

Improving Enterprise Application Development & Delivery with Cloud Computing

Desmond Koh, Cloud Computing Architect WW Cloud Computing Client Engagement Team

Introduction

Why Agile Operations Cloud?

Definition:

An Agile Operations Cloud is a cloud service for rapid development of new applications by implementing the integration of development & operations ("DevOps").

An Agile Operations Cloud is agile from two perspectives:

- 1) Agile in Operations itself
- 2) Agile in translating developed artifacts into production
- The primary consumer of an "agile operations cloud service" are developers & testers.
- The cloud aspect of an Agile Operations Cloud is that developed application artifacts can be deployed rapidly & operated in a cloud environment.

Deployment is a complex task

Development and Operations teams collaboration challenges

▶ Hand-off from development teams is inconsistent and manual

Application component requirements do not match IT infrastructure

Deployment requirements are difficult to validate

- ▶ Enterprise, Software & IT architects all use different formats
- No standardization or templates for reuse

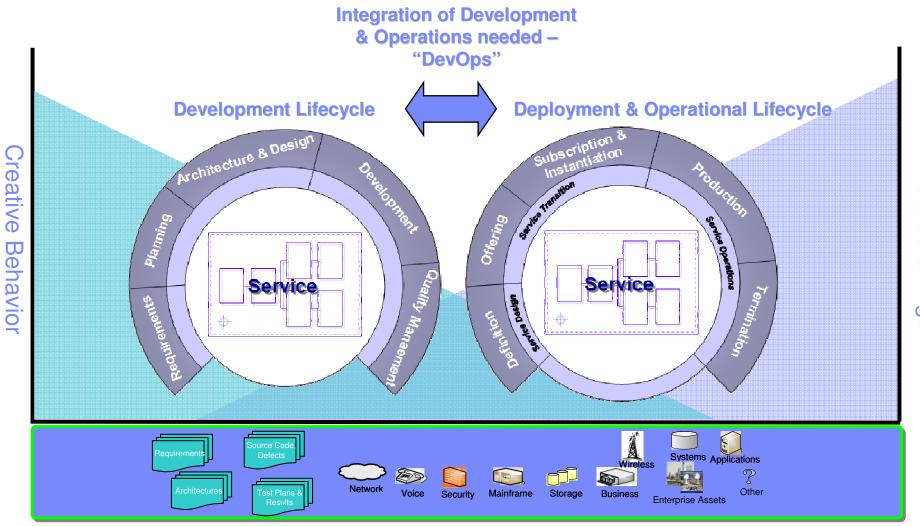

Complex series of steps

- Deployment engineers often execute manual steps
- Not repeatable, prone to error
- Automations are hard to build, maintain and reuse
- Hard to tell what if the right things were installed

- √ 50% of applications put into production are later rolled back (Gartner)
- √ 60% 80% of an average company's IT budget is spent on maintaining existing applications
 (Intelligent Enterprise.com)
- ✓ Software related downtime cost industries almost \$300 billion annually (CENTS Comparative Economic Normalization Technology Study)

Service Lifecycle Management & Automation

Agile Operations Cloud Solution

Cloud Based Operation offers

Evolving from changing the economics of IT... to becoming a catalyst for transformation.

Reduce costs of service delivery	Higher quality services	Accelerate business agility
Business Benefits Lowered IT operating, capital and support costs Optimized performance Improved compliance	Easier to integrate Optimized security	Faster delivery of custom cloud patterns Enable business transformation
		Automation
	Standardization	
Virtualization		

IBM Deployment Planning and Automation lifecycle

 Plan your desired deployment using discovered resources and standard configuration templates

 Govern, catalog and share application artifacts, standard templates and deployment plans

Govern

 Automate infrastructure provisioning, middleware configuration, and application installation

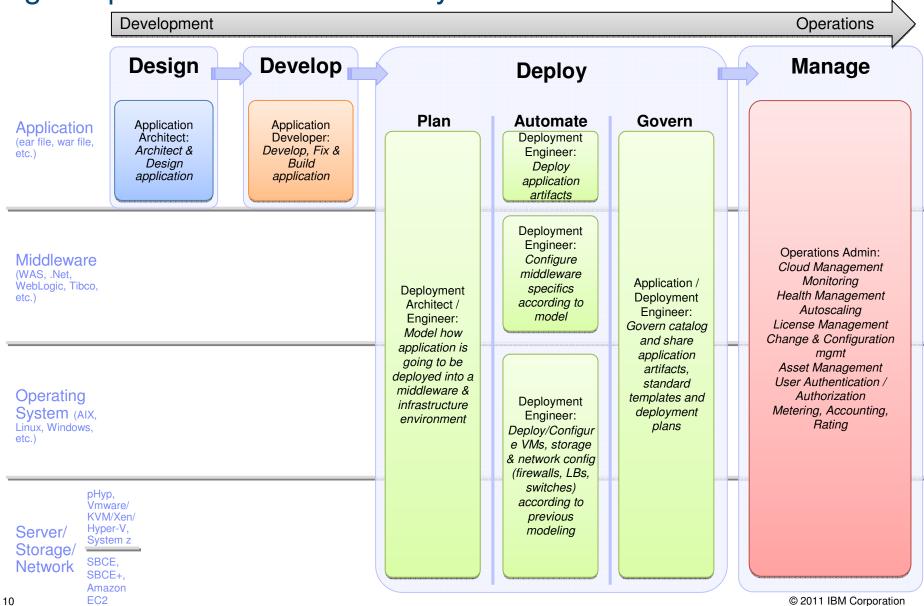

Automate

Speed the delivery of high quality applications to physical environments, virtual environments, and cloud environments

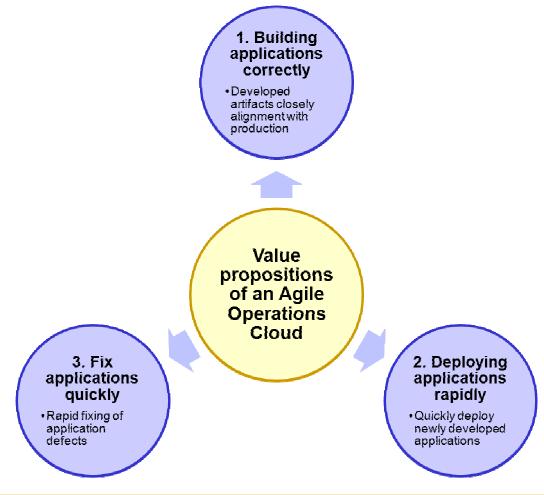

Lifecycle within an Agile Operations Cloud

Agile Operations Cloud – Lifecycle Phases Details

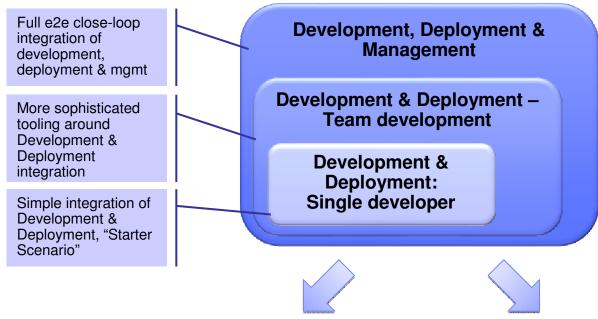

DevOps - specific value Propositions of an Agile Operations Cloud

These value propositions are achieved by the scenarios described on the following slides

Agile Operations Cloud – Scenario Progression

Topology-based

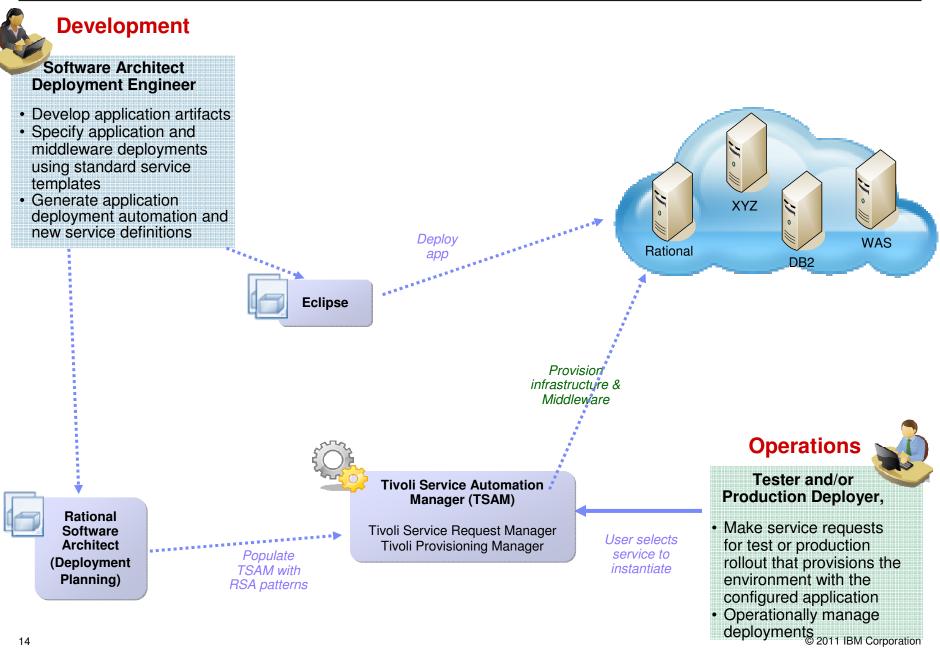

- Allows starting from existing IT infrastructure & mgmt technology footprint and IT operations staff skills
- Allows phased approach introducing with little risk

Workload-based

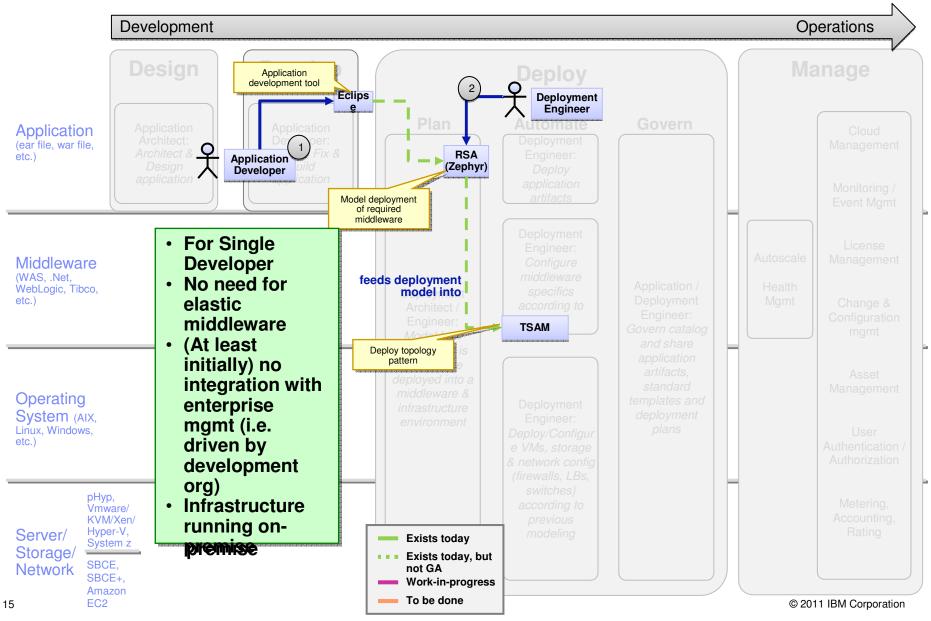

- Change the in way organizations deploy & manage middleware
- Allows achieving reduced costs by hiding middleware complexities

Depending on the requirements & maturity of the current IT environment, either a topologyor workload-focused scenario is appropriate Agile Operations Cloud – Topology-based scenarios

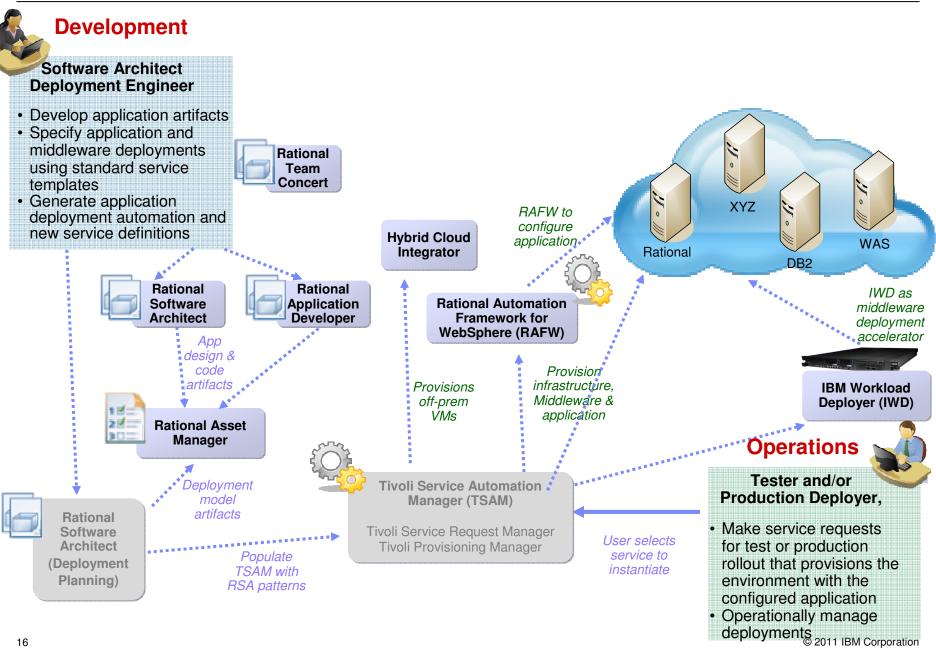

Development & Deployment Scenario — "Single Developer" (topology-based)

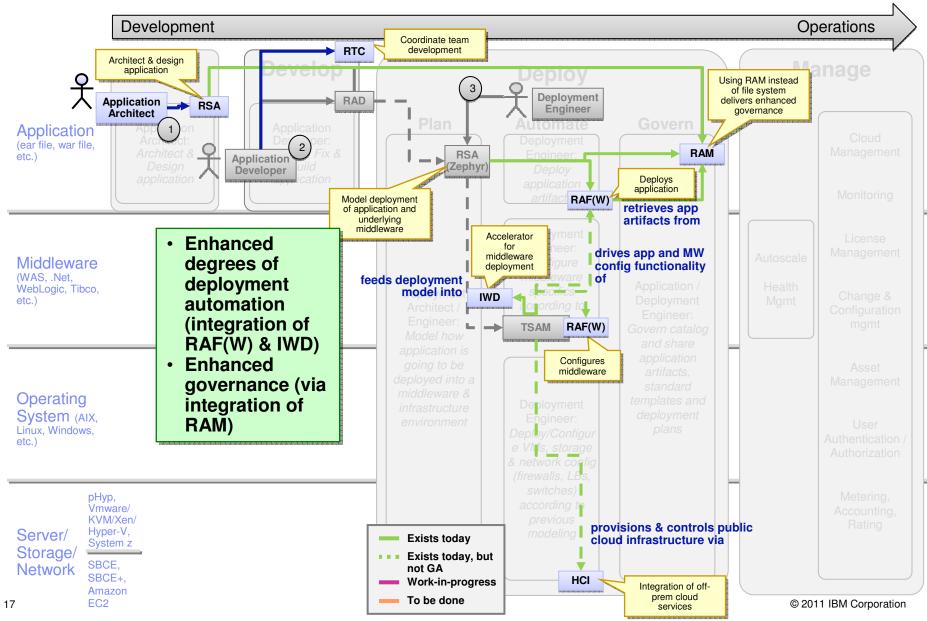

Details: Development & Deployment Scenario — "Single Developer" (topology-based)

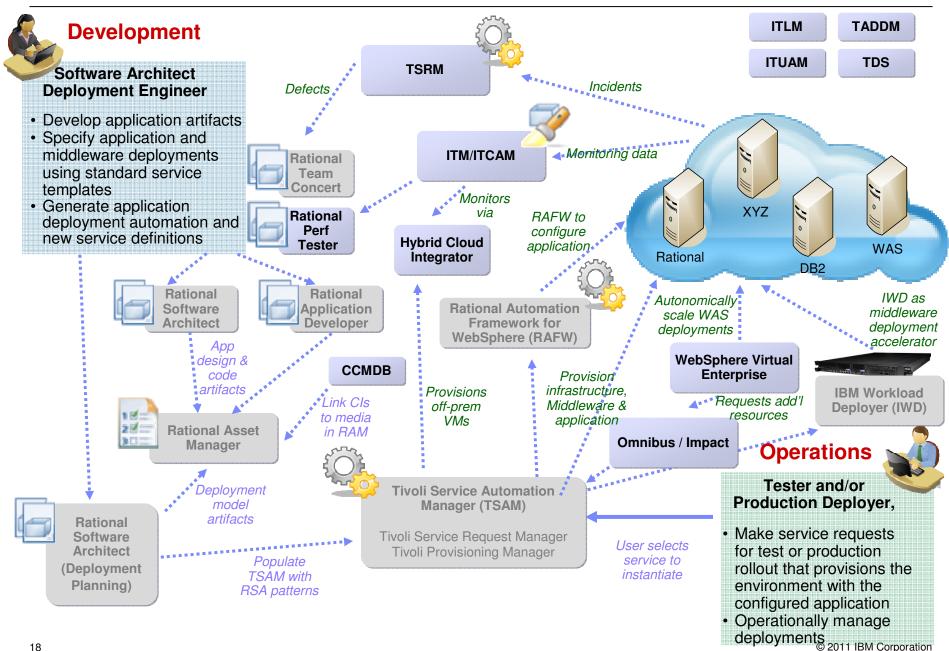

Development & Deployment Scenario - "Team Development" (topology-based)

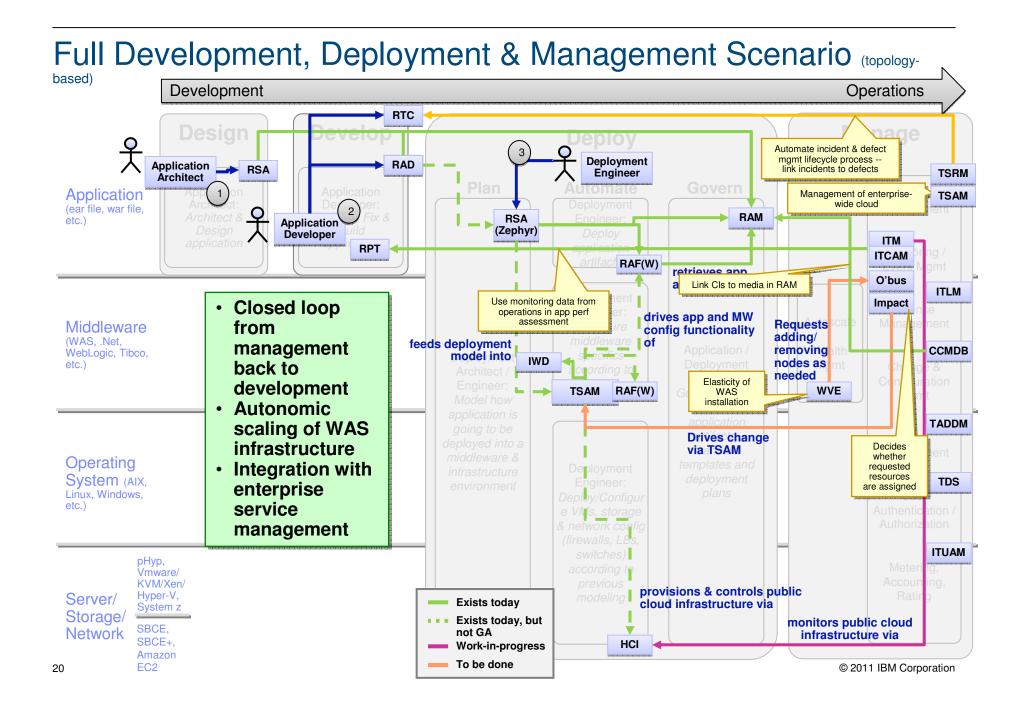

Details: Development & Deployment Scenario - "Team Development" (topology-based)

Development, Deployment & Management Scenario (topology-based)

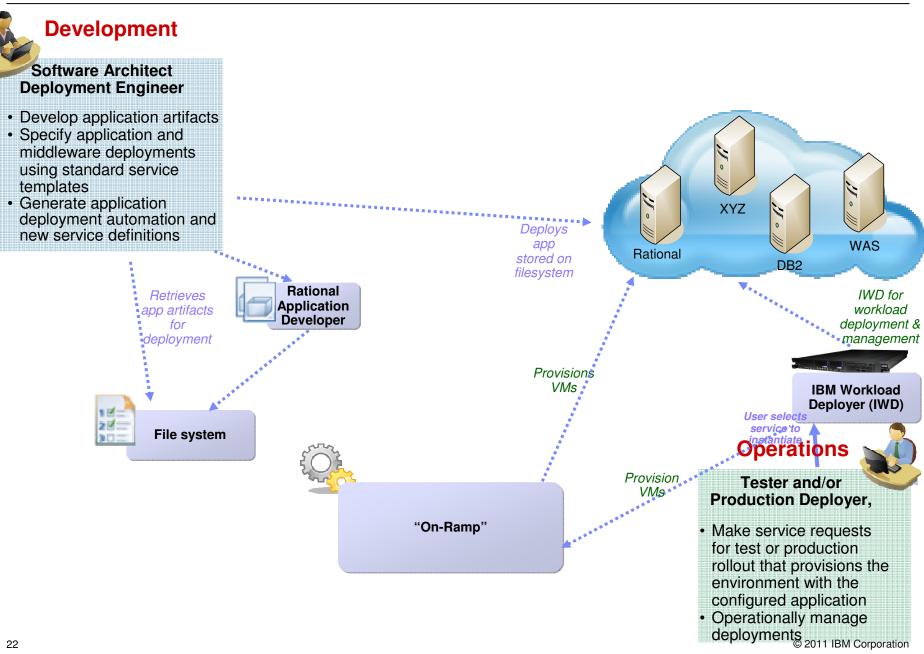

Details: Development, Deployment & Management Scenario (topology-based) Development **Operations** RTC Automate incident & defect mgmt lifecycle process --Deployment RAD Application link incidents to defects Engineer **TSRM** Architect Automate Application Management of enterprise **TSAM** wide cloud (ear file, war file, RAM RSA etc.) Application (Zephyr Developer ITM **RPT ITCAM** RAF(W) retrieves ann O'bus Link CIs to media in RAM ITLM Use monitoring data from **Impact** Closed loop operations in app perf drives app and MW assessment Middleware Requests from config functionality adding/ (WAS. .Net. feeds deployment management removing **CCMDB** WebLogic, Tibco. model into IWD nodes as back to needed Elasticity of development **TSAM** RAF(W) WVE WAS installation Autonomic **TADDM** scaling of WAS **Drives change** infrastructure Decides via TSAM whether Operating Integration with requested Deployment resources System (AIX. **TDS** ngineer: enterprise are assigned Linux, Windows, Deplby/Configur etc.) service & network con management ITUAM pHyp. according to Vmware/ KVM/Xen/ provisions & controls public Hyper-V, Server/ **Exists today** cloud infrastructure via System z Storage/ Exists today, but monitors public cloud SBCE \blacksquare Network not GA infrastructure via SBCE+. Agile Operations Cloud – Workload-based scenarios

Development & Deployment Scenario - "Single Developer" (workload-based)

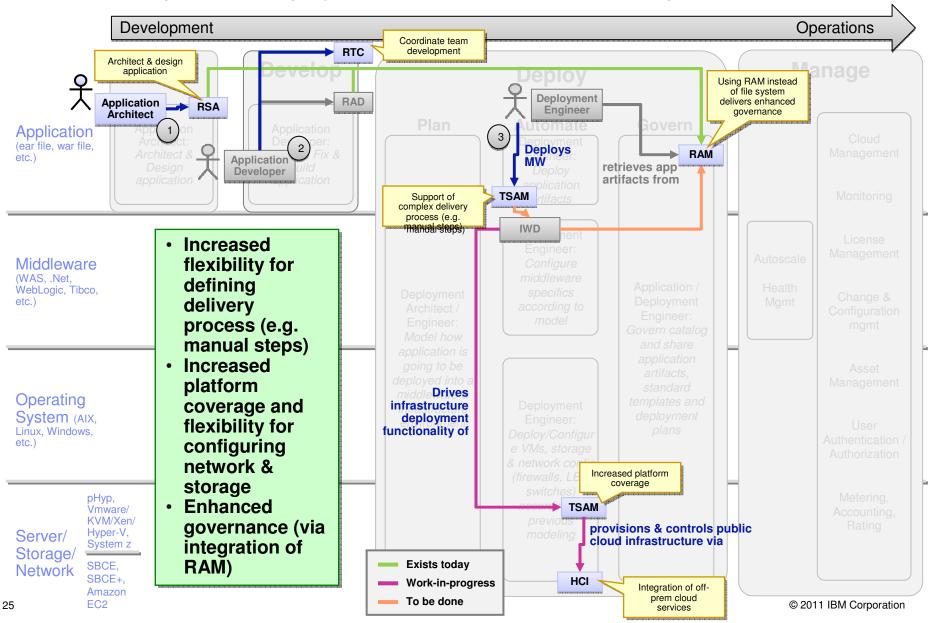

Details: Development & Deployment Scenario - "Single Developer" (workload-based)

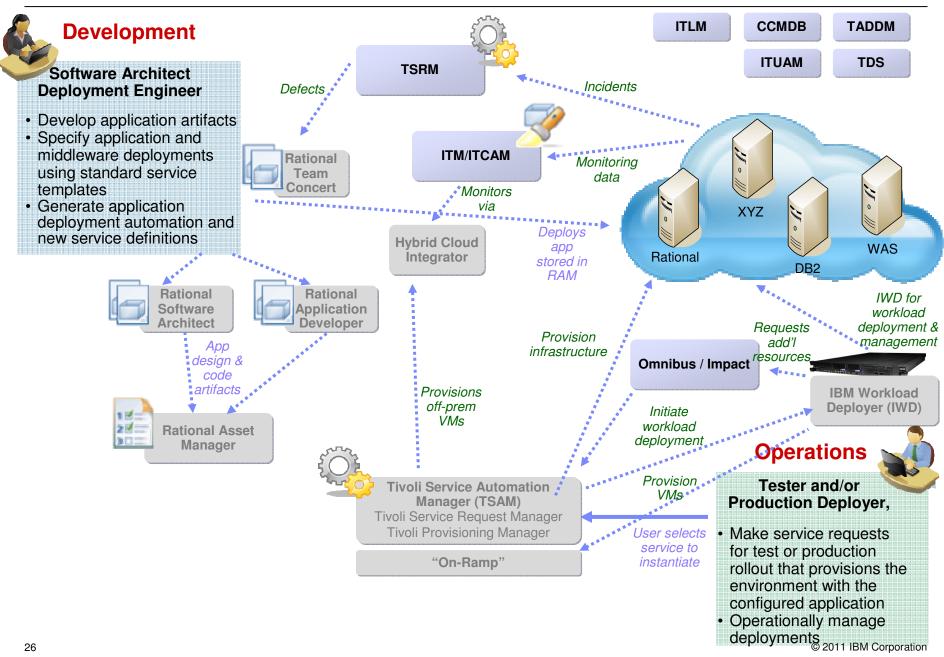

Development & Deployment Scenario - "Team Development" (workload-based)

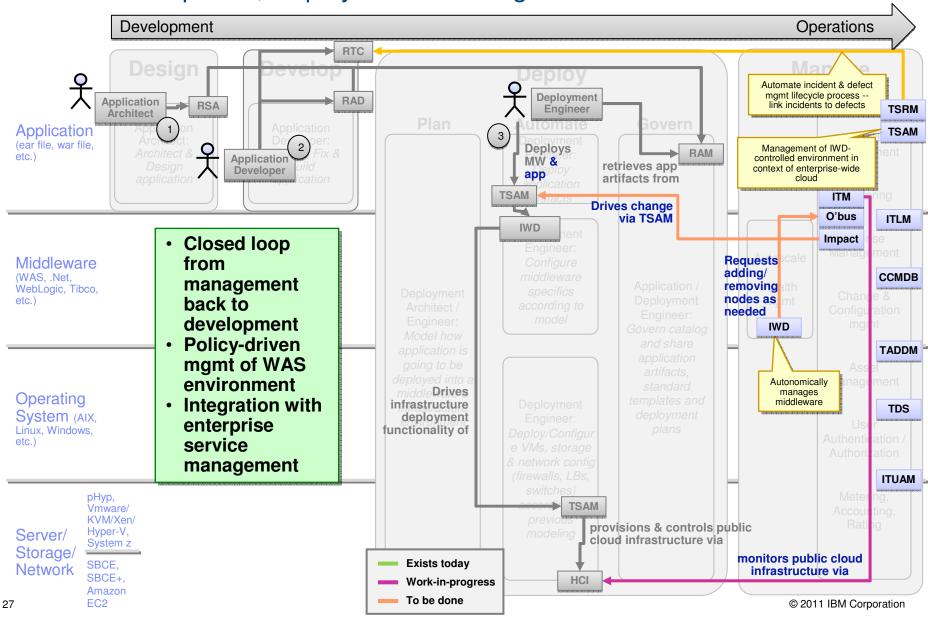

Details: Development & Deployment Scenario - "Team Development" (workload-based)

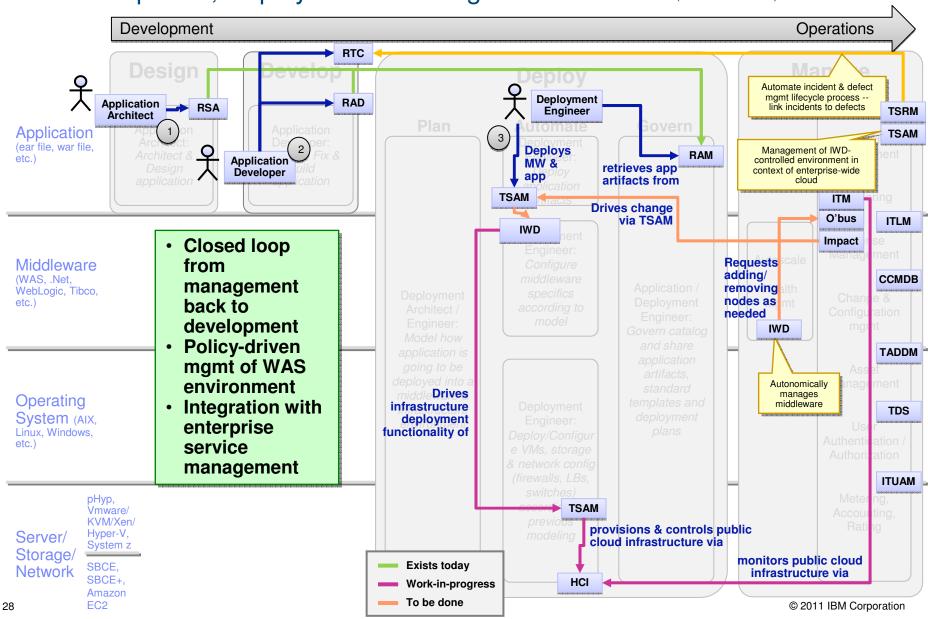

Development, Deployment & Management Scenario (workload-based)

Details: Development, Deployment & Management Scenario (workload-based)

Full Development, Deployment & Management Scenario (workload-based)

Summary

Agile Operation Cloud solution address

✓ Development and Operations teams collaboration challenges

Hand-off from development teams is inconsistent and manual

✓ Application component requirements do not match IT infrastructure

Deployment requirements are difficult to validate

- ✓ Enterprise, Software & IT architects all use different formats
- No standardization or templates for reuse

Complex series of steps

- Deployment engineers often execute manual steps
- ✓ Not repeatable, prone to error
- Automations are hard to build, maintain and reuse
- ✓ Hard to tell what if the right things were installed

Question???
