

**V06 Workload Management and Server Virtualization in Server Consolidation Scenarios
by Dan Dulick, Aurema**

Workload Management and server virtualization can be used separately or together to facilitate server consolidation on IBM xSeries hardware. Workload Management solutions such as ARMTech from Aurema reduce operating system instances and improve application performance, helping customers to achieve maximum efficiency and lowest Total Cost of Ownership. Using virtualization to partition troublesome or legacy applications adds even greater reliability.

This presentation defines scenarios for successfully including Workload Management in server consolidation projects. All attendees will receive a FREE evaluation copy of ARMTech.

Aurema is the leading provider of Workload Management solutions for server consolidation and improved server performance. ARMTech for Windows, ARMTech for Citrix MetaFrame, and Application Workload Manager are resold by IBM and carry IBM xSeries part numbers.
