A remote queue can be specified in one of two ways in the *ObjDesc* parameter of this call.

- By specifying for *ObjectName* the name of a local definition of the remote queue. In this case, *ObjectQMgrName* refers to the local queue manager, and can be specified as blanks or (in the C programming language) a null string.

The security validation performed by the local queue manager verifies that the user is authorized to open the local definition of the remote queue.

- By specifying for *ObjectName* the name of the remote queue as known to the remote queue manager. In this case, *ObjectQMgrName* is the name of the remote queue manager.

The security validation performed by the local queue manager verifies that the user is authorized to send messages to the transmission queue resulting from the name resolution process.

In either case:

- No messages are sent by the local queue manager to the remote queue manager to check that the user is authorized to put messages on the queue.
- When a message arrives at the remote queue manager, the remote queue manager might reject it because the user originating the message is not authorized.

See the *ObjectName* and *ObjectQMgrName* fields described in “MQOD - Object descriptor” on page 2245 for more information.

## Objects

### Security

The following notes relate to the security aspects of using MQOPEN.

The queue manager performs security checks when an MQOPEN call is issued, to verify that the user identifier under which the application is running has the appropriate level of authority before access is permitted. The authority check is made on the name of the object being opened, and not on the name, or names, resulting after a name has been resolved.

If the object being opened is an alias queue which points at a topic object, the queue manager performs a security check on the alias queue name, before performing a security check for the topic as if the topic object had been used directly.

If the object being opened is a topic object, whether with *ObjectName* alone or by using the *ObjectString* (with or without a basing *ObjectName*), the queue manager performs the security check by using the resultant topic string, taken from within the topic object specified in *ObjectName*, and if required concatenating it with that provided in *ObjectString*, and then finding the closest topic object at or above that point in the topic tree to perform the security check against. This might not be the same topic object that was specified in *ObjectName*.

If the object being opened is a model queue, the queue manager performs a full security check against both the name of the model queue and the name of the dynamic queue that is created. If the resulting dynamic queue is then opened explicitly, a further resource security check is performed against the name of the dynamic queue.

On z/OS, the queue manager performs security checks only if security is enabled. For more information about security checking, see Setting up security on z/OS .

## Attributes

The following notes relate to attributes.

The attributes of an object can change while an application has the object open. In many cases, the application does not notice this, but for certain attributes the queue manager marks the handle as no longer valid. These attributes are:

- Any attribute that affects the name resolution of the object. This applies regardless of the open options used, and includes the following:
  - A change to the *BaseQName* attribute of an alias queue that is open.
  - A change to the *TargetType* attribute of an alias queue that is open.
  - A change to the *RemoteQName* or *RemoteQMGrName* queue attributes, for any handle that is open for this queue, or for a queue that resolves through this definition as a queue-manager alias.
  - Any change that causes a currently open handle for a remote queue to resolve to a different transmission queue, or to fail to resolve to one at all. For example, this can include:
    - A change to the *XmitQName* attribute of the local definition of a remote queue, whether the definition is being used for a queue, or for a queue-manager alias.
    - (z/OS only) A change to the value of the *IntraGroupqueuing* queue-manager attribute, or a change in the definition of the shared transmission queue (SYSTEM.QSG.TRANSMIT.QUEUE) used by the IGQ agent.

There is one exception to this: the creation of a new transmission queue. A handle that would have resolved to this queue had it been present when the handle was opened, but instead resolved to the default transmission queue, is not made invalid.

- A change to the *DefXmitQName* queue-manager attribute. In this case all open handles that resolved to the previously named queue (that resolved to it only because it was the default transmission queue) are marked as invalid. Handles that resolved to this queue for other reasons are not affected.
- The *Shareability* queue attribute, if there are two or more handles that are currently providing MQOO\_INPUT\_SHARED access for this queue, or for a queue that resolves to this queue. If so, *all* handles that are open for this queue, or for a queue that resolves to this queue, are marked as invalid, regardless of the open options.

On z/OS, the handles previously described are marked as invalid if one or more handles is currently providing MQOO\_INPUT\_SHARED or MQOO\_INPUT\_EXCLUSIVE access to the queue.
- The *Usage* queue attribute, for all handles that are open for this queue, or for a queue that resolves to this queue, regardless of the open options.

When a handle is marked as invalid, all subsequent calls (other than MQCLOSE) using this handle fail with reason code MQRC\_OBJECT\_CHANGED. The application must issue an MQCLOSE call (using the original handle) and then reopen the queue. Any uncommitted updates against the old handle from previous successful calls can still be committed or backed out, as required by the application logic.

If changing an attribute causes this to happen, use a special force version of the call.

## C invocation

```
MQOPEN (Hconn, &ObjDesc, Options, &Hobj, &CompCode,  
        &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;    /* Connection handle */  
MQOD     ObjDesc;  /* Object descriptor */  
MQLONG   Options;  /* Options that control the action of MQOPEN */  
MQHOBJ   Hobj;     /* Object handle */  
MQLONG   CompCode; /* Completion code */  
MQLONG   Reason;   /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQOPEN' USING HCONN, OBJDESC, OPTIONS, HOBJ, COMPCODE, REASON
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN    PIC S9(9) BINARY.
** Object descriptor
01 OBJDESC.
   COPY CMQODV.
** Options that control the action of MQOPEN
01 OPTIONS  PIC S9(9) BINARY.
** Object handle
01 HOBJ     PIC S9(9) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON   PIC S9(9) BINARY.
```

## PL/I invocation

```
call MQOPEN (Hconn, ObjDesc, Options, Hobj, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn    fixed bin(31); /* Connection handle */
dc1 ObjDesc  like MQOD;     /* Object descriptor */
dc1 Options  fixed bin(31); /* Options that control the action of
                             MQOPEN */
dc1 Hobj     fixed bin(31); /* Object handle */
dc1 CompCode fixed bin(31); /* Completion code */
dc1 Reason   fixed bin(31); /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

```
CALL MQOPEN,(HCONN,OBJDESC,OPTIONS,HOBJ,COMPCODE,REASON)
```

Declare the parameters as follows:

```
HCONN    DS      F  Connection handle
OBJDESC  CMQODA  ,  Object descriptor
OPTIONS  DS      F  Options that control the action of MQOPEN
HOBJ     DS      F  Object handle
COMPCODE DS      F  Completion code
REASON   DS      F  Reason code qualifying COMPCODE
```

## Visual Basic invocation

```
MQOPEN Hconn, ObjDesc, Options, Hobj, CompCode, Reason
```

Declare the parameters as follows:

```
Dim Hconn    As Long 'Connection handle'
Dim ObjDesc  As MQOD 'Object descriptor'
Dim Options  As Long 'Options that control the action of MQOPEN'
Dim Hobj     As Long 'Object handle'
Dim CompCode As Long 'Completion code'
Dim Reason   As Long 'Reason code qualifying CompCode'
```

## **MQPUT - Put message:**

The MQPUT call puts a message on a queue or distribution list, or to a topic. The queue, distribution list, or topic must already be open.

### **Syntax**

MQPUT (*Hconn*, *Hobj*, *MsgDesc*, *PutMsgOpts*, *BufferLength*, *Buffer*, *CompCode*, *Reason*)

### **Parameters**

#### ***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn*:

#### **MQHC\_DEF\_HCONN**

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

#### ***Hobj***

Type: MQHOBJ - input

This handle represents the queue to which the message is added, or the topic to which the message is published. The value of *Hobj* was returned by a previous MQOPEN call that specified the MQOO\_OUTPUT option.

#### ***MsgDesc***

Type: MQMD - input/output

This structure describes the attributes of the message being sent, and receives information about the message after the put request is complete. See “MQMD - Message descriptor” on page 2179 for details.

If the application provides a version-1 MQMD, the message data can be prefixed with an MQMDE structure to specify values for the fields that exist in the version-2 MQMD but not the version-1. The *Format* field in the MQMD must be set to MQFMT\_MD\_EXTENSION to indicate that an MQMDE is present. See “MQMDE - Message descriptor extension” on page 2234 for more details.

The application does not need to provide an MQMD structure if a valid message handle is supplied in the *OriginalMsgHandle* or *NewMsgHandle* fields of the MQPMO structure. If nothing is provided in one of these fields, the descriptor of the message is taken from the descriptor associated with the message handles.

If you use, or plan to use, API exits then we recommend that you explicitly supply an MQMD structure and do not use the message descriptors associated with the message handles. This is because the API Exit associated with MQPUT or MQPUT1 call is unable to ascertain which MQMD values are used by the queue manager to complete the MQPUT or MQPUT1 request.

#### ***PutMsgOpts***

Type: MQPMO - input/output

See “MQPMO - Put-message options” on page 2269 for details.

#### ***BufferLength***

Type: MQLONG - input

The length of the message in *Buffer*. Zero is valid, and indicates that the message contains no application data. The upper limit for *BufferLength* depends on various factors:

- If the destination is a local queue or resolves to a local queue, the upper limit depends on whether:
  - The local queue manager supports segmentation.
  - The sending application specifies the flag that allows the queue manager to segment the message. This flag is MQMF\_SEGMENTATION\_ALLOWED, and can be specified either in a version-2 MQMD, or in an MQMDE used with a version-1 MQMD.

If both of these conditions are satisfied, *BufferLength* cannot exceed 999 999 999 minus the value of the *Offset* field in MQMD. The longest logical message that can be put is therefore 999 999 999 bytes (when *Offset* is zero). However, resource constraints imposed by the operating system or environment in which the application is running might result in a lower limit.

If one or both of the previous conditions is not satisfied, *BufferLength* cannot exceed the smaller of the queue's *MaxMsgLength* attribute and queue-manager's *MaxMsgLength* attribute.

- If the destination is a remote queue or resolves to a remote queue, the conditions for local queues apply, *but at each queue manager through which the message must pass in order to reach the destination queue*; in particular:
  1. The local transmission queue used to store the message temporarily at the local queue manager
  2. Intermediate transmission queues (if any) used to store the message at queue managers on the route between the local and destination queue managers
  3. The destination queue at the destination queue manager

The longest message that can be put is therefore governed by the most restrictive of these queues and queue managers.

When a message is on a transmission queue, additional information resides with the message data, and this reduces the amount of application data that can be carried. In this situation, subtract MQ\_MSG\_HEADER\_LENGTH bytes from the *MaxMsgLength* values of the transmission queues when determining the limit for *BufferLength*.

**Note:** Only failure to comply with condition 1 can be diagnosed synchronously (with reason code MQRC\_MSG\_TOO\_BIG\_FOR\_Q or MQRC\_MSG\_TOO\_BIG\_FOR\_Q\_MGR) when the message is put. If conditions 2 or 3 are not satisfied, the message is redirected to a dead-letter (undelivered-message) queue, either at an intermediate queue manager or at the destination queue manager. If this happens, a report message is generated if one was requested by the sender.

## **Buffer**

Type: MQBYTEExBufferLength - input

This is a buffer containing the application data to be sent. The buffer must be aligned on a boundary appropriate to the nature of the data in the message. 4-byte alignment is suitable for most messages (including messages containing IBM MQ header structures), but some messages might require more stringent alignment. For example, a message containing a 64-bit binary integer might require 8-byte alignment.

If *Buffer* contains character or numeric data, set the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to the values appropriate to the data; this enables the receiver of the message to convert the data (if necessary) to the character set and encoding used by the receiver.

**Note:** All the other parameters on the MQPUT call must be in the character set and encoding of the local queue manager (given by the *CodedCharSetId* queue-manager attribute and MQENC\_NATIVE).

In the C programming language, the parameter is declared as a pointer-to-void; the address of any type of data can be specified as the parameter.

If the *BufferLength* parameter is zero, *Buffer* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler can be null.

**CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

**MQCC\_OK**

Successful completion.

**MQCC\_WARNING**

Warning (partial completion).

**MQCC\_FAILED**

Call failed.

**Reason**

Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_INCOMPLETE\_GROUP**

(2241, X'8C1') Message group not complete.

**MQRC\_INCOMPLETE\_MSG**

(2242, X'8C2') Logical message not complete.

**MQRC\_INCONSISTENT\_PERSISTENCE**

(2185, X'889') Inconsistent persistence specification.

**MQRC\_INCONSISTENT\_UOW**

(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC\_MULTIPLE\_REASONS**

(2136, X'858') Multiple reason codes returned.

**MQRC\_PRIORITY\_EXCEEDS\_MAXIMUM**

(2049, X'801') Message Priority exceeds maximum value supported.

**MQRC\_UNKNOWN\_REPORT\_OPTION**

(2104, X'838') Report option(s) in message descriptor not recognized.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'89C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

**MQRC\_ALIAS\_TARGTYPE\_CHANGED**

(2480, X'09B0') Subscription target type has changed from queue to topic object.

**MQRC\_API\_EXIT\_ERROR**

(2374, X'946') API exit failed.

**MQRC\_API\_EXIT\_LOAD\_ERROR**

(2183, X'887') Unable to load API exit.

**MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_BACKED\_OUT**  
(2003, X'7D3') Unit of work backed out.

**MQRC\_BUFFER\_ERROR**  
(2004, X'7D4') Buffer parameter not valid.

**MQRC\_BUFFER\_LENGTH\_ERROR**  
(2005, X'7D5') Buffer length parameter not valid.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CALL\_INTERRUPTED**  
(2549, X'9F5') MQPUT or MQCMIT was interrupted and reconnection processing cannot reestablish a definite outcome.

**MQRC\_CF\_NOT\_AVAILABLE**  
(2345, X'929') Coupling facility not available.

**MQRC\_CF\_STRUC\_FAILED**  
(2373, X'945') Coupling-facility structure failed.

**MQRC\_CF\_STRUC\_IN\_USE**  
(2346, X'92A') Coupling-facility structure in use.

**MQRC\_CFGR\_ERROR**  
(2416, X'970') PCF group parameter structure MQCFGR in the message data is not valid.

**MQRC\_CFH\_ERROR**  
(2235, X'8BB') PCF header structure not valid.

**MQRC\_CFIF\_ERROR**  
(2414, X'96E') PCF integer filter parameter structure in the message data is not valid.

**MQRC\_CFIL\_ERROR**  
(2236, X'8BC') PCF integer list parameter structure or PCIF\*64 integer list parameter structure not valid.

**MQRC\_CFIN\_ERROR**  
(2237, X'8BD') PCF integer parameter structure or PCIF\*64 integer parameter structure not valid.

**MQRC\_CFSF\_ERROR**  
(2415, X'96F') PCF string filter parameter structure in the message data is not valid.

**MQRC\_CFSL\_ERROR**  
(2238, X'8BE') PCF string list parameter structure not valid.

**MQRC\_CFST\_ERROR**  
(2239, X'8BF') PCF string parameter structure not valid.

**MQRC\_CICS\_WAIT\_FAILED**  
(2140, X'85C') Wait request rejected by CICS.

**MQRC\_CLUSTER\_EXIT\_ERROR**  
(2266, X'8DA') Cluster workload exit failed.

**MQRC\_CLUSTER\_RESOLUTION\_ERROR**  
(2189, X'88D') Cluster name resolution failed.

**MQRC\_CLUSTER\_RESOURCE\_ERROR**  
(2269, X'8DD') Cluster resource error.

**MQRC\_COD\_NOT\_VALID\_FOR\_XCF\_Q**  
(2106, X'83A') COD report option not valid for XCF queue.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_NOT\_AUTHORIZED**  
(2217, X'8A9') Not authorized for connection.

**MQRC\_CONNECTION\_QUIESCING**  
(2202, X'89A') Connection quiescing.

**MQRC\_CONNECTION\_STOPPING**  
(2203, X'89B') Connection shutting down.

**MQRC\_CONTENT\_ERROR**  
2554 (X'09FA') Message content could not be parsed to determine whether the message should be delivered to a subscriber with an extended message selector.

**MQRC\_CONTEXT\_HANDLE\_ERROR**  
(2097, X'831') Queue handle referred to does not save context.

**MQRC\_CONTEXT\_NOT\_AVAILABLE**  
(2098, X'832') Context not available for queue handle referred to.

**MQRC\_DATA\_LENGTH\_ERROR**  
(2010, X'7DA') Data length parameter not valid.

**MQRC\_DH\_ERROR**  
(2135, X'857') Distribution header structure not valid.

**MQRC\_DLH\_ERROR**  
(2141, X'85D') Dead letter header structure not valid.

**MQRC\_EPH\_ERROR**  
(2420, X'974') Embedded PCF structure not valid.

**MQRC\_EXPIRY\_ERROR**  
(2013, X'7DD') Expiry time not valid.

**MQRC\_FEEDBACK\_ERROR**  
(2014, X'7DE') Feedback code not valid.

**MQRC\_GLOBAL\_UOW\_CONFLICT**  
(2351, X'92F') Global units of work conflict.

**MQRC\_GROUP\_ID\_ERROR**  
(2258, X'8D2') Group identifier not valid.

**MQRC\_HANDLE\_IN\_USE\_FOR\_UOW**  
(2353, X'931') Handle in use for global unit of work.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_HEADER\_ERROR**  
(2142, X'85E') MQ header structure not valid.

**MQRC\_HOBJ\_ERROR**  
(2019, X'7E3') Object handle not valid.

**MQRC\_IH\_ERROR**  
(2148, X'864') IMS information header structure not valid.

**MQRC\_INCOMPLETE\_GROUP**  
(2241, X'8C1') Message group not complete.

**MQRC\_INCOMPLETE\_MSG**  
(2242, X'8C2') Logical message not complete.

**MQRC\_INCONSISTENT\_PERSISTENCE**  
(2185, X'889') Inconsistent persistence specification.

**MQRC\_INCONSISTENT\_UOW**  
(2245, X'8C5') Inconsistent unit-of-work specification.

**MQRC\_LOCAL\_UOW\_CONFLICT**  
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC\_MD\_ERROR**  
(2026, X'7EA') Message descriptor not valid.

**MQRC\_MDE\_ERROR**  
(2248, X'8C8') Message descriptor extension not valid.

**MQRC\_MISSING\_REPLY\_TO\_Q**  
(2027, X'7EB') Missing reply-to queue or MQPMO\_SUPPRESS\_REPLYTO was used

**MQRC\_MISSING\_WIH**  
(2332, X'91C') Message data does not begin with MQWIH.

**MQRC\_MSG\_FLAGS\_ERROR**  
(2249, X'8C9') Message flags not valid.

**MQRC\_MSG\_SEQ\_NUMBER\_ERROR**  
(2250, X'8CA') Message sequence number not valid.

**MQRC\_MSG\_TOO\_BIG\_FOR\_Q**  
(2030, X'7EE') Message length greater than maximum for queue.

**MQRC\_MSG\_TOO\_BIG\_FOR\_Q\_MGR**  
(2031, X'7EF') Message length greater than maximum for queue manager.

**MQRC\_MSG\_TYPE\_ERROR**  
(2029, X'7ED') Message type in message descriptor not valid.

**MQRC\_MULTIPLE\_REASONS**  
(2136, X'858') Multiple reason codes returned.

**MQRC\_NO\_DESTINATIONS\_AVAILABLE**  
(2270, X'8DE') No destination queues available.

**MQRC\_NOT\_OPEN\_FOR\_OUTPUT**  
(2039, X'7F7') Queue not open for output.

**MQRC\_NOT\_OPEN\_FOR\_PASS\_ALL**  
(2093, X'82D') Queue not open for pass all context.

**MQRC\_NOT\_OPEN\_FOR\_PASS\_IDENT**  
(2094, X'82E') Queue not open for pass identity context.

**MQRC\_NOT\_OPEN\_FOR\_SET\_ALL**  
(2095, X'82F') Queue not open for set all context.

**MQRC\_NOT\_OPEN\_FOR\_SET\_IDENT**  
(2096, X'830') Queue not open for set identity context.

**MQRC\_OBJECT\_CHANGED**  
(2041, X'7F9') Object definition changed since opened.

**MQRC\_OBJECT\_DAMAGED**  
(2101, X'835') Object damaged.

**MQRC\_OFFSET\_ERROR**  
(2251, X'8CB') Message segment offset not valid.

**MQRC\_OPEN\_FAILED**  
(2137, X'859') Object not opened successfully.

**MQRC\_OPTIONS\_ERROR**  
(2046, X'7FE') Options not valid or not consistent.

**MQRC\_ORIGINAL\_LENGTH\_ERROR**  
(2252, X'8CC') Original length not valid.

**MQRC\_PAGESET\_ERROR**  
(2193, X'891') Error accessing page-set data set.

**MQRC\_PAGESET\_FULL**  
(2192, X'890') External storage medium is full.

**MQRC\_PCF\_ERROR**  
(2149, X'865') PCF structures not valid.

**MQRC\_PERSISTENCE\_ERROR**  
(2047, X'7FF') Persistence not valid.

**MQRC\_PERSISTENT\_NOT\_ALLOWED**  
(2048, X'800') Queue does not support persistent messages.

**MQRC\_PMO\_ERROR**  
(2173, X'87D') Put-message options structure not valid.

**MQRC\_PMO\_RECORD\_FLAGS\_ERROR**  
(2158, X'86E') Put message record flags not valid.

**MQRC\_PRIORITY\_ERROR**  
(2050, X'802') Message priority not valid.

**MQRC\_PUBLICATION\_FAILURE**  
(2502, X'9C6') The publication has not been delivered to any of the subscribers.

**MQRC\_PUT\_INHIBITED**  
(2051, X'803') Put calls inhibited for the queue, for the queue to which this queue resolves, or the topic.

**MQRC\_PUT\_MSG\_RECORDS\_ERROR**  
(2159, X'86F') Put message records not valid.

**MQRC\_PUT\_NOT\_RETAINED**  
(2479, X'09AF') Publication could not be retained

**MQRC\_Q\_DELETED**  
(2052, X'804') Queue has been deleted.

**MQRC\_Q\_FULL**  
(2053, X'805') Queue already contains maximum number of messages.

**MQRC\_Q\_MGR\_NAME\_ERROR**  
(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**  
(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR QUIESCING**  
(2161, X'871') Queue manager quiescing.

**MQRC\_Q\_MGR\_STOPPING**  
(2162, X'872') Queue manager shutting down.

**MQRC\_Q\_SPACE\_NOT\_AVAILABLE**  
(2056, X'808') No space available on disk for queue.

**MQRC\_RECONNECT\_FAILED**  
(2548, X'9F4') After reconnecting, an error occurred reinstating the handles for a reconnectable connection.

**MQRC\_RECS\_PRESENT\_ERROR**  
(2154, X'86A') Number of records present not valid.

**MQRC\_REPORT\_OPTIONS\_ERROR**  
(2061, X'80D') Report options in message descriptor not valid.

**MQRC\_RESOURCE\_PROBLEM**  
(2102, X'836') Insufficient system resources available.

**MQRC\_RESPONSE\_RECORDS\_ERROR**  
(2156, X'86C') Response records not valid.

**MQRC\_RFH\_ERROR**  
(2334, X'91E') MQRFH or MQRFH2 structure not valid.

**MQRC\_RMH\_ERROR**  
(2220, X'8AC') Reference message header structure not valid.

**MQRC\_SEGMENT\_LENGTH\_ZERO**  
(2253, X'8CD') Length of data in message segment is zero.

**MQRC\_SEGMENTS\_NOT\_SUPPORTED**  
(2365, X'93D') Segments not supported.

**MQRC\_SELECTION\_NOT\_AVAILABLE**  
2551 (X'09F7') A possible subscriber for the publication exists, but the queue manager cannot check whether to send the publication to the subscriber.

**MQRC\_STOPPED\_BY\_CLUSTER\_EXIT**  
(2188, X'88C') Call rejected by cluster workload exit.

**MQRC\_STORAGE\_CLASS\_ERROR**  
(2105, X'839') Storage class error.

**MQRC\_STORAGE\_MEDIUM\_FULL**  
(2192, X'890') External storage medium is full.

**MQRC\_STORAGE\_NOT\_AVAILABLE**  
(2071, X'817') Insufficient storage available.

**MQRC\_SUPPRESSED\_BY\_EXIT**  
(2109, X'83D') Call suppressed by exit program.

**MQRC\_SYNCPOINT\_LIMIT\_REACHED**  
(2024, X'7E8') No more messages can be handled within current unit of work.

**MQRC\_SYNCPOINT\_NOT\_AVAILABLE**  
(2072, X'818') Syncpoint support not available.

**MQRC\_TM\_ERROR**  
(2265, X'8D9') Trigger message structure not valid.

**MQRC\_TMC\_ERROR**  
(2191, X'88F') Character trigger message structure not valid.

**MQRC\_UNEXPECTED\_ERROR**  
(2195, X'893') Unexpected error occurred.

**MQRC\_UOW\_ENLISTMENT\_ERROR**  
(2354, X'932') Enlistment in global unit of work failed.

**MQRC\_UOW\_MIX\_NOT\_SUPPORTED**

(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC\_UOW\_NOT\_AVAILABLE**

(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC\_WIH\_ERROR**

(2333, X'91D') MQWIH structure not valid.

**MQRC\_WRONG\_MD\_VERSION**

(2257, X'8D1') Wrong version of MQMD supplied.

**MQRC\_XQH\_ERROR**

(2260, X'8D4') Transmission queue header structure not valid.

For detailed information about these codes, see Reason codes.

**Topic usage notes**

1. The following notes apply to the use of topics:

- a. When using MQPUT to publish messages on a topic, where one or more subscribers to that topic cannot be given the publication due to a problem with their subscriber queue (for example it is full), the Reason code returned to the MQPUT call and the delivery behavior is dependent on the setting of the PMSGDLV or NPMSGDLV attributes on the TOPIC. Note delivery of a publication to the dead letter queue when MQRO\_DEAD\_LETTER\_Q is specified, or discarding the message when MQRO\_DISCARD\_MSG is specified, is considered as a successful delivery of the message. If none of the publications are delivered, the MQPUT returns with MQRC\_PUBLICATION\_FAILURE. This can happen in the following cases:

- A message is published to a TOPIC with PMSGDLV or NPMSGDLV (depending on the persistence of the message) set to ALL and any subscription (durable or not) has a queue which cannot receive the publication.
- A message is published to a TOPIC with PMSGDLV or NPMSGDLV (depending on the persistence of the message) set to ALLDUR and a durable subscription has a queue which cannot receive the publication.

The MQPUT can return with MQRC\_NONE even though publications could not be delivered to some subscribers in the following cases:

- A message is published to a TOPIC with PMSGDLV or NPMSGDLV (depending on the persistence of the message) set to ALLAVAIL and any subscription, durable or not, has a queue which cannot receive the publication.
- A message is published to a TOPIC with PMSGDLV or NPMSGDLV (depending on the persistence of the message) set to ALLDUR and a non-durable subscription has a queue which cannot receive the publication.

You can use the USEDQLQ topic attribute to determine whether the dead-letter queue is used when publication messages cannot be delivered to their correct subscriber queue. For more information about the use of USEDQLQ, see DEFINE TOPIC.

- b. If there are no subscribers to the topic being used, the message published is not sent to any queue and is discarded. It does not matter whether the message is persistent or non-persistent, or whether it has unlimited expiry or has an expiry time, it is still discarded if there are no subscribers. The exception to this is if the message is to be retained, in which case, although it is not sent to any subscribers' queues, it is stored against the topic to be delivered to any new subscriptions or to any subscribers that ask for retained publications using MQSUBRQ.

**MQPUT and MQPUT1**

You can use both the MQPUT and MQPUT1 calls to put messages on a queue; which call to use depends on the circumstances

- Use the MQPUT call to place multiple messages on the *same* queue.  
An MQOPEN call specifying the MQOO\_OUTPUT option is issued first, followed by one or more MQPUT requests to add messages to the queue; finally the queue is closed with an MQCLOSE call. This gives better performance than repeated use of the MQPUT1 call.
- Use the MQPUT1 call to put only *one* message on a queue.  
This call encapsulates the MQOPEN, MQPUT, and MQCLOSE calls into a single call, minimizing the number of calls that must be issued.

## Destination Queues

The following notes apply to the use of destination queues:

1. If an application puts a sequence of messages on the same queue without using message groups, the order of those messages is preserved if the conditions detailed are satisfied. Some conditions apply to both local and remote destination queues; other conditions apply only to remote destination queues.

### Conditions that apply to local and remote destination queues

- All the MQPUT calls are within the same unit of work, or none of them is within a unit of work.  
Be aware that when messages are put onto a particular queue within a single unit of work, messages from other applications might be interspersed with the sequence of messages on the queue.
- All the MQPUT calls are made using the same object handle *Hobj*.  
In some environments, message sequence is also preserved when different object handles are used, if the calls are made from the same application. The meaning of *same application* is determined by the environment:
  - On z/OS, the application is:
    - For CICS, the CICS task
    - For IMS, the task
    - For z/OS batch, the task
  - On IBM i, the application is the job.
  - On Windows and UNIX systems, the application is the thread.
- The messages all have the same priority.
- The messages are not put to a cluster queue with MQOO\_BIND\_NOT\_FIXED specified (or with MQOO\_BIND\_AS\_Q\_DEF in effect when the DefBind queue attribute has the value MQBND\_BIND\_NOT\_FIXED).

### Additional conditions that apply to remote destination queues

- There is only one path from the sending queue manager to the destination queue manager.  
If some messages in the sequence might go on a different path (for example, because of reconfiguration, traffic balancing, or path selection based on message size), the order of the messages at the destination queue manager cannot be guaranteed.
- Messages are not placed temporarily on dead-letter queues at the sending, intermediate, or destination queue managers.  
If one or more of the messages is put temporarily on a dead-letter queue (for example, because a transmission queue or the destination queue is temporarily full), the messages can arrive on the destination queue out of sequence.
- The messages are either all persistent or all nonpersistent.  
If a channel on the route between the sending and destination queue managers has its *NonPersistentMsgSpeed* attribute set to MQNPMMS\_FAST, nonpersistent messages can jump ahead of persistent messages, resulting in the order of persistent messages relative to nonpersistent messages not being preserved. However, the order of persistent messages relative to each other, and of nonpersistent messages relative to each other, is preserved.

If these conditions are not satisfied, you can use message groups to preserve message order, but this requires both the sending and receiving applications to use the message-grouping support. For more information about message groups, see:

- MQMD - MsgFlags field
- MQPMO\_LOGICAL\_ORDER
- MQGMO\_LOGICAL\_ORDER

## Distribution Lists

The following notes apply to the use of distribution lists.

Distribution lists are supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

1. You can put messages to a distribution list using either a version-1 or a version-2 MQPMO. If you use a version-1 MQPMO (or a version-2 MQPMO with *RecsPresent* equal to zero), the application can provide no put message records or response records. You cannot identify the queues that encounter errors if the message is sent successfully to some queues in the distribution list and not others.

If the application provides put message records or response records, set the *Version* field to MQPMO\_VERSION\_2.

You can also use a version-2 MQPMO to send messages to a single queue that is not in a distribution list, by ensuring that *RecsPresent* is zero.

2. The completion code and reason code parameters are set as follows:

- If the puts to the queues in the distribution list all succeed or fail in the same way, the completion code and reason code parameters are set to describe the common result. The MQRR response records (if provided by the application) are not set in this case.

For example, if every put succeeds, the completion code and reason code are set to MQCC\_OK and MQRC\_NONE; if every put fails because all the queues are inhibited for puts, the parameters are set to MQCC\_FAILED and MQRC\_PUT\_INHIBITED.

- If the puts to the queues in the distribution list do not all succeed or fail in the same way:
  - The completion code parameter is set to MQCC\_WARNING if at least one put succeeded, and to MQCC\_FAILED if all failed.
  - The reason code parameter is set to MQRC\_MULTIPLE\_REASONS.
  - The response records (if provided by the application) are set to the individual completion codes and reason codes for the queues in the distribution list.

If the put to a destination fails because the open for that destination failed, the fields in the response record are set to MQCC\_FAILED and MQRC\_OPEN\_FAILED; that destination is included in *InvalidDestCount*.

3. If a destination in the distribution list resolves to a local queue, the message is placed on that queue in normal form (that is, not as a distribution-list message). If more than one destination resolves to the same local queue, one message is placed on the queue for each such destination.

If a destination in the distribution list resolves to a remote queue, a message is placed on the appropriate transmission queue. Where several destinations resolve to the same transmission queue, a single distribution-list message containing those destinations can be placed on the transmission queue, even if those destinations were not adjacent in the list of destinations provided by the application. However, this can be done only if the transmission queue supports distribution-list messages (see *DistLists* ).

If the transmission queue does not support distribution lists, one copy of the message in normal form is placed on the transmission queue for each destination that uses that transmission queue.

If a distribution list with the application message data is too large for a transmission queue, the distribution list message is split into smaller distribution-list messages, each containing fewer

destinations. If the application message data only just fits on the queue, distribution-list messages cannot be used at all, and the queue manager generates one copy of the message in normal form for each destination that uses that transmission queue.

If different destinations have different message priority or message persistence (this can occur when the application specifies MQPRI\_PRIORITY\_AS\_Q\_DEF or MQPER\_PERSISTENCE\_AS\_Q\_DEF), the messages are not held in the same distribution-list message. Instead, the queue manager generates as many distribution-list messages as are necessary to accommodate the differing priority and persistence values.

4. A put to a distribution list can result in:

- A single distribution-list message, or
- A number of smaller distribution-list messages, or
- A mixture of distribution list messages and normal messages, or
- Normal messages only.

Which of the above occurs depends on whether:

- The destinations in the list are local, remote, or a mixture.
- The destinations have the same message priority and message persistence.
- The transmission queues can hold distribution-list messages.
- The transmission queues' maximum message lengths are large enough to accommodate the message in distribution-list form.

However, regardless of which of the above occurs, each *physical* message resulting (that is, each normal message or distribution-list message resulting from the put) counts as only *one* message when:

- Checking whether the application has exceeded the permitted maximum number of messages in a unit of work (see the *MaxUncommittedMsgs* queue-manager attribute).
- Checking whether the triggering conditions are satisfied.
- Incrementing queue depths and checking whether the queues' maximum queue depth would be exceeded.

5. Any change to the queue definitions that would have caused a handle to become invalid had the queues been opened individually (for example, a change in the resolution path), does not cause the distribution-list handle to become invalid. However, it does result in a failure for that particular queue when the distribution-list handle is used on a subsequent MQPUT call.

## Headers

If a message is put with one or more IBM MQ header structures at the beginning of the application message data, the queue manager performs certain checks on the header structures to verify that they are valid. If the queue manager detects an error, the call fails with an appropriate reason code. The checks performed vary according to the particular structures that are present:

- Checks are performed only if a version-2 or later MQMD is used on the MQPUT or MQPUT1 call. Checks are not performed if a version-1 MQMD is used, even if an MQMDE is present at the start of the message data.
- Structures that are not supported by the local queue manager, and structures following the first MQDLH in the message, are not validated.
- The MQDHE and MQMDE structures are validated completely by the queue manager.
- Other structures are validated partially by the queue manager (not all fields are checked).

General checks performed by the queue manager include the following:

- The *StrucId* field must be valid.
- The *Version* field must be valid.
- The *StrucLength* field must specify a value that is large enough to include the structure plus any variable-length data that forms part of the structure.

- The *CodedCharSetId* field must not be zero, or a negative value that is not valid (MQCCSI\_DEFAULT, MQCCSI\_EMBEDDED, MQCCSI\_Q\_MGR, and MQCCSI\_UNDEFINED are *not* valid in most IBM MQ header structures).
- The *BufferLength* parameter of the call must specify a value that is large enough to include the structure (the structure must not extend beyond the end of the message).

In addition to general checks on structures, the following conditions must be satisfied:

- The sum of the lengths of the structures in a PCF message must equal the length specified by the *BufferLength* parameter on the MQPUT or MQPUT1 call. A PCF message is a message that has a format name of MQFMT\_ADMIN, MQFMT\_EVENT, or MQFMT\_PCF.
- An IBM MQ structure must not be truncated, except in the following situations where truncated structures are permitted:
  - Messages that are report messages.
  - PCF messages.
  - Messages containing an MQDLH structure. (Structures *following* the first MQDLH can be truncated; structures preceding the MQDLH cannot.)
- An IBM MQ structure must not be split over two or more segments; the structure must be contained entirely within one segment.

## Buffer

For the Visual Basic programming language, the following points apply:

- If the size of the *Buffer* parameter is less than the length specified by the *BufferLength* parameter, the call fails with reason code MQRC\_BUFFER\_LENGTH\_ERROR.
- The *Buffer* parameter is declared as being of type String. If the data to be placed on the queue is not of type String, use the MQPUTAny call in place of MQPUT.

The MQPUTAny call has the same parameters as the MQPUT call, except that the *Buffer* parameter is declared as being of type Any, allowing any type of data to be placed on the queue. However, this means that *Buffer* cannot be checked to ensure that it is at least *BufferLength* bytes in size.

## C invocation

```
MQPUT (Hconn, Hobj, &MsgDesc, &PutMsgOpts, BufferLength, Buffer,
      &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;          /* Connection handle */
MQHOBJ   Hobj;          /* Object handle */
MQMD     MsgDesc;       /* Message descriptor */
MQPMO    PutMsgOpts;    /* Options that control the action of MQPUT */
MQLONG   BufferLength;   /* Length of the message in Buffer */
MQBYTE   Buffer[n];     /* Message data */
MQLONG   CompCode;     /* Completion code */
MQLONG   Reason;       /* Reason code qualifying CompCode */
```

## COBOL invocation

```
CALL 'MQPUT' USING HCONN, HOBJ, MSGDESC, PUTMSGOPTS, BUFFERLENGTH,
                  BUFFER, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN          PIC S9(9) BINARY.
** Object handle
01 HOBJ           PIC S9(9) BINARY.
** Message descriptor
01 MSGDESC.
```

```

COPY CMQMDV.
** Options that control the action of MQPUT
01 PUTMSGOPTS.
COPY CMQPMOV.
** Length of the message in BUFFER
01 BUFFERLENGTH PIC S9(9) BINARY.
** Message data
01 BUFFER PIC X(n).
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON PIC S9(9) BINARY.

```

### PL/I invocation

```
call MQPUT (Hconn, Hobj, MsgDesc, PutMsgOpts, BufferLength, Buffer,
           CompCode, Reason);
```

Declare the parameters as follows:

```

dc1 Hconn      fixed bin(31); /* Connection handle */
dc1 Hobj       fixed bin(31); /* Object handle */
dc1 MsgDesc    like MQMD;    /* Message descriptor */
dc1 PutMsgOpts like MQPMO;    /* Options that control the action of
                             MQPUT */
dc1 BufferLength fixed bin(31); /* Length of the message in Buffer */
dc1 Buffer      char(n);      /* Message data */
dc1 CompCode   fixed bin(31); /* Completion code */
dc1 Reason     fixed bin(31); /* Reason code qualifying CompCode */

```

### High Level Assembler invocation

```
CALL MQPUT, (HCONN, HOBJ, MSGDESC, PUTMSGOPTS, BUFFERLENGTH, X
            BUFFER, COMPCODE, REASON)
```

Declare the parameters as follows:

HCONN	DS	F	Connection handle
HOBJ	DS	F	Object handle
MSGDESC	CMQMDA	,	Message descriptor
PUTMSGOPTS	CMQPMOA	,	Options that control the action of MQPUT
BUFFERLENGTH	DS	F	Length of the message in BUFFER
BUFFER	DS	CL(n)	Message data
COMPCODE	DS	F	Completion code
REASON	DS	F	Reason code qualifying COMPCODE

### Visual Basic invocation

```
MQPUT Hconn, Hobj, MsgDesc, PutMsgOpts, BufferLength, Buffer, CompCode,
      Reason
```

Declare the parameters as follows:

```

Dim Hconn      As Long 'Connection handle'
Dim Hobj       As Long 'Object handle'
Dim MsgDesc    As MQMD 'Message descriptor'
Dim PutMsgOpts As MQPMO 'Options that control the action of MQPUT'
Dim BufferLength As Long 'Length of the message in Buffer'
Dim Buffer      As String 'Message data'
Dim CompCode   As Long 'Completion code'
Dim Reason     As Long 'Reason code qualifying CompCode'

```

## MQPUT1 - Put one message:

The MQPUT1 call puts one message on a queue, or distribution list, or to a topic.

The queue, distribution list, or topic does not need to be open.

### Syntax

MQPUT1 (*Hconn*, *ObjDesc*, *MsgDesc*, *PutMsgOpts*, *BufferLength*, *Buffer*, *CompCode*, *Reason*)

### Parameters

#### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn*:

#### **MQHC\_DEF\_HCONN**

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See *Compatibility mode for RPG applications on IBM i*

#### **ObjDesc**

Type: MQOD - input/output

This is a structure that identifies the queue to which the message is added, or the topic to which the message is published. See “MQOD - Object descriptor” on page 2245 for details.

If the structure is a queue, the user must be authorized to open the queue for output. The queue must **not** be a model queue.

#### **MsgDesc**

Type: MQMD - input/output

This structure describes the attributes of the message being sent, and receives feedback information after the put request is complete. See “MQMD - Message descriptor” on page 2179 for details.

If the application provides a version-1 MQMD, the message data can be prefixed with an MQMDE structure to specify values for the fields that exist in the version-2 MQMD but not the version-1. Set the *Format* field in the MQMD to MQFMT\_MD\_EXTENSION to indicate that an MQMDE is present. See “MQMDE - Message descriptor extension” on page 2234 for more details.

The application does not need to provide an MQMD structure if a valid message handle is supplied in the *MsgHandle* field of the MQGMO structure or in the *OriginalMsgHandle* or *NewMsgHandle* fields of the MQPMO structure. If nothing is provided in one of these fields, the descriptor of the message is taken from the descriptor associated with the message handles.

#### **PutMsgOpts**

Type: MQPMO - input/output

See “MQPMO - Put-message options” on page 2269 for details.

#### **BufferLength**

Type: MQLONG - input

The length of the message in *Buffer*. Zero is valid, and indicates that the message contains no application data. The upper limit depends on various factors; see “MQPUT - Put message” on page 2537 for the description of the *BufferLength* parameter.

### **Buffer**

Type: MQBYTE×*BufferLength* - input

This is a buffer containing the application message data to be sent. Align the buffer on a boundary appropriate to the nature of the data in the message. 4-byte alignment is suitable for most messages (including messages containing IBM MQ header structures), but some messages might require more stringent alignment. For example, a message containing a 64-bit binary integer might require 8-byte alignment.

If *Buffer* contains character or numeric data, set the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to the values appropriate to the data; this enables the receiver of the message to convert the data (if necessary) to the character set and encoding used by the receiver.

**Note:** All the other parameters on the MQPUT1 call must be in the character set and encoding of the local queue manager (given by the *CodedCharSetId* queue-manager attribute and MQENC\_NATIVE).

In the C programming language, the parameter is declared as a pointer-to-void; the address of any type of data can be specified as the parameter.

If the *BufferLength* parameter is zero, *Buffer* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler can be null.

### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

#### **MQCC\_OK**

Successful completion.

#### **MQCC\_WARNING**

Warning (partial completion).

#### **MQCC\_FAILED**

Call failed.

### **Reason**

Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

#### **MQRC\_MULTIPLE\_REASONS**

(2136, X'858') Multiple reason codes returned.

#### **MQRC\_INCOMPLETE\_GROUP**

(2241, X'8C1') Message group not complete.

#### **MQRC\_INCOMPLETE\_MSG**

(2242, X'8C2') Logical message not complete.

#### **MQRC\_PRIORITY\_EXCEEDS\_MAXIMUM**

(2049, X'801') Message Priority exceeds maximum value supported.

#### **MQRC\_UNKNOWN\_REPORT\_OPTION**

(2104, X'838') Report options in message descriptor not recognized.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'89C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

**MQRC\_ALIAS\_BASE\_Q\_TYPE\_ERROR**

(2001, X'7D1') Alias base queue not a valid type.

**MQRC\_API\_EXIT\_ERROR**

(2374, X'946') API exit failed.

**MQRC\_API\_EXIT\_LOAD\_ERROR**

(2183, X'887') Unable to load API exit.

**MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_BACKED\_OUT**

(2003, X'7D3') Unit of work backed out.

**MQRC\_BUFFER\_ERROR**

(2004, X'7D4') Buffer parameter not valid.

**MQRC\_BUFFER\_LENGTH\_ERROR**

(2005, X'7D5') Buffer length parameter not valid.

**MQRC\_CALL\_IN\_PROGRESS**

(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CF\_NOT\_AVAILABLE**

(2345, X'929') coupling facility not available.

**MQRC\_CF\_STRUC\_AUTH\_FAILED**

(2348, X'92C') Coupling-facility structure authorization check failed.

**MQRC\_CF\_STRUC\_ERROR**

(2349, X'92D') Coupling-facility structure not valid.

**MQRC\_CF\_STRUC\_FAILED**

(2373, X'945') Coupling-facility structure failed.

**MQRC\_CF\_STRUC\_IN\_USE**

(2346, X'92A') Coupling-facility structure in use.

**MQRC\_CF\_STRUC\_LIST\_HDR\_IN\_USE**

(2347, X'92B') Coupling-facility structure list-header in use.

**MQRC\_CFGR\_ERROR**

(2416, X'970') PCF group parameter structure MQCFGR in the message data is not valid.

**MQRC\_CFH\_ERROR**

(2235, X'8BB') PCF header structure not valid.

**MQRC\_CFIF\_ERROR**

(2414, X'96E') PCF integer filter parameter structure in the message data is not valid.

**MQRC\_CFIL\_ERROR**

(2236, X'8BC') PCF integer list parameter structure or PCIF\*64 integer list parameter structure not valid.

**MQRC\_CFIN\_ERROR**

(2237, X'8BD') PCF integer parameter structure or PCIF\*64 integer parameter structure not valid.

**MQRC\_CFSF\_ERROR**  
(2415, X'96F') PCF string filter parameter structure in the message data is not valid.

**MQRC\_CFSL\_ERROR**  
(2238, X'8BE') PCF string list parameter structure not valid.

**MQRC\_CFST\_ERROR**  
(2239, X'8BF') PCF string parameter structure not valid.

**MQRC\_CICS\_WAIT\_FAILED**  
(2140, X'85C') Wait request rejected by CICS.

**MQRC\_CLUSTER\_EXIT\_ERROR**  
(2266, X'8DA') Cluster workload exit failed.

**MQRC\_CLUSTER\_RESOLUTION\_ERROR**  
(2189, X'88D') Cluster name resolution failed.

**MQRC\_CLUSTER\_RESOURCE\_ERROR**  
(2269, X'8DD') Cluster resource error.

**MQRC\_COD\_NOT\_VALID\_FOR\_XCF\_Q**  
(2106, X'83A') COD report option not valid for XCF queue.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_NOT\_AUTHORIZED**  
(2217, X'8A9') Not authorized for connection.

**MQRC\_CONNECTION QUIESCING**  
(2202, X'89A') Connection quiescing.

**MQRC\_CONNECTION\_STOPPING**  
(2203, X'89B') Connection shutting down.

**MQRC\_CONTENT\_ERROR**  
2554 (X'09FA) Message content could not be parsed to determine whether the message can be delivered to a subscriber with an extended message selector.

**MQRC\_CONTEXT\_HANDLE\_ERROR**  
(2097, X'831') Queue handle referred to does not save context.

**MQRC\_CONTEXT\_NOT\_AVAILABLE**  
(2098, X'832') Context not available for queue handle referred to.

**MQRC\_DATA\_LENGTH\_ERROR**  
(2010, X'7DA') Data length parameter not valid.

**MQRC\_DB2\_NOT\_AVAILABLE**  
(2342, X'926') Db2 subsystem not available.

**MQRC\_DEF\_XMIT\_Q\_TYPE\_ERROR**  
(2198, X'896') Default transmission queue not local.

**MQRC\_DEF\_XMIT\_Q\_USAGE\_ERROR**  
(2199, X'897') Default transmission queue usage error.

**MQRC\_DH\_ERROR**  
(2135, X'857') Distribution header structure not valid.

**MQRC\_DLH\_ERROR**  
(2141, X'85D') Dead letter header structure not valid.

**MQRC\_EPH\_ERROR**  
(2420, X'974') Embedded PCF structure not valid.

**MQRC\_EXPIRY\_ERROR**  
(2013, X'7DD') Expiry time not valid.

**MQRC\_FEEDBACK\_ERROR**  
(2014, X'7DE') Feedback code not valid.

**MQRC\_GLOBAL\_UOW\_CONFLICT**  
(2351, X'92F') Global units of work conflict.

**MQRC\_GROUP\_ID\_ERROR**  
(2258, X'8D2') Group identifier not valid.

**MQRC\_HANDLE\_IN\_USE\_FOR\_UOW**  
(2353, X'931') Handle in use for global unit of work.

**MQRC\_HANDLE\_NOT\_AVAILABLE**  
(2017, X'7E1') No more handles available.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_HEADER\_ERROR**  
(2142, X'85E') IBM MQ header structure not valid.

**MQRC\_IIH\_ERROR**  
(2148, X'864') IMS information header structure not valid.

**MQRC\_LOCAL\_UOW\_CONFLICT**  
(2352, X'930') Global unit of work conflicts with local unit of work.

**MQRC\_MD\_ERROR**  
(2026, X'7EA') Message descriptor not valid.

**MQRC\_MDE\_ERROR**  
(2248, X'8C8') Message descriptor extension not valid.

**MQRC\_MISSING\_REPLY\_TO\_Q**  
(2027, X'7EB') Missing reply-to queue.

**MQRC\_MISSING\_WIH**  
(2332, X'91C') Message data does not begin with MQWIH.

**MQRC\_MSG\_FLAGS\_ERROR**  
(2249, X'8C9') Message flags not valid.

**MQRC\_MSG\_SEQ\_NUMBER\_ERROR**  
(2250, X'8CA') Message sequence number not valid.

**MQRC\_MSG\_TOO\_BIG\_FOR\_Q**  
(2030, X'7EE') Message length greater than maximum for queue.

**MQRC\_MSG\_TOO\_BIG\_FOR\_Q\_MGR**  
(2031, X'7EF') Message length greater than maximum for queue manager.

**MQRC\_MSG\_TYPE\_ERROR**  
(2029, X'7ED') Message type in message descriptor not valid.

**MQRC\_MULTIPLE\_REASONS**  
(2136, X'858') Multiple reason codes returned.

**MQRC\_NO\_DESTINATIONS\_AVAILABLE**  
(2270, X'8DE') No destination queues available.

**MQRC\_NOT\_AUTHORIZED**  
(2035, X'7F3') Not authorized for access.

**MQRC\_OBJECT\_DAMAGED**  
(2101, X'835') Object damaged.

**MQRC\_OBJECT\_IN\_USE**  
(2042, X'7FA') Object already open with conflicting options.

**MQRC\_OBJECT\_LEVEL\_INCOMPATIBLE**  
(2360, X'938') Object level not compatible.

**MQRC\_OBJECT\_NAME\_ERROR**  
(2152, X'868') Object name not valid.

**MQRC\_OBJECT\_NOT\_UNIQUE**  
(2343, X'927') Object not unique.

**MQRC\_OBJECT\_Q\_MGR\_NAME\_ERROR**  
(2153, X'869') Object queue-manager name not valid.

**MQRC\_OBJECT\_RECORDS\_ERROR**  
(2155, X'86B') Object records not valid.

**MQRC\_OBJECT\_TYPE\_ERROR**  
(2043, X'7FB') Object type not valid.

**MQRC\_OD\_ERROR**  
(2044, X'7FC') Object descriptor structure not valid.

**MQRC\_OFFSET\_ERROR**  
(2251, X'8CB') Message segment offset not valid.

**MQRC\_OPTIONS\_ERROR**  
(2046, X'7FE') Options not valid or not consistent.

**MQRC\_ORIGINAL\_LENGTH\_ERROR**  
(2252, X'8CC') Original length not valid.

**MQRC\_PAGESET\_ERROR**  
(2193, X'891') Error accessing page-set data set.

**MQRC\_PAGESET\_FULL**  
(2192, X'890') External storage medium is full.

**MQRC\_PCF\_ERROR**  
(2149, X'865') PCF structures not valid.

**MQRC\_PERSISTENCE\_ERROR**  
(2047, X'7FF') Persistence not valid.

**MQRC\_PERSISTENT\_NOT\_ALLOWED**  
(2048, X'800') Queue does not support persistent messages.

**MQRC\_PMO\_ERROR**  
(2173, X'87D') Put-message options structure not valid.

**MQRC\_PMO\_RECORD\_FLAGS\_ERROR**  
(2158, X'86E') Put message record flags not valid.

**MQRC\_PRIORITY\_ERROR**  
(2050, X'802') Message priority not valid.

**MQRC\_PUBLICATION\_FAILURE**  
(2502, X'9C6') The publication has not been delivered to any of the subscribers.

**MQRC\_PUT\_INHIBITED**  
(2051, X'803') Put calls inhibited for the queue.

**MQRC\_PUT\_MSG\_RECORDS\_ERROR**  
(2159, X'86F') Put message records not valid.

**MQRC\_Q\_DELETED**  
(2052, X'804') Queue has been deleted.

**MQRC\_Q\_FULL**  
(2053, X'805') Queue already contains maximum number of messages.

**MQRC\_Q\_MGR\_NAME\_ERROR**  
(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**  
(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR QUIESCING**  
(2161, X'871') Queue manager quiescing.

**MQRC\_Q\_MGR\_STOPPING**  
(2162, X'872') Queue manager shutting down.

**MQRC\_Q\_SPACE\_NOT\_AVAILABLE**  
(2056, X'808') No space available on disk for queue.

**MQRC\_Q\_TYPE\_ERROR**  
(2057, X'809') Queue type not valid.

**MQRC\_RECS\_PRESENT\_ERROR**  
(2154, X'86A') Number of records present not valid.

**MQRC\_REMOTE\_Q\_NAME\_ERROR**  
(2184, X'888') Remote queue name not valid.

**MQRC\_REPORT\_OPTIONS\_ERROR**  
(2061, X'80D') Report options in message descriptor not valid.

**MQRC\_RESOURCE\_PROBLEM**  
(2102, X'836') Insufficient system resources available.

**MQRC\_RESPONSE\_RECORDS\_ERROR**  
(2156, X'86C') Response records not valid.

**MQRC\_RFH\_ERROR**  
(2334, X'91E') MQRFH or MQRFH2 structure not valid.

**MQRC\_RMH\_ERROR**  
(2220, X'8AC') Reference message header structure not valid.

**MQRC\_SECURITY\_ERROR**  
(2063, X'80F') Security error occurred.

**MQRC\_SEGMENT\_LENGTH\_ZERO**  
(2253, X'8CD') Length of data in message segment is zero.

**MQRC\_SELECTION\_NOT\_AVAILABLE**  
2551 (X'09F7') A possible subscriber for the publication exists, but the queue manager cannot check whether to send the publication to the subscriber.

**MQRC\_STOPPED\_BY\_CLUSTER\_EXIT**  
(2188, X'88C') Call rejected by cluster workload exit.

**MQRC\_STORAGE\_CLASS\_ERROR**  
(2105, X'839') Storage class error.

**MQRC\_STORAGE\_MEDIUM\_FULL**  
(2192, X'890') External storage medium is full.

**MQRC\_STORAGE\_NOT\_AVAILABLE**  
(2071, X'817') Insufficient storage available.

**MQRC\_SUPPRESSED\_BY\_EXIT**  
(2109, X'83D') Call suppressed by exit program.

**MQRC\_SYNCPOINT\_LIMIT\_REACHED**  
(2024, X'7E8') No more messages can be handled within current unit of work.

**MQRC\_SYNCPOINT\_NOT\_AVAILABLE**  
(2072, X'818') Syncpoint support not available.

**MQRC\_TM\_ERROR**  
(2265, X'8D9') Trigger message structure not valid.

**MQRC\_TMC\_ERROR**  
(2191, X'88F') Character trigger message structure not valid.

**MQRC\_UNEXPECTED\_ERROR**  
(2195, X'893') Unexpected error occurred.

**MQRC\_UNKNOWN\_ALIAS\_BASE\_Q**  
(2082, X'822') Unknown alias base queue.

**MQRC\_UNKNOWN\_DEF\_XMIT\_Q**  
(2197, X'895') Unknown default transmission queue.

**MQRC\_UNKNOWN\_OBJECT\_NAME**  
(2085, X'825') Unknown object name.

**MQRC\_UNKNOWN\_OBJECT\_Q\_MGR**  
(2086, X'826') Unknown object queue manager.

**MQRC\_UNKNOWN\_REMOTE\_Q\_MGR**  
(2087, X'827') Unknown remote queue manager.

**MQRC\_UNKNOWN\_XMIT\_Q**  
(2196, X'894') Unknown transmission queue.

**MQRC\_UOW\_ENLISTMENT\_ERROR**  
(2354, X'932') Enlistment in global unit of work failed.

**MQRC\_UOW\_MIX\_NOT\_SUPPORTED**  
(2355, X'933') Mixture of unit-of-work calls not supported.

**MQRC\_UOW\_NOT\_AVAILABLE**  
(2255, X'8CF') Unit of work not available for the queue manager to use.

**MQRC\_WIH\_ERROR**  
(2333, X'91D') MQWIH structure not valid.

**MQRC\_WRONG\_CF\_LEVEL**  
(2366, X'93E') Coupling-facility structure is wrong level.

**MQRC\_WRONG\_MD\_VERSION**  
(2257, X'8D1') Wrong version of MQMD supplied.

**MQRC\_XMIT\_Q\_TYPE\_ERROR**  
(2091, X'82B') Transmission queue not local.

**MQRC\_XMIT\_Q\_USAGE\_ERROR**  
(2092, X'82C') Transmission queue with wrong usage.

**MQRC\_XQH\_ERROR**  
(2260, X'8D4') Transmission queue header structure not valid.

For detailed information about these codes, see Reason codes.

## Usage notes

1. Both the MQPUT and MQPUT1 calls can be used to put messages on a queue; which call to use depends on the circumstances:
  - Use the MQPUT call to place multiple messages on the *same* queue.  
An MQOPEN call specifying the MQOO\_OUTPUT option is issued first, followed by one or more MQPUT requests to add messages to the queue; finally the queue is closed with an MQCLOSE call. This gives better performance than repeated use of the MQPUT1 call.
  - Use the MQPUT1 call to put only *one* message on a queue.  
This call encapsulates the MQOPEN, MQPUT, and MQCLOSE calls into a single call, minimizing the number of calls that must be issued.
2. If an application puts a sequence of messages on the same queue without using message groups, the order of those messages is preserved if certain conditions are satisfied. However, in most environments the MQPUT1 call does not satisfy these conditions, and so does not preserve message order. The MQPUT call must be used instead in these environments. See MQPUT usage notes for details.
3. The MQPUT1 call can be used to put messages to distribution lists. For general information about this, see the usage notes for the MQOPEN and MQPUT calls.  
Distribution lists are supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.  
The following differences apply when using the MQPUT1 call:
  - a. If the application provides MQRR response records, they must be provided using the MQOD structure; they cannot be provided using the MQPMO structure.
  - b. The reason code MQRC\_OPEN\_FAILED is never returned by MQPUT1 in the response records; if a queue fails to open, the response record for that queue contains the reason code resulting from the open operation.  
If an open operation for a queue succeeds with a completion code of MQCC\_WARNING, the completion code and reason code in the response record for that queue are replaced by the completion and reason codes resulting from the put operation.  
As with the MQOPEN and MQPUT calls, the queue manager sets the response records (if provided) only when the outcome of the call is not the same for all queues in the distribution list; this is indicated by the call completing with reason code MQRC\_MULTIPLE\_REASONS.
4. If the MQPUT1 call is used to put a message on a cluster queue, the call behaves as though MQOO\_BIND\_NOT\_FIXED had been specified on the MQOPEN call.
5. If a message is put with one or more IBM MQ header structures at the beginning of the application message data, the queue manager performs certain checks on the header structures to verify that they are valid. For more information about this, see the usage notes for the MQPUT call.
6. If more than one of the warning situations arise (see the *CompCode* parameter), the reason code returned is the *first* one in the following list that applies:
  - a. MQRC\_MULTIPLE\_REASONS
  - b. MQRC\_INCOMPLETE\_MSG
  - c. MQRC\_INCOMPLETE\_GROUP
  - d. MQRC\_PRIORITY\_EXCEEDS\_MAXIMUM or MQRC\_UNKNOWN\_REPORT\_OPTION
7. For the Visual Basic programming language, the following points apply:
  - If the size of the *Buffer* parameter is less than the length specified by the *BufferLength* parameter, the call fails with reason code MQRC\_BUFFER\_LENGTH\_ERROR.
  - The *Buffer* parameter is declared as being of type String. If the data to be placed on the queue is not of type String, use the MQPUT1Any call in place of MQPUT1.

The MQPUT1Any call has the same parameters as the MQPUT1 call, except that the *Buffer* parameter is declared as being of type Any, allowing any type of data to be placed on the queue. However, this means that *Buffer* cannot be checked to ensure that it is at least *BufferLength* bytes in size.

8. When an MQPUT1 call is issued with MQPMO\_SYNCPOINT, the default behavior changes, so that the put operation is completed asynchronously. This might cause a change in the behavior of some applications that rely on certain fields in the MQOD and MQMD structures being returned, but which now contain undefined values. An application can specify MQPMO\_SYNC\_RESPONSE to ensure that the put operation is performed synchronously and that all the appropriate field values are completed.

### C invocation

```
MQPUT1 (Hconn, &ObjDesc, &MsgDesc, &PutMsgOpts,
        BufferLength, Buffer, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;           /* Connection handle */
MQOD     ObjDesc;        /* Object descriptor */
MQMD     MsgDesc;        /* Message descriptor */
MQPMO    PutMsgOpts;     /* Options that control the action of MQPUT1 */
MQLONG   BufferLength;   /* Length of the message in Buffer */
MQBYTE   Buffer[n];      /* Message data */
MQLONG   CompCode;      /* Completion code */
MQLONG   Reason;        /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQPUT1' USING HCONN, OBJDESC, MSGDESC, PUTMSGOPTS,
                   BUFFERLENGTH, BUFFER, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN          PIC S9(9) BINARY.
** Object descriptor
01 OBJDESC.
   COPY CMQODV.
** Message descriptor
01 MSGDESC.
   COPY CMQMDV.
** Options that control the action of MQPUT1
01 PUTMSGOPTS.
   COPY CMQPMOV.
** Length of the message in BUFFER
01 BUFFERLENGTH  PIC S9(9) BINARY.
** Message data
01 BUFFER        PIC X(n).
** Completion code
01 COMPCODE      PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON        PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQPUT1 (Hconn, ObjDesc, MsgDesc, PutMsgOpts, BufferLength, Buffer,
             CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn          fixed bin(31); /* Connection handle */
dc1 ObjDesc        like MQOD;     /* Object descriptor */
dc1 MsgDesc        like MQMD;     /* Message descriptor */
dc1 PutMsgOpts     like MQPMO;    /* Options that control the action of
                                   MQPUT1 */
dc1 BufferLength    fixed bin(31); /* Length of the message in Buffer */
```

```

dc1 Buffer      char(n);      /* Message data */
dc1 CompCode   fixed bin(31); /* Completion code */
dc1 Reason     fixed bin(31); /* Reason code qualifying CompCode */

```

### High Level Assembler invocation

```

CALL MQPUT1, (HCONN,OBJDESC,MSGDESC,PUTMSGOPTS,BUFFERLENGTH, X
            BUFFER,COMPCODE,REASON)

```

Declare the parameters as follows:

```

HCONN      DS      F      Connection handle
OBJDESC    CMQODA   ,      Object descriptor
MSGDESC    CMQMDA   ,      Message descriptor
PUTMSGOPTS CMQPMOA  ,      Options that control the action of MQPUT1
BUFFERLENGTH DS      F      Length of the message in BUFFER
BUFFER     DS      CL(n)  Message data
COMPCODE   DS      F      Completion code
REASON     DS      F      Reason code qualifying COMPCODE

```

### Visual Basic invocation

```

MQPUT1 Hconn, ObjDesc, MsgDesc, PutMsgOpts, BufferLength, Buffer,
      CompCode, Reason

```

Declare the parameters as follows:

```

Dim Hconn      As Long   'Connection handle'
Dim ObjDesc    As MQOD   'Object descriptor'
Dim MsgDesc    As MQMD   'Message descriptor'
Dim PutMsgOpts As MQPMO  'Options that control the action of MQPUT1'
Dim BufferLength As Long  'Length of the message in Buffer'
Dim Buffer      As String 'Message data'
Dim CompCode   As Long   'Completion code'
Dim Reason     As Long   'Reason code qualifying CompCode'

```

### MQSET - Set object attributes:

Use the MQSET call to change the attributes of an object represented by a handle. The object must be a queue.

### Syntax

```

MQSET (Hconn, Hobj, SelectorCount, Selectors, IntAttrCount, IntAttrs, CharAttrLength, CharAttrs, Compcode, Reason)

```

### Parameters

#### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn*:

#### **MQHC\_DEF\_HCONN**

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

### **Hobj**

Type: MQHOBJ - input

This handle represents the queue object with attributes that are to be set. The handle was returned by a previous MQOPEN call that specified the MQOO\_SET option.

### **SelectorCount**

Type: MQLONG - input

This is the count of selectors that are supplied in the *Selectors* array. It is the number of attributes that are to be set. Zero is a valid value. The maximum number allowed is 256.

### **Selectors**

Type: MQLONGxSelectorCount - input

This is an array of *SelectorCount* attribute selectors; each selector identifies an attribute (integer or character) with a value that is to be set.

Each selector must be valid for the type of queue that *Hobj* represents. Only certain MQIA\_\* and MQCA\_\* values are allowed; as listed later.

Selectors can be specified in any order. Attribute values that correspond to integer attribute selectors (MQIA\_\* selectors) must be specified in *IntAttrs* in the same order in which these selectors occur in *Selectors*. Attribute values that correspond to character attribute selectors (MQCA\_\* selectors) must be specified in *CharAttrs* in the same order in which those selectors occur. MQIA\_\* selectors can be interleaved with the MQCA\_\* selectors; only the relative order within each type is important.

You can specify the same selector more than once; if you do, the last value specified for a particular selector is the one that takes effect.

#### **Note:**

1. The integer and character attribute selectors are allocated within two different ranges; the MQIA\_\* selectors reside within the range MQIA\_FIRST through MQIA\_LAST, and the MQCA\_\* selectors within the range MQCA\_FIRST through MQCA\_LAST.  
For each range, the constants MQIA\_LAST\_USED and MQCA\_LAST\_USED define the highest value that the queue manager accepts.
2. If all the MQIA\_\* selectors occur first, the same element numbers can be used to address corresponding elements in the *Selectors* and *IntAttrs* arrays.
3. If the *SelectorCount* parameter is zero, *Selectors* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler might be null.

The attributes that can be set are listed in the following table. No other attributes can be set using this call. For the MQCA\_\* attribute selectors, the constant that defines the length in bytes of the string that is required in *CharAttrs* is supplied in parentheses.

Table 252. MQSET attribute selectors for queues

Selector	Description	Note
MQCA_TRIGGER_DATA	Trigger data (MQ_TRIGGER_DATA_LENGTH).	
MQIA_DIST_LISTS	Distribution list support.	1
MQIA_INHIBIT_GET	Whether get operations are allowed.	
MQIA_INHIBIT_PUT	Whether put operations are allowed.	
MQIA_TRIGGER_CONTROL	Trigger control.	
MQIA_TRIGGER_DEPTH	Trigger depth.	
MQIA_TRIGGER_MSG_PRIORITY	Threshold message priority for triggers.	
MQIA_TRIGGER_TYPE	Trigger type.	

**Note:**

1. Supported only on AIX, HP-UX, IBM i, Solaris, Linux, Windows, plus IBM MQ MQI clients connected to these systems.

**IntAttrCount**

Type: MQLONG - input

This is the number of elements in the *IntAttrs* array, and must be at least the number of MQIA\_\* selectors in the *Selectors* parameter. Zero is a valid value if there are none.

**IntAttrs**

Type: MQLONGxIntAttrCount - input

This is an array of *IntAttrCount* integer attribute values. These attribute values must be in the same order as the MQIA\_\* selectors in the *Selectors* array.

If the *IntAttrCount* or *SelectorCount* parameter is zero, *IntAttrs* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler might be null.

**CharAttrLength**

Type: MQLONG - input

This is the length in bytes of the *CharAttrs* parameter, and must be at least the sum of the lengths of the character attributes specified in the *Selectors* array. Zero is a valid value if there are no MQCA\_\* selectors in *Selectors*.

**CharAttrs**

Type: MQCHARxCharAttrLength - input

This is the buffer containing the character attribute values, concatenated together. The length of the buffer is given by the *CharAttrLength* parameter.

The characters attributes must be specified in the same order as the MQCA\_\* selectors in the *Selectors* array. The length of each character attribute is fixed (see *Selectors*). If the value to be set for an attribute contains fewer nonblank characters than the defined length of the attribute, pad the value in *CharAttrs* to the right with blanks to make the attribute value match the defined length of the attribute.

If the *CharAttrLength* or *SelectorCount* parameter is zero, *CharAttrs* is not referred to; in this case, the parameter address passed by programs written in C or System/390 assembler might be null.

**CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

**MQCC\_OK**

Successful completion.

**MQCC\_FAILED**

Call failed.

**Reason**

Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'89C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**  
(2130, X'852') Unable to load adapter service module.

**MQRC\_API\_EXIT\_ERROR**  
(2374, X'946') API exit failed.

**MQRC\_API\_EXIT\_LOAD\_ERROR**  
(2183, X'887') Unable to load API exit.

**MQRC\_ASID\_MISMATCH**  
(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_CALL\_IN\_PROGRESS**  
(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CF\_NOT\_AVAILABLE**  
(2345, X'929') Coupling facility not available.

**MQRC\_CF\_STRUC\_FAILED**  
(2373, X'945') Coupling-facility structure failed.

**MQRC\_CF\_STRUC\_IN\_USE**  
(2346, X'92A') Coupling-facility structure in use.

**MQRC\_CF\_STRUC\_LIST\_HDR\_IN\_USE**  
(2347, X'92B') Coupling-facility structure list-header in use.

**MQRC\_CHAR\_ATTR\_LENGTH\_ERROR**  
(2006, X'7D6') Length of character attributes not valid.

**MQRC\_CHAR\_ATTRS\_ERROR**  
(2007, X'7D7') Character attributes string not valid.

**MQRC\_CICS\_WAIT\_FAILED**  
(2140, X'85C') Wait request rejected by CICS.

**MQRC\_CONNECTION\_BROKEN**  
(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_NOT\_AUTHORIZED**  
(2217, X'8A9') Not authorized for connection.

**MQRC\_CONNECTION\_STOPPING**  
(2203, X'89B') Connection shutting down.

**MQRC\_DB2\_NOT\_AVAILABLE**  
(2342, X'926') Db2 subsystem not available.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_HOBJ\_ERROR**  
(2019, X'7E3') Object handle not valid.

**MQRC\_INHIBIT\_VALUE\_ERROR**  
(2020, X'7E4') Value for inhibit-get or inhibit-put queue attribute not valid.

**MQRC\_INT\_ATTR\_COUNT\_ERROR**  
(2021, X'7E5') Count of integer attributes not valid.

**MQRC\_INT\_ATTRS\_ARRAY\_ERROR**  
(2023, X'7E7') Integer attributes array not valid.

**MQRC\_NOT\_OPEN\_FOR\_SET**  
(2040, X'7F8') Queue not open for set.

**MQRC\_OBJECT\_CHANGED**  
(2041, X'7F9') Object definition changed since opened.

**MQRC\_OBJECT\_DAMAGED**  
(2101, X'835') Object damaged.

**MQRC\_PAGESET\_ERROR**  
(2193, X'891') Error accessing page-set data set.

**MQRC\_Q\_DELETED**  
(2052, X'804') Queue has been deleted.

**MQRC\_Q\_MGR\_NAME\_ERROR**  
(2058, X'80A') Queue manager name not valid or not known.

**MQRC\_Q\_MGR\_NOT\_AVAILABLE**  
(2059, X'80B') Queue manager not available for connection.

**MQRC\_Q\_MGR\_STOPPING**  
(2162, X'872') Queue manager shutting down.

**MQRC\_RESOURCE\_PROBLEM**  
(2102, X'836') Insufficient system resources available.

**MQRC\_SELECTOR\_COUNT\_ERROR**  
(2065, X'811') Count of selectors not valid.

**MQRC\_SELECTOR\_ERROR**  
(2067, X'813') Attribute selector not valid.

**MQRC\_SELECTOR\_LIMIT\_EXCEEDED**  
(2066, X'812') Count of selectors too large.

**MQRC\_STORAGE\_NOT\_AVAILABLE**  
(2071, X'817') Insufficient storage available.

**MQRC\_SUPPRESSED\_BY\_EXIT**  
(2109, X'83D') Call suppressed by exit program.

**MQRC\_TRIGGER\_CONTROL\_ERROR**  
(2075, X'81B') Value for trigger-control attribute not valid.

**MQRC\_TRIGGER\_DEPTH\_ERROR**  
(2076, X'81C') Value for trigger-depth attribute not valid.

**MQRC\_TRIGGER\_MSG\_PRIORITY\_ERR**  
(2077, X'81D') Value for trigger-message-priority attribute not valid.

**MQRC\_TRIGGER\_TYPE\_ERROR**  
(2078, X'81E') Value for trigger-type attribute not valid.

**MQRC\_UNEXPECTED\_ERROR**  
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

#### Usage notes

1. Using this call, the application can specify an array of integer attributes, or a collection of character attribute strings, or both. If no errors occur, the attributes specified are all set simultaneously. If an error occurs (for example, if a selector is not valid, or an attempt is made to set an attribute to a value that is not valid), the call fails and no attributes are set.
2. The values of attributes can be determined using the MQINQ call; see "MQINQ - Inquire object attributes" on page 2494 for details.

**Note:** Not all attributes with values that can be inquired using the MQINQ call can have their values changed using the MQSET call. For example, no process-object or queue-manager attributes can be set with this call.

3. Attribute changes are preserved across restarts of the queue manager (other than alterations to temporary dynamic queues, which do not survive restarts of the queue manager).
4. You cannot change the attributes of a model queue using the MQSET call. However, if you open a model queue using the MQOPEN call with the MQOO\_SET option, you can use the MQSET call to set the attributes of the dynamic local queue that is created by the MQOPEN call.
5. If the object being set is a cluster queue, there must be a local instance of the cluster queue for the open to succeed.

For more information about object attributes, see:

- “Attributes for queues” on page 2625
- “Attributes for namelists” on page 2661
- “Attributes for process definitions” on page 2664
- “Attributes for the queue manager” on page 2586

### C invocation

```
MQSET (Hconn, Hobj, SelectorCount, Selectors, IntAttrCount, IntAttrs,
      CharAttrLength, CharAttrs, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;           /* Connection handle */
MQHOBJ   Hobj;           /* Object handle */
MQLONG   SelectorCount;  /* Count of selectors */
MQLONG   Selectors[n];   /* Array of attribute selectors */
MQLONG   IntAttrCount;   /* Count of integer attributes */
MQLONG   IntAttrs[n];    /* Array of integer attributes */
MQLONG   CharAttrLength; /* Length of character attributes buffer */
MQCHAR   CharAttrs[n];   /* Character attributes */
MQLONG   CompCode;       /* Completion code */
MQLONG   Reason;         /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQSET' USING HCONN, HOBJ, SELECTORCOUNT, SELECTORS-TABLE,
                  INTATTRCOUNT, INTATTRS-TABLE, CHARATTRLENGTH,
                  CHARATTRS, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN          PIC S9(9) BINARY.
** Object handle
01 HOBJ          PIC S9(9) BINARY.
** Count of selectors
01 SELECTORCOUNT PIC S9(9) BINARY.
** Array of attribute selectors
01 SELECTORS-TABLE.
02 SELECTORS     PIC S9(9) BINARY OCCURS n TIMES.
** Count of integer attributes
01 INTATTRCOUNT PIC S9(9) BINARY.
** Array of integer attributes
01 INTATTRS-TABLE.
02 INTATTRS     PIC S9(9) BINARY OCCURS n TIMES.
** Length of character attributes buffer
01 CHARATTRLENGTH PIC S9(9) BINARY.
** Character attributes
01 CHARATTRS     PIC X(n).
```

```

** Completion code
01 COMPCODE      PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON        PIC S9(9) BINARY.

```

### PL/I invocation

```

call MQSET (Hconn, Hobj, SelectorCount, Selectors, IntAttrCount,
            IntAttrs, CharAttrLength, CharAttrs, CompCode, Reason);

```

Declare the parameters as follows:

```

dc1 Hconn          fixed bin(31); /* Connection handle */
dc1 Hobj           fixed bin(31); /* Object handle */
dc1 SelectorCount  fixed bin(31); /* Count of selectors */
dc1 Selectors(n)   fixed bin(31); /* Array of attribute selectors */
dc1 IntAttrCount   fixed bin(31); /* Count of integer attributes */
dc1 IntAttrs(n)    fixed bin(31); /* Array of integer attributes */
dc1 CharAttrLength fixed bin(31); /* Length of character attributes
                                buffer */
dc1 CharAttrs      char(n);       /* Character attributes */
dc1 CompCode       fixed bin(31); /* Completion code */
dc1 Reason         fixed bin(31); /* Reason code qualifying
                                CompCode */

```

### High Level Assembler invocation

```

CALL MQSET,(HCONN,HOBJ,SELECTORCOUNT,SELECTORS,INTATTRCOUNT, X
            INTATTRS,CHARATTRLENGTH,CHARATTRS,COMPCODE,REASON)

```

Declare the parameters as follows:

```

HCONN      DS F      Connection handle
HOBJ       DS F      Object handle
SELECTORCOUNT DS F      Count of selectors
SELECTORS  DS (n)F   Array of attribute selectors
INTATTRCOUNT DS F      Count of integer attributes
INTATTRS   DS (n)F   Array of integer attributes
CHARATTRLENGTH DS F      Length of character attributes buffer
CHARATTRS  DS CL(n)  Character attributes
COMPCODE   DS F      Completion code
REASON     DS F      Reason code qualifying COMPCODE

```

### Visual Basic invocation

```

MQSET Hconn, Hobj, SelectorCount, Selectors, IntAttrCount, IntAttrs,
      CharAttrLength, CharAttrs, CompCode, Reason

```

Declare the parameters as follows:

```

Dim Hconn          As Long 'Connection handle'
Dim Hobj           As Long 'Object handle'
Dim SelectorCount  As Long 'Count of selectors'
Dim Selectors      As Long 'Array of attribute selectors'
Dim IntAttrCount   As Long 'Count of integer attributes'
Dim IntAttrs       As Long 'Array of integer attributes'
Dim CharAttrLength As Long 'Length of character attributes buffer'
Dim CharAttrs      As String 'Character attributes'
Dim CompCode       As Long 'Completion code'
Dim Reason         As Long 'Reason code qualifying CompCode'

```

## MQSETMP - Set message property:

Use the MQSETMP call to set or modify a property of a message handle.

### Syntax

MQSETMP (*Hconn*, *Hmsg*, *SetPropOpts*, *Name*, *PropDesc*, *Type*, *ValueLength*, *Value*, *Compcode*, *Reason*)

### Parameters

#### **Hconn**

Type: MQHCONN - input

This handle represents the connection to the queue manager.

The value must match the connection handle that was used to create the message handle specified in the *Hmsg* parameter. If the message handle was created using MQHC\_UNASSOCIATED\_HCONN, a valid connection must be established on the thread setting a property of the message handle, otherwise the call fails with reason code MQRC\_CONNECTION\_BROKEN.

#### **Hmsg**

Type: MQHMSG - input

This is the message handle to be modified. The value was returned by a previous MQCRTMH call.

#### **SetPropOpts**

Type: MQSMPO - input

Control how message properties are set.

This structure allows applications to specify options that control how message properties are set. The structure is an input parameter on the MQSETMP call. See MQSMPO for further information.

#### **Name**

Type: MQCHARV- input

This is the name of the property to set.

See Property names and Property name restrictions for further information about the use of property names.

#### **PropDesc**

Type: MQPD - input/output

This structure is used to define the attributes of a property, including:

- what happens if the property is not supported
- what message context the property belongs to
- what messages the property is copied into as it flows

See MQPD for further information about this structure.

#### **Type**

Type: MQLONG - input

The data type of the property being set. It can be one of the following:

##### **MQTYPE\_BOOLEAN**

A Boolean. *ValueLength* must be 4.

##### **MQTYPE\_BYTE\_STRING**

A byte string. *ValueLength* must be zero or greater.

##### **MQTYPE\_INT8**

An 8-bit signed integer. *ValueLength* must be 1.

**MQTYPE\_INT16**

A 16-bit signed integer. *ValueLength* must be 2.

**MQTYPE\_INT32**

A 32-bit signed integer. *ValueLength* must be 4.

**MQTYPE\_INT64**

A 64-bit signed integer. *ValueLength* must be 8.

**MQTYPE\_FLOAT32**

A 32-bit floating-point number. *ValueLength* must be 4.

Note: this type is not supported with applications using IBM COBOL for z/OS.

**MQTYPE\_FLOAT64**

A 64-bit floating-point number. *ValueLength* must be 8.

Note: this type is not supported with applications using IBM COBOL for z/OS.

**MQTYPE\_STRING**

A character string. *ValueLength* must be zero or greater, or the special value MQVL\_NULL\_TERMINATED.

**MQTYPE\_NULL**

The property exists but has a null value. *ValueLength* must be zero.

**ValueLength**

Type: MQLONG - input

The length in bytes of the property value in the *Value* parameter. Zero is valid only for null values or for strings or byte strings. Zero indicates that the property exists but that the value contains no characters or bytes.

The value must be greater than or equal to zero or the following special value if the *Type* parameter has MQTYPE\_STRING set:

**MQVL\_NULL\_TERMINATED**

The value is delimited by the first null encountered in the string. The null is not included as part of the string. This value is invalid if MQTYPE\_STRING is not also set.

Note: The null character used to terminate a string if MQVL\_NULL\_TERMINATED is set is a null from the character set of the *Value*.

**Value**

Type: MQBYTE×ValueLength - input

The value of the property to be set. The buffer must be aligned on a boundary appropriate to the nature of the data in the value.

In the C programming language, the parameter is declared as a pointer-to-void; the address of any type of data can be specified as the parameter.

If *ValueLength* is zero, *Value* is not referred to. In this case, the parameter address passed by programs written in C or System/390 assembler can be null.

**CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

**MQCC\_OK**

Successful completion.

**MQCC\_FAILED**

Call failed.

**Reason**

Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_RFH\_FORMAT\_ERROR**

(2421, X'0975') An MQRFH2 folder containing properties could not be parsed.

If *CompCode* is MQCC\_FAILED:

**MQRC\_ADAPTER\_NOT\_AVAILABLE**

(2204, X'089C') Adapter not available.

**MQRC\_ADAPTER\_SERV\_LOAD\_ERROR**

(2130, X'852') Unable to load adapter service module.

**MQRC\_ASID\_MISMATCH**

(2157, X'86D') Primary and home ASIDs differ.

**MQRC\_BUFFER\_ERROR**

(2004, X'07D4') Value parameter not valid.

**MQRC\_BUFFER\_LENGTH\_ERROR**

(2005, X'07D5') Value length parameter not valid.

**MQRC\_CALL\_IN\_PROGRESS**

(2219, X'08AB') MQI call entered before previous call completed.

**MQRC\_HMSG\_ERROR**

(2460, X'099C') Message handle pointer not valid.

**MQRC\_MSG\_HANDLE\_IN\_USE**

(2499, X'09C3') Message handle already in use.

**MQRC\_OPTIONS\_ERROR**

(2046, X'07FE') Options not valid or not consistent.

**MQRC\_PD\_ERROR**

(2482, X'09B2') Property descriptor structure not valid.

**MQRC\_PROPERTY\_NAME\_ERROR**

(2442, X'098A') Invalid property name.

**MQRC\_PROPERTY\_TYPE\_ERROR**

(2473, X'09A9') Invalid property data type.

**MQRC\_PROP\_NUMBER\_FORMAT\_ERROR**

(2472, X'09A8') Number format error encountered in value data.

**MQRC\_SMPO\_ERROR**

(2463, X'099F') Set message property options structure not valid.

**MQRC\_SOURCE\_CCSID\_ERROR**

(2111, X'083F') Property name coded character set identifier not valid.

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

**MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

### C invocation

```
MQSETMP (Hconn, Hmsg, &SetPropOpts, &Name, &PropDesc, Type,  
ValueLength, &Value, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN Hconn;      /* Connection handle */  
MQHMSG  Hmsg;       /* Message handle */  
MQSMPO  SetPropOpts; /* Options that control the action of MQSETMP */  
MQCHARV Name;       /* Property name */  
MQPD    PropDesc;   /* Property descriptor */  
MQLONG  Type;       /* Property data type */  
MQLONG  ValueLength; /* Length of property value in Value */  
MQBYTE  Value[n];   /* Property value */  
MQLONG  CompCode;   /* Completion code */  
MQLONG  Reason;     /* Reason code qualifying CompCode */
```

### COBOL invocation

```
CALL 'MQSETMP' USING HCONN, HMSG, SETMSGOPTS, NAME, PROPDSC, TYPE,  
VALUELENGTH, VALUE, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle  
01 HCONN PIC S9(9) BINARY.  
** Message handle  
01 HMSG PIC S9(18) BINARY.  
** Options that control the action of MQSETMP  
01 SETMSGOPTS.  
COPY CMQSMPOV.  
** Property name  
01 NAME  
COPY CMQCHRNV.  
** Property descriptor  
01 PROPDSC.  
COPY CMQPDV.  
** Property data type  
01 TYPE PIC S9(9) BINARY.  
** Length of property value in VALUE  
01 VALUELENGTH PIC S9(9) BINARY.  
** Property value  
01 VALUE PIC X(n).  
** Completion code  
01 COMPCODE PIC S9(9) BINARY.  
** Reason code qualifying COMPCODE  
01 REASON PIC S9(9) BINARY.
```

### PL/I invocation

```
call MQSETMP (Hconn, Hmsg, SetPropOpts, Name, PropDesc, Type, ValueLength,  
Value, CompCode, Reason);
```

Declare the parameters as follows:

```
dc1 Hconn      fixed bin(31); /* Connection handle */  
dc1 Hmsg       fixed bin(63); /* Message handle */  
dc1 SetPropOpts like MQSMPO;  /* Options that control the action of MQSETMP */  
dc1 Name       like MQCHARV;  /* Property name */  
dc1 PropDesc   like MQPD;     /* Property descriptor */  
dc1 Type       fixed bin(31); /* Property data type */  
dc1 ValueLength fixed bin(31); /* Length of property value in Value */  
dc1 Value      char(n);       /* Property value */  
dc1 CompCode   fixed bin(31); /* Completion code */  
dc1 Reason     fixed bin(31); /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

```
CALL MQSETMP, (HCONN,HMSG,SETMSGHOPTS,NAME,PROPDESC,TYPE,VALUELENGTH,  
VALUE,COMPCODE,REASON)
```

Declare the parameters as follows:

HCONN	DS	F	Connection handle
HMSG	DS	D	Message handle
SETMSGOPTS	CMQSMPOA	,	Options that control the action of MQSETMP
NAME	CMQCHRVA	,	Property name
PROPDESC	CMQPDA	,	Property descriptor
TYPE	DS	F	Property data type
VALUELENGTH	DS	F	Length of property value in VALUE
VALUE	DS	CL(n)	Property value
COMPCODE	DS	F	Completion code
REASON	DS	F	Reason code qualifying COMPCODE

## MQSTAT - Retrieve status information:

Use the MQSTAT call to retrieve status information. The type of status information returned is determined by the Type value specified on the call.

### Syntax

MQSTAT (*Hconn*, *Type*, *Stat*, *Compcode*, *Reason*)

### Parameters

#### *Hconn*

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn*:

**MQHC\_DEF\_HCONN**

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

#### *Type*

Type: MQLONG - input

Type of status information being requested. The > valid values are:

**MQSTAT\_TYPE\_ASYNC\_ERROR**

Return information about previous asynchronous put operations.

**MQSTAT\_TYPE\_RECONNECTION**

Return information about reconnection. If the connection is reconnecting or failed to reconnect, the information describes the failure which caused the connection to begin reconnecting.

This value is only valid for client connections. For other types of connection, the call fails with reason code **MQRC\_ENVIRONMENT\_ERROR**

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

Return information about a previous failure related to reconnect. If the connection failed to reconnect, the information describes the failure which caused reconnection to fail.

This value is only valid for client connections. For other types of connection, the call fails with reason code **MQRC\_ENVIRONMENT\_ERROR**.

**Stat**

Type: MQSTS - input/output

Status information structure. See "MQSTS - Status reporting structure" on page 2370 for details.

**CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

**MQCC\_OK**

Successful completion.

**MQCC\_FAILED**

Call failed.

**Reason**

Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED:

**MQRC\_API\_EXIT\_ERROR**

(2374, X'946') API exit failed

**MQRC\_API\_EXIT\_LOAD\_ERROR**

(2183, X'887') Unable to load API exit.

**MQRC\_CALL\_IN\_PROGRESS**

(2219, X'8AB') MQI call entered before previous call complete.

**MQRC\_CONNECTION\_BROKEN**

(2009, X'7D9') Connection to queue manager lost.

**MQRC\_CONNECTION\_STOPPING**

(2203, X'89B') Connection shutting down.

**MQRC\_FUNCTION\_NOT\_SUPPORTED**

(2298, X'8FA') The function requested is not available in the current environment.

**MQRC\_HCONN\_ERROR**

(2018, X'7E2') Connection handle not valid.

**MQRC\_Q\_MGR\_STOPPING**

(2162, X'872') - Queue manager stopping

**MQRC\_RESOURCE\_PROBLEM**

(2102, X'836') Insufficient system resources available.

**MQRC\_STAT\_TYPE\_ERROR**

(2430, X'97E') Error with MQSTAT type

**MQRC\_STORAGE\_NOT\_AVAILABLE**

(2071, X'817') Insufficient storage available.

## **MQRC\_STS\_ERROR**

(2426, X'97A') Error with MQSTS structure

## **MQRC\_UNEXPECTED\_ERROR**

(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

### **Usage notes**

1. A call to MQSTAT specifying a type of MQSTAT\_TYPE\_ASYNC\_ERROR returns information about previous asynchronous MQPUT and MQPUT1 operations. The MQSTS structure passed back on return from the MQSTAT call contains the first recorded asynchronous warning or error information for that connection. If further errors or warnings follow the first, they do not normally alter these values. However, if an error occurs with a completion code of MQCC\_WARNING, a subsequent failure with a completion code of MQCC\_FAILED is returned instead.
2. If no errors have occurred since the connection was established or since the last call to MQSTAT then a CompCode of MQCC\_OK and Reason of MQRC\_NONE are returned in the MQSTS structure.
3. Counts of the number of asynchronous calls that have been processed under the connection handle are returned by way of three counter fields; PutSuccessCount, PutWarningCount and PutFailureCount. These counters are incremented by the queue manager each time an asynchronous operation is processed successfully, has a warning, or fails (note that for accounting purposes a put to a distribution list counts once per destination queue rather than once per distribution list). A counter is not incremented beyond the maximum positive value AMQ\_LONG\_MAX.
4. A successful call to MQSTAT results in any previous error information or counts being reset.
5. The behavior of MQSTAT depends on the value of the MQSTAT Type parameter you provide.
- 6.

### **MQSTAT\_TYPE\_ASYNC\_ERROR**

- a. A call to MQSTAT specifying a type of MQSTAT\_TYPE\_ASYNC\_ERROR returns information about previous asynchronous MQPUT and MQPUT1 operations. The MQSTS structure passed back on return from the MQSTAT call contains the first recorded asynchronous warning or error information for that connection. If further errors or warnings follow the first, they do not normally alter these values. However, if an error occurs with a completion code of MQCC\_WARNING, a subsequent failure with a completion code of MQCC\_FAILED is returned instead.
- b. If no errors have occurred since the connection was established or since the last call to MQSTAT then a CompCode of MQCC\_OK and Reason of MQRC\_NONE are returned in the MQSTS structure.
- c. Counts of the number of asynchronous calls that have been processed under the connection handle are returned by way of three counter fields; PutSuccessCount, PutWarningCount and PutFailureCount. These counters are incremented by the queue manager each time an asynchronous operation is processed successfully, has a warning, or fails (note that for accounting purposes a put to a distribution list counts once per destination queue rather than once per distribution list). A counter is not incremented beyond the maximum positive value AMQ\_LONG\_MAX.
- d. A successful call to MQSTAT results in any previous error information or counts being reset.

### **MQSTAT\_TYPE\_RECONNECTION**

Suppose you call MQSTAT with Type set to MQSTAT\_TYPE\_RECONNECTION inside an event handler during reconnection. Consider these examples.

#### **The client is attempting reconnection or failed to reconnect.**

CompCode in the MQSTS structure is MQCC\_FAILED and Reason might be either

MQRC\_CONNECTION\_BROKEN or MQRC\_Q\_MGR QUIESCING. ObjectType is MQOT\_Q\_MGR, ObjectName is the name of the queue manager, and ObjectQMGrName is blank.

**The client completed reconnection successfully or was never disconnected.**

CompCode in the MQSTS structure is MQCC\_OK and the Reason is MQRC\_NONE

Subsequent calls to MQSTAT return the same results.

**MQSTAT\_TYPE\_RECONNECTION\_ERROR**

Suppose you call MQSTAT with Type set to MQSTAT\_TYPE\_RECONNECTION\_ERROR in response to receiving MQRC\_RECONNECT\_FAILED to an MQI call. Consider these examples.

**An authorization failure occurred when a queue was being reopened during reconnection to a different queue manager.**

CompCode in the MQSTS structure is MQCC\_FAILED and Reason is the reason that the reconnection failed, such as MQRC\_NOT\_AUTHORIZED. ObjectType is the type of object that caused the problem, such as MQOT\_QUEUE, ObjectName is the name of the queue and ObjectQMGrName the name of the queue manager owning the queue.

**A socket connection error occurred during reconnection.**

CompCode in the MQSTS structure is MQCC\_FAILED and Reason is the reason that the reconnection failed, such as MQRC\_HOST\_NOT\_AVAILABLE. ObjectType is MQOT\_Q\_MGR, ObjectName is the name of the queue manager, and ObjectQMGrName is blank.

Subsequent calls to MQSTAT return the same results.

**C invocation**

```
MQSTAT (Hconn, StatType, &Stat, &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN Hconn; /* Connection Handle */
MQLONG StatType; /* Status type */
MQSTS Stat; /* Status information structure */
MQLONG CompCode; /* Completion code */
MQLONG Reason; /* Reason code qualifying CompCode */
```

**COBOL invocation**

```
CALL 'MQSTAT' USING HCONN, STATTYPE, STAT, COMPCODE, REASON.
```

Declare the parameters as follows:

```
** Connection handle
01 HCONN PIC S9(9) BINARY.
** Status type
01 STATTYPE PIC S9(9) BINARY.
** Status information
01 STAT.
COPY CMQSTSV.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON PIC S9(9) BINARY.
```

**PL/I invocation**

```
call MQSTAT (Hconn, StatType, Stat, Compcode, Reason);
```

Declare the parameters as follows:

```

dc1 Hconn      fixed bin(31); /* Connection handle */
dc1 StatType   fixed bin(31); /* Status type */
dc1 Stat       like MQSTS; /* Status information structure */
dc1 CompCode   fixed bin(31); /* Completion code */
dc1 Reason     fixed bin(31); /* Reason code qualifying CompCode */

```

### System/390 Assembler invocation

```
CALL MQSTAT,(HCONN,STATTYPE,STAT,COMPCODE,REASON)
```

Declare the parameters as follows:

```

HCONN      DS      F      Connection handle
STATTYPE   DS      F      Status type
STAT       CMQSTSA,  Status information structure
COMPCODE   DS      F      Completion code
REASON     DS      F      Reason code qualifying COMPCODE

```

### MQSUB - Register subscription:

Use the MQSUB call to register the applications subscription to a particular topic.

#### Syntax

```
MQSUB (Hconn, SubDesc, Hobj, Hsub, Compcode, Reason)
```

#### Parameters

##### *Hconn*

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn*:

```
MQHC_DEF_HCONN
    Default connection handle.
```

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See [Compatibility mode for RPG applications on IBM i](#)

##### *SubDesc*

Type: MQSD - input/output

This is a structure that identifies the object in use that is being registered by the application. See “MQSD - Subscription descriptor” on page 2341 for more information.

##### *Hobj*

Type: MQHOBJ - input/output

This handle represents the access that has been established to obtain the messages sent to this subscription. These messages can either be stored on a specific queue or the queue manager can manage their storage without using a specific queue.

To use a specific queue, you must associate it with the subscription when the subscription is created. You can do this in two ways:

- By using the DEFINE SUB MQSC command and provided that command with the name of a queue object.
- By providing this handle when calling MQSUB with the MQSO\_CREATE

If this handle is provided as an input parameter on the call, it must be a valid object handle returned from a previous MQOPEN call of a queue using at least one of the following options:

- MQOO\_INPUT\_\*
- MQOO\_BROWSE
- MQOO\_OUTPUT (if the queue is a remote queue)

If this is not the case, the call fails with MQRC\_HOBJ\_ERROR. It cannot be an object handle to an alias queue that resolves to a topic object. If so, the call fails with MQRC\_HOBJ\_ERROR.

If the queue manager is to manage the storage of messages sent to this subscription, this should be set when you create the subscription, by using the MQSO\_MANAGED option. The queue manager then returns this handle as an output parameter on the call. The handle that is returned is known as a managed handle. If MQHO\_NONE is specified but MQSO\_MANAGED is not specified, the call fails with MQRC\_HOBJ\_ERROR.

When a managed handle is returned to you by the queue manager, you can use it on an MQGET or MQCB call with or without browse options, on an MQINQ call, or on MQCLOSE. You cannot use it on MQPUT, MQSUB, MQSET; attempting to do so fails with MQRC\_NOT\_OPEN\_FOR\_OUTPUT, MQRC\_HOBJ\_ERROR, or MQRC\_NOT\_OPEN\_FOR\_SET.

If this subscription is being resumed using the MQSO\_RESUME option in the MQSD structure, the handle can be returned to the application in this parameter by setting MQSO\_MANAGED to MQHO\_NONE. You can do this whether the subscription is using a managed handle or not and it can be useful to provide subscriptions created using DEFINE SUB with the handle to the subscription queue defined on that command. In the case where an administratively created subscription is being resumed, the queue opens with MQOO\_INPUT\_AS\_Q\_DEF and MQOO\_BROWSE. If you need to specify other options, the application must open the subscription queue explicitly and provide the object handle on the call. If there is a problem opening the queue the call fails with MQRC\_INVALID\_DESTINATION. If the *Hobj* is provided, it must be equivalent to the *Hobj* in the original MQSUB call. This means if an object handle returned from an MQOPEN call is being provided, the handle must be to the same queue as previously used. If it is not the same queue, the call fails with MQRC\_HOBJ\_ERROR.

If this subscription is being altered using the MQSO\_ALTER option in the MQSD structure, then a different *Hobj* can be provided. Any publications that have been delivered to the queue and were previously identified through this parameter stay on that queue and it is the responsibility of the application to retrieve those messages if the *Hobj* parameter now represents a different queue.

The table summarizes the use of this parameter with various subscription options:

Options	<i>Hobj</i>	Description
MQSO_CREATE + MQSO_MANAGED	Ignored on input	Creates a subscription with storage of messages managed by the queue manager
MQSO_CREATE	A valid object handle	Creates a subscription providing a specific queue as the destination for messages.
MQSO_RESUME	MQHO_NONE	Resumes a previously created subscription whether it was managed or not, and has the queue manager return the object handle for use by the application.
MQSO_RESUME	A valid, matching, object handle	Resumes a previously created subscription that uses a specific queue as the destination for messages and use an object handle with specific open options.

Options	Hobj	Description
MQSO_ALTER + MQSO_MANAGED	MQHO_NONE	Alters an existing subscription that was previously using a specific queue, so it is now a managed subscription. The class of destination (managed or not) cannot be changed.
MQSO_ALTER	A valid object handle	Alters an existing subscription, whether it was managed or not, so that it now uses a specific queue. When the MQSO_MANAGED option is not used, the queue provided can be changed, but the class of destination (managed or not) cannot be changed.

Whether it was provided or returned, *Hobj* must be specified on subsequent MQGET or MQCB calls that want to receive the publication messages sent to this subscription.

The *Hobj* handle is no longer valid when the MQCLOSE call is issued on it, or when the unit of processing that defines the scope of the handle terminates (until the application disconnects). The scope of the object handle returned is the same as that of the connection handle specified on the call. See Hconn (MQHCONN) - output for information about handle scope. An MQCLOSE of the *Hobj* handle does not affect the *Hsub* handle.

### **Hsub**

Type: MQHOBJ - output

This handle represents the subscription that has been made. It can be used for two further operations:

- It can be used on a subsequent MQSUBRQ call to request that publications be sent when the MQSO\_PUBLICATIONS\_ON\_REQUEST option has been used when making the subscription.
- It can be used on a subsequent MQCLOSE call to remove the subscription that has been made. The *Hsub* handle ceases to be valid when the MQCLOSE call is issued, or when the unit of processing that defines the scope of the handle terminates. The scope of the object handle returned is the same as that of the connection handle specified on the call. An MQCLOSE of the *Hsub* handle does not affect the *Hobj* handle.

This handle cannot be passed to an MQGET or MQCB call. You must use the *Hobj* parameter. You cannot use this handle on any IBM MQ call other than MQCLOSE or MQSUBRQ. Passing this handle to any other IBM MQ call results in MQRC\_HOBJ\_ERROR.

### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

#### **MQCC\_OK**

Successful completion

#### **MQCC\_WARNING**

Warning (partial completion)

#### **MQCC\_FAILED**

Call failed

### **Reason**

Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC\_OK, the reason code is as follows:

**MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED, the reason code is one of the following:

**MQRC\_CLUSTER\_RESOLUTION\_ERROR**

(2189, X'88D') Cluster name resolution failed.

**MQRC\_DURABILITY\_NOT\_ALLOWED**

2436 (X'0984') An MQSUB call using the MQSO\_DURABLE option failed.

**MQRC\_FUNCTION\_NOT\_SUPPORTED**

2298 (X'08FA') The function requested is not available in the current environment.

**MQRC\_HOBJ\_ERROR**

2019 (X'07E3') Object handle Hobj not valid.

**MQRC\_IDENTITY\_MISMATCH**

2434 (X'0982') Subscription name matches existing subscription.

**MQRC\_NOT\_AUTHORIZED**

2035 (X'07F3') The user is not authorized to perform the operation.

**MQRC\_NO\_SUBSCRIPTION**

2428 (X'097C') The identified subscription name does not exist.

**MQRC\_OBJECT\_STRING\_ERROR**

2441 (X'0989') Objectstring field not valid.

**MQRC\_OPTIONS\_ERROR**

2046 (X'07FE') Options parameter or field contains options that are not valid, or a combination of options that is not valid.

**MQRC\_Q\_MGR QUIESCING**

2161 (X'0871') Queue manager quiescing.

**MQRC\_RECONNECT\_Q\_MGR\_REQD**

2555 (X'09FB'X) The MQCNO\_RECONNECT\_Q\_MGR option is required.

**MQRC\_RETAINED\_MSG\_Q\_ERROR**

2525 (X'09DD') Retained publications which exist for the subscribed topic string, cannot be retrieved.

**MQRC\_RETAINED\_NOT\_DELIVERED**

2526 (X'09DE') The retained publications which exist for the subscribed topic string, cannot be delivered to the subscription destination queue, and cannot be delivered to the dead-letter queue.

**MQRC\_SD\_ERROR**

2424 (X'0978') Subscription descriptor (MQSD) not valid.

**MQRC\_SELECTION\_NOT\_AVAILABLE**

2551 (X'09F7') The selection string does not follow the IBM MQ selector syntax and no extended message selection provider was available.

**MQRC\_SELECTION\_STRING\_ERROR**

2519 (X'09D7') The selection string must be specified as described in the MQCHARV structure documentation.

**MQRC\_SELECTOR\_SYNTAX\_ERROR**

2459 (X'099B') An MQOPEN, MQPUT1, or MQSUB call was issued but a selection string was specified which contained a syntax error.

**MQRC\_SUB\_USER\_DATA\_ERROR**

2431 (X'097F') SubUserData field not valid.

**MQRC\_SUB\_NAME\_ERROR**

2440 (X'0988') SubName field not valid.

**MQRC\_SUB\_ALREADY\_EXISTS**

2432 (X'0980') Subscription already exists.

**MQRC\_SUB\_USER\_DATA\_ERROR**

2431 (X'097F') SubUserData field not valid.

**MQRC\_TOPIC\_STRING\_ERROR**

2425 (X'0979') Topic string is not valid.

**MQRC\_UNKNOWN\_OBJECT\_NAME**

2085 (X'0825') Object identified in the MQSD ObjectName field cannot be found.

For detailed information about these codes, see Reason codes.

**Usage notes**

- The subscription is made to a topic, named either using the short name of a pre-defined topic object, the full name of the topic string, or it is formed by the concatenation of two parts. See the description of *ObjectName* and *ObjectString* in “MQSD - Subscription descriptor” on page 2341.
- The queue manager performs security checks when an MQSUB call is issued, to verify that the user identifier under which the application is running has the appropriate level of authority before access is permitted. The appropriate topic object is located in the topic hierarchy and an authority check is made on this topic object to ensure authority to subscribe is set. If the MQSO\_MANAGED option is not used, an authority check is made on the destination queue to ensure that authority for output is set. If the MQSO\_MANAGED option is used, no authority check is made on the managed queue for output or inquire access.
- If you do not provide an Hobj as input, the MQSUB call allocates two handles, an object handle (Hobj) and a subscription handle (Hsub).
- The Hobj returned on the MQSUB call when the MQSO\_MANAGED option is used, can be inquired in order to find out attributes such as the Backout threshold and the Excessive backout requeue name. You can also inquire the name of the managed queue, but you must not attempt to directly open this queue.
- Subscriptions can be grouped allowing only a single publication to be delivered to the group of subscriptions even where more than one of the group matched the publication. Subscriptions are grouped using the MQSO\_GROUP\_SUB option and in order to group subscriptions they must be
  - using the same named queue (that is not using the MQSO\_MANAGED option) on the same queue manager - represented by the Hobj parameter on the MQSUB call
  - share the same SubCorrelId
  - be of the same SubLevel

These attributes define the set of subscriptions considered to be in the group, and are also the attributes that cannot be altered if a subscription is grouped. Alteration of SubLevel results in MQRC\_SUBLEVEL\_NOT\_ALTERABLE, and alteration of any of the others (which can be changed if a subscription is not grouped) results in MQRC\_GROUPING\_NOT\_ALTERABLE.

- Successful completion of the MQSUB call does not mean that the action completed. To check that this call has completed, see the DEFINE SUB step in Checking that async commands for distributed networks have finished.
- Fields in the MQSD are filled in on return from an MQSUB call which uses the MQSO\_RESUME option. The MQSD returned can be passed directly into an MQSUB call which uses the MQSO\_ALTER option with any changes you need to make to the subscription applied to the MQSD. Some fields have special considerations as noted in the table.

MQSD output from MQSUB

Field name in MQSD	Special considerations
Access or creation options	Some of the options can be reset on return from the MQSUB call. If you then reuse the MQSD in an MQSUB call, the option you require must be explicitly set.
Durability options, Destination options, Registration Options & Wildcard options	These options are set as appropriate
Publication options	These options are set as appropriate, except for MQSO_NEW_PUBLICATIONS_ONLY which is only applicable to MQSO_CREATE.
Other options	These options are unchanged on return from an MQSUB call. They control how the API call is issued and are not stored with the subscription. They must be set as required on any subsequent MQSUB call reusing the MQSD.
ObjectName	This input only field is unchanged on return from an MQSUB call.
ObjectString	This input only field is unchanged on return from an MQSUB call. The Full topic name used is returned in the <i>ResObjectString</i> field, if a buffer is provided.
AlternateUserId and AlternateSecurityId	These input only fields are unchanged on return from an MQSUB call. They control how the API call is issued and are not stored with the subscription. They must set as required on any subsequent MQSUB call reusing the MQSD.
SubExpiry	On return from an MQSUB call using the MQSO_RESUME option, this field is set to the original expiry of the subscription and not the remaining expiry time. If you then reuse the MQSD in an MQSUB call using the MQSO_ALTER option you reset the expiry of the subscription to start counting down again.
SubName	This field is an input field on an MQSUB call and is not changed on output.
SubUserData and SelectionString	<p>These variable length fields are returned on output from an MQSUB call using the MQSO_RESUME option, if a buffer is provided, and also a positive buffer length in <i>VSBufSize</i>. If no buffer is provided only the length is returned in the <i>VSLength</i> field of the MQCHARV. If the buffer provided is smaller than the space required to return the field, only <i>VSBufSize</i> bytes are returned in the provided buffer.</p> <p>If you then reuse the MQSD in an MQSUB call using the MQSO_ALTER option and a buffer is not provided but a non-zero <i>VSLength</i> is provided, if that length matches the existing length of the field, no alteration is made to the field.</p>

MQSD output from MQSUB

Field name in MQSD	Special considerations
SubCorrelId and PubAccountingToken	If you do not use MQSO_SET_CORREL_ID, then the <i>SubCorrelId</i> is generated by the queue manager. If you do not use MQSO_SET_IDENTITY_CONTEXT, then the <i>PubAccountingToken</i> is generated by the queue manager.  These fields are returned in the MQSD from an MQSUB call using the MQSO_RESUME option. If they are generated by the queue manager, the generated value is returned on an MQSUB call using the MQSO_CREATE or MQSO_ALTER option.
PubPriority, SubLevel & PubApplIdentityData	These fields are returned in the MQSD.
ResObjectString	This output only field is returned in the MQSD if a buffer is provided.

**C invocation**

MQSUB (Hconn, &SubDesc, &Hobj, &Hsub, &CompCode, &Reason)

Declare the parameters as follows:

```
MQHCONN Hconn; /* Connection handle */
MQSD SubDesc; /* Subscription descriptor */
MQHOBJ Hobj; /* Object handle */
MQHOBJ Hsub; /* Subscription handle */
MQLONG CompCode; /* Completion code */
MQLONG Reason; /* Reason code qualifying CompCode */
```

**COBOL invocation**

CALL 'MQSUB' USING HCONN, SUBDESC, HOBJ, HSUB, COMPCODE, REASON.

Declare the parameters as follows:

```
** Connection handle
01 HCONN PIC S9(9) BINARY.
** Subscription descriptor
01 SUBDESC.
COPY CMQSDV.
** Object handle
01 HOBJ PIC S9(9) BINARY.
** Subscription handle
01 HSUB PIC S9(9) BINARY.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON PIC S9(9) BINARY.
```

**PL/I invocation**

call MQSUB (Hconn, SubDesc, Hobj, Hsub, CompCode, Reason)

Declare the parameters as follows:

```
dc1 Hconn fixed bin(31); /* Connection handle */
dc1 SubDesc like MQSD; /* Subscription descriptor */
dc1 Hobj fixed bin(31); /* Object handle */
dc1 Hsub fixed bin(31); /* Subscription handle */
dc1 CompCode fixed bin(31); /* Completion code */
dc1 Reason fixed bin(31); /* Reason code qualifying CompCode */
```

## High Level Assembler invocation

CALL MQSUB, (HCONN, SUBDESC, HOBJ, HSUB, COMPCODE, REASON)

Declare the parameters as follows:

HCONN	DS	F	Connection handle
SUBDESC	CMQSDA	,	Subscription descriptor
HOBJ	DS	F	Object handle
HSUB	DS	F	Subscription handle
COMPCODE	DS	F	Completion code
REASON	DS	F	Reason code qualifying COMPCODE

## MQSUBRQ - Subscription request:

Use the MQSUBRQ call to make a request for the retained publication, when the subscriber has been registered with MQSO\_PUBLICATIONS\_ON\_REQUEST.

### Syntax

MQSUBRQ (*Hconn*, *Hsub*, *Action*, *SubRqOpts*, *Compcode*, *Reason*)

### Parameters

#### *Hconn*

Type: MQHCONN - input

This handle represents the connection to the queue manager. The value of *Hconn* was returned by a previous MQCONN or MQCONNX call.

On z/OS for CICS applications, and on IBM i for applications running in compatibility mode, the MQCONN call can be omitted, and the following value specified for *Hconn*:

**MQHC\_DEF\_HCONN**

Default connection handle.

**Important:**  If you are still using compatibility mode, consider recompiling your application and using static bound calls instead. See Compatibility mode for RPG applications on IBM i

#### *Hsub*

Type: MQHOBJ - input

This handle represents the subscription for which an update is to be requested. The value of *Hsub* was returned from a previous MQSUB call.

#### *Action*

Type: MQLONG - input

This parameter controls the particular action that is being requested on the subscription. The following value must be specified:

**MQSR\_ACTION\_PUBLICATION**

This action requests that an update publication is sent for the specified topic. It can be used only if the subscriber specified the option MQSO\_PUBLICATIONS\_ON\_REQUEST on the MQSUB call when it made the subscription. If the queue manager has a retained publication for the topic, this is sent to the subscriber. If not, the call fails. If an application is sent a publication which was retained, this is indicated by the MQIsRetained message property of that publication.

Since the topic in the existing subscription represented by the *Hsub* parameter can contain wildcards, the subscriber might receive multiple retained publications.

### **SubRqOpts**

Type: MQSRO - input/output

These options control the action of MQSUBRQ, see "MQSRO - Subscription request options" on page 2367 for details.

If no options are required, programs written in C or S/390 assembler can specify a null parameter address instead of specifying the address of an MQSRO structure.

### **CompCode**

Type: MQLONG - output

The completion code; it is one of the following:

#### **MQCC\_OK**

Successful completion

#### **MQCC\_WARNING**

Warning (partial completion)

#### **MQCC\_FAILED**

Call failed

### **Reason**

Type: MQLONG - output

The reason code qualifying *CompCode*.

If *CompCode* is MQCC\_OK:

#### **MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_FAILED:

#### **MQRC\_FUNCTION\_NOT\_SUPPORTED**

2298 (X'08FA') The function requested is not available in the current environment.

#### **MQRC\_NO\_RETAINED\_MSG**

2437 (X'0985') There are no retained publications currently stored for this topic.

#### **MQRC\_OPTIONS\_ERROR**

2046 (X'07FE') Options parameter or field contains options that are not valid, or a combination of options that is not valid.

#### **MQRC\_Q\_MGR QUIESCING**

2161 (X'0871') Queue manager quiescing.

#### **MQRC\_SRO\_ERROR**

2438 (X'0986') On the MQSUBRQ call, the Subscription Request Options MQSRO is not valid.

#### **MQRC\_RETAINED\_MSG\_Q\_ERROR**

2525 (X'09DD') Retained publications which exist for the subscribed topic string, cannot be retrieved.

#### **MQRC\_RETAINED\_NOT\_DELIVERED**

2526 (X'09DE') The retained publications which exist for the subscribed topic string, cannot be delivered to the subscription destination queue, and cannot be delivered to the dead-letter queue.

For detailed information about these codes, see Reason codes.

### **Usage notes**

The following usage notes apply to the use of the Action code MQSR\_ACTION\_PUBLICATION:

1. If this verb completes successfully, the retained publications matching the subscription specified have been sent to the subscription and can be received by using MQGET or MQCB using the Hobj returned on the original MQSUB verb that created the subscription.
2. If the topic subscribed to by the original MQSUB verb that created the subscription contained a wildcard, more than one retained publication can be sent. The number of publications sent as a result of this call is recorded in the NumPubs field in the SubRqOpts structure.
3. If this verb completes with a reason code of MQRC\_NO\_RETAINED\_MSG then there were no currently retained publications for the topic specified.#
4. If this verb completes with a reason code of MQRC\_RETAINED\_MSG\_Q\_ERROR or MQRC\_RETAINED\_NOT\_DELIVERED then there are currently retained publications for the topic specified but an error has occurred that that meant they were unable to be delivered.
5. The application must have a current subscription to the topic before it can make this call. If the subscription was made in a previous instance of the application and a valid handle to the subscription is not available, the application must first call MQSUB with the MQSO\_RESUME option to obtain a handle to it for use in this call.
6. The publications are sent to the destination that is registered for use with the current subscription of this application. If the publications must be sent somewhere else, the subscription must first be altered using the MQSUB call with the MQSO\_ALTER option.

### C invocation

MQSUB (Hconn, Hsub, Action, &SubRqOpts, &CompCode, &Reason)

Declare the parameters as follows:

```
MQHCONN Hconn;    /* Connection handle */
MQHOBJ  Hsub;     /* Subscription handle */
MQLONG  Action;   /* Action requested by MQSUBRQ */
MQSRO   SubRqOpts; /* Options that control the action of MQSUBRQ */
MQLONG  CompCode; /* Completion code */
MQLONG  Reason;   /* Reason code qualifying CompCode */
```

### COBOL invocation

CALL 'MQSUBRQ' USING HCONN, HSUB, ACTION, SUBRQOPTS, COMPCODE, REASON.

Declare the parameters as follows:

```
** Connection handle
01 HCONN PIC S9(9) BINARY.
** Subscription handle
01 HSUB PIC S9(9) BINARY.
** Action requested by MQSUBRQ
01 ACTION PIC S9(9) BINARY.
** Options that control the action of MQSUBRQ
01 SUBRQOPTS.
COPY CMQSROV.
** Completion code
01 COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON PIC S9(9) BINARY.
```

### PL/I invocation

call MQSUBRQ (Hconn, Hsub, Action, SubRqOpts, CompCode, Reason)

Declare the parameters as follows:

```
dc1 Hconn fixed bin(31); /* Connection handle */
dc1 Hsub fixed bin(31); /* Subscription handle */
dc1 Action fixed bin(31); /* Action requested by MQSUBRQ */
```

```

dc1 SubRqOpts like MQSR0; /* Options that control the action of MQSUBRQ */
dc1 CompCode fixed bin(31); /* Completion code */
dc1 Reason fixed bin(31); /* Reason code qualifying CompCode */

```

## High Level Assembler invocation

```
CALL MQSUBRQ,(HCONN, HSUB, ACTION, SUBRQOPTS,COMP CODE,REASON)
```

Declare the parameters as follows:

```

HCONN DS F Connection handle
HSUB DS F Subscription handle
ACTION DS F Action requested by MQSUBRQ
SUBRQOPTS CMQSR0A , Options that control the action of MQSUBRQ
COMP CODE DS F Completion code
REASON DS F Reason code qualifying COMP CODE

```

## Attributes of objects

This collection of topics lists only those IBM MQ objects that can be the subject of an MQINQ function call, and gives details of the attributes that can be inquired on and the selectors to be used.

### Attributes for the queue manager:

Some queue-manager attributes are fixed for particular implementations; others can be changed by using the MQSC command ALTER QMGR.

The attributes can also be displayed by using the command DISPLAY QMGR. Most queue-manager attributes can be inquired by opening a special MQOT\_Q\_MGR object, and using the MQINQ call with the handle returned.

The following table summarizes the attributes that are specific to the queue manager. The attributes are described in alphabetical order.

**Note:** The names of the attributes shown in this section are descriptive names used with the MQINQ call; the names are the same as for the PCF commands. When MQSC commands are used to define, alter, or display attributes, alternative short names are used; see Script (MQSC) Commands for more information.

*Table 253. Attributes for the queue manager*

Attribute	Description
AccountingConnOverride	Override accounting settings.
AccountingInterval	How often to write intermediate accounting records.
ActivityConnOverride	Override activity settings.
ActivityTrace	Controls the collection of IBM MQ MQI application activity trace.
AdoptNewMCACheck	Elements checked to determine whether to adopt new MCA.
AdoptNewMCAType	Whether to restart automatically an orphaned instance of an MCA of a particular channel type.
AlterationDate	Date when definition was last changed
AlterationTime	Time when definition was last changed
AuthorityEvent	Controls whether authorization (Not Authorized) events are generated
BridgeEvent	Control attribute for bridge events.
ChannelAutoDef	Controls whether automatic channel definition is permitted
ChannelAutoDefEvent	Controls whether channel automatic-definition events are generated
ChannelAutoDefExit	Name of user exit for automatic channel definition
ChannelEvent	Control attribute for channel events.
ChannelInitiatorControl	Control attribute for channel initiator
ChannelMonitoring	Online monitoring data for channels
ChannelStatistics	Controls collection of statistics data for channels.
ChinitAdapters	Number of adapter subtasks for processing IBM MQ calls.

Table 253. Attributes for the queue manager (continued)

Attribute	Description
ChinitDispatchers	Number of dispatchers to use for the channel initiator.
	Reserved for IBM use.
ChinitTraceAutoStart	Whether channel initiator trace should start automatically.
ChinitTraceTableSize	Size of channel initiator's trace data space.
ClusterSenderMonitoringDefault	Online monitoring data default for cluster sender channels
ClusterSenderStatistics	Controls collection of statistics monitoring information for cluster sender channels.
ClusterWorkloadData	User data for cluster workload exit
ClusterWorkloadExit	Name of user exit for cluster workload management
ClusterWorkloadLength	Maximum length of message data passed to cluster workload exit
CLWLMRUChannels	Number of most recently used channels for cluster workload balancing
CLWLUseQ	Cluster workload use remote queue.
CodedCharSetId	Coded character set identifier
CommandEvent	Control attribute for command events.
CommandInputQName attribute	Command input queue name
CommandLevel	Command level
CommandServerControl attribute	Control attribute for command server.
Configuration Event attribute	Control attribute for configuration events.
DeadLetterQName	Name of dead-letter queue
DEFCLXQ	Default cluster transmission queue type
DefXmitQName	Default transmission queue name
DistLists	Distribution list support
DNSGroup	Name of group for TCP listener when using Workload Manager Dynamic Domain Name Services support.
DNSWLM	Whether TCP listener registers with Workload Manager for Dynamic Domain Name Services.
ExpiryInterval	Interval between scans for expired messages
IGQPutAuthority	Intra-group queuing put authority
IGQUserId	Intra-group queuing user identifier
InhibitEvent	Controls whether inhibit (Inhibit Get and Inhibit Put) events are generated
IPAddressVersion	Version of the Internet Protocol address
IntraGroupqueuing	Intra-group queuing support
ListenerTimer	Time interval between attempts to restart listener after APPC or TCP/IP failure.
LocalEvent	Controls whether local error events are generated
LoggerEvent	Controls whether logger events are generated
LUGroupName	Generic LU name for LU 6.2 listener that handles inbound transmissions for queue-sharing group.
LUName	Name of LU to use for outbound LU 6.2 transmissions.
LU62ARMSuffix	Suffix of SYS1.PARMLIB member APPCPMxx, that nominates LUADD for this channel initiator.
LU62Channels	Maximum number of current channels or connected clients that use LU 6.2.
MaxActiveChannels	Maximum number of channels that can be active at any time.
MaxChannels	Maximum number of current channels.
MaxHandles	Maximum number of handles
MaxMsgLength	Maximum message length in bytes
MaxPriority attribute	Maximum priority
MaxPropertiesLength	Maximum length of property data in bytes
MaxUncommittedMsgs	Maximum number of uncommitted messages within a unit of work
MQIAccounting	Controls collection of accounting information for MQI data.
MQIStatistics	Controls collection of statistics monitoring information for queue manager.
MsgMarkBrowseInterval	Interval after which the queue manager can remove the mark from browsed messages.
OutboundPortMin	With <i>OutboundPortMin</i> , defines range of port numbers to use when binding outgoing channels.
OutboundPortMax	With <i>OutboundPortMax</i> , defines range of port numbers to use when binding outgoing channels.
PerformanceEvent	Controls whether performance-related events are generated
Platform	Platform on which the queue manager is running

Table 253. Attributes for the queue manager (continued)

Attribute	Description
PubSubNPInputMsg	Whether to discard (or keep) an undelivered input message
PubSubNPResponse	Controls the behavior of undelivered
PubSubMaxMsgRetryCount	The number of retries when processing (under syncpoint) a failed command message
PubSubSyncPoint	Whether only persistent (or all) messages should be processed under syncpoint
PubSubMode	Whether the queued publish/subscribe interface is running
QMGrDesc	Queue manager description
QMGrIdentifier	Unique internally generated identifier of queue manager
QMGrName	Queue manager name
QSGName	Name of queue-sharing group
QueueAccounting	Controls collection of accounting information for queues.
QueueMonitoring	Online monitoring data for queues
QueueStatistics	Controls collection of statistics data for queues.
ReceiveTimeout	How long TCP/IP channel waits for data before returning to inactive state.
ReceiveTimeoutMin	Qualifier for <i>ReceiveTimeout</i> .
ReceiveTimeoutType	Minimum time that TCP/IP channel waits for data before returning to inactive state.
RemoteEvent	Controls whether remote error events are generated
RepositoryName	Name of cluster for which this queue manager provides repository services
RepositoryNamelist	Name of namelist object containing names of clusters for which this queue manager provides repository services
ScyCase	Case of security profiles
SharedQMGrName	Shared queue queue-manager name
"SPLCAP" on page 2621	IBM MQ Advanced Message security protection for a queue manager turned on or off.
SSLCRLNamelist <sub>1</sub>	Name of namelist object containing names of authentication information objects.
SSLCryptoHardware <sub>1</sub>	Cryptographic hardware configuration string.
SSLEvent	Control attribute for SSL events.
SSLFIPSRequired	Use only FIPS-certified algorithms for cryptography.
SSLKeyRepository <sub>1</sub>	Location of SSL key repository.
SSLKeyResetCount	SSL key reset count.
SSLTasks <sub>1</sub>	Number of server subtasks for processing SSL calls.
StatisticsInterval	How often to write statistics monitoring data.
StartStopEvent	Controls whether start and stop events are generated
SyncPoint	Syncpoint availability
TCPChannels	Maximum number of current channels or connected clients that use TCP/IP.
TCPKeepAlive	Whether to use TCP KEEPALIVE to check other end of connection.
TCPName	Name of TCP/IP system that you are using.
TCPStackType	How channel initiator can use TCP/IP addresses.
TraceRouteRecording attribute	Controls recording of trace-route information.
TriggerInterval	Trigger-message interval
Version	Version
XrCapability	Specifies whether Telemetry commands are supported.
<b>Notes:</b>	
1. This attribute cannot be inquired using the MQINQ call, and is not described in this section. See Change Queue Manager for details of this attribute.	

**Related information:**

Specifying that only FIPS-certified CipherSpecs are used at run time on the MQI client  
Federal Information Processing Standards (FIPS) for UNIX, Linux and Windows

*AccountingConnOverride (MQLONG):*

This allows applications to override the setting of the ACCTMQI and ACCTQDATA values in the Qmgr attribute.

The value is one of the following:

**MQMON\_DISABLED**

Applications cannot override the setting of the ACCTMQI and ACCTQ Qmgr attributes using the Options field in the MQCNO structure on the MQCONN call. This is the default value.

**MQMON\_ENABLED**

Applications can override the ACCTQ and ACCTMQI Qmgr attributes using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This attribute is supported only on IBM i, Unix systems, and Windows.

To determine the value of this attribute, use the MQIA\_ACCOUNTING\_CONN\_OVERRIDE selector with the MQINQ call.

*AccountingInterval (MQLONG):*

This specifies how long before intermediate accounting records are written (in seconds).

The value is an integer in the range 0 to 604800, with a default value of 1800 (30 minutes). Specify 0 to turn off intermediate records.

This attribute is supported only on IBM i, Windows, UNIX, and Linux systems.

To determine the value of this attribute, use the MQIA\_ACCOUNTING\_INTERVAL selector with the MQINQ call.

*ActivityConnOverride (MQLONG):*

This allows applications to override the setting of the ACTVTRC value in the queue manager attribute.

The value is one of the following:

**MQMON\_DISABLED**

Applications cannot override the setting of the ACTVTRC queue manager attribute using the Options field in the MQCNO structure on the MQCONN call. This is the default value.

**MQMON\_ENABLED**

Applications can override the ACTVTRC queue manager attribute using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This attribute is supported only on IBM i, Unix systems, and Windows.

To determine the value of this attribute, use the MQIA\_ACTIVITY\_CONN\_OVERRIDE selector with the MQINQ call.

*ActivityTrace (MQLONG):*

This controls the collection of IBM MQ MQI application activity trace.

The value is one of the following:

**MQMON\_ON**

Collect IBM MQ MQI application activity trace.

**MQMON\_OFF**

Do not collect IBM MQ MQI application activity trace. This is the default value.

If you set the queue manager attribute ACTVCON0 to ENABLED, this value might be overridden for individual connections using the Options field in the MQCNO structure.

Changes to this value are only effective for connections to the queue manager after the change to the attribute.

This attribute is supported only on IBM i, Unix systems, and Windows.

To determine the value of this attribute, use the MQIA\_ACTIVITY\_TRACE selector with the MQINQ call.

*AdoptNewMCACheck (MQLONG):*

This defines the elements to check to determine whether to adopt an MCA when a new inbound channel is detected that has the same name as an MCA that is already active

The value is one of the following:

**MQADOPT\_CHECK\_Q\_MGR\_NAME**

Check the queue manager name.

**MQADOPT\_CHECK\_NET\_ADDR**

Check the network address.

**MQADOPT\_CHECK\_ALL**

Check the queue manager name and network address. If possible, perform this check to protect your channels from being shut down, inadvertently or maliciously. This is the default value.

**MQADOPT\_CHECK\_NONE**

Do not check any elements.

Changes to this attribute take effect the next time that a channel attempts to adopt a channel.

This attribute is supported only on z/OS.

To determine the value of this attribute, use the MQIA\_ADOPTNEWMCA\_CHECK selector with the MQINQ call.

*AdoptNewMCAType (MQLONG):*

This specifies whether to restart automatically an orphaned instance of an MCA of a particular channel type when a new inbound channel request matching the AdoptNewMCACheck attribute is detected

It is one of the following values:

**MQADOPT\_TYPE\_NO**

Adopting orphaned channel instances is not required. This is the default value.

**MQADOPT\_TYPE\_ALL**

Adopt all channel types.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_ADOPTNEWMCA\_TYPE selector with the MQINQ call.

*AlterationDate (MQCHAR12):*

This is the date when the definition was last changed. The format of the date is YYYY-MM-DD, padded with two trailing blanks to make the length 12 bytes.

To determine the value of this attribute, use the MQCA\_ALTERATION\_DATE selector with the MQINQ call. The length of this attribute is given by MQ\_DATE\_LENGTH.

*AlterationTime (MQCHAR8):*

This is the time when the definition was last changed. The format of the time is HH.MM.SS.

To determine the value of this attribute, use the MQCA\_ALTERATION\_TIME selector with the MQINQ call. The length of this attribute is given by MQ\_TIME\_LENGTH.

*AuthorityEvent (MQLONG):*

This controls whether authorization (Not Authorized) events are generated. It is one of the following values:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA\_AUTHORITY\_EVENT selector with the MQINQ call.

*BridgeEvent (MQLONG):*

This specifies whether IMS bridge events are generated.

The value is one of the following:

**MQEVR\_ENABLED**

Generate IMS bridge events, as follows:

MQRC\_BRIDGE\_STARTED

MQRC\_BRIDGE\_STOPPED

**MQEVR\_DISABLED**

Do not generate IMS bridge events; this is the default value.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_BRIDGE\_EVENT selector with the MQINQ call.

*ChannelAutoDef (MQLONG):*

This attribute controls the automatic definition of channels of type MQCHT\_RECEIVER and MQCHT\_SVRCONN. Automatic definition of MQCHT\_CLUSSDR channels is always enabled. The value is one of the following:

**MQCHAD\_DISABLED**

Channel auto-definition disabled.

**MQCHAD\_ENABLED**

Channel auto-definition enabled.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

To determine the value of this attribute, use the MQIA\_CHANNEL\_AUTO\_DEF selector with the MQINQ call.

*ChannelAutoDefEvent (MQLONG):*

This controls whether channel automatic-definition events are generated. It applies to channels of type MQCHT\_RECEIVER, MQCHT\_SVRCONN, and MQCHT\_CLUSSDR. The value is one of the following:

**MQEVN\_DISABLED**

Event reporting disabled.

**MQEVN\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

To determine the value of this attribute, use the MQIA\_CHANNEL\_AUTO\_DEF\_EVENT selector with the MQINQ call.

*ChannelAutoDefExit (MQCHARn):*

This is the name of the user exit for automatic channel definition. If this name is nonblank, and *ChannelAutoDef* has the value MQCHAD\_ENABLED, the exit is called each time that the queue manager is about to create a channel definition. This applies to channels of type MQCHT\_RECEIVER, MQCHT\_SVRCONN, and MQCHT\_CLUSSDR. The exit can then do one of the following:

- Create the channel definition without change.
- Modify the attributes of the channel definition that is created.
- Suppress creation of the channel entirely.

**Note:** Both the length and the value of this attribute are environment specific. See the introduction to the MQCD structure in “MQCD - Channel definition” on page 3342 for details of the value of this attribute in various environments.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows, and z/OS. On z/OS, it applies only to cluster-sender and cluster-receiver channels.

To determine the value of this attribute, use the MQCA\_CHANNEL\_AUTO\_DEF\_EXIT selector with the MQINQ call. The length of this attribute is given by MQ\_EXIT\_NAME\_LENGTH.

*ChannelEvent (MQLONG):*

This specifies whether channel events are generated.

It is one of the following values:

**MQEVR\_EXCEPTION**

Only generate the following channel events:

- MQRC\_CHANNEL\_ACTIVATED
- MQRC\_CHANNEL\_CONV\_ERROR
- MQRC\_CHANNEL\_NOT\_ACTIVATED
- MQRC\_CHANNEL\_STOPPED with the following ReasonQualifiers:

MQRQ\_CHANNEL\_STOPPED\_ERROR

MQRQ\_CHANNEL\_STOPPED\_RETRY

MQRQ\_CHANNEL\_STOPPED\_DISABLED

MQRC\_CHANNEL\_STOPPED\_BY\_USER

**MQEVR\_ENABLED**

Generate all channel events. That is, in addition to those generated by EXCEPTION, generate the following channel events:

- MQRC\_CHANNEL\_STARTED
- MQRC\_CHANNEL\_STOPPED with the following ReasonQualifier:

MQRQ\_CHANNEL\_STOPPED\_OK

**MQEVR\_DISABLED**

Do not generate channel events; this is the default value.

To determine the value of this attribute, use the MQIA\_CHANNEL\_EVENT selector with the MQINQ call.

*ChannelInitiatorControl (MQLONG):*

This specifies whether the channel initiator is to be started when the queue manager starts.

It is one of the following values:

**MQSVC\_CONTROL\_MANUAL**

The channel initiator is not to be started automatically.

**MQSVC\_CONTROL\_Q\_MGR**

The channel initiator is to be started automatically when the queue manager starts.

To determine the value of this attribute, use the MQIA\_CHINIT\_CONTROL selector with the MQINQ call.

*ChannelMonitoring (MQLONG):*  

This attribute specifies online monitoring data for channels.

The value is one of the following:

**MQMON\_NONE**

Disable data collection for channel monitoring for all channels regardless of the setting of the MONCHL channel attribute. This is the default value.

**MQMON\_OFF**

Turn monitoring data collection off for channels that specify QMGR in the MONCHL channel attribute.

### **MQMON\_LOW**

Turn monitoring data collection on with a low ratio of data collection for channels specifying QMGR in the MONCHL channel attribute.

### **MQMON\_MEDIUM**

Turn monitoring data collection on with a moderate ratio of data collection for channels specifying QMGR in the MONCHL channel attribute.

### **MQMON\_HIGH**

Turn monitoring data collection on with a high ratio of data collection for channels specifying QMGR in the MONCHL channel attribute.

On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

To determine the value of this attribute, use the MQIA\_MONITORING\_CHANNEL selector with the MQINQ call.

*ChannelStatistics (MQLONG):*  

This controls the collection of statistics data for channels.

The value is one of the following:

### **MQMON\_NONE**

Disable data collection for channel statistics for all channels regardless of the setting of the STATCHL channel attribute. This is the default value.

### **MQMON\_OFF**

Turn statistics data collection off for channels that specify QMGR in the STATCHL channel attribute.

### **MQMON\_LOW**

Turn statistics data collection on with a low ratio of data collection for channels specifying QMGR in the STATCHL channel attribute.

### **MQMON\_MEDIUM**

Turn statistics data collection on with a moderate ratio of data collection for channels specifying QMGR in the STATCHL channel attribute.

### **MQMON\_HIGH**

Turn statistics data collection on with a high ratio of data collection for channels specifying QMGR in the STATCHL channel attribute.

For most systems you are recommended to use MEDIUM. However, for a channel that processes a high volume of messages each second, you might want to reduce the sampling level by selecting LOW. Also, for a channel that processes only a few messages, and for which the most current information is important, you might want to select HIGH.

On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

To determine the value of this attribute, use the MQIA\_STATISTICS\_CHANNEL selector with the MQINQ call.

*ChinitAdapters (MQLONG):*

This is the number of adapter subtasks to use to process IBM MQ calls. The value must be 0 - 9999, with a default value of 8.

The ratio of adapters to dispatchers (the `ChinitDispatchers` attribute) should be about 8 to 5. However, if you have only few channels, you do not have to decrease the value of this parameter from the default value. You can use the following values: for a test system, 8 (default); for a production system, 20. Ideally, you should have 20 adapters, which gives greater parallelism of IBM MQ calls. This is important for persistent messages. Fewer adapters might be better for nonpersistent messages.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the `MQIA_CHINIT_ADAPTERS` selector with the `MQINQ` call.

*ChinitDispatchers (MQLONG):*

This is the number of dispatchers to use for the channel initiator. The value must be 0 - 9999, with a default value of 5.

As a guideline, allow one dispatcher for 50 current channels. However, if you have only few channels, you do not have to decrease the value of this attribute from the default value. If you are using TCP/IP, the greatest number of dispatchers that are used for TCP/IP channels is 100, even if you specify a larger value here. You can use the following settings: test systems, 5 (the default); production systems, 20 (you need 20 dispatchers to handle up to 1000 active channels).

This attribute is supported on z/OS only.

To determine the value of this attribute, use the `MQIA_CHINIT_DISPATCHERS` selector with the `MQINQ` call.

*ChinitTraceAutoStart (MQLONG):*

This specifies whether to start channel initiator trace automatically.

The value is one of the following:

**MQTRAXSTR\_YES**

Start channel initiator trace automatically. This is the default value.

**MQTRAXSTR\_NO**

Do not start channel initiator trace automatically.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the `MQIA_CHINIT_TRACE_AUTO_START` selector with the `MQINQ` call.

*ChinitTraceTableSize (MQLONG):*

This is the size of the channel initiator's trace data space (in MB).

The value must be in the range 0 through 2048, with a default value of 2.

**Note:** Whenever you use large z/OS data spaces, ensure that you have sufficient auxiliary storage on your system to support any related z/OS paging activity. You might also need to increase the size of your `SYS1.DUMP` data sets.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_CHINIT\_TRACE\_TABLE\_SIZE selector with the MQINQ call.

*ClusterSenderMonitoringDefault* (MQLONG):

This specifies the value to be substituted for the ChannelMonitoring attribute of automatically-defined cluster sender channels.

The value is one of the following:

**MQMON\_Q\_MGR**

Collection of online monitoring data is inherited from the setting of the queue manager *ChannelMonitoring* attribute. This is the default value.

**MQMON\_OFF**

Monitoring for the channel is switched off

**MQMON\_LOW**

Unless *ChannelMonitoring* is MQMON\_NONE, monitoring is switched on with a low rate of data collection with a minimal effect on system performance. The data collected is not likely to be the most current.

**MQMON\_MEDIUM**

Unless *ChannelMonitoring* is MQMON\_NONE, monitoring is switched on with a moderate rate of data collection with limited effect on system performance.

**MQMON\_HIGH**

Unless *ChannelMonitoring* is MQMON\_NONE, monitoring is switched on with a high rate of data collection with a likely effect on system performance. The data collected is the most current available.

To determine the value of this attribute, use the MQIA\_MONITORING\_AUTO\_CLUSSDR selector with the MQINQ call.

*ClusterSenderStatistics* (MQLONG):  

Because cluster sender channels can be automatically defined from the definition of CLUSRCVR in the repository, you cannot alter the setting of the STATCHL attribute for these auto-defined cluster sender channels using ALTER channel. For these channels the decision of whether to collect online monitoring data is based on the setting of this queue manager attribute.

The value is one of the following:

**MQMON\_Q\_MGR**

Statistics data collection for auto-defined cluster sender channels is based on the value of the queue manager attribute STATCHL. This is the default value.

**MQMON\_OFF**

Switch off statistics data collection for auto-defined cluster sender channels.

**MQMON\_LOW**

Switch on statistics data collection for auto-defined cluster sender channels with a low ratio of data collection.

**MQMON\_MEDIUM**

Switch on statistics data collection for auto-defined cluster sender channels with a moderate ratio of data collection.

**MQMON\_HIGH**

Switch on statistics data collection for auto-defined cluster sender channels with a high ratio of data collection.

For most systems we recommend MEDIUM. However, for an auto-defined cluster sender channel that processes a high volume of messages each second, you might want to reduce the sampling level by selecting LOW. Also, for a channel that processes only a few messages, and for which the most current information is important, you might want to select HIGH.

On z/OS, this parameter simply turns on statistics data collection, regardless of the value you select. Specifying LOW, MEDIUM, or HIGH makes no difference to your results.

To determine the value of this attribute, use the MQIA\_STATISTICS\_AUTO\_CLUSSDR selector with the MQINQ call.

*ClusterWorkloadData (MQCHAR32):*

This is a user-defined 32-byte character string that is passed to the cluster workload exit when it is called. If there is no data to pass to the exit, the string is blank.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows and z/OS.

To determine the value of this attribute, use the MQCA\_CLUSTER\_WORKLOAD\_DATA selector with the MQINQ call.

*ClusterWorkloadExit (MQCHARn):*

This is the name of the user exit for cluster workload management. If this name is not blank, the exit is called each time that a message is put to a cluster queue or moved from one cluster-sender queue to another. The exit can then either accept the queue instance selected by the queue manager as the destination for the message, or select another queue instance.

**Note:** Both the length and the value of this attribute are environment specific.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows and z/OS.

To determine the value of this attribute, use the MQCA\_CLUSTER\_WORKLOAD\_EXIT selector with the MQINQ call. The length of this attribute is given by MQ\_EXIT\_NAME\_LENGTH.

*ClusterWorkloadLength (MQLONG):*

This is the maximum length of message data that is passed to the cluster workload exit. The actual length of data passed to the exit is the minimum of the following:

- The length of the message.
- The queue-manager's *MaxMsgLength* attribute.
- The *ClusterWorkloadLength* attribute.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows and z/OS.

To determine the value of this attribute, use the MQIA\_CLUSTER\_WORKLOAD\_LENGTH selector with the MQINQ call.

*CLWLMRUChannels (MQLONG):*

This specifies the maximum number of most-recently-used cluster channels, to be considered for use by the cluster workload choice algorithm.

This is a value in the range 1 through 999999999.

To determine the value of this attribute, use the MQIA\_CLWL\_MRU\_CHANNELS selector with the MQINQ call.

*CLWLUseQ (MQLONG):*

This specifies whether to use remote queues for the cluster workload.

The value is one of the following:

**MQCLWL\_USEQ\_ANY**

Use both local and remote queues.

**MQCLWL\_USEQ\_LOCAL**

Do not use remote queues. This is the default value.

To determine the value of this attribute, use the MQIA\_CLWL\_USEQ selector with the MQINQ call.

*CodedCharSetId (MQLONG):*

This defines the character set used by the queue manager for all character string fields defined in the MQI such as the names of objects, and queue creation date and time. The character set must be one that has single-byte characters for the characters that are valid in object names. It does not apply to application data carried in the message. The value depends on the environment:

- On z/OS, the value is set from the system parameters when the queue manager is started; the default value is 500.
- On Windows, the value is the primary CODEPAGE of the user creating the queue manager.
- On IBM i, the value is that which is set in the environment when the queue manager is first created.
- On UNIX systems, the value is the default CODESET for the locale of the user creating the queue manager.

To determine the value of this attribute, use the MQIA\_CODED\_CHAR\_SET\_ID selector with the MQINQ call.

*CommandEvent (MQLONG):*

This specifies whether command events are generated, as follows:

**MQEVR\_DISABLED**

Do not generate command events. This is the default.

**MQEVR\_ENABLED**

Generate command events.

**MQEVR\_NO\_DISPLAY**

Command events are generated for all successful commands other than MQINQ.

To determine the value of this attribute, use the MQIA\_COMMAND\_EVENT selector with the MQINQ call.

*CommandInputQName (MQCHAR48):*

This is the name of the command input queue defined on the local queue manager. This is a queue to which users can send commands, if authorized to do so. The name of the queue depends on the environment:

- On z/OS, the name of the queue is SYSTEM.COMMAND.INPUT; MQSC and PCF commands can be sent to it. See The MQSC commands for details of MQSC commands and Definitions of the Programmable Command Formats for details of PCF commands.

- In all other environments, the name of the queue is SYSTEM.ADMIN.COMMAND.QUEUE, and only PCF commands can be sent to it. However, an MQSC command can be sent to this queue if the MQSC command is enclosed within a PCF command of type MQCMD\_ESCAPE. See Escape for information about the Escape command.

To determine the value of this attribute, use the MQCA\_COMMAND\_INPUT\_Q\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_NAME\_LENGTH.

*CommandLevel (MQLONG):*

This indicates the level of system control commands supported by the queue manager. This can be one of the following values:

**MQCMDL\_LEVEL\_1**

Level 1 of system control commands.

This value is returned by the following versions:

- MQSeries for AIX Version 2.2
- MQSeries for MVS/ESA
  - Version 1.1.1
  - Version 1.1.2
  - Version 1.1.3
- MQSeries for OS/400
  - Version 2.3
  - Version 3.1
  - Version 3.6
- MQSeries for Windows Version 2.0

**MQCMDL\_LEVEL\_101**

MQSeries for Windows Version 2.0.1.

**MQCMDL\_LEVEL\_110**

MQSeries for Windows Version 2.1.

**MQCMDL\_LEVEL\_114**

MQSeries for Version 1.1.4.

**MQCMDL\_LEVEL\_120**

MQSeries for Version 1.2.0.

**MQCMDL\_LEVEL\_200**

MQSeries for Windows NT Version 2.0.

**MQCMDL\_LEVEL\_210**

MQSeries for OS/390 Version 2.1.0.

**MQCMDL\_LEVEL\_220**

Level 220 of system control commands.

This value is returned by the following versions:

- MQSeries for AT&T GIS UNIX Version 2.2
- MQSeries for SINIX and DC/OSx Version 2.2
- MQSeries for SunOS Version 2.2
- MQSeries for Tandem NonStop Kernel Version 2.2

**MQCMDL\_LEVEL\_221**

Level 221 of system control commands.

This value is returned by the following versions:

- MQSeries for AIX Version 2.2.1

#### **MQCMDL\_LEVEL\_320**

Level 320 of system control commands.

This value is returned by the following versions of:

- MQSeries for OS/400
  - Version 3.2
  - Version 3.7

#### **MQCMDL\_LEVEL\_420**

Level 420 of system control commands.

This value is returned by the following versions:

- MQSeries for IBM i
  - Version 4.2.0
  - Version 4.2.1

#### **MQCMDL\_LEVEL\_500**

Level 500 of system control commands.

This value is returned by the following versions:

- MQSeries for AIX Version 5.0
- MQSeries for HP-UX Version 5.0
- MQSeries for Solaris Version 5.0
- MQSeries for Windows NT Version 5.0

#### **MQCMDL\_LEVEL\_510**

Level 510 of system control commands.

This value is returned by the following versions:

- MQSeries for AIX Version 5.1
- MQSeries for AS/400 Version 5.1
- MQSeries for HP-UX Version 5.1
- MQSeries for IBM WebSphere MQ Version 5.1
- MQSeries for Compaq Tru64 UNIX Version 5.1
- MQSeries for Solaris Version 5.1
- MQSeries for Windows NT Version 5.1

#### **MQCMDL\_LEVEL\_520**

Level 520 of system control commands.

This value is returned by the following versions:

- MQSeries for AIX Version 5.2
- MQSeries for AS/400 Version 5.2
- MQSeries for HP-UX Version 5.2
- MQSeries for Linux Version 5.2
- MQSeries for OS/390 Version 5.2
- MQSeries for Sun Solaris Version 5.2
- MQSeries for Windows NT Version 5.2

#### **MQCMDL\_LEVEL\_530**

Level 530 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 5.3

- IBM WebSphere MQ for HP-UX Version 5.3
- IBM WebSphere MQ for iSeries Version 5.3
- IBM WebSphere MQ for Linux for Intel Version 5.3
- IBM WebSphere MQ for Linux for zSeries Version 5.3
- IBM WebSphere MQ for Solaris Version 5.3
- IBM WebSphere MQ for Windows Version 5.3
- IBM WebSphere MQ for z/OS Version 5.3

#### **MQCMDL\_LEVEL\_600**

Level 600 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 6.0
- IBM WebSphere MQ for HP-UX Version 6.0
- IBM WebSphere MQ for iSeries Version 6.0
- IBM WebSphere MQ for Linux Version 6.0
- IBM WebSphere MQ for Solaris Version 6.0
- IBM WebSphere MQ for Windows Version 6.0
- IBM WebSphere MQ for z/OS Version 6.0

#### **MQCMDL\_LEVEL\_700**

Level 700 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 7.0
- IBM WebSphere MQ for HP-UX Version 7.0
- IBM WebSphere MQ for IBM i Version 7.0
- IBM WebSphere MQ for Linux Version 7.0
- IBM WebSphere MQ for Solaris Version 7.0
- IBM WebSphere MQ for Windows Version 7.0
- IBM WebSphere MQ for z/OS Version 7.0

#### **MQCMDL\_LEVEL\_701**

Level 701 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 7.0.1
- IBM WebSphere MQ for HP-UX Version 7.0.1
- IBM WebSphere MQ for IBM i Version 7.0.1
- IBM WebSphere MQ for Linux Version 7.0.1
- IBM WebSphere MQ for Solaris Version 7.0.1
- IBM WebSphere MQ for Windows Version 7.0.1
- IBM WebSphere MQ for z/OS Version 7.0.1

#### **MQCMDL\_LEVEL\_710**

Level 710 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 7.1
- IBM WebSphere MQ for HP-UX Version 7.1
- IBM WebSphere MQ for IBM i Version 7.1
- IBM WebSphere MQ for Linux Version 7.1

- IBM WebSphere MQ for Solaris Version 7.1
- IBM WebSphere MQ for Windows Version 7.1
- IBM WebSphere MQ for z/OS Version 7.1

#### **MQCMDL\_LEVEL\_750**

Level 750 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 7.5
- IBM WebSphere MQ for HP-UX Version 7.5
- IBM WebSphere MQ for IBM i Version 7.5
- IBM WebSphere MQ for Linux Version 7.5
- IBM WebSphere MQ for Solaris Version 7.5
- IBM WebSphere MQ for Windows Version 7.5

#### **MQCMDL\_LEVEL\_800**

Level 800 of system control commands.

This value is returned by the following versions:

- IBM WebSphere MQ for AIX Version 8.0
- IBM WebSphere MQ for HP-UX Version 8.0
- IBM WebSphere MQ for IBM i Version 8.0
- IBM WebSphere MQ for Linux Version 8.0
- IBM WebSphere MQ for Solaris Version 8.0
- IBM WebSphere MQ for Windows Version 8.0
- IBM WebSphere MQ for z/OS Version 8.0

#### **V 8.0.0.2 MQCMDL\_LEVEL\_801**

Level 801 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX Version 8.0.0.2
- IBM MQ for HP-UX Version 8.0.0.2
- IBM MQ for IBM i Version 8.0.0.2
- IBM MQ for Linux Version 8.0.0.2
- IBM MQ for Solaris Version 8.0.0.2

#### **V 8.0.0.3 MQCMDL\_LEVEL\_802**

Level 802 of system control commands.

This value is returned by the following versions:

- IBM MQ for AIX Version 8.0.0.3
- IBM MQ for HP-UX Version 8.0.0.3
- IBM MQ for IBM i Version 8.0.0.3
- IBM MQ for Linux Version 8.0.0.3
- IBM MQ for Solaris Version 8.0.0.3
- IBM MQ for Windows Version 8.0.0.3

The set of system control commands that corresponds to a particular value of the *CommandLevel* attribute varies according to the value of the *Platform* attribute; both must be used to decide which system control commands are supported.

To determine the value of this attribute, use the MQIA\_COMMAND\_LEVEL selector with the MQINQ call.

*CommandServerControl (MQLONG):*

Specifies whether the command server is to be started when the queue manager starts.

The value can be any of the following values:

**MQSVC\_CONTROL\_MANUAL**

The command server is not to be started automatically.

**MQSVC\_CONTROL\_Q\_MGR**

The command server is to be started automatically when the queue manager starts.

This attribute is not supported on z/OS.

To determine the value of this attribute, use the MQIA\_CMD\_SERVER\_CONTROL selector with the MQINQ call.

*ConfigurationEvent (MQLONG):*

Controls whether configuration events are generated.

To determine the value of this attribute, use the MQIA\_CONFIGURATION\_EVENT selector with the MQINQ call.

The value can be any of the following values:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

*DeadLetterQName (MQCHAR48):*

This is the name of a queue defined on the local queue manager as the dead-letter (undelivered-message) queue. Messages are sent to this queue if they cannot be routed to their correct destination.

For example, messages are put on this queue when:

- A message arrives at a queue manager, destined for a queue that is not yet defined on that queue manager
- A message arrives at a queue manager, but the queue for which it is destined cannot receive it because, possibly:
  - The queue is full
  - Put requests are inhibited
  - The sending node does not have authority to put messages on the queue

Applications can also put messages on the dead-letter queue.

Report messages are treated in the same way as ordinary messages; if the report message cannot be delivered to its destination queue (usually the queue specified by the *ReplyToQ* field in the message descriptor of the original message), the report message is placed on the dead-letter (undelivered-message) queue.

**Note:** Messages that have passed their expiry time (see MQMD - Expiry field ) are **not** transferred to this queue when they are discarded. However, an expiration report message (MQRO\_EXPIRATION) is still generated and sent to the *ReplyToQ* queue, if requested by the sending application.

Messages are not put on the dead-letter (undelivered-message) queue when the application that issued the put request has been notified synchronously of the problem by means of the reason code returned by the MQPUT or MQPUT1 call (for example, a message put on a local queue for which put requests are inhibited).

Messages on the dead-letter (undelivered-message) queue sometimes have their application message data prefixed with an MQDLH structure. This structure contains extra information that indicates why the message was placed on the dead-letter (undelivered-message) queue. See “MQDLH - Dead-letter header” on page 2107 for more details of this structure.

This queue must be a local queue, with a *Usage* attribute of MQUS\_NORMAL.

If a queue manager does not support a dead-letter (undelivered-message) queue, or one has not been defined, the name is all blanks. All IBM MQ queue managers support a dead-letter (undelivered-message) queue, but by default it is not defined.

If the dead-letter (undelivered-message) queue is not defined, full, or unusable for some other reason, a message which would have been transferred to it by a message channel agent is retained instead on the transmission queue.

To determine the value of this attribute, use the MQCA\_DEAD\_LETTER\_Q\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_NAME\_LENGTH.

*DefClusterXmitQueueType* (MQLONG):

The *DefClusterXmitQueueType* attribute controls which transmission queue is selected by default by cluster-sender channels to get messages from, to send the messages to cluster-receiver channels.

The values of *DefClusterXmitQueueType* are MQCLXQ\_SCTQ or MQCLXQ\_CHANNEL.

#### **MQCLXQ\_SCTQ**

All cluster-sender channels send messages from SYSTEM.CLUSTER.TRANSMIT.QUEUE. The *correlID* of messages placed on the transmission queue identifies which cluster-sender channel the message is destined for.

SCTQ is set when a queue manager is defined. This behavior is implicit in versions of IBM WebSphere MQ, earlier than Version 7.5. In earlier versions, the queue manager attribute *DefClusterXmitQueueType* was not present.

#### **MQCLXQ\_CHANNEL**

Each cluster-sender channel sends messages from a different transmission queue. Each transmission queue is created as a permanent dynamic queue from the model queue SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE.

If the queue manager attribute, *DefClusterXmitQueueType*, is set to CHANNEL, the default configuration is changed to cluster-sender channels being associated with individual cluster transmission queues. The transmission queues are permanent-dynamic queues created from the model queue

SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE. Each transmission queue is associated with one cluster-sender channel. As one cluster-sender channel services a cluster transmission queue, the transmission queue contains messages for only one queue manager in one cluster. You can configure clusters so that each queue manager in a cluster contains only one cluster queue. In this case, the message traffic from a queue manager to each cluster queue is transferred separately from messages to other queues.

To query the value, call MQINQ, or send an Inquire Queue Manager (MQCMD\_INQUIRE\_Q\_MGR) PCF command, setting the MQIA\_DEF\_CLUSTER\_XMIT\_Q\_TYPE selector. To change the value, send a Change Queue Manager (MQCMD\_CHANGE\_Q\_MGR) PCF command, setting the MQIA\_DEF\_CLUSTER\_XMIT\_Q\_TYPE selector.

**Related reference:**

“MQINQ - Inquire object attributes” on page 2494

The MQINQ call returns an array of integers and a set of character strings containing the attributes of an object.

**Related information:**

Change Queue Manager

The Change Queue Manager ( MQCMD\_CHANGE\_Q\_MGR ) command changes the specified attributes of the queue manager.

Inquire Queue Manager

The Inquire Queue Manager ( MQCMD\_INQUIRE\_Q\_MGR ) command inquires about the attributes of a queue manager.

*DefXmitQName (MQCHAR48):*

This is the name of the transmission queue that is used for the transmission of messages to remote queue managers, if there is no other indication of which transmission queue to use.

If there is no default transmission queue, the name is entirely blank. The initial value of this attribute is blank.

To determine the value of this attribute, use the MQCA\_DEF\_XMIT\_Q\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_NAME\_LENGTH.

*DistLists (MQLONG):*

This indicates whether the local queue manager supports distribution lists on the MQPUT and MQPUT1 calls. It is one of the following values:

**MQDL\_SUPPORTED**

Distribution lists supported.

**MQDL\_NOT\_SUPPORTED**

Distribution lists not supported.

To determine the value of this attribute, use the MQIA\_DIST\_LISTS selector with the MQINQ call.

*DNSGroup (MQCHAR18):*

This parameter is no longer used. Refer to WLM/DNS no longer supported.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA\_DNS\_GROUP selector with the MQINQ call. The length of this attribute is given by MQ\_DNS\_GROUP\_NAME\_LENGTH.

*DNSWLM (MQLONG):*

This parameter is no longer used. Refer to WLM/DNS no longer supported.

The value is one of the following:

**MQDNSWLM\_YES**

This value may be seen on a queue manager migrated from an earlier release. The value is ignored.

**MQDNSWLM\_NO**

This is the only value supported by the queue manager.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_DNS\_WLM selector with the MQINQ call.

*ExpiryInterval (MQLONG):*

This indicates the frequency with which the queue manager scans the queues looking for expired messages. It is either a time interval in seconds in the range 1 through 99 999 999, or the following special value:

#### **MQEXPI\_OFF**

The queue manager does not scan the queues looking for expired messages.

To determine the value of this attribute, use the MQIA\_EXPIRY\_INTERVAL selector with the MQINQ call.

This attribute is supported only on z/OS.

*IGQPutAuthority (MQLONG):*

This attribute applies only if the local queue manager is a member of a queue-sharing group. It indicates the type of authority checking that is performed when the local intra-group queuing agent (IGQ agent) removes a message from the shared transmission queue and places the message on a local queue. The value is one of the following:

#### **MQIGQPA\_DEFAULT**

The user identifier checked for authorization is the value of the *UserIdentifier* field in the *separate* MQMD that is associated with the message when the message is on the shared transmission queue. This is the user identifier of the program that placed the message on the shared transmission queue, and is usually the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) is also checked.

#### **MQIGQPA\_CONTEXT**

The user identifier checked for authorization is the value of the *UserIdentifier* field in the *separate* MQMD that is associated with the message when the message is on the shared transmission queue. This is the user identifier of the program that placed the message on the shared transmission queue, and is usually the same as the user identifier under which the remote queue manager is running.

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the user identifier of the local IGQ agent (*IGQUserId*) and the value of the *UserIdentifier* field in the *embedded* MQMD are also checked. The latter user identifier is usually the user identifier of the application that originated the message.

#### **MQIGQPA\_ONLY\_IGQ**

The user identifier checked for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, this user identifier is used for all checks.

#### **MQIGQPA\_ALTERNATE\_OR\_IGQ**

The user identifier checked for authorization is the user identifier of the local IGQ agent (*IGQUserId*).

If the RESLEVEL profile indicates that more than one user identifier is to be checked, the value of the *UserIdentifier* field in the *embedded* MQMD is also checked. This user identifier is usually the user identifier of the application that originated the message.

To determine the value of this attribute, use the MQIA\_IGQ\_PUT\_AUTHORITY selector with the MQINQ call.

This attribute is supported only on z/OS.

*IGQUserId (MQLONG):*

This attribute is applicable only if the local queue manager is a member of a queue-sharing group. It specifies the user identifier that is associated with the local intra-group queuing agent (IGQ agent). This identifier is one of the user identifiers that can be checked for authorization when the IGQ agent puts messages on local queues. The actual user identifiers checked depend on the setting of the *IGQPutAuthority* attribute, and on external security options.

If *IGQUserId* is blank, no user identifier is associated with the IGQ agent and the corresponding authorization check is not performed (although other user identifiers might still be checked for authorization).

To determine the value of this attribute, use the MQCA\_IGQ\_USER\_ID selector with the MQINQ call. The length of this attribute is given by MQ\_USER\_ID\_LENGTH.

This attribute is supported only on z/OS.

*InhibitEvent (MQLONG):*

This controls whether inhibit (Inhibit Get and Inhibit Put) events are generated. The value is one of the following:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA\_INHIBIT\_EVENT selector with the MQINQ call.

On z/OS, you cannot use the MQINQ call to determine the value of this attribute.

*IntraGroupqueuing (MQLONG):*

This attribute applies only if the local queue manager is a member of a queue-sharing group. It indicates whether intra-group queuing is enabled for the queue-sharing group. The value is one of the following:

**MQIGQ\_DISABLED**

All messages destined for other queue managers in the queue-sharing group are transmitted using conventional channels..

**MQIGQ\_ENABLED**

Messages destined for other queue managers in the queue-sharing group are transmitted using the shared transmission queue if the following condition is satisfied:

- The length of the message data plus transmission header does not exceed 63 KB (64 512 bytes).

It is recommended that somewhat more space than the size of MQXQH be allocated for the transmission header; the constant MQ\_MSG\_HEADER\_LENGTH is provided for this purpose.

If this condition is not satisfied, the message is transmitted using conventional channels.

**Note:** When intra-group queuing is enabled, the order of messages transmitted using the shared transmission queue is not preserved relative to those transmitted using conventional channels.

To determine the value of this attribute, use the MQIA\_INTRA\_GROUP\_queuing selector with the MQINQ call.

This attribute is supported only on z/OS.

*IPAddressVersion (MQLONG):*

Specifies which IP address version, either IPv4 or IPv6, is used.

This attribute is only relevant for systems that run both IPv4 and IPv6 and only affects channels defined as having a *TransportType* of MQXPY\_TCP when one of the following conditions is true:

- The channel's *ConnectionName* is a host name that resolves to both an IPv4 and IPv6 address and its *LocalAddress* parameter is not specified.
- The channel's *ConnectionName* and *LocalAddress* are both host names that resolve to both IPv4 and IPv6 addresses.

The value can be any of the following values:

**MQIPADDR\_IPv4**

IPv4 is used.

**MQIPADDR\_IPv6**

IPv6 is used.

To determine the value of this attribute, use the MQIA\_IP\_ADDRESS\_VERSION selector with the MQINQ call.

*ListenerTimer (MQLONG):*

This is the time interval (in seconds) between IBM MQ attempts to restart the listener if there has been an APPC or TCP/IP failure. The value must be between 5 and 9999, with a default value of 60.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_LISTENER\_TIMER selector with the MQINQ call.

*LocalEvent (MQLONG):*

This controls whether local error events are generated. The value is one of the following:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA\_LOCAL\_EVENT selector with the MQINQ call.

On z/OS, you cannot use the MQINQ call to determine the value of this attribute.

*LoggerEvent (MQLONG):*

This controls whether recovery log events are generated. The value is one of the following:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA\_LOGGER\_EVENT selector with the MQINQ call.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, and Windows.

*LUGroupName (MQCHAR8):*

This is the generic LU name for the LU 6.2 listener that handles inbound transmissions for the queue-sharing group. If you leave this name blank, you cannot use this listener.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA\_LU\_GROUP\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_LU\_NAME\_LENGTH.

*LUName (MQCHAR8):*

This is the name of the LU to use for outbound LU 6.2 transmissions. Set this to the same LU that the listener uses for inbound transmissions. If you leave this name blank, the APPC/MVS default LU is used; this is variable, so always set LUName if you are using LU6.2.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA\_LU\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_LU\_NAME\_LENGTH.

*LU62ARMSuffix (MQCHAR2):*

This is the suffix of the SYS1.PARMLIB member APPCPMxx, that nominates the LUADD for this channel initiator. The z/OS command SET APPC=xx is issued when ARM restarts the channel initiator. If you leave this name is blank, no SET APPC=xx is issued.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA\_LU62\_ARM\_SUFFIX selector with the MQINQ call. The length of this attribute is given by MQ\_ARM\_SUFFIX\_LENGTH.

*LU62Channels (MQLONG):*

This is the maximum number of channels that can be current, or clients that can be connected, that use the LU 6.2 transmission protocol.

The value must be in the range 0 through 9999, with a default value of 200. If you set this to zero, the LU 6.2 transmission protocol is not used.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_LU62\_CHANNELS selector with the MQINQ call.

### *MaxActiveChannels (MQLONG):*

This attribute is the maximum number of channels that can be *active* at any time.

The default is the value specified for the `MaxChannels` attribute.

For z/OS, the value must be in the range 1 through 9 999.

For all other platforms, the value must be in the range 1 through 65 535.

The **MaxActiveChannels** parameter is a queue manager attribute on z/OS only. On the other platforms, **MaxActiveChannels** is an attribute in the `qm.ini` file. See Configuration file stanzas for distributed queuing for information on how you set the **MaxActiveChannels** attribute on other platforms.

To determine the value of this attribute, use the `MQIA_ACTIVE_CHANNELS` selector with the **MQINQ** call.

#### **Related information:**

Channel states

### *MaxChannels (MQLONG):*

This attribute is the maximum number of channels that can be *current* (including server-connection channels with connected clients).

For z/OS, the value must be in the range 1 through 9 999, with a default value of 200.

For all other platforms, the value must be in the range 1 through 65 535, with a default value of 100.

A system that is busy serving connections from the network might need a higher number than the default setting. Determine the value that is correct for your environment, ideally by observing the behavior of your system during testing.

The **MaxChannels** parameter is a queue manager attribute on z/OS only. On the other platforms, **MaxChannels** is an attribute in the `qm.ini` file. See Configuration file stanzas for distributed queuing for information on how you set the **MaxChannels** attribute on other platforms.

To determine the value of this attribute, use the `MQIA_MAX_CHANNELS` selector with the **MQINQ** call.

#### **Related information:**

Channel states

### *MaxHandles (MQLONG):*

This is the maximum number of open handles that any one task can use concurrently. Each successful **MQOPEN** call for a single queue (or for an object that is not a queue) uses one handle. That handle becomes available for reuse when the object is closed. However, when a distribution list is opened, each queue in the distribution list is allocated a separate handle, and so that **MQOPEN** call uses as many handles as there are queues in the distribution list. This must be taken into account when deciding on a suitable value for *MaxHandles*.

The **MQPUT1** call performs an **MQOPEN** call as part of its processing; as a result, **MQPUT1** uses as many handles as **MQOPEN** would, but the handles are used only for the duration of the **MQPUT1** call itself.

On z/OS, *task* means a CICS task, an MVS task, or an IMS dependent region.

The value is in the range 1 through 999 999 999. The default value is determined by the environment:

- On z/OS, the default value is 100.
- In all other environments, the default value is 256.

To determine the value of this attribute, use the MQIA\_MAX\_HANDLES selector with the MQINQ call.

*MaxMsgLength (MQLONG):*

This is the length of the longest *physical* message that the queue manager can handle. However, because the *MaxMsgLength* queue-manager attribute can be set independently of the *MaxMsgLength* queue attribute, the longest physical message that can be placed on a queue is the lesser of those two values.

If the queue manager supports segmentation, an application can put a *logical* message that is longer than the lesser of the two *MaxMsgLength* attributes, but only if the application specifies the MQMF\_SEGMENTATION\_ALLOWED flag in MQMD. If that flag is specified, the upper limit for the length of a logical message is 999 999 999 bytes, but usually resource constraints imposed by the operating system, or by the environment in which the application is running, result in a lower limit.

The lower limit for the *MaxMsgLength* attribute is 32 KB (32 768 bytes). The upper limit is 100 MB (104 857 600 bytes).

To determine the value of this attribute, use the MQIA\_MAX\_MSG\_LENGTH selector with the MQINQ call.

*MaxPriority (MQLONG):*

This is the maximum message priority supported by the queue manager. Priorities range from zero (lowest) to *MaxPriority* (highest).

To determine the value of this attribute, use the MQIA\_MAX\_PRIORITY selector with the MQINQ call.

*MaxPropertiesLength (MQLONG):*

This is used to control the size of the properties that can flow with a message. This includes both the property name in bytes and the size of the property value also in bytes.

To determine the value of this attribute, use the MQIA\_MAX\_PROPERTIES\_LENGTH selector with the MQINQ call.

*MaxUncommittedMsgs (MQLONG):*

This is the maximum number of uncommitted messages that can exist within a unit of work. The number of uncommitted messages is the sum of the following since the start of the current unit of work:

- Messages put by the application with the MQPMO\_SYNCPOINT option
- Messages retrieved by the application with the MQGMO\_SYNCPOINT option
- Trigger messages and COA report messages generated by the queue manager for messages put with the MQPMO\_SYNCPOINT option
- COD report messages generated by the queue manager for messages retrieved with the MQGMO\_SYNCPOINT option

The following are *not* counted as uncommitted messages:

- Messages put or retrieved by the application outside a unit of work
- Trigger messages or COA/COD report messages generated by the queue manager as a result of messages put or retrieved outside a unit of work
- Expiration report messages generated by the queue manager (even if the call causing the expiration report message specified MQGMO\_SYNCPOINT)

- Event messages generated by the queue manager (even if the call causing the event message specified MQPMO\_SYNCPOINT or MQGMO\_SYNCPOINT)

**Note:**

1. Exception report messages are generated by the Message Channel Agent (MCA), or by the application, and are treated in the same way as ordinary messages put or retrieved by the application.
2. When a message or segment is put with the MQPMO\_SYNCPOINT option, the number of uncommitted messages is incremented by one regardless of how many physical messages actually result from the put. (More than one physical message might result if the queue manager must subdivide the message or segment.)
3. When a distribution list is put with the MQPMO\_SYNCPOINT option, the number of uncommitted messages is incremented by one *for each physical message that is generated*. This can be as small as one, or as great as the number of destinations in the distribution list.

The lower limit for this attribute is 1; the upper limit is 999 999 999. The default value is 10000.

To determine the value of this attribute, use the MQIA\_MAX\_UNCOMMITTED\_MSGS selector with the MQINQ call.

*MQIAccounting (MQLONG):*

This controls the collection of accounting information for MQI data.

The value is one of the following:

**MQMON\_ON**

Collect API accounting data.

**MQMON\_OFF**

Do not collect API accounting data. This is the default value.

If you set the queue manager attribute ACCTCONO to ENABLED, this value might be overridden for individual connections using the Options field in the MQCNO structure. Changes to this value are only effective for connections to the queue manager that occur after the change to the attribute.

This attribute is supported only on IBM i, UNIX systems, and Windows.

To determine the value of this attribute, use the MQIA\_ACCOUNTING\_MQI selector with the MQINQ call.

*MQIStatistics (MQLONG):*

This controls the collection of statistics monitoring information for the queue manager.

The value is one of the following:

**MQMON\_ON**

Collect MQI statistics.

**MQMON\_OFF**

Do not collect MQI statistics. This is the default value.

This attribute is supported only on IBM i, UNIX and Linux systems, and Windows.

To determine the value of this attribute, use the MQIA\_STATISTICS\_MQI selector with the MQINQ call.

*MsgMarkBrowseInterval (MQLONG):*

Time interval in milliseconds after which the queue manager can automatically remove the mark from browse messages.

This is a time interval (in milliseconds) after which the queue manager can automatically remove the mark from browse messages.

This attribute describes the time interval for which messages that have been marked as browsed by a call to MQGET, using the get message option MQGMO\_MARK\_BROWSE\_CO\_OP, are expected to remain marked as browsed.

The queue manager might automatically unmark browsed messages that have been marked as browsed for the cooperating set of handles when they have been marked for more than this approximate interval.

This does not affect the state of any message marked as browse, that was obtained by a call to MQGET, using the get message option MQGMO\_MARK\_BROWSE\_HANDLE.

The value is not less than -1 and not greater than 999 999 999. The default value is 5000. A *MsgMarkBrowseInterval* of -1 represents an unlimited time interval. A *MsgMarkBrowseInterval* of 0 causes the queue manager to unmark the message immediately.

To determine the value of this attribute, use the MQIA\_MSG\_MARK\_BROWSE\_INTERVAL selector with the MQINQ call.

*OutboundPortMax (MQLONG):*

This is the highest port number in the range, defined by OutboundPortMin and OutboundPortMax, of port numbers to be used to bind outgoing channels.

The value is an integer in the range 0 through 65535, and must be equal to or greater than the OutboundPortMin value. The default value is 0.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_OUTBOUND\_PORT\_MAX selector with the MQINQ call.

*OutboundPortMin (MQLONG):*

This is the lowest port number in the range, defined by OutboundPortMin and OutboundPortMax, of port numbers to be used to bind outgoing channels.

The value is an integer in the range 0 through 65535, and must be equal to or less than the OutboundPortMax value. The default value is 0.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_OUTBOUND\_PORT\_MIN selector with the MQINQ call.

*PerformanceEvent (MQLONG):*

This controls whether performance-related events are generated. It is one of the following values:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA\_PERFORMANCE\_EVENT selector with the MQINQ call.

*Platform (MQLONG):*

This indicates the operating system on which the queue manager is running:

**MQPL\_AIX**

AIX (same value as MQPL\_UNIX).

**V 8.0.0.2 MQPL\_APPLIANCE**

IBM MQ Appliance

**MQPL\_MVS**

z/OS (same value as MQPL\_ZOS).

**MQPL\_NSK**

HP Integrity NonStop Server.

**MQPL\_OS390**

z/OS (same value as MQPL\_ZOS).

**MQPL\_OS400**

IBM i.

**MQPL\_UNIX**

UNIX systems.

**MQPL\_WINDOWS\_NT**

Windows systems.

**MQPL\_ZOS**

z/OS.

To determine the value of this attribute, use the MQIA\_PLATFORM selector with the MQINQ call.

*PubSubNPInputMsg (MQLONG):*

Whether to discard or keep an undelivered input message.

The value is one of the following:

**MQUNDELIVERED\_DISCARD**

Non-persistent input messages may be discarded if they cannot be processed.

This is the default value.

**MQUNDELIVERED\_KEEP**

Non-persistent input messages will not be discarded if they cannot be processed. In this situation the queued publish/subscribe interface will continue to retry the process at appropriate intervals and does not continue processing subsequent messages.

To determine the value of this attribute, use the MQIA\_PUBSUB\_NP\_MSG selector with the MQINQ call.

*PubSubNPResponse (MQLONG):*

Controls the behavior of undelivered response messages.

The value is one of the following:

**MQUNDELIVERED\_NORMAL**

Non-persistent responses which cannot be placed on the reply queue are put on the dead letter queue, if they cannot be placed on the DLQ then they are discarded.

**MQUNDELIVERED\_SAFE**

Non-persistent responses which cannot be placed on the reply queue are put on the dead letter queue. If the response cannot be set and cannot be placed on the DLQ then the queued publish/subscribe interface will roll back the current operation and then retry at appropriate intervals and does not continue processing subsequent messages.

**MQUNDELIVERED\_DISCARD**

Non-persistent responses are not placed on the reply queue are discarded.

This is the default value for new queue managers.

**MQUNDELIVERED\_KEEP**

Non-persistent responses are not placed on the dead letter queue or discarded. Instead, the queued publish/subscribe interface will back out the current operation and then retry it at appropriate intervals.

To determine the value of this attribute, use the MQIA\_PUBSUB\_NP\_RESP selector with the MQINQ call.

**Default value for migrated queue managers.**

If the queue manager has been migrated from IBM MQ V6.0, the initial value of this attribute depends on the values of *DiscardNonPersistentResponse* and *DLQNonPersistentResponse* before migration, as shown in the following table.

		DLQNonPersistentResponse		
		Yes	No	Not set
DiscardNonPersistentResponse	Yes	MQUNDELIVERED_NORMAL	MQUNDELIVERED_DISCARD	MQUNDELIVERED_NORMAL
	No	MQUNDELIVERED_SAFE	MQUNDELIVERED_KEEP	MQUNDELIVERED_SAFE
	Not set	If SyncPointPersistent = No, MQUNDELIVERED_SAFE else MQUNDELIVERED_NORMAL	If SyncPointPersistent = No, MQUNDELIVERED_KEEP else MQUNDELIVERED_DISCARD	If SyncPointPersistent = No, MQUNDELIVERED_SAFE else MQUNDELIVERED_NORMAL

*PubSubMaxMsgRetryCount (MQLONG):*

The number of retries when processing a failed command message under syncpoint.

The value is one of the following:

**0 - 999 999 999**

The default value is 5.

To determine the value of this attribute, use the MQIA\_PUBSUB\_MAXMSG\_RETRY\_COUNT selector with the MQINQ call.

*PubSubSyncPoint (MQLONG):*

Whether only persistent messages or all messages are processed under syncpoint.

The value is one of the following:

### **MQSYNCPPOINT\_IFPER**

This makes the queued publish/subscribe interface receive non-persistent messages outside syncpoint. If the daemon receives a publication outside syncpoint, the daemon forwards the publication to subscribers known to it outside syncpoint.

This is the default value.

### **MQSYNCPPOINT\_YES**

This makes the queued publish/subscribe interface receive all messages under syncpoint.

To determine the value of this attribute, use the MQIA\_PUBSUB\_SYNC\_PT selector with the MQINQ call.

*PubSubMode (MQLONG):*

Whether the publish/subscribe engine and the queued publish/subscribe interface are running, therefore allowing applications to publish/subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface.

The value is one of the following:

### **MQPSM\_COMPAT**

The publish/subscribe engine is running. It is therefore possible to publish/subscribe by using the application programming interface. The queued publish/subscribe interface is not running, therefore any message that is put to the queues that are monitored by the queued publish/subscribe interface is not acted on. This setting is used for compatibility with WebSphere Message Broker V6 or earlier versions using this queue manager, because it must read the same queues from which the queued publish/subscribe interface normally reads.

### **MQPSM\_DISABLED**

The publish/subscribe engine and the queued publish/subscribe interface are not running. It is therefore not possible to publish/subscribe by using the application programming interface. Any publish/subscribe messages that are put to the queues that are monitored by the queued publish/subscribe interface are not acted on.

### **MQPSM\_ENABLED**

The publish/subscribe engine and the queued publish/subscribe interface are running. It is therefore possible to publish/subscribe by using the application programming interface and the queues that are being monitored by the queued publish/subscribe interface. This is the queue manager's initial default value.

To determine the value of this attribute, use the MQIA\_PUBSUB\_MODE selector with the MQINQ call.

*QMgrDesc (MQCHAR64):*

Use this field for a commentary describing the queue manager. The content of the field is of no significance to the queue manager, but the queue manager might require that the field contain only characters that can be displayed. It cannot contain any null characters; if necessary, it is padded to the right with blanks. In a DBCS installation, this field can contain DBCS characters (subject to a maximum field length of 64 bytes).

**Note:** If this field contains characters that are not in the queue manager's character set (as defined by the *CodedCharSetId* queue manager attribute), those characters might be translated incorrectly if this field is sent to another queue manager.

- On z/OS, the default value is the product name and version number.
- In all other environments, the default value is blanks.

To determine the value of this attribute, use the MQCA\_Q\_MGR\_DESC selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_MGR\_DESC\_LENGTH.

*QMgrIdentifier (MQCHAR48):*

This is an internally-generated unique name for the queue manager.

To determine the value of this attribute, use the MQCA\_Q\_MGR\_IDENTIFIER selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_MGR\_IDENTIFIER\_LENGTH.

This attribute is supported in the following environments: AIX, HP-UX, z/OS, IBM i, Solaris, Linux, Windows, plus IBM MQ clients connected to these systems.

*QMgrName (MQCHAR48):*

This is the name of the local queue manager, that is, the name of the queue manager to which the application is connected.

The first 12 characters of the name are used to construct a unique message identifier (see MQMD - MsgId field ). Queue managers that can intercommunicate must therefore have names that differ in the first 12 characters, in order for message identifiers to be unique in the queue-manager network.

On z/OS, the name is the same as the subsystem name, which is limited to 4 nonblank characters.

To determine the value of this attribute, use the MQCA\_Q\_MGR\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_MGR\_NAME\_LENGTH.

*QSGName (MQCHAR4):*

This is the name of the queue-sharing group to which the local queue manager belongs. If the local queue manager does not belong to a queue-sharing group, the name is blank.

To determine the value of this attribute, use the MQCA\_QSG\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_QSG\_NAME\_LENGTH.

This attribute is supported only on z/OS.

*QueueAccounting (MQLONG):*

This controls the collection of accounting information for queues.

The value is one of the following:

**MQMON\_NONE**

Do not collect accounting data for queues, regardless of the setting of the queue accounting attribute ACCTQ. This is the default value.

**MQMON\_OFF**

Do not collect accounting data for queues that specify QMGR in the ACCTQ queue attribute.

**MQMON\_ON**

Collect accounting data for queues that specify QMGR in the ACCTQ queue attribute.

Changes to this value are only effective for connections to the queue manager that occur after the change to the attribute.

To determine the value of this attribute, use the MQIA\_ACCOUNTING\_Q selector with the MQINQ call.

*QueueMonitoring (MQLONG):*

This specifies the default setting for online monitoring of queues.

If the *QueueMonitoring* queue attribute is set to MQMON\_Q\_MGR, this attribute specifies the value which is assumed by the channel. The value can be:

**MQMON\_OFF**

Online monitoring data collection is turned off. This is the queue manager's initial default value.

**MQMON\_NONE**

Online monitoring data collection is turned off for queues regardless of the setting of their *QueueMonitoring* attribute.

**MQMON\_LOW**

Online monitoring data collection is turned on, with a low ratio of data collection.

**MQMON\_MEDIUM**

Online monitoring data collection is turned on, with a moderate ratio of data collection.

**MQMON\_HIGH**

Online monitoring data collection is turned on, with a high ratio of data collection.

To determine the value of this attribute, use the MQIA\_MONITORING\_Q selector with the MQINQ call.

*QueueStatistics* (MQLONG):

This controls the collection of statistics data for queues.

It is one of the following values:

**MQMON\_NONE**

Do not collect queue statistics for queues, regardless of the setting of the *QueueStatistics* queue attribute. This is the default value.

**MQMON\_OFF**

Do not collect statistics data for queues that specify Queue Manager in the *QueueStatistics* queue attribute.

**MQMON\_ON**

Collect statistics data for queues that specify Queue Manager in the *QueueStatistics* queue attribute.

To determine the value of this attribute, use the MQIA\_STATISTICS\_Q selector with the MQINQ call.

*ReceiveTimeout* (MQLONG):

This specifies how long a TCP/IP channel waits to receive data, including heartbeats, from its partner before returning to the inactive state. It applies only to message channels and not to MQI channels.

The exact meaning of the *ReceiveTimeout* is altered by the value specified in *ReceiveTimeoutType*. *ReceiveTimeoutType* can be set to one of the following:

- MQRCVTIME\_EQUAL - this value is the number in seconds for the channel to wait. Specify a value in the range 0 - 999999.
- MQRCVTIME\_ADD - this value is the number in seconds to add to the negotiated HBINT, and it determines how long a channel waits. Specify a value in the range 1 - 999999.
- MQRCVTIME\_MULTIPLY - this value is a multiplier to apply to the negotiated HBINT. Specify a value of 0 or a value in the range 2 - 99.

The default value is 0.

Set *ReceiveTimeoutType* to MQRCVTIME\_MULTIPLY or MQRCVTIME\_EQUAL, and *ReceiveTimeout* to 0, to stop a channel from timing out its wait to receive data from its partner.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_RECEIVE\_TIMEOUT selector with the MQINQ call.

*ReceiveTimeoutMin (MQLONG):*

This is the minimum time, in seconds, that a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state.

It applies only to message channels, not to MQI channels. The value must be in the range 0 through 999999, with a default of 0.

If you use *ReceiveTimeoutType* to specify that the TCP/IP channel wait time is to be calculated relative to the negotiated value of HBINT, and the resultant value is less than the value of this parameter, this value is used instead.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_RECEIVE\_TIMEOUT\_MIN selector with the MQINQ call.

*ReceiveTimeoutType (MQLONG):*

This is the qualifier, applied to *ReceiveTimeout* to define how long a TCP/IP channel waits to receive data, including heartbeats, from its partner, before returning to the inactive state. It applies only to message channels, not to MQI channels.

The value is one of the following:

**MQRCVTIME\_MULTIPLY**

*ReceiveTimeout* is a multiplier to apply to the negotiated HBINT value to determine how long a channel waits. This is the default value.

**MQRCVTIME\_ADD**

*ReceiveTimeout* is a value, in seconds, to add to the negotiated HBINT value to determine how long a channel waits.

**MQRCVTIME\_EQUAL**

*ReceiveTimeout* is a value, in seconds, that the channel waits.

To stop a channel timing out its wait to receive data from its partner, set *ReceiveTimeoutType* to MQRCVTIME\_MULTIPLY or MQRCVTIME\_EQUAL, and *ReceiveTimeout* to 0.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_RECEIVE\_TIMEOUT\_TYPE selector with the MQINQ call.

*RemoteEvent (MQLONG):*

This controls whether remote error events are generated. It is one of the following values:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA\_REMOTE\_EVENT selector with the MQINQ call.

*RepositoryName* (MQCHAR48):

This is the name of a cluster for which this queue manager provides a repository-manager service. If the queue manager provides this service for more than one cluster, *RepositoryNameList* specifies the name of a namelist object that identifies the clusters, and *RepositoryName* is blank. At least one of *RepositoryName* and *RepositoryNameList* must be blank.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows, and z/OS.

To determine the value of this attribute, use the MQCA\_REPOSITORY\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_MGR\_NAME\_LENGTH.

*RepositoryNameList* (MQCHAR48):

This is the name of a namelist object that contains the names of clusters for which this queue manager provides a repository-manager service. If the queue manager provides this service for only one cluster, the namelist object contains only one name. Alternatively, *RepositoryName* can be used to specify the name of the cluster, in which case *RepositoryNameList* is blank. At least one of *RepositoryName* and *RepositoryNameList* must be blank.

This attribute is supported only on AIX, HP-UX, IBM i, Linux, Solaris, Windows, and z/OS.

To determine the value of this attribute, use the MQCA\_REPOSITORY\_NAMELIST selector with the MQINQ call. The length of this attribute is given by MQ\_NAMELIST\_NAME\_LENGTH.

*SecurityCase*(MQCHAR8):

Specifies whether the queue manager supports security profile names in mixed case, or in uppercase only.

The value is one of the following:

**MQSCYC\_UPPER**

Security profile names must be in uppercase.

**MQSCYC\_MIXED**

Security profile names can be in uppercase or in mixed case.

Changes to this attribute take effect when a Refresh Security command is run with *SecurityType*(MQSECTYPE\_CLASSES) specified.

This attribute is supported only on z/OS.

To determine the value of this attribute, use the MQIA\_SECURITY\_CASE selector with the MQINQ call.

*SharedQMgrName* (MQLONG):

This specifies whether the *ObjectQmgrName* should be used or treated as the local queue manager on an MQOPEN call, for a shared queue, when the *ObjectQmgrName* is that of another queue manager in the queue-sharing group.

The value can be any of the following values:

**MQSQQM\_USE**

*ObjectQmgrName* is used and the appropriate transmission queue is opened.

**MQSQQM\_IGNORE**

If the target queue is shared, and the *ObjectQmgrName* is that of a queue manager in the same queue-sharing group, the open is performed locally.

This attribute is valid only on z/OS.

To determine the value of this attribute, use the MQIA\_SHARED\_Q\_Q\_MGR\_NAME selector with the MQINQ call.

*SPLCAP*:

Indicates whether security capabilities of IBM MQ Advanced Message Security are available for a queue manager.

**MQCAP\_SUPPORTED**

This is the default value if the IBM MQ AMS component is installed for the installation that the queue manager is running under.

**MQCAP\_NOT\_SUPPORTED**

*SSLEvent (MQLONG)*:

This specifies whether SSL events are generated.

It is one of the following values:

**MQEVR\_ENABLED**

Generate SSL events, as follows:  
MQRC\_CHANNEL\_SSL\_ERROR

**MQEVR\_DISABLED**

Do not generate SSL events; this is the default value.

To determine the value of this attribute, use the MQIA\_SSL\_EVENT selector with the MQINQ call.

*SSLFIPSRequired (MQLONG)*:

This lets you specify that only FIPS-certified algorithms are to be used if the cryptography is executed in IBM MQ, rather than in cryptographic hardware. If cryptographic hardware is configured, the cryptography modules used are those modules provided by the hardware product; these modules might or might not be FIPS-certified to a particular level depending on the hardware product in use.

The value is one of the following values:

**MQSSL\_FIPS\_NO**

Use any CipherSpec supported on the platform in use. This value is the default value.

**MQSSL\_FIPS\_YES**

Use only FIPS-certified cryptographic algorithms in the CipherSpecs allowed on all SSL connections from and to this queue manager.

This parameter is valid only on UNIX, Linux, Windows, and z/OS platforms.

To determine the value of this attribute, use the MQIA\_SSL\_FIPS\_REQUIRED selector with the MQINQ call.

**Related information:**

Specifying that only FIPS-certified CipherSpecs are used at run time on the MQI client  
Federal Information Processing Standards (FIPS) for UNIX, Linux and Windows

*SSLKeyResetCount (MQLONG):*

This specifies when SSL channel message channel agents (MCAs) that initiate communication reset the secret key used for encryption on the channel.

The value represents the total number of unencrypted bytes that are sent and received on the channel before the secret key is renegotiated. The number of bytes includes control information sent by the MCA.

The value is a number in the range 0 through 999 999 999, with a default value of 0. If you specify an SSL/TLS secret key reset count in the range 1 byte through 32 KB, SSL/TLS channels will use a secret key reset count of 32 KB. This is to avoid the processing cost of excessive key resets which would occur for small SSL/TLS secret key reset values.

The secret key is renegotiated when the total number of unencrypted bytes sent and received by the initiating channel MCA exceeds the specified value, or if channel heartbeats are enabled before data is sent or received following a channel heartbeat, whichever occurs first.

The count of bytes sent and received for renegotiation includes control information sent and received by the channel MCA and is reset whenever a renegotiation occurs.

Use a value of 0 to indicate that secret keys are never renegotiated.

To determine the value of this attribute, use the MQIA\_SSL\_RESET\_COUNT selector with the MQINQ call.

*StartStopEvent (MQLONG):*

This controls whether start and stop events are generated. The value is one of the following:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA\_START\_STOP\_EVENT selector with the MQINQ call.

*StatisticsInterval (MQLONG):*

This specifies how often (in seconds) to write statistics monitoring data to the monitoring queue.

The value is an integer in the range 0 to 604800, with a default value of 1800 (30 minutes).

To determine the value of this attribute, use the MQIA\_STATISTICS\_INTERVAL selector with the MQINQ call.

*SyncPoint (MQLONG):*

This indicates whether the local queue manager supports units of work and syncpointing with the MQGET, MQPUT, and MQPUT1 calls.

**MQSP\_AVAILABLE**

Units of work and syncpointing available.

**MQSP\_NOT\_AVAILABLE**

Units of work and syncpointing not available.

- On z/OS this value is never returned.

To determine the value of this attribute, use the MQIA\_SYNCPOINT selector with the MQINQ call.

*TCPChannels (MQLONG):*

This is the maximum number of channels that can be current, or clients that can be connected, that use the TCP/IP transmission protocol.

The value must be in the range 0 through 9999, with a default value of 200. If you specify 0, TCP/IP is not used.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_TCP\_CHANNELS selector with the MQINQ call.

*TCPKeepAlive (MQLONG):*

This specifies whether to use TCP KEEPALIVE to check that the other end of the connection is still available. If it is not available, the channel is closed.

The value is one of the following:

**MQTCPKEEP\_YES**

Use TCP KEEPALIVE as specified in the TCP profile configuration data set. If you specify the channel attribute KeepAliveInterval (KAINT), the value to which it is set is used.

**MQTCPKEEP\_NO**

Do not use TCP KEEPALIVE. This is the default value.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_TCP\_KEEP\_ALIVE selector with the MQINQ call.

*TCPName (MQCHAR8):*

This is the name of either the only or preferred TCP/IP stack that will be used, depending on the value of TCPStackType. This parameter is only applicable in CINET multiple stack environments. The default value is TCPIP.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQCA\_TCP\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_TCP\_NAME\_LENGTH.

*TCPStackType (MQLONG):*

This specifies whether the channel initiator can use only the TCP/IP stack specified in TCPName, or can optionally bind to any selected TCP/IP stack. This parameter is only applicable in CINET multiple stack environments.

The value is one of the following:

### **MQTCPSTACK\_SINGLE**

The channel initiator can use only the TCP/IP address spaces named in TCPName. This is the default value.

### **MQTCPSTACK\_MULTIPLE**

The channel initiator can use any TCP/IP address space available to it. It defaults to the one specified in TCPName if no other is specified for a channel or listener.

This attribute is supported on z/OS only.

To determine the value of this attribute, use the MQIA\_TCP\_STACK\_TYPE selector with the MQINQ call.

*TraceRouteRecording (MQLONG):*

This controls the recording of trace- route information.

The value is one of the following:

### **MQRECORDING\_DISABLED**

No appending to trace- route messages allowed.

### **MQRECORDING\_Q**

Put trace- route messages to fixed named queue.

### **MQRECORDING\_MSG**

Put trace- route messages to a queue determined using the message itself. This is the default value

To determine the value of this attribute, use the MQIA\_TRACE\_ROUTE\_RECORDING selector with the MQINQ call.

*TriggerInterval (MQLONG):*

This is a time interval (in milliseconds) used to restrict the number of trigger messages. This is relevant only when the *TriggerType* is MQTT\_FIRST. In this case trigger messages are usually generated only when a suitable message arrives on the queue, and the queue was previously empty. Under certain circumstances, however, an additional trigger message can be generated with MQTT\_FIRST triggering even if the queue was not empty. These additional trigger messages are not generated more often than every *TriggerInterval* milliseconds.

For more information on triggering, see Triggering channels.

The value is not less than 0 and not greater than 999 999 999. The default value is 999 999 999.

To determine the value of this attribute, use the MQIA\_TRIGGER\_INTERVAL selector with the MQINQ call.

*TriggerInterval (MQLONG):*

This is a time interval (in milliseconds) used to restrict the number of trigger messages. This is relevant only when the *TriggerType* is MQTT\_FIRST. In this case trigger messages are usually generated only when a suitable message arrives on the queue, and the queue was previously empty. Under certain circumstances, however, an additional trigger message can be generated with MQTT\_FIRST triggering even if the queue was not empty. These additional trigger messages are not generated more often than every *TriggerInterval* milliseconds.

For more information on triggering, see Triggering channels.

The value is not less than 0 and not greater than 999 999 999. The default value is 999 999 999.

To determine the value of this attribute, use the MQIA\_TRIGGER\_INTERVAL selector with the MQINQ call.

*Version (MQCFST):*

This is the version of the IBM MQ code as VVRRMMFF, where:

VV - Version

RR - Release

MM - Maintenance level

FF - Fix level

*XrCapability(MQLONG):*

This controls whether IBM MQ Telemetry commands are supported by the queue manager.

The value is one of the following:

**MQCAP\_SUPPORTED**

IBM MQ Telemetry component installed and Telemetry commands are supported.

**MQCAP\_NOT\_SUPPORTED**

IBM MQ Telemetry component not installed.

This attribute is supported only on IBM i, Unix systems, and Windows.

To determine the value of this attribute, use the MQIA\_XR\_CAPABILITY selector with the MQINQ call.

**Attributes for queues:**

There are five types of queue definition. Some queue attributes apply to all types of queue; other queue attributes apply only to certain types of queue.

**Types of queue**

The queue manager supports the following types of queue definition:

**Local queue**

You can store messages on a local queue. On z/OS you can make it a shared or private queue.

A queue is known to a program as *local* if it is owned by the queue manager to which the program is connected. You can get messages from, and put messages on, local queues.

The queue definition object holds the definition information of the queue as well as the physical messages put on the queue.

**Local queue manager queue**

The queue exists on the local queue manager. The queue is known as a private queue on z/OS.

**Shared queue ( z/OS only)**

The queue exists in a shared repository that is accessible to all the queue managers that belong to the queue-sharing group that owns the shared repository.

Applications connected to any queue manager in the queue-sharing group can place messages on and remove messages from queues of this type. Such queues are effectively the same as local queues. The value of the *QType* queue attribute is MQQT\_LOCAL.

Applications connected to the local queue manager can place messages on and remove messages from queues of this type. The value of the *QType* queue attribute is MQQT\_LOCAL.

### Cluster queue

You can store messages on a cluster queue on the queue manager where it is defined. A cluster queue is a queue that is hosted by a cluster queue manager and made available to other queue managers in the cluster. The value of the *QType* queue attribute is MQQT\_CLUSTER.

A cluster queue definition is advertised to other queue managers in the cluster. The other queue managers in the cluster can put messages to a cluster queue without needing a corresponding remote-queue definition. A cluster queue can be advertised in more than one cluster by using a cluster namelist.

When a queue is advertised, any queue manager in the cluster can put messages to it. To put a message, the queue manager must find out, from the full repositories, where the queue is hosted. Then it adds some routing information to the message and puts the message on a cluster transmission queue.

A queue manager can store messages for other queue managers in a cluster on multiple transmission queues. You can configure a queue manager to store messages on multiple cluster transmission queues in two different ways. If you set the queue manager attribute DEFCLXQ to CHANNEL, a different cluster transmission queue is created automatically from SYSTEM.CLUSTER.TRANSMIT.MODEL.QUEUE for each cluster-sender channel. If you set the CLCHNAME transmission queue option to match one or more cluster-senders channel, the queue manager can store messages for the matching channels on that transmission queue.

A cluster queue can be a queue that is shared by members of a queue-sharing group in IBM MQ for z/OS.

### Remote queue

A remote queue is not a physical queue; it is the local definition of a queue that exists on a remote queue manager. The local definition of the remote queue contains information that tells the local queue manager how to route messages to the remote queue manager.

Applications connected to the local queue manager can place messages on queues of this type; the messages are placed on the local transmission queue used to route messages to the remote queue manager. Applications cannot remove messages from remote queues. The value of the *QType* queue attribute is MQQT\_REMOTE.

You can also use a remote queue definition for:

- Reply-queue aliasing  
In this case the name of the definition is the name of a reply-to queue. For more information, see Reply-to queue aliases and clusters.
- Queue-manager aliasing  
In this case the name of the definition is an alias for a queue manager, and not the name of a queue. For more information, see Queue manager aliases and clusters.

### Alias queue

This is not a physical queue; it is an alternative name for a local queue, a shared queue, a cluster queue, or a remote queue. The name of the queue to which the alias resolves is part of the definition of the alias queue.

Applications connected to the local queue manager can place messages on queues of this type; the messages are placed on the queue to which the alias resolves. Applications can remove messages from queues of this type if the alias resolves to a local queue, a shared queue, or a cluster queue that has a local instance. The value of the *QType* queue attribute is MQQT\_ALIAS.

## Model queue

This is not a physical queue; it is a set of queue attributes from which a local queue can be created.

Messages cannot be stored on queues of this type.

## Queue attributes

Some queue attributes apply to all types of queue; other queue attributes apply only to certain types of queue. The types of queue to which an attribute applies are shown in Table 254 and subsequent tables.

Table 254 summarizes the attributes that are specific to queues. The attributes are described in alphabetical order.

**Note:** The names of the attributes shown in this section are descriptive names used with the MQINQ and MQSET calls; the names are the same as for the PCF commands. When MQSC commands are used to define, alter, or display attributes, alternative short names are used; see Script (MQSC) commands for details.

*Table 254. Attributes for queues.* The columns apply as follows:

- The column for local queues applies also to shared queues.
- The column for model queues indicates which attributes are inherited by the local queue created from the model queue.
- The column for cluster queues indicates the attributes that can be inquired when the cluster queue is opened for inquire alone, or for inquire and output. If the cluster queue is opened for inquire plus one or more of input, browse, or set, the column for local queues applies instead.

Attribute	Description	Local	Model	Alias	Remote	Cluster
AlterationDate	Date when definition was last changed	✓		✓	✓	
AlterationTime	Time when definition was last changed	✓		✓	✓	
BackoutRequeueQName	Excessive backout requeue queue name	✓	✓			
BackoutThreshold	Backout threshold	✓	✓			
BaseQName	Queue name to which alias resolves			✓		
CFStrucName	Coupling-facility structure name	✓	✓			
CLCHNAME	Cluster-sender channel names	✓	✓			
ClusterName	Name of cluster to which queue belongs	✓		✓	✓	✓
ClusterNameList	Name of namelist object containing names of clusters to which queue belongs	✓		✓	✓	
CLWLQueuePriority	Cluster workload queue priority	✓		✓	✓	✓
CLWLQueueRank	Cluster workload queue rank	✓		✓	✓	✓
CLWLUseQ	Use remote queue	✓				
CreationDate	Date that the queue was created	✓				

Table 254. Attributes for queues (continued). The columns apply as follows:

- The column for local queues applies also to shared queues.
- The column for model queues indicates which attributes are inherited by the local queue created from the model queue.
- The column for cluster queues indicates the attributes that can be inquired when the cluster queue is opened for inquire alone, or for inquire and output. If the cluster queue is opened for inquire plus one or more of input, browse, or set, the column for local queues applies instead.

Attribute	Description	Local	Model	Alias	Remote	Cluster
CreationTime	Time that the queue was created	✓				
CurrentQDepth	Current queue depth	✓				
DefaultPutResponse	Default put response	✓	✓	✓	✓	
DefBind	Default binding	✓		✓	✓	✓
DefinitionType attribute	Queue definition type	✓	✓			
DefInputOpenOption	Default input open option	✓	✓			
DefPersistence	Default message persistence	✓	✓	✓	✓	✓
DefPriority	Default message priority	✓	✓	✓	✓	✓
DefReadAhead	Default read ahead	✓	✓	✓		
DistLists	Distribution list support	✓	✓			
HardenGetBackout	Whether to maintain an accurate backout count	✓	✓			
IndexType	Index type	✓	✓			
InhibitGet	Whether get operations for the queue are allowed	✓	✓	✓		
InhibitPut	Whether put operations for the queue are allowed	✓	✓	✓	✓	✓
InitiationQName	Name of initiation queue	✓	✓			
MaxMsgLength	Maximum message length in bytes	✓	✓			
MaxQDepth	Maximum queue depth	✓	✓			
MsgDeliverySequence attribute	Message delivery sequence	✓	✓			
NonPersistentMessage Class	Reliability goal for non-persistent messages	✓	✓			
OpenInputCount	Number of opens for input	✓				
OpenOutputCount	Number of opens for output	✓				
PropertyControl	Property control	✓	✓	✓		

Table 254. Attributes for queues (continued). The columns apply as follows:

- The column for local queues applies also to shared queues.
- The column for model queues indicates which attributes are inherited by the local queue created from the model queue.
- The column for cluster queues indicates the attributes that can be inquired when the cluster queue is opened for inquire alone, or for inquire and output. If the cluster queue is opened for inquire plus one or more of input, browse, or set, the column for local queues applies instead.

Attribute	Description	Local	Model	Alias	Remote	Cluster
ProcessName	Process name	✓	✓			
QDepthHighEvent attribute	Whether Queue Depth High events are generated	✓	✓			
QDepthHighLimit	High limit for queue depth	✓	✓			
QDepthLowEvent attribute	Whether Queue Depth Low events are generated	✓	✓			
QDepthLowLimit attribute	Low limit for queue depth	✓	✓			
QDepthMaxEvent	Whether Queue Full events are generated	✓	✓			
QDesc	Queue description	✓	✓	✓	✓	✓
QName	Queue name	✓		✓	✓	✓
QServiceInterval	Target for queue service interval	✓	✓			
QServiceIntervalEvent attribute	Whether Service Interval High or Service Interval OK events are generated	✓	✓			
QSGDisp attribute	Queue-sharing group disposition	✓		✓	✓	
QueueAccounting	Queue accounting data collection	✓	✓	✓	✓	✓
QueueMonitoring	Online monitoring data for queues	✓	✓			
QueueStatistics	Queue statistics data collection	✓	✓	✓	✓	✓
QType	Queue type	✓		✓	✓	✓
RemoteQMgrName	Name of remote queue manager				✓	
RemoteQName	Name of remote queue				✓	
RetentionInterval	Retention interval	✓	✓			
Scope	Whether an entry for the queue also exists in a cell directory	✓		✓	✓	
Shareability	Queue shareability	✓	✓			
StorageClass	Storage class for queue	✓	✓			
TriggerControl	Trigger control	✓	✓			

Table 254. Attributes for queues (continued). The columns apply as follows:

Usage attribute	Queue usage	✓	✓			
XmitQName	Transmission queue name				✓	

**Related information:**

Cluster queues

Local queues

*AlterationDate* (MQCHAR12):

Date when definition was last changed.

Local	Model	Alias	Remote	Cluster
X		X	X	

This is the date when the definition was last changed. The format of the date is YYYY-MM-DD, padded with two trailing blanks to make the length 12 bytes (for example, 1992-09-23 , where represents two blank characters).

The values of certain attributes (for example, *CurrentQDepth*) change as the queue manager operates. Changes to these attributes do not affect *AlterationDate*.

To determine the value of this attribute, use the MQCA\_ALTERATION\_DATE selector with the MQINQ call. The length of this attribute is given by MQ\_DATE\_LENGTH.

*AlterationTime* (MQCHAR8):

Time when definition was last changed.

Local	Model	Alias	Remote	Cluster
X		X	X	

This is the time when the definition was last changed. The format of the time is HH.MM.SS using the 24-hour clock, with a leading zero if the hour is less than 10 (for example 09.10.20).

- On z/OS, the time is Greenwich Mean Time (GMT), subject to the system clock being set accurately to GMT.
- In other environments, the time is local time.

The values of certain attributes (for example, *CurrentQDepth*) change as the queue manager operates. Changes to these attributes do not affect *AlterationTime*.

To determine the value of this attribute, use the MQCA\_ALTERATION\_TIME selector with the MQINQ call. The length of this attribute is given by MQ\_TIME\_LENGTH.

*BackoutRequeueQName* (MQCHAR48):

This is the excessive backout requeue queue name. Apart from allowing its value to be queried, the queue manager takes no action based on the value of this attribute.

Local	Model	Alias	Remote	Cluster
X	X			

Applications running inside WebSphere Application Server and those that use the IBM MQ Application Server Facilities use this attribute to determine where messages that have been backed out should go. For all other applications, the queue manager takes no action based on the value of the attribute.

IBM MQ classes for JMS uses this attribute to determine where to transfer a message that has already been backed out the maximum number of times as specified by the *BackoutThreshold* attribute.

To determine the value of this attribute, use the MQCA\_BACKOUT\_REQ\_Q\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_NAME\_LENGTH.

*BackoutThreshold* (MQLONG):

This is the backout threshold. Apart from allowing its value to be queried, the queue manager takes no action based on the value of this attribute.

Local	Model	Alias	Remote	Cluster
X	X			

Applications running inside of WebSphere Application Server and those that use the IBM MQ Application Server Facilities will use this attribute to determine if a message should be backed out. For all other applications, the queue manager takes no action based on the value of the attribute.

IBM MQ classes for JMS uses this attribute to determine how many times to allow a message to be backed out before transferring the message to the queue specified by the *BackoutRequeueQName* attribute.

To determine the value of this attribute, use the MQIA\_BACKOUT\_THRESHOLD selector with the MQINQ call.

*BaseQName (MQCHAR48):*

This is the name of a queue that is defined to the local queue manager.

Local	Model	Alias	Remote	Cluster
		X		

(For more information on queue names, see MQOD - ObjectName field.) The queue is one of the following types:

**MQQT\_LOCAL**

Local queue.

**MQQT\_REMOTE**

Local definition of a remote queue.

**MQQT\_CLUSTER**

Cluster queue.

To determine the value of this attribute, use the MQCA\_BASE\_Q\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_NAME\_LENGTH.

*BaseType (MQCFIN):*

The type of object to which the alias resolves.

Local	Model	Alias	Remote	Cluster
		X		

It is one of the following values:

**MQOT\_Q**

Base object type is a queue

**MQOT\_TOPIC**

Base object type is a topic

*CFStrucName (MQCHAR12):*

This is the name of the coupling-facility structure where the messages on the queue are stored. The first character of the name is in the range A through Z, and the remaining characters are in the range A through Z, 0 through 9, or blank.

Local	Model	Alias	Remote	Cluster
X	X			

To get the full name of the structure in the coupling facility, suffix the value of the *QSGName* queue-manager attribute with the value of the *CFStrucName* queue attribute.

This attribute applies only to shared queues; it is ignored if *QSGDisp* does not have the value MQQSGD\_SHARED.

To determine the value of this attribute, use the MQCA\_CF\_STRUC\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_CF\_STRUC\_NAME\_LENGTH.

This attribute is supported only on z/OS.

*ClusterChannelName (MQCHAR20):*

ClusterChannelName is the generic name of the cluster-sender channels that use this queue as a transmission queue. The attribute specifies which cluster-sender channels send messages to a cluster-receiver channel from this cluster transmission queue.

Local	Model	Alias	Remote	Cluster
✓	✓			

The default queue manager configuration is for all cluster-sender channels to send messages from a single transmission queue, SYSTEM.CLUSTER.TRANSMIT.QUEUE. The default configuration can be changed by modified by changing the queue manager attribute, DefClusterXmitQueueType. The default value of the attribute is SCTQ. You can change the value to CHANNEL. If you set the DefClusterXmitQueueType attribute to CHANNEL, each cluster-sender channel defaults to using a specific cluster transmission queue, SYSTEM.CLUSTER.TRANSMIT.ChannelName.

You can also set the transmission queue attribute ClusterChannelName attribute to a cluster-sender channel manually. Messages that are destined for the queue manager connected by the cluster-sender channel are stored in the transmission queue that identifies the cluster-sender channel. They are not stored in the default cluster transmission queue. If you set the ClusterChannelName attribute to blanks, the channel switches to the default cluster transmission queue when the channel restarts. The default queue is either SYSTEM.CLUSTER.TRANSMIT.ChannelName or SYSTEM.CLUSTER.TRANSMIT.QUEUE, depending on the value of the queue manager DefClusterXmitQueueType attribute.

By specifying asterisks, "\*", in ClusterChannelName, you can associate a transmission queue with a set of cluster-sender channels. The asterisks can be at the beginning, end, or any number of places in the middle of the channel name string. ClusterChannelName is limited to a length of 20 characters: MQ\_CHANNEL\_NAME\_LENGTH.

*ClusterName (MQCHAR48):*

This is the name of the cluster to which the queue belongs.

Local	Model	Alias	Remote	Cluster
X		X	X	X

If the queue belongs to more than one cluster, ClusterNameList specifies the name of a namelist object that identifies the clusters, and ClusterName is blank. At least one of ClusterName and ClusterNameList must be blank.

To determine the value of this attribute, use the MQCA\_CLUSTER\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_CLUSTER\_NAME\_LENGTH.

*ClusterNameList (MQCHAR48):*

This is the name of a namelist object that contains the names of clusters to which this queue belongs.

Local	Model	Alias	Remote	Cluster
X		X	X	

If the queue belongs to only one cluster, the namelist object contains only one name. Alternatively, *ClusterName* can be used to specify the name of the cluster, in which case *ClusterNamelist* is blank. At least one of *ClusterName* and *ClusterNamelist* must be blank.

To determine the value of this attribute, use the MQCA\_CLUSTER\_NAMELIST selector with the MQINQ call. The length of this attribute is given by MQ\_NAMELIST\_NAME\_LENGTH.

*CLWLQueuePriority (MQLONG):*

This is the cluster workload queue priority, a value in the range 0 through 9 representing the priority of the queue.

Local	Model	Alias	Remote	Cluster
X		X	X	X

For more information, see Cluster queues.

To determine the value of this attribute, use the MQIA\_CLWL\_Q\_PRIORITY selector with the MQINQ call.

*CLWLQueueRank (MQLONG):*

This is the cluster workload queue rank, a value in the range 0 through 9 representing the rank of the queue.

Local	Model	Alias	Remote	Cluster
X		X	X	X

For more information, see Cluster queues.

To determine the value of this attribute, use the MQIA\_CLWL\_Q\_RANK selector with the MQINQ call.

*CLWLUseQ (MQLONG):*

This defines the behavior of an MQPUT when the target queue has both a local instance and at least one remote cluster instance. If the put originates from a cluster channel, this attribute does not apply.

Local	Model	Alias	Remote	Cluster
X				

The value is one of the following:

**MQCLWL\_USEQ\_ANY**

Use remote and local queues.

**MQCLWL\_USEQ\_LOCAL**

Do not use remote queues.

**MQCLWL\_USEQ\_AS\_Q\_MGR**

Inherit definition from queue manager's MQIA\_CLWL\_USEQ.

For more information, see Cluster queues.

To determine the value of this attribute, use the MQCA\_CLWL\_USEQ selector with the MQINQ call. The length of this attribute is given by MQ\_CLWL\_USEQ\_LENGTH.

*CreationDate (MQCHAR12):*

This is the date when the queue was created.

Local	Model	Alias	Remote	Cluster
X				

The format of the date is YYYY-MM-DD, padded with two trailing blanks to make the length 12 bytes (for example, 2013-09-23-- , where -- represents 2 blank characters).

- On IBM i, the creation date of a queue can differ from that of the underlying operating system entity (file or userspace) that represents the queue.

To determine the value of this attribute, use the MQCA\_CREATION\_DATE selector with the MQINQ call. The length of this attribute is given by MQ\_CREATION\_DATE\_LENGTH.

*CreationTime (MQCHAR8):*

This is the time when the queue was created.

Local	Model	Alias	Remote	Cluster
X				

The format of the time is HH.MM.SS using the 24-hour clock, with a leading zero if the hour is less than 10 (for example 09.10.20).

- On z/OS, the time is Greenwich Mean Time (GMT), subject to the system clock being set accurately to GMT.
- In other environments, the time is local time.
- On IBM i, the creation time of a queue can differ from that of the underlying operating system entity (file or userspace) that represents the queue.

To determine the value of this attribute, use the MQCA\_CREATION\_TIME selector with the MQINQ call. The length of this attribute is given by MQ\_CREATION\_TIME\_LENGTH.

*CurrentQDepth (MQLONG):*

This is the number of messages currently on the queue.

Local	Model	Alias	Remote	Cluster
X				

It is incremented during an MQPUT call, and during backout of an MQGET call. It is decremented during a nonbrowse MQGET call, and during backout of an MQPUT call. The effect of this is that the count includes messages that have been put on the queue within a unit of work, but that have not yet been committed, even though they are not eligible to be retrieved by the MQGET call. Similarly, it excludes messages that have been retrieved within a unit of work using the MQGET call, but that have yet to be committed.

The count also includes messages that have passed their expiry time but have not yet been discarded, although these messages are not eligible to be retrieved. See MQMD - Expiry field for more information.

Unit-of-work processing and the segmentation of messages can both cause *CurrentQDepth* to exceed *MaxQDepth*. However, this does not affect the retrievability of the messages; *all* messages on the queue can be retrieved using the MQGET call in the normal way.

The value of this attribute fluctuates as the queue manager operates.

To determine the value of this attribute, use the MQIA\_CURRENT\_Q\_DEPTH selector with the MQINQ call.

*DefaultPutResponse* (MQLONG):

Specifies the type of response to be used for put operations to the queue when an application specifies MQPMO\_RESPONSE\_AS\_Q\_DEF.

Local	Model	Alias	Remote	Cluster
X	X	X	X	

It is one of the following values:

**MQPRT\_SYNC\_RESPONSE**

The put operation is issued synchronously, returning a response.

**MQPRT\_ASYNC\_RESPONSE**

The put operation is issued asynchronously, returning a subset of MQMD fields.

*DefBind* (MQLONG):

This is the default binding that is used when MQOO\_BIND\_AS\_Q\_DEF is specified on the MQOPEN call and the queue is a cluster queue.

Local	Model	Alias	Remote	Cluster
X		X	X	X

The value is one of the following:

**MQBND\_BIND\_ON\_OPEN**

Binding fixed by MQOPEN call.

**MQBND\_BIND\_NOT\_FIXED**

Binding not fixed.

**MQBND\_BIND\_ON\_GROUP**

Allows an application to request that a group of messages are all allocated to the same destination instance. Because this value is new in IBM WebSphere MQ Version 7.1, it must not be used if any of the applications opening this queue are connecting to IBM WebSphere MQ Version 7.0.1 or earlier queue managers.

To determine the value of this attribute, use the MQIA\_DEF\_BIND selector with the MQINQ call.

*DefinitionType* (MQLONG):

This indicates how the queue was defined.

Local	Model	Alias	Remote	Cluster
X	X			

The value is one of the following:

#### **MQQDT\_PREDEFINED**

The queue is a permanent queue created by the system administrator; only the system administrator can delete it.

Predefined queues are created using the DEFINE MQSC command, and can be deleted only by using the DELETE MQSC command. Predefined queues cannot be created from model queues.

Commands can be issued either by an operator, or by an authorized user sending a command message to the command input queue (see CommandInputQName attribute for more information).

#### **MQQDT\_PERMANENT\_DYNAMIC**

The queue is a permanent queue that was created by an application issuing an MQOPEN call with the name of a model queue specified in the object descriptor MQOD. The model queue definition had the value MQQDT\_PERMANENT\_DYNAMIC for the *DefinitionType* attribute.

This type of queue can be deleted using the MQCLOSE call. See “MQCLOSE - Close object” on page 2437 for more details.

The value of the *QSGDisp* attribute for a permanent dynamic queue is MQQSGD\_Q\_MGR.

#### **MQQDT\_TEMPORARY\_DYNAMIC**

The queue is a temporary queue that was created by an application issuing an MQOPEN call with the name of a model queue specified in the object descriptor MQOD. The model queue definition had the value MQQDT\_TEMPORARY\_DYNAMIC for the *DefinitionType* attribute.

This type of queue is deleted automatically by the MQCLOSE call when it is closed by the application that created it.

The value of the *QSGDisp* attribute for a temporary dynamic queue is MQQSGD\_Q\_MGR.

#### **MQQDT\_SHARED\_DYNAMIC**

The queue is a shared permanent queue that was created by an application issuing an MQOPEN call with the name of a model queue specified in the object descriptor MQOD. The model queue definition had the value MQQDT\_SHARED\_DYNAMIC for the *DefinitionType* attribute.

This type of queue can be deleted using the MQCLOSE call. See “MQCLOSE - Close object” on page 2437 for more details.

The value of the *QSGDisp* attribute for a shared dynamic queue is MQQSGD\_SHARED.

This attribute in a model queue definition does not indicate how the model queue was defined, because model queues are always predefined. Instead, the value of this attribute in the model queue is used to determine the *DefinitionType* of each of the dynamic queues created from the model queue definition using the MQOPEN call.

To determine the value of this attribute, use the MQIA\_DEFINITION\_TYPE selector with the MQINQ call.

*DefInputOpenOption* (MQLONG):

This is the default way in which to open the queue for input.

Local	Model	Alias	Remote	Cluster
X	X			

It applies if the MQOO\_INPUT\_AS\_Q\_DEF option is specified on the MQOPEN call when the queue is opened. The value is one of the following:

#### MQOO\_INPUT\_EXCLUSIVE

Open queue to get messages with exclusive access.

The queue is opened for use with subsequent MQGET calls. The call fails with reason code MQRC\_OBJECT\_IN\_USE if the queue is currently open by this or another application for input of any type (MQOO\_INPUT\_SHARED or MQOO\_INPUT\_EXCLUSIVE).

#### MQOO\_INPUT\_SHARED

Open queue to get messages with shared access.

The queue is opened for use with subsequent MQGET calls. The call can succeed if the queue is currently open by this or another application with MQOO\_INPUT\_SHARED, but fails with reason code MQRC\_OBJECT\_IN\_USE if the queue is currently open with MQOO\_INPUT\_EXCLUSIVE.

To determine the value of this attribute, use the MQIA\_DEF\_INPUT\_OPEN\_OPTION selector with the MQINQ call.

*DefPersistence (MQLONG):*

This is the default persistence of messages on the queue. It applies if MQPER\_PERSISTENCE\_AS\_Q\_DEF is specified in the message descriptor when the message is put.

Local	Model	Alias	Remote	Cluster
X	X	X	X	X

If there is more than one definition in the queue-name resolution path, the default persistence is taken from the value of this attribute in the *first* definition in the path at the time of the MQPUT or MQPUT1 call. This could be:

- An alias queue
- A local queue
- A local definition of a remote queue
- A queue-manager alias
- A transmission queue (for example, the *DefXmitQName* queue)

The value is one of the following:

#### MQPER\_PERSISTENT

The message survives system failures and queue manager restarts. Persistent messages cannot be placed on:

- Temporary dynamic queues
- Shared queues that map to a CFSTRUCT object at CFLEVEL(2) or below, or where the CFSTRUCT object is defined as RECOVER(NO).

Persistent messages can be placed on permanent dynamic queues, and predefined queues.

## MQPER\_NOT\_PERSISTENT

The message does not normally survive system failures or queue manager restarts. This applies even if an intact copy of the message is found on auxiliary storage during a queue manager restart.

In the case of shared queues, nonpersistent messages *do* survive restarts of queue managers in the queue-sharing group, but do not survive failures of the coupling facility used to store messages on the shared queues.

Both persistent and nonpersistent messages can exist on the same queue.

To determine the value of this attribute, use the MQIA\_DEF\_PERSISTENCE selector with the MQINQ call.

*DefPriority* (MQLONG):

This is the default priority for messages on the queue. This applies if MQPRI\_PRIORITY\_AS\_Q\_DEF is specified in the message descriptor when the message is put on the queue.

Local	Model	Alias	Remote	Cluster
X	X	X	X	X

If there is more than one definition in the queue-name resolution path, the default priority for the message is taken from the value of this attribute in the *first* definition in the path at the time of the put operation. This could be:

- An alias queue
- A local queue
- A local definition of a remote queue
- A queue-manager alias
- A transmission queue (for example, the *DefXmitQName* queue)

The way in which a message is placed on a queue depends on the value of the queue's *MsgDeliverySequence* attribute:

- If the *MsgDeliverySequence* attribute is MQMDS\_PRIORITY, the logical position at which a message is placed on the queue depends on the value of the *Priority* field in the message descriptor.
- If the *MsgDeliverySequence* attribute is MQMDS\_FIFO, messages are placed on the queue as though they had a priority equal to the *DefPriority* of the resolved queue, regardless of the value of the *Priority* field in the message descriptor. However, the *Priority* field retains the value specified by the application that put the message. See *MsgDeliverySequence* attribute for more information.

Priorities are in the range zero (lowest) through *MaxPriority* (highest); see *MaxPriority* attribute.

To determine the value of this attribute, use the MQIA\_DEF\_PRIORITY selector with the MQINQ call.

*DefReadAhead* (MQLONG):

Specifies the default read ahead behavior for non-persistent messages delivered to the client.

Local	Model	Alias	Remote	Cluster
X	X	X		

DefReadAhead can be set to one of the following values::

**MQREADA\_NO**

Non-persistent messages are not sent ahead to the client before an applications requests them. A maximum of one non-persistent message can be lost if the client ends abnormally.

**MQREADA\_YES**

Non-persistent messages are sent ahead to the client before an application requests them. Non-persistent messages can be lost if the client ends abnormally or if the client does not consume all the messages it is sent.

**MQREADA\_DISABLED**

Read ahead of non-persistent messages in not enabled for this queue. Messages are not sent ahead to the client regardless of whether read ahead is requested by the client application.

To determine the value of this attribute, use the MQIA\_DEF\_READ\_AHEAD selector with the MQINQ call.

*DefPResp (MQLONG):*

The default put response type (DEFPRESP) attribute defines the value used by applications when the PutResponseType within MQPMO has been set to MQPMO\_RESPONSE\_AS\_Q\_DEF. This attribute is valid for all queue types.

Local	Model	Alias	Remote	Cluster
Yes	Yes	Yes	Yes	Yes

The value is one of the following:

**SYNC** The put operation is issued synchronously returning a response.

**ASYNC**

The put operation is issued asynchronously, returning a subset of MQMD fields.

To determine the value of this attribute, use the MQIA\_DEF\_PUT\_RESPONSE\_TYPE selector with the MQINQ call.

*DistLists (MQLONG):*

This indicates whether distribution-list messages can be placed on the queue.

Local	Model	Alias	Remote	Cluster
X	X			

A message channel agent (MCA) sets the attribute to inform the local queue manager whether the queue manager at the other end of the channel supports distribution lists. This latter queue manager (called the *partnering* queue manager) is the one that next receives the message, after it has been removed from the local transmission queue by a sending MCA.

The sending MCA sets the attribute whenever it establishes a connection to the receiving MCA on the partnering queue manager. In this way, the sending MCA can cause the local queue manager to place on the transmission queue only messages that the partnering queue manager can process correctly.

This attribute is primarily for use with transmission queues, but the processing described is performed regardless of the usage defined for the queue (see Usage attribute ).

The value is one of the following:

**MQDL\_SUPPORTED**

Distribution-list messages can be stored on the queue, and transmitted to the partnering queue manager in that form. This reduces the amount of processing required to send the message to multiple destinations.

**MQDL\_NOT\_SUPPORTED**

Distribution-list messages cannot be stored on the queue, because the partnering queue manager does not support distribution lists. If an application puts a distribution-list message, and that message is to be placed on this queue, the queue manager splits the distribution-list message and places the individual messages on the queue instead. This increases the amount of processing required to send the message to multiple destinations, but ensures that the messages are processed correctly by the partnering queue manager.

To determine the value of this attribute, use the MQIA\_DIST\_LISTS selector with the MQINQ call. To change the value of this attribute, use the MQSET call.

This attribute is not supported on z/OS.

*HardenGetBackout* (MQLONG):

For each message, a count is kept of the number of times that the message is retrieved by an MQGET call within a unit of work, and that unit of work subsequently backed out.

Local	Model	Alias	Remote	Cluster
X	X			

This count is available in the *BackoutCount* field in the message descriptor after the MQGET call has completed.

The message backout count survives restarts of the queue manager. However, to ensure that the count is accurate, information has to be *hardened* (recorded on disk or other permanent storage device) each time that an MQGET call retrieves a message within a unit of work for this queue. If this is not done, the queue manager fails, and the MQGET call backs out, the count might or might not be incremented.

Hardening information for each MQGET call within a unit of work, however, imposes additional processing cost, so set the *HardenGetBackout* attribute to MQQA\_BACKOUT\_HARDENED only if it is essential that the count is accurate.

On IBM i, UNIX systems, and Windows, the message backout count is always hardened, regardless of the setting of this attribute.

The following values are possible:

**MQQA\_BACKOUT\_HARDENED**

Hardening is used to ensure that the backout count for messages on this queue is accurate.

**MQQA\_BACKOUT\_NOT\_HARDENED**

Hardening is not used to ensure that the backout count for messages on this queue is accurate. The count might therefore be lower than it should be.

To determine the value of this attribute, use the MQIA\_HARDEN\_GET\_BACKOUT selector with the MQINQ call.

*IndexType* (MQLONG):

This specifies the type of index that the queue manager maintains for messages on the queue.

Local	Model	Alias	Remote	Cluster
X	X			

The type of index required depends on how the application retrieves messages, and whether the queue is a shared queue or a nonshared queue (see QSGDisp attribute ). The following values are possible for *IndexType*:

#### **MQIT\_NONE**

No index is maintained by the queue manager for this queue. Use this value for queues that are typically processed sequentially, that is, without using any selection criteria on the MQGET call.

#### **MQIT\_MSG\_ID**

The queue manager maintains an index that uses the message identifiers of the messages on the queue. Use this value queues where the application typically retrieves messages using the message identifier as the selection criterion on the MQGET call.

#### **MQIT\_CORREL\_ID**

The queue manager maintains an index that uses the correlation identifiers of the messages on the queue. Use this value for queues where the application typically retrieves messages using the correlation identifier as the selection criterion on the MQGET call.

#### **MQIT\_MSG\_TOKEN**

The queue manager maintains an index that uses the message tokens of the messages on the queue for use with the workload manager (WLM) functions of z/OS.

You *must* specify this option for WLM-managed queues; do not specify it for any other type of queue. Also, do not use this value for a queue where an application is not using the z/OS workload manager functions, but is retrieving messages using the message token as a selection criterion on the MQGET call.

#### **MQIT\_GROUP\_ID**

The queue manager maintains an index that uses the group identifiers of the messages on the queue. This value *must* be used for queues where the application retrieves messages using the MQGMO\_LOGICAL\_ORDER option on the MQGET call.

A queue with this index type cannot be a transmission queue. A shared queue with this index type must be defined to map to a CFSTRUCT object at CFLEVEL(3) or higher.

#### **Note:**

1. The physical order of messages on a queue with index type MQIT\_GROUP\_ID is not defined, as the queue is optimized for efficient retrieval of messages using the MQGMO\_LOGICAL\_ORDER option on the MQGET call. This means that the physical order of the messages is not typically the order in which the messages arrived on the queue.
2. If an MQIT\_GROUP\_ID queue has a

of MQMDS\_PRIORITY, the queue manager uses message priorities 0 and 1 to optimize the retrieval of messages in logical order. As a result, the first message in a group must not have a priority of zero or one; if it does, the message is processed as though it had a priority of two. The

field in the MQMD structure is not changed.

For more information about message groups, see the description of the group and segment options in MQGMO - Options field.

The index type that should be used in various cases is shown in Table 255 and Table 256.

Table 255. Suggested or required values of queue index type when MQGMO\_LOGICAL\_ORDER not specified

Selection criteria on MQGET call	Index type for nonshared queue	Index type for shared queue
None	Any	Any
<b>Selection using one identifier:</b>		
Message identifier	MQIT_MSG_ID suggested	MQIT_NONE or MQIT_MSG_ID required; MQIT_MSG_ID suggested
Correlation identifier	MQIT_CORREL_ID suggested	MQIT_CORREL_ID required
Group identifier	MQIT_GROUP_ID suggested	MQIT_GROUP_ID required
<b>Selection using two identifiers:</b>		
Message identifier plus correlation identifier	MQIT_MSG_ID or MQIT_CORREL_ID suggested	MQIT_NONE or MQIT_MSG_ID or MQIT_CORREL_ID required  (For efficiency, it is suggested that the index type is chosen to match the MQMD field which will have the most distinct keys)
Message identifier plus group identifier	MQIT_MSG_ID or MQIT_GROUP_ID suggested	Not supported
Correlation identifier plus group identifier	MQIT_CORREL_ID or MQIT_GROUP_ID suggested	Not supported
<b>Selection using three identifiers:</b>		
Message identifier plus correlation identifier plus group identifier	MQIT_MSG_ID or MQIT_CORREL_ID or MQIT_GROUP_ID suggested	Not supported
<b>Selection using group-related criteria:</b>		
Group identifier plus message sequence number	MQIT_GROUP_ID required	MQIT_GROUP_ID required
Message sequence number (must be 1)	MQIT_GROUP_ID required	MQIT_GROUP_ID required
<b>Selection using message token:</b>		
Message token for application use	Do not use MQIT_MSG_TOKEN	
Message token for WLM use	MQIT_MSG_TOKEN required	Not supported

Table 256. Suggested or required values of queue index type when MQGMO\_LOGICAL\_ORDER specified

Selection criteria on MQGET call	Index type for nonshared queue	Index type for shared queue
None	MQIT_GROUP_ID required	MQIT_GROUP_ID required
<b>Selection using one identifier:</b>		
Message identifier	MQIT_GROUP_ID required	Not supported
Correlation identifier	MQIT_GROUP_ID required	Not supported
Group identifier	MQIT_GROUP_ID required	MQIT_GROUP_ID required
<b>Selection using two identifiers:</b>		
Message identifier plus correlation identifier	MQIT_GROUP_ID required	Not supported

Table 256. Suggested or required values of queue index type when MQGMO\_LOGICAL\_ORDER specified (continued)

Selection criteria on MQGET call	Index type for nonshared queue	Index type for shared queue
Message identifier plus group identifier	MQIT_GROUP_ID required	Not supported
Correlation identifier plus group identifier	MQIT_GROUP_ID required	Not supported
<b>Selection using three identifiers:</b>		
Message identifier plus correlation identifier plus group identifier	MQIT_GROUP_ID required	Not supported

To determine the value of this attribute, use the MQIA\_INDEX\_TYPE selector with the MQINQ call.

This attribute is supported only on z/OS.

*InhibitGet* (MQLONG):

This controls whether get operations for this queue are allowed.

Local	Model	Alias	Remote	Cluster
X	X	X		

If the queue is an alias queue, get operations must be allowed for both the alias and the base queue at the time of the get operation, for the MQGET call to succeed. The value is one of the following:

#### **MQQA\_GET\_INHIBITED**

Get operations are inhibited.

MQGET calls fail with reason code MQRC\_GET\_INHIBITED. This includes MQGET calls that specify MQGMO\_BROWSE\_FIRST or MQGMO\_BROWSE\_NEXT.

**Note:** If an MQGET call operating within a unit of work completes successfully, changing the value of the *InhibitGet* attribute subsequently to MQQA\_GET\_INHIBITED does not prevent the unit of work being committed.

#### **MQQA\_GET\_ALLOWED**

Get operations are allowed.

To determine the value of this attribute, use the MQIA\_INHIBIT\_GET selector with the MQINQ call. To change the value of this attribute, use the MQSET call.

*InhibitPut* (MQLONG):

This controls whether put operations for this queue are allowed.

Local	Model	Alias	Remote	Cluster
X	X	X	X	X

If there is more than one definition in the queue-name resolution path, put operations must be allowed for *every* definition in the path (including any queue-manager alias definitions) at the time of the put operation, for the MQPUT or MQPUT1 call to succeed. The value is one of the following:

#### MQQA\_PUT\_INHIBITED

Put operations are inhibited.

MQPUT and MQPUT1 calls fail with reason code MQRC\_PUT\_INHIBITED.

**Note:** If an MQPUT call operating within a unit of work completes successfully, changing the value of the *InhibitPut* attribute subsequently to MQQA\_PUT\_INHIBITED does not prevent the unit of work being committed.

#### MQQA\_PUT\_ALLOWED

Put operations are allowed.

To determine the value of this attribute, use the MQIA\_INHIBIT\_PUT selector with the MQINQ call. To change the value of this attribute, use the MQSET call.

*InitiationQName* (MQCHAR48):

This is the name of a queue defined on the local queue manager; the queue must be of type MQQT\_LOCAL.

Local	Model	Alias	Remote	Cluster
X				

The queue manager sends a trigger message to the initiation queue when application start-up is required as a result of a message arriving on the queue to which this attribute belongs. The initiation queue must be monitored by a trigger monitor application that starts the appropriate application after receipt of the trigger message.

To determine the value of this attribute, use the MQCA\_INITIATION\_Q\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_NAME\_LENGTH.

*MaxMsgLength* (MQLONG):

This is an upper limit for the length of the longest *physical* message that can be placed on the queue.

Local	Model	Alias	Remote	Cluster
X	X			

However, because the *MaxMsgLength* queue attribute can be set independently of the *MaxMsgLength* queue-manager attribute, the actual upper limit for the length of the longest physical message that can be placed on the queue is the lesser of those two values.

If the queue manager supports segmentation, it is possible for an application to put a *logical* message that is longer than the lesser of the two *MaxMsgLength* attributes, but only if the application specifies the MQMF\_SEGMENTATION\_ALLOWED flag in MQMD. If that flag is specified, the upper limit for the length of a logical message is 999 999 999 bytes, but usually resource constraints imposed by the operating system, or by the environment in which the application is running, result in a lower limit.

An attempt to place on the queue a message that is too long fails with one of the following reason codes:

- MQRC\_MSG\_TOO\_BIG\_FOR\_Q if the message is too big for the queue
- MQRC\_MSG\_TOO\_BIG\_FOR\_Q\_MGR if the message is too big for the queue manager, but not too big for the queue

The lower limit for the *MaxMsgLength* attribute is zero; the upper limit is 100 MB (104 857 600 bytes).

For more information, see MQPUT - BufferLength parameter.

To determine the value of this attribute, use the MQIA\_MAX\_MSG\_LENGTH selector with the MQINQ call.

*MaxQDepth* (MQLONG):

This is the defined upper limit for the number of physical messages that can exist on the queue at any one time.

Local	Model	Alias	Remote	Cluster
X	X			

An attempt to put a message on a queue that already contains *MaxQDepth* messages fails with reason code MQRC\_Q\_FULL.

Unit-of-work processing and the segmentation of messages can both cause the actual number of physical messages on the queue to exceed *MaxQDepth*. However, this does not affect the retrievability of the messages; *all* messages on the queue can be retrieved using the MQGET call.

The value of this attribute is zero or greater. The upper limit is determined by the environment:

- On AIX, HP-UX, z/OS, Solaris, Linux, and Windows, the value cannot exceed 999 999 999.
- On IBM i, the value cannot exceed 640 000.

**Note:** The storage space available to the queue might be exhausted even if there are fewer than *MaxQDepth* messages on the queue.

To determine the value of this attribute, use the MQIA\_MAX\_Q\_DEPTH selector with the MQINQ call.

*MsgDeliverySequence* (MQLONG):

Local	Model	Alias	Remote	Cluster
X	X			

This determines the order in which the MQGET call returns messages to the application :

#### **MQMDS\_FIFO**

Messages are returned in FIFO order (first in, first out).

An MQGET call returns the *first* message that satisfies the selection criteria specified on the call, regardless of the priority of the message.

#### **MQMDS\_PRIORITY**

Messages are returned in priority order.

An MQGET call returns the *highest-priority* message that satisfies the selection criteria specified on the call. Within each priority level, messages are returned in FIFO order (first in, first out).

- On z/OS, if the queue has an *IndexType* of MQIT\_GROUP\_ID, the *MsgDeliverySequence* attribute specifies the order in which message groups are returned to the application. The particular sequence in which the groups are returned is determined by the position or priority of the first message in each group. The physical order of messages on the queue is not defined, as the queue is optimized for efficient retrieval of messages using the MQGMO\_LOGICAL\_ORDER option on the MQGET call.
- On z/OS, if *IndexType* is MQIT\_GROUP\_ID and *MsgDeliverySequence* is MQMDS\_PRIORITY, the queue manager uses message priorities zero and one to optimize the retrieval of messages in logical order. As a result, the first message in a group must not have a priority of zero or one; if it does, the message is processed as though it had a priority of two. The *Priority* field in the MQMD structure is not changed.

If the relevant attributes are changed while there are messages on the queue, the delivery sequence is as follows:

- The order in which messages are returned by the MQGET call is determined by the values of the *MsgDeliverySequence* and *DefPriority* attributes in force for the queue at the time that the message arrives on the queue:
  - If *MsgDeliverySequence* is MQMDS\_FIFO when the message arrives, the message is placed on the queue as though its priority were *DefPriority*. This does not affect the value of the *Priority* field in the message descriptor of the message; that field retains the value it had when the message was first put.
  - If *MsgDeliverySequence* is MQMDS\_PRIORITY when the message arrives, the message is placed on the queue at the place appropriate to the priority given by the *Priority* field in the message descriptor.

If the value of the *MsgDeliverySequence* attribute is changed while there are messages on the queue, the order of the messages on the queue is not changed.

If the value of the *DefPriority* attribute is changed while there are messages on the queue, the messages are not necessarily delivered in FIFO order, even though the *MsgDeliverySequence* attribute is set to MQMDS\_FIFO; those that were placed on the queue at the higher priority are delivered first.

To determine the value of this attribute, use the MQIA\_MSG\_DELIVERY\_SEQUENCE selector with the MQINQ call.

*NonPersistentMessageClass* (MQLONG):

The reliability goal for nonpersistent messages.

Local	Model	Alias	Remote	Cluster
X	X			

This specifies the circumstances under which nonpersistent messages put on this queue are discarded:

#### **MQNPM\_CLASS\_NORMAL**

Nonpersistent messages are limited to the lifetime of the queue manager session; the messages are discarded in the event of a queue manager restart. This is valid only for non-shared queues, and is the default value.

#### **MQNPM\_CLASS\_HIGH**

The queue manager attempts to retain nonpersistent messages for the lifetime of the queue. Nonpersistent messages might still be lost in the event of a failure. This value is enforced for shared queues.

To determine the value of this attribute, use the MQIA\_NPM\_CLASS selector with the MQINQ call.

*OpenInputCount (MQLONG):*

This is the number of handles that are currently valid for removing messages from the queue by means of the MQGET call.

Local	Model	Alias	Remote	Cluster
X				

It is the total number of such handles known to the *local* queue manager. If the queue is a shared queue, the count does not include opens for input that were performed for the queue at other queue managers in the queue-sharing group to which the local queue manager belongs.

The count includes handles where an alias queue that resolves to this queue was opened for input. The count does not include handles where the queue was opened for actions that did not include input (for example, a queue opened only for browse).

The value of this attribute fluctuates as the queue manager operates.

To determine the value of this attribute, use the MQIA\_OPEN\_INPUT\_COUNT selector with the MQINQ call.

*OpenOutputCount (MQLONG):*

This is the number of handles that are currently valid for adding messages to the queue by means of the MQPUT call.

Local	Model	Alias	Remote	Cluster
X				

It is the total number of such handles known to the *local* queue manager; it does not include opens for output that were performed for this queue at remote queue managers. If the queue is a shared queue, the count does not include opens for output that were performed for the queue at other queue managers in the queue-sharing group to which the local queue manager belongs.

The count includes handles where an alias queue that resolves to this queue was opened for output. The count does not include handles where the queue was opened for actions that did not include output (for example, a queue opened only for inquire).

The value of this attribute fluctuates as the queue manager operates.

To determine the value of this attribute, use the MQIA\_OPEN\_OUTPUT\_COUNT selector with the MQINQ call.

*ProcessName (MQCHAR48):*

This is the name of a process object that is defined on the local queue manager. The process object identifies a program that can service the queue.

Local	Model	Alias	Remote	Cluster
X	X			

To determine the value of this attribute, use the MQCA\_PROCESS\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_PROCESS\_NAME\_LENGTH.

*PropertyControl (MQLONG):*

Specifies how message properties are handled for messages that are retrieved from queues using the MQGET call with the MQGMO\_PROPERTIES\_AS\_Q\_DEF option.

Local	Model	Alias	Remote	Cluster
X	X	X		

The value is one of the following:

#### **MQPROP\_ALL**

All properties of the message are included with the message when it is delivered to the application. The properties, except those in the message descriptor (or extension), are placed in one or more MQRFH2 headers in the message data. If a message handle is supplied then the behavior is to return the properties in the message handle.

#### **MQPROP\_COMPATIBILITY**

If the message contains a property with a prefix of mcd., jms., usr. or mqext., all message properties are delivered to the application in an MQRFH2 header. Otherwise all properties of the message, except those contained in the message descriptor (or extension), are discarded and are no longer accessible to the application. This is the default value; it allows applications which expect JMS related properties to be in an MQRFH2 header in the message data to continue to work unmodified. If a message handle is supplied then the behavior is to return the properties in the message handle..

#### **MQPROP\_FORCE\_MQRFH2**

Properties are always returned in the message data in an MQRFH2 header regardless of whether the application specifies a message handle. A valid message handle supplied in the MsgHandle field of the MQGMO structure on the MQGET call is ignored. Properties of the message are not accessible via the message handle.

#### **MQPROP\_NONE**

All properties of the message, except those in the message descriptor (or extension), are removed from the message before the message is delivered to the application. If a message handle is supplied then the behavior is to return the properties in the message handle.

This parameter is applicable to Local, Alias and Model queues. To determine its value, use the MQIA\_PROPERTY\_CONTROL selector with the MQINQ call.

*QDepthHighEvent (MQLONG):*

This controls whether Queue Depth High events are generated.

Local	Model	Alias	Remote	Cluster
X	X			

A Queue Depth High event indicates that an application has put a message on a queue, and this has caused the number of messages on the queue to become greater than or equal to the queue depth high threshold (see the *QDepthHighLimit* attribute).

**Note:** The value of this attribute can change dynamically.

The value is one of the following:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA\_Q\_DEPTH\_HIGH\_EVENT selector with the MQINQ call.

This attribute is supported on z/OS, but the MQINQ call cannot be used to determine its value.

*QDepthHighLimit (MQLONG):*

This is the threshold against which the queue depth is compared to generate a Queue Depth High event.

Local	Model	Alias	Remote	Cluster
X	X			

This event indicates that an application has put a message on a queue, and that this has caused the number of messages on the queue to become greater than or equal to the queue depth high threshold. See *QDepthHighEvent* attribute.

The value is expressed as a percentage of the maximum queue depth (*MaxQDepth* attribute), and is greater than or equal to 0 and less than or equal to 100. The default value is 80.

To determine the value of this attribute, use the MQIA\_Q\_DEPTH\_HIGH\_LIMIT selector with the MQINQ call.

This attribute is supported on z/OS, but the MQINQ call cannot be used to determine its value.

*QDepthLowEvent (MQLONG):*

This controls whether Queue Depth Low events are generated.

Local	Model	Alias	Remote	Cluster
X	X			

A Queue Depth Low event indicates that an application has retrieved a message from a queue, and that this has caused the number of messages on the queue to become less than or equal to the queue depth low threshold (see `QDepthLowLimit` attribute).

**Note:** The value of this attribute can change dynamically.

The value is one of the following:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the `MQIA_Q_DEPTH_LOW_EVENT` selector with the `MQINQ` call.

This attribute is supported on z/OS, but the `MQINQ` call cannot be used to determine its value.

*QDepthLowLimit (MQLONG):*

This is the threshold against which the queue depth is compared to generate a Queue Depth Low event.

Local	Model	Alias	Remote	Cluster
X	X			

This event indicates that an application has retrieved a message from a queue, and that this has caused the number of messages on the queue to become less than or equal to the queue depth low threshold. See `QDepthLowEvent` attribute.

The value is expressed as a percentage of the maximum queue depth (`MaxQDepth` attribute), and is greater than or equal to 0 and less than or equal to 100. The default value is 20.

To determine the value of this attribute, use the `MQIA_Q_DEPTH_LOW_LIMIT` selector with the `MQINQ` call.

This attribute is supported on z/OS, but the `MQINQ` call cannot be used to determine its value.

*QDepthMaxEvent (MQLONG):*

This controls whether Queue Full events are generated. A Queue Full event indicates that a put to a queue has been rejected because the queue is full, that is, the queue depth has already reached its maximum value.

Local	Model	Alias	Remote	Cluster
X	X			

**Note:** The value of this attribute can change dynamically.

The value is one of the following:

**MQEVR\_DISABLED**

Event reporting disabled.

**MQEVR\_ENABLED**

Event reporting enabled.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the MQIA\_Q\_DEPTH\_MAX\_EVENT selector with the MQINQ call.

This attribute is supported on z/OS, but the MQINQ call cannot be used to determine its value.

*QDesc (MQCHAR64):*

Use this field for descriptive commentary.

Local	Model	Alias	Remote	Cluster
X	X	X	X	X

The content of the field is of no significance to the queue manager, but the queue manager might require that the field contain only characters that can be displayed. It cannot contain any null characters; if necessary, it is padded to the right with blanks. In a DBCS installation, the field can contain DBCS characters (subject to a maximum field length of 64 bytes).

**Note:** If this field contains characters that are not in the queue manager's character set (as defined by the *CodedCharSetId* queue manager attribute), those characters might be translated incorrectly if this field is sent to another queue manager.

To determine the value of this attribute, use the MQCA\_Q\_DESC selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_DESC\_LENGTH.

*QName (MQCHAR48):*

This is the name of a queue defined on the local queue manager.

Local	Model	Alias	Remote	Cluster
X		X	X	X

All queues defined on a queue manager share the same queue namespace. Therefore, an MQQT\_LOCAL queue and an MQQT\_ALIAS queue cannot have the same name.

To determine the value of this attribute, use the MQCA\_Q\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_NAME\_LENGTH.

*QServiceInterval (MQLONG):*

This is the service interval used for comparison to generate Service Interval High and Service Interval OK events.

Local	Model	Alias	Remote	Cluster
X	X			

See `QServiceIntervalEvent` attribute.

The value is in units of milliseconds, and is greater than or equal to zero, and less than or equal to 999 999 999.

To determine the value of this attribute, use the `MQIA_Q_SERVICE_INTERVAL` selector with the `MQINQ` call.

This attribute is supported on z/OS, but the `MQINQ` call cannot be used to determine its value.

*QServiceIntervalEvent (MQLONG):*

This controls whether Service Interval High or Service Interval OK events are generated.

Local	Model	Alias	Remote	Cluster
X	X			

- A Service Interval High event is generated when a check indicates that no messages have been retrieved from the queue for at least the time indicated by the *QServiceInterval* attribute.
- A Service Interval OK event is generated when a check indicates that messages have been retrieved from the queue within the time indicated by the *QServiceInterval* attribute.

**Note:** The value of this attribute can change dynamically.

The value is one of the following:

**MQQSIE\_HIGH**

Queue Service Interval High events enabled.

- Queue Service Interval High events are **enabled** and
- Queue Service Interval OK events are **disabled**.

**MQQSIE\_OK**

Queue Service Interval OK events enabled.

- Queue Service Interval High events are **disabled** and
- Queue Service Interval OK events are **enabled**.

**MQQSIE\_NONE**

No queue service interval events enabled.

- Queue Service Interval High events are **disabled** and
- Queue Service Interval OK events are also **disabled**.

For shared queues, the value of this attribute is ignored; the value `MQQSIE_NONE` is assumed.

For more information about events, see Event monitoring.

To determine the value of this attribute, use the `MQIA_Q_SERVICE_INTERVAL_EVENT` selector with the `MQINQ` call.

On z/OS, you cannot use the MQINQ call to determine the value of this attribute.

*QSGDisp (MQLONG):*

This specifies the disposition of the queue.

Local	Model	Alias	Remote	Cluster
X		X	X	

The value is one of the following:

#### **MQQSGD\_Q\_MGR**

The object has queue-manager disposition. This means that the object definition is known only to the local queue manager; the definition is not known to other queue managers in the queue-sharing group.

Each queue manager in the queue-sharing group can have an object with the same name and type as the current object, but these are separate objects and there is no correlation between them. Their attributes are not constrained to be the same as each other.

#### **MQQSGD\_COPY**

The object is a local copy of a master object definition that exists in the shared repository. Each queue manager in the queue-sharing group can have its own copy of the object. Initially, all copies have the same attributes, but by using MQSC commands, you can alter each copy so that its attributes differ from those of the other copies. The attributes of the copies are resynchronized when the master definition in the shared repository is altered.

#### **MQQSGD\_SHARED**

The object has shared disposition. This means that there exists in the shared repository a single instance of the object that is known to all queue managers in the queue-sharing group. When a queue manager in the group accesses the object, it accesses the single shared instance of the object.

To determine the value of this attribute, use the MQIA\_QSG\_DISP selector with the MQINQ call.

This attribute is supported only on z/OS.

*QueueAccounting (MQLONG):*

Local	Model	Alias	Remote	Cluster
X	X	X	X	

This controls the collection of accounting data for the queue. For accounting data to be collected for this queue, accounting data for this connection must also be enabled, using either the QMGR attribute ACCTQ or the Options field in the MQCNO structure on the MQCONN call.

This attribute has one of the following values:

#### **MQMON\_Q\_MGR**

Accounting data for this queue is collected based on the setting of the QMGR attribute ACCTQ. This is the default setting.

#### **MQMON\_OFF**

Do not collect accounting data for this queue.

#### **MQMON\_ON**

Collect accounting data for this queue.

To determine the value of this attribute, use the MQIA\_ACCOUNTING\_Q selector with the MQINQ call.

*QueueMonitoring (MQLONG):*

Controls the collection of online monitoring data for queues.

Local	Model	Alias	Remote	Cluster
X	X			

The value is one of the following:

**MQMON\_Q\_MGR**

Collect monitoring data according to the setting of the *QueueMonitoring* queue manager attribute. This is the default value.

**MQMON\_OFF**

Online monitoring data collection is turned off for this queue.

**MQMON\_LOW**

If the value of the *QueueMonitoring* queue manager attribute is not MQMON\_NONE, online monitoring data collection is turned on, with a low rate of data collection for this queue.

**MQMON\_MEDIUM**

If the value of the *QueueMonitoring* queue manager attribute is not MQMON\_NONE, online monitoring data collection is turned on, with a moderate rate of data collection for this queue.

**MQMON\_HIGH**

If the value of the *QueueMonitoring* queue manager attribute is not MQMON\_NONE, online monitoring data collection is turned on, with a high rate of data collection for this queue.

To determine the value of this attribute, use the MQIA\_MONITORING\_Q selector with the MQINQ call.

*QueueStatistics (MQCHAR12):*

Local	Model	Alias	Remote	Cluster
X	X	X	X	

This controls the collection of statistics data for the queue.

This attribute has one of the following values:

**MQMON\_Q\_MGR**

Accounting data for this queue is collected based on the setting of the QMGR attribute STATQ. This is the default setting.

**MQMON\_OFF**

Switch off statistics data collection for this queue.

**MQMON\_ON**

Switch on statistics data collection for this queue.

*QType (MQLONG):*

Local	Model	Alias	Remote	Cluster
X		X	X	X

This is the type of queue; it has one of the following values:

**MQQT\_ALIAS**

Alias queue definition.

**MQQT\_CLUSTER**

Cluster queue.

**MQQT\_LOCAL**

Local queue.

**MQQT\_REMOTE**

Local definition of a remote queue.

To determine the value of this attribute, use the MQIA\_Q\_TYPE selector with the MQINQ call.

*RemoteQMgrName* (MQCHAR48):

Local	Model	Alias	Remote	Cluster
			X	

This is the name of the remote queue manager on which the queue *RemoteQName* is defined. If the *RemoteQName* queue has a *QSGDisp* value of MQQSGD\_COPY or MQQSGD\_SHARED, *RemoteQMgrName* can be the name of the queue-sharing group that owns *RemoteQName*.

If an application opens the local definition of a remote queue, *RemoteQMgrName* must not be blank and must not be the name of the local queue manager. If *XmitQName* is blank, the local queue with the same name as *RemoteQMgrName* is used as the transmission queue. If there is no queue with the name *RemoteQMgrName*, the queue identified by the *DefXmitQName* queue-manager attribute is used.

If this definition is used for a queue-manager alias, *RemoteQMgrName* is the name of the queue manager that is being aliased. It can be the name of the local queue manager. Otherwise, if *XmitQName* is blank when the open occurs, there must be a local queue with a name that is the same as *RemoteQMgrName*; this queue is used as the transmission queue.

If this definition is used for a reply-to alias, this name is the name of the queue manager that is to be the *ReplyToQMgr*.

**Note:** No validation is performed on the value specified for this attribute when the queue definition is created or modified.

To determine the value of this attribute, use the MQCA\_REMOTE\_Q\_MGR\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_MGR\_NAME\_LENGTH.

*RemoteQName* (MQCHAR48):

Local	Model	Alias	Remote	Cluster
			X	

This is the name of the queue as it is known on the remote queue manager *RemoteQMgrName*.

If an application opens the local definition of a remote queue, when the open occurs *RemoteQName* must not be blank.

If this definition is used for a queue-manager alias definition, when the open occurs *RemoteQName* must be blank.

If the definition is used for a reply-to alias, this name is the name of the queue that is to be the *ReplyToQ*.

**Note:** No validation is performed on the value specified for this attribute when the queue definition is created or modified.

To determine the value of this attribute, use the MQCA\_REMOTE\_Q\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_NAME\_LENGTH.

*RetentionInterval (MQLONG):*

This is the period of time for which to retain the queue. After this time has elapsed, the queue is eligible for deletion.

Local	Model	Alias	Remote	Cluster
X	X			

The time is measured in hours, counting from the date and time when the queue was created. The creation date and time of the queue are recorded in the *CreationDate* and *CreationTime* attributes.

This information is provided to enable a housekeeping application or the operator to identify and delete queues that are no longer required.

**Note:** The queue manager never takes any action to delete queues based on this attribute, or to prevent the deletion of queues with a retention interval that has not expired; it is the user's responsibility to take any required action.

Use a realistic retention interval to prevent the accumulation of permanent dynamic queues (see *DefinitionType* attribute ). However, this attribute can also be used with predefined queues.

To determine the value of this attribute, use the MQIA\_RETENTION\_INTERVAL selector with the MQINQ call.

*Scope (MQLONG):*

This controls whether an entry for this queue also exists in a cell directory.

Local	Model	Alias	Remote	Cluster
X		X	X	

A cell directory is provided by an installable Name service. The value is one of the following:

#### **MQSCO\_Q\_MGR**

The queue definition has queue-manager scope: the definition of the queue does not extend beyond the queue manager that owns it. To open the queue for output from some other queue manager, either the name of the owning queue manager must be specified, or the other queue manager must have a local definition of the queue.

#### **MQSCO\_CELL**

The queue definition has cell scope: the queue definition is also placed in a cell directory available to all the queue managers in the cell. The queue can be opened for output from any of the queue managers in the cell by specifying the name of the queue; the name of the queue manager that owns the queue need not be specified. However, the queue definition is not available to any queue manager in the cell that also has a local definition of a queue with that name, as the local definition takes precedence.

A cell directory is provided by an installable Name service.

Model and dynamic queues cannot have cell scope.

This value is only valid if a name service supporting a cell directory has been configured.

To determine the value of this attribute, use the MQIA\_SCOPE selector with the MQINQ call.

Support for this attribute is subject to the following restrictions:

- On IBM i, the attribute is supported, but only MQSCO\_Q\_MGR is valid.
- On z/OS, the attribute is not supported.

*Shareability (MQLONG):*

This indicates whether the queue can be opened for input multiple times concurrently.

Local	Model	Alias	Remote	Cluster
X	X			

The value is one of the following:

#### **MQQA\_SHAREABLE**

Queue is shareable.

Multiple opens with the MQOO\_INPUT\_SHARED option are allowed.

#### **MQQA\_NOT\_SHAREABLE**

Queue is not shareable.

An MQOPEN call with the MQOO\_INPUT\_SHARED option is treated as MQOO\_INPUT\_EXCLUSIVE.

To determine the value of this attribute, use the MQIA\_SHAREABILITY selector with the MQINQ call.

*StorageClass (MQCHAR8):*

This is a user-defined name that defines the physical storage used to hold the queue. In practice, a message is written to disk only if it needs to be paged out of its memory buffer.

Local	Model	Alias	Remote	Cluster
X	X			

To determine the value of this attribute, use the MQCA\_STORAGE\_CLASS selector with the MQINQ call. The length of this attribute is given by MQ\_STORAGE\_CLASS\_LENGTH.

This attribute is supported only on z/OS.

*TriggerControl (MQLONG):*

This controls whether trigger messages are written to an initiation queue to start an application to service the queue.

Local	Model	Alias	Remote	Cluster
X	X			

This is one of the following:

**MQTC\_OFF**

No trigger messages are to be written for this queue. The value of *TriggerType* is irrelevant in this case.

**MQTC\_ON**

Trigger messages are to be written for this queue when the appropriate trigger events occur.

To determine the value of this attribute, use the MQIA\_TRIGGER\_CONTROL selector with the MQINQ call. To change the value of this attribute, use the MQSET call.

*TriggerData (MQCHAR64):*

This is free-format data that the queue manager inserts into the trigger message when a message arriving on this queue causes a trigger message to be written to the initiation queue.

Local	Model	Alias	Remote	Cluster
X	X			

The content of this data is of no significance to the queue manager. It is meaningful either to the trigger-monitor application that processes the initiation queue, or to the application that the trigger monitor starts.

The character string must not contain any nulls. It is padded to the right with blanks if necessary.

To determine the value of this attribute, use the MQCA\_TRIGGER\_DATA selector with the MQINQ call. To change the value of this attribute, use the MQSET call. The length of this attribute is given by MQ\_TRIGGER\_DATA\_LENGTH.

*TriggerDepth (MQLONG):*

Local	Model	Alias	Remote	Cluster
X	X			

This is the number of messages of priority *TriggerMsgPriority* or greater that must be on the queue before a trigger message is written. This applies when *TriggerType* is set to MQTT\_DEPTH. The value of *TriggerDepth* is one or greater. This attribute is not used otherwise.

To determine the value of this attribute, use the MQIA\_TRIGGER\_DEPTH selector with the MQINQ call. To change the value of this attribute, use the MQSET call.

*TriggerMsgPriority* (MQLONG):

This is the message priority below which messages do not contribute to the generation of trigger messages (that is, the queue manager ignores these messages when deciding whether to generate a trigger message).

Local	Model	Alias	Remote	Cluster
X	X			

*TriggerMsgPriority* can be in the range zero (lowest) through *MaxPriority* (highest; see *MaxPriority* attribute ); a value of zero causes all messages to contribute to the generation of trigger messages.

To determine the value of this attribute, use the MQIA\_TRIGGER\_MSG\_PRIORITY selector with the MQINQ call. To change the value of this attribute, use the MQSET call.

*TriggerType* (MQLONG):

This controls the conditions under which trigger messages are written as a result of messages arriving on this queue.

Local	Model	Alias	Remote	Cluster
X	X			

It has one of the following values:

**MQTT\_NONE**

No trigger messages are written as a result of messages on this queue. This has the same effect as setting *TriggerControl* to MQTC\_OFF.

**MQTT\_FIRST**

A trigger message is written whenever the number of messages of priority *TriggerMsgPriority* or greater on the queue changes from 0 to 1.

**MQTT EVERY**

A trigger message is written whenever a message of priority *TriggerMsgPriority* or greater arrives on the queue.

**MQTT\_DEPTH**

A trigger message is written whenever the number of messages of priority *TriggerMsgPriority* or greater on the queue equals or exceeds *TriggerDepth*. After the trigger message has been written, *TriggerControl* is set to MQTC\_OFF to prevent further triggering until it is explicitly turned on again.

To determine the value of this attribute, use the MQIA\_TRIGGER\_TYPE selector with the MQINQ call. To change the value of this attribute, use the MQSET call.

Usage (MQLONG):

This indicates what the queue is used for.

Local	Model	Alias	Remote	Cluster
X	X			

The value is one of the following:

#### **MQUS\_NORMAL**

This is a queue that applications use when putting and getting messages; the queue is not a transmission queue.

#### **MQUS\_TRANSMISSION**

This is a queue used to hold messages destined for remote queue managers. When an application sends a message to a remote queue, the local queue manager stores the message temporarily on the appropriate transmission queue in a special format. A message channel agent then reads the message from the transmission queue, and transports the message to the remote queue manager. For more information about transmission queues, see *Defining a transmission queue*.

Only privileged applications can open a transmission queue for MQOO\_OUTPUT to put messages on it directly. Usually, only utility applications do this. Ensure that the message data format is correct (see "MQXQH - Transmission-queue header" on page 2404 ) or errors might occur during the transmission process. Context is not passed or set unless one of the MQPMO\_\*\_CONTEXT context options is specified.

To determine the value of this attribute, use the MQIA\_USAGE selector with the MQINQ call.

XmitQName (MQCHAR48):

This is the transmission queue name. If this attribute is nonblank when an open occurs, either for a remote queue or for a queue-manager alias definition, it specifies the name of the local transmission queue to be used for forwarding the message.

Local	Model	Alias	Remote	Cluster
			X	

If *XmitQName* is blank, the local queue with a name that is the same as *RemoteQMGrName* is used as the transmission queue. If there is no queue with the name *RemoteQMGrName*, the queue identified by the *DefXmitQName* queue-manager attribute is used.

This attribute is ignored if the definition is being used as a queue-manager alias and *RemoteQMGrName* is the name of the local queue manager. It is also ignored if the definition is used as a reply-to queue alias definition.

To determine the value of this attribute, use the MQCA\_XMIT\_Q\_NAME selector with the MQINQ call. The length of this attribute is given by MQ\_Q\_NAME\_LENGTH.

#### **Attributes for namelists:**

The following table summarizes the attributes that are specific to namelists. The attributes are described in alphabetical order.

Namelists are supported on all IBM MQ systems, plus IBM MQ MQI clients connected to these systems.

**Note:** The names of the attributes shown in this section are descriptive names used with the MQINQ and MQSET calls; the names are the same as for the PCF commands. When MQSC commands are used to define, alter, or display attributes, alternative short names are used; see Script (MQSC) Commands for more information.

*Table 257. Attributes for namelists*

Attribute	Description
AlterationDate	Date when definition was last changed
AlterationTime	Time when definition was last changed
NameCount	Number of names in namelist
NamelistDesc	Namelist description
NamelistName	Namelist name
Names	A list of <i>NameCount</i> names
NamelistType	Namelist type
QSGDisp	Queue-sharing group disposition

*AlterationDate (MQCHAR12):*

This is the date when the definition was last changed. The format of the date is YYYY-MM-DD, padded with two trailing blanks to make the length 12 bytes.

To determine the value of this attribute, use the MQCA\_ALTERATION\_DATE selector with the MQINQ call. The length of this attribute is given by MQ\_DATE\_LENGTH.

*AlterationTime (MQCHAR8):*

This is the time when the definition was last changed. The format of the time is HH.MM.SS.

To determine the value of this attribute, use the MQCA\_ALTERATION\_TIME selector with the MQINQ call. The length of this attribute is given by MQ\_TIME\_LENGTH.

*NameCount (MQLONG):*

This is the number of names in the namelist. It is greater than or equal to zero. The following value is defined:

**MQNC\_MAX\_NAMELIST\_NAME\_COUNT**  
Maximum number of names in a namelist.

To determine the value of this attribute, use the MQIA\_NAME\_COUNT selector with the MQINQ call.

*NamelistDesc (MQCHAR64):*

Use this field for descriptive commentary; its value is established by the definition process. The content of the field is of no significance to the queue manager, but the queue manager might require that the field contain only characters that can be displayed. It cannot contain any null characters; if necessary, it is padded to the right with blanks. In a DBCS installation, this field can contain DBCS characters (subject to a maximum field length of 64 bytes).

**Note:** If this field contains characters that are not in the queue manager's character set (as defined by the *CodedCharSetId* queue manager attribute), those characters might be translated incorrectly if this field is sent to another queue manager.

To determine the value of this attribute, use the MQCA\_NAMELIST\_DESC selector with the MQINQ call.

The length of this attribute is given by MQ\_NAMELIST\_DESC\_LENGTH.

*NamelistName (MQCHAR48):*

This is the name of a namelist that is defined on the local queue manager. For more information about namelist names, see the Other object names section.

Each namelist has a name that is different from the names of other namelists belonging to the queue manager, but might duplicate the names of other queue manager objects of different types (for example, queues).

To determine the value of this attribute, use the MQCA\_NAMELIST\_NAME selector with the MQINQ call.

The length of this attribute is given by MQ\_NAMELIST\_NAME\_LENGTH.

*NamelistType (MQLONG):*

This specifies the nature of the names in the namelist, and indicates how the namelist is used. It is one of the following values:

**MQNT\_NONE**

Namelist with no assigned type.

**MQNT\_Q**

Namelist containing the names of queues.

**MQNT\_CLUSTER**

Namelist containing the names of clusters.

**MQNT\_AUTH\_INFO**

Namelist containing the names of authentication-information objects.

To determine the value of this attribute, use the MQIA\_NAMELIST\_TYPE selector with the MQINQ call.

This attribute is supported only on z/OS.

*Names (MQCHAR48xNameCount):*

This is a list of *NameCount* names, where each name is the name of an object that is defined to the local queue manager. For more information about object names, see Rules for naming IBM MQ objects.

To determine the value of this attribute, use the MQCA\_NAMES selector with the MQINQ call.

The length of each name in the list is given by MQ\_OBJECT\_NAME\_LENGTH.

*QSGDisp (MQLONG):*

This specifies the disposition of the namelist. The value is one of the following:

**MQQSGD\_Q\_MGR**

The object has queue-manager disposition: the object definition is known only to the local queue manager; the definition is not known to other queue managers in the queue-sharing group.

Each queue manager in the queue-sharing group can have an object with the same name and type as the current object, but these are separate objects and there is no correlation between them. Their attributes are not constrained to be the same as each other.

**MQQSGD\_COPY**

The object is a local copy of a master object definition that exists in the shared repository. Each queue manager in the queue-sharing group can have its own copy of the object. Initially, all copies have the same attributes, but you can alter each copy, using MQSC commands, so that its

attributes differ from those of the other copies. The attributes of the copies are resynchronized when the master definition in the shared repository is altered.

To determine the value of this attribute, use the MQIA\_QSG\_DISP selector with the MQINQ call.

This attribute is supported only on z/OS.

**Attributes for process definitions:**

The following table summarizes the attributes that are specific to process definitions. The attributes are described in alphabetical order.

**Note:** The names of the attributes in this section are descriptive names used with the MQINQ and MQSET calls; the names are the same as for the PCF commands. When MQSC commands are used to define, alter, or display attributes, alternative short names are used; see Script (MQSC) Commands for more information.

*Table 258. Attributes for process definitions*

Attribute	Description
AlterationDate	Date when definition was last changed
AlterationTime	Time when definition was last changed
ApplId	Application identifier
ApplType	Application type
EnvData	Environment data
ProcessDesc	Process description
ProcessName	Process name
QSGDisp	Queue-sharing group disposition
UserData	User data

*AlterationDate (MQCHAR12):*

This is the date when the definition was last changed. The format of the date is YYYY-MM-DD, padded with two trailing blanks to make the length 12 bytes.

To determine the value of this attribute, use the MQCA\_ALTERATION\_DATE selector with the MQINQ call. The length of this attribute is given by MQ\_DATE\_LENGTH.

*AlterationTime (MQCHAR8):*

This is the time when the definition was last changed. The format of the time is HH.MM.SS.

To determine the value of this attribute, use the MQCA\_ALTERATION\_TIME selector with the MQINQ call. The length of this attribute is given by MQ\_TIME\_LENGTH.

*ApplId (MQCHAR256):*

This is a character string that identifies the application to be started. This information is for use by a trigger-monitor application that processes messages on the initiation queue; the information is sent to the initiation queue as part of the trigger message.

The meaning of *ApplId* is determined by the trigger-monitor application. The trigger monitor provided by IBM MQ requires *ApplId* to be the name of an executable program. The following notes apply to the environments indicated:

- On z/OS, *ApplId* must be:

- A CICS transaction identifier, for applications started using the CICS trigger-monitor transaction CKTI
- An IMS transaction identifier, for applications started using the IMS trigger monitor CSQQTRMN
- On Windows systems, the program name can be prefixed with a drive and directory path.
- On UNIX systems, the program name can be prefixed with a directory path.

The character string cannot contain any nulls. It is padded to the right with blanks if necessary.

To determine the value of this attribute, use the MQCA\_APPL\_ID selector with the MQINQ call. The length of this attribute is given by MQ\_PROCESS\_APPL\_ID\_LENGTH.

*ApplType (MQLONG):*

This identifies the nature of the program to be started in response to the receipt of a trigger message. This information is for use by a trigger-monitor application that processes messages on the initiation queue; the information is sent to the initiation queue as part of the trigger message.

*ApplType* can have any value, but the following values are recommended for standard types; restrict user-defined application types to values in the range MQAT\_USER\_FIRST through MQAT\_USER\_LAST:

**MQAT\_AIX**

AIX application (same value as MQAT\_UNIX).

**MQAT\_BATCH**

Batch application

**MQAT\_BROKER**

Broker application

**MQAT\_CICS**

CICS transaction.

**MQAT\_CICS\_BRIDGE**

CICS bridge application.

**MQAT\_CICS\_VSE**

CICS/VSE transaction.

**MQAT\_DOS**

IBM MQ MQI client application on PC DOS.

**MQAT\_IMS**

IMS application.

**MQAT\_IMS\_BRIDGE**

IMS bridge application.

**MQAT\_JAVA**

Java application.

**MQAT\_MVS**

MVS or TSO application (same value as MQAT\_ZOS).

**MQAT\_NOTES\_AGENT**

Lotus Notes Agent application.

**MQAT\_NSK**

HP Integrity NonStop Server application.

**MQAT\_OS390**

OS/390 application (same value as MQAT\_ZOS).

<b>MQAT_OS400</b>	IBM i application.
<b>MQAT_RRS_BATCH</b>	RRS batch application.
<b>MQAT_UNIX</b>	UNIX application.
<b>MQAT_UNKNOWN</b>	Application of unknown type.
<b>MQAT_USER</b>	User application.
<b>MQAT_VOS</b>	Stratus VOS application.
<b>MQAT_WINDOWS</b>	16-bit Windows application.
<b>MQAT_WINDOWS_NT</b>	32-bit Windows application.
<b>MQAT_WLM</b>	z/OS workload manager application.
<b>MQAT_XCF</b>	XCF.
<b>MQAT_ZOS</b>	z/OS application.
<b>MQAT_USER_FIRST</b>	Lowest value for user-defined application type.
<b>MQAT_USER_LAST</b>	Highest value for user-defined application type.

To determine the value of this attribute, use the MQIA\_APPL\_TYPE selector with the MQINQ call.

*EnvData* (MQCHAR128):

This is a character string that contains environment-related information pertaining to the application to be started. This information is for use by a trigger-monitor application that processes messages on the initiation queue; the information is sent to the initiation queue as part of the trigger message.

The meaning of *EnvData* is determined by the trigger-monitor application. The trigger monitor provided by IBM MQ appends *EnvData* to the parameter list passed to the started application. The parameter list consists of the MQTMC2 structure, followed by one blank, followed by *EnvData* with trailing blanks removed. The following notes apply to the environments indicated:

- On z/OS:
  - *EnvData* is not used by the trigger-monitor applications provided by IBM MQ.
  - If ApplType is MQAT\_WLM, you can supply default values in *EnvData* for the ServiceName and ServiceStep fields in the work information header (MQWIH).
- On UNIX systems, *EnvData* can be set to the & character to run the started application in the background.

The character string cannot contain any nulls. It is padded to the right with blanks if necessary.

To determine the value of this attribute, use the MQCA\_ENV\_DATA selector with the MQINQ call. The length of this attribute is given by MQ\_PROCESS\_ENV\_DATA\_LENGTH.

*ProcessDesc (MQCHAR64):*

Use this field for descriptive commentary. The content of the field is of no significance to the queue manager, but the queue manager might require that the field contain only characters that can be displayed. It cannot contain any null characters; if necessary, it is padded to the right with blanks. In a DBCS installation, the field can contain DBCS characters (subject to a maximum field length of 64 bytes).

**Note:** If this field contains characters that are not in the queue manager's character set (as defined by the *CodedCharSetId* queue manager attribute), those characters might be translated incorrectly if this field is sent to another queue manager.

To determine the value of this attribute, use the MQCA\_PROCESS\_DESC selector with the MQINQ call.

The length of this attribute is given by MQ\_PROCESS\_DESC\_LENGTH.

*ProcessName (MQCHAR48):*

This is the name of a process definition that is defined on the local queue manager.

Each process definition has a name that is different from the names of other process definitions belonging to the queue manager. But the name of the process definition might be the same as the names of other queue manager objects of different types (for example, queues).

To determine the value of this attribute, use the MQCA\_PROCESS\_NAME selector with the MQINQ call.

The length of this attribute is given by MQ\_PROCESS\_NAME\_LENGTH.

*QSGDisp (MQLONG):*

This specifies the disposition of the process definition. The value is one of the following:

#### **MQQSGD\_Q\_MGR**

The object has queue-manager disposition: the object definition is known only to the local queue manager; the definition is not known to other queue managers in the queue-sharing group.

Each queue manager in the queue-sharing group can have an object with the same name and type as the current object, but these are separate objects and there is no correlation between them. Their attributes are not constrained to be the same as each other.

#### **MQQSGD\_COPY**

The object is a local copy of a master object definition that exists in the shared repository. Each queue manager in the queue-sharing group can have its own copy of the object. Initially, all copies have the same attributes, but you can alter each copy, using MQSC commands, so that its attributes differ from those of the other copies. The attributes of the copies are resynchronized when the master definition in the shared repository is altered.

To determine the value of this attribute, use the MQIA\_QSG\_DISP selector with the MQINQ call.

This attribute is supported only on z/OS.

*UserData* (MQCHAR128):

*UserData* is a character string that contains user information pertaining to the application to be started. This information is for use by a trigger-monitor application that processes messages on the initiation queue, or the application that is started by the trigger monitor. The information is sent to the initiation queue as part of the trigger message.

The meaning of *UserData* is determined by the trigger-monitor application. The trigger monitor provided by IBM MQ passes *UserData* to the started application as part of the parameter list. The parameter list consists of the MQTMC2 structure (containing *UserData*), followed by one blank, followed by *EnvData* with trailing blanks removed.

The character string cannot contain any nulls. It is padded to the right with blanks if necessary. For Microsoft Windows, the character string must not contain double quotation marks if the process definition is going to be passed to **runmqtrm**.

To determine the value of this attribute, use the MQCA\_USER\_DATA selector with the MQINQ call. The length of this attribute is given by MQ\_PROCESS\_USER\_DATA\_LENGTH.

## Return codes

For each IBM MQ Message Queue Interface (MQI) and IBM MQ Administration Interface (MQAI) call, a **completion** code and a **reason** code are returned by the queue manager or by an exit routine, to indicate the success or failure of the call.

Applications must not depend upon errors being checked for in a specific order, except where specifically noted. If more than one completion code or reason code could arise from a call, the particular error reported depends on the implementation.

Applications checking for successful completion following an IBM MQ API call must always check the completion code. Do not assume the completion code value, based on the value of the reason code.

## Completion codes

The completion code parameter (*CompCode*) allows the caller to see quickly whether the call completed successfully, completed partially, or failed. The following is a list of completion codes, with more detail than is given in the call descriptions:

### MQCC\_OK

The call completed fully; all output parameters have been set. The *Reason* parameter always has the value MQRC\_NONE in this case.

### MQCC\_WARNING

The call completed partially. Some output parameters might have been set in addition to the *CompCode* and *Reason* output parameters. The *Reason* parameter gives additional information about the partial completion.

### MQCC\_FAILED

The processing of the call did not complete. The state of the queue manager is unchanged, except where specifically noted. The *CompCode* and *Reason* output parameters have been set; other parameters are unchanged, except where noted.

The reason might be a fault in the application program, or it might be the result of some situation external to the program, for example the user's authority might have been revoked. The *Reason* parameter gives additional information about the error.

## Reason codes

The reason code parameter (*Reason*) qualifies the completion code parameter (*CompCode*).

If there is no special reason to report, MQRC\_NONE is returned. A successful call returns MQCC\_OK and MQRC\_NONE.

If the completion code is either MQCC\_WARNING or MQCC\_FAILED, the queue manager always reports a qualifying reason; details are given under each call description.

Where user exit routines set completion codes and reasons, they must adhere to these rules. In addition, any special reason values defined by user exits must be less than zero, to ensure that they do not conflict with values defined by the queue manager. Exits can set reasons already defined by the queue manager, where appropriate.

Reason codes also occur in:

- The *Reason* field of the MQDLH structure
- The *Feedback* field of the MQMD structure

For complete descriptions of reason codes, see Reason codes.

## Rules for validating MQI options

This section lists the situations that produce an MQRC\_OPTIONS\_ERROR reason code from an MQOPEN, MQPUT, MQPUT1, MQGET, MQCLOSE, or MQSUB call.

### MQOPEN call

For the options of the MQOPEN call:

- At least *one* of the following must be specified:
  - MQOO\_BROWSE
  - MQOO\_INPUT\_EXCLUSIVE<sup>1</sup>
  - MQOO\_INPUT\_SHARED<sup>1</sup>
  - MQOO\_INPUT\_AS\_Q\_DEF<sup>1</sup>
  - MQOO\_INQUIRE
  - MQOO\_OUTPUT
  - MQOO\_SET
  - MQOO\_BIND\_ON\_OPEN<sup>2</sup>
  - MQOO\_BIND\_NOT\_FIXED<sup>2</sup>
  - MQOO\_BIND\_ON\_GROUP<sup>2</sup>
  - MQOO\_BIND\_AS\_Q\_DEF<sup>2</sup>
- Only *one* of the following is allowed:
  - MQOO\_READ\_AHEAD
  - MQOO\_NO\_READ\_AHEAD
  - MQOO\_READ\_AHEAD\_AS\_Q\_DEF

1. Only *one* of the following is allowed:

- MQOO\_INPUT\_EXCLUSIVE
- MQOO\_INPUT\_SHARED
- MQOO\_INPUT\_AS\_Q\_DEF

2. Only *one* of the following is allowed:

- MQOO\_BIND\_ON\_OPEN
- MQOO\_BIND\_NOT\_FIXED
- MQOO\_BIND\_ON\_GROUP
- MQOO\_BIND\_AS\_Q\_DEF

**Note:** The options that are listed previously are mutually exclusive. However, as the value of MQOO\_BIND\_AS\_Q\_DEF is zero, specifying it with either of the other two bind options does not result in reason code MQRC\_OPTIONS\_ERROR. MQOO\_BIND\_AS\_Q\_DEF is provided to aid program documentation.

- If MQOO\_SAVE\_ALL\_CONTEXT is specified, one of the MQOO\_INPUT\_\* options must also be specified.
- If one of the MQOO\_SET\_\*\_CONTEXT or MQOO\_PASS\_\*\_CONTEXT options are specified, MQOO\_OUTPUT must also be specified.
- If MQOO\_CO\_OP is specified, MQOO\_BROWSE must also be specified
- If MQOO\_NO\_MULTICAST is specified, MQOO\_OUTPUT must also be specified.

## MQPUT call

For the put-message options:

- The combination of MQPMO\_SYNCPOINT and MQPMO\_NO\_SYNCPOINT is not allowed.
- Only *one* of the following is allowed:
  - MQPMO\_DEFAULT\_CONTEXT
  - MQPMO\_NO\_CONTEXT
  - MQPMO\_PASS\_ALL\_CONTEXT
  - MQPMO\_PASS\_IDENTITY\_CONTEXT
  - MQPMO\_SET\_ALL\_CONTEXT
  - MQPMO\_SET\_IDENTITY\_CONTEXT
- Only *one* of the following is allowed:
  - MQPMO\_ASYNC\_RESPONSE
  - MQPMO\_SYNC\_RESPONSE
  - MQPMO\_RESPONSE\_AS\_TOPIC\_DEF
  - MQPMO\_RESPONSE\_AS\_Q\_DEF
- MQPMO\_ALTERNATE\_USER\_AUTHORITY is not allowed (it is valid only on the MQPUT1 call).

## MQPUT1 call

For the put-message options, the rules are the same as for the MQPUT call, except for the following:

- MQPMO\_ALTERNATE\_USER\_AUTHORITY is allowed.
- MQPMO\_LOGICAL\_ORDER is *not* allowed.

## MQGET call

For the get-message options:

- Only *one* of the following is allowed:
  - MQGMO\_NO\_SYNCPOINT
  - MQGMO\_SYNCPOINT
  - MQGMO\_SYNCPOINT\_IF\_PERSISTENT
- Only *one* of the following is allowed:
  - MQGMO\_BROWSE\_FIRST
  - MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
  - MQGMO\_BROWSE\_NEXT
  - MQGMO\_MSG\_UNDER\_CURSOR
- MQGMO\_SYNCPOINT is not allowed with any of the following:

- MQGMO\_BROWSE\_FIRST
- MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
- MQGMO\_BROWSE\_NEXT
- MQGMO\_LOCK
- MQGMO\_UNLOCK
- MQGMO\_SYNCPOINT\_IF\_PERSISTENT is not allowed with any of the following:
  - MQGMO\_BROWSE\_FIRST
  - MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
  - MQGMO\_BROWSE\_NEXT
  - MQGMO\_COMPLETE\_MSG
  - MQGMO\_UNLOCK
- MQGMO\_MARK\_SKIP\_BACKOUT requires MQGMO\_SYNCPOINT to be specified.
- The combination of MQGMO\_WAIT and MQGMO\_SET\_SIGNAL is not allowed.
- If MQGMO\_LOCK is specified, one of the following must also be specified:
  - MQGMO\_BROWSE\_FIRST
  - MQGMO\_BROWSE\_MSG\_UNDER\_CURSOR
  - MQGMO\_BROWSE\_NEXT
- If MQGMO\_UNLOCK is specified, only the following are allowed:
  - MQGMO\_NO\_SYNCPOINT
  - MQGMO\_NO\_WAIT

### **MQCLOSE call**

For the options of the MQCLOSE call:

- The combination of MQCO\_DELETE and MQCO\_DELETE\_PURGE is not allowed.
- Only one of the following is allowed:
  - MQCO\_KEEP\_SUB
  - MQCO\_REMOVE\_SUB

### **MQSUB call**

For the options of the MQSUB call:

- At least one of the following must be specified:
  - MQSO\_ALTER
  - MQSO\_RESUME
  - MQSO\_CREATE
- Only one of the following is allowed:
  - MQSO\_DURABLE
  - MQSO\_NON\_DURABLE

**Note:** The options that are listed previously are mutually exclusive. However, as the value of MQSO\_NON\_DURABLE is zero, specifying it with MQSO\_DURABLE does not result in reason code MQRC\_OPTIONS\_ERROR. MQSO\_NON\_DURABLE is provided to aid program documentation.

- The combination of MQSO\_GROUP\_SUB and MQSO\_MANAGED is not allowed.
- MQSO\_GROUP\_SUB requires MQSO\_SET\_CORREL\_ID to be specified.
- Only one of the following is allowed:
  - MQSO\_ANY\_USERID

- MQSO\_FIXED\_USERID
- MQSO\_NEW\_PUBLICATIONS\_ONLY is allowed in combination with:
  - MQSO\_CREATE
  - MQSO\_ALTER, if MQSO\_NEW\_PUBLICATIONS\_ONLY was set on the original subscription
- The combination of MQSO\_PUBLICATIONS\_ON\_REQUEST and SubLevel greater than 1 is not allowed.
- Only one of the following is allowed:
  - MQSO\_WILDCARD\_CHAR
  - MQSO\_WILDCARD\_TOPIC
- MQSO\_NO\_MULTICAST requires MQSO\_MANAGED to be specified.

## Queued publish/subscribe command messages

An application can use MQRFH2 command messages to control a queued publish/subscribe application.

An application that is using MQRFH2 for publish/subscribe can send the following command messages to the SYSTEM.BROKER.CONTROL.QUEUE:

- “Delete Publication message” on page 2673
- “Deregister Subscriber message” on page 2674
- “Publish message” on page 2677
- “Register Subscriber message” on page 2680
- “Request Update message” on page 2685

If you are writing queued publish/subscribe applications, you must understand these messages, the queue manager response message, and the message descriptor (MQMD); see the following information:

- “Queue Manager Response message” on page 2687
- “MQMD settings for publications forwarded by a queue manager” on page 2692
- “MQMD settings in queue manager response messages” on page 2693
- “Publish/subscribe reason codes” on page 2688

The commands are contained in a <psc> folder in the **NameValueData** field of the MQRFH2 header. The message that can be sent by a broker in response to a command message is contained in a <pscr> folder.

The descriptions of each command list the properties that can be contained in a folder. Unless otherwise specified, the properties are optional and can occur only once.

Names of properties are shown as <Command>.

Values must be in string format, for example: Publish.

A string constant representing the value of a property is shown in parentheses, for example: (MQPSC\_PUBLISH).

String constants are defined in the header file cmqpsc.h which is supplied with the queue manager.

## Delete Publication message:

The **Delete Publication** command message is sent to a queue manager from a publisher, or from another queue manager, to tell the queue manager to delete any retained publications for the specified topics.

This message is sent to a queue monitored by the queue manager's queued publish/subscribe interface.

The input queue should be the queue that the original publication was sent to.

If you have the authority for some, but not all, of the topics that are specified in the **Delete Publication** command message, only those topics are deleted. A **Broker Response** message indicates which topics are not deleted.

Similarly, if a **Publish** command contains more than one topic, a **Delete Publication** command matching some, but not all, of those topics deletes only the publications for the topics that are specified in the **Delete Publication** command.

See "MQMD settings for publications forwarded by a queue manager" on page 2692 for details of the message descriptor (MQMD) parameters that are needed when sending a command message to the queue manager.

*Properties:*

### <Command> (MQPSC\_COMMAND)

The value is DeletePub (MQPSC\_DELETE\_PUBLICATION).

This property must be specified.

### <Topic> (MQPSC\_TOPIC)

The value is a string that contains a topic for which retained publications are to be deleted. Wildcard characters can be included in the string to delete publications on more than one topic.

This property must be specified; it can be repeated for as many topics as needed.

### <DelOpt> (MQPSC\_DELETE\_OPTION)

The delete options property can take one of the following values:

#### Local (MQPSC\_LOCAL)

All retained publications for the specified topics are deleted at the local queue manager (that is, the queue manager to which this message is sent), whether they were published with the Local option or not.

Publications at other queue managers are not affected.

#### None (MQPSC\_NONE)

All options take their default values. This has the same effect as omitting the DelOpt property. If other options are specified at the same time, None is ignored.

The default if this property is omitted is that all retained publications for the specified topics are deleted at all queue managers in the network, regardless of whether they were published with the Local option.

*Example:*

Here is an example of NameValueData for a **Delete Publication** command message. This is used by the sample application to delete, at the local queue manager, the retained publication that contains the latest score in the match between Team1 and Team2.

```
<psc>
  <Command>DeletePub</Command>
  <Topic>Sport/Soccer/State/LatestScore/Team1 Team2</Topic>
  <DelOpt>Local</DelOpt>
</psc>
```

## Deregister Subscriber message:

The **Deregister Subscriber** command message is sent to a queue manager by a subscriber, or by another application on behalf of a subscriber, to indicate that it no longer wants to receive messages matching the given parameters.

This message is sent to `SYSTEM.BROKER.CONTROL.QUEUE`, the queue manager's control queue. The user must have the necessary authority to put a message onto this queue.

See MQMD settings for publications forwarded by a queue manager for details of the message descriptor (MQMD) parameters that are needed when sending a command message to the queue manager.

An individual subscription can be deregistered by specifying the corresponding topic, subscription point and filter values of the original subscription. If any of the values were not specified (that is, they took the default values) in the original subscription, they should be omitted when the subscription is deregistered.

All subscriptions for a subscriber, or a group of subscribers, can be deregistered by using the `DeregAll` option. For example, if `DeregAll` is specified, together with a subscription point (but no topic or filter), then all subscriptions for the subscriber on the specified subscription point are deregistered, regardless of the topic and filter. Any combination of topic, filter and subscription point is allowed; if all three are specified only one subscription can match, and the `DeregAll` option is ignored.

The message must be sent by the subscriber that registered the subscription; this is confirmed by checking the subscriber's user ID.

Subscriptions can also be deregistered by a system administrator using MQSC or PCF commands. However, the subscriptions registered with a temporary dynamic queue are associated with the queue, not just the queue name. If the queue is deleted, either explicitly, or by the application disconnecting from the queue manager, it is no longer possible to use the **Deregister Subscriber** command to deregister the subscriptions for that queue. The subscriptions can be deregistered using the developer workbench, and they are removed automatically by the queue manager the next time that it matches a publication to the subscription, or the next time the queue manager restarts. Under normal circumstances, applications should deregister their subscriptions before deleting the queue, or disconnecting from the queue manager.

If a subscriber sends a message to deregister a subscription, and receives a response message to say that this was processed successfully, some publications might still reach the subscriber queue if they were being processed by the queue manager at the same time as the subscription was being deregistered. If the messages are not removed from the queue, there might be a buildup of unprocessed messages on the subscriber queue. If the application executes a loop that includes an `MQGET` call with the appropriate `CorrelId` after sleeping for a while, these messages are cleared off the queue.

Similarly, if the subscriber uses a permanent dynamic queue, and deregisters and closes the queue with the `MQCO_DELETE_PURGE` option on an `MQCLOSE` call, the queue might not be empty. If any publications from the queue manager are not yet committed when the queue is deleted, an `MQRC_Q_NOT_EMPTY` return code is issued by the `MQCLOSE` call. The application can avoid this problem by sleeping and reissuing the `MQCLOSE` call from time to time.

*Properties:*

**<Command> (MQPSC\_COMMAND)**

The value is DeregSub (MQPSC\_DEREGISTER\_SUBSCRIBER).

This property must be specified.

**<Topic> (MQPSC\_TOPIC)**

The value is a string that contains the topic to be deregistered.

This property can, optionally, be repeated if multiple topics are to be deregistered. It can be omitted if DeregAll is specified in <RegOpt>.

The topics that are specified can be a subset of those that are registered if the subscriber wants to retain subscriptions for other topics. Wildcard characters are allowed, but a topic string that contains wildcard characters must exactly match the corresponding string that was specified in the **Deregister Subscriber** command message.

**<SubPoint> (MQPSC\_SUBSCRIPTION\_POINT)**

The value is a string that specifies the subscription point from which the subscription is to be detached.

This property must not be repeated. It can be omitted if a <Topic> is specified, or if DeregAll is specified in <RegOpt>. If you omit this property, the following happens:

- If you do **not** specify DeregAll, subscriptions matching the <Topic> property (and the <Filter> property, if present) are deregistered from the default subscription point.
- If you specify DeregAll, all subscriptions (matching the <Topic> and <Filter> properties if present) are deregistered from all subscription points.

Note that you cannot specify the default subscription point explicitly. Therefore, there is no way of deregistering all subscriptions from this subscription point only; you must specify the topics.

**<SubIdentity> (MQPSC\_SUBSCRIPTION\_IDENTITY)**

This is a variable-length string with a maximum length of 64 characters. It is used to represent an application with an interest in a subscription. The queue manager maintains a set of subscriber identities for each subscription. Each subscription can allow its identity set to hold only a single identity, or an unlimited number of identities.

If the SubIdentity is in the identity set for the subscription then it is removed from the set. If the identity set becomes empty as a result of this, the subscription is removed from the queue manager, unless LeaveOnly is specified as a value of the RegOpt property. If the identity set still contains other identities then the subscription is not removed from the queue manager, and publication flow is not interrupted.

If SubIdentity is specified, but the SubIdentity is not in the identity set for the subscription, then the **Deregister Subscriber** command fails with the return code *MQRCCF\_SUB\_IDENTITY\_ERROR*.

**<Filter> (MQPSC\_FILTER)**

The value is a string specifying the filter to be deregistered. It must match exactly, including case and any spaces, a subscription filter that has been previously registered.

This property can, optionally, be repeated if more than one filter is to be deregistered. It can be omitted if a <Topic> is specified, or if DeregAll is specified in <RegOpt>.

The filters specified can be a subset of those registered if the subscriber wants to retain subscriptions for other filters.

**<RegOpt> (MQPSC\_REGISTRATION\_OPTION)**

The registration options property can take the following values:

**DeregAll**

(MQPSC\_DEREGISTER\_ALL)

All matching subscriptions registered for this subscriber are to be deregistered.

If you specify `DeregAll`:

- `<Topic>`, `<SubPoint>`, and `<Filter>` can be omitted.
- `<Topic>` and `<Filter>` can be repeated, if required.
- `<SubPoint>` must not be repeated.

If you do **not** specify `DeregAll`:

- `<Topic>` must be specified, and can be repeated if required.
- `<SubPoint>` and `<Filter>` can be omitted.
- `<SubPoint>` must not be repeated.
- `<Filter>` can be repeated, if required.

If topics and filters are both repeated, then all subscriptions matching all combinations of the two are removed. For example, a **Deregister Subscriber** command that specifies three topics and three filters will attempt to remove nine subscriptions.

### **CorrelAsId**

(MQPSC\_CORREL\_ID\_AS\_IDENTITY)

The `CorrelId` in the message descriptor (MQMD), which must not be zero, is used to identify the subscriber. It must match the `CorrelId` used in the original subscription.

### **FullResp**

(MQPSC\_FULL\_RESPONSE)

When `FullResp` is specified all attributes of the subscription are returned in the response message, if the command does not fail.

When `FullResp` is specified `DeregAll` is not permitted in the **Deregister Subscriber** command. It is also not possible to specify multiple topics. The command fails with return code `MQRCCF_REG_OPTIONS_ERROR`, in both cases.

### **LeaveOnly**

(MQPSC\_LEAVE\_ONLY)

When you specify this with a `SubIdentity` which is in the identity set for the subscription the `SubIdentity` is removed from the identity set for the subscription. The subscription is not removed from the queue manager, even if the resulting identity set is empty. If the `SubIdentity` value is not in the identity set the command fails with return code `MQRCCF_SUB_IDENTITY_ERROR`.

If `LeaveOnly` is specified with no `SubIdentity`, the command fails with return code `MQRCCF_REG_OPTIONS_ERROR`.

If neither `LeaveOnly` nor a `SubIdentity` are specified, then the subscription is removed regardless of the contents of the identity set for the subscription.

### **None**

(MQPSC\_NONE)

All options take their default values. This has the same effect as omitting the registration options property. If other options are specified at the same time, `None` is ignored.

### **VariableUserId**

(MQPSC\_VARIABLE\_USER\_ID)

When specified the identity of the subscriber (queue, queue manager and correlid) is not restricted to a single userid. This differs from the existing behavior of the queue manager that associates the userid of the original registration message with the subscriber's identity and from then on prevents any other user using that identity. If a new subscriber tries to use the same identity, the return code `MQRCCF_DUPLICATE_SUBSCRIPTION` is returned.

Any user can modify or deregister the subscription when they have suitable authority, avoiding the existing check that the userid must match that of the original subscriber.

To add this option to an existing subscription the command must come from the same userid as the original subscription itself.

If the subscription to be deregistered has `VariableUserId` set this must be set at deregister time to indicate which subscription is being deregistered. Otherwise, the userid of the **Deregister Subscriber** command is used to identify the subscription. This is overridden, along with the other subscriber identifiers, if a subscription name is supplied.

The default, if this property is omitted, is that no registration options are set.

**<QMgrName> (MQPSC\_Q\_MGR\_NAME)**

The value is the queue manager name for the subscriber queue. It must match the `QMgrName` used in the original subscription.

If this property is omitted, the default is the `ReplyToQMgr` name in the message descriptor (MQMD). If the resulting name is blank, it defaults to the name of the queue manager.

**<QName> (MQPSC\_Q\_NAME)**

The value is the name of the subscriber queue. It must match the `QName` used in the original subscription.

If this property is omitted, the default is the `ReplyToQ` name in the message descriptor (MQMD), which must not be blank.

**<SubName> (MQPSC\_SUBSCRIPTION\_NAME)**

If you specify `SubName` on a **Deregister Subscriber** command the `SubName` value takes precedence over all other identifier fields except the `userid`, unless `VariableUserId` is set on the subscription itself. If `VariableUserId` is not set, the **Deregister Subscriber** command succeeds only if the `userid` of the command message matches that of the subscription, if not the command fails with return code `MQRCCF_DUPLICATE_IDENTITY`.

If a subscription exists that matches the traditional identity of this command but has no `SubName` the **Deregister Subscriber** command fails with return code `MQRCCF_SUB_NAME_ERROR`. If an attempt is made to deregister a subscription that has a `SubName` using a command message that matches the traditional identity but with no `SubName` specified the command succeeds.

**<SubUserData> (MQPSC\_SUBSCRIPTION\_USER\_DATA)**

This is a variable-length text string. The value is stored by the queue manager with the subscription but has no influence on the delivery of the publication to the subscriber. The value can be altered by re-registering to the same subscription with a new value. This attribute is for the use of the application.

`SubUserData` is returned in the Metatopic information (`MQCACF_REG_SUB_USER_DATA`) for a subscription, if `SubUserData` is present.

*Example:*

Here is an example of `NameValueData` for a **Deregister Subscriber** command message. In this example, the sample application is deregistering its subscription to the topics which contain the latest score for all matches. The subscriber's identity, including the `CorrelId`, is taken from the defaults in the MQMD.

```
<psc>
  <Command>DeregSub</Command>
  <RegOpt>CorrelAsId</RegOpt>
  <Topic>Sport/Soccer/State/LatestScore/#</Topic>
</psc>
```

**Publish message:**

The **Publish** command message is put to a queue, or from a queue manager to a subscriber, to publish information on a specified topic or topics.

Authority to put a message onto a queue and authority to publish information on a specified topic or topics is necessary.

If the user has authority to publish information on some, but not all, topics, only those topics are used to publish; a warning response indicates which topics are not used to publish.

If a subscriber has any matching subscriptions, the queue manager forwards the **Publish** message to the subscriber queues defined in the corresponding **Register Subscriber** command messages.

See Queue Manager Response message for details of the message descriptor (MQMD) parameters needed when sending a command message to the queue manager, and used when a queue manager forwards a publication to a subscriber.

The queue manager forwards the **Publish** message to other queue managers in the network that have matching subscriptions, unless it is a local publication.

Publication data, if any, is included in the body of the message. The data can be described in an <mc> folder in the NameValueData field of the MQRFH2 header.

## Properties

### <Command> (MQPSC\_COMMAND)

The value is Publish (MQPSC\_PUBLISH).

This property must be specified.

### <Topic> (MQPSC\_TOPIC)

The value is a string that contains a topic that categorizes this publication. No wildcard characters are allowed.

You must add the topic to the namelist SYSTEM.QPUBSUB.QUEUE.NAMELIST, see Adding a stream for instructions on how to complete this task.

This property must be specified, and can optionally be repeated for as many topics as needed.

### <SubPoint> (MQPSC\_SUBSCRIPTION\_POINT)

The subscription point on which the publication is published.

In WebSphere Event Broker V6, the value of the <SubPoint> property is the value of the Subscription Point attribute of the Publication node that is handling the publishing.

In IBM MQ V7.0.1, the value of the <SubPoint> property must match the name of a subscription point. See Adding a subscription point.

### <PubOpt> (MQPSC\_PUBLICATION\_OPTION)

The publication options property can take the following values:

#### **RetainPub**

(MQPSC\_RETAIN\_PUB)

The queue manager is to retain a copy of the publication. If this option is not set, the publication is deleted as soon as the queue manager has sent the publication to all its current subscribers.

#### **IsRetainedPub**

(MQPSC\_IS\_RETAINED\_PUB)

(Can only be set by a queue manager.) This publication has been retained by the queue manager. The queue manager sets this option to notify a subscriber that this publication was published earlier and has been retained, provided that the subscription has been registered with the InformIfRetained option. It is set only in response to a **Register Subscriber** or **Request Update** command message. Retained publications that are sent directly to subscribers do not have this option set.

#### **Local**

(MQPSC\_LOCAL)

This option tells the queue manager that this publication must not be sent to other queue managers. All subscribers that registered at this queue manager receive this publication if they have matching subscriptions.

**OtherSubsOnly**

(MQPSC\_OTHER\_SUBS\_ONLY)

This option allows simpler processing of conference-type applications, where a publisher is also a subscriber to the same topic. It tells the queue manager not to send the publication to the publisher's subscriber queue even if it has a matching subscription. The publisher's subscriber queue consists of its QMgrName, QName, and optional CorrelId, as described in the following list.

**CorrelAsId**

(MQPSC\_CORREL\_ID\_AS\_IDENTITY)

The CorrelId in the MQMD (which must not be zero) is part of the publisher's subscriber queue, in applications where the publisher is also a subscriber.

**None**

(MQPSC\_NONE)

All options take their default values. This has the same effect as omitting the publication options property. If other options are specified at the same time, None is ignored.

You can have more than one publication option by introducing additional <PubOpt> elements.

The default, if this property is omitted, is that no publication options are set.

**<PubTime> (MQPSC\_PUBLISH\_TIMESTAMP)**

The value is an optional publication timestamp set by the publisher. It is 16 characters long with format:

YYYYMMDDHHMSSSTH

using Universal Time. This information is not checked by the queue manager before being sent to the subscribers.

**<SeqNum> (MQPSC\_SEQUENCE\_NUMBER)**

The value is an optional sequence number set by the publisher.

It must be incremented by 1 with each publication. However, this is not checked by the queue manager, which merely transmits this information to subscribers.

If publications on the same topic are published to different interconnected queue managers, it is the responsibility of the publishers to ensure that sequence numbers, if used, are meaningful.

**<QMgrName> (MQPSC\_Q\_MGR\_NAME)**

The value is a string containing the name of the queue manager for the publisher's subscriber queue, in applications where the publisher is also a subscriber (see OtherSubsOnly).

If this property is omitted, the default is the ReplyToQMgr name in the message descriptor (MQMD). If the resulting name is blank, it defaults to the name of the queue manager.

**<QName> (MQPSC\_Q\_NAME)**

The value is a string containing the name of the publisher's subscriber queue, in applications where the publisher is also a subscriber (see OtherSubsOnly).

If this property is omitted, the default is the ReplyToQ name in the message descriptor (MQMD), which must not be blank if OtherSubsOnly is set.

**Example**

Here are some examples of *NameValueData* for a **Publish** command message.

The first example is for a publication sent by the match simulator in the sample application to indicate that a match has started.

```
<psc>
  <Command>Publish</Command>
  <Topic>Sport/Soccer/Event/MatchStarted</Topic>
</psc>
```

The second example is for a retained publication. The latest score in the match between Team1 and Team2 is published.

```
<psc>
  <Command>Publish</Command>
  <PubOpt>RetainPub</PubOpt>
  <Topic>Sport/Soccer/State/LatestScore/Team1 Team2</Topic>
</psc>
```

### Register Subscriber message:

The **Register Subscriber** command message is sent to a queue manager by a subscriber, or by another application on behalf of a subscriber, to indicate that it wants to subscribe to one or more topics at a subscription point. A message content filter can also be specified.

In publish/subscribe filter expressions, nesting parentheses causes performance to decrease exponentially. Avoid nesting parentheses to a depth greater than about 6.

The message is sent to SYSTEM.BROKER.CONTROL.QUEUE, which is the queue manager's control queue. Authority to put a message to this queue is required, in addition to access authority (set by the queue manager's system administrator) for the topic, or topics, in the subscription.

If the user has authority on some, but not all, topics, only those with authority are registered; a warning response indicates those that are not registered.

See "MQMD settings in command messages to the queue manager" on page 2691 for details of the message descriptor (MQMD) parameters that are needed when sending a command message to the queue manager.

If the reply to queue is a temporary dynamic queue, the subscription is deregistered automatically by the queue manager when the queue is closed.

### Properties

#### <Command> (MQPSC\_COMMAND)

The value is RegSub (MQPSC\_REGISTER\_SUBSCRIBER). This property must be specified.

#### <Topic> (MQPSC\_TOPIC)

The topic for which the subscriber wants to receive publications. Wildcard characters can be specified as part of the topic.

If you use the MQSC command **display sub** to examine the subscription created in this way, the value of the <Topic> tag is shown as the TOPICSTR property of the subscription.

This property is required, and can optionally be repeated for as many topics as needed.

#### <SubPoint> (MQPSC\_SUBSCRIPTION\_POINT)

The value is the subscription point to which the subscription is attached.

If this property is omitted, the default subscription point is used.

In WebSphere Event Broker V6, the value of the <SubPoint> property must match the value of the Subscription Point attribute of the Publication nodes that are subscribed to.

In IBM MQ V7.0.1, the value of the <SubPoint> property must match the name of a subscription point. See Adding a subscription point.

**<Filter> (MQPSC\_FILTER)**

The value is an SQL expression that is used as a filter on the contents of publication messages. If a publication on the specified topic matches the filter, it is sent to the subscriber. This property corresponds to the Selection String that is used in MQSUB and MQOPEN calls. For more information, see Selecting on the content of a message

If this property is omitted, no content filtering takes place.

**<RegOpt> (MQPSC\_REGISTRATION\_OPTION)**

This Registration Options property can take the following values:

**AddName**

(MQPSC\_ADD\_NAME)

When specified for an existing subscription that matches the traditional identity of this Register Subscription command, but with no current SubName value, the SubName specified in this command is added to the subscription.

If AddName is specified the SubName field is mandatory, otherwise MQRCCF\_REG\_OPTIONS\_ERROR is returned.

**CorrelAsId**

(MQPSC\_CORREL\_ID\_AS\_IDENTITY)

The CorrelId in the message descriptor (MQMD) is used when sending matching publications to the subscriber queue. The CorrelId must not be zero,

**FullResp**

(MQPSC\_FULL\_RESPONSE)

When specified all attributes of the subscription are returned in the response message, if the command does not fail.

FullResp is valid only when the command message refers to a single subscription. Therefore, only one topic is permitted in the command; otherwise the command fails with return code MQRCCF\_REG\_OPTIONS\_ERROR.

**InformIfRet**

(MQPSC\_INFORM\_IF\_RETAINED)

The queue manager informs the subscriber if a publication is retained when it sends a Publish message in response to a **Register Subscriber** or **Request Update** command message. The queue manager does this by including the IsRetainedPub publication option in the message.

**JoinExcl**

(MQPSC\_JOIN\_EXCLUSIVE)

This option indicates that the specified SubIdentity should be added as the exclusive member of the identity set for the subscription, and that no other identities can be added to the set.

If the identity has already joined 'shared' and is the sole entry in the set, the set is changed to an exclusive lock held by this identity. Otherwise, if the subscription currently has other identities in the identity set (with shared access) the command fails with return code MQRCCF\_SUBSCRIPTION\_IN\_USE.

**JoinShared**

(MQPSC\_JOIN\_SHARED)

This option indicates that the specified SubIdentity should be added to the identity set for the subscription.

If the subscription is currently locked exclusively (using the `JoinExcl` option), the command fails with return code `MQRCCF_SUBSCRIPTION_LOCKED`, unless the identity that has the subscription locked is the same identity as that in this command message. In this case the lock is automatically modified to a shared lock.

**Local**

(`MQPSC_LOCAL`)

The subscription is local and is not distributed to other queue managers in the network. Publications made at other queue managers are not delivered to this subscriber, unless it also has a corresponding global subscription.

**NewPubsOnly**

(`MQPSC_NEW_PUBS_ONLY`)

Retained publications that exist at the time the subscription is registered are not sent to the subscriber; only new publications are sent.

If a subscriber re-registers and changes this option so that it is no longer set, a publication that has already been sent to it might be sent again.

**NoAlter**

(`MQPSC_NO_ALTER`)

The attributes of an existing matching subscription is not changed.

When a subscription is being created, this option is ignored. All other options specified apply to the new subscription.

If a `SubIdentity` also has one of the join options (`JoinExcl` or `JoinShared`) specified, the identity is added to the identity set regardless of whether `NoAlter` is specified.

**None**

(`MQPSC_NONE`)

All registration options take their default values.

If the subscriber is already registered, its options are reset to their default values (note that this does *not* have the same affect as omitting the registration options property), and the subscription expiry is updated from the MQMD of the **Register Subscriber** message.

If other registration options are specified at the same time, `None` is ignored.

**NonPers**

(`MQPSC_NON_PERSISTENT`)

Publications matching this subscription are delivered to the subscriber as non-persistent messages.

**Pers**

(`MQPSC_PERSISTENT`)

Publications matching this subscription are delivered to the subscriber as persistent messages.

**PersAsPub**

(`MQPSC_PERSISTENT_AS_PUBLISH`)

Publications matching this subscription are delivered to the subscriber with the persistence specified by the publisher. This is the default behavior.

**PersAsQueue**

(`MQPSC_PERSISTENT_AS_Q`)

Publications matching this subscription are delivered to the subscriber with the persistence specified on the subscriber queue.

**PubOnReqOnly**

(MQPSC\_PUB\_ON\_REQUEST\_ONLY)

The queue manager does not send publications to the subscriber, except in response to a **Request Update** command message.

**VariableUserId**

(MQPSC\_VARIABLE\_USER\_ID)

When specified the identity of the subscriber (queue, queue manager and correlid) is not restricted to a single userid. This differs from the existing behavior of the queue manager that associates the userid of the original registration message with the subscriber's identity and from then on prevents any other user using that identity. If a new subscriber tries to use the same identity *MQRCCF\_DUPLICATE\_SUBSCRIPTION* is returned.

This allows any user to modify or deregister the subscription if the user has suitable authority. There is therefore no need to check that the userid matches that of the original subscriber.

To add this option to an existing subscription the command must come from the same userid as the original subscription itself.

If the subscription of the **Request Update** command has *VariableUserId* set, this must be set at request update time to indicate which subscription is referred to. Otherwise, the userid of the **Request Update** command is used to identify the subscription. This is overridden, along with the other subscriber identifiers, if a subscription name is supplied.

If a **Register Subscriber** command message without this option set refers to an existing subscription which has this option set, the option is removed from this subscription and the userid of the subscription is now fixed. If there already exists a subscriber which has the same identity (queue, queue manager and correlation identifier) but with a different user ID associated to it, the command fails with return code *MQRCCF\_DUPLICATE\_IDENTITY* because there can only be one userid associated with a subscriber identity.

If the registration options property is omitted and the subscriber is already registered, its registration options are not changed and the subscription expiry is updated from the MQMD of the **Register Subscriber** message.

If the subscriber is not already registered, a new subscription is created with all registration options taking their default values.

The default values are *PersAsPub* and no other options set.

**<QMgrName> (MQPSC\_Q\_MGR\_NAME)**

The value is the name of the queue manager for the subscriber queue, to which matching publications are sent by the queue manager.

If this property is omitted, the default is the *ReplyToQMgr* name in the message descriptor (MQMD). If the resulting name is blank, it defaults to the queue manager's *QMgrName*.

**<QName> (MQPSC\_Q\_NAME)**

The value is the name of the subscriber queue, to which matching publications are sent by the queue manager.

If this property is omitted, the default is the *ReplyToQ* name in the message descriptor (MQMD), which must not be blank in this case.

If the queue is a temporary dynamic queue, nonpersistent delivery of publications ( *NonPers* ) must be specified in the *<RegOpt>* property.

If the queue is a temporary dynamic queue, the subscription is deregistered automatically by the queue manager when the queue is closed.

#### <SubName> (*MQPSC\_SUBSCRIPTION\_NAME*)

This is a name given to a particular subscription. You can use it instead of the queue manager, queue and optional correId to refer to a subscription.

If a subscription already exists with this **SubName**, any other attributes of the subscription (Topic, QMgrName, QName, CorrelId, UserId, RegOpts, UserSubData, and Expiry) are overridden with the attributes, if specified, that are passed in the new **Register Subscriber** command message. However, if **SubName** is used with no QName field specified, and a ReplyToQ is specified in the MQMD header, the subscriber queue is changed to be the ReplyToQ.

If a subscription that matches the traditional identity of this command already exists, but has no **SubName**, the Registration command fails with return code *MQRCCF\_DUPLICATE\_SUBSCRIPTION*, unless the **AddName** option is specified.

If you try to alter an existing named subscription by using another **Register Subscriber** command that specifies the same **SubName**, and the values of Topic, QMgrName, QName, and CorrelId in the new command match a different existing subscription, with or without a SubName defined, the command fails with return code *MQRCCF\_DUPLICATE\_SUBSCRIPTION*. This prevents two subscription names referring to the same subscription.

#### <SubIdentity> (*MQPSC\_SUBSCRIPTION\_IDENTITY*)

This string is used to represent an application with an interest in a subscription. It is a variable-length character string with a maximum length of 64 characters, and is optional. The queue manager maintains a set of subscriber identities for each subscription. Each subscription can allow its identity set to contain only one identity, or an unlimited number of identities (see the **JoinShared** and **JoinExcl** options).

A subscribe command that specifies the **JoinShared** or **JoinExcl** option adds the **SubIdentity** to the subscription's identity set, if it is not already there and if the existing set of identities allows such an action; that is, no other subscriber has joined exclusively or the identity set is empty.

Any alteration of the subscription's attributes as the result of a **Register Subscriber** command in which a **SubIdentity** is specified, only succeeds if it would be the only member of the set of identities for this subscription. Otherwise the command fails with return code *MQRCCF\_SUBSCRIPTION\_IN\_USE*. This prevents a subscription's attributes from changing without other interested subscribers being aware.

If you specify a character string that is longer than 64 characters, the command fails with return code *MQRCCF\_SUB\_IDENTITY\_ERROR*.

#### <SubUserData> (*MQPSC\_SUBSCRIPTION\_USER\_DATA*)

This is a variable-length text string. The value is stored by the queue manager with the subscription, but has no influence on publication delivery to the subscriber. The value can be altered by re-registering to the same subscription with a new value. This attribute is there for the use of the application.

The **SubUserData** is returned in the Metatopic information (*MQCACF\_REG\_SUB\_USER\_DATA*) for a subscription if present.

If you specify more than one of the registration option values **NonPers**, **PersAsPub**, **PersAsQueue**, and **Pers**, then only the last one is used. You cannot combine these options in an individual subscription.

#### Example

Here is an example of NameValueData for a **Register Subscriber** command message. In the sample application, the results service uses this message to register a subscription to the topics containing the latest scores in all matches, with the 'Persistent as publish' option set. The subscriber's identity, including the CorrelId, is taken from the defaults in the MQMD.

```

<psc>
  <Command>RegSub</Command>
  <RegOpt>PersAsPub</RegOpt>
  <RegOpt>CorrelAsId</RegOpt>
  <Topic>Sport/Soccer/State/LatestScore/#</Topic>
</psc>

```

### Request Update message:

The **Request Update** command message is sent from a subscriber to a queue manager, to request the current retained publications for the specified topic and subscription point that match the given (optional) filter.

This message is sent to *SYSTEM.BROKER.CONTROL.QUEUE*, the queue manager's control queue. Authority to put a message to this queue is required, in addition to access authority for the topic in the request update; this is set by the queue manager's system administrator.

This command is normally used if the subscriber specified the option *PubOnReqOnly* when it registered. If the queue manager has any matching retained publications, they are sent to the subscriber. If the queue manager has no matching retained publications, the request fails with return code *MQRCCF\_NO\_RETAINED\_MSG*. The requester must have previously registered a subscription with the same *Topic*, *SubPoint*, and *Filter* values.

*Properties:*

**<Command> (MQPSC\_COMMAND)**

The value is *ReqUpdate (MQPSC\_REQUEST\_UPDATE)*. This property must be specified.

**<Topic> (MQPSC\_TOPIC)**

The value is the topic that the subscriber is requesting; wildcard characters are allowed.

This property must be specified, but only one occurrence is allowed in this message.

**<SubPoint> (MQPSC\_SUBSCRIPTION\_POINT)**

The value is the subscription point to which the subscription is attached.

If this property is omitted, the default subscription point is used.

**<Filter> (MQPSC\_FILTER)**

The value is an ESQL expression that is used as a filter on the contents of publication messages. If a publication on the specified topic matches the filter, it is sent to the subscriber.

The *<Filter>* property should have the same value as that specified on the original subscription for which you are now requesting an update.

If this property is omitted, no content filtering takes place.

**<RegOpt> (MQPSC\_REGISTRATION\_OPTION)**

The registration options property can take the following value:

**CorrelAsId**

*(MQPSC\_CORREL\_ID\_AS\_IDENTITY)*

The *CorrelId* in the message descriptor (MQMD), which must not be zero, is used when sending matching publications to the subscriber queue.

**None**

*(MQPSC\_NONE)*

All options take their default values. This has the same effect as omitting the *<RegOpt>* property. If other options are specified at the same time, *None* is ignored.

**VariableUserId**

*(MQPSC\_VARIABLE\_USER\_ID)*

When specified the identity of the subscriber (queue, queue manager, and correlid) is not restricted to a single userid. This differs from the existing behavior of the queue manager that associates the userid of the original registration message with the subscriber's identity and from then on prevents any other user using that identity. If a new subscriber tries to use the same identity, the command fails with return code *MQRCCF\_DUPLICATE\_SUBSCRIPTION*.

This allows any user to modify or deregister the subscription when they have suitable authority. Therefore, there is no need to check that the userid matches that of the original subscriber.

To add this option to an existing subscription, the command must come from the same userid as the original subscription.

If the subscription of the **Request Update** command has *VariableUserId* set, this must be set at request update time to indicate which subscription is referred to. Otherwise, the userid of the **Request Update** command is used to identify the subscription. This is overridden, along with the other subscriber identifiers, if a subscription name is supplied.

The default, if this property is omitted, is that no registration options are set.

**<QMgrName> (MQPSC\_Q\_MGR\_NAME)**

The value is the name of the queue manager for the subscriber queue, to which the matching retained publication is sent by the queue manager.

If this property is omitted, the default is the *ReplyToQMgr* name in the message descriptor (MQMD). If the resulting name is blank, it defaults to the queue manager's *QMgrName*.

**<QName> (MQPSC\_Q\_NAME)**

The value is the name of the subscriber queue, to which the matching retained publication is sent by the queue manager.

If this property is omitted, the default is the *ReplyToQ* name in the message descriptor (MQMD), which must not be blank in this case.

**<SubName> (MQPSC\_SUBSCRIPTION\_NAME)**

This is a name given to a particular subscription. If specified on a **Request Update** command the *SubName* value takes precedence over all other identifier fields except the *userid*, unless *VariableUserId* is set on the subscription itself. If *VariableUserId* is not set, the *Request Update* command succeeds only if the *userid* of the command message matches that of the subscription. If the *userid* of the command message does not match that of the subscription, the command fails with return code *MQRCCF\_DUPLICATE\_IDENTITY*.

If *VariableUserId* is set, and the *userid* differs from that of the subscription, the command succeeds if the *userid* of the new command message has authority to browse the stream queue and put to the subscriber queue of the subscription. Otherwise, the command fails with return code *MQRCCF\_NOT\_AUTHORIZED*.

If a subscription exists that matches the traditional identity of this command, but has no *SubName*, the **Request Update** command fails with return code *MQRCCF\_SUB\_NAME\_ERROR*.

If an attempt is made to request an update for a subscription that has a *SubName* using a command message that matches the traditional identity, but with no *SubName* specified, the command succeeds.

*Example:*

Here is an example of *NameValueData* for a **Request Update** command message. In the sample application, the results service uses this message to request retained publications containing the latest scores for all teams. The subscriber's identity, including the *CorrelId*, is taken from the defaults in the MQMD.

```
<psc>
  <Command>ReqUpdate</Command>
  <RegOpt>CorrelAsId</RegOpt>
  <Topic>Sport/Soccer/State/LatestScore/#</Topic>
</psc>
```

## Queue Manager Response message:

A **Queue Manager Response** message is sent from a queue manager to the ReplyToQ of a publisher or a subscriber, to indicate the success or failure of a command message received by the queue manager if the command message descriptor specified that a response is required.

The response message is contained within the NameValueData field of the MQRFH2 header, in a <pscr> folder.

In the case of a warning or error, the response message contains the <pscr> folder from the command message as well as the <pscr> folder. The message data, if any, is not contained in the queue manager response message. In the case of an error, none of the message that caused an error has been processed; in the case of a warning, some of the message might have been processed successfully.

If there is a failure sending a response:

- For publication messages, the queue manager tries to send the response to the IBM MQ dead-letter queue if the MQPUT fails. This allows the publication to be sent to subscribers even if the response cannot be sent back to the publisher.
- For other messages, or if the publication response cannot be sent to the dead-letter queue, an error is logged and the command message is normally rolled back. Whether this happens depends on how the MQInput node has been configured.

*Properties:*

### <Completion> (MQPSCR\_COMPLETION)

The completion code, which can take one of three values:

- ok** Command completed successfully
- warning** Command completed but with warning
- error** Command failed

### <Response> (MQPSCR\_RESPONSE)

The response to a command message, if that command produced a completion code of warning or error. It contains a <Reason> property, and might contain other properties that indicate the cause of the warning or error.

In the case of one or more errors, there is only one response folder, indicating the cause of the first error only. In the case of one or more warnings, there is a response folder for each warning.

### <Reason> (MQPSCR\_REASON)

The reason code qualifying the completion code, if the completion code is a warning or error. It is set to one of the error codes listed in the following example. The <Reason> property is contained within a <Response> folder. The reason code can be followed by any valid property from the <pscr> folder (for example, a topic name), indicating the cause of the error or warning. If you get a reason code of ????, check the data for correctness, for example, matching angled brackets (< >).

*Examples:*

Here are some examples of NameValueData in a **Queue Manager Response** message. A successful response might be the following:

```
<pscr>
  <Completion>ok</Completion>
</pscr>
```

Here is an example of a failure response; the failure is a filter error. The first NameValueData string contains the response; the second contains the original command.

```
<pscr>
  <Completion>error</Completion>
  <Response>
```

```

    <Reason>3150</Reason>
  </Reponse>
</pscr>

<psc>
  ...
  command message (to which
  the queue manager is responding)
  ...
</psc>

```

Here is an example of a warning response (due to unauthorized topics). The first NameValueData string contains the response; the second NameValueData string contains the original command.

```

<pscr>
  <Completion>warning</Completion>
  <Response>
    <Reason>3081</Reason>
    <Topic>topic1</Topic>
  </Reponse>
  <Response>
    <Reason>3081</Reason>
    <Topic>topic2</Topic>
  </Reponse>
</pscr>

<psc>
  ...
  command message (to which
  the queue manager is responding)
  ...
</psc>

```

### Publish/subscribe reason codes:

These reason codes might be returned in the Reason field of a publish/subscribe response <pscr> folder. Constants that can be used to represent these codes in the C or C++ programming languages are also listed.

The MQRC\_ constants require the IBM MQ cmqc.h header file. The MQRCCF\_ constants require the IBM MQ cmqcf.h header file (apart from MQRCCF\_FILTER\_ERROR and MQRCCF\_WRONG\_USER, which require the cmqpsc.h header file).

Reason code and text	Explanation	Issued by
2336 MQRC_RFH_COMMAND_ERROR	Valid values for the <Command> field of a <psc> folder are: RegSub, DeregSub, Publish, DeletePub, and ReqUpdate. Any other values result in this error code being issued.	Any command
2337 MQRC_RFH_PARM_ERROR	The <psc> and <mcd> folders both have a set of valid parameters that can be specified within them. Check the descriptions of these folders and ensure that you have not specified incorrect parameters.	Any command
2338 MQRC_RFH_DUPLICATE_PARM	Some parameters (for example, Topic) within a <psc> folder can be repeated, but others (for example, Command) cannot be repeated. Check that you have not duplicated a non-repeatable parameter.	Any command

Reason code and text	Explanation	Issued by
2339 MQRC_RFH_PARM_MISSING	Some parameters within <psc> or <mcd> folders are optional and can be omitted; some are mandatory and must not be omitted. Check that you have included all mandatory parameters within your <psc> and <mcd> folders.	Any command
2551 MQRC_SELECTION_NOT_AVAILABLE	No extended message selection provider was available to determine which subscribers with a filter specified should receive the publication.	Publish, Register Subscriber, and Request Update
	No extended message selection provider was available to handle the filter of the specified subscriber.	Register Subscriber and Request Update
2554 MQRC_CONTENT_ERROR	An extended message selection provider found an error in the current or retained publication.	Publish and Request Update
3008 MQRCCF_COMMAND_FAILED	An internal error occurred which prevented the command from executing correctly. The error might occur if the command is reissued. The system event log for the queue manager contains information which should be used when reporting the problem to IBM.	Any command
3072 MQRCCF_TOPIC_ERROR	One or more of the values you supplied for the Topic parameter are incorrect. Check that your values for Topic conform to the specified restrictions.	Any command
3073 MQRCCF_NOT_REGISTERED	The combination of SubPoint, Topic, and Filter that you specified on your DeregSub or ReqUpdate command was either not a combination with which you had previously registered or, for the DeregSub command if the DeregAll option was specified, one of the SubPoint, Topic, or Filter properties was not used to deregister any subscription.	Deregister Subscriber and Request Update commands
3074 MQRCCF_Q_MGR_NAME_ERROR	The specified queue manager was not valid, or the queue manager was not available or did not exist.	Deregister Subscriber, Publish, Register Subscriber, and Request Update commands
3076 MQRCCF_Q_NAME_ERROR	The specified queue name was not valid, or the queue did not exist on the specified queue manager.	Deregister Subscriber, Publish, Register Subscriber, and Request Update commands
3077 MQRCCF_NO_RETAINED_MSG	There were no retained messages for the topic you specified. This might or might not be an error, depending on the design of your application program.	Request Update command

Reason code and text	Explanation	Issued by
3079 MQRCCF_INCORRECT_Q	RegSub, DeregSub, and ReqUpdate commands are always sent to the SYSTEM.BROKER.CONTROL.QUEUE queue of the queue manager for which they are intended. Publish and Delete Publication commands are sent to the input queue for the particular publish/subscribe message flow for which they are intended; this is determined when the message flow is designed. This error code is returned if a command is sent to the wrong queue.	Any command
3080 MQRCCF_CORREL_ID_ERROR	You have specified CorrelAsId as one of your RegOpt parameters. However, the CorrelId field of the MQMD does not contain a valid correlation identifier (that is, it is set to MQCI_NONE).	Deregister Subscriber and Register Subscriber commands
3081 MQRCCF_NOT_AUTHORIZED	You are not authorized to perform the requested action. Authorization settings for the queue manager are handled by the system administrator using the Topics Hierarchy editor.	Publish and Register Subscriber commands
3083 MQRCCF_REG_OPTIONS_ERROR	You have specified an unrecognized RegOpt parameter in the <psc> folder that contains your RegSub or DeregSub command.	Deregister Subscriber and Register Subscriber commands
3084 MQRCCF_PUB_OPTIONS_ERROR	You have specified an unrecognized PubOpt parameter in the <psc> folder that contains your Publish command.	Publish command
3087 MQRCCF_DEL_OPTIONS_ERROR	You have specified an unrecognized DelOpt parameter in the <psc> folder that contains your DeletePub command.	Delete Publication command
3150 MQRCCF_FILTER_ERROR	The value specified for the Filter parameter is not valid. Check the section that describes the valid syntax for filter expressions and ensure that your expression conforms.	Deregister Subscriber, Register Subscriber, and Request Update commands
3151 MQRCCF_WRONG_USER	A subscription that matches the one specified already exists; however, it was registered by a different user. A subscription can only be changed or deregistered by the user who originally registered it.	Deregister Subscriber, Register Subscriber, and Request Update commands
3152 MQRCCF_DUPLICATE_SUBSCRIPTION	A matching subscription already exists with a different subscription name.	
3153 MQRCCF_SUB_NAME_ERROR	Either the format of the subscription name is not valid, or a matching subscription already exists with no subscription name.	

Reason code and text	Explanation	Issued by
3154 MQRCCF_SUB_IDENTITY_ERROR	The subscription identity parameter is in error. Either the supplied value exceeds the maximum length allowed, or the subscription identity is not currently a member of the subscription's identity set and a Join registration option was not specified.	
3155 MQRCCF_SUBSCRIPTION_IN_USE	An attempt to modify or deregister a subscription was attempted by a member of the identity set when it was not the only member of this set.	
3156 MQRCCF_SUBSCRIPTION_LOCKED	The subscription is currently exclusively locked by another identity.	
3157 MQRCCF_ALREADY_JOINED	A Join registration option was specified but the subscriber identity was already a member of the subscription's identity set.	

### MQMD settings in command messages to the queue manager:

Applications that send command messages to the queue manager use the following settings of fields in the message descriptor (MQMD). Fields that are left as the default value, or can be set to any valid value in the usual way, are not listed here.

#### Report

See `MsgType` and `CorrelId`.

#### MsgType

`MsgType` should be set to either `MQMT_REQUEST` or `MQMT_DATAGRAM`.

`MQRCCF_MSG_TYPE_ERROR` will be returned if `MsgType` is not set to one of these values.

`MsgType` should be set to `MQMT_REQUEST` for a command message if a response is always required. The `MQRO_PAN` and `MQRO_NAN` flags in the `Report` field are not significant in this case.

If `MsgType` is set to `MQMT_DATAGRAM`, responses depend on the setting of the `MQRO_PAN` and `MQRO_NAN` flags in the `Report` field:

- `MQRO_PAN` alone means that the queue manager sends a response only if the command succeeds.
- `MQRO_NAN` alone means that the queue manager sends a response only if the command fails.
- If a command completes with a warning, a response is sent if either `MQRO_PAN` or `MQRO_NAN` is set.
- `MQRO_PAN` + `MQRO_NAN` means that the queue manager sends a response whether the command succeeds or fails. This has the same effect from the queue manager's perspective as setting `MsgType` to `MQMT_REQUEST`.
- If neither `MQRO_PAN` nor `MQRO_NAN` is set, no response is ever sent.

#### Format

Set to `MQFMT_RF_HEADER_2`

#### MsgId

This field is normally set to `MQMI_NONE`, so that the queue manager generates a unique value.

#### CorrelId

This field can be set to any value. If the sender's identity includes a `CorrelId`, specify this value, together with `MQRO_PASS_CORREL_ID` in the `Report` field, to ensure that it is set in all response messages sent by the queue manager to the sender.

**ReplyToQ**

This field defines the queue to which responses, if any, are to be sent. This might be the sender's queue; this has the advantage that the QName parameter can be omitted from the message. If, however, responses are to be sent to a different queue, the QName parameter is needed.

**ReplyToQMgr**

This field defines the queue manager for responses. If you leave this field blank (the default value), the local queue manager puts its own name in this field.

**MQMD settings for publications forwarded by a queue manager:**

A queue manager uses these settings of fields in the message descriptor (MQMD) when it sends a publication to a subscriber. All other fields in the MQMD are set to their default values.

**Report**

Report is set to MQRO\_NONE.

**MsgType**

MsgType is set to MQMT\_DATAGRAM.

**Expiry**

Expiry is set to the value in the **Publish** message received from the publisher. In the case of a retained message, the time outstanding is reduced by the approximate time that the message has been at the queue manager.

**Format**

Format is set to MQFMT\_RF\_HEADER\_2

**MsgId**

MsgId is set to a unique value.

**CorrelId**

If CorrelId is part of the subscriber's identity, this is the value specified by the subscriber when registering. Otherwise, it is a non-zero value chosen by the queue manager.

**Priority**

Priority takes the value set by the publisher, or as resolved if the publisher specified MQPRI\_PRIORITY\_AS\_Q\_DEF.

**Persistence**

Persistence takes the value set by the publisher, or as resolved if the publisher specified MQPER\_PERSISTENCE\_AS\_Q\_DEF, unless specified otherwise in the **Register Subscriber** message for the subscriber to which this publication is being sent.

**ReplyToQ**

ReplyToQ is set to blanks.

**ReplyToQMgr**

ReplyToQMgr is set to the name of the queue manager.

**UserIdentifier**

UserIdentifier is the subscriber's user identifier, as set when the subscriber registered.

**AccountingToken**

AccountingToken is the subscriber's accounting token, as set when the subscriber first registered.

**AppIdentityData**

AppIdentityData is the subscriber's application identity data, as set when the subscriber first registered.

**PutAppType**

PutAppType is set to MQAT\_BROKER.

**PutAppName**

PutAppName is set to the first 28 characters of the name of the queue manager.

**PutDate**

PutDate is the date when the message was put.

**PutTime**

PutTime is the time when the message was put.

**App1OriginData**

App1OriginData is set to blanks.

**MQMD settings in queue manager response messages:**

A queue manager uses these settings of fields in the message descriptor (MQMD) when sending a reply to a publication message. All other fields in the MQMD are set to their default values.

**Report**

Report is set to all zeros.

**MsgType**

MsgType is set to MQMT\_REPLY.

**Format**

Format is set to MQFMT\_RF\_HEADER\_2

**MsgId**

The setting of MsgId depends on the Report options in the original command message. By default, it is set to MQMI\_NONE, so that the queue manager generates a unique value.

**CorrelId**

The setting of CorrelId depends on the Report options in the original command message. By default, this means that the CorrelId is set to the same value as the MsgId of the command message. This can be used to correlate commands with their responses.

**Priority**

Priority is set to the same value as in the original command message.

**Persistence**

Persistence is set to the value set in the original command message.

**Expiry**

Expiry is set to the same value as in the original command message received by the queue manager.

**PutApp1Type**

PutApp1Type is set to MQAT\_BROKER.

**PutAppName**

PutAppName is set to the first 28 characters of name of the queue manager.

Other context fields are set as if generated with MQPMO\_PASS\_IDENTITY\_CONTEXT.

## Machine encodings

This section describes the structure of the *Encoding* field in the message descriptor.

See “MQMD - Message descriptor” on page 2179 for a summary of the fields in the structure.

The *Encoding* field is a 32-bit integer that is divided into four separate subfields; these subfields identify:

- The encoding used for binary integers
- The encoding used for packed-decimal integers
- The encoding used for floating-point numbers
- Reserved bits

Each subfield is identified by a bit mask that has 1-bits in the positions corresponding to the subfield, and 0-bits elsewhere. The bits are numbered such that bit 0 is the most significant bit, and bit 31 the least significant bit. The following masks are defined:

### MQENC\_INTEGER\_MASK

Mask for binary-integer encoding.

This subfield occupies bit positions 28 through 31 within the *Encoding* field.

### MQENC\_DECIMAL\_MASK

Mask for packed-decimal-integer encoding.

This subfield occupies bit positions 24 through 27 within the *Encoding* field.

### MQENC\_FLOAT\_MASK

Mask for floating-point encoding.

This subfield occupies bit positions 20 through 23 within the *Encoding* field.

### MQENC\_RESERVED\_MASK

Mask for reserved bits.

This subfield occupies bit positions 0 through 19 within the *Encoding* field.

## Binary-integer encoding:

The following values are valid for the binary-integer encoding:

### MQENC\_INTEGER\_UNDEFINED

Binary integers are represented using an encoding that is undefined.

### MQENC\_INTEGER\_NORMAL

Binary integers are represented in the conventional way:

- The least significant byte in the number has the highest address of any of the bytes in the number; the most significant byte has the lowest address
- The least significant bit in each byte is adjacent to the byte with the next higher address; the most significant bit in each byte is adjacent to the byte with the next lower address

### MQENC\_INTEGER\_REVERSED

Binary integers are represented in the same way as MQENC\_INTEGER\_NORMAL, but with the bytes arranged in reverse order. The bits within each byte are arranged in the same way as MQENC\_INTEGER\_NORMAL.

### **Packed-decimal-integer encoding:**

The following values are valid for the packed-decimal-integer encoding:

#### **MQENC\_DECIMAL\_UNDEFINED**

Packed-decimal integers are represented using an encoding that is undefined.

#### **MQENC\_DECIMAL\_NORMAL**

Packed-decimal integers are represented in the conventional way:

- Each decimal digit in the printable form of the number is represented in packed decimal by a single hexadecimal digit in the range X'0' through X'9'. Each hexadecimal digit occupies four bits, and so each byte in the packed decimal number represents two decimal digits in the printable form of the number.
- The least significant byte in the packed-decimal number is the byte that contains the least significant decimal digit. Within that byte, the most significant four bits contain the least significant decimal digit, and the least significant four bits contain the sign. The sign is either X'C' (positive), X'D' (negative), or X'F' (unsigned).
- The least significant byte in the number has the highest address of any of the bytes in the number; the most significant byte has the lowest address.
- The least significant bit in each byte is adjacent to the byte with the next higher address; the most significant bit in each byte is adjacent to the byte with the next lower address.

#### **MQENC\_DECIMAL\_REVERSED**

Packed-decimal integers are represented in the same way as MQENC\_DECIMAL\_NORMAL, but with the bytes arranged in reverse order. The bits within each byte are arranged in the same way as MQENC\_DECIMAL\_NORMAL.

### **Floating-point encoding:**

The following values are valid for the floating-point encoding:

#### **MQENC\_FLOAT\_UNDEFINED**

Floating-point numbers are represented using an encoding that is undefined.

#### **MQENC\_FLOAT\_IEEE\_NORMAL**

Floating-point numbers are represented using the standard IEEE<sup>2</sup> floating-point format, with the bytes arranged as follows:

- The least significant byte in the mantissa has the highest address of any of the bytes in the number; the byte containing the exponent has the lowest address
- The least significant bit in each byte is adjacent to the byte with the next higher address; the most significant bit in each byte is adjacent to the byte with the next lower address

Details of the IEEE float encoding can be found in IEEE Standard 754.

#### **MQENC\_FLOAT\_IEEE\_REVERSED**

Floating-point numbers are represented in the same way as MQENC\_FLOAT\_IEEE\_NORMAL, but with the bytes arranged in reverse order. The bits within each byte are arranged in the same way as MQENC\_FLOAT\_IEEE\_NORMAL.

#### **MQENC\_FLOAT\_S390**

Floating-point numbers are represented using the standard System/390 floating-point format; this is also used by System/370.

### Constructing encodings:

To construct a value for the *Encoding* field in MQMD, the relevant constants that describe the required encodings can be added together (do not add the same constant more than once), or combined using the bitwise OR operation (if the programming language supports bit operations).

Whichever method is used, combine only one of the MQENC\_INTEGER\_\* encodings with one of the MQENC\_DECIMAL\_\* encodings and one of the MQENC\_FLOAT\_\* encodings.

### Analyzing encodings:

The *Encoding* field contains subfields; because of this, applications that need to examine the integer, packed decimal, or float encoding must use one of the techniques described.

### Using bit operations

If the programming language supports bit operations, perform the following steps:

1. Select one of the following values, according to the type of encoding required:
  - MQENC\_INTEGER\_MASK for the binary integer encoding
  - MQENC\_DECIMAL\_MASK for the packed decimal integer encoding
  - MQENC\_FLOAT\_MASK for the floating point encodingCall the value A.
2. Combine the *Encoding* field with A using the bitwise AND operation; call the result B.
3. B is the encoding required, and can be tested for equality with each of the values that is valid for that type of encoding.

### Using arithmetic

If the programming language *does not* support bit operations, perform the following steps using integer arithmetic:

1. Select one of the following values, according to the type of encoding required:
  - 1 for the binary integer encoding
  - 16 for the packed decimal integer encoding
  - 256 for the floating point encodingCall the value A.
2. Divide the value of the *Encoding* field by A ; call the result B.
3. Divide B by 16; call the result C.
4. Multiply C by 16 and subtract from B ; call the result D.
5. Multiply D by A ; call the result E.
6. E is the encoding required, and can be tested for equality with each of the values that is valid for that type of encoding.

## Summary of machine architecture encodings:

Encodings for machine architectures are shown in Table 259.

Table 259. Summary of encodings for machine architectures

Machine architecture	Binary integer encoding	Packed-decimal integer encoding	Floating-point encoding
IBM i	normal	normal	IEEE normal
Intel x86	reversed	reversed	IEEE reversed
PowerPC®	normal	normal	IEEE normal
System/390	normal	normal	System/390

## Report options and message flags

This section describes the *Report* and *MsgFlags* fields that are part of the message descriptor MQMD specified on the MQGET, MQPUT, and MQPUT1 calls.

The topics in this section describe:

- The structure of the report field and how the queue manager processes it
- How an application analyzes the report field
- The structure of the message-flags field

For more information about the MQMD message descriptor, see “MQMD - Message descriptor” on page 2179.

### Structure of the report field:

This information describes the structure of the report field.

The *Report* field is a 32-bit integer that is divided into three separate subfields. These subfields identify:

- Report options that are rejected if the local queue manager does not recognize them
- Report options that are always accepted, even if the local queue manager does not recognize them
- Report options that are accepted only if certain other conditions are satisfied

Each subfield is identified by a bit mask that has 1-bits in the positions corresponding to the subfield, and 0-bits elsewhere. The bits in a subfield are not necessarily adjacent. The bits are numbered such that bit 0 is the most significant bit, and bit 31 the least significant bit. The following masks are defined to identify the subfields:

#### MQRO\_REJECT\_UNSUP\_MASK

This mask identifies the bit positions within the *Report* field where report options that are not supported by the local queue manager cause the MQPUT or MQPUT1 call to fail with completion code MQCC\_FAILED and reason code MQRC\_REPORT\_OPTIONS\_ERROR.

This subfield occupies bit positions 3, and 11 through 13.

#### MQRO\_ACCEPT\_UNSUP\_MASK

This mask identifies the bit positions within the *Report* field where report options that are not supported by the local queue manager are nevertheless accepted on the MQPUT or MQPUT1 calls. Completion code MQCC\_WARNING with reason code MQRC\_UNKNOWN\_REPORT\_OPTION are returned in this case.

This subfield occupies bit positions 0 through 2, 4 through 10, and 24 through 31.

The following report options are included in this subfield:

- MQRO\_ACTIVITY

- MQRO\_COPY\_MSG\_ID\_TO\_CORREL\_ID
- MQRO\_DEAD\_LETTER\_Q
- MQRO\_DISCARD\_MSG
- MQRO\_EXCEPTION
- MQRO\_EXCEPTION\_WITH\_DATA
- MQRO\_EXCEPTION\_WITH\_FULL\_DATA
- MQRO\_EXPIRATION
- MQRO\_EXPIRATION\_WITH\_DATA
- MQRO\_EXPIRATION\_WITH\_FULL\_DATA
- MQRO\_NAN
- MQRO\_NEW\_MSG\_ID
- MQRO\_NONE
- MQRO\_PAN
- MQRO\_PASS\_CORREL\_ID
- MQRO\_PASS\_MSG\_ID

#### **MQRO\_ACCEPT\_UNSUP\_IF\_XMIT\_MASK**

This mask identifies the bit positions within the *Report* field where report options that are not supported by the local queue manager are nevertheless accepted on the MQPUT or MQPUT1 calls *provided* that both of the following conditions are satisfied:

- The message is destined for a remote queue manager.
- The application is not putting the message directly on a local transmission queue (that is, the queue identified by the *ObjectQMgrName* and *ObjectName* fields in the object descriptor specified on the MQOPEN or MQPUT1 call is not a local transmission queue).

Completion code MQCC\_WARNING with reason code MQRC\_UNKNOWN\_REPORT\_OPTION are returned if these conditions are satisfied, and MQCC\_FAILED with reason code MQRC\_REPORT\_OPTIONS\_ERROR if not.

This subfield occupies bit positions 14 through 23.

The following report options are included in this subfield:

- MQRO\_COA
- MQRO\_COA\_WITH\_DATA
- MQRO\_COA\_WITH\_FULL\_DATA
- MQRO\_COD
- MQRO\_COD\_WITH\_DATA
- MQRO\_COD\_WITH\_FULL\_DATA

If any options are specified in the *Report* field that the queue manager does not recognize, the queue manager checks each subfield in turn by using the bitwise AND operation to combine the *Report* field with the mask for that subfield. If the result of that operation is not zero, the completion code and reason codes described previously are returned.

If MQCC\_WARNING is returned, it is not defined which reason code is returned if other warning conditions exist.

The ability to specify and have accepted report options that are not recognized by the local queue manager is useful when sending a message with a report option that is recognized and processed by a *remote* queue manager.

## Analyzing the report field:

The *Report* field contains subfields; because of this, applications that need to check whether the sender of the message requested a particular report must use one of the techniques described.

### Using bit operations

If the programming language supports bit operations, perform the following steps:

1. Select one of the following values, according to the type of report to be checked:
  - MQRO\_COA\_WITH\_FULL\_DATA for COA report
  - MQRO\_COD\_WITH\_FULL\_DATA for COD report
  - MQRO\_EXCEPTION\_WITH\_FULL\_DATA for exception report
  - MQRO\_EXPIRATION\_WITH\_FULL\_DATA for expiration report

Call the value A.

On z/OS, use the MQRO\*\_WITH\_DATA values instead of the MQRO\*\_WITH\_FULL\_DATA values.

2. Combine the *Report* field with A using the bitwise AND operation; call the result B.
3. Test B for equality with each value that is possible for that type of report.

For example, if A is MQRO\_EXCEPTION\_WITH\_FULL\_DATA, test B for equality with each of the following to determine what was specified by the sender of the message:

- MQRO\_NONE
- MQRO\_EXCEPTION
- MQRO\_EXCEPTION\_WITH\_DATA
- MQRO\_EXCEPTION\_WITH\_FULL\_DATA

The tests can be performed in whatever order is most convenient for the application logic.

Use a similar method to test for the MQRO\_PASS\_MSG\_ID or MQRO\_PASS\_CORREL\_ID options; select as the value A whichever of these two constants is appropriate, and then proceed as described previously.

### Using arithmetic

If the programming language *does not* support bit operations, perform the following steps using integer arithmetic:

1. Select one of the following values, according to the type of report to be checked:
  - MQRO\_COA for COA report
  - MQRO\_COD for COD report
  - MQRO\_EXCEPTION for exception report
  - MQRO\_EXPIRATION for expiration report

Call the value A.

2. Divide the *Report* field by A ; call the result B.
3. Divide B by 8 ; call the result C.
4. Multiply C by 8 and subtract from B ; call the result D.
5. Multiply D by A ; call the result E.
6. Test E for equality with each value that is possible for that type of report.

For example, if A is MQRO\_EXCEPTION, test E for equality with each of the following to determine what was specified by the sender of the message:

- MQRO\_NONE
- MQRO\_EXCEPTION
- MQRO\_EXCEPTION\_WITH\_DATA

- MQRO\_EXCEPTION\_WITH\_FULL\_DATA

The tests can be performed in whatever order is most convenient for the application logic.

The following pseudocode illustrates this technique for exception report messages:

```
A = MQRO_EXCEPTION
B = Report/A
C = B/8
D = B - C*8
E = D*A
```

Use a similar method to test for the MQRO\_PASS\_MSG\_ID or MQRO\_PASS\_CORREL\_ID options; select as the value A whichever of these two constants is appropriate, and then proceed as described previously, but replacing the value 8 in the previous steps by the value 2.

### Structure of the message-flags field:

This information describes the structure of the message-flags field.

The *MsgFlags* field is a 32-bit integer that is divided into three separate subfields. These subfields identify:

- Message flags that are rejected if the local queue manager does not recognize them
- Message flags that are always accepted, even if the local queue manager does not recognize them
- Message flags that are accepted only if certain other conditions are satisfied

**Note:** All subfields in *MsgFlags* are reserved for use by the queue manager.

Each subfield is identified by a bit mask that has 1-bits in the positions corresponding to the subfield, and 0-bits elsewhere. The bits are numbered such that bit 0 is the most significant bit, and bit 31 the least significant bit. The following masks are defined to identify the subfields:

#### MQMF\_REJECT\_UNSUP\_MASK

This mask identifies the bit positions within the *MsgFlags* field where message flags that are not supported by the local queue manager cause the MQPUT or MQPUT1 call to fail with completion code MQCC\_FAILED and reason code MQRC\_MSG\_FLAGS\_ERROR.

This subfield occupies bit positions 20 through 31.

The following message flags are included in this subfield:

- MQMF\_LAST\_MSG\_IN\_GROUP
- MQMF\_LAST\_SEGMENT
- MQMF\_MSG\_IN\_GROUP
- MQMF\_SEGMENT
- MQMF\_SEGMENTATION\_ALLOWED
- MQMF\_SEGMENTATION\_INHIBITED

#### MQMF\_ACCEPT\_UNSUP\_MASK

This mask identifies the bit positions within the *MsgFlags* field where message flags that are not supported by the local queue manager are nevertheless accepted on the MQPUT or MQPUT1 calls. The completion code is MQCC\_OK.

This subfield occupies bit positions 0 through 11.

#### MQMF\_ACCEPT\_UNSUP\_IF\_XMIT\_MASK

This mask identifies the bit positions within the *MsgFlags* field where message flags that are not supported by the local queue manager are nevertheless accepted on the MQPUT or MQPUT1 calls *provided* that both of the following conditions are satisfied:

- The message is destined for a remote queue manager.

- The application is not putting the message directly on a local transmission queue (that is, the queue identified by the *ObjectQMgrName* and *ObjectName* fields in the object descriptor specified on the MQOPEN or MQPUT1 call is not a local transmission queue).

Completion code MQCC\_OK is returned if these conditions are satisfied, and MQCC\_FAILED with reason code MQRC\_MSG\_FLAGS\_ERROR if not.

This subfield occupies bit positions 12 through 19.

If there are flags specified in the *MsgFlags* field that the queue manager does not recognize, the queue manager checks each subfield in turn by using the bitwise AND operation to combine the *MsgFlags* field with the mask for that subfield. If the result of that operation is not zero, the completion code and reason codes described previously are returned.

## Data conversion

This collection of topics describes the interface to the data-conversion exit, and the processing performed by the queue manager when data conversion is required.

For more information about data conversion, see the document *Data Conversion under IBM MQ* at <http://www.ibm.com/support/docview.wss?uid=swg27005729>.

The data-conversion exit is invoked as part of the processing of the MQGET call in order to convert the application message data to the representation required by the receiving application. Conversion of the application message data is optional; it requires the MQGMO\_CONVERT option to be specified on the MQGET call.

The following subjects are described:

- The processing performed by the queue manager in response to the MQGMO\_CONVERT option; see “Conversion processing” on page 2702.
- Processing conventions used by the queue manager when processing a built-in format; these conventions are recommended for user-written exits too. See “Processing conventions” on page 2703.
- Special considerations for converting report messages; see “Conversion of report messages” on page 2707.
- The parameters passed to the data-conversion exit; see “MQ\_DATA\_CONV\_EXIT - Data conversion exit” on page 2720.
- A call that can be used from the exit to convert character data between different representations; see “MQXCNVC - Convert characters” on page 2714.
- The data-structure parameter that is specific to the exit; see “MQDXP - Data-conversion exit parameter” on page 2708.

## Conversion processing:

This information describes the processing performed by the queue manager in response to the MQGMO\_CONVERT option.

The queue manager performs the following actions if the MQGMO\_CONVERT option is specified on the MQGET call, and there is a message to be returned to the application:

1. If one or more of the following is true, no conversion is necessary:
  - The message data is already in the character set and encoding required by the application issuing the MQGET call. The application must set the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter of the MQGET call to the values required, before issuing the call.
  - The length of the message data is zero.
  - The length of the *Buffer* parameter of the MQGET call is zero.

In these cases the message is returned without conversion to the application issuing the MQGET call; the *CodedCharSetId* and *Encoding* values in the *MsgDesc* parameter are set to the values in the control information in the message, and the call completes with one of the following combinations of completion code and reason code:

Completion code	Reason code
MQCC_OK	MQRC_NONE
MQCC_WARNING	MQRC_TRUNCATED_MSG_ACCEPTED
MQCC_WARNING	MQRC_TRUNCATED_MSG_FAILED

The following steps are performed only if the character set or encoding of the message data differs from the corresponding value in the *MsgDesc* parameter, and there is data to be converted:

2. If the *Format* field in the control information in the message has the value MQFMT\_NONE, the message is returned unconverted, with completion code MQCC\_WARNING and reason code MQRC\_FORMAT\_ERROR.

In all other cases conversion processing continues.

3. The message is removed from the queue and placed in a temporary buffer that is the same size as the *Buffer* parameter. For browse operations, the message is copied into the temporary buffer, instead of being removed from the queue.
4. If the message has to be truncated to fit in the buffer, the following is done:
  - If the MQGMO\_ACCEPT\_TRUNCATED\_MSG option was *not* specified, the message is returned unconverted, with completion code MQCC\_WARNING and reason code MQRC\_TRUNCATED\_MSG\_FAILED.
  - If the MQGMO\_ACCEPT\_TRUNCATED\_MSG option *was* specified, the completion code is set to MQCC\_WARNING, the reason code is set to MQRC\_TRUNCATED\_MSG\_ACCEPTED, and conversion processing continues.
5. If the message can be accommodated in the buffer without truncation, or the MQGMO\_ACCEPT\_TRUNCATED\_MSG option was specified, the following is done:
  - If the format is a built-in format, the buffer is passed to the queue-manager's data-conversion service.
  - If the format is not a built-in format, the buffer is passed to a user-written exit with the same name as the format. If the exit cannot be found, the message is returned unconverted, with completion code MQCC\_WARNING and reason code MQRC\_FORMAT\_ERROR.

If no error occurs, the output from the data-conversion service or from the user-written exit is the converted message, plus the completion code and reason code to be returned to the application issuing the MQGET call.

6. If the conversion is successful, the queue manager returns the converted message to the application. In this case, the completion code and reason code returned by the MQGET call are one of the following combinations:

**Completion code**  
MQCC\_OK  
MQCC\_WARNING

**Reason code**  
MQRC\_NONE  
MQRC\_TRUNCATED\_MSG\_ACCEPTED

However, if the conversion is performed by a user-written exit, other reason codes can be returned, even when the conversion is successful.

If the conversion fails, the queue manager returns the unconverted message to the application, with the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter set to the values in the control information in the message, and with completion code MQCC\_WARNING.

### Processing conventions:

When converting a built-in format, the queue manager follows the processing conventions described.

User-written exits should also follow these conventions, although this is not enforced by the queue manager. The built-in formats converted by the queue manager are:

- MQFMT\_ADMIN
  - MQFMT\_CICS ( z/OS only)
  - MQFMT\_COMMAND\_1
  - MQFMT\_COMMAND\_2
  - MQFMT\_DEAD\_LETTER\_HEADER
  - MQFMT\_DIST\_HEADER
  - MQFMT\_EVENT version 1
  - MQFMT\_EVENT version 2
  - MQFMT\_IMS
  - MQFMT\_IMS\_VAR\_STRING
  - MQFMT\_MD\_EXTENSION
  - MQFMT\_PCF
  - MQFMT\_REF\_MSG\_HEADER
  - MQFMT\_RF\_HEADER
  - MQFMT\_RF\_HEADER\_2
  - MQFMT\_STRING
  - MQFMT\_TRIGGER
  - MQFMT\_WORK\_INFO\_HEADER ( z/OS only)
  - MQFMT\_XMIT\_Q\_HEADER
1. If the message expands during conversion, and exceeds the size of the *Buffer* parameter, the following is done:
    - If the MQGMO\_ACCEPT\_TRUNCATED\_MSG option was *not* specified, the message is returned unconverted, with completion code MQCC\_WARNING and reason code MQRC\_CONVERTED\_MSG\_TOO\_BIG.
    - If the MQGMO\_ACCEPT\_TRUNCATED\_MSG option *was* specified, the message is truncated, the completion code is set to MQCC\_WARNING, the reason code is set to MQRC\_TRUNCATED\_MSG\_ACCEPTED, and conversion processing continues.
  2. If truncation occurs (either before or during conversion), the number of valid bytes returned in the *Buffer* parameter can be *less than* the length of the buffer.

This can occur, for example, if a 4-byte integer or a DBCS character straddles the end of the buffer. The incomplete element of information is not converted, and those bytes in the returned message do not contain valid information. This can also occur if a message that was truncated before conversion shrinks during conversion.

If the number of valid bytes returned is less than the length of the buffer, the unused bytes at the end of the buffer are set to nulls.

3. If an array or string straddles the end of the buffer, as much of the data as possible is converted; only the particular array element or DBCS character which is incomplete is not converted; preceding array elements or characters are converted.
4. If truncation occurs (either before or during conversion), the length returned for the *DataLength* parameter is the length of the *unconverted* message before truncation.
5. When strings are converted between single-byte character sets (SBCS), double-byte character sets (DBCS), or multi-byte character sets (MBCS), the strings can expand or contract.
  - In the PCF formats MQFMT\_ADMIN, MQFMT\_EVENT, and MQFMT\_PCF, the strings in the MQCFST and MQCFSL structures expand or contract as necessary to accommodate the string after conversion.

For the string-list structure MQCFSL, the strings in the list might expand or contract by different amounts. If this happens, the queue manager pads the shorter strings with blanks to make them the same length as the longest string after conversion.

- In the format MQFMT\_REF\_MSG\_HEADER, the strings addressed by the *SrcEnvOffset*, *SrcNameOffset*, *DestEnvOffset*, and *DestNameOffset* fields expand or contract as necessary to accommodate the strings after conversion.
- In the format MQFMT\_RF\_HEADER, the *NameValueString* field expands or contracts as necessary to accommodate the name/value pairs after conversion.
- In structures with fixed field sizes, the queue manager allows strings to expand or contract within their fixed fields, provided that no significant information is lost. In this regard, trailing blanks and characters following the first null character in the field are treated as insignificant.
  - If the string expands, but only insignificant characters need to be discarded to accommodate the converted string in the field, the conversion succeeds and the call completes with MQCC\_OK and reason code MQRC\_NONE (assuming no other errors).
  - If the string expands, but the converted string requires significant characters to be discarded in order to fit in the field, the message is returned unconverted and the call completes with MQCC\_WARNING and reason code MQRC\_CONVERTED\_STRING\_TOO\_BIG.

**Note:** Reason code MQRC\_CONVERTED\_STRING\_TOO\_BIG results in this case whether or not the MQGMO\_ACCEPT\_TRUNCATED\_MSG option was specified.

- If the string contracts, the queue manager pads the string with blanks to the length of the field.
6. For messages consisting of one or more MQ header structures followed by user data, one or more of the header structures might be converted, while the remainder of the message is not. However, (with two exceptions) the *CodedCharSetId* and *Encoding* fields in each header structure always correctly indicate the character set and encoding of the data that follows the header structure.

The two exceptions are the MQCIH and MQIIH structures, where the values in the *CodedCharSetId* and *Encoding* fields in those structures are not significant. For those structures, the data following the structure is in the same character set and encoding as the MQCIH or MQIIH structure itself.

7. If the *CodedCharSetId* or *Encoding* fields in the control information of the message being retrieved, or in the *MsgDesc* parameter, specify values that are undefined or not supported, the queue manager might ignore the error if the undefined or unsupported value does not need to be used in converting the message.

For example, if the *Encoding* field in the message specifies an unsupported float encoding, but the message contains only integer data, or contains floating-point data that does not require conversion (because the source and target float encodings are identical), the error might not be diagnosed.

If the error is diagnosed, the message is returned unconverted, with completion code MQCC\_WARNING and one of the MQRC\_SOURCE\_\*\_ERROR or MQRC\_TARGET\_\*\_ERROR reason codes (as appropriate); the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are set to the values in the control information in the message.

If the error is not diagnosed and the conversion completes successfully, the values returned in the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are those specified by the application issuing the MQGET call.

8. In all cases, if the message is returned to the application unconverted the completion code is set to MQCC\_WARNING, and the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter are set to the values appropriate to the unconverted data. This is done for MQFMT\_NONE also.

The *Reason* parameter is set to a code that indicates why the conversion could not be carried out, unless the message also had to be truncated; reason codes related to truncation take precedence over reason codes related to conversion. (To determine if a truncated message was converted, check the values returned in the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter.)

When an error is diagnosed, either a specific reason code is returned, or the general reason code MQRC\_NOT\_CONVERTED. The reason code returned depends on the diagnostic capabilities of the underlying data-conversion service.

9. If completion code MQCC\_WARNING is returned, and more than one reason code is relevant, the order of precedence is as follows:
  - a. The following reasons take precedence over all others; only one of the reasons in this group can arise:
    - MQRC\_SIGNAL\_REQUEST\_ACCEPTED
    - MQRC\_TRUNCATED\_MSG\_ACCEPTED
  - b. The order of precedence within the remaining reason codes is not defined.

10. On completion of the MQGET call:

- The following reason code indicates that the message was converted successfully:
  - MQRC\_NONE
- The following reason codes indicate that the message *might* have been converted successfully (check the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to find out):
  - MQRC\_MSG\_MARKED\_BROWSE\_CO\_OP
  - MQRC\_TRUNCATED\_MSG\_ACCEPTED
- All other reason codes indicate that the message was not converted.

The following processing is specific to the built-in formats; it does not apply to user-defined formats:

11. With the exception of the following formats:

- MQFMT\_ADMIN
- MQFMT\_COMMAND\_1
- MQFMT\_COMMAND\_2
- MQFMT\_EVENT
- MQFMT\_IMS\_VAR\_STRING
- MQFMT\_PCF
- MQFMT\_STRING

none of the built-in formats can be converted from or to character sets that do not have SBCS characters for the characters that are valid in queue names. If an attempt is made to perform such a conversion, the message is returned unconverted, with completion code MQCC\_WARNING and reason code MQRC\_SOURCE\_CCSID\_ERROR or MQRC\_TARGET\_CCSID\_ERROR, as appropriate.

The Unicode character set UCS-2 is an example of a character set that does not have SBCS characters for the characters that are valid in queue names.

12. If the message data for a built-in format is truncated, fields within the message that contain lengths of strings, or counts of elements or structures, are *not* adjusted to reflect the length of the data actually returned to the application; the values returned for such fields within the message data are the values applicable to the message *before truncation*.

When processing messages such as a truncated MQFMT\_ADMIN message, ensure that the application does not attempt to access data beyond the end of the data returned.

13. If the format name is MQFMT\_DEAD\_LETTER\_HEADER, the message data begins with an MQDLH structure, possibly followed by zero or more bytes of application message data. The format, character set, and encoding of the application message data are defined by the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQDLH structure at the start of the message. Because the MQDLH structure and application message data can have different character sets and encodings, one, other, or both of the MQDLH structure and application message data might require conversion.

The queue manager converts the MQDLH structure first, as necessary. If conversion is successful, or the MQDLH structure does not require conversion, the queue manager checks the *CodedCharSetId* and *Encoding* fields in the MQDLH structure to see if conversion of the application message data is required. If conversion is required, the queue manager invokes the user-written exit with the name given by the *Format* field in the MQDLH structure, or performs the conversion itself (if *Format* is the name of a built-in format).

If the MQGET call returns a completion code of MQCC\_WARNING, and the reason code is one of those indicating that conversion was not successful, one of the following applies:

- The MQDLH structure could not be converted. In this case the application message data will not have been converted either.
- The MQDLH structure was converted, but the application message data was not.

The application can examine the values returned in the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter, and those in the MQDLH structure, in order to determine which of the previously applies.

14. If the format name is MQFMT\_XMIT\_Q\_HEADER, the message data begins with an MQXQH structure, possibly followed by zero or more bytes of additional data. This additional data is usually the application message data (which may be of zero length), but there can also be one or more further MQ header structures present, at the start of the additional data.

The MQXQH structure must be in the character set and encoding of the queue manager. The format, character set, and encoding of the data following the MQXQH structure are given by the *Format*, *CodedCharSetId*, and *Encoding* fields in the MQMD structure contained *within* the MQXQH. For each subsequent MQ header structure present, the *Format*, *CodedCharSetId*, and *Encoding* fields in the structure describe the data that follows that structure; that data is either another MQ header structure, or the application message data.

If the MQGMO\_CONVERT option is specified for an MQFMT\_XMIT\_Q\_HEADER message, the application message data and certain of the MQ header structures are converted, *but the data in the MQXQH structure is not*. On return from the MQGET call, therefore:

- The values of the *Format*, *CodedCharSetId*, and *Encoding* fields in the *MsgDesc* parameter describe the data in the MQXQH structure, and *not* the application message data; the values are therefore *not* the same as those specified by the application that issued the MQGET call.

The effect of this is that an application that repeatedly gets messages from a transmission queue with the MQGMO\_CONVERT option specified must reset the *CodedCharSetId* and *Encoding* fields in the *MsgDesc* parameter to the values required for the application message data, before each MQGET call.

- The values of the *Format*, *CodedCharSetId*, and *Encoding* fields in the last MQ header structure present describe the application message data. If there are no other MQ header structures present, the application message data is described by these fields in the MQMD structure within the MQXQH structure. If conversion is successful, the values will be the same as those specified in the *MsgDesc* parameter by the application that issued the MQGET call.

If the message is a distribution-list message, the MQXQH structure is followed by an MQDH structure (plus its arrays of MQOR and MQPMR records), which in turn might be followed by zero or more further MQ header structures and zero or more bytes of application message data. Like the MQXQH structure, the MQDH structure must be in the character set and encoding of the queue manager, and it is not converted on the MQGET call, even if the MQGMO\_CONVERT option is specified.

The processing of the MQXQH and MQDH structures described previously is primarily intended for use by message channel agents when they get messages from transmission queues.

### Conversion of report messages:

In general a report message can contain varying amounts of application message data, according to the report options specified by the sender of the original message. However, an activity report can contain data but without the report option mentioning \*\_WITH\_DATA in the constant.

In particular, a report message can contain either:

1. No application message data
2. Some of the application message data from the original message  
This occurs when the sender of the original message specifies MQRO\_\*\_WITH\_DATA and the message is longer than 100 bytes.
3. All the application message data from the original message  
This occurs when the sender of the original message specifies MQRO\_\*\_WITH\_FULL\_DATA, or specifies MQRO\_\*\_WITH\_DATA and the message is 100 bytes or shorter.

When the queue manager or message channel agent generates a report message, it copies the format name from the original message into the *Format* field in the control information in the report message. The format name in the report message might therefore imply a length of data that is different from the length actually present in the report message (cases 1 and 2 previously).

If the MQGMO\_CONVERT option is specified when the report message is retrieved:

- For case 1 previously, the data-conversion exit is not invoked (because the report message has no data).
- For case 3 previously, the format name correctly implies the length of the message data.
- But for case 2 previously, the data-conversion exit is invoked to convert a message that is *shorter* than the length implied by the format name.

In addition, the reason code passed to the exit is usually MQRC\_NONE (that is, the reason code does not indicate that the message has been truncated). This happens because the message data was truncated by the *sender* of the report message, and not by the receiver's queue manager in response to the MQGET call.

Because of these possibilities, the data-conversion exit must *not* use the format name to deduce the length of data passed to it; instead the exit must check the length of data provided, and be prepared to convert *less* data than the length implied by the format name. If the data can be converted successfully, completion code MQCC\_OK and reason code MQRC\_NONE must be returned by the exit. The length of the message data to be converted is passed to the exit as the *InBufferLength* parameter.

### Product-sensitive programming interface

## MQDXP - Data-conversion exit parameter:

The MQDXP structure is a parameter that the queue manager passes to the data-conversion exit when the exit is invoked to convert the message data as part of the processing of the MQGET call. See the description of the MQ\_DATA\_CONV\_EXIT call for details of the data conversion exit.

Character data in MQDXP is in the character set of the local queue manager; this is given by the *CodedCharSetId* queue-manager attribute. Numeric data in MQDXP is in the native machine encoding; this is given by MQENC\_NATIVE.

Only the *DataLength*, *CompCode*, *Reason*, and *ExitResponse* fields in MQDXP can be changed by the exit; changes to other fields are ignored. However, the *DataLength* field *cannot* be changed if the message being converted is a segment that contains only part of a logical message.

When control returns to the queue manager from the exit, the queue manager checks the values returned in MQDXP. If the values returned are not valid, the queue manager continues processing as though the exit had returned MQXDR\_CONVERSION\_FAILED in *ExitResponse* ; however, the queue manager ignores the values of the *CompCode* and *Reason* fields returned by the exit in this case, and uses instead the values those fields had on *input* to the exit. The following values in MQDXP cause this processing to occur:

- *ExitResponse* field not MQXDR\_OK and not MQXDR\_CONVERSION\_FAILED
- *CompCode* field not MQCC\_OK and not MQCC\_WARNING
- *DataLength* field less than zero, or *DataLength* field changed when the message being converted is a segment that contains only part of a logical message.

The following table summarizes the fields in the structure.

Table 260. Fields in MQDXP

Field	Description	Topic
<i>StrucId</i>	Structure identifier	StrucId
<i>Version</i>	Structure version number	Version
<i>AppOptions</i>	Application options	AppOptions
<i>Encoding</i>	Numeric encoding required by application	Encoding
<i>CodedCharSetId</i>	Character set required by application	CodedCharSetId
<i>DataLength</i>	Length in bytes of message data	DataLength
<i>CompCode</i>	Completion code	CompCode
<i>Reason</i>	Reason code qualifying <i>CompCode</i>	Reason
<i>ExitResponse</i>	Response from exit	ExitResponse
<i>Hconn</i>	Connection handle	Hconn
<i>pEntryPoints</i>	Address of the MQIEP structure	pEntryPoints

## Fields

The MQDXP structure contains the following fields; the fields are described in alphabetical order.

### AppOptions

Type: MQLONG

This is a copy of the *Options* field of the MQGMO structure specified by the application issuing the MQGET call. The exit might need to examine these to ascertain whether the MQGMO\_ACCEPT\_TRUNCATED\_MSG option was specified.

This is an input field to the exit.

#### **CodedCharSetId**

Type: MQLONG

This is the coded character-set identifier of the character set required by the application issuing the MQGET call; see the *CodedCharSetId* field in the MQMD structure for more details. If the application specifies the special value MQCCSI\_Q\_MGR on the MQGET call, the queue manager changes this to the actual character-set identifier of the character set used by the queue manager, before invoking the exit.

If the conversion is successful, the exit must copy this to the *CodedCharSetId* field in the message descriptor.

This is an input field to the exit.

#### **CompCode**

Type: MQLONG

When the exit is invoked, this contains the completion code that is returned to the application that issued the MQGET call, if the exit does nothing. It is always MQCC\_WARNING, because either the message was truncated, or the message requires conversion and this has not yet been done.

On output from the exit, this field contains the completion code to be returned to the application in the *CompCode* parameter of the MQGET call; only MQCC\_OK and MQCC\_WARNING are valid. See the description of the *Reason* field for suggestions on how the exit can set this field on output.

This is an input/output field to the exit.

#### **DataLength**

Type: MQLONG

When the exit is invoked, this field contains the original length of the application message data. If the message was truncated to fit into the buffer provided by the application, the size of the message provided to the exit is *smaller* than the value of *DataLength*. The size of the message provided to the exit is always given by the *InBufferLength* parameter of the exit, irrespective of any truncation that has occurred.

Truncation is indicated by the *Reason* field having the value MQRC\_TRUNCATED\_MSG\_ACCEPTED on input to the exit.

Most conversions do not need to change this length, but an exit can do so if necessary; the value set by the exit is returned to the application in the *DataLength* parameter of the MQGET call. However, this length *cannot* be changed if the message being converted is a segment that contains only part of a logical message. This is because changing the length would cause the offsets of later segments in the logical message to be incorrect.

Note that, if the exit wants to change the length of the data, be aware that the queue manager has already decided whether the message data fits into the application's buffer, based on the length of the *unconverted* data. This decision determines whether the message is removed from the queue (or the browse cursor moved, for a browse request), and is not affected by any change to the data length caused by the conversion. For this reason it is recommended that conversion exits do not cause a change in the length of the application message data.

If character conversion does imply a change of length, a string can be converted into another string with the same length in bytes, truncating trailing blanks, or padding with blanks as necessary.

The exit is not invoked if the message contains no application message data; hence *DataLength* is always greater than zero.

This is an input/output field to the exit.

### Encoding

Type: MQLONG

Numeric encoding required by application.

This is the numeric encoding required by the application issuing the MQGET call; see the *Encoding* field in the MQMD structure for more details.

If the conversion is successful, the exit copies this to the *Encoding* field in the message descriptor.

This is an input field to the exit.

### ExitOptions

Type: MQLONG

This is a reserved field; its value is 0.

### ExitResponse

Type: MQLONG

Response from exit. This is set by the exit to indicate the success or otherwise of the conversion. It must be one of the following:

#### MQXDR\_OK

Conversion was successful.

If the exit specifies this value, the queue manager returns the following to the application that issued the MQGET call:

- The value of the *CompCode* field on output from the exit
- The value of the *Reason* field on output from the exit
- The value of the *DataLength* field on output from the exit
- The contents of the exit's output buffer *OutBuffer*. The number of bytes returned is the lesser of the exit's *OutBufferLength* parameter, and the value of the *DataLength* field on output from the exit.

If the *Encoding* and *CodedCharSetId* fields in the exit's message descriptor parameter are *both* unchanged, the queue manager returns:

- The value of the *Encoding* and *CodedCharSetId* fields in the MQDXP structure on *input* to the exit.

If one or both of the *Encoding* and *CodedCharSetId* fields in the exit's message descriptor parameter has been changed, the queue manager returns:

- The value of the *Encoding* and *CodedCharSetId* fields in the exit's message descriptor parameter on output from the exit

#### MQXDR\_CONVERSION\_FAILED

Conversion was unsuccessful.

If the exit specifies this value, the queue manager returns the following to the application that issued the MQGET call:

- The value of the *CompCode* field on output from the exit
- The value of the *Reason* field on output from the exit
- The value of the *DataLength* field on *input* to the exit
- The contents of the exit's input buffer *InBuffer*. The number of bytes returned is given by the *InBufferLength* parameter

If the exit has altered *InBuffer*, the results are undefined.

*ExitResponse* is an output field from the exit.

## Hconn

Type: MQHCONN

This is a connection handle which can be used on the MQXCNVC call. This handle is not necessarily the same as the handle specified by the application which issued the MQGET call.

## pEntryPoints

Type: PMQIEP

The address of an MQIEP structure through which MQI and DCI calls can be made.

## Reason

Type: MQLONG

Reason code qualifying *CompCode*.

When the exit is invoked, this contains the reason code that is returned to the application that issued the MQGET call, if the exit chooses to do nothing. Among possible values are MQRC\_TRUNCATED\_MSG\_ACCEPTED, indicating that the message was truncated in order fit into the buffer provided by the application, and MQRC\_NOT\_CONVERTED, indicating that the message requires conversion but that this has not yet been done.

On output from the exit, this field contains the reason to be returned to the application in the *Reason* parameter of the MQGET call; the following is recommended:

- If *Reason* had the value MQRC\_TRUNCATED\_MSG\_ACCEPTED on input to the exit, the *Reason* and *CompCode* fields must not be altered, irrespective of whether the conversion succeeds or fails. (If the *CompCode* field is not MQCC\_OK, the application which retrieves the message can identify a conversion failure by comparing the returned *Encoding* and *CodedCharSetId* values in the message descriptor with the values requested; in contrast, the application cannot distinguish a truncated message from a message that fitted the buffer. For this reason, MQRC\_TRUNCATED\_MSG\_ACCEPTED must be returned in preference to any of the reasons that indicate conversion failure.)
- If *Reason* had any other value on input to the exit:
  - If the conversion succeeds, *CompCode* must be set to MQCC\_OK and *Reason* set to MQRC\_NONE.
  - If the conversion fails, or the message expands and has to be truncated to fit in the buffer, *CompCode* must be set to MQCC\_WARNING (or left unchanged), and *Reason* set to one of the values listed, to indicate the nature of the failure.

Note if the message after conversion is too large for the buffer, it must be truncated only if the application that issued the MQGET call specified the MQGMO\_ACCEPT\_TRUNCATED\_MSG option:

- If it did specify that option, reason MQRC\_TRUNCATED\_MSG\_ACCEPTED is returned.
- If it did not specify that option, the message is returned unconverted, with reason code MQRC\_CONVERTED\_MSG\_TOO\_BIG.

The reason codes listed are recommended for use by the exit to indicate the reason that conversion failed, but the exit can return other values from the set of MQRC\_\* codes if deemed appropriate. In addition, the range of values MQRC\_APPL\_FIRST through MQRC\_APPL\_LAST are allocated for use by the exit to indicate conditions that the exit wants to communicate to the application issuing the MQGET call.

**Note:** If the message cannot be converted successfully, the exit *must* return MQXDR\_CONVERSION\_FAILED in the *ExitResponse* field, in order to cause the queue manager to return the unconverted message. This is true regardless of the reason code returned in the *Reason* field.

## MQRC\_APPL\_FIRST

(900, X'384') Lowest value for application-defined reason code.

**MQRC\_APPL\_LAST**

(999, X'3E7') Highest value for application-defined reason code.

**MQRC\_CONVERTED\_MSG\_TOO\_BIG**

(2120, X'848') Converted data too large for buffer.

**MQRC\_NOT\_CONVERTED**

(2119, X'847') Message data not converted.

**MQRC\_SOURCE\_CCSID\_ERROR**

(2111, X'83F') Source coded character set identifier not valid.

**MQRC\_SOURCE\_DECIMAL\_ENC\_ERROR**

(2113, X'841') Packed-decimal encoding in message not recognized.

**MQRC\_SOURCE\_FLOAT\_ENC\_ERROR**

(2114, X'842') Floating-point encoding in message not recognized.

**MQRC\_SOURCE\_INTEGER\_ENC\_ERROR**

(2112, X'840') Source integer encoding not recognized.

**MQRC\_TARGET\_CCSID\_ERROR**

(2115, X'843') Target coded character set identifier not valid.

**MQRC\_TARGET\_DECIMAL\_ENC\_ERROR**

(2117, X'845') Packed-decimal encoding specified by receiver not recognized.

**MQRC\_TARGET\_FLOAT\_ENC\_ERROR**

(2118, X'846') Floating-point encoding specified by receiver not recognized.

**MQRC\_TARGET\_INTEGER\_ENC\_ERROR**

(2116, X'844') Target integer encoding not recognized.

**MQRC\_TRUNCATED\_MSG\_ACCEPTED**

(2079, X'81F') Truncated message returned (processing completed).

This is an input/output field to the exit.

**StrucId**

Type: MQCHAR4

Structure identifier. The value must be:

**MQDXP\_STRUC\_ID**

Identifier for data conversion exit parameter structure.

For the C programming language, the constant MQDXP\_STRUC\_ID\_ARRAY is also defined; this has the same value as MQDXP\_STRUC\_ID, but is an array of characters instead of a string.

This is an input field to the exit.

**Version**

Type: MQLONG

Structure version number. The value must be:

**MQDXP\_VERSION\_1**

Version number for data-conversion exit parameter structure.

The following constant specifies the version number of the current version:

**MQDXP\_CURRENT\_VERSION**

Current version of data-conversion exit parameter structure.

**Note:** When a new version of this structure is introduced, the layout of the existing part is not changed. The exit must therefore check that the *Version* field is equal to or greater than the lowest version which contains the fields that the exit needs to use.

This is an input field to the exit.

### C declaration

```
typedef struct tagMQDXP MQDXP;
struct tagMQDXP {
    MCHAR4  StrucId;          /* Structure identifier */
    MQLONG  Version;         /* Structure version number */
    MQLONG  ExitOptions;     /* Reserved */
    MQLONG  AppOptions;      /* Application options */
    MQLONG  Encoding;        /* Numeric encoding required by
                             application */
    MQLONG  CodedCharSetId; /* Character set required by application */
    MQLONG  DataLength;      /* Length in bytes of message data */
    MQLONG  CompCode;        /* Completion code */
    MQLONG  Reason;          /* Reason code qualifying CompCode */
    MQLONG  ExitResponse;    /* Response from exit */
    MQHCONN Hconn;           /* Connection handle */
    PMQIEP  pEntryPoints;    /* Address of the MQIEP structure */
};
```

### COBOL declaration ( IBM i only)

```
** MQDXP structure
10 MQDXP.
** Structure identifier
15 MQDXP-STRUCID PIC X(4).
** Structure version number
15 MQDXP-VERSION PIC S9(9) BINARY.
** Reserved
15 MQDXP-EXITOPTIONS PIC S9(9) BINARY.
** Application options
15 MQDXP-APPOPTIONS PIC S9(9) BINARY.
** Numeric encoding required by application
15 MQDXP-ENCODING PIC S9(9) BINARY.
** Character set required by application
15 MQDXP-CODEDCHARSETID PIC S9(9) BINARY.
** Length in bytes of message data
15 MQDXP-DATALENGTH PIC S9(9) BINARY.
** Completion code
15 MQDXP-COMPCODE PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
15 MQDXP-REASON PIC S9(9) BINARY.
** Response from exit
15 MQDXP-EXITRESPONSE PIC S9(9) BINARY.
** Connection handle
15 MQDXP-HCONN PIC S9(9) BINARY.
```

### System/390 assembler declaration

```
MQDXP          DSECT
MQDXP_STRUCID  DS CL4 Structure identifier
MQDXP_VERSION  DS F   Structure version number
MQDXP_EXITOPTIONS DS F   Reserved
MQDXP_APPOPTIONS DS F   Application options
MQDXP_ENCODING DS F   Numeric encoding required by application
MQDXP_CODEDCHARSETID DS F   Character set required by application
MQDXP_DATALENGTH DS F   Length in bytes of message data
MQDXP_COMPCODE DS F   Completion code
MQDXP_REASON   DS F   Reason code qualifying COMPCODE
MQDXP_EXITRESPONSE DS F   Response from exit
MQDXP_HCONN    DS F   Connection handle
```

```

*
MQDXP_LENGTH      EQU  *-MQDXP
                   ORG  MQDXP
MQDXP_AREA        DS   CL(MQDXP_LENGTH)

```

### **MQXCNVC - Convert characters:**

The MQXCNVC call converts characters from one character set to another using the C programming language.

This call is part of the IBM MQ Data Conversion Interface (DCI), which is one of the IBM MQ framework interfaces.

Note: The call can be used from both application, and data-conversion exit environments.

### **Syntax**

MQXCNVC (*Hconn*, *Options*, *SourceCCSID*, *SourceLength*, *SourceBuffer*, *TargetCCSID*, *TargetLength*, *TargetBuffer*, *DataLength*, *CompCode*, *Reason*)

### **Parameters**

#### ***Hconn***

Type: MQHCONN - input

This handle represents the connection to the queue manager.

In a data-conversion exit, *Hconn* is normally the handle that is passed to the data-conversion exit in the *Hconn* field of the MQDXP structure; this handle is not necessarily the same as the handle specified by the application which issued the MQGET call.

On IBM i, the following special value can be specified for *Hconn*:

#### **MQHC\_DEF\_HCONN**

Default connection handle.

If you run a CICS TS 3.2 or higher application, ensure that the character conversion exit program, which invokes the MQXCNVC call, is defined as OPENAPI. This definition prevents the 2018 MQRC\_HCONN\_ERROR error caused by from an incorrect connection, and allows the MQGET to complete.

#### ***Options***

Type: MQLONG - input

Options that control the action of MQXCNVC.

Zero or more of the options described can be specified. To specify more than one option, either add the values together (do not add the same constant more than once), or combine the values using the bitwise OR operation (if the programming language supports bit operations).

**Default-conversion option:** The following option controls the use of default character conversion:

#### **MQDCC\_DEFAULT\_CONVERSION**

Default conversion.

This option specifies that default character conversion can be used if one or both of the character sets specified on the call is not supported. This allows the queue manager to use an installation-specified default character set that approximates the specified character set, when converting the string.

**Note:** The result of using an approximate character set to convert the string is that some characters can be converted incorrectly. This can be avoided by using in the string only characters which are common to both the specified character set and the default character set.

The default character sets are defined by a configuration option when the queue manager is installed or restarted.

If MQDCC\_DEFAULT\_CONVERSION is not specified, the queue manager uses only the specified character sets to convert the string, and the call fails if one or both of the character sets is not supported.

This option is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows.

**Padding option:** The following option allows the queue manager to pad the converted string with blanks or discard insignificant trailing characters, in order to make the converted string fit the target buffer:

#### MQDCC\_FILL\_TARGET\_BUFFER

Fill target buffer.

This option requests that conversion take place in such a way that the target buffer is filled completely:

- If the string contracts when it is converted, trailing blanks are added in order to fill the target buffer.
- If the string expands when it is converted, trailing characters that are not significant are discarded to make the converted string fit the target buffer. If this can be done successfully, the call completes with MQCC\_OK and reason code MQRC\_NONE.

If there are too few insignificant trailing characters, as much of the string as can fit is placed in the target buffer, and the call completes with MQCC\_WARNING and reason code MQRC\_CONVERTED\_MSG\_TOO\_BIG.

Insignificant characters are:

- Trailing blanks
- Characters following the first null character in the string (but excluding the first null character itself)
- If the string, *TargetCCSID*, and *TargetLength* are such that the target buffer cannot be set completely with valid characters, the call fails with MQCC\_FAILED and reason code MQRC\_TARGET\_LENGTH\_ERROR. This can occur when *TargetCCSID* is a pure DBCS character set (such as UCS-2, but *TargetLength* specifies a length that is an odd number of bytes.
- *TargetLength* can be less than or greater than *SourceLength*. On return from MQXCNVC, *DataLength* has the same value as *TargetLength*.

If this option is not specified:

- The string is allowed to contract or expand within the target buffer as required. Insignificant trailing characters are not added or discarded.

If the converted string fits in the target buffer, the call completes with MQCC\_OK and reason code MQRC\_NONE.

If the converted string is too large for the target buffer, as much of the string as fits is placed in the target buffer, and the call completes with MQCC\_WARNING and reason code MQRC\_CONVERTED\_MSG\_TOO\_BIG. Note fewer than *TargetLength* bytes can be returned in this case.

- *TargetLength* can be less than or greater than *SourceLength*. On return from MQXCNVC, *DataLength* is less than or equal to *TargetLength*.

This option is supported in the following environments: AIX, HP-UX, IBM i, Solaris, Linux, Windows.

**Encoding options:** The options described can be used to specify the integer encodings of the source and target strings. The relevant encoding is used *only* when the corresponding character set identifier

indicates that the representation of the character set in main storage is dependent on the encoding used for binary integers. This affects only certain multibyte character sets (for example, UCS-2 character sets).

The encoding is ignored if the character set is a single-byte character set (SBCS), or a multibyte character set with representation in main storage that is not dependent on the integer encoding.

Only one of the MQDCC\_SOURCE\_\* values must be specified, combined with one of the MQDCC\_TARGET\_\* values:

**MQDCC\_SOURCE\_ENC\_NATIVE**

Source encoding is the default for the environment and programming language.

**MQDCC\_SOURCE\_ENC\_NORMAL**

Source encoding is normal.

**MQDCC\_SOURCE\_ENC\_REVERSED**

Source encoding is reversed.

**MQDCC\_SOURCE\_ENC\_UNDEFINED**

Source encoding is undefined.

**MQDCC\_TARGET\_ENC\_NATIVE**

Target encoding is the default for the environment and programming language.

**MQDCC\_TARGET\_ENC\_NORMAL**

Target encoding is normal.

**MQDCC\_TARGET\_ENC\_REVERSED**

Target encoding is reversed.

**MQDCC\_TARGET\_ENC\_UNDEFINED**

Target encoding is undefined.

The encoding values defined previously can be added directly to the *Options* field. However, if the source or target encoding is obtained from the *Encoding* field in the MQMD or other structure, the following processing must be done:

1. The integer encoding must be extracted from the *Encoding* field by eliminating the float and packed-decimal encodings; see “Analyzing encodings” on page 2696 for details of how to do this.
2. The integer encoding resulting from step 1 must be multiplied by the appropriate factor before being added to the *Options* field. These factors are:
  - MQDCC\_SOURCE\_ENC\_FACTOR for the source encoding
  - MQDCC\_TARGET\_ENC\_FACTOR for the target encoding

The following example code illustrates how this might be coded in the C programming language:

```
Options = (MsgDesc.Encoding & MQENC_INTEGER_MASK)
          * MQDCC_SOURCE_ENC_FACTOR
          + (DataConvExitParms.Encoding & MQENC_INTEGER_MASK)
          * MQDCC_TARGET_ENC_FACTOR;
```

If not specified, the encoding options default to undefined (MQDCC\_\*\_ENC\_UNDEFINED). In most cases, this does not affect the successful completion of the MQXCNVC call. However, if the corresponding character set is a multibyte character set with representation that is dependent on the encoding (for example, a UCS-2 character set), the call fails with reason code MQRC\_SOURCE\_INTEGER\_ENC\_ERROR or MQRC\_TARGET\_INTEGER\_ENC\_ERROR as appropriate.

The encoding options are supported in the following environments: AIX, HP-UX, z/OS, IBM i, Solaris, Linux, Windows.

**Default option:** If none of the options described previously is specified, the following option can be used:

**MQDCC\_NONE**

No options specified.

MQDCC\_NONE is defined to aid program documentation. It is not intended that this option is used with any other, but as its value is zero, such use cannot be detected.

**SourceCCSID**

Type: MQLONG - input

This is the coded character set identifier of the input string in *SourceBuffer*.

**SourceLength**

Type: MQLONG - input

This is the length in bytes of the input string in *SourceBuffer* ; it must be zero or greater.

**SourceBuffer**

Type: MQCHARxSourceLength - input

This is the buffer containing the string to be converted from one character set to another.

**TargetCCSID**

Type: MQLONG - input

This is the coded character set identifier of the character set to which *SourceBuffer* is to be converted.

**TargetLength**

Type: MQLONG - input

This is the length in bytes of the output buffer *TargetBuffer* ; it must be zero or greater. It can be less than or greater than *SourceLength*.

**TargetBuffer**

Type: MQCHARxTargetLength - output

This is the string after it has been converted to the character set defined by *TargetCCSID*. The converted string can be shorter or longer than the unconverted string. The *DataLength* parameter indicates the number of valid bytes returned.

**DataLength**

Type: MQLONG - output

This is the length of the string returned in the output buffer *TargetBuffer*. The converted string can be shorter or longer than the unconverted string.

**CompCode**

Type: MQLONG - output

It is one of the following:

**MQCC\_OK**

Successful completion.

**MQCC\_WARNING**

Warning (partial completion).

**MQCC\_FAILED**

Call failed.

**Reason**

Type: MQLONG - output

Reason code qualifying *CompCode*.

If *CompCode* is MQCC\_OK:

**MQRC\_NONE**

(0, X'000') No reason to report.

If *CompCode* is MQCC\_WARNING:

**MQRC\_CONVERTED\_MSG\_TOO\_BIG**  
(2120, X'848') Converted data too large for buffer.

If *CompCode* is MQCC\_FAILED:

**MQRC\_DATA\_LENGTH\_ERROR**  
(2010, X'7DA') Data length parameter not valid.

**MQRC\_DBCS\_ERROR**  
(2150, X'866') DBCS string not valid.

**MQRC\_HCONN\_ERROR**  
(2018, X'7E2') Connection handle not valid.

**MQRC\_OPTIONS\_ERROR**  
(2046, X'7FE') Options not valid or not consistent.

**MQRC\_RESOURCE\_PROBLEM**  
(2102, X'836') Insufficient system resources available.

**MQRC\_SOURCE\_BUFFER\_ERROR**  
(2145, X'861') Source buffer parameter not valid.

**MQRC\_SOURCE\_CCSID\_ERROR**  
(2111, X'83F') Source coded character set identifier not valid.

**MQRC\_SOURCE\_INTEGER\_ENC\_ERROR**  
(2112, X'840') Source integer encoding not recognized.

**MQRC\_SOURCE\_LENGTH\_ERROR**  
(2143, X'85F') Source length parameter not valid.

**MQRC\_STORAGE\_NOT\_AVAILABLE**  
(2071, X'817') Insufficient storage available.

**MQRC\_TARGET\_BUFFER\_ERROR**  
(2146, X'862') Target buffer parameter not valid.

**MQRC\_TARGET\_CCSID\_ERROR**  
(2115, X'843') Target coded character set identifier not valid.

**MQRC\_TARGET\_INTEGER\_ENC\_ERROR**  
(2116, X'844') Target integer encoding not recognized.

**MQRC\_TARGET\_LENGTH\_ERROR**  
(2144, X'860') Target length parameter not valid.

**MQRC\_UNEXPECTED\_ERROR**  
(2195, X'893') Unexpected error occurred.

For detailed information about these codes, see Reason codes.

## C invocation

```
MQXCNCV (Hconn, Options, SourceCCSID, SourceLength, SourceBuffer,  
        TargetCCSID, TargetLength, TargetBuffer, &DataLength,  
        &CompCode, &Reason);
```

Declare the parameters as follows:

```
MQHCONN  Hconn;           /* Connection handle */  
MQLONG   Options;        /* Options that control the action of  
                        MQXCNCV */  
MQLONG   SourceCCSID;    /* Coded character set identifier of string  
                        before conversion */  
MQLONG   SourceLength;   /* Length of string before conversion */
```

```

MQCHAR  SourceBuffer[n]; /* String to be converted */
MQLONG  TargetCCSID;    /* Coded character set identifier of string
                        after conversion */
MQLONG  TargetLength;  /* Length of output buffer */
MQCHAR  TargetBuffer[n]; /* String after conversion */
MQLONG  DataLength;    /* Length of output string */
MQLONG  CompCode;      /* Completion code */
MQLONG  Reason;        /* Reason code qualifying CompCode */

```

### COBOL declaration ( IBM i only)

```

CALL 'MQXCNC' USING HCONN, OPTIONS, SOURCECCSID, SOURCELENGTH,
SOURCEBUFFER, TARGETCCSID, TARGETLENGTH,
TARGETBUFFER, DATALENGTH, COMPCODE, REASON.

```

Declare the parameters as follows:

```

** Connection handle
01 HCONN          PIC S9(9) BINARY.
** Options that control the action of MQXCNC
01 OPTIONS        PIC S9(9) BINARY.
** Coded character set identifier of string before conversion
01 SOURCECCSID   PIC S9(9) BINARY.
** Length of string before conversion
01 SOURCELENGTH  PIC S9(9) BINARY.
** String to be converted
01 SOURCEBUFFER  PIC X(n).
** Coded character set identifier of string after conversion
01 TARGETCCSID   PIC S9(9) BINARY.
** Length of output buffer
01 TARGETLENGTH  PIC S9(9) BINARY.
** String after conversion
01 TARGETBUFFER  PIC X(n).
** Length of output string
01 DATALENGTH  PIC S9(9) BINARY.
** Completion code
01 COMPCODE      PIC S9(9) BINARY.
** Reason code qualifying COMPCODE
01 REASON        PIC S9(9) BINARY.

```

### S/390 assembler declaration

```

CALL MQXCNC, (HCONN, OPTIONS, SOURCECCSID, SOURCELENGTH,      X
SOURCEBUFFER, TARGETCCSID, TARGETLENGTH, TARGETBUFFER,      X
DATALENGTH, COMPCODE, REASON)

```

Declare the parameters as follows:

```

HCONN      DS  F      Connection handle
OPTIONS     DS  F      Options that control the action of MQXCNC
SOURCECCSID DS  F      Coded character set identifier of string before
* conversion
SOURCELENGTH DS  F      Length of string before conversion
SOURCEBUFFER DS CL(n) String to be converted
TARGETCCSID DS  F      Coded character set identifier of string after
* conversion
TARGETLENGTH DS  F      Length of output buffer
TARGETBUFFER DS CL(n) String after conversion
DATALENGTH  DS  F      Length of output string
COMPCODE    DS  F      Completion code
REASON      DS  F      Reason code qualifying COMPCODE

```

## MQ\_DATA\_CONV\_EXIT - Data conversion exit:

The MQ\_DATA\_CONV\_EXIT call describes the parameters that are passed to the data-conversion exit.

No entry point called MQ\_DATA\_CONV\_EXIT is provided by the queue manager (see usage note 11 ).

This definition is part of the IBM MQ Data Conversion Interface (DCI), which is one of the IBM MQ framework interfaces.

### Syntax

MQ\_DATA\_CONV\_EXIT (*DataConvExitParms*, *MsgDesc*, *InBufferLength*, *InBuffer*, *OutBufferLength*, *OutBuffer*)

### Parameters

#### **DataConvExitParms**

Type: MQDXP - input/output

This structure contains information relating to the invocation of the exit. The exit sets information in this structure to indicate the outcome of the conversion. See “MQDXP - Data-conversion exit parameter” on page 2708 for details of the fields in this structure.

#### **MsgDesc**

Type: MQMD - input/output

On input to the exit, this is the message descriptor associated with the message data passed to the exit in the *InBuffer* parameter.

**Note:** The *MsgDesc* parameter passed to the exit is always the most-recent version of MQMD supported by the queue manager which invokes the exit. If the exit is intended to be portable between different environments, the exit will check the *Version* field in *MsgDesc* to verify that the fields that the exit needs to access are present in the structure.

In the following environments, the exit is passed a version-2 MQMD: AIX, HP-UX, IBM i, Solaris, Linux, Windows. In all other environments that support the data conversion exit, the exit is passed a version-1 MQMD.

On output, the exit will change the *Encoding* and *CodedCharSetId* fields to the values requested by the application, if conversion was successful; these changes are reflected back to the application. Any other changes that the exit makes to the structure are ignored; they are not reflected back to the application.

If the exit returns MQXDR\_OK in the *ExitResponse* field of the MQDXP structure, but does not change the *Encoding* or *CodedCharSetId* fields in the message descriptor, the queue manager returns for those fields the values that the corresponding fields in the MQDXP structure had on input to the exit.

#### **InBufferLength**

Type: MQLONG - input

Length in bytes of *InBuffer*.

This is the length of the input buffer *InBuffer*, and specifies the number of bytes to be processed by the exit. *InBufferLength* is the lesser of the length of the message data before conversion, and the length of the buffer provided by the application on the MQGET call.

The value is always greater than zero.

#### **InBuffer**

Type: MQBYTExInBufferLength - input

Buffer containing the unconverted message.

This contains the message data before conversion. If the exit is unable to convert the data, the queue manager returns the contents of this buffer to the application after the exit has completed.

**Note:** The exit should not alter *InBuffer* ; if this parameter is altered, the results are undefined.

In the C programming language, this parameter is defined as a pointer-to-void.

### ***OutBufferLength***

Type: MQLONG - input

Length in bytes of *OutBuffer*.

This is the length of the output buffer *OutBuffer*, and is the same as the length of the buffer provided by the application on the MQGET call.

The value is always greater than zero.

### ***OutBuffer***

Type: MQBYTExOutBufferLength - output

Buffer containing the converted message.

On output from the exit, if the conversion was successful (as indicated by the value MQXDR\_OK in the *ExitResponse* field of the *DataConvExitParms* parameter), *OutBuffer* contains the message data to be delivered to the application, in the requested representation. If the conversion was unsuccessful, any changes that the exit has made to this buffer are ignored.

In the C programming language, this parameter is defined as a pointer-to-void.

### **Usage notes**

1. A data-conversion exit is a user-written exit which receives control during the processing of an MQGET call. The function performed by the data-conversion exit is defined by the provider of the exit; however, the exit must conform to the rules described here, and in the associated parameter structure MQDXP.

The programming languages that can be used for a data-conversion exit are determined by the environment.

2. The exit is invoked only if *all* of the following are true:

- The MQGMO\_CONVERT option is specified on the MQGET call
- The *Format* field in the message descriptor is not MQFMT\_NONE
- The message is not already in the required representation; that is, one or both of the message's *CodedCharSetId* and *Encoding* is different from the value specified by the application in the message descriptor supplied on the MQGET call
- The queue manager has not already done the conversion successfully
- The length of the application's buffer is greater than zero
- The length of the message data is greater than zero
- The reason code so far during the MQGET operation is MQRC\_NONE or MQRC\_TRUNCATED\_MSG\_ACCEPTED

3. When an exit is being written, consider coding the exit in a way that allows it to convert messages that have been truncated. Truncated messages can arise in the following ways:

- The receiving application provides a buffer that is smaller than the message, but specifies the MQGMO\_ACCEPT\_TRUNCATED\_MSG option on the MQGET call.

In this case, the *Reason* field in the *DataConvExitParms* parameter on input to the exit has the value MQRC\_TRUNCATED\_MSG\_ACCEPTED.

- The sender of the message truncated it before sending it. This can happen with report messages, for example (see "Conversion of report messages" on page 2707 for more details).

In this case, the *Reason* field in the *DataConvExitParms* parameter on input to the exit has the value MQRC\_NONE (if the receiving application provided a buffer that was large enough for the message).

Thus the value of the *Reason* field on input to the exit cannot always be used to decide whether the message has been truncated.

The distinguishing characteristic of a truncated message is that the length provided to the exit in the *InBufferLength* parameter is *less than* the length implied by the format name contained in the *Format* field in the message descriptor. The exit should therefore check the value of *InBufferLength* before attempting to convert any of the data; the exit *should not* assume that the full amount of data implied by the format name has been provided.

If the exit has *not* been written to convert truncated messages, and *InBufferLength* is less than the value expected, the exit will return MQXDR\_CONVERSION\_FAILED in the *ExitResponse* field of the *DataConvExitParms* parameter, with the *CompCode* and *Reason* fields set to MQCC\_WARNING and MQRC\_FORMAT\_ERROR.

If the exit *has* been written to convert truncated messages, the exit will convert as much of the data as possible (see next usage note), taking care not to attempt to examine or convert data beyond the end of *InBuffer*. If the conversion completes successfully, the exit will leave the *Reason* field in the *DataConvExitParms* parameter unchanged. This returns MQRC\_TRUNCATED\_MSG\_ACCEPTED if the message was truncated by the receiver's queue manager, and MQRC\_NONE if the message was truncated by the sender of the message.

It is also possible for a message to expand *during* conversion, to the point where it is bigger than *OutBuffer*. In this case the exit must decide whether to truncate the message; the *AppOptions* field in the *DataConvExitParms* parameter indicates whether the receiving application specified the MQGMO\_ACCEPT\_TRUNCATED\_MSG option.

4. Generally, all the data in the message provided to the exit in *InBuffer* is converted, or that none of it is. An exception to this, however, occurs if the message is truncated, either before conversion or during conversion; in this case there can be an incomplete item at the end of the buffer (for example: 1 byte of a double-byte character, or 3 bytes of a 4-byte integer). In this situation, consider omitting the incomplete item and set the unused bytes in the *OutBuffer* to nulls. However, complete elements or characters within an array or string *should* be converted.
5. When an exit is needed for the first time, the queue manager attempts to load an object that has the same name as the format (apart from extensions). The object loaded must contain the exit that processes messages with that format name. Consider making the exit name, and the name of the object that contains the exit identical, although not all environments require this.
6. A new copy of the exit is loaded when an application attempts to retrieve the first message that uses that *Format* since the application connected to the queue manager. For CICS or IMS applications, this means when the CICS or IMS subsystem connected to the queue manager. A new copy can also be loaded at other times, if the queue manager has discarded a previously loaded copy. For this reason, an exit must not attempt to use static storage to communicate information from one invocation of the exit to the next - the exit can be unloaded between the two invocations.
7. If there is a user-supplied exit with the same name as one of the built-in formats supported by the queue manager, the user-supplied exit does not replace the built-in conversion routine. The only circumstances in which such an exit is invoked are:
  - If the built-in conversion routine cannot handle conversions to or from either the *CodedCharSetId* or *Encoding* involved, or
  - If the built-in conversion routine has failed to convert the data (for example, because there is a field or character which cannot be converted).
8. The scope of the exit is environment-dependent. *Format* names must be chosen to minimize the risk of clashes with other formats. Consider starting with characters that identify the application defining the format name.
9. The data-conversion exit runs in an environment like that of the program which issued the MQGET call; environment includes address space and user profile (where applicable). The program could be

a message channel agent sending messages to a destination queue manager that does not support message conversion. The exit cannot compromise the queue manager's integrity, since it does not run in the queue manager's environment.

10. The only MQI call which can be used by the exit is MQXCNVC; attempting to use other MQI calls fails with reason code MQRC\_CALL\_IN\_PROGRESS, or other unpredictable errors.
11. No entry point called MQ\_DATA\_CONV\_EXIT is provided by the queue manager. However, a **typedef** is provided for the name MQ\_DATA\_CONV\_EXIT in the C programming language, and this can be used to declare the user-written exit, to ensure that the parameters are correct. The name of the exit must be the same as the format name (the name contained in the *Format* field in MQMD), although this is not required in all environments.

The following example illustrates how the exit that processes the format MYFORMAT can be declared in the C programming language:

```
#include "cmqc.h"
#include "cmqxc.h"

MQ_DATA_CONV_EXIT MYFORMAT;

void MQENTRY MYFORMAT(
    PMQDXP  pDataConvExitParms, /* Data-conversion exit parameter
                                block */
    PMQMD   pMsgDesc,           /* Message descriptor */
    MQLONG  InBufferLength,     /* Length in bytes of InBuffer */
    PMQVOID pInBuffer,         /* Buffer containing the unconverted
                                message */
    MQLONG  OutBufferLength,    /* Length in bytes of OutBuffer */
    PMQVOID pOutBuffer)       /* Buffer containing the converted
                                message */
{
    /* C language statements to convert message */
}
```

12. On z/OS, if an API-crossing exit is also in force, it is called after the data-conversion exit.

### C invocation

```
exitname (&DataConvExitParms, &MsgDesc, InBufferLength,
          InBuffer, OutBufferLength, OutBuffer);
```

The parameters passed to the exit are declared as follows:

```
MQDXP  DataConvExitParms; /* Data-conversion exit parameter block */
MQMD   MsgDesc;          /* Message descriptor */
MQLONG InBufferLength;   /* Length in bytes of InBuffer */
MQBYTE InBuffer[n];     /* Buffer containing the unconverted
                          message */
MQLONG OutBufferLength; /* Length in bytes of OutBuffer */
MQBYTE OutBuffer[n];    /* Buffer containing the converted
                          message */
```

### COBOL declaration ( IBM i only)

```
CALL 'exitname' USING DATACONVEXITPARMS, MSGDESC, INBUFFERLENGTH,
                     INBUFFER, OUTBUFFERLENGTH, OUTBUFFER.
```

The parameters passed to the exit are declared as follows:

```
** Data-conversion exit parameter block
01 DATACONVEXITPARMS.
   COPY CMQDXPV.
** Message descriptor
01 MSGDESC.
   COPY CMQMDV.
** Length in bytes of INBUFFER
01 INBUFFERLENGTH PIC S9(9) BINARY.
** Buffer containing the unconverted message
```

```

01 INBUFFER          PIC X(n).
** Length in bytes of OUTBUFFER
01 OUTBUFFERLENGTH  PIC S9(9) BINARY.
** Buffer containing the converted message
01 OUTBUFFER        PIC X(n).

```

### System/390 assembler declaration

```

CALL EXITNAME,(DATA CONVEXITPARMS,MSGDESC,INBUFFERLENGTH, X
INBUFFER,OUTBUFFERLENGTH,OUTBUFFER)

```

The parameters passed to the exit are declared as follows:

```

DATA CONVEXITPARMS  CMQDXPA  ,      Data-conversion exit parameter block
MSGDESC             CMQMDA   ,      Message descriptor
INBUFFERLENGTH     DS        F      Length in bytes of INBUFFER
INBUFFER           DS        CL(n)  Buffer containing the unconverted
*                                     message
OUTBUFFERLENGTH    DS        F      Length in bytes of OUTBUFFER
OUTBUFFER          DS        CL(n)  Buffer containing the converted
*                                     message

```

### Properties specified as MQRFH2 elements

Non-message descriptor properties can be specified as elements in MQRFH2 header folders. Overview of MQRFH2 elements being specified as properties.

This retains compatibility with the previous versions of the IBM MQ JMS and XMS clients. This section describes how to specify properties in MQRFH2 headers.

To use MQRFH2 elements as properties, specify the elements as described in Using IBM MQ classes for Java . This information supplements the information described in "MQRFH2 - Rules and formatting header 2" on page 2300.

### Mapping property data types to MQRFH2 data types:

This topic provides information on message property types mapped to their corresponding MQRFH2 data types.

Table 261. Supported MQRFH2 data types

Message property type	MQRFH2 data type
MQBYTE[]	bin.hex
MQBOOL	boolean
MQINT8	i1
MQINT16	i2
MQINT32	i4
MQINT64	i8
MQFLOAT32	r4
MQFLOAT64	r8
MQCHAR[]	string

Any element without a data type is assumed to be of type "string".

An MQRFH2 data type of int, meaning an integer of unspecified size, is treated as if it were an i8.

A null value is indicated by the element attribute `xsi:nil='true'`. Do not use the attribute `xsi:nil='false'` for non-null values.

For example, the following property has a null value:

```
<NullProperty xsi:nil='true'></NullProperty>
```

A byte or character string property can have an empty value. This is represented by an MQRFH2 element with a zero length element value.

For example, the following property has an empty value:

```
<EmptyProperty></EmptyProperty>
```

### Supported MQRFH2 folders:

Overview of the use of message descriptor fields as properties.

The folders `<jms>`, `<mcd>`, `<mqext>`, and `<usr>` are described in The MQRFH2 header and JMS. The `<usr>` folder is used to transport any JMS application-defined properties that are associated with a message. Groups are not allowed in the `<usr>` folder.

The MQRFH2 header and JMS supports the following additional folders:

- `<mq>`  
This folder is used and reserved for MQ-defined properties that are used by IBM MQ.
- `<mq_usr>`  
This folder can be used to transport any application-defined properties that are not exposed as JMS user-defined properties, as the properties might not meet the requirements of a JMS property. This folder can contain groups that the `<usr>` folder cannot.
- Any folder marked with the `content='properties'` attribute.  
Such a folder is equivalent to the `<mq_usr>` folder in content.
- `<mqps>`  
This folder is used for IBM MQ publish/subscribe properties.

IBM MQ also supports the following folders that are already in use by WAS/SIB:

- `<sib>`  
This folder is used and reserved for WAS/SIB system message properties that are not exposed as JMS properties, or are mapped to `JMS_IBM_*` properties, but are exposed to WAS/SIB applications; these include forward and reverse routing paths properties.  
At least some cannot be exposed as JMS properties, because they are byte arrays. If your application adds properties to this folder, the value is either ignored or removed.
- `<sib_usr>`  
This folder is used and reserved for WAS/SIB user message properties that cannot be exposed as JMS user properties because they are not of supported types; they are exposed to WAS/SIB applications. These are user properties, that you can get or set through the `SIMessage` interface, but the content of the byte array is mapped to the required property value.  
If your IBM MQ application writes an arbitrary `bin.hex` element to the folder, the application probably receives an `IOException`, as it is not of the format expected to restore. If you add anything other than a `bin.hex` element you receive a `ClassCastException`.  
Do not attempt to make properties available to WAS/SIB by using this folder; instead user the `<usr>` folder for that purpose.
- `<sib_context>`  
This folder is used for WAS/SIB system message properties that are not exposed to WAS/SIB user applications or as JMS properties. These include security and transactional properties that are used for web services and similar.  
Your application must not add properties to this folder.

- <mqema>

This folder was used by WAS/SIB instead of the <mqext> folder.

MQRFH2 folder names are case-sensitive.

The following folders are reserved, in any mixture of lowercase or uppercase characters:

- Any folder prefixed by mq or wmq ; reserved for use by IBM MQ.
- Any folder prefixed by sib ; reserved for use by WAS/SIB.
- <Root> and <Body> folders; reserved but not used.

The following folders are not recognized as containing message properties:

- <psc>  
Used by IBM Integration Bus to convey publish/subscribe command messages to the broker.
- <pscr>  
Used by IBM Integration Bus to contain information from the broker, in response to publish/subscribe command messages.
- Any folder not defined by IBM, that is not marked with the content='properties' attribute.

Do not specify content='properties' on the <psc> or <pscr> folders. If you do so, these folders are treated as properties and IBM Integration Bus is likely to stop functioning as expected.

If your application is building messages with properties, in MQRFH2 headers to be recognized as an MQRFH2 header containing properties, the header must be in the list of headers that can be chained at the head of the message.

The MQRFH2 can be preceded by any number of MQH standard headers, or an MQCIH, an MQDLH, an MQIIH, an MQTM, an MQTMC2, or an MQXQH. A string or an MQCFH ends parsing because they cannot be chained.

It is possible for a message to contain multiple MQRFH2 headers all carrying message properties. Folders with the same name can coexist in different headers unless otherwise restricted, for example by WAS/SIB. The folders are treated as one logical folder, if they are all in significant headers.

While folders from the significant headers cannot be merged with those folders in nonsignificant headers, folders with the same name within the significant headers can be merged, removing any conflicting properties. Your applications must not depend on the layout of properties within their message.

MQRFH2 groups are parsed for properties in user-defined folders, that is, not the <wmq>, <jms>, <mcd>, <usr>, <mqext>, <sib>, <sib\_usr>, <sib\_context>, and <mqema> folders.

Groups in the IBM-defined properties folders, except for the <wmq> and <mq> folders, are parsed for properties.

An MQRFH2 folder cannot contain mixed content; a folder or group can contain either groups or properties, or a value, but not both.

A segment of a message, either the first or a subsequent segment, cannot contain IBM MQ -defined properties other than those properties in the message descriptor. Therefore putting a message containing such properties with either MQMF\_SEGMENT or MQMF\_SEGMENTATION\_ALLOWED set causes the put to fail with MQRC\_SEGMENTATION\_NOT\_ALLOWED.

However, message groups can contain IBM MQ -defined properties.

## Generation of MQRFH2 headers:

If IBM MQ converts message properties to their MQRFH2 representation, it must add the MQRFH2 to the message. It adds the MQRFH2 either as a separate header, or merges it with an existing header.

Generation of new MQRFH2 headers by IBM MQ might disrupt existing headers in a message. Applications that parse a message buffer for headers must be aware that the number and position of headers in a buffer might change in some circumstances. IBM MQ attempts to minimize the impact of adding properties to a message by merging message properties into an existing MQRFH2 header, where it can. It also attempts to minimize the impact by inserting a generated MQRFH2 into a fixed position relative to other headers in the message buffer.

A generated MQRFH2 header is placed following the MQMD, and any number of MQXQH, MQRFH, and MQDLH headers, whatever order they are in. The generated MQRFH2 header is placed immediately before the first header that is not an MQMD, MQXQH, MQDLH, or MQRFH header.

## Rules for merging generated MQRFH2

The following rules apply to merging a generated MQRFH2 with an existing MQRFH2. The generated MQRFH2 header is merged with an existing MQRFH2 header, if:

1. The existing MQRFH2 is in the same position IBM MQ would place a generated MQRFH2, or earlier in the header chain.
2. The CCSID of the generated properties is the same as the NameValueCCSID of the existing MQRFH2.

Otherwise, the generated header is placed separately in the buffer, in the position described before.

## Rules for merging folders in an existing MQRFH2

If message properties are merged into an existing MQRFH2, then the existing MQRFH2 is scanned for folders that match the message properties, and merges them. If a matching folder does not exist a new folder is added to the end of the existing folders. If a matching folder does exist, the folder is searched. Any matching properties are overwritten. Any new ones are added at the end of the folder.

## MQRFH2 folder restrictions:

Overview of folder restrictions in MQRFH2 headers

The MQRFH2 restrictions apply to the following folders:

- Element names in the <usr> folder must not begin with the prefix JMS ; such property names are reserved for use by JMS and are not valid for user-defined properties.  
Such an element name does not cause parsing of the MQRFH2 to fail, but is not accessible to the IBM MQ message property APIs.
- Element names in the <usr> folder must not be, in any mixture of lower or uppercase, NULL, TRUE, FALSE, NOT, AND, OR, BETWEEN, LIKE, IN, IS and ESCAPE. These names match SQL keywords and make parsing selectors harder, because <usr> is the default folder used when no folder is specified for a particular property in a selector.  
Such an element name does not cause parsing of the MQRFH2 to fail, but is not accessible to the IBM MQ message property APIs.
- Element names in any folder considered to contain message properties must not contain a period (.) (Unicode character U+002E), because this is used in property names to indicate the hierarchy.  
Such an element name does not cause parsing of the MQRFH2 to fail, but is not accessible to the IBM MQ message property APIs.

In general, MQRFH2 headers that contain valid XML-style data can be parsed by IBM MQ without failure, although certain elements of the MQRFH2 are not accessible through the IBM MQ message property APIs.

### **MQRFH2 element name conflicts:**

Overview of conflicts within MQRFH2 element names.

Only one value can be attached to a message property. If an attempt to access a property leads to a conflict of values, one is chosen in preference over another.

The IBM MQ syntax for accessing MQRFH2 elements allows unique identification of an element, if a folder contains no elements with the same name. If a folder contains more than one element with the same name, the value of the property used is the one closest to the head of the message.

This applies if two or more folders of the same name are contained in different significant MQRFH2 headers within the same message.

A conflict can result when the MQGET call is processed after a non-message descriptor property has been set twice: both through an MQSETMP call and directly in the raw MQRFH2 header.

If this happens, the property associated with the message by an API call takes preference over one in the message data, that is, the one in the raw MQRFH2 header. If a conflict occurs, it is considered to come logically before the message data.

### **Mapping from property names to MQRFH2 folder and element names:**

Overview of the differences between property names and element names in the MQRFH2 header.

When using any of the defined APIs that ultimately generate MQRFH2 headers, in order to specify message properties (for example, MQ JMS), the property name is not necessarily the element name in the MQRFH2 folder.

Therefore, a mapping occurs from the property name to the MQRFH2 element, and in the reverse way, taking into account both the folder name that contains the element, and the element name. Some examples from IBM MQ classes for JMS are already documented in Using Java.

<b>Property name</b>	<b>MQRFH2 folder name</b>	<b>MQRFH2 element name</b>
JMSDestination	jms	Dst
JMSType	mcd	Type, Set, Fmt
xxx (user defined, where xxx does not begin with JMS)	usr	xxx

Therefore, when a JMS application accesses the JMSDestination property this maps to the Dst element in the <jms> folder.

When specifying properties as MQRFH2 elements, IBM MQ defines its elements as follows:

Property name	MQRFH2 folder name	MQRFH2 group name	MQRFH2 element name
<Property>	<usr>	n/a	<Property>
<folder>. <Property>	<folder>	n/a	<Property>
<folder>. <group>. <Property>	<folder>	<group>	<Property>

For example, when an IBM MQ application attempts to access the Property1 property, this maps to the Property1 element in the <usr> folder. The wmq.Property2 property maps to the Property2 property in the <wmq> folder.

If the property name contains more than one . character, the MQRFH2 element name used is the one following the final . character, and MQRFH2 groups are used to form a hierarchy; nested MQRFH2 groups are permitted.

The JMS header and provider-specific properties that are contained in an MQRFH2 in the <mcd>, <jms>, and <mqext> folders are accessed by an IBM MQ application using the short names defined in Using IBM MQ classes for Java .

JMS user-defined properties are accessed from the <usr> folder. An IBM MQ application can use the <usr> folder for its application properties if it is acceptable for the property to appear to JMS applications as one of its user-defined properties.

If it is not acceptable, choose another folder; the <wmq\_usr> folder is provided as a standard location for such non-JMS properties.

Your applications can specify and use any MQRFH2 folder with a well-defined use, not documented in “Properties specified as MQRFH2 elements” on page 2724 if you note the following:

1. The folder might already be in use, or might be used in the future, by another application providing undefined access to properties contained inside it; see Property names for the suggested naming convention for property names.
2. The properties are not accessible to previous versions of the IBM MQ classes for JMS or XMS client that can only access the <usr> folder for user-defined properties
3. The folder must be marked with the attribute content with the value set to properties, for example, content='properties'.  
“MQSETMP - Set message property” on page 2568 automatically adds this attribute as required. This attribute must not be added to any of the IBM-defined folders, for example, <jms> and <usr>. Doing so, causes the message to be rejected by the IBM MQ classes for JMS client before Version 7.0. with a MessageFormatException.

Because the <usr> folder is the default location for properties of the <Property> syntax, an IBM MQ application and a JMS application to access the same user-defined property value using the same name.

### Reserved folder names

There are several reserved folder names. You cannot use such names as your folder prefixes; for example, Root.Property1 does not access a valid property because Root is reserved. The following list contains reserved folder names:

- Root
- Body
- Properties
- Environment
- LocalEnvironment

- DestinationList
- ExceptionList
- InputBody
- InputRoot
- InputProperties
- InputLocalEnvironment
- InputDestinationList
- InputExceptionList
- OutputRoot
- OutputLocalEnvironment
- OutputDestinationList
- OutputExceptionList

### Mapping property descriptor fields into MQRFH2 headers:

When a property is translated into an MQRFH2 element the following element attributes are used to specify the significant fields of the property descriptor: This describes how MQPD fields are translated to MQRFH2 element attributes.

### Support

The Support property descriptor field is split into three element attributes

- The **sr** element attribute specifies values in the MQPD\_REJECT\_UNSUP\_MASK bit mask.
- The **sa** element attribute specifies values in the MQPD\_ACCEPT\_UNSUP\_MASK bit mask.
- The **sx** element attribute specifies values in the MQPD\_ACCEPT\_UNSUP\_IF\_XMIT\_MASK bit mask.

These element attributes are only valid in the <mq> folder and are ignored if set on elements in the other folders containing properties.

Support value	MQRFH2 element attribute	MQRFH2 attribute value
MQPD_SUPPORT_OPTIONAL	sa	optional This is the default value.
MQPD_SUPPORT_REQUIRED	sr	required
MQPD_SUPPORT_REQUIRED_IF_LOCAL	sx	local

### Context

Use the **context** element attribute to indicate the message context to which a property belongs. Use one value only. This element attribute is valid on a property in any folder containing properties.

Context value	MQRFH2 attribute value
MQPD_NO_CONTEXT	none This is the default value.
MQPD_USER_CONTEXT	user

## CopyOptions

Use the **copy** element attribute to indicate messages into which a property should be copied. More than one value is acceptable; separate multiple values with a comma. For example **copy='reply'** and **copy='publish,report'** are both valid. This element attribute is valid on a property in any folder containing properties.

**Note:** In the attribute definition, single quotation marks or double quotation marks are valid use, for example **copy='reply'** or **copy="report"**

CopyOption value	MQRFH2 attribute value
MQPD_COPY_FORWARD	forward
MQPD_COPY_REPLY	reply
MQPD_COPY_REPORT	report
MQPD_COPY_PUBLISH	publish
MQPD_COPY_ALL	all  Do not specify this with any other value. When used with another value, this takes precedence over any value except <b>none</b> .
MQPD_COPY_DEFAULT	default  This is the default value. It is equivalent to specifying the three values MQCOPY_FORWARD, MQCOPY_REPORT and MQCOPY_PUBLISH.  Do not specify this with any other value.
MQPD_COPY_NONE	none  Do not specify this with any other value. When used with another value, this takes precedence.

## Restrictions to the <mq> MQRFH2 folder

When a message is put on to a queue, it is searched for an <mq> folder so that the message can be processed according to its MQ-defined properties. To allow the efficient parsing of MQ-defined properties, the following restrictions apply to the folder:

- Only properties in the first significant <mq> folder in the message are acted upon by MQ; properties in any other <mq> folder in the message are ignored.
- If the folder is in UTF-8, only single-byte UTF-8 characters are allowed in the folder. A multi-byte character in the folder, can cause parsing to fail, and the message to be rejected.
- Do not include MQRFH2 groups in the <mq> folder. The presence of Unicode character U+003C in a property value will cause the message to be rejected.
- Do not use escape strings in the folder. An escape string is treated as the actual value of the element.
- Only Unicode character U+0020 is treated as white space within the folder. All other characters are treated as significant and can cause parsing of the folder to fail, and the message to be rejected.

If parsing of the <mq> folder fails, or if the folder does not observe these restrictions, the message is rejected with CompCode **MQCC\_FAILED** and Reason **MQRC\_RFH\_RESTRICTED\_FORMAT\_ERR**.

## **MQRFH2 headers that are not valid:**

At the time an MQPUT, MQPUT1, or MQGET call processes, a partial parsing of any MQRFH2 headers in the message can occur to check what folders are included, and to determine if the folders contain properties. Overview of MQRFH2 headers that are not valid.

If the partial parsing of the message cannot complete successfully because the structure is not valid, for example, the StrucLength field is too small, then:

- The MQPUT or MQPUT1 call fails with reason code MQRC\_RFH\_ERROR, if it can be determined that the application includes some IBM MQ Version 7 option, so that existing applications do not fail.
- The MQGET call returns successfully, and the MQRFH2 containing the error is returned in the buffer you provided.

If the partial parsing fails because it cannot be detected whether a particular folder contains properties or not, for example, the folder begins <<jms, so parsing fails before the folder name is determined, then:

- The MQPUT or MQPUT1 call fails with reason code MQRC\_RFH\_FORMAT\_ERROR, if it can be determined that the application includes some IBM MQ Version 7 option, so that existing applications do not fail.
- The MQGET call returns successfully, and the MQRFH2 containing the error is returned in the buffer you provided.
- While internally within the queue manager, the message is not rejected due to the badly formatted folder, but the folder is always treated as if no properties were contained inside it.

A message can flow through the queue manager network with a folder containing such a syntax error, but never being parsed and detected, while one or more folders in the message are:

- Valid
- Successfully parsed
- Used in the processing of the message

Therefore, detection is not guaranteed.

If one of your applications uses “MQSETMP - Set message property” on page 2568, or MQINQMP to access a property, and in so doing this causes an MQRFH2 folder to be fully parsed, detecting an error such that parsing cannot complete, this is indicated by an appropriate return code to the API call. No properties in the folder are made available to the application.

If an attempt is made to fully parse an MQRFH2 folder and the parser finds unrecognized element attributes, or an unrecognized data type, parsing continues and complete successfully with no warnings being issued; this does not constitute a parsing error.

## Code page conversion

This section describes codeset names and CCSIDs, national language, z/OS conversion, IBM i conversion, and Unicode conversion support.

Each national language section lists the following information:

- The native CCSIDs supported
- The code page conversions that are **not** supported

The following terms are used in the information:

**-8** Indicates for HP-UX that the CCSID is for the HP-UX defined codeset *roman8*

**AIX** Indicates IBM MQ for AIX

### HP-UX

Indicates IBM MQ for HP-UX

**Linux** Indicates IBM MQ for Linux for Intel and IBM MQ for Linux for zSeries

### HP Integrity NonStop Server

Indicates IBM MQ for HP Integrity NonStop Server

### OS/400

Indicates IBM MQ for IBM i

### Solaris

Indicates IBM MQ for Solaris

### Windows

Indicates IBM MQ for Windows

**z/OS** Indicates IBM MQ for z/OS

The default for data conversion is for the conversion to be performed at the target (receiving) system.

If the source product supports the conversion a channel can be set up and data exchanged by setting the channel attribute **DataConversion** to YES at the source.

### Note:

1. Conversion for IBM MQ MQI client information takes place in the server, so the server must support conversion from the client CCSID to the server CCSID.
2. The conversion might include support added by CSD/PTF to the latest version of IBM MQ. Check the content of the latest service level to see if you need to install a CSD/PTF to enable this conversion.
3. The IBM MQ queue manager CCSID must be Mixed or SBCS.
4. Some CCSIDs, for example 850 on AIX, that are not supported by the operating system can still be used by the application and also can be set as the IBM MQ queue manager CCSID. This is allowed for backward compatibility purpose only and the conversion will fail if the relevant conversion tables are not installed.

See Table 262 on page 2734 for a cross reference between some of the CCSID numbers and some industry codeset names.

## Codeset names and CCSIDs:

IBM MQ for z/OS provides more conversion than is listed in the language specific tables.

Table 262. Codeset names and CCSIDs

Codeset names	CCSIDs
ISO 8859-1	819
ISO 8859-2	912
ISO 8859-3	913
ISO 8859-5	915
ISO 8859-6	1089
ISO 8859-7	813
ISO 8859-8	916
ISO 8859-9	920
ISO 8859-13	921
ISO 8859-15 (euro)	923
big5	950
eucJP	954 5050 33722
eucKR	970
eucTW	964
eucCN	1383
PCK	943
GBK	1386
koi8-r	878

 A complete list of conversions provided is shown in Table 263 on page 2759.

## National languages:

This information contains languages supported by IBM MQ.

The languages supported by IBM MQ are:

- US English - see topic "US English" on page 2735
- German - see topic "German" on page 2736
- Danish and Norwegian - see topic "Danish and Norwegian" on page 2736
- Finnish and Swedish - see topic "Finnish and Swedish" on page 2737
- Italian - see topic "Italian" on page 2738
- Spanish - see topic "Spanish" on page 2738
- UK English / Gaelic - see topic "UK English /Gaelic" on page 2739
- French - see topic "French" on page 2739
- Multilingual - see topic "Multilingual" on page 2740
- Portuguese - see topic "Portuguese" on page 2740
- Icelandic - see topic "Icelandic" on page 2741
- Eastern European languages - see topic "Eastern European languages" on page 2742
- Cyrillic - see topic "Cyrillic" on page 2743

- Estonian - see topic "Estonian" on page 2744
- Latvian and Lithuanian - see topic "Latvian and Lithuanian" on page 2745
- Ukranian - see topic "Ukrainian" on page 2746
- Greek - see topic "Greek" on page 2746
- Turkish - see topic "Turkish" on page 2747
- Hebrew - see topic "Hebrew" on page 2748
- Farsi - see topic "Farsi" on page 2750
- Urdu - see topic "Urdu" on page 2750
- Thai - see topic "Thai" on page 2750
- Lao - see topic "Lao" on page 2751
- Vietnamese - see topic "Vietnamese" on page 2751
- Japanese Latin SBCS - see topic "Japanese Latin SBCS" on page 2751
- Japanese Katakana SBCS - see topic "Japanese Katakana SBCS" on page 2753
- Japanese Kanji/ Latin Mixed - see topic "Japanese Kanji/ Latin Mixed" on page 2754
- Japanese Kanji/ Katakana Mixed - see topic "Japanese Kanji/ Katakana Mixed" on page 2755
- Korean - see topic "Korean" on page 2757
- Simplified Chinese - see topic "Simplified Chinese" on page 2757
- Traditional Chinese - see topic "Traditional Chinese" on page 2758

*US English:*

Details of CCSIDs and CCSID conversion for US English.

The following table shows the native CCSIDs for US English on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	37, 924, 1140
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	437, 850, 1252, 5348, 858
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

**IBM i**

Code page:

- 37** Does not convert to code pages 923, 858
- 924** Does not convert to code pages 437, 858, 1051, 1140, 1252, 1275, 5348
- 1140** Does not convert to code pages 924, 1051, 1275

German:

Details of CCSIDs and CCSID conversion for German.

The following table shows the native CCSIDs for German on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	273, 924, 1141
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	437, 850, 858, 1252, 5348
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

#### IBM i

Code page:

**273** Does not convert to code pages 858, 923, 924, 1275

**924** Does not convert to code pages 273, 437, 858, 1051, 1141, 1252, 1275, 5348

**1141** Does not convert to code pages 924, 1051, 1275

*Danish and Norwegian:*

Details of CCSIDs and CCSID conversion for Danish and Norwegian.

The following table shows the native CCSIDs for Danish and Norwegian on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	277, 924, 1142
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	850, 858, 865, 1252, 5348
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

#### IBM i

Code page:

**277** Does not convert to code pages 858, 923, 924, 1275

**924** Does not convert to code pages 277, 858, 865, 1051, 1142, 1252, 1275, 5348

**1142** Does not convert to code pages 924, 865, 1051, 1275

**2736** IBM MQ: Reference

## AIX

Code page:

**819** Does not convert to code page 865

Code page:

**1051** Does not convert to code page 865

## Windows

Code page:

**865** Does not convert to code pages 1051, 1275

*Finnish and Swedish:*

Details of CCSIDs and CCSID conversion for Finnish and Swedish.

The following table shows the native CCSIDs for Finnish and Swedish on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	278, 924, 1143
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	437, 850, 858, 865, 1252, 5348
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

## IBM i

Code page:

**278** Does not convert to code pages 858, 923, 924, 1275

**924** Does not convert to code pages 278, 437, 858, 865, 1051, 1143, 1252, 1275, 5348

**1143** Does not convert to code pages 865, 924, 1051, 1275

## AIX

Code page:

**819** Does not convert to code page 865

**850** Does not convert to code page 865

## HP-UX

Code page:

**1051** Does not convert to code page 865

## Windows

Code page:

**865** Does not convert to code pages 1051, 1275

*Italian:*

Details of CCSIDs and CCSID conversion for Italian.

The following table shows the native CCSIDs for Italian on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	280, 924, 1144
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	437, 850, 858, 1252, 5348
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

## IBM i

Code page:

**280** Does not convert to code pages 858, 923, 924, 1275

**924** Does not convert to code pages 280, 437, 858, 1051, 1144, 1252, 1275, 5348

**1144** Does not convert to code pages 924, 1051, 1275

*Spanish:*

Details of CCSIDs and CCSID conversion for Spanish.

The following table shows the native CCSIDs for Spanish on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	284, 924, 1145
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	437, 850, 858, 1252, 5348
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

## IBM i

Code page:

**2738** IBM MQ: Reference

- 284** Does not convert to code pages 858, 923, 924, 1275
- 924** Does not convert to code pages 284, 437, 858, 1051, 1145, 1252, 1275, 5348
- 1145** Does not convert to code pages 924, 1051, 1275

*UK English /Gaelic:*

Details of CCSIDs and CCSID conversion for UK English/Gaelic.

The following table shows the native CCSIDs for UK English / Gaelic on supported platforms:

<b>Platform</b>	<b>Native CCSIDs</b>
IBM i, z/OS	285, 924, 1146
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	437, 850, 858, 1252, 5348
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

**IBM i**

Code page:

- 285** Does not convert to code pages 858, 923, 924, 1275
- 924** Does not convert to code pages 285, 437, 858, 1051, 1146, 1252, 1275, 5348
- 1146** Does not convert to code pages 924, 1051, 1275

*French:*

Details of CCSIDs and CCSID conversion for French.

The following table shows the native CCSIDs for French on supported platforms:

<b>Platform</b>	<b>Native CCSIDs</b>
IBM i, z/OS	297, 924, 1147
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	437, 850, 858, 1252, 5348
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

**IBM i**

Code page:

- 297** Does not convert to code pages 858, 923, 924, 1275, 5348
- 924** Does not convert to code pages 297, 437, 858, 1051, 1147, 1252, 1275, 5348
- 1147** Does not convert to code pages 924, 1051, 1275

*Multilingual:*

Details of CCSIDs and CCSID conversion for Multilingual.

The following table shows the native CCSIDs for multilingual conversion on supported platforms:

<b>Platform</b>	<b>Native CCSIDs</b>
IBM i, z/OS	500, 924, 1148
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	437, 850, 858, 1252, 5348
HP Integrity NonStop Server, SINIX, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

**IBM i**

Code page:

- 500** Does not convert to code pages 858, 923
- 924** Does not convert to code pages 437, 858, 1051, 1148, 1252, 1275, 5348
- 1148** Does not convert to code pages 924, 1051, 1275

*Portuguese:*

Details of CCSIDs and CCSID conversion for Portuguese.

The following table shows the native CCSIDs for Portuguese on supported platforms:

<b>Platform</b>	<b>Native CCSIDs</b>
IBM i	37, 500, 924, 1140
z/OS	500, 924, 1140
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	850, 858, 860, 1252, 5348
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

## IBM i

Code page:

- 37 Does not convert to code pages 858, 923, 1275
- 500 Does not convert to code pages 858, 923, 1275
- 924 Does not convert to code pages 858, 860, 1051, 1140, 1252, 1275, 5348
- 1140 Does not convert to code pages 860, 924, 1051, 1275

## HP-UX

Code page:

- 1051 Does not convert to code page 860

## Windows

Code page:

- 860 Does not convert to code pages 1051, 1275

*Icelandic:*

Details of CCSIDs and CCSID conversion for Icelandic.

The following table shows the native CCSIDs for Icelandic on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	871, 924, 1149
AIX	819, 923, 5348
HP-UX	819, 923, 1051
Windows	850, 858, 861, 1252, 5348
HP Integrity NonStop Server, Solaris, Linux	819, 923
Apple client	1275

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

## IBM i

Code page:

- 871 Does not convert to code pages 858, 923, 924, 1275, 5348
- 924 Does not convert to code pages 858, 861, 871, 1051, 1149, 1252, 1275, 5348
- 1149 Does not convert to code pages 924, 1051, 1275

## HP-UX

Code page:

- 1051 Does not convert to code page 861

## Windows

Code page:

**861** Does not convert to code pages 1051, 1275

*Eastern European languages:*

Details of CCSIDs and CCSID conversion for Eastern European Languages. The typical languages using these CCSIDs include Albanian, Croatian, Czech, Hungarian, Polish, Romanian, Serbian, Slovak, and Slovenian.

The following table shows the native CCSIDs for Eastern European languages on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	870, 1153
Windows	852, 1250, 5346, 9044
AIX, HP-UX, HP Integrity NonStop Server, Solaris, Linux	912
Eastern European Apple client	1282
Romanian Apple client	1285
Croatian Apple client	1284

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

## z/OS

Code page:

**870** Does not convert to code pages 1284, 1285

**1153** Does not convert to code pages 1250, 1284, 1285

## IBM i

Code page:

**870** Does not convert to code pages 1284, 1285, 5346, 9044

**1153** Does not convert to code pages 1282, 1284, 1285, 5346, 9044

## HP-UX, Solaris, Linux

Code page:

**912** Does not convert to code pages 1284, 1285

## HP Integrity NonStop Server

Code page:

**912** Does not convert to code pages 1153, 1284, 1285, 9044

## Windows

Code page:

- 852 Does not convert to code pages 1284, 1285
- 1250 Does not convert to code pages 1284, 1285
- 9044 Does not convert to code pages 912, 1282, 1284, 1285

*Cyrillic:*

Details of CCSIDs and CCSID conversion for Cyrillic. The typical languages using these CCSIDs include Belarussian, Bulgarian, Macedonian, Russian, and Serbian.

The following table shows the native CCSIDs for Cyrillic on supported platforms:

Platform	Native CCSIDs
z/OS	1025
IBM i	880, 1025
Windows	855, 866, 1131, 1251, 5347
Solaris	878, 915
AIX, HP-UX, Linux , HP Integrity NonStop Server	915
Apple client	1283

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

**IBM i**

Code page:

- 880 Does not convert to code pages 855, 866, 878, 1131, 5347
- 1025 Does not convert to code pages 878, 5347

**Windows**

Code page:

- 855 Does not convert to code page 1131
- 866 Does not convert to code page 1131
- 1131 Does not convert to code pages 855, 866, 880, 1283

*Estonian:*

Details of CCSIDs and CCSID conversion for Estonian.

The following table shows the native CCSIDs for Estonian on supported platforms:

<b>Platform</b>	<b>Native CCSIDs</b>
IBM i, z/OS	1122, 1157
Windows	902, 922, 1257, 5353, 9449
AIX, HP-UX, Solaris, Linux	902, 922
HP Integrity NonStop Server	922

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

### **z/OS**

Code page:

**1122** Does not convert to code pages 902, 1157, 9449

**1157** Does not convert to code pages 922, 1122, 1257, 9449

### **IBM i**

Code page:

**1122** Does not convert to code pages 902, 5353, 9449

**1157** Does not convert to code pages 922, 5353, 9449

### **HP-UX, Solaris, Linux**

Code page:

**902** Does not convert to code pages 922, 1122, 9449

**922** Does not convert to code pages 902, 1157, 9449

### **Windows**

Code page:

**5353** Does not convert to code page 9449

**9449** Does not convert to code pages 902, 922, 1122, 1157, 1257, 5353

**902** Does not convert to code pages 922, 1122, 9449

### **HP Integrity NonStop Server**

Code page:

**922** Does not convert to code pages 902, 1157, 9449

*Latvian and Lithuanian:*

Details of CCSIDs and CCSID conversion for Latvian and Lithuanian.

The following table shows the native CCSIDs for Latvian and Lithuanian on supported platforms:

<b>Platform</b>	<b>Native CCSIDs</b>
IBM i, z/OS	1112, 1156
Windows	901, 921, 1257, 5353, 9449
AIX, HP-UX, Solaris, Linux	901, 921
HP Integrity NonStop Server,	921

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

**z/OS**

Code page:

**1112** Does not convert to code pages 901, 1156, 9449

**1156** Does not convert to code pages 901, 1156, 9449

**IBM i**

Code page:

**1112** Does not convert to code page 5353

**1153** Does not convert to code pages 921, 5353, 9449

**HP-UX, Solaris, Linux**

Code page:

**902** Does not convert to code pages 921, 1112, 1257, 9449

**921** Does not convert to code pages 901, 1156, 9449

**Windows**

Code page:

**901** Does not convert to code pages 921, 1112, 1257, 9449

**5355** Does not convert to code page 9449

**9449** Does not convert to code pages 901, 921, 1112, 1156, 1257

**HP Integrity NonStop Server**

Code page:

**921** Does not convert to code pages 901, 1156, 9449

*Ukrainian:*

Details of CCSIDs and CCSID conversion for Ukrainian.

The following table shows the native CCSIDs for Ukrainian on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	1123
Windows	1124, 1125, 1251, 5347
AIX, HP-UX, HP Integrity NonStop Server, Solaris, Linux	1124

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

### IBM i

Code page:

**1123** Does not convert to code page 5347

### HP-UX

Code page:

**1124** Does not convert to code page 5347

### Windows

Code page:

**1125** Does not convert to code page 1123

*Greek:*

Details of CCSIDs and CCSID conversion for Greek.

The following table shows the native CCSIDs for Greek on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	875
HP-UX	813 (see note)
Windows	869, 1253, 5349
AIX, NCR, HP Integrity NonStop Server, Solaris, Linux	813
Apple client	1280
DOS client	737

**Note:** Only the ISO codeset is supported on HP-UX. The HP-UX proprietary greek8 codeset has no registered CCSID and is not supported.

All non-client platforms support conversion between their native CCSIDs, the native CCSIDs of the other platforms with the following exceptions.

## IBM i

Code page:

875 Does not convert to code page 5349

## Windows

Code page:

1253 Does not convert to code page 737

5349 Does not convert to code page 737

*Turkish:*

Details of CCSIDs and CCSID conversion for Turkish.

The following table shows the native CCSIDs for Turkish on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	1026
HP-UX	920 (see note)
Windows	857, 1254, 5350
AIX, HP Integrity NonStop Server, Solaris, Linux	920
Apple client	1281

**Note:** Only the ISO codeset is supported on HP-UX. The HP-UX proprietary `turkish8` codeset has no registered CCSID and is not supported.

All non-client platforms support conversion between their native CCSIDs and the native CCSIDs of the other platforms, with the following exceptions.

## IBM i

Code page:

1026 Does not convert to code page 5350

Hebrew:

Details of CCSIDs and CCSID conversion for Hebrew.

The following table shows the native CCSIDs for Hebrew on supported platforms:

Platform	Native CCSIDs
z/OS	424, 803, 4899, 12712
IBM i	424
AIX	916, 9048
HP-UX	916 (see note)
Windows	1255, 5351
HP Integrity NonStop Server, Solaris, Linux	916

**Note:** Only the ISO codeset is supported on HP-UX. The HP-UX proprietary greek8 codeset has no registered CCSID and is not supported.

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

#### **z/OS**

Code page:

**424** Does not convert to code pages 867, 4899, 9048, 12712

**803** Does not convert to code pages 867, 4899, 5351, 9048, 12712

**4899** Does not convert to code pages 424, 803, 856, 862, 916, 1255

**12712** Does not convert to code pages 424, 803, 856, 916, 1255

#### **IBM i**

Code page:

**424** Does not convert to code pages 803, 867, 4899, 5351, 9048, 12712

Code page 424 also converts to and from CCSID 4952, which is a variant of 856.

#### **AIX**

Code page:

**916** Does not convert to code pages 867, 4899, 9048, 12712

**9048** Does not convert to code pages 424, 803, 856, 862, 916, 1255

#### **Windows**

Code page:

**1255** Does not convert to code pages 867, 4899, 9048, 12712

**5351** Does not convert to code page 803

*Arabic:*

Details of CCSIDs and CCSID conversion for Arabic

The following table shows the native CCSIDs for Arabic on supported platforms:

<b>Platform</b>	<b>Native CCSIDs</b>
IBM i, z/OS	420
AIX	1046, 1089
HP-UX	1089 (see note)
Windows	720, 864, 1256, 5352
HP Integrity NonStop Server, Solaris, Linux	1089

**Note:** Only the ISO codeset is supported on HP-UX. The HP-UX proprietary arabic8 codeset has no registered CCSID and is not supported.

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

**IBM i**

Code page:

**420** Does not convert to code page 5352

**HP-UX, Solaris, Linux, HP Integrity NonStop Server, Tru64**

Code page:

**1089** Does not convert to code page 720

**Windows**

Code page:

**720** Does not convert to code pages 1089, 5352

**5352** Does not convert to code page 720

*Farsi:*

Details of CCSIDs and CCSID conversion for Farsi.

The following table shows the native CCSIDs for Farsi on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	1097
AIX, HP-UX, HP Integrity NonStop Server, Solaris, Linux Windows	1098 (see note)

**Note:** The native CCSID for these platforms has not been standardized and might change.

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms.

*Urdu:*

Details of CCSIDs and CCSID conversion for Urdu.

The following table shows the native CCSIDs for Urdu on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	918
Windows	868
AIX, HP-UX, HP Integrity NonStop Server, Solaris, Linux	1006

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

**IBM i**

Code page:

**918** Does not convert to code page 1006

*Thai:*

Details of CCSIDs and CCSID conversion for Thai.

The following table shows the native CCSIDs for Thai on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	838
AIX, HP-UX, HP Integrity NonStop Server, Solaris, Linux Windows	874 (see note)

**Note:** The native CCSID for these platforms has not been standardized and might change.

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms.

*Lao:*

Details of CCSIDs and CCSID conversion for Lao.

The following table shows the native CCSIDs for Lao on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	1132
AIX, HP-UX, HP Integrity NonStop Server, Solaris, Linux Windows	1133

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms.

*Vietnamese:*

Details of CCSIDs and CCSID conversion for Vietnamese.

The following table shows the native CCSIDs for Vietnamese on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	1130
Windows	1258, 5354
AIX, HP-UX, HP Integrity NonStop Server, Solaris, Linux	1129

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

### **IBM i**

Code page:

**1130** Does not convert to code pages 1129, 5354

*Japanese Latin SBCS:*

Details of CCSIDs and CCSID conversion for Japanese Latin SBCS.

The following table shows the native CCSIDs for Japanese Latin SBCS on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	1027
AIX	932, 5050, 33722 (see Note 1)
Windows	932, 943 (see Notes 2 and 3)
Linux, HP Integrity NonStop Server, Solaris	943, 5050
HP-UX	Not known

### **Note:**

1. 5050 and 33722 are CCSIDs related to base code page 954 on AIX. The CCSID reported by the operating system is 33722.
2. Windows NT uses code page 932 but this is best represented by the CCSID of 943. However, not all platforms of IBM MQ support this CCSID.

On IBM MQ for Windows CCSID 932 is used to represent code page 932, but a change to file `../conv/table/ccsid.tbl` can be made which changes the CCSID used to 943.

3. IBM MQ does not support code pages based on the JIS X 0213 (JIS2004) standard.

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

### **z/OS**

Code page:

1027 Does not convert to code pages 932, 942, 943, 954, 5050, 33722

### **IBM i**

Code page:

1027 Does not convert to code page 932

### **AIX**

Code page:

932 Does not convert to code page 1027

5050 Does not convert to code page 1027

33722 Does not convert to code page 1027

### **Linux**

Code page:

943 Does not convert to code page 1027

5050 Does not convert to code page 1027

### **Solaris**

Code page:

943 Does not convert to code page 1027

5050 Does not convert to code page 1027

### **HP Integrity NonStop Server**

Code page:

943 Does not convert to code page 1027

5050 Does not convert to code page 1027

## Japanese Katakana SBCS:

Details of CCSIDs and CCSID conversion for Japanese Katakana SBCS.

The following table shows the native CCSIDs for Japanese Katakana SBCS on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	290
HP-UX	897
AIX	932, 5050, 33722 (see Note 1)
Windows	932, 943 (see Notes 2 and 3)
Linux, HP Integrity NonStop Server, Solaris	943, 5050

### Note:

1. 5050 and 33722 are CCSIDs related to base code page 954 on AIX. The CCSID reported by the operating system is 33722.
2. Windows NT uses code page 932 but this is best represented by the CCSID of 943. However, not all platforms of IBM MQ support this CCSID.  
On IBM MQ for Windows CCSID 932 is used to represent code page 932, but a change to file `../conv/table/ccsid.tbl` can be made which changes the CCSID used to 943.
3. IBM MQ does not support code pages based on the JIS X 0213 (JIS2004) standard.
4. In addition to the previous conversions, the IBM MQ products on AIX, HP-UX, Solaris, Linux and Tru64 support conversion from CCSID 897 to CCSIDs 37, 273, 277, 278, 280, 284, 285, 290, 297, 437, 500, 819, 850, 1027, and 1252.

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

### z/OS

Code page:

**290** Does not convert to code pages 932, 943, 954, 5050, 33722

### IBM i

Code page:

**290** Does not convert to code page 932

### AIX

Code page:

**932** Does not convert to code pages 290, 897

**5050** Does not convert to code pages 290, 897

**33722** Does not convert to code pages 290, 897

### HP-UX

Code page:

**897** Does not convert to code pages 932, 943, 954, 5050, 33722

## Linux

Code page:

943 Does not convert to code pages 290, 897

5050 Does not convert to code pages 290, 897

## Solaris

Code page:

943 Does not convert to code pages 290, 897

5050 Does not convert to code pages 290, 897

## HP Integrity NonStop Server

Code page:

943 Does not convert to code pages 290, 897

5050 Does not convert to code pages 290, 897

### *Japanese Kanji/ Latin Mixed:*

Details of CCSIDs and CCSID conversion for Japanese Kanji/Latin Mixed.

The following table shows the native CCSIDs for Japanese Kanji/ Latin Mixed on supported platforms:

Platform	Native CCSIDs
IBM i, z/OS	1399, 5035 (see Note 1)
AIX	932, 5050, 33722 (see Note 2)
HP-UX	932, 954, 5039 (see Note 3)
Windows	932, 943 (see Notes 4 and 5)
Linux, HP Integrity NonStop Server, Solaris	943, 5050

### Note:

1. 5035 is a CCSID related to code page 939
2. 5050 and 33722 are CCSIDs related to base code page 954 on AIX. The CCSID reported by the operating system is 33722.
3. Code sets japan15 and SJIS on HP-UX are represented by CCSID 932. These have a few DBCS characters having different representations in SJIS so 932 may be converted incorrectly if the conversion is not performed on an HP-UX system. IBM MQ for HP-UX supports 5039, the correct CCSID for HP SJIS. A change to file `/var/mqm/conv/ccsid.tbl` can be made to change the CCSID used from 932 to 5039.
4. Windows NT uses code page 932 but this is best represented by the CCSID of 943. However, not all platforms of IBM MQ support this CCSID.  
On IBM MQ for Windows CCSID 932 is used to represent code page 932, but a change to file `../conv/table/ccsid.tbl` can be made which changes the CCSID used to 943.
5. IBM MQ does not support code pages based on the JIS X 0213 (JIS2004) standard.

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

## z/OS

Code page:

1399 Does not convert to code pages 954, 5035, 5050, 33722

5035 Does not convert to code pages 954, 1399, 5050, 33722

## IBM i

Code page:

1399 Does not convert to code page 5039

5035 Does not convert to code page 5039

## HP-UX

Code page:

932 Does not convert to code pages 942, 943, 1399

954 Does not convert to code pages 942, 943, 1399

5039 Does not convert to code pages 942, 943, 1399

## HP Integrity NonStop Server

Code page:

943 Does not convert to code page 1399

5050 Does not convert to code page 1399

*Japanese Kanji/ Katakana Mixed:*

Details of CCSIDs and CCSID conversion for Japanese Kanji/Katakana Mixed.

The following table shows the native CCSIDs for Japanese Kanji/ Katakana Mixed on supported platforms:

Platform	Native CCSIDs
z/OS	1390, 5026 (see Note 1)
IBM i	5026 (see Note 1)
AIX	932, 5050, 33722 (see Note 2)
HP-UX	932, 954, 5039 (see Note 3)
Windows	932, 943 (see Notes 4 and 5)
Linux, HP Integrity NonStop Server, Solaris	943, 5050

### Note:

1. CCSID 1390 does not accept lower case characters. 5026 is a CCSID related to code page 930. CCSID 5026 is the CCSID reported on IBM i when the Japanese Katakana (DBCS) feature is selected.
2. 5050 and 33722 are CCSIDs related to base code page 954 on AIX. The CCSID reported by the operating system is 33722.
3. Code sets japan15 and SJIS on HP-UX are represented by CCSID 932. These have a few DBCS characters having different representations in SJIS so 932 may be converted incorrectly if the

conversion is not performed on an HP-UX system. IBM MQ for HP-UX supports 5039, the correct CCSID for HP SJIS. A change to file `/var/mqm/conv/ccsid.tbl` can be made to change the CCSID used from 932 to 5039.

4. Windows NT uses code page 932 but this is best represented by the CCSID of 943. However, not all platforms of IBM MQ support this CCSID.

On IBM MQ for Windows, CCSID 932 is used to represent code page 932, but a change to file `../conv/table/ccsid.tbl` can be made that changes the CCSID used to 943.

5. IBM MQ does not support code pages based on the JIS X 0213 (JIS2004) standard.

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

### **z/OS**

Code page:

**1390** Does not convert to code pages 954, 5026, 5050, 33722

Does not accept lower case characters.

**5026** Does not convert to code pages 954, 1390, 5050, 33722

### **IBM i**

Code page:

**5026** Does not convert to code pages 1390, 5039

### **HP-UX**

Code page:

**932** Does not convert to code pages 942, 943, 1390

**954** Does not convert to code pages 942, 943, 1390

**5039** Does not convert to code pages 942, 943, 1390

### **HP Integrity NonStop Server**

Code page:

**943** Does not convert to code page 1390

**5050** Does not convert to code page 1390

*Korean:*

Details of CCSIDs and CCSID conversion for Korean.

The following table shows the native CCSIDs for Korean on supported platforms:

Platform	Native CCSIDs
z/OS, IBM i	933, 1364
AIX, HP-UX, Linux, HP Integrity NonStop Server, Solaris	970
Windows	949, 1363

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

### **z/OS**

Code page:

**933** Does not convert to code page 970

**1364** Does not convert to code page 970

### **HP-UX**

Code page:

**970** Does not convert to code pages 949, 1363, 1364

*Simplified Chinese:*

Details of CCSIDs and CCSID conversion for Simplified Chinese.

The following table shows the native CCSIDs for Simplified Chinese on supported platforms:

Platform	Native CCSIDs
z/OS	935, 1388
IBM i	935, 1388
AIX	1383, 1386
HP-UX	1381 (see Note 1)
Windows	1381, 1386(see Note 2)
Linux, HP Integrity NonStop Server, Solaris	1383

### **Note:**

1. Code sets prc15 and hp15CN on HP-UX are represented by CCSID 1381.
2. Windows uses code page 936 but this is best represented by the CCSID of 1386. However, not all platforms of IBM MQ support this CCSID.

On IBM MQ for Windows CCSID 1381 is used to represent code page 936, but a change to file `../conv/table/ccsid.tbl` can be made which changes the CCSID used to 1386.

3. IBM MQ supports phase one of the Chinese GB18030 standard.

On z/OS, Linux, Windows, and Solaris, conversion support is provided between Unicode (UTF-8 and UCS-2) and CCSID 1388 (EBCDIC with GB18030 extensions), Unicode (UTF-8 and UCS-2) and CCSID 5488 (GB18030 phase one), and between CCSID 1388 and CCSID 5488.

**Note:**

On IBM i, support is provided by the operating system for conversion between Unicode (UTF-8 and UCS-2) and CCSID 1388 (EBCDIC with GB18030 extensions).

On HP-UX there is currently no support available on the HP11 operating system for GB18030. On HP11i, patch PHCO\_26456 provides conversion support between GB18030 (CCSID 5488) and Unicode. Support is not provided for the conversion between GB18030 and 1388 (EBCDIC).

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

**z/OS**

Code page:

**935** Does not convert to code page 1383

**1388** Does not convert to code page 1383

**HP-UX**

Code page:

**1381** Does not convert to code pages 1383, 1386, 1388

*Traditional Chinese:*

Details of CCSIDs and CCSID conversion for Traditional Chinese.

The following table shows the native CCSIDs for Traditional Chinese on supported platforms:

Platform	Native CCSIDs
z/OS, IBM i	937
HP-UX	938, 950, 964 (see Note)
Windows	950
AIX, HP Integrity NonStop Server, Solaris, Linux	950, 964

**Note:** Code set roc15 on HP-UX is represented by CCSID 938.

All platforms support conversion between their native CCSIDs and the native CCSIDs of other platforms, with the following exceptions.

**z/OS**

Code page:

**937** Does not convert to code page 964

**1388** Does not convert to code page 1383

**HP-UX**

Code page:

**938** Does not convert to code page 948

**950** Does not convert to code page 948

**964** Does not convert to code page 948

**2758** IBM MQ: Reference

## Linux, Solaris

Code page:

964 Does not convert to code page 938

### z/OS conversion support:

A list of supported CCSID conversions.

Table 263. IBM MQ for z/OS CCSID conversion support

CCSID	Converts to and from CCSIDS
37	256, 273, 275, 277-278, 280, 284-285, 290, 297, 367, 420, 423-424, 437, 500, 720, 737, 775, 813, 819, 833, 836, 838, 850, 852, 855, 857-858, 860-866, 869-871, 874-875, 880, 897, 903-905, 912, 914-916, 920-924, 1009, 1025-1027, 1040-1043, 1047, 1051, 1088, 1097, 1100, 1112, 1114-1115, 1122, 1124, 1126, 1130-1132, 1137, 1140-1149, 1200, 1208, 1250-1255, 1257-1258, 1275, 1280-1281, 1283, 4386, 4909, 4929, 4932, 4934, 4946, 4948, 4951, 4953, 4960, 4970-4971, 5012, 5123, 5210-5211, 5346, 5348, 8229, 8482, 8612, 9025, 9030, 9044, 9049, 9056, 9061, 9066, 13121, 13488, 16804, 17248, 17584, 25473, 25479, 25480, 25617, 25619, 25664, 28709
