

Introducing IBM Smart Analytics Optimizer

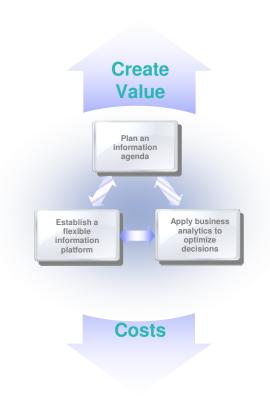

Dan Wardman VP, Information Management Mainframe Software

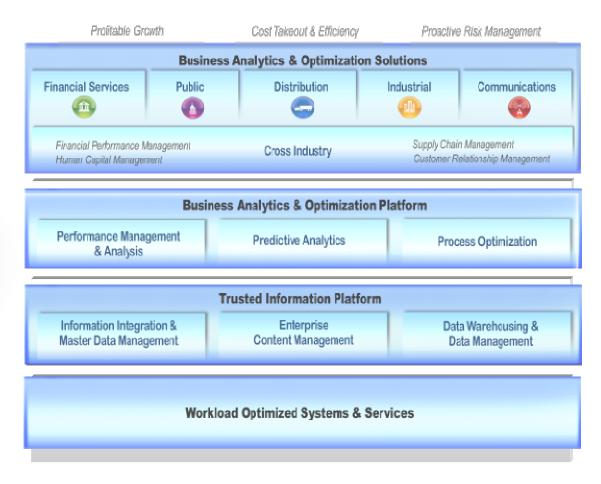

Getting started with an information-led transformation

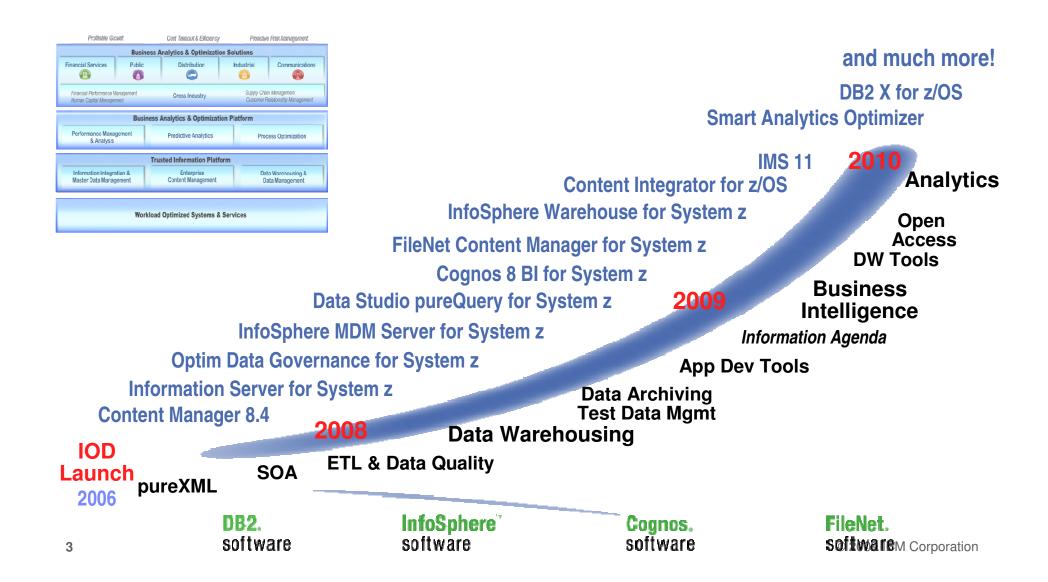

Information-Led Transformation for System z

More new capabilities delivered in the past 3 years than at any point in the mainframe's history

The Resurgence of Data Warehousing and Business Intelligence on System z

→ IBM has invested hundreds of millions of dollars to bring new state of the art capabilities and solutions to System z in support of customers' warehouse and BI requirements

 A 2007 study by IDUG found that nearly 50% of IDUG respondents are already using DB2 for z/OS for data warehousing. 78% indicated a desire for more capabilities in warehousing, query and reporting.

 Analysts Agree! IBM's Data Warehousing & BI breadth on System z is a game changer in the market.
 Donald Feinberg, Gartner

Mission Critical Workloads Require Highest QoS

- More than 90% of Global 2000 companies plan to incorporate analytics into multiple operational applications that access the data warehouse by 2010, but fewer than 15% of data warehouses have been designed to provide high availability, failover, disaster recovery and the remaining components of mission-critical systems.
- By the end of 2009, 90% of Global 2000 companies will have implemented some type of mission-critical dependency between the warehouse and at least one revenue supporting or cost-controlling operational application — up from less than 25% in 2007.
- Fewer than 15% of data warehouses in 2007 have been designed to provide high availability, failover, disaster recovery and the remaining components of mission-critical systems.

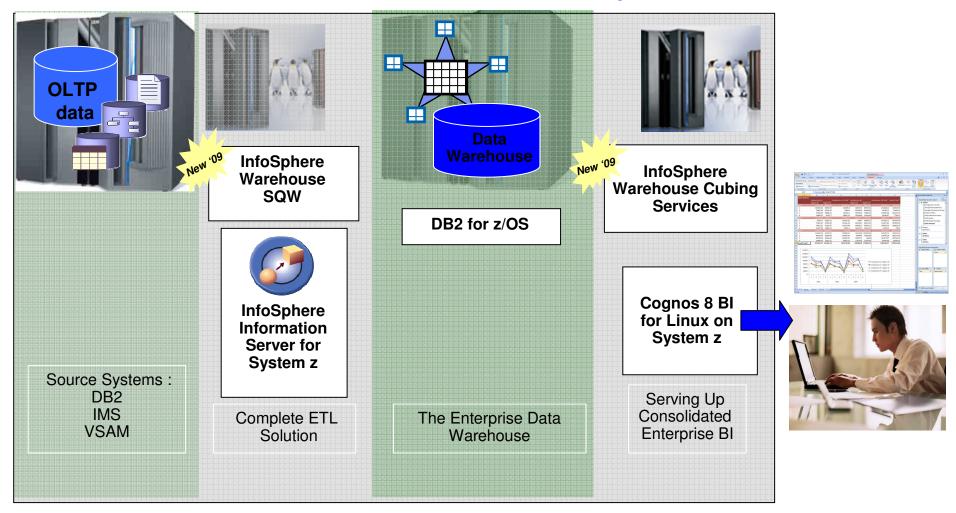

- Sounds like a good match for System z value proposition
 - Proven reliability and continuous availability capabilities
 - Exploiting synergistic effects of proximity to the operational data

¹ Operational Analytics and the Emerging Mission-Critical Data Warehouse, 14 May 2007

The Data Warehouse and BI Solution on System z

Combining the Reliability and Availability of DB2 for z/OS with Cost Effective Applications running on Linux for System z

Cognos 8 BI

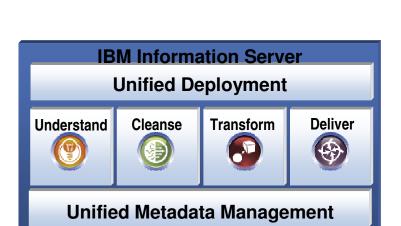

Information Server

InfoSphere Information Server for System z

Accelerating the delivery of trusted information

Profile, cleanse, and transform information from heterogeneous data sources to drive greater business insight

- Significant cost savings on System z
- Scalable to any volume and processing requirements
- Fully integrated, auditable data quality
- Metadata-driven integration for increased productivity

InfoSphere MDM Server for System z

The first multi-domain, multi-function MDM product in the market

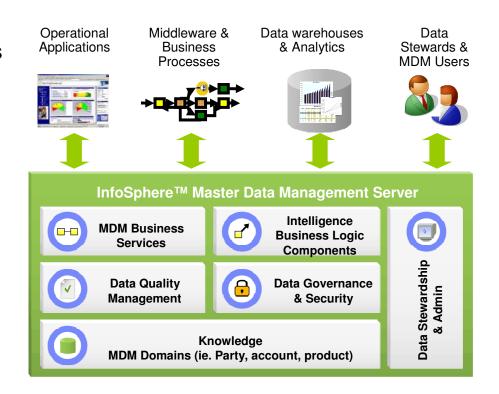

Packaged to address all types of MDM implementations

- From small "registry" projects to strategic "transaction-hub" deployments
- Allows clients to grow as required by implementing existing functionality
- Significantly lowers client risk and time/cost to implement

Enables a SOA Library

- 800 pre-packaged business services
- Significant out of the box functionality
- Reduces total cost of ownership

Provides leading performance& scalability

Agenda

- Business and Technology Drivers
- Key Design and Operational Features
 - → IBM Smart Analytics Optimizer as a virtual DB2 component
 - → ISAO engine
 - → Marts
 - → Query execution
- Supported workloads

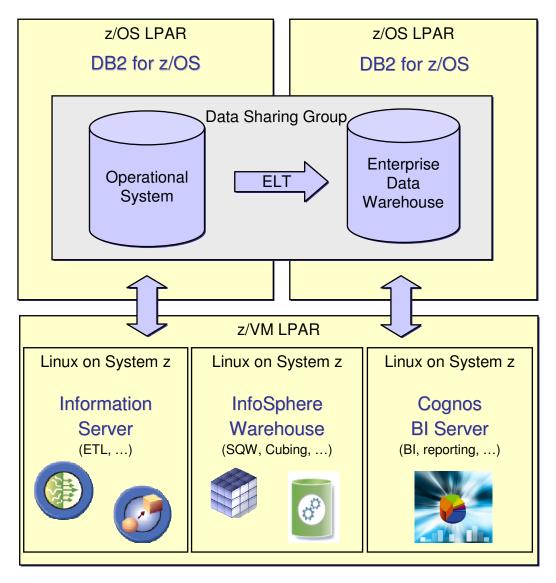

Business Challenges and Technology Trends

- Changing business requirements
 - → BI/DW becoming mission critical and requires OLTP-like QoS
 - reliability, continuous availability, security, mixed workload management, ...
 - orders of magnitude faster execution of complex, ad hoc queries
 - predictable query performance
 - Shift towards dynamic DW and operational BI
 - Combining OLTP and OLAP workloads
- Traditional performance tuning tools of the trade such as indexing, prebuilt aggregates and MQTs struggling to keep the pace
 - Require top DBA expertise and sophisticated tools
 - Even then not good enough due to ad-hoc, unpredictable nature of the workload
- Technology trends
 - → Very large number of processor sockets and cores
 - Massive amounts of real memory
 - → Specialized physical data designs: row-store vs. column-store

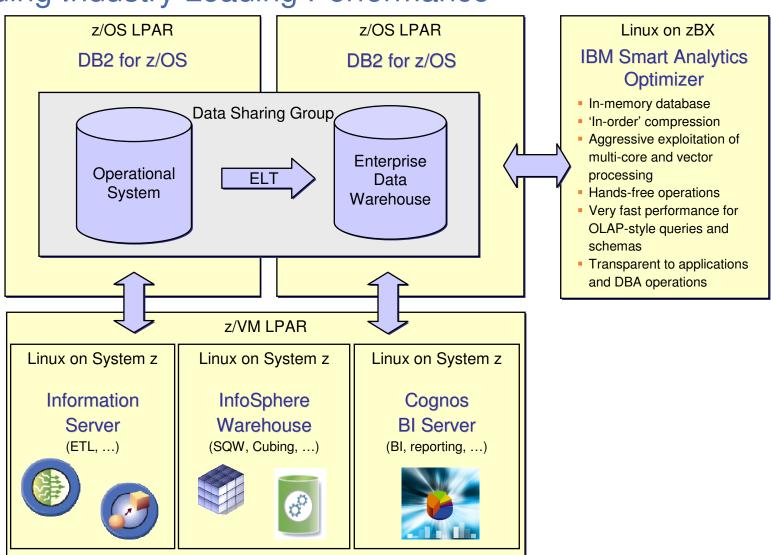

Ultimate Consolidation Opportunity

- Consolidation of mission-critical data on System z
- Leveraging existing environment, high availability, backup and governance procedures as well as skills
- Efficient data movement within a data sharing group (no network)
- Performance and TCO improvements through cubing services (data marts) and DB2 enhancements
- Complex transformations and data quality are driven from Linux on System z with Information Server

IBM Smart Analytics Optimizer Adding Industry Leading Performance

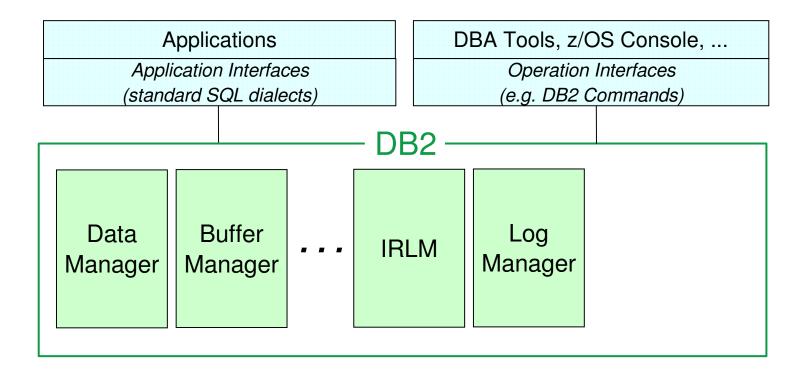

Agenda

- Business and Technology Drivers
- Key Design and Operational Features
 - → IBM Smart Analytics Optimizer as a virtual DB2 component
 - → ISAO engine
 - → Marts
 - → Query execution
- Supported workloads

Deep DB2 Integration within zHybrid Architecture IBM Smart Analytics Optimizer as a Virtual DB2 Component

100's GB of memory

Applications

Application Interfaces (standard SQL dialects) DBA Tools, z/OS Console, ...

Operation Interfaces (e.g. DB2 Commands)

Enabling Technology – IBM Research Project BLINK

- Various Compression Techniques
 - → Enables in-memory database
 - → Order-preserving
 - → Frequency partitioning
- Register-store: a combination of row- and column-based stores
- Multi-core friendly scans
 - → Massive scale-out parallelism
 - → Scans on compressed data
 - → Vector processing Evaluation of all predicates in parallel
- Selective schema melting

OLTP vs. DW

- In a typical transactional workload, you normally fetch and use all attributes of a tuple. If you for example have a CUSTOMERS table, you wouldn't fetch the STREETNAME w/o also fetching the house number or ZIP code.
 - → A transactional query is used to fetch few, very specific records of a relation.
- In typical Data Warehouse workloads, you tend to fetch only a small subset of each record.
 - → The tables are usually very wide, having multiple measure columns.
 - Queries almost never touch all attributes of the tuples but only a small subset of the available attributes.
 - → A query usually needs to evaluate/aggregate many tuples per relation.

Row-Store – Optimal Choice for OLTP

- In traditional DBMS, we use a Row – Store approach where each row is stored contiguously and where multiple rows are stored sequentially in I/O optimizerd data structures.
- If only few attributes are required, the complete row needs to be fetched and uncompressed.
- Lots of the data is moved and decompressed w/o even being used.

	COL1		COL2		COL3		COL4		COL5		COLn	COL1	
	COL2		COL3 COL4			COL5		COLn		COL1	COL2		
	COL3	COL4		COL5			COLn		COL1		COL2	COL3	
	COL4		COL5		COLn		COL1		COL2		COL3	COL4	
	COL5		COLn		COL1		COL2		COL3		COL4	COL5	
	COLn		COL1		COL2		COL3		COL4		COL5		1
	COL1		COL2		COL3		COL4		COL5		COLn	COL1	
	COL2		COL3		COL4		COL5		COLn		COL1	COL2	
	COL3		COL4		COL5		COLn		COL1		COL2	COL3	
	COL4		COL5		COLn		COL1		COL2		COL3	COL4	ſ
	COL5		COLn		COL1		COL2		COL3		COL4	COL5	
	COLn		COL1		COL2		COL3		COL4		COL5		
													\bot

While a **Row – Store** is very efficient for transactional workloads, it is suboptimal for analytical workloads where only a subset of the attributes is needed!

Column-Store: Optimized for Certain DW Workloads

- Query Engines, which are optimized for analytical queries, sometimes use a Column – Store approach.
- In a Column Store, the data of a specific column is stored sequentially before the data of the next column begins.
- If attributes are not required for a specific query execution, they simply can be skipped, not causing any I/O or decompression overhead.

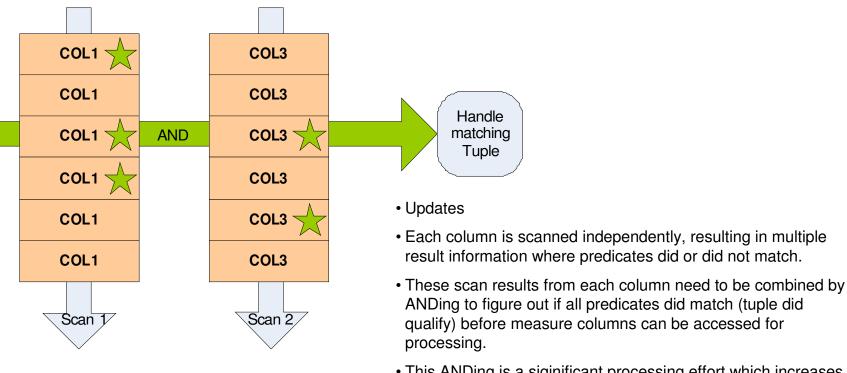

In a **Column – Store**, the data is also compressed sequentially for a column. This is an optimized approach if you plan to perform a sequential scan over your data. Random access to specific attributes in this store is not performing well.

This is normaly handled by limiting the number of tuples per column before the next column is stored. (The data is split into blocks.)

Column-Store Deficiencies

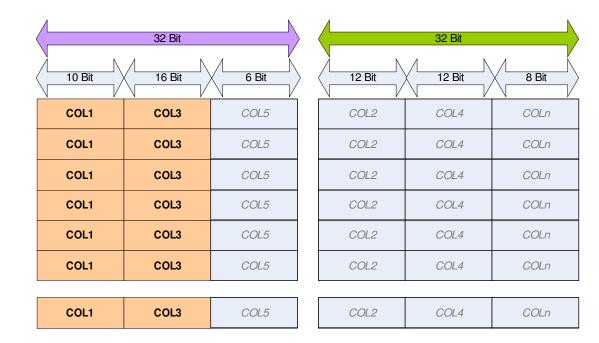

- This ANDing is a siginificant processing effort which increases with tuple count and amount of columns.
- The access to measure colums for processing (i.e. aggregation) is a "random access" which is not performing well on pure columns stores.
- The width of a compressed column is often not matching processure architectures.

Register-Store

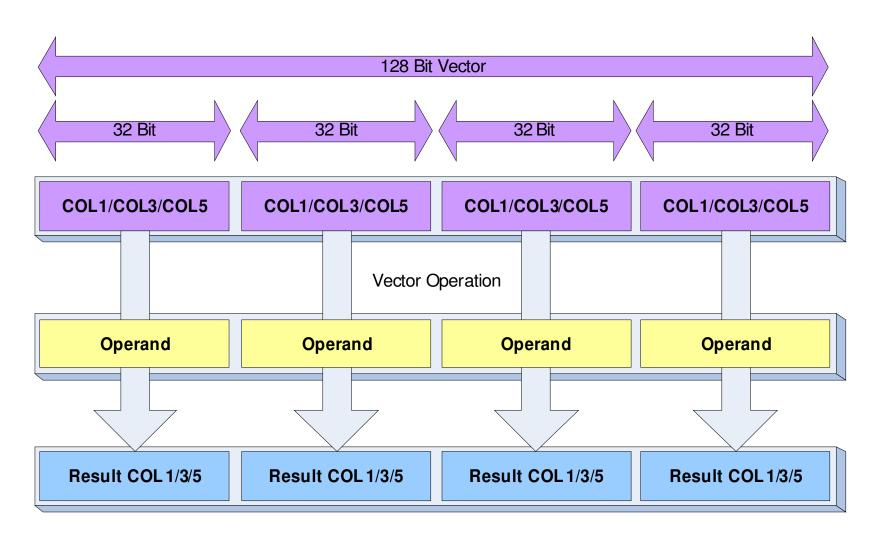

- Within a Register Store, several columns are grouped together.
- The sum of the width of the compressed columns doesn't exceed a register compatible width. This could for example be 32 or 64 bit for a 64 bit system. It doesn't matter how many columns are placed within the register – wide data element.
- It is beneficial to place commonly used columns within the same register – wide data element. But this requires dynamic knowledge about the executed workload (runtime statistics).
- Having multiple columns within the same register – wide data element prevents ANDing of different results.

The **Register – Store** is an optimization of the Column – Store approach where we try to make the best use of existing hardware. Reshuffling small data elements at runtime into a register is time consuming and can be avoided. The **Register – Store** also delivers good vectorization capabilities.

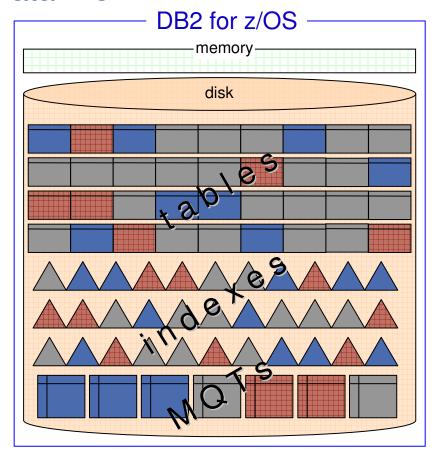

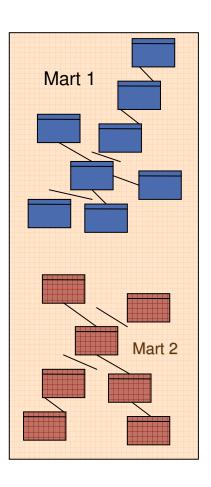

Single Instruction Multiple Data Paradigm

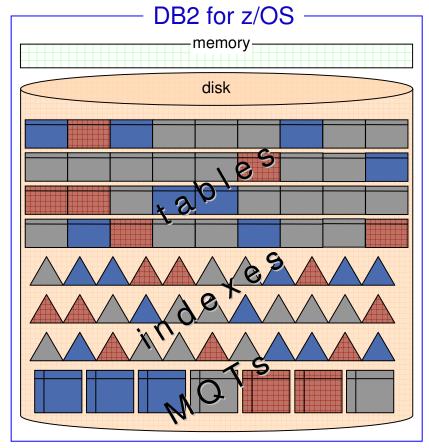

Data View

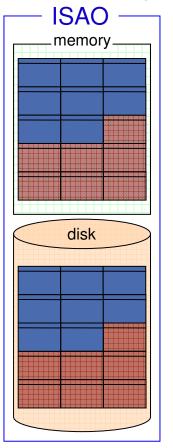

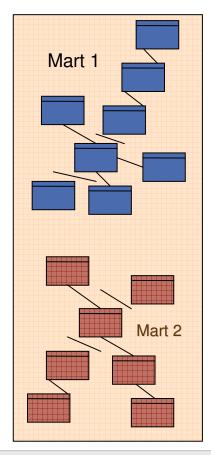

Data View: Marts - Redundant Sets of Memory Resident Tables

- DB2 continues to own and manage all data
- Access performance is influenced by traditional tuning mechanisms such as indexing, MQTs, aggregates, ...
- Typical usage: Enterprise Data Warehouse, large Data Marts

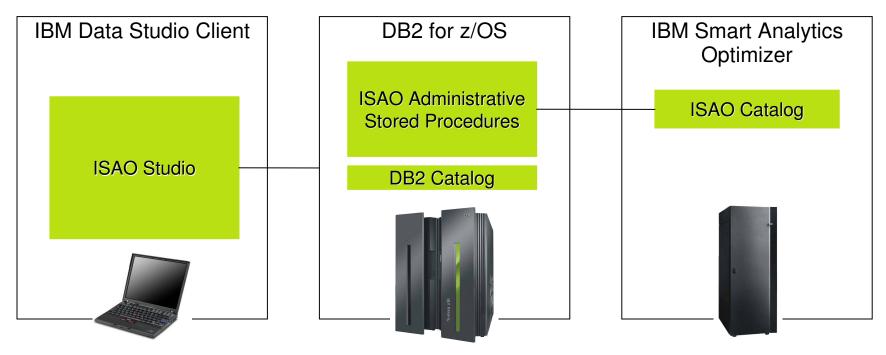

- ISAO contains fully memory resident, compressed copies of performance critical tables grouped into logically connected marts, bound ideally by star schema constraints
- Similar but much broader than MQTs: no column projections, no row restrictions, no row aggregations
- Typical usage: Data Marts, MQTs consolidation and replacement

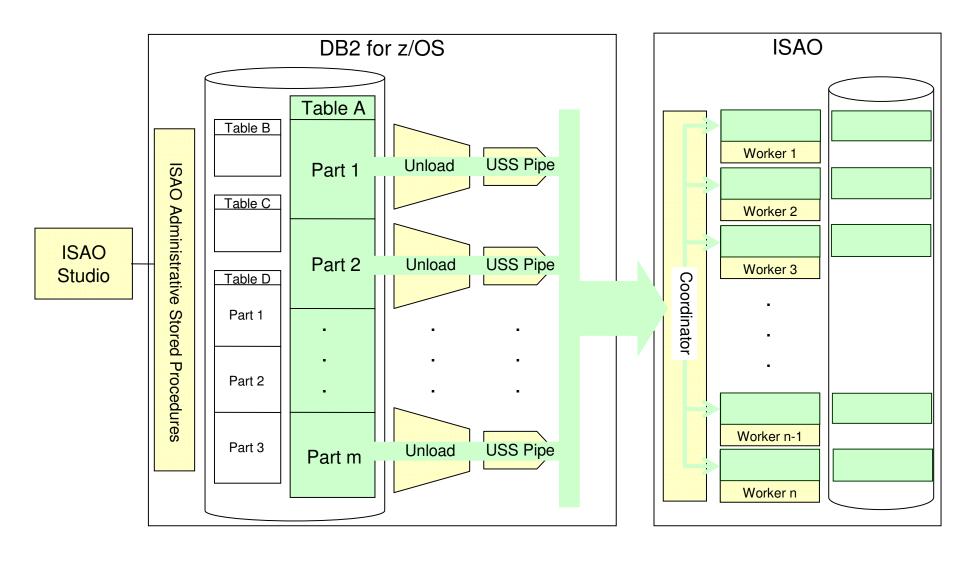

ISAO Mart Definition and Deployment

- ISAO marts need to be defined and deployed to ISAO before data is loaded and queries sent to ISAO for processing.
 - Definition: identifying tables and relations that make up marts.
 - Deployment: making marts known to DB2, i.e. storing mart meta data in the DB2 and ISAO catalog.
- ISAO Studio guides you through the process of defining and deploying marts, as well as invoking other administrative tasks.
- ISAO Stored Procedures implement and execute various administrative operations such as mart deployment, load and update, and serve as the primary administrative interface to ISAO from the outside world including ISAO Studio.

ISAO Mart Load

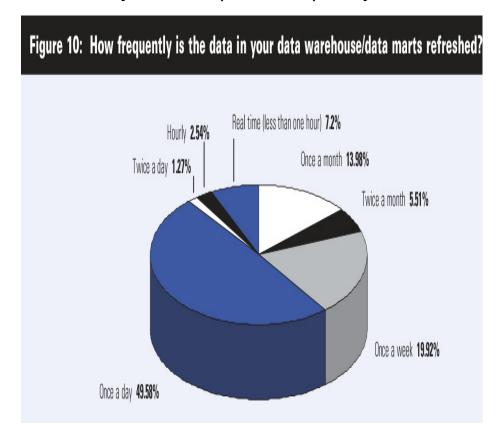

ISAO Mart Update

- Typical DW update operations:
 - LOAD RESUME and REPLACE
 - ADD and ROTATE PARTITION
 - SQL INSERT, UPDATE, DELETE
 - Delete complete partition or table
 - TRUNCATE TABLE
- → ISAO will over time phase-in support for all the typical operations in this order
 - 1. Full table reload
 - 2. Updated partition reload
 - 3. Individual row change
- The marts update is initiated and controlled through ISAO Studio
- Queries off-loaded to ISAO before the marts are refreshed can return different result set as compared to not being off-loaded
 - In case this is not acceptable use SET CURRENT REFRESH AGE = 0

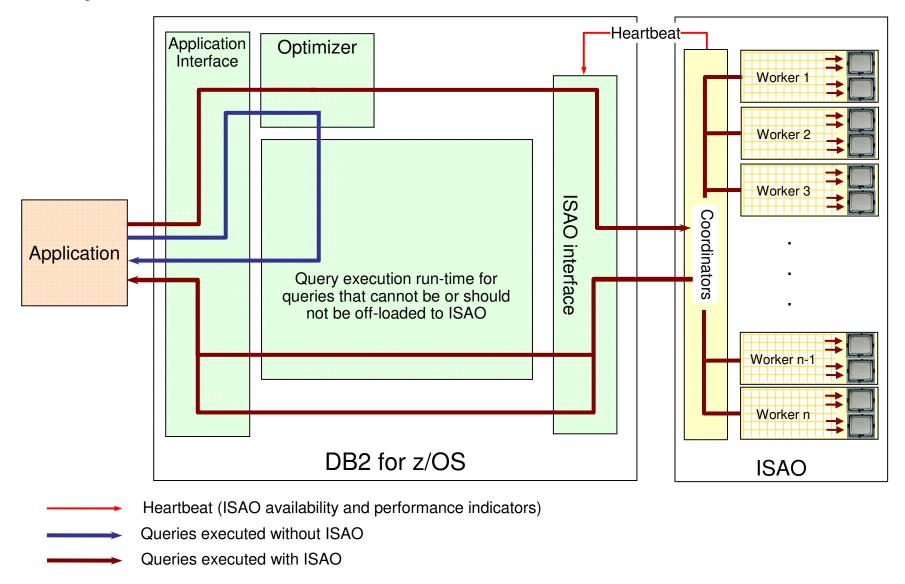

IDUG study on DW update frequency

In 90% of cases DW is updated once a day or even less frequently

Query Execution Process Flow

Additional DB2 Support

- Explain
 - → Indicates ISAO involvement in query execution or the reason for no usage
 - → New table DSN_QUERYINFO_TABLE
- Instrumentation
 - → ISAO availability and performance indicators
- DB2 Commands
 - → DISPLAY THREAD
 - → DISPLAY ISAO
 - → START ISAO
 - → STOP ISAO

Possible ISAO Packaging Options

System z10

ISAO Offerings	XS .5TB	S 1TB	M 2TB	L 3TB	XL 4TB
Enterprise Rack	1	1	1	2	2
BC-H Chassis, incl. double infrastructure (AMM, PDU, 10Gb Enet for data, 1Gb Enet for service, 4Gb F/C switches)	1	1	2	3	4
Blades	7	14	28	42	56
DS5020 with # of SATA disks (750GB)	16	16	16	32	32
Storage Expansion Units	0	0	0	1	1

DS5020

Testing Results

- The problem queries provided by a customer
- Expert database tunning done on all the queries
 - Q1 Q6 even after tuning run for too long and consume lots of resources
 - Q7 improved significantly no ISAO offload is needed
- The table shows elapsed and CPU times measured in DB2 (without ISAO)

	Times measured in DB2 without ISAO						
Query	Total Elapsed	СР	zIIP	Total CPU Time			
Q1	0:02:43	0:03:52	0:02:39	0:06:31			
Q2	0:38:31	0:11:52	0:36:10	0:48:02			
Q3	0:00:25	0:00:04	0:00:15	0:00:19			
Q4	0:26:33	0:13:43	0:20:50	0:34:33			
Q5	0:00:35	0:00:09	0:00:29	0:00:38			
Q6	1:30:35	5:53:30	1:29:56	7:23:26			
Q7	0:00:02	0:00:02	0:00:00	0:00:02			

Testing Results: Performance Improvement after Adding ISAO

seconds

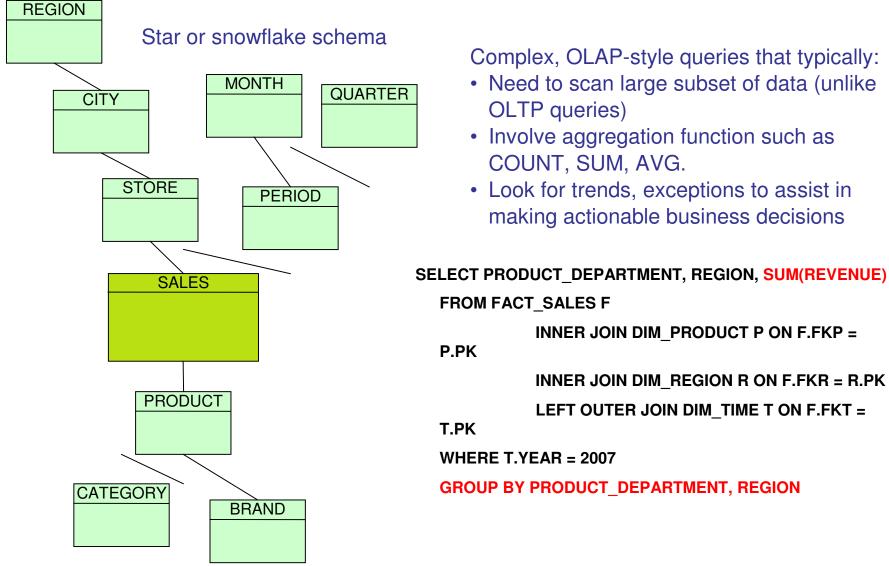

Agenda

- Business and Technology Drivers
- Key Design and Operational Features
 - → IBM Smart Analytics Optimizer as a virtual DB2 component
 - → ISAO engine
 - → Marts
 - → Query execution
- Supported workloads

What Is ISAO Ideally Suited For?

First Release Restrictions

- One query block at a time
 - → If a query consists of multiple query blocks, ISAO processes them one by one
 - Outer query block that contains a subselect is not processed by ISAO (DB2 does not pass the subselect result set to ISAO)
 - Multiple query blocks can be (but do not have to be) generated by
 - Subselects in quantitative predicates (SOME, ANY, ALL)
 - EXISTS or IN predicates with subselects
 - . UNION, INTERSECT, EXCEPT
- Examples:

```
SELECT * FROM Nested Table Expression (SELECT C1+C2 FROM TA) TX
```

```
WITH DTOTAL (deptno, totalpay) AS Common Table Expression (SELECT deptno, sum(salary+bonus)
FROM DSN8810.EMP GROUP BY deptno)
SELECT deptno FROM DTOTAL
WHERE totalpay = (SELECT max(totalpay) FROM DTOTAL);
```

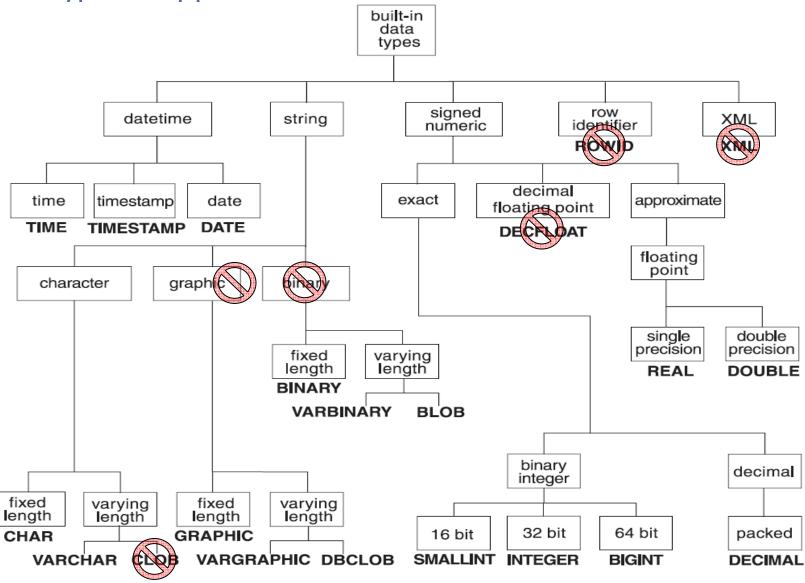

First Release Restrictions

- No static SQL
- No full outer join, no right outer join
- Only equi-joins (no range join predicates)
- No queries that do not include at least one fact table
- No queries that spread across multiple marts
- Not all DB2 functions
 - → No mathematical functions such as SIN, COS, TAN.
 - No user defined functins
 - → No advanced string functions such as LOCATE, LEFT, OVERLAY.
 - → No advanced OLAP functions such as RANK, ROLLUP, CUBE
- Not all DB2 data types such as LOBs, ROWID, XML.

Data Types Support

Options for Workload Analysis

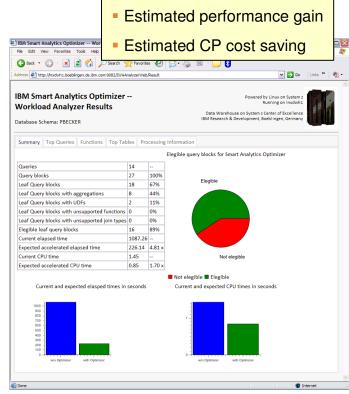

Stage	Purpose
Questionnaire	 Initial assessment based on size, query response time, update characteristics and customer pain points
Quick Workload Test	 Assessment based on dynamic customer workload, runtime statistics, table sizes and SQL.
Detailed Online Workload Analysis	 Assessment based on data mart definition for customer data model and offload capabilities in a real ISAO environment. Addresses all inhibitors for offload and data mart definition questions.

Quick Workload Test

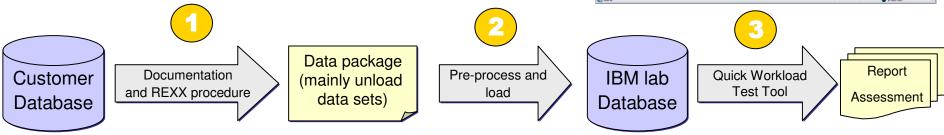

Customer

- Collecting information from dynamic statement cache, supported by step-by-step instruction and REXX script (small effort for customer)
- Uploading compressed file (up to some MB) to IBM FTP server
- → IBM / Center of Excellence
 - Importing data into local database
 - Quick analysis based on known Smart Analytics Optimizer capabilities

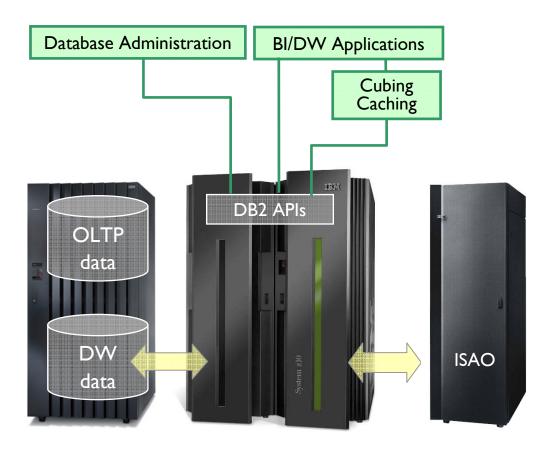

Report for a first assessment:

Query offload potential

IBM Smart Analytics Optimizer Summary of Value Proposition

- Seamless integration of new computing paradigms into proven technology
 - Massive multi-core and vector processing
 - In-memory database
 - Hybrid row- and column-based store
 - No changes to the applications, applications continue to attach to DB2
 - Preserving traditional System z and DB2 quality of service, full fencing and protection of DB2 against possible ISAO failures
- Order of magnitude performance improvement
 - Linear scaling with the number of CPUs
- Reducing need for tedious tuning of DB2 (MQTs, aggregates, indexes, etc.)
- Appliance characteristics
 - User/reference guide assisted installation, initial configuration
 - Hands free operations
- Providing building block for Dynamic DW and Operational BI
- Augmenting System z value proposition as the overall Enterprise Data Hub
 - System z hybrid topology enables additional transparency and management integration
