Messages

Note!

Before using this information and the product it supports, be sure to read the information in "Notices" on page 949.

Edition Notice

This edition applies to Version 6 Release 1 of the IBM Tivoli Storage Manager and to all subsequent releases and modification until otherwise indicated in new editions or technical newsletters.

Changes since the previous edition are marked by a vertical bar (|) in the left margin. Ensure that you are using the correct edition for the level of the product.

Preface

Tivoli® Storage Manager is an enterprise-wide storage management application for the network. It provides automated storage management services to multi-vendor workstations, personal computers, and local area network (LAN) file servers.

This publication contains explanations and suggested actions for messages issued by the following Tivoli Storage Manager components:

- Server
- Administrative client
- Backup-Archive client
- Space Manager (Hierarchical storage management (HSM) client for UNIX and Linux)
- Application programming interface (API)

Who should read this guide

The target audience for this publication is system administrators who service the Tivoli Storage Manager components.

Publications

Tivoli Storage Manager publications and other related publications are available online.

You can search all publications in the Tivoli Storage Manager Information Center: <http://publib.boulder.ibm.com/infocenter/tsminfo/v6>.

You can download PDF versions of publications from the Tivoli Storage Manager Information Center or from the IBM® Publications Center at <http://www.ibm.com/shop/publications/order/>.

You can also order some related publications from the IBM Publications Center Web site. The Web site provides information for ordering publications from countries other than the United States. In the United States, you can order publications by calling 800-879-2755.

Tivoli Storage Manager publications

Publications are available for the server, storage agent, client, and Data Protection.

Table 1. Tivoli Storage Manager server publications

Publication title	Order number
<i>IBM Tivoli Storage Manager Messages</i>	GC23-9787
<i>IBM Tivoli Storage Manager Performance Tuning Guide</i>	GC23-9788
<i>IBM Tivoli Storage Manager Problem Determination Guide</i>	GC23-9789
<i>IBM Tivoli Storage Manager for AIX Installation Guide</i>	GC23-9781
<i>IBM Tivoli Storage Manager for AIX Administrator's Guide</i>	SC23-9769
<i>IBM Tivoli Storage Manager for AIX Administrator's Reference</i>	SC23-9775

Table 1. Tivoli Storage Manager server publications (continued)

Publication title	Order number
<i>IBM Tivoli Storage Manager for HP-UX Installation Guide</i>	GC23-9782
<i>IBM Tivoli Storage Manager for HP-UX Administrator's Guide</i>	SC23-9770
<i>IBM Tivoli Storage Manager for HP-UX Administrator's Reference</i>	SC23-9776
<i>IBM Tivoli Storage Manager for Linux Installation Guide</i>	GC23-9783
<i>IBM Tivoli Storage Manager for Linux Administrator's Guide</i>	SC23-9771
<i>IBM Tivoli Storage Manager for Linux Administrator's Reference</i>	SC23-9777
<i>IBM Tivoli Storage Manager for Sun Solaris Installation Guide</i>	GC23-9784
<i>IBM Tivoli Storage Manager for Sun Solaris Administrator's Guide</i>	SC23-9772
<i>IBM Tivoli Storage Manager for Sun Solaris Administrator's Reference</i>	SC23-9778
<i>IBM Tivoli Storage Manager for Windows Installation Guide</i>	GC23-9785
<i>IBM Tivoli Storage Manager for Windows Administrator's Guide</i>	SC23-9773
<i>IBM Tivoli Storage Manager for Windows Administrator's Reference</i>	SC23-9779
<i>IBM Tivoli Storage Manager Server Upgrade Guide</i>	SC23-9554
<i>IBM Tivoli Storage Manager for System Backup and Recovery Installation and User's Guide</i>	SC32-6543

Table 2. Tivoli Storage Manager storage agent publications

Publication title	Order number
<i>IBM Tivoli Storage Manager for SAN for AIX Storage Agent User's Guide</i>	SC23-9797
<i>IBM Tivoli Storage Manager for SAN for HP-UX Storage Agent User's Guide</i>	SC23-9798
<i>IBM Tivoli Storage Manager for SAN for Linux Storage Agent User's Guide</i>	SC23-9799
<i>IBM Tivoli Storage Manager for SAN for Sun Solaris Storage Agent User's Guide</i>	SC23-9800
<i>IBM Tivoli Storage Manager for SAN for Windows Storage Agent User's Guide</i>	SC23-9553

Table 3. Tivoli Storage Manager client publications

Publication title	Order number
<i>IBM Tivoli Storage Manager for UNIX and Linux: Backup-Archive Clients Installation and User's Guide</i>	SC23-9791
<i>IBM Tivoli Storage Manager for Windows: Backup-Archive Clients Installation and User's Guide</i>	SC23-9792
<i>IBM Tivoli Storage Manager for Space Management for UNIX and Linux: User's Guide</i>	SC23-9794
<i>IBM Tivoli Storage Manager for HSM for Windows Administration Guide</i>	SC23-9795
<i>IBM Tivoli Storage Manager Using the Application Program Interface</i>	SC23-9793
<i>Program Directory for IBM Tivoli Storage Manager z/OS Edition Backup-Archive Client</i>	GI11-8912
<i>Program Directory for IBM Tivoli Storage Manager z/OS Edition Application Program Interface</i>	GI11-8911

Table 4. Tivoli Storage Manager Data Protection publications

Publication title	Order number
<i>IBM Tivoli Storage Manager for Advanced Copy Services: Data Protection for Snapshot Devices Installation and User's Guide</i>	SC33-8331
<i>IBM Tivoli Storage Manager for Databases: Data Protection for Microsoft SQL Server Installation and User's Guide</i>	SC32-9059
<i>IBM Tivoli Storage Manager for Databases: Data Protection for Oracle for UNIX and Linux Installation and User's Guide</i>	SC32-9064
<i>IBM Tivoli Storage Manager for Databases: Data Protection for Oracle for Windows Installation and User's Guide</i>	SC32-9065
<i>IBM Tivoli Storage Manager for Enterprise Resource Planning: Data Protection for SAP Installation and User's Guide for DB2</i>	SC33-6341
<i>IBM Tivoli Storage Manager for Enterprise Resource Planning: Data Protection for SAP Installation and User's Guide for Oracle</i>	SC33-6340
<i>IBM Tivoli Storage Manager for Mail: Data Protection for Lotus Domino for UNIX, Linux, and OS/400® Installation and User's Guide</i>	SC32-9056
<i>IBM Tivoli Storage Manager for Mail: Data Protection for Lotus Domino for Windows Installation and User's Guide</i>	SC32-9057
<i>IBM Tivoli Storage Manager for Mail: Data Protection for Microsoft Exchange Server Installation and User's Guide</i>	SC23-9796
<i>Program Directory for IBM Tivoli Storage Manager for Mail (Data Protection for Lotus Domino)</i>	GI11-8909

Support information

You can find support information for IBM products from a variety of sources.

Getting technical training

Information about Tivoli technical training courses is available online.

Go to <http://www.ibm.com/software/tivoli/education/>.

Searching knowledge bases

If you have a problem with Tivoli Storage Manager, there are several knowledge bases that you can search.

You can begin with the Tivoli Storage Manager Information Center at <http://publib.boulder.ibm.com/infocenter/tsminfo/v6>. From this Web site, you can search all Tivoli Storage Manager publications.

Searching the Internet:

If you cannot find an answer to your question in the Tivoli Storage Manager information center, search the Internet for the latest, most complete information that might help you resolve your problem.

To search multiple Internet resources, go to the support Web site for Tivoli Storage Manager at <http://www.ibm.com/software/sysmgmt/products/support/IBMTivoliStorageManager.html>. From there, you can search a variety of resources including:

- IBM technotes
- IBM downloads

- IBM Redbooks®

If you still cannot find the solution to the problem, you can search forums and newsgroups on the Internet for the latest information that might help you resolve your problem. To share your experiences and learn from others in the user community, go to the Tivoli Storage Manager wiki at <http://www.ibm.com/developerworks/wikis/display/tivolistoragemanager/Home>.

Using IBM Support Assistant:

At no additional cost, you can install on any workstation the IBM Support Assistant, a stand-alone application. You can then enhance the application by installing product-specific plug-in modules for the IBM products that you use.

The IBM Support Assistant helps you gather support information when you need to open a problem management record (PMR), which you can then use to track the problem. The product-specific plug-in modules provide you with the following resources:

- Support links
- Education links
- Ability to submit problem management reports

For more information, see the IBM Support Assistant Web site at <http://www.ibm.com/software/support/isa/>.

Finding product fixes:

A product fix to resolve your problem might be available from the IBM Software Support Web site.

About this task

You can determine what fixes are available by checking the Web site:

1. Go to the IBM Software Support Web site at <http://www.ibm.com/software/tivoli/products/storage-mgr/product-links.html>.
2. Click the **Support Pages** link for your Tivoli Storage Manager product.
3. Click **Download**, and then click **Fixes by version**.

Getting e-mail notification of product fixes:

You can get notifications about fixes and other news about IBM products.

About this task

To receive weekly e-mail notifications about fixes and other news about IBM products, follow these steps:

1. From the support page for any IBM product, click **My support** in the upper-right corner of the page.
2. If you have already registered, skip to the next step. If you have not registered, click **Register** in the upper-right corner of the support page to establish your user ID and password.
3. Sign in to **My support**.

4. On the My support page, click **Edit profiles** in the left navigation pane, and scroll to **Select Mail Preferences**. Select a product family and check the appropriate boxes for the type of information you want.
5. Click **Submit**.
6. For e-mail notification for other products, repeat steps 4 and 5.

Contacting IBM Software Support

You can contact IBM Software Support if you have an active IBM software maintenance contract and if you are authorized to submit problems to IBM.

About this task

Before you contact IBM Software Support, follow these steps:

1. Set up a software maintenance contract.
2. Determine the business impact of your problem.
3. Describe your problem and gather background information.

What to do next

Then see “Submit the problem to IBM Software Support” on page x for information on contacting IBM Software Support.

Setting up a software maintenance contract:

Set up a software maintenance contract. The type of contract that you need depends on the type of product you have.

- For IBM distributed software products (including, but not limited to, Tivoli, Lotus®, and Rational® products, as well as IBM DB2® and IBM WebSphere® products that run on Microsoft® Windows® or UNIX® operating systems), enroll in IBM Passport Advantage® in one of the following ways:
 - **Online:** Go to the Passport Advantage Web page at <http://www.ibm.com/software/lotus/passportadvantage/>, click **How to enroll**, and follow the instructions.
 - **By Phone:** For the phone number to call in your country, go to the IBM Software Support Handbook Web page at <http://www14.software.ibm.com/webapp/set2/sas/f/handbook/home.html> and click **Contacts**.
- For server software products, you can purchase a software maintenance agreement by working directly with an IBM sales representative or an IBM Business Partner. For more information about support for server software products, go to the IBM Technical support advantage Web page at <http://www.ibm.com/servers/>.

What to do next

If you are not sure what type of software maintenance contract you need, call 1-800-IBMSERV (1-800-426-7378) in the United States. For a list of telephone numbers of people who provide support for your location, go to the Software Support Handbook page at <http://www14.software.ibm.com/webapp/set2/sas/f/handbook/home.html>.

Determine the business impact:

When you report a problem to IBM, you are asked to supply a severity level. Therefore, you need to understand and assess the business impact of the problem you are reporting.

Severity 1	Critical business impact: You are unable to use the program, resulting in a critical impact on operations. This condition requires an immediate solution.
Severity 2	Significant business impact: The program is usable but is severely limited.
Severity 3	Some business impact: The program is usable with less significant features (not critical to operations) unavailable.
Severity 4	Minimal business impact: The problem causes little impact on operations, or a reasonable circumvention to the problem has been implemented.

Describe the problem and gather background information:

When explaining a problem to IBM, it is helpful to be as specific as possible. Include all relevant background information so that IBM Software Support specialists can help you solve the problem efficiently.

To save time, know the answers to these questions:

- What software versions were you running when the problem occurred?
- Do you have logs, traces, and messages that are related to the problem symptoms? IBM Software Support is likely to ask for this information.
- Can the problem be recreated? If so, what steps led to the failure?
- Have any changes been made to the system? For example, hardware, operating system, networking software, and so on.
- Are you currently using a workaround for this problem? If so, be prepared to explain it when you report the problem.

Submit the problem to IBM Software Support:

You can submit the problem to IBM Software Support online or by phone.

Online

Go to the IBM Software Support Web site at <http://www.ibm.com/software/support/probsub.html>. Enter your information into the appropriate problem submission tool.

By phone

For the phone number to call in your country, go to the contacts page of the IBM Software Support Handbook at <http://www14.software.ibm.com/webapp/set2/sas/f/handbook/home.html>.

If the problem that you submit is for a software defect or for missing or inaccurate documentation, IBM Software Support creates an Authorized Program Analysis Report (APAR). The APAR describes the problem in detail. If a workaround is possible, IBM Software Support provides one for you to implement until the APAR is resolved and a fix is delivered. IBM publishes resolved APARs on the Tivoli Storage Manager product support Web site at <http://www.ibm.com/software/sysmgmt/products/support/IBMTivoliStorageManager.html>, so that users who experience the same problem can benefit from the same resolutions.

Chapter 1. Introduction to messages

This publication contains explanations and suggested actions for messages issued by the Tivoli Storage Manager server program for storage management services, the administrative client graphical user interface, administrative command line client, backup-archive client, API, and space management client.

This introduction contains information to help you understand the messages issued by these components.

The client can send statistics to the server providing information about a backup or restore. These statistics are informational messages that can be enabled or disabled to the various event logging receivers. These messages are not published in this manual.

Messages for HSM for Windows and for Data Protection products are included in an appendix in the user's guides for those products, and in product-specific subsections of the Troubleshooting section of the Web-based information center.

Messages can appear on the server console, the administrative client, an operator terminal, the administrative graphical user interface, the backup-archive client, or the space-management client.

Tivoli Storage Manager provides an activity log to help the administrator track server activity and monitor the system. The activity log contains messages generated by the server, and is stored in the database. The server automatically deletes messages from the activity log after they have passed the specified retention period. Any messages sent to the server console are stored in the activity log. Examples of the types of messages stored in the activity log include:

- When client sessions start or end
- When migration starts or ends
- When backed up files are expired from server storage
- Any output generated from background processes

See the *Tivoli Storage Manager Administrator's Guide* for more information about activity logs.

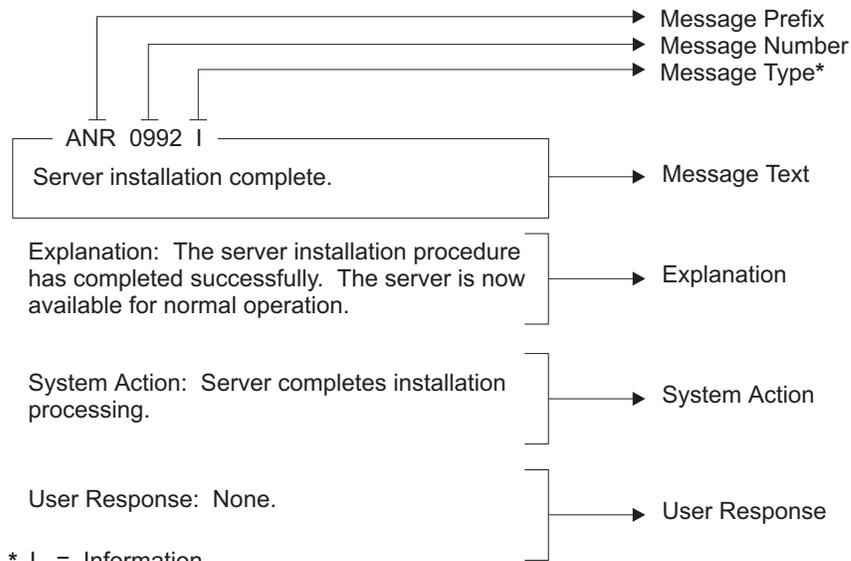

Message format

Messages consist of the following elements:

- A three-letter prefix. The relation of the prefixes to products is explained above.
- A numeric message identifier.
- A one-letter severity code. Severity codes are explained below.
- Message text that is displayed on screen and written to message logs.
- Explanation, System Action, and User Response texts. These texts elaborate on the message text, and are accessible only in documentation.

The image below presents a typical message.

The callouts on the right of the image identify each element of the message.

- * I = Information
- E = Error
- S = Severe Error
- W = Warning
- K = Kernel message that originates from the hierarchical storage management (HSM) client

The following letters give an indication of the severity of the action that generated the message. The severity codes and their meanings are as follows:

E	Error	Processing cannot continue.
W	Warning	Processing can continue, but problems may occur later.
I	Information	Processing continues. User response is not necessary.

Message variables in the message text appear in italics.

Messages prefixes

Messages have different prefixes to help you identify the Tivoli Storage Manager component that issues the message. The table below identifies the prefix that is associated with each component.

Table 5. Messages prefixes by component

Prefix	Component
ACD	Data Protection for Lotus Domino® Server
ACN	Data Protection for Microsoft Exchange Server
ACO	Data Protection for Microsoft SQL Server

Table 5. Messages prefixes by component (continued)

Prefix	Component
ANE	Events from any of the following clients, when the events are written to server log files: <ul style="list-style-type: none"> • Administrative clients • Application program interface clients • Backup–archive clients • Space manager (HSM) clients • Microsoft Exchange VSS and Hardware Devices Snapshot Integration Modules • DB2 UDB and Hardware Devices Snapshot Integration Modules
ANR	Servers
ANS	<ul style="list-style-type: none"> • Administrative clients • Application program interface clients • Backup–archive clients • Space manager (HSM) clients • Microsoft Exchange VSS and Hardware Devices Snapshot Integration Modules • DB2 UDB and Hardware Devices Snapshot Integration Modules
ANU	Data Protection for Oracle.
BKI	Data Protection for mySAP for DB2 UDB and Data Protection for mySAP for Oracle.
EEO	<ul style="list-style-type: none"> • Data Protection for Snapshot Devices for mySAP for Oracle • Data Protection for Disk Storage and SAN VC for Oracle
EEP	Data Protection for Snapshot Devices for mySAP for DB2 UDB
IDS	<ul style="list-style-type: none"> • Data Protection for Snapshot Devices for mySAP for Oracle • Data Protection for Snapshot Devices for mySAP for DB2 UDB

Interpreting return code messages

Many different commands can generate the same *return code*. The following examples are illustrations of two different commands issued that result in the same return code; therefore, you must read the *descriptive message* for the command.

In these examples, two different commands yield the same return code, but they also return descriptive messages that are unique to each command. The two commands are **q event standard dddd** and **def vol cstg05 primary**. Both yield a generic message with return code:

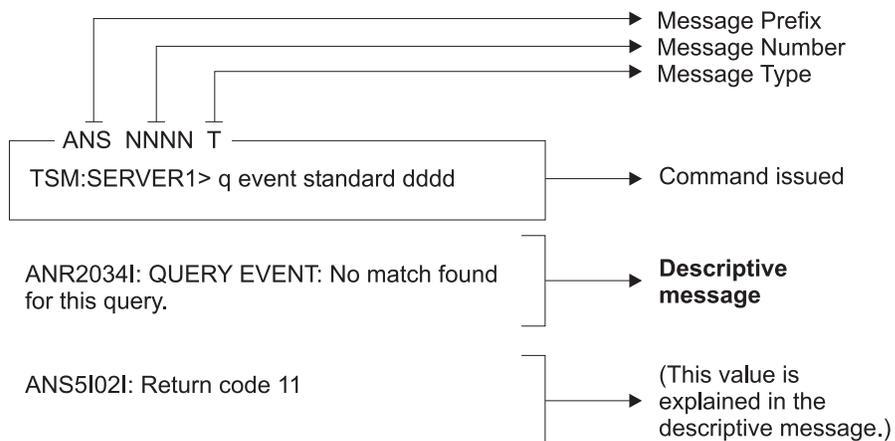

ANS5102I: Return Code 11.

But the first command also yields a descriptive message:

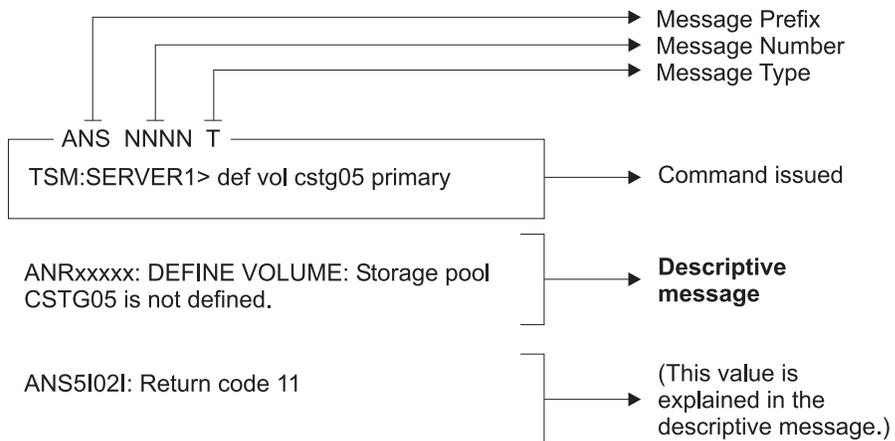

ANR2034I: QUERY EVENT: No match found for this query.

And the second command also yields a unique, descriptive message:
ANRxxxx: DEFINE VOLUME: Storage pool CSTG05 is not defined.

Example one for QUERY EVENT command

Example two for DEFINE VOLUME command

Chapter 2. Server messages reference

This section lists all publishable server messages, and identifies which of those messages are new, changed, or have been deleted since the previous release.

The messages are for server version 6.1.2.

Server messages changes

This section lists the server messages that are new or changed since the previous release. Messages that have been deleted since the previous release are also listed. The changes occurred since the publication of messages at version 5.5.0, November 2007.

Server ANR messages changes

This section lists the new, changed, and deleted ANR messages for the servers.

Changed ANR messages

In addition to the message number, the part of the message that has changed is listed.

If a message text changes because a blank space is added or deleted, the change might not be visible when documented in PDF or XHTML or format. This is due to the way that the PDF and XHTML formatters handle blank spaces. When the message text is written to the activity log or displayed in a command prompt window, the blank spaces are preserved. Hence, the change is visible when the message is recorded in the activity log or displayed in a command prompt window.

In the change descriptions below, if a message text changes only in casing or in blank spaces, the distinction is noted. This distinction is not noted for changes to the message explanation, system action, or user response.

Message Number	Change
ANR0100E	Message text (in casing or blank spaces only)

Message Number Change

ANR0101E	Message text (in casing or blank spaces only), user response
ANR0102E	Message text (in casing or blank spaces only)

Server ANE messages changes

This section lists the new, changed, and deleted ANE messages for the servers.

New ANE messages

There are no new ANE messages.

Changed ANE messages

In addition to the message number, the part of the message that has changed is listed.

Message Number	Change
ANE4991I	Message text, explanation, system action, user response
ANE4992W	Message text, explanation, system action, user response
ANE4993E	Message text, explanation, system action, user response
ANE4994S	Message text, explanation, system action, user response

Deleted ANE messages

There are no deleted ANE messages.

Server ANR messages list

This section lists the server ANR messages. The messages are listed in ascending numeric order. When several messages have the same message number, it is because similar messages apply to several server platforms. In this case the message number is followed by a server platform identifier. The message can be slightly different among platforms.

ANR0100E *Source file(line number): Error error code creating table "table name".*

Explanation: An internal error has occurred in an attempt to create a server database table. This message always accompanies another error message and provides more detail about that error.

System action: The activity that generated this error fails.

User response: Contact your service representative.

ANR0101E *Source file(line number): Error error code opening table "table name".*

Explanation: An internal error has occurred in an attempt to access a server database table. This message always accompanies another error message and

provides more detail about that error.

System action: The activity that generated this error fails.

User response: If the server or storage agent is stopping in response to a HALT command and this message is encountered it can be ignored. Otherwise contact your service representative.

ANR0102E *Source file(line number): Error error code inserting row in table "table name".*

Explanation: An internal error has occurred in an attempt to add data to a server database table. This message always accompanies another error message and provides more detail about that error.

System action: The activity that generated this error fails.

User response: Contact your service representative.

ANR0103E *Source file(line number):* **Error error code updating row in table "table name".**

Explanation: An internal error has occurred in an attempt to update data in a server database table. This message always accompanies another error message and provides more detail about that error.

System action: The activity that generated this error fails.

User response: Contact your service representative.

ANR0104E *Source file(line number):* **Error error code deleting row from table "table name".**

Explanation: An internal error has occurred in an attempt to remove data from a server database table. This message always accompanies another error message and provides more detail about that error.

System action: The activity that generated this error fails.

User response: Contact your service representative.

ANR0105E *Source file(line number):* **Error setting search bounds for table "table name".**

Explanation: An internal error has occurred in an attempt to access data in a server database table. This message always accompanies another error message and provides more detail about that error.

System action: The activity that generated this error fails.

User response: Contact your service representative.

ANR0106E *Source file(line number):* **Unexpected error error code fetching row in table "table name".**

Explanation: An internal error has occurred in an attempt to access data in a server database table. This message always accompanies another error message and provides more detail about that error.

System action: The activity that generated this error fails.

User response: Contact your service representative.

ANR0107W *Source file(line number):* **Transaction transaction ID was not committed due to an internal error.**

Explanation: An internal error was detected during transaction commit. This message should be preceded by another error message which provides more detail about that error.

System action: The activity that generated this error fails.

User response: Contact your service representative.

ANR0108E *Source file(line number):* **could not start a new transaction.**

Explanation: An error occurred while attempting to start a new transaction. Possibly there is not enough memory.

System action: The activity that generated this error fails.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0109E **Attempt number att_num Unable to load cryptography module from 'icc location'.**

Explanation: An error occurred while attempting to load the cryptography module.

System action: The application will not start.

User response: Verify that the ICC cryptography directory is located in either the application root directory or the directory specified in the platform specific environment variable (the DSMSERV_DIR for Unix platforms or the Windows registry).

ANR0110E **An unexpected system date has been detected; the server is disabled. Verify the system date and use the ACCEPT DATE command to establish the current date as valid.**

Explanation: The server has noted that the current system date is suspect. It is earlier than the server install date or has suddenly moved into the future by 30 days or more.

System action: The server is disabled for client, server and administrative access. Most server processes will not execute.

User response: If the current system date is not valid, reset the date. Use the ACCEPT DATE command to establish the current date as valid on the server. After executing this command, you can use the ENABLE SESSIONS ALL command to enable the server for sessions. Accepting an invalid date can cause any of the following problems: Premature deletion of data Excessive retention of data Scheduling problems Event record problems Password expiration problems.

ANR0111E *Command: The BEGINNODEID and ENDNODEID are both required to be specified.*

Explanation: The BEGINNODEID and ENDNODEID are both required to be specified or neither of them are required.

System action: The server fails the command.

User response: Reissue the command, specifying both BEGINNODEID and ENDNODEID, or neither of them.

ANR0112E *Command: The specified BEGINNODEID node id is greater than the ENDNODEID node id.*

Explanation: Either the BEGINNODEID or the ENDNODEID is invalid because the value of the BEGINNODEID is greater than the ENDNODEID.

System action: The server fails the command.

User response: Reissue the command, specifying the ENDNODEID to be greater than the BEGINNODEID, or both to be equal.

ANR0113E *Command: The storage pool list specified with the parameter parameter name includes storage pool storage pool name more than once for simultaneous write.*

Explanation: The storage pool name specified has been specified more than once. The name occurs more than once in the COPYSTGPOOLS list, more than once in the ACTIVEDATAPOOLS list, or it has been specified in both lists.

System action: The command fails.

User response: Reissue the command specifying unique storage pool names.

ANR0114E *Command: The NUMBER parameter is required on this command. The current default value is 0.*

Explanation: The NUMBER parameter is required for the FORMAT LfvOLUME COMMAND when the LfvOLUMEFORMATCOUNT option is set to 0.

System action: The command is not executed.

User response: Either reissue the command with the NUMBER parameter or else use the the SETOPT command to change the LfvOLUMEFORMATCOUNT value.

ANR0115W *The server script script name attempted to start more parallel commands than are allowed for a single script. A single script is limited to parallel command limit parallel commands.*

Explanation: The server waits for all previous parallel commands started by the script to complete. When all previous parallel commands are complete, the server allows the script to continue. The script can attempt to start more parallel commands.

System action: The server waits for all previous parallel commands before allowing the script to continue.

User response: If you need to start more parallel commands than the script limit allows, modify the script to invoke multiple scripts in parallel, each of which can start multiple parallel commands, up to the script limit.

ANR0116W *The server script script name attempted to start more parallel commands than are allowed for the server. The server is limited to parallel command limit parallel commands.*

Explanation: The server waits for all previous parallel commands started by the script to complete. When all previous parallel commands are complete, the server allows the script to continue. The script can attempt to start more parallel commands. If the limit is exceeded, the command will run serially.

System action: The server waits for all previous parallel commands before allowing the script to continue.

User response: Reduce the number of parallel commands or scripts that are running on the server at any one time.

ANR0117E *The server contains stored data. Archive data retention protection cannot be changed.*

Explanation: The archive data retention protection state cannot be changed while the server contains any backup, archive, or space-managed data.

System action: Processing continues.

User response: In order to change the archive data retention protection state, the server must contain no backup, archive, or space-managed data. Either re-initialize the server database, or delete all stored data and try the command again.

ANR0118W *The client option client option is not valid and will not be sent to the client. Use the INCLEXCL option instead.*

Explanation: The client options INCLUDE and EXCLUDE are not valid and have been replaced by the combined INCLEXCL. If INCLUDE and EXCLUDE are used in client option sets, use the INCLEXCL option along with the specific include or exclude option that you want the clients to use.

System action: The option is ignored and is not sent to the client. The server continues processing.

User response: Client options INCLUDE and EXCLUDE are not valid; use the INCLEXCL option along with the specific include or exclude option that you want the clients to use.

ANR0119W The client option *client option* is not valid and will not be sent to the client. Delete it from client option set.

Explanation: The client option is not supported by this server and should be deleted from the client option set.

System action: The option is ignored and is not sent to the client. The server continues processing.

User response: Delete the option from the option set. Check the documentation for a possible replacement for the option.

ANR0120I Archive data retention protection is set to *state of archive data retention protection*.

Explanation: The archive data retention protection state has been set.

System action: Processing continues.

User response: None.

ANR0121E *command* is not allowed when archive data retention is enabled.

Explanation: The specified command is not allowed when archive data retention protection is enabled on the server.

System action: Processing continues.

User response: None.

ANR0122E *command*: A node cannot be assigned to a new domain when archive data retention is enabled.

Explanation: A previously defined node cannot be assigned to a new domain when archive data retention protection is enabled on the server.

System action: Processing continues.

User response: None.

ANR0123E *command*: A device type of SERVER is not allowed when archive data retention is enabled.

Explanation: The specified device type is not allowed when archive data retention protection is enabled on the server.

System action: Processing continues.

User response: None.

ANR0124W Object *object name (object id hi.object id lo)* for node *node name (node id)*, **filesystem *filesystem name (filesystem id)* is retention protected and can not be deleted.**

Explanation: The specified object can not be deleted because:

- Archive retention protection is enabled and the object's retention period has not elapsed, or
- The object is part of a deletion hold.

System action: Server operation continues.

User response: None.

ANR0125W DELETE FILESPACE *filesystem name* for node *node name* contains retention protected data and cannot be deleted.

Explanation: The specified file space cannot be deleted because it contains one or more objects that must be retained for one of the following reasons:

- Archive retention protection is enabled and the object's retention period has not elapsed.
- The object is part of a deletion hold.

System action: The file space is not deleted.

User response: None.

ANR0126W DELETE VOLUME: Volume *volume name* contains retention protected data and can not be deleted.

Explanation: The specified volume cannot be deleted because it contains one or more objects that must be retained because of one of the following:

- Archive retention protection is enabled and the object's retention period has not elapsed.
- The object is part of a deletion hold.

System action: Processing continues.

User response: None.

ANR0127E *command* to another server is not allowed when data retention protection is enabled on the target server.

Explanation: The specified command is not allowed when data retention protection is enabled on the target server.

System action: Processing continues.

User response: None.

ANR0128W The previous database upgrade did not complete successfully.

Explanation: At server startup, the server discovered that a previously started database upgrade operation did not complete successfully. To complete the database upgrade, specify the UPGRADEDB parameter when starting the server.

System action: Processing continues.

User response: Check the server error messages on console to determine the reason the previous database upgrade did not complete successfully. Correct the problem, and perform the database upgrade again, if possible. If the problem cannot be corrected, contact your service representative.

ANR0129I Database upgrade completed successfully.

Explanation: The requested database upgrade operation completed successfully.

System action: Processing continues.

User response: None.

ANR0130E *Diagnostic(ID):* Server LOG space exhausted.

Explanation: There is no space to write data to the server recovery log.

System action: The activity that generated this error fails.

User response: To increase the amount of log space available to the server, evaluate the directories and filesystem assigned to the ACTIVELOGDIR, ARCHIVELOGDIR, and ARCHFAILOVERLOGDIR. An out of log space condition may occur because the ACTIVELOGDIR location is full. Alternatively, an out of log condition may occur if the log files in the ACTIVELOGDIR which are no longer active can not be archived to the ARCHIVELOGDIR and ARCHFAILOVERLOGDIR locations. If necessary, a larger ARCHIVELOGDIR or ARCHFAILOVERLOGDIR can be specified by updating this option in the dsmserv.opt file and then restarting the server.

ANR0131E *Diagnostic(ID):* Server DB space exhausted.

Explanation: There is no space to write data to the server database.

System action: The activity that generated this error fails.

User response: To increase the amount of database space available to the server, an authorized administrator can add database volumes by using the DEFINE DBSPACE command. Once additional space

has been added for the database, the server database manager will automatically extend into that space and use it.

ANR0132E *Diagnostic(ID):* Memory allocation failed: object object name, size size.

Explanation: The server cannot obtain enough memory to create the object named.

System action: The activity that generated this error fails.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0133E Error loading module *modname: error string*

Explanation: The error specified by *error string* occurred when the server attempted to load module *modname*

System action: Server operation continues, but the function provided by the module is not available.

User response: Refer to the error string and correct the condition causing the load to fail.

ANR0134W There is an error reading from standard input; the console input daemon stopped.

Explanation: Warning: *warning string*

System action: Server operation continues, but standard input is not available.

User response: If the server was started in the background, there is no error, or else standard input is in an error state.

ANR0135I Table maintenance performed successfully for processed tables of total tables.

Explanation: The server periodically performs maintenance on the database tables. The maintenance processing allows the database to update statistics used to determine how to best access a given table. The maintenance processing will periodically process all tables for the server. And during other processing cycles, it will only process those tables that have changes such as inserts, updates, or deletes for records in that table.

System action: Server operation continues.

User response: No user action required.

ANR0136I **Table updating statistics performed successfully for processed tables of total tables.**

Explanation: The server periodically performs maintenance on the database tables. The maintenance processing allows the database to update statistics determine how to best access a given table. The maintenance processing will periodically process all tables for the server.

System action: Server operation continues.

User response: No user action required.

ANR0137E *Source file(line number):* **Error error code allocating num rows database rows.**

Explanation: An internal error has occurred in an attempt to allocate storage for the requested number of database rows indicated.

System action: The activity that generated this error fails.

User response: Contact your service representative.

ANR0138E *Value primary logs for number of primary logs* **is invalid.**

Explanation: The command has been issued with an invalid number of primary logs.

System action: Server installation stops.

User response: Reissue the command with a valid number of primary logs.

ANR0139I **This command has been disable for DB2.**

Explanation: During DB2 development cycle. This command/function has been temporarily disable.

System action: System operation continues.

User response: None.

ANR0140I *Command: success. Node node_id_1 is granted proxy authority to node node_id_2.*

Explanation: The command was successful.

System action: The server performs the command.

User response: None.

ANR0141E *Command: failed. Node node_id_1 was not granted proxynode authority to node node_id_2.*

Explanation: The command fails if either of the nodes do not exist, or if the administrator issuing the command does not have sufficient authority.

System action: The server fails the command.

User response: Verify that both nodes exist and that the administrator has sufficient authority, then issue the command again.

ANR0142I *Command: success. Proxynode authority for node node_id_1 has been revoked from node node_id_2.*

Explanation: The command was successful.

System action: The server performs the command.

User response: None.

ANR0143E *Command: failed. Proxynode authority for node node_id_1 has not been revoked to node node_id_2.*

Explanation: The command fails if the administrator issuing the command does not have sufficient authority.

System action: The server fails the command.

User response: Check the help for the command and verify that the administrator has either system or unrestricted policy authority; then issue the command again.

ANR0144E *Command: failed. Node node_id_1 was not granted proxynode authority to node node_id_2 because node node_id_missing has not been defined to the server.*

Explanation: The command failed because one of the nodes has not been defined to the server.

System action: The server fails the command.

User response: Verify that both nodes have been defined to the server and then issue the command again.

ANR0145E *Command: failed. Node node_id_1 already has been granted proxynode authority to node node_id_2.*

Explanation: The command failed because a proxy relationship between the two nodes already exists.

System action: The server fails the command, but does not change the existing association.

User response: None.

ANR0146E *Command: failed. Node node_id_1 was not granted proxynode authority to itself.*

Explanation: The command failed because a node cannot have a proxy relationship defined to itself.

System action: The server fails the command.

User response: None.

ANR0147E *Command: failed. Proxy node authority for node `node_id_1` to node `node_id_2` was not revoked because node `node_id_missing` has not been defined to the server.*

Explanation: The command failed because one of the nodes has not been defined to the server.

System action: The server fails the command.

User response: Verify that both nodes have been defined to the server, and then issue the command again.

ANR0148I *Command: No proxy relationships were found.*

Explanation: No proxy relationships were found.

System action: None.

User response: None.

ANR0149E *Filespace `filespace` for node `node_name` was deleted concurrently with the command.*

Explanation: The command failed. The requested filesystem was deleted concurrently with the command.

System action: The server will fail the command.

User response: Retry the command.

ANR0150E *Failed to open `object object_name`. There was an error decrypting the `password_type` password.*

Explanation: The server could not open the object specified due to the error encountered while decrypting the password.

System action: The server will fail the related command or action.

User response: Reset the password using the appropriate UPDATE command and retry the failing command or action.

ANR0151W *Failure starting database manager.*

Explanation: The server was unable to start the database manager.

System action: The server operation terminates.

User response: If the server is not able to run without the database manager. Evaluate recent changes to the server machine and the available system error logs to try to determine the cause of the failure.

ANR0152I *Database manager successfully started.*

Explanation: The server was successfully able to start the database manager.

System action: The server operations continue.

User response: None.

ANR0153I *Database manager already running.*

Explanation: The server database manager is already running.

System action: The server continues startup.

User response: None.

ANR0154E *Command: The active data pool list specified with the ACTIVEDESTINATION parameter includes active data pool `active data pool name` more than once.*

Explanation: The number of active data pool names that can be specified with the ACTIVEDESTINATION parameter is limited to 10, and the names entered with this parameter must be unique.

System action: The command fails.

User response: Reissue the command specifying unique active-data pool names.

ANR0155E *Command: The number of active data pool names specified with the ACTIVEDESTINATION parameter exceeds the maximum number allowed.*

Explanation: The number of active data pool names that can be specified with the ACTIVEDESTINATION parameter is limited to 10, and the names entered with this parameter must be unique.

System action: The command fails.

User response: Reissue the command specifying unique active-data pool names.

ANR0156E *Command: The pool `active data pool name` with pool ID `pool ID` is not an active pool.*

Explanation: The storage pool specified is not an active-data pool. Only active-data pools are allowed to be specified in the ACTIVEDESTINATION parameter.

System action: The command fails.

User response: Reissue the command specifying ten or fewer active-data pool names.

ANR0157W Database operation *table operation for table table name failed with result code op code and tracking ID: id.*

Explanation: An error occurred during the specified *table operation* for the table indicated.

System action: The activity that generated this error fails.

User response: If there were no operational failures as a result of issue, then this was anticipated and the server was able to continue appropriately. If this resulted in a failure for a client session or server process, this information is needed to help diagnose the issue. In the even of a failure, please contact your IBM service representative for further assistance.

ANR0158W Database operation *table operation for table table name failed with operation code op code and tracking id tracking number. The data for column column number is: column data.*

Explanation: An error occurred during the specified *table operation* for the table indicated.

System action: The activity that generated this error fails.

User response: If there were no operational failures as a result of issue, then this was anticipated and the server was able to continue appropriately. If this resulted in a failure for a client session or server process, this information is needed to help diagnose the issue. In the even of a failure, please contact your IBM service representative for further assistance.

ANR0159E Diagnostic(ID): Database deadlock detected on DB2 Statement Handle.

Explanation: The database server detected a deadlock situation and rolled back the outstanding work on this statement handle. When server processes encounter a database deadlock, they usually reattempt the work that was in progress when the deadlock was encountered. Not all processes can explicitly try an operation again. For example, migration and reclamation will eventually be tried again. However, something such as a delete volume run in a macro will only be tried again if the delete command is reissued either in the macro or the command line.

System action: The work being done on the statement handle is rolled back. Some processes will attempt to retry the request. Others will just stop. Server operation continues.

User response: If a process can retry (like migration), then monitor the re-try attempt to see if it succeeds or not. If the process or command is not able to retry on it's own, then reissue the command or macro that caused the action to occur.

ANR0160I Displaying segment *segment number of total segments for client object object identifier with text: object name.*

Explanation: Display a client object, such as a file or directory, that uses a long fully qualified name. The name is displayed in smaller segments until the entire name is shown. The segment numbers are incremented from 1 to N until all the segments for this object name are displayed.

System action: The fully qualified name for this object is displayed.

User response: None.

ANR0161I Displaying segment *segment number for message insert insert identifier with text segment text.*

Explanation: Display a segment of a message insert that was too long to be displayed within the specified message. There may be one or more segments displayed for a given message insert.

System action: The entire message insert segment is displayed.

User response: None.

ANR0162W Supplemental database diagnostic information: *dbReturnCode:dbState:dbCode (dbErrorMessage).*

Explanation: The *dbReturnCode*, *dbState*, and *dbCode* are displayed as supplemental information. This information should be used in conjunction with any other database error or warning messages issues to assist with diagnosing a given issue.

System action: The activity that generated this error fails.

User response: None. This is supplemental information corresponding to another database error or warning message issued.

ANR0163E Diagnostic(ID): Database insufficient memory detected on DB2 Statement Handle.

Explanation: The database server detected an insufficient memory condition and rolled back the outstanding work on this statement handle.

System action: The work being done on the statement handle is rolled back. Server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0165I Inventory file expiration started processing for node *nodename*, filespace *filespace name*, copygroup *copygroup* and object type *type*.

Explanation: Inventory file expiration processing started processing for the *node name* and *filespace name* indicated. For this *node name* and *filespace name* the indicated copygroup and object types are currently being evaluated.

System action: Inventory file expiration continues.

User response: This message is for informational purposes only and is only displayed if the expiration processing is executed with QUIET=NO.

ANR0166I Inventory file expiration finished processing for node *nodename*, filespace *filespace name*, copygroup *copygroup* and object type *type* with processing statistics: examined *examined*, deleted *deleted*, retrying *retrying*, and failed *failed*.

Explanation: Inventory file expiration processing finished processing for the *node name* and *filespace name* indicated. For this *node name* and *filespace name* the indicated copygroup and object types were evaluated. And the ending statistics show the number of objects examined, deleted, retrying and those that failed to be processed.

System action: Inventory file expiration continues.

User response: This message is for informational purposes only and is only displayed if the expiration processing is executed with QUIET=NO.

ANR0167I Inventory file expiration process *process ID* processed for *minutes* minutes.

Explanation: Server expiration processing ran for the indicated number of minutes.

System action: None.

User response: None.

ANR0168I Analyst authority for administrator *admin name* will be ignored. Analyst authority is not supported on this server.

Explanation: Analyst authority is not supported for servers at V6.1 or later.

System action: The operation continues.

User response: None.

ANR0169E An unexpected error has occurred and the TSM server is stopping.

Explanation: The TSM server encountered an error from which it cannot recover, and the server is halting. Other messages will be issued along with this message indicating the specific error conditions which have occurred.

System action: The server halts.

User response: Follow the instructions indicated in any associated messages, then start the server.

ANR0170E *Diagnostic(ID): Error detected on DB2 Statement Handle, database restart required.*

Explanation: The TSM server encountered an error on the database and needs to issue a DB2 RESTART DB to the database manager. All connections to the database server are severed, and uncompleted operations are aborted. The TSM server will then restart the database and attempt to continue. If the database manager cannot be restarted, the TSM server will halt. Other messages may be issued along with this message indicating the specific error conditions which have occurred.

System action: The server continues, or if it cannot restart the database, it halts.

User response: If the server is able to recover, no action is needed, except to restart operations that were aborted. However, if the server cannot recover, it will halt. Follow the instructions indicated in any associated messages, then start the server. If the server still cannot be started, manually issue the DB2 RESTART DB command, then attempt to start the TSM server again.

ANR0171I *Diagnostic(ID): Error detected on DB2 Statement Handle, database in evaluation mode.*

Explanation: The TSM server encountered an error on the database and will take action to determine the type of error and whether or not it can recover from the error.

System action: Server processing continues.

User response: This is an information message. As the TSM server attempts to resolve the error, it might issue other messages. Follow the instructions indicated in any associated messages.

ANR0172I *Diagnostic(ID): Error encountered performing action action.*

Explanation: The TSM server encountered an error performing the specified database action. This error caused the action to fail and prevented the server from being able to continue.

System action: Server processing terminates, the requested action fails.

User response: Review other messages issued to determine the actual error and then take steps to remedy that failure before retrying the operation.

ANR0173I The database failed action *action* because of insufficient system memory available.

Explanation: The TSM server encountered an error while performing the specified action. Specifically, the server database did not have sufficient memory to communicate with the server database or was unable to acquire the memory needed for the server buffer pools.

System action: Server processing terminates, the requested action fails.

User response: In most cases, this indicates a lack of available resources on the system. This may be a lack of physical resources or it may be an environment setting that prevents the server from having access to the needed resources. For instance, on Linux® systems, this may be caused by the SHMMAX value (maximum allowed shared memory) being set too low. On Linux, this can be viewed using the command "ipcs -l". Similarly, for Linux, this value can be increased using the command "sysctl -w kernel.shmmax=nnn" where nnn is the new maximum memory value to assign to be used for shared memory. As a general recommendation, this value should be set to approximately 1.25 GB or higher depending upon the actual physical memory (RAM) available on that system.

ANR0174E *Diagnostic(ID):* Maximum DB2 connections reached on DB2 Handle.

Explanation: There are no more available connections to the server database.

System action: The activity that generated this error fails.

User response: To increase the number of database connections available to the server, the DB2 administrator can modify the IDBACK parameter in the DSNzPARM settings.

ANR0175E *Diagnostic(ID):* Space exhausted for one or more of the following: DB, LOG, or instance directory.

Explanation: The space assigned to the server database, the recovery log, or instance directory has been exhausted.

System action: The server terminates.

User response: Review the filesystems or other space assigned to the server for the database, recovery log or instance directory. If the space assigned to the database is full, restart the server and add additional database

space using the EXTEND DBSPACE command or use the DSMSEV EXTEND DBSPACE utility. If the server ACTIVELOGDIR is full, update this server option to a new location that has space available for the server to use for logging changes to the database. If the server instance directory is full, remove unneeded files or else extend this filesystem.

Please note that the server should be configured with the database, activelog, and archivelogs using different directories and storage devices. For example, if the database and activelog are configured to use the same directory and underlying storage device, this may adversely impact performance. This may also compromise the server's ability to manage the database and active log space effectively. Similarly, the server's instance directory should also be monitored and managed with some amount of space available. The server instance directory is used to record and log some server and database actions.

ANR0185E The data in *primary storage pool name* can not be copied to *active data pool name*. The active-data pool is not defined to a domain.

System action: The command fails.

User response: Define the active-data pool to a domain using the ACTIVEDESTINATION parameter on either the DEFINE DOMAIN or UPDATE DOMAIN command.

ANR0186E There is insufficient authority to start the database manager.

Explanation: The user ID under which the dsmserv process is running does not have authority to start the database manager.

System action: The server process ends.

User response: Ensure that the user ID under which the server is running is authorized to start the database manager. Take the following actions:

- Log in to the user ID for your Tivoli Storage Manager instance and start the server.
 - To run the server using the root user ID on a UNIX system, add the root user ID to the primary group of the Tivoli Storage Manager instance user ID.
 - Or, to run the server using the instance user ID on a UNIX system, when using the automatic start, specify the -u option when you start the server.

ANR0187E Database *db name* was not found.

Explanation: The server attempted to open the database, but it was not found by the database manager. If this occurs immediately after formatting a new database, it could mean the format operation failed.

ANR0188E • ANR0198E

System action: The server process ends.

User response: Ensure that you format the database before starting it the first time. Ensure that all database and log directories are online and available.

ANR0188E Fail to start the database manager.
Database manager license not found

Explanation: Could not find database manager license.

System action: The server process ends.

User response: Contact your service representative.

ANR0189E Fail to start the database manager.
Database manager license has expired

Explanation: Database manager license has expired.

System action: The server process ends.

User response: Contact your service representative.

ANR0190I Inventory file expiration started
processing node *node name* for backup
sets.

Explanation: Expiration processing is currently evaluating information for backup sets for the node specified.

System action: Inventory file expiration continues.

User response: This message is for informational purposes only and is only displayed if the expiration processing is invoked with QUIET=NO.

ANR0191I Inventory file expiration finished
processing node *node name* for backup
sets with processing statistics: examined
examined, deleted *deleted*, retrying
retrying, and failed *failed*.

Explanation: Expiration processing has finished processing backup sets for the node specified. The ending statistics show the number of objects examined, deleted, and those that failed to be processed.

System action: Inventory file expiration continues.

User response: This message is for informational purposes only and is only displayed if the expiration processing is invoked with QUIET=NO.

ANR0193E The REPAIR EXPIRATION TYPE=*type*
command cannot be issued from the
server console.

Explanation: The specified REPAIR EXPIRATION command was issued from the server console. This command cannot be issued from the server console because the administrator must be prompted to continue processing the command.

System action: The server ignores the command and continues processing.

User response: Issue the command from an administrative client.

ANR0195W Attempting to remove extraneous
database entries for volume *volume name*.

Explanation: The server is attempting to remove extraneous database entries for the specified volume.

System action: TSM will attempt to remove the extraneous database entries for this volume.

User response: Review the completion messages for this volume to determine if the removal of the extraneous database entries was successful or if an error was encountered.

ANR0196I Removal of extraneous database entries
for volume *volume name* was successful.

Explanation: The server successfully removed extraneous database entries for the specified volume.

System action: System operation continues and future operations on the specified volume should work normally.

User response: The server successfully repaired the specified volume.

ANR0197E Removal of extraneous database entries
for volume *volume name* failed due to
contention with other server processes
or activities.

Explanation: The server was not able to remove extraneous database entries for the specified volume. This was due to contention with another server process or activity.

System action: System operation continues and this volume still has extraneous database entries.

User response: It is possible that future server activities or processes will select this volume and attempt to repair it. If this occurs and the future attempt is successful, no further action is needed. The server administrator should review the activity log for the time that the repair was attempted and try to determine what caused the contention. If you are unable to determine the cause of the contention of the problem persists, please contact your service representative for additional assistance.

ANR0198E Removal of extraneous database entries
for volume *volume name* failed.

Explanation: The server was not able to remove extraneous database entries for the specified volume.

System action: System operation continues and this

volume still has extraneous database entries.

User response: The server administrator should review the activity log for the time that the repair was attempted and try to determine the cause of the failure. If you are unable to determine the cause of the contention of the problem persists, please contact your service representative for additional assistance.

ANR0199W Not possible to repair volume *volume name* due to other database references to this volume.

Explanation: The server was not able to remove extraneous database entries for the specified volume because other database references to this volume exist.

System action: System operation continues.

User response: The volume repair operation for this volume is not able to take any action because other unexpected database references to this volume exists. For additional assistance contact your IBM service representative.

ANR0200I Recovery log assigned capacity is *size* megabytes.

Explanation: The amount of space allocated to the recovery log is shown.

System action: None.

User response: None.

ANR0201I Database assigned capacity is *size* megabytes.

Explanation: The amount of space allocated to the database is shown.

System action: None.

User response: None.

ANR0202W Database volume *volume name* varied offline due to excessive read errors.

Explanation: The database volume shown has been varied offline because too many read errors have been encountered.

System action: If available, a mirrored copy of the volume is used.

User response: Correct the cause of the read errors.

ANR0203W Database volume *volume name* varied offline due to excessive write errors.

Explanation: The database volume shown has been varied offline because too many write errors have been encountered.

System action: If available, a mirrored copy of the volume is used.

User response: Correct the cause of the write errors.

ANR0204W Recovery log volume *volume name* varied offline due to excessive read errors.

Explanation: The recovery log volume shown has been varied offline because too many read errors have been encountered.

System action: If available, a mirrored copy of the volume is used.

User response: Correct the cause of the read errors.

ANR0205W Recovery log volume *volume name* varied offline due to excessive write errors.

Explanation: The recovery log volume shown has been varied offline because too many write errors have been encountered.

System action: If available, a mirrored copy of the volume is used.

User response: Correct the cause of the write errors.

ANR0206W Partial write detected on database volume *volume name*, logical page *logical page number* (physical page *physical page number*).

Explanation: During a write of a database page, an error occurred so that the page was not completely written to disk.

System action: The failed I/O operation is retried on a mirrored volume.

User response: See accompanying messages for information about the volume in error.

ANR0207E Page address mismatch detected on database volume *volume name*, logical page *logical page number* (physical page *physical page number*); actual: *logical page number*.

Explanation: During a read of a database page, the page does not contain the expected page address.

System action: The failed I/O operation is retried on a mirrored volume.

User response: See accompanying messages for information about the volume in error.

ANR0208W Partial write detected on recovery log volume *volume name*, logical page *logical page number* (physical page *physical page number*).

Explanation: During a write of a recovery log page,

ANR0209E • ANR0218I

an error occurs so that the page is not completely written to disk.

System action: The failed I/O operation is retried on a mirrored volume.

User response: See accompanying messages for information about the volume in error.

ANR0209E Page address mismatch detected on recovery log volume *volume name*, logical page *logical page number* (physical page *physical page number*); **actual:** *logical page number*.

Explanation: During a read of a recovery log page, the page does not contain the expected page address.

System action: The failed I/O operation is retried on a mirrored volume.

User response: See accompanying messages for information about the volume in error.

ANR0210S Inconsistency found in LVM data page *page number* - partial write detected.

Explanation: During a write of an LVM internal page, an error occurs so that the page is not completely written to disk.

System action: The failed I/O operation is retried on a mirrored volume.

User response: See accompanying messages for information about the volume in error.

ANR0211S Inconsistency found in LVM data page *page number* - page address mismatch (**actual** *page number*).

Explanation: During a read of an LVM internal page, the page does not contain the expected page address.

System action: The failed I/O operation is retried on a mirrored volume.

User response: See accompanying messages for information about the volume in error.

ANR0212E Unable to read disk definition file *file specification*.

Explanation: At startup, the server cannot read the indicated file in order to obtain a list of disk volumes to mount.

System action: Server initialization fails.

User response: Use a text editor to recreate the file; it should contain one line with the name of a single log or database volume. Then restart the server.

ANR0213W Unable to rewrite disk definition file.

Explanation: An error occurs trying to update the disk definition file.

System action: None.

User response: Attempt to determine the cause of the write error and correct it.

ANR0214W Database volume *volume name* is in the offline state - VARY ON required.

Explanation: At system startup, the server finds that the specified database volume is in the offline state.

System action: The volume is not accessed.

User response: Determine the reason for the volume being offline; if possible, vary it online.

ANR0215W Recovery log volume *volume name* is in the offline state - VARY ON required.

Explanation: At system startup, the server finds that the recovery log volume shown is in the offline state.

System action: The volume is not accessed.

User response: Determine the reason for the volume being offline; if possible, vary it online.

ANR0216I Database volume *volume name* is in the "stale" state - synchronization process started.

Explanation: At system startup, the server finds that the database volume shown is not synchronized.

System action: A process is started to synchronize the volume.

User response: None.

ANR0217I Recovery log volume *volume name* is in the "stale" state - synchronization process started.

Explanation: At system startup, the server finds that the recovery log volume shown is not synchronized.

System action: A process is started to synchronize the volume.

User response: None.

ANR0218I Unable to install database volume *volume name* - capacity must be at least 5 megabytes.

Explanation: An attempt has been made to add a database volume that is smaller than the server minimum.

System action: The volume is not added.

User response: Increase the size of the volume or supply another larger volume.

ANR0219I Unable to install recovery log volume *volume name* - capacity must be at least 5 megabytes.

Explanation: An attempt has been made to add a recovery log volume that is smaller than the server minimum.

System action: The volume is not added.

User response: Increase the size of the volume or supply another larger volume.

ANR0220I Synchronization of database volume *volume name* started as process *process ID*.

Explanation: A background process was started to synchronize the contents of the database volume shown with its copy volume. The background process was assigned the process ID shown.

System action: The background process starts to synchronize the volume and server operation continues.

User response: The administrator may query the status of the background process by using the QUERY PROCESS command, or cancel the process by using the CANCEL PROCESS command.

ANR0221I Synchronization of recovery log volume *volume name* started as process *process ID*.

Explanation: A background process was started to synchronize the contents of the recovery log volume shown with its copy volume(s). The background process was assigned the process ID shown.

System action: The background process starts to synchronize the volume and server operation continues.

User response: The administrator may query the status of the background process by using the QUERY PROCESS command, or cancel the process by using the CANCEL PROCESS command.

ANR0222E Error action **disk definition file** *file specification*.

Explanation: An error occurred creating or changing the disk definition file.

System action: None.

User response: Attempt to determine the cause of the write error and correct it.

ANR0223E Error writing list of disks to disk definition file.

Explanation: The disk definition file cannot be written.

System action: Installation ends.

User response: Determine the cause of the write error and correct it.

ANR0224E Volume *volume name* is specified more than once - server installation failed.

Explanation: The specified volume name was specified more than once in the server installation execution.

System action: Installation ends.

User response: Reinitialize the server install specifying a unique name for each database and recovery log volume.

ANR0225S Invalid use of the **-S** command-line option.

Explanation: The **-S** option cannot be specified on the command line if the database ID file (*dsmserv.dbid*) is intact. This option is to be used only if the ID file does not exist.

System action: The server does not start.

User response: Start the server without specifying the **-S** command-line option.

ANR0226S The database ID file could not be found for server startup.

Explanation: The server's database ID file (*dsmserv.dbid*) could not be found. This file is created when the database is formatted, is stored in the directory from which the format is performed, and is required for normal server operation.

System action: The server does not start.

User response: Ensure that you are starting the server from the correct instance directory, and that the *dsmserv.dbid* file exists and can be read. If no *dsmserv.dbid* file exists, restart the server with the **-S** option to create a new database ID file.

ANR0227S Incorrect database opened. Server cannot start.

Explanation: The ID of the database opened does not match the ID stored in the database ID file (*dsmserv.dbid*).

System action: The server does not start.

User response: Ensure that you are in the proper instance directory for the database being opened, and

that the environment is set up correctly. The instance directory is generally the directory from which you formatted the database, or, if on UNIX, have specified with the `-i` command-line option.

When the ID of the database that is opened does not match the ID that is stored in the database ID file (`dsmserv.dbid`), the server will not start. Use the `-S` (skip DB ID check) parameter after deleting the `dsmserv.dbid` file. After the initial use of the `-S` parameter in a restore scenario, the server creates a new `dsmserv.dbid` file in the instance directory.

ANR0228S Error *errno* opening the database ID file for server startup.

Explanation: The server's database ID file (`dsmserv.dbid`) could not be opened. The `errno` indicates the reason for the failure.

System action: The server does not start.

User response: Ensure that you are starting the server from the correct instance directory, and that the `dsmserv.dbid` file has the correct ownership and permission. If the file is empty, erase the file, and restart the server with the `-S` command-line option to generate a new database ID file.

ANR0229W Server is unable to add entries to the Activity Log. Console messages will not be logged until database access is available.

Explanation: The process that monitors the default (console) output stream and maintains the activity log cannot update the activity log. The error is due to the inability of the server to access the server database.

System action: The server does not update the activity log. The activity log will continue to run and attempt to recover from this situation.

User response: Access to the server database is temporarily unavailable. The server database manager will attempt to recover from this situation and reestablish access to the server database. When access to the server database is reestablished, the activity log processing will continue. If the server database access fails to be reestablished, additional messages will be issued providing more information.

ANR0230E Synchronization process failed for database volume *volume name*.

Explanation: The process that was attempting to synchronize the database volume shown has failed.

System action: The volume is in the stale state.

User response: See accompanying messages for more information.

ANR0231E Synchronization process failed for recovery log volume *volume name*.

Explanation: The process that was attempting to synchronize the recovery log volume shown has failed.

System action: The volume is in the stale state.

User response: See accompanying messages for more information.

ANR0232I Synchronization process canceled for database volume *volume name*.

Explanation: The process that was attempting to synchronize the database volume shown has been canceled.

System action: The volume is in the stale state.

User response: If desired, issue a `VARY ONLINE` command to start another synchronize process.

ANR0233I Synchronization process canceled for recovery log volume *volume name*.

Explanation: The process that was attempting to synchronize the database volume shown has been canceled.

System action: The volume is in the stale state.

User response: If desired, issue a `VARY ONLINE` command to start another synchronize process.

ANR0234I Synchronization complete for database volume *volume name*.

Explanation: The synchronization process for the database volume named has finished successfully.

System action: The volume is varied online.

User response: None.

ANR0235I Synchronization complete for recovery log volume *volume name*.

Explanation: The synchronization process for the recovery log volume named has finished successfully.

System action: The volume is varied online.

User response: None.

ANR0236E Fail to start the database manager due to an I/O error. Check for filesystem full conditions, file permissions, and operating system errors.

Explanation: The TSM server encountered an I/O error while attempting to start the database manager.

System action: The server process ends.

User response: Review the filesystems assigned to the

server for the database and recovery log.

ANR0237E Fail to start the database manager. An unexpected system error occurred.

Explanation: An unexpected system error occurred.

Some common reasons for this error are:

- The system name where you ran the server has been changed
- The system date and time is set incorrectly

System action: The server process ends.

User response: Contact your service representative.

ANR0238E A database recovery task is prohibiting activation of *db name* with *sqlcode dbCode*.

Explanation: While attempting to activate the database an error occurred because the database was busy performing a BACKUP, RESTORE or was in ROLLFORWARD pending state. Examine the *sqlcode* to determine the condition that is preventing the database from activating. The following *sqlcodes* are most likely to occur during the activate database step and will prevent the server from starting. *SQLC_RC_BKP_PEND* (-1116) indicates a database BACKUP is pending and must complete prior to activating the database. Once the database BACKUP is complete, the database can be activated by starting the server.

SQLC_RC_ROLLFWD_PEND (-1117) indicates a database Roll Forward operation is pending and must complete before activating the database. After the Roll Forward recovery step is complete, the database can be activated by starting the server.

SQLC_RC_BKP_INPROG (-1118) occurs when an attempt to activate the database fails because a database BACKUP was in progress. Prior to activating the database, it is necessary to rerun database BACKUP. Once the database BACKUP completes successfully, the database can be activated by starting the server.

SQLC_RC_RST_INPROG (-1119) shows that a database RESTORE was in progress when the database failed to activate. The RESTORE database must be restarted and allowed to complete successfully before activating the database. Once the database RESTORE is complete, the database can be activated by starting the server. *SQLC_RC_BR_INPROG* (-1120) means that either a database BACKUP or RESTORE must complete before activating the database. Ensure that either a BACKUP or RESTORE operation completes successfully before activating the database.

System action: The server is not started because the database cannot be activated.

User response: See message explanation for more information.

ANR0239E The DB2 instance name *instance name* may not be valid or is not configured properly. The return code was *sqlcode*

Explanation: TSM Server attempted to connect using the database instance set by the DB2INSTANCE environment variable, but the attempt failed.

User response: Verify that the database instance exists and that it is configured properly. You can list DB2 instances by issuing the *db2ilist* command from the instance directory, under the DB2 installation directory. Example: *c:\Program Files\tivoli\tsm\db2\instance\db2ilist*

System action: The server is not started because the database instance is not valid.

ANR0240E Deletion process failed for database volume *volume name*.

Explanation: The process that was attempting to delete the database volume shown has failed.

System action: The volume is not deleted.

User response: See accompanying messages for more information.

ANR0241E Deletion process failed for recovery log volume *volume name*.

Explanation: The process that was attempting to delete the recovery log volume shown has failed.

System action: The volume is not deleted.

User response: See accompanying messages for more information.

ANR0242I Deletion process canceled for database volume *volume name*.

Explanation: The process that was attempting to delete the database volume shown has been canceled.

System action: The volume is not deleted.

User response: None.

ANR0243I Deletion process canceled for recovery log volume *volume name*.

Explanation: The process that was attempting to delete the recovery log volume shown has been canceled.

System action: The volume is not deleted.

User response: None.

ANR0244I Deletion complete for database volume *volume name*.

Explanation: The delete process for the database volume named has finished successfully.

System action: The volume is deleted.

User response: None.

ANR0245I Deletion complete for recovery log volume *volume name*.

Explanation: The delete process for the recovery log volume named has finished successfully.

System action: The volume is deleted.

User response: None.

ANR0246E Error reading logical page *logical page number* (physical page *physical page number*) from database volume *volume name*.

Explanation: An error has been encountered when attempting to read a page from the specified database volume.

System action: The failed I/O operation is retried on a mirrored volume, if available.

User response: See accompanying messages for information about the volume in error. If the error persists and another mirrored copy of the volume is available, the failing volume should be taken offline by using the VARY OFF command, and repaired. Otherwise, halt the server and repair the volume. Then restart the server.

ANR0247I Database page *logical page number* successfully read from an alternate copy on volume *volume name*.

Explanation: After a read error, the server is able to read the desired page from another synchronized mirrored volume.

System action: Processing continues.

User response: None.

ANR0248E Unable to read database page *logical page number* from any alternate copy.

Explanation: After a read error, the server is unable to read the desired page from another mirrored volume because no other mirrored volume is in the synchronized state. This message is normally preceded by a message indicating which volume failed.

System action: Processing is ended.

User response: You can repair the failed volume by halting the server and correcting the volume errors.

ANR0249E Error reading logical page *logical page number* (physical page *physical page number*) from recovery log volume *volume name*.

Explanation: An error has been encountered when attempting to read a page from the specified recovery log volume.

System action: The failed I/O operation is retried on a mirrored volume, if available.

User response: See accompanying messages for information about the volume in error. If the error persists and another mirrored copy of the volume is available, the failing volume should be taken offline, by using the VARY OFF command, and repaired.

ANR0250I Recovery log page *logical page number* successfully read from an alternate copy on volume *volume name*.

Explanation: After a read error, the server is able to read the desired page from another synchronized mirrored volume.

System action: Processing continues.

User response: None.

ANR0251E Unable to read recovery log page *logical page number* from any alternate copy.

Explanation: After a read error, the server is unable to read the desired page from another mirrored volume because no other mirrored volume was in the synchronized state. This message is normally preceded by a message indicating which volume failed.

System action: Processing is ended.

User response: You can repair the failed volume by halting the server and correcting the volume errors.

ANR0252E Error writing logical page *logical page number* (physical page *physical page number*) to database volume *volume name*.

Explanation: An error has been encountered when attempting to write a page to the specified database volume.

System action: If a mirrored volume is available then the failing volume is forced into the offline state.

User response: Repair the failing volume, and then use the VARY ON command to bring the volume back online.

ANR0253E Unable to write database page *logical page number* to any alternate copy.

Explanation: After a write error, the server is unable to write the desired page to another mirrored volume because no other mirrored volume is in the synchronized state. This message is normally preceded by a message indicating which volume failed.

System action: Processing is ended.

User response: Repair the failed volume.

ANR0254E Error writing logical page *logical page number* (physical page *physical page number*) to recovery log volume *volume name*.

Explanation: An error has been encountered when attempting to write a page to the specified recovery log volume.

System action: If a mirrored volume is available, the failing volume is forced into the offline state.

User response: Repair the failing volume, and then use the VARY ON command to bring the volume back online.

ANR0255E Unable to write recovery log page *logical page number* to any alternate copy.

Explanation: After a write error, the server is unable to write the desired page to another mirrored volume because no other mirrored volume is in the synchronized state. This message is normally preceded by a message indicating which volume failed.

System action: Processing is ended.

User response: You can repair the failed volume by halting the server and correcting the volume errors.

ANR0256E Error writing physical page *physical page number* to restart/checkpoint area on database volume *volume name*.

Explanation: An error has been encountered when attempting to write a page to the specified database volume.

System action: If a mirrored volume is available, the failing volume is forced into the offline state.

User response: Repair the failing volume, and then use the VARY ON command to bring the volume back online.

ANR0257E Error writing physical page *physical page number* to restart/checkpoint area on recovery log volume *volume name*.

Explanation: An error has been encountered when

attempting to write a page to the specified database volume.

System action: If a mirrored volume is available, the failing volume is forced into the offline state.

User response: Repair the failing volume, and then use the VARY ON command to bring the volume back online.

ANR0258E Unable to write complete restart/checkpoint information to disk.

Explanation: While writing restart/checkpoint information to disk, the server encounters an error writing to a database or recovery log volume for which no synchronized mirrored copy is available. This message is normally preceded by a message indicating which volume failed.

System action: Processing is ended.

User response: Repair the failing volume.

ANR0259E Unable to read complete restart/checkpoint information from any database or recovery log volume.

Explanation: During server restart, the server is unable to read a complete set of restart/checkpoint information from any of the defined database or recovery log volumes.

System action: Server restart is ended.

User response: Ensure that all defined database and recovery log volumes are available for use by the server.

ANR0260I Database page *logical page number* successfully resynchronized.

Explanation: After detecting a partially-written database page, the server is able to rewrite the page by using a synchronized mirror copy.

System action: Processing continues.

User response: None.

ANR0261I Recovery log page *logical page number* successfully resynchronized.

Explanation: After detecting a partially-written recovery log page, the server is able to rewrite the page by using a synchronized mirror copy.

System action: Processing continues.

User response: None.

ANR0262W Incompatible database restart/recovery area has been detected.

Explanation: The restart/recovery area of the server database and recovery log volumes were written in a format that is not compatible with the restart/recovery area written by other versions of the server.

System action: The server starts normally. If the database and recovery log are writable (not Read Only), then the restart/recovery area will be converted to a compatible format. Message ANR0263I will be issued when the conversion has been completed.

User response: None.

ANR0263I Database restart/recover area successfully converted to compatible format.

Explanation: The server converted the restart/recovery areas of its database and recover log volumes to a format compatible with the restart/recovery area written by other versions of the server. This is a one time conversion, and will only be performed if the restart/recovery area was not already in the compatible format.

System action: The restart/recovery area was successfully converted.

User response: None.

ANR0264E A database file IO error is prohibiting activation of *db name* with sqlcode *dbCode*.

Explanation: While attempting to activate the database an IO error occurred when processing a database file. The problem may have occurred in one of the following situations: The system cannot open, read from, or write to a database file. The system cannot create the database because an error occurred while the system was creating a database file or a directory for the database. The system cannot drop the database because an error occurred while the system was deleting a database file or a directory for the database. The system cannot create the database because an interrupt was received while the system was creating or deleting a database file or a directory for the database. The system cannot locate the database subdirectory or database configuration file during connect. Problem causes are ordered in terms of their frequency of occurrence: A log file cannot be found in the active log path directory. There may be a problem with the database directory the operation is being attempted on. There may be inadequate disk space to complete the operation. The database cannot be used.

System action: The server is not started because the database cannot be activated.

User response: Appropriate responses for the problem causes described above are: To verify if a log file is

missing, check the db2diag.log for the presence of a logging error (return code contains SQLO_FNEX). If present, this error will contain the name of the missing log file. Ensure that the file is located in the active log path directory. If the file cannot be located, restore and roll-forward the database to an earlier point in time referenced in a log file preceding the missing log file (use a timestamp that is earlier than that of the missing file). There may be a problem with the database directory. Check the integrity of the directory. Examples of potential problems include: permissions issues, mount point problems, corruption. Increase filesystem size.

ANR0265E Log disk processing failed: sufficient memory is not available.

Explanation: At server installation, the server is unable to process the server log disks due to insufficient memory.

System action: Server installation stops.

User response: Restart the server installation process with more memory available.

ANR0266E Database disk processing failed: sufficient memory is not available.

Explanation: At server installation, the server is unable to process the server database disks due to insufficient memory.

System action: Server installation stops.

User response: Restart the server installation process with more memory available.

ANR0267E Log volume *volume name* is not available.

Explanation: The specified volume cannot be found during installation.

System action: Server installation stops.

User response: Determine the reason the disk is unavailable, and correct the problem. Restart the server installation process.

ANR0268E Database volume *volume name* is not available.

Explanation: The specified volume cannot be found during installation.

System action: Server installation stops.

User response: Determine the reason the disk is unavailable, and correct the problem. Restart the server.

ANR0269E Process for Log volume *volume name* terminated - thread resource not available.

Explanation: During installation for the indicated volume, the server cannot start a thread to service I/O requests.

System action: Server installation stops.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory". Restart the server installation process.

ANR0270E Process for Database volume *volume name* terminated - thread resource not available.

Explanation: During installation for the indicated volume, the server cannot start a thread to service I/O requests.

System action: Server installation stops.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory". Restart the server installation process.

ANR0271E Maximum number of recovery log volumes exceeded.

Explanation: More recovery log volumes have been specified than the server can manage.

System action: Server installation stops.

User response: Reduce the number of recovery log volumes specified. Restart the server installation process.

ANR0272E Maximum number of database volumes exceeded.

Explanation: More database volumes have been specified than the server can manage.

System action: Server installation stops.

User response: Reduce the number of database volumes specified. Restart the server installation process.

ANR0273W Not initializing library *library name* because the library is set offline .

Explanation: The External Library is set offline. It will not be used for new transactions until it is set online again.

System action: This server skips the initialization of the library. The server continues processing.

User response: Refer to the UPDATE PATH command for details on changing the online option.

ANR0274E Attempt to access library *library name* failed, because the library is set offline.

Explanation: The External Library is set offline. It will not be used for new transactions until it is set online again.

System action: This mount fails.

User response: Refer to the UPDATE PATH command for details on changing the online option.

ANR0275I Detected schema change for table *table*, attempting to reconcile.

Explanation: The schema for the table referenced does not match the server definition for this table. The schema difference for this table will be reconciled.

System action: Server startup continues if the schema difference was successfully reconciled. Server startup will fail if the schema reconciliation failed.

User response: The schema for this table will attempt to be reconciled. Specifically, the server will try to modify the table in the database to match the schema that was expected. A message will be issued indicating the success or failure of the schema reconciliation.

ANR0276I Schema reconciliation for table *table* succeeded.

Explanation: The schema differences for this table were successfully reconciled.

System action: Server operation continues.

User response: None

ANR0277E Schema reconciliation for table *table* failed.

Explanation: The server was unable to reconcile the schema differences for the indicated table.

System action: Server operation terminates.

User response: Contact your IBM service representative.

ANR0285I Database page shadowing started using file *file name*.

Explanation: The database page shadowing function was started. The file specified is used to store the shadowed database pages.

System action: None.

User response: None.

ANR0286W Database page shadowing using file *file name* failed to start.

Explanation: The database page shadowing function could not start. An error has been encountered accessing the page shadow file specified.

System action: None.

User response: Verify that there is enough space for the page shadow file. That page shadow file requires approximately 65 kilobytes of space, if this space is not available a new location for the file should be specified.

ANR0287W Contents of the page shadow file *file name* are not valid.

Explanation: The database page shadowing function could not use the contents of the existing file. Restart recovery using this file is not possible.

System action: The server attempts to start without having the database page shadow file available.

User response: The database page shadow file contents are not valid. This can be caused by: a partial write to the page shadow file itself, the file being manipulated by a process outside of the server, the file being overlaid by a different file, or the file could have been erased.

ANR0288W One or more database pages in the last batch written is corrupt - contents of database page shadow file will be used to fix the page or pages.

Explanation: One or more pages from the last batch of pages written to the server database has been detected to be corrupt. The server will attempt to use the contents of database page shadow file and replace the corrupted database page.

System action: Server startup continues.

User response: A corruption of a database page within the server database, is typically caused by a partial write. A partial write may occur when the server is brought down external to normal server processing. If the server terminated without a halt command being issued or if the machine the server is running on crashed unexpectedly, this may account for the partial write. Other possible causes of a partial write are a disk drive failure, improperly terminated SCSI bus, or a failure in a device controller. Please try to identify the cause of the partial write and take the appropriate action to prevent this from occurring in the future.

ANR0289W Damaged database pages were successfully replaced using contents of page shadow file.

Explanation: The damaged database pages were replaced using the corresponding pages from the page shadow file. The pages were successfully replaced.

System action: The server continues to restart.

User response: None.

ANR0290W Failure occurred attempting to replace one or more damaged database pages using the contents of the page shadow file.

Explanation: The damaged database pages could not be replaced using the corresponding pages from the page shadow file.

System action: The server continues to restart.

User response: None.

ANR0291E Error writing to database page shadow file.

Explanation: The server encountered an error writing to the database page shadow file. The page shadowing for the server is currently disabled.

System action: Database page shadowing for the server will remain disabled until the server is halted and restarted.

User response: Check the file specified as the database page shadow file. It may be that there is not enough space for the file. If enough space is available, check the filesystem, drive, or disk that it resides on for an indication of the error. Once the error preventing the server from writing to the page shadow file has been resolved, restart the server.

ANR0292W Database page shadow file *file name* does not exist.

Explanation: The server attempted to use the page shadow file referenced but was unable to open the file. The file does not exist.

System action: The server will continue to operate and will attempt to create this as a new database page shadow file.

User response: None.

ANR0293I Reorganization for table *table name* started.

Explanation: The server is performing an online reorganization for the table referenced.

System action: The server will continue to operate.

User response: Monitor the available log space in the active log and archive log storage paths. If the log space available to the filesystem begins to fill up, then perform a BACKUP DATABASE command with the TYPE=FULL parameter in order to initiate pruning of the archive log space.

ANR0294I Reorganization for table *table name* ended.

Explanation: The server online reorganization for the table referenced has ended.

System action: The server will continue to operate.

User response: Review the available log space in the active log and archive log storage paths. If the log space available to the filesystem has to filled up or is close to filling up, then perform a BACKUP DATABASE command with the TYPE=FULL parameter in order to initiate pruning of the archive log space.

ANR0295I A full database backup is needed. The active log space used is *log space used* megabytes, and the active log space available is *log space available* megabytes. The ratio, active log used ratio, exceeds the threshold *log utilization threshold*.

Explanation: When the active log space used exceeds the log utilization threshold, a database backup is needed.

System action: None.

User response: None.

ANR0296I A full database backup is needed. The total space used in log file system is *log space used* megabytes, and the total space available in the log file system is *log space available* megabytes. The ratio is *log file system used ratio* and is greater than the threshold *log file system utilization threshold*.

Explanation: When the space used in the log file system exceeds the threshold for log file system utilization, a full database backup is required.

System action: None.

User response: None.

ANR0297I A full database backup is needed. The last log number used is *last log used* and the first log number used is *first log used*. The log file size is *log file size* megabytes. The maximum log file size is *maximum log file size* megabytes.

Explanation: When the log space used since the last database backup exceeds the maximum log file size, a full database backup is needed.

System action: None.

User response: None.

ANR0300I Recovery log format started; assigned capacity *count* megabytes.

Explanation: Initial formatting of the server recovery log has started.

System action: The log is formatted for use by the server.

User response: None.

ANR0301I Recovery log format in progress; *count* megabytes of *count*.

Explanation: The amount of the server recovery log shown has been successfully formatted.

System action: Formatting continues.

User response: None.

ANR0302I Recovery log formatting took *mseconds* milliseconds.

Explanation: Formatting of the recovery log has completed and took the number of milliseconds shown.

System action: None.

User response: None.

ANR0303I Format rate: *rate* pages/second.

Explanation: During formatting, the formatter processed the number of pages indicated each second.

System action: None.

User response: None.

ANR0304I Page service time: *rate* ms.

Explanation: During formatting, the formatter required the number of milliseconds indicated to process each page.

System action: None.

User response: None.

ANR0305I Recovery log format complete.

Explanation: Formatting of the server recovery log completed successfully.

System action: None.

User response: None.

ANR0306I Recovery log volume mount in progress.

Explanation: During restart, the server is mounting required recovery log volumes.

System action: None.

User response: None.

ANR0307I Recovery log extend in progress; *count* megabytes of *count* formatted.

Explanation: As a result of an EXTEND LOG command, the additional recovery log pages are being formatted.

System action: Formatting continues.

User response: None.

ANR0309I Recovery log extend terminated - process canceled.

Explanation: The process started as a result of an EXTEND LOG command and has been canceled.

System action: The EXTEND command is ended.

User response: None.

ANR0311I Recovery log reduce in progress; *count* megabytes of *count* moved.

Explanation: As a result of a REDUCE LOG command, the amount of data from the recovery log shown has been moved.

System action: The REDUCE LOG command continues.

User response: None.

ANR0313I Recovery log reduce terminated - process canceled.

Explanation: The process started as a result of a REDUCE LOG command and has been canceled.

System action: The REDUCE command is ended.

User response: None.

ANR0314W Recovery log usage exceeds *utilization* percentage % of its assigned capacity.

Explanation: This message is issued to notify the administrator that the server recovery log utilization exceeds 90% or more of its assigned capacity.

System action: Server operation continues.

User response:

- If the server is operating in NORMAL log mode, depending upon the size of your recovery log, add recovery log volumes, or extend the recovery log, or both, before it fills completely. Refer to the DEFINE LOGVOL, and EXTEND LOG commands for more information on these operations.
- If the server is operating in ROLLFORWARD log mode:
 - backup the database, or
 - define a database backup trigger if one is not already defined, or

- lower the database backup trigger if one is defined

Refer to the DEFINE DBBACKUPTRIGGER or UPDATE DBBACKUPTRIGGER commands.

ANR0315E LOG SCAN ERROR encountered. The recovery log is unusable and the server is unable to continue.

Explanation: The server encountered corrupted information in the recovery log. Typically, the corruption is caused by a hardware or environmental failure external to TSM.

System action: Server operation terminates.

User response: If the server database and recovery log are mirrored, set the MIRRORREAD LOG VERIFY and MIRRORREAD DB VERIFY options in the server options file and restart the server. If database and recovery log mirrors are not available, or all mirrors are corrupted, restore the server database to the latest backup and restart the server.

ANR0320W Storage agent *storage agent* is not able to use device class *device class* for storage pool *storagepool* for LAN-Free data movement operations.

Explanation: The storage agent referenced is not able to perform LAN-Free data movement operations using this storage pool and device class. The storage agent is back-level and is not able to support LAN-Free operations using this device class.

System action: LAN-Free data movement operations are not performed. The operations are either sent via the LAN or else proxied by the storage agent directly to the server.

User response: In TSM version 5.3, a change was made to the way the FILE and device classes are supported. This change prevents back-level storage agents from being able to use these device classes. The storage agent should be upgraded to the same version and release as the server. Until the storage agent is upgraded, any LAN-Free data movement operations that are attempted will be done using the LAN.

ANR0321W Storage agent *storage agent name* at version *storage agent VRMF* does not support operation *operationName*, although the server *server name* at version *server VRMF* can support it.

Explanation: The storage agent is at an earlier version than the server and is not able to use advanced functions that were requested by a client.

System action: The operation is not allowed.

User response: The storage agent must be upgraded to a version, release, and level that supports this

operation. Typically, the problem is that the storage agent and server are not at the same version and release. For example, if the server is version 5.3.0.0 and the storage agent is version 5.2.3.0, the storage agent needs to be upgraded to version 5.3.0.0 to perform the requested function.

If this was a restore or retrieve operation and the client node DATAREADPATH setting was ANY or LANFREE, the server will override this to be LAN only. This will cause the operation to fail on the storage agent and message ANR0416W to be issued. Retry the operation after performing one of the following actions:

- Halt the storage agent, upgrade the storage agent program, and then restart the storage agent.
- Set the ENABLELANFREE client option to NO, and then restart the client

If this was a no-query restore operation, the data was not restored by the storage agent using LAN-Free data transfer. If the client node is allowed to read data over the LAN, the data was restored over the LAN. If the operation failed because the client node is not allowed to read data over the LAN, consider updating the DATAREADPATH setting for this node by using the UPDATE NODE command.

If this was an operation performed by an agent node with proxy node authority to a target node, the session failed with a protocol error. The operation was attempted by a version 5.3 or higher client and server, but the storage agent is not able to support this operation. To allow an agent node to perform operations for a target node, the storage agent must be upgraded to version 5.3.0 or later.

ANR0347E Database *database name* is reporting a drive is invalid and the database can not be removed.

Explanation: This message is issued to notify the administrator that the server has detected that the API is reporting an invalid drive condition during a REMOVE DB process.

System action: Server REMOVE DB stops.

User response: Interrogate the database, correct the problem then issue the command again.

ANR0348S Database restart record version *version* is not recognized.

Explanation: During server initialization, the server database initialization failed because the version of the restart record is not recognized.

System action: The Server is terminated.

User response: Install the latest version of the Server or restore the database to a point in time prior to the previous upgrade.

ANR0349S The database has been upgraded from Express.

Explanation: The Express™ server has been started with a database that has been upgraded from Express to base TSM. Once the database is upgraded from Express, it cannot be used by an Express server.

System action: The Server is terminated.

User response: Either restore the database from a version taken prior to the upgrade, or use a base TSM Server with the current database.

ANR0350I Recovery checkpoint started.

Explanation: During server initialization, the process of bringing the server database back to a state of consistency has begun.

System action: None.

User response: None.

ANR0351I Recovery checkpoint complete.

Explanation: During server initialization, the process of bringing the server database back to a state of consistency has completed successfully.

System action: None.

User response: None.

ANR0352I Transaction recovery complete.

Explanation: During server initialization, the process of recovering any incomplete transactions has completed successfully.

System action: None.

User response: None.

ANR0353I Recovery log analysis pass in progress.

Explanation: During server initialization, the process of analyzing the server recovery log has begun.

System action: None.

User response: None.

ANR0354I Recovery log redo pass in progress.

Explanation: During server initialization, the process of committing incomplete transactions has begun.

System action: None.

User response: None.

ANR0355I Recovery log undo pass in progress.

Explanation: During server initialization, the process of rolling back incomplete transactions has begun.

System action: None.

User response: None.

ANR0356I Recovery log compression started.

Explanation: The process of removing unneeded data from the server recovery log has begun.

System action: None.

User response: None.

ANR0357I Recovery log compression ended.

Explanation: The process of removing unneeded data from the server recovery log has completed.

System action: None.

User response: None.

ANR0358E Database initialization failed: sufficient memory is not available.

Explanation: During server initialization, the server database fails initialization because sufficient server memory is not available.

System action: Initialization fails.

User response: Make more memory available to the server.

ANR0359E Database initialization failed: unable to read database restart record.

Explanation: During server initialization, the server database initialization fails because the required restart record cannot be read.

System action: Initialization fails.

User response: Contact your service representative.

ANR0360E Database initialization failed: database size mismatch; LVM size = *size*, expected size = *size*.

Explanation: During server initialization, the server database initialization fails because the size of the database does not match its prior size.

System action: Initialization fails.

User response: Contact your service representative.

ANR0361E Database initialization failed: error initializing database page allocator.

Explanation: During server initialization, the server database initialization fails because the page allocator cannot be started.

System action: Initialization fails.

User response: Contact your service representative.

ANR0362W Database usage exceeds *utilization percentage %* of its assigned capacity.

Explanation: This message is issued to notify the administrator that the server database utilization exceeds 80% or more of its assigned capacity.

System action: Server operation continues.

User response: Depending upon the size of your database, add database volumes, or extend the database, or both, before it fills completely. The server expiration process may also free up database space making it available to other server processes. Refer to the EXPIRE INVENTORY, DEFINE DBVOL, and EXTEND DB commands for more information on these operations.

ANR0363I Database was automatically upgraded to the server program level.

Explanation: This message is issued to notify the administrator that the server database was automatically upgraded to the current server program level. The upgrade is performed when the UPGRADEDDB parameter is specified at server startup and the server is started over a database that was written by a down-level version of the server program.

System action: Server operation continues.

User response: None. The UPGRADEDDB parameter does not need to be specified during future server start-ups.

ANR0364W Server has detected a zero bit mismatch error.

Explanation: This message is issued to notify the administrator that the server has detected a zero bit mismatch error during a RESTORE DB process. The recovery process is the database must be restored with a process that includes a DSMSERV FORMAT. Either the data base volumes must be formatted then a DSMSERV RESTORE DB performed from a data base backup that does not have this problem, or a DSMSERV UNLOADDB followed by the formatting, then a DSMSERV LOADDB. Do not use DSMSERV DUMPDB on the data base for this recovery.

System action: Server RESTORE DB continues.

User response: Perform one of the data base recovery

actions after the RESTORE DB completes.

ANR0365E Database *database name* is currently in use and can not be removed.

Explanation: This message is issued to notify the administrator that the server has detected that the database is currently in use during a REMOVE DB process.

System action: Server REMOVE DB stops.

User response: Drop all database connections then issue the command again.

ANR0366I Database *database name* was removed successfully.

Explanation: This message is issued to notify the administrator that the server has removed the server database successfully.

System action: None.

User response: The server database was removed. In order to run the TSM server, you need to format a new database using the 'DSMSERV FORMAT' command.

ANR0367W The server failed to format the database *database name*. This database name already exists.

Explanation: While attempting to format a database, the Tivoli Storage Manager server has found that this database name already exists.

System action: Server format stops.

User response: Before reissuing the command to format a new database, check the following items:

- Remove the old database using command 'DSMSERV REMOVEDB DB_NAME'.
- Ensure that the command is using the correct options file for the server. If you are using the -o option with the command to specify a server options file, ensure that the name and location of the file is correct.

ANR0368I Formatting server's database: *database name*.

System action: The server is done creating its database

User response: None.

ANR0369I Stopping the database manager because of a server shutdown.

System action: Stopping the server's database manager.

User response: None.

ANR0370E *Diagnostic(ID)* During the format operation, the server cannot create files in one or more directories that you specified for *log type*. Ensure that the file system where the directory is located has sufficient space.

Explanation: Space is not available for the server to write data to the directory.

System action: The format operation stops.

User response: Before reissuing the command to format a new database, check the following items:

- Check whether the format operation created a database but did not remove the database after the failure. If the database that was created was not removed, use the utility DSMSERV REMOVEDB *db_name* to remove it.
- Check that space is available to the directories that you specified for ACTIVELOGDIR, ARCHIVELOGDIR, and ARCHFAILOVERLOGDIR. Ensure that the amount of space meets requirements. For example, the directory for ACTIVELOGDIR must have at least 8 GB space available.
- Remove any files that are in the directories that you want to use for the recovery logs.

ANR0371E Error setting environment variable *environment variable name* with value *value* - return code *return code value*.

Explanation: The server is unable to set the content of the environment variable on the operating system to the value specified in the message. The return code in the message is the last error code set in the operating system. The return code, or, last error code is a system error code as a result of the failed function call to set the environment variable.

System action: The server operation stops.

User response: Refer to the list of system error codes provided by the operating system to determine the cause of the problem. Resolve the problem and retry the server operation.

ANR0372E Database *database name* is currently damaged and can not be removed.

Explanation: This message is issued to notify the administrator that the server has detected that the database is damaged during a REMOVE DB process.

System action: Server REMOVE DB stops.

User response: Interrogate the database, correct the problem then issue the command again.

ANR0373E Database *database name* is reporting a File error and can not be removed.

Explanation: This message is issued to notify the administrator that the server has detected that the database is reporting a File error during a REMOVE DB process.

System action: Server REMOVE DB stops.

User response: Interrogate the database, correct the problem then issue the command again.

ANR0374E Database *database name* is invalid and can not be removed.

Explanation: This message is issued to notify the administrator that the server has detected that the API is reporting an Invalid DB error during a REMOVE DB process.

System action: Server REMOVE DB stops.

User response: Interrogate the database, correct the problem then issue the command again.

ANR0375E Database *database name* is reporting an authorization error and can not be removed.

Explanation: This message is issued to notify the administrator that the server has detected that the database is reporting an authorization error during a REMOVE DB process.

System action: Server REMOVE DB stops.

User response: Interrogate the database, correct the problem then issue the command again.

ANR0376E Database *database name* is not found and can not be removed.

Explanation: This message is issued to notify the administrator that the server has detected that the API is reporting the DB cannot be found during a REMOVE DB process.

System action: Server REMOVE DB stops.

User response: Interrogate the database, correct the problem then issue the command again.

ANR0377E Database *database name* is reporting a drive is not found and can not be removed.

Explanation: This message is issued to notify the administrator that the server has detected that the API is reporting a database drive cannot be found during a REMOVE DB process.

System action: Server REMOVE DB stops.

User response: Interrogate the database, correct the

problem then issue the command again.

ANR0378W Database *database name* is reporting a drive is not found and can not be removed.

Explanation: This message is issued to notify the administrator that the server has detected that the API is reporting a warning during a REMOVE DB process.

System action: Server REMOVE DB completed successfully.

User response: The drop database command has completed successfully, however, there are some nodes where the database alias or database name was not found. It is possible that DROP DATABASE AT[®] NODE was already performed on these nodes.

ANR0379W A server database deadlock situation has been encountered; the lock request for the *lock name lock*, *key name* will be denied to resolve the deadlock.

Explanation: The server detected a deadlock situation between a number of processes attempting to access database information. A lock request for one of the processes will be denied to resolve the database deadlock. When the server processes encounter a database deadlock, they usually try to run the function that was in progress when the deadlock was encountered again. Not all process can explicitly try an operation again. For example, migration and reclamation will eventually try again. However, something like a delete volume run in a macro will only be tried again if the delete command is reissued either in the macro or the command line.

System action: A lock request fails for one of the deadlocked processes. Server operation continues.

User response: If a process can try again (like migration), then monitor the try-again attempt to see if it succeeds or not. If it fails, contact a service representative. If the process or command is not able to try again, then reissue the command or macro that caused the action to occur. If it fails again, contact a service representative for further assistance to better isolate the deadlock condition.

ANR0380W The database buffer pool recovered from an overcommit of *number of pages* pages. Consider increasing your buffer pool size by *kilobytes needed* kilobytes under current server load.

Explanation: During normal processing, additional buffer pool space is required beyond that specified in the BUFPOOLSIZE in the server options file. The additional kilobytes of buffer pool space that are required are indicated in the message.

System action: Server operation continues; the

additional buffer pool space is obtained from available server memory.

User response: If the current server load is typical, consider increasing the size specified for your BUFPOOLSIZE option by the number of kilobytes specified in the message. To do this, you must halt the server, change the options file, and then restart the server.

ANR0381I Buffer pool statistics were successfully reset.

Explanation: Buffer pool statistics, such as the Cache Hit Ratio, have been reset. The RESET BUFPOOL command and the ESTIMATE DBREORGSTATS command will reset the buffer pool statistics.

System action: Server operation continues.

User response: The QUERY DB command (FORMAT=DETAILED) can be used to display the current values for the buffer pool statistics.

ANR0382I The database maximum utilization statistic was successfully reset.

Explanation: The database maximum utilization statistic has been reset by the RESET DBMAXUTILIZATION command to the current utilization.

System action: Server operation continues.

User response: The QUERY DB command (FORMAT=DETAILED) can be used to display the current value for the maximum utilization.

ANR0383I The recovery log maximum utilization statistic was successfully reset.

Explanation: The recovery log maximum utilization statistic has been reset by the RESET LOGMAXUTILIZATION command to the current utilization.

System action: Server operation continues.

User response: The QUERY LOG command (FORMAT=DETAILED) can be used to display the current value for the maximum utilization.

ANR0384I The recovery log consumption statistic was successfully reset.

Explanation: The recovery log consumption statistic has been reset by the RESET LOGCONSUMPTION command.

System action: Server operation continues.

User response: The QUERY LOG command (FORMAT=DETAILED) can be used to display the current value for recovery log consumption.

ANR0385I Could not free sufficient buffers to reach reduced BUFPoolsize.

Explanation: A reduction in the database buffer pool size was requested. However, too many buffers were in use to reach the lower buffer pool size.

System action: Server operation continues. Whatever buffer pool size reduction that could be achieved is in effect. The new bufpoolsize is written to the options file for use on the next server startup.

User response: None.

ANR0386I The BUFPoolsize has been changed to *buffer pool size*.

Explanation: The BUFPoolsize option has been changed to the indicated value.

System action: Server operation continues.

User response: None.

ANR0387I Evaluating node *node name* using storage agent *storage agent* for LAN-free data movement.

Explanation: The server is evaluating whether the node and storage agent can use storage pools capable of LAN-free data movement.

System action: The server evaluates the storage pool destinations available to this node and reports which storage pools can and cannot be used for LAN-free data movement.

User response: Review the results of this processing to determine if the appropriate LAN-free environment is configured.

ANR0388I Node *node name* using storage agent *storage agent* has *capable count* storage pools capable of LAN-free data movement and *not capable count* storage pools not capable of LAN-free data movement.

Explanation: The server has completed evaluation of the LAN-free and non-LAN-free storage pool destinations for this node using this storage agent. The server determined that there are *capable count* storage pools that are capable of LAN-free data movement. It also determined that there are *not capable count* storage pools that cannot be used for LAN-free data movement.

System action: None.

User response: Review the other messages issued to determine which storage pools are capable of LAN-free data movement and those which are not capable of LAN-free data movement for this node using this storage agent.

ANR0389W Node *node name* has data path restrictions.

Explanation: The *node name* has data path restrictions. The registered node has data write path, data read path, or both, configured to not allow LAN-free operations.

System action: None.

User response: Issue the command QUERY NODE *node name* F=D and evaluate the data read path and data write path settings. To store data or read data using LAN-free data movement, set the data write path to ANY or LANFREE.

ANR0390W A server database deadlock situation has been encountered; the lock request for transaction *transaction ID* will be denied.

Explanation: The server detected a deadlock situation between a number of processes that were attempting to access database information. A lock request for one of the processes is denied, to resolve the database deadlock. When server processes encounter a database deadlock, they usually reattempt the function that was in progress when the deadlock was encountered. Not all process can explicitly try an operation again. For example, migration and reclamation will eventually be tried again. However, something such as a delete volume run in a macro will only be tried again if the delete command is reissued either in the macro or the command line.

System action: A lock request fails for one of the deadlocked processes. Server operation continues.

User response: If a process can try again (like migration), then monitor the subsequent attempt to see if it succeeds or not. If it fails, contact a service representative. If the process or command is not able to automatically try again, then reissue the command or macro that caused the action to occur. If it fails again, contact a service representative for further assistance to better isolate the deadlock condition.

ANR0391I Evaluating LAN-free destination for node *node name* using storage agent *storage agent*.

Explanation: The server is evaluating to determine LAN-free destination storage pools for the node and storage agent referenced.

System action: The server will evaluate the storage pool destinations available to this node and report which pools may be used LAN-free and for those that can not be used LAN-free it will report why that pool can not be used.

User response: Review the results of this processing to determine if the appropriate LAN-free environment is configured.

ANR0392I Node *node name* using storage agent *storage agent* has LAN-free count storage pools enabled for LAN-free data transfer and *non-LAN-free count* storage pools that are not enabled for LAN-free data transfer.

Explanation: The server has completed evaluation of the storage pool destinations for this node using this storage agent. The server determined that there are LAN-free count storage pools that are LAN-free enabled. It also determined that there are non-LAN-free count storage pools that are not enabled for LAN-free data transfer for this node.

System action: None.

User response: Review the other messages issued to determine which storage pools are capable of LAN-free data transfer and those which are not capable of LAN-free data transfer for this node using this storage agent.

ANR0393I Management class *management class* with destination *storage pool* for operation type operations is enabled for LAN-free data transfer for node *node name* using storage agent *storage agent name*.

Explanation: The *storage pool* is capable of LAN-free data transfer operations for node *node name* using storage agent *storage agent name*.

System action: None.

User response: None.

ANR0394W Management class *management class* with destination *storage pool* for operation type operations is not enabled for LAN-free data transfer for node *node name* using storage agent *storage agent name* because this destination is a CENTERA device.

Explanation: The destination *storage pool* is not capable of LAN-free data transfer operations for node *node name* using storage agent *storage agent name*. This storage pool uses a CENTERA device and as such can not be used for LAN-free operations.

System action: None.

User response: To configure this node for LAN-free data transfer operations, update the destination storage pool for the copy group or assign this node to a domain that has LAN-free storage pool destinations.

ANR0395W Management class *management class* with destination *storage pool* for operation type operations is not enabled for LAN-free data transfer for node *node name* using storage agent *storage agent name* because this destination is configured for simultaneous write.

Explanation: The destination *storage pool* is not capable of LAN-free data transfer operations for node *node name* using storage agent *storage agent name*. This storage pool is configured for simultaneous write operations. Simultaneous write operations are only allowed for data sent directly to the server. Configuring a storage pool for simultaneous write operations disqualifies it from being eligible for use for LAN-free operations.

System action: None.

User response: To configure this node for LAN-free data transfer operations, update the destination storage pool for the copygroup or assign this node to a domain that has LAN-free storage pool destinations. Or update this storage pool to disable simultaneous write by setting the copy storage pools field to blank.

ANR0396W Management class *management class* with destination *storage pool* for operation type operations is not LAN-free enabled for node *node name* using storage agent *namestorage agent name* because no online paths are available.

Explanation: The destination *storage pool* is not capable of LAN-free data transfer operations for node *node name* using storage agent *storage agent name*.

System action: None.

User response: A storage pool can be reported as not having LAN-free enabled paths for a number of reasons. First, if this is a DISK storage pool, these are not capable of LAN-free operations. In this case, the destination for this node or the domain that this node is assigned to should be changed to one that is LAN-free enabled. The next reason a storage pool is reported as not LAN-free capable is if there are no paths defined for a device to this storage agent. Use the QUERY PATH, QUERY SERVER, QUERY STGPOOL, QUERY LIBRARY, and QUERY DRIVE commands to determine the drive or drives that need paths defined to this server (storage agent). The final reason a storage pool is reported as not LAN-free enabled is if there are define paths to this storage agent but no paths are online. Use the QUERY PATH and QUERY DRIVE commands to evaluate this and if necessary use update those paths to be online.

ANR0397I Session *session number* for node *agent_node* has begun a proxy session for node *target_node*.

Explanation: A client session has begun proxy operations.

System action: The server granted a proxy session to a client node.

User response: None.

ANR0398W Session *session number* for node *agent_node* has failed to begin a proxy session for node *target_node*.

Explanation: A client session attempted to begin a proxy operation. The server failed the client request. This can occur if the agent node does not have a proxy association with the target node.

System action: The server blocks the proxy authorization attempt.

User response: None.

ANR0399I Session *session number* for node *agent_node* has ended a proxy session for node *target_node*.

Explanation: A proxy session has been ended. The server terminates a session if there is an error in the protocol. On the other hand, the client can also terminate the session.

System action: The server, or the client, has ended a proxy session for a client node.

User response: None.

ANR0400I Session *session number* started for node *node name (client platform) (communication method)*.

Explanation: A new client session has been initiated by the specified node. The session number, client platform type and communication method used by this session are included in the message.

System action: The server begins a communications session to service the client node.

User response: None.

ANR0401I Session *session number* started for node *node name (client platform) (communication method) (WDSF client)*.

Explanation: A new WDSF client session has been initiated by the specified node. The session number, client platform type and communication method used by this session are included in the message.

System action: The server begins a communications session to service the client node.

User response: None.

ANR0402I Session *session number* started for administrator *administrator ID* (*administrator's platform*) (*communication method*).

Explanation: A new administrator client session has been initiated by the specified administrator. The session number, administrator's platform type and communication method used by this session are included in the message.

System action: The server begins a communications session to service the administrator client.

User response: None.

ANR0403I Session *session number* ended for node *node name* (*client platform*).

Explanation: A client session has completed normally.

System action: Server operation continues.

User response: None.

ANR0404I Session *session number* ended for node *node name* (*client platform*) (**WDSF client**).

Explanation: A WDSF client session has completed normally.

System action: Server operation continues.

User response: None.

ANR0405I Session *session number* ended for administrator *administrator ID* (*client platform*).

Explanation: An administrative client session has completed normally.

System action: Server operation continues.

User response: None.

ANR0406I Session *session number* started for node *node name* (*client platform*) (*communication method* *communication address*).

Explanation: A new client session has been initiated by the specified node. The session number, client platform type, communication method and address used by this session are included in the message.

System action: The server begins a communications session to service the client node.

User response: None.

ANR0407I Session *session number* started for administrator *administrator ID* (*administrator's platform*) (*communication method* *communication address*).

Explanation: A new administrator client session has been initiated by the specified administrator. The session number, administrator's platform type, communication method and address used by this session are included in the message.

System action: The server begins a communications session to service the administrator client.

User response: None.

ANR0408I Session *session number* started for server *server name* (*server's platform*) (*communication method*) for purpose.

Explanation: A new server session has been initiated by the specified server for the specified purpose. The session number, server's platform type and communication method used by this session are included in the message.

System action: The server begins a communications session to service the administrator client.

User response: None.

ANR0409I Session *session number* ended for server *server name* (*client platform*).

Explanation: A server has completed normally.

System action: Server operation continues.

User response: None.

ANR0410E EXPORT operation to server *server name* rejected - administrator *administrator* is not authorized to perform the import operation on the target server.

Explanation: An export operation to the named server was rejected, because the administrator issuing the export command is not defined on the target server or does not have sufficient authority to perform the import operation on the target server.

System action: Server operation continues.

User response: None.

ANR0411I Session *session number* for administrator *administrator name* logged in as node *node name* restored or retrieved *object type* object: node *node name*, *filesystem* *filesystem name*, object *object name*.

Explanation: This message logs information about an object that was restored or retrieved by an administrator logged in for a node.

System action: Server operation continues.

User response: None.

ANR0412I Session *session number* for node *node name* restored or retrieved *object type*
object: node *node name*, **filesystem** *filesystem name*, **object** *object name*.

Explanation: This message logs information about an object that was restored or retrieved by an administrator logged in for a node.

System action: Server operation continues.

User response: None.

ANR0413I Session *session number* for administrator *administrator name* logged in as node *node name* is restoring backup set: node *node name*, set *filesystem name*.

Explanation: This message logs information about a backup set restored by an administrator logged in for a node.

System action: Server operation continues.

User response: None.

ANR0414I Session *session number* for node *node name* is restoring backup set: node *node name*, set *filesystem name*.

Explanation: This message logs information about a backup set restored by a node.

System action: Server operation continues.

User response: None.

ANR0415I Session *session number* proxied by storage agent *agent name* started for node *node name*.

Explanation: This session is started for the indicated node and the storage agent acts as the proxy for the node. Client node sessions are used to perform LAN-free operations between the client and server.

System action: Server operation continues.

User response: None.

ANR0416W Session *session number* for node *node name* not allowed to operation using path *data transfer path*.

Explanation: This session attempted this operation using the specified data transfer path. This operation is not permitted for this client.

System action: Server operation continues.

User response: Issue QUERY NODE FORMAT=DETAILED for this node to see the current DATA WRITE PATH or DATA READ PATH settings.

These settings determine if a given operation is permitted using a specific data transfer path. If this client node should be permitted to perform this operation using this data transfer path, the UPDATE NODE command should be used to correct this.

ANR0417W Session *session number* for node *node name* terminated - data transfer path not allowed.

Explanation: This session attempted an operation that needed a data transfer path that this node is not allowed to use.

System action: This client session terminates.

User response: Refer to the ANR0416W message that was issued for this client session to determine which operation and data transfer path was attempted.

ANR0418W Session *session number* for administrator *administrator name* (*client platform*) is refused because an incorrect password was submitted.

Explanation: The server refuses a request to start a client session because an invalid password has been submitted by the client during sign-on processing.

System action: The server will continue to deny access attempts by this client until a valid password is submitted.

User response: Enter the proper password. If you have forgotten the password, contact an authorized administrator, who can assign a new password using the UPDATE ADMIN command.

ANR0419W Administrative client userid *administrative ID* cannot be used when authentication is on.

Explanation: The server refuses a request for a client (administrative) session because the user ID specified cannot be used when authentication of IDs is in effect. SERVER_CONSOLE is an administrative ID that has this restriction.

System action: Server operation continues.

User response: Use an administrative ID that was registered for this server and that has a password.

ANR0420W Session *session number* for node *node name* (*client platform*) refused - server disabled for user access.

Explanation: The server refuses a request for a client (backup-archive) session because the server is currently disabled for client access.

System action: Server operation continues.

Administrative clients are permitted access to the server.

User response: An authorized administrator must issue the ENABLE SESSION command before client nodes are permitted access to the server.

ANR0421W Session *session number* for node *node name (client platform)* refused - sign-on protocol violation.

Explanation: The server refuses a request for a client session because sign-on protocol has been violated.

System action: Server operation continues.

User response: This error is usually the result of a client programming error in which the sign-on verb has been incorrectly formatted and delivered to the server. This error can also result when the server is contacted by an application that is not a part of this product.

ANR0422W Session *session number* for node *node name (client platform)* refused - node name not registered.

Explanation: The server refuses a request to start a client session because the client node name is not registered in the server database.

System action: Server operation continues.

User response: Register the node name with the server before establishing a session. If the server is running with OPEN registration, no action is required; the client prompts the user for a password and registers the client with the server. If CLOSED registration is in effect on the server, an authorized administrator must use the REGISTER NODE command to register the client node name with the server.

ANR0423W Session *session number* for administrator *administrator ID (client platform)* refused - administrator name not registered.

Explanation: The server refuses a request to start an administrative session because the administrator name is not registered in the server database.

System action: Server operation continues.

User response: Register the administrator name with the server before establishing a session. An authorized administrator must use the REGISTER ADMIN command to register the administrator with the server.

ANR0424W Session *session number* for node *node name (client platform)* refused - invalid password submitted.

Explanation: The server refuses a request to start a client session because an invalid password has been submitted by the client during sign-on processing. The server will continue to deny access attempts by this client until a valid password is submitted.

System action: Server operation continues.

User response: Enter the proper password. If the password has been forgotten by the user, an authorized administrator can assign a new password by using the UPDATE NODE command.

ANR0425W Session *session number* for node *node name (client platform)* refused - Node password has expired.

Explanation: The server refuses the specified session because the client node's password has expired.

System action: Server operation continues.

User response: Upon receipt of this error condition, the client program immediately reconnects to the server specifying a password update session and prompts the user for a new password. After the user enters a new password, the client reconnects to the server for normal operations. Alternatively, an authorized administrator can update the client password using the UPDATE NODE command.

ANR0426W Session *session number* for node *node name (client platform)* refused - open registration not permitted.

Explanation: The server refuses a client session because an open registration action has been attempted and the server is running with CLOSED registration.

System action: Server operation continues.

User response: Ask an authorized administrator to submit the request using the REGISTER NODE or REGISTER ADMIN command.

ANR0427W Session *session number* for node *node name (client platform)* refused - server version is down-level with this client.

Explanation: The server refuses a client session because the client program version level is newer than that supported by the server program.

System action: Server operation continues.

User response: Apply service to the server program to make it compatible with the newer client program, or use an older client program to contact the server.

ANR0428W Session *session number* for node *node name (client platform)* refused - client is down-level with this server version.

Explanation: The server refuses a client session because the client program version level is older than that supported by the server program. For certain problems (such as the compression fix), once a node connects to the server using the newer client, the server records this fact and will not let this node back off this client version to a version that does not include the fix.

System action: Server operation continues.

User response: Apply service to the client program to make it compatible with the newer server program.

ANR0429W **Session** *session number for node node name (client platform)* **refused - maximum server sessions (max sessions allowed) exceeded.**

Explanation: The server refuses the specified client or administrative session because the maximum number of concurrent client sessions has been exceeded.

System action: Server operation continues.

User response: If necessary, increase the maximum number of permitted sessions. To do this, update the value for the MAXSESSIONS parameter in the server options file and restart the server with the updated options file. Note that increasing the MAXSESSIONS value requires additional memory resource by the server. You may want to retry the connection at a later time.

ANR0430W **Session** *session number for node node name (client platform)* **refused - node name is locked.**

Explanation: The server refuses the specified client session because the node is locked from server access (with the LOCK NODE command).

System action: Server operation continues.

User response: Before the client node is permitted to access the server, a properly authorized administrator must unlock the node with the UNLOCK NODE command.

ANR0431W **Session** *session number* **refused - administrator** *administrator ID (client platform)* **is locked.**

Explanation: The server refuses the specified administrative session because the administrator is locked from server access (with the LOCK ADMIN command).

System action: Server operation continues.

User response: Before the administrator is permitted to access the server, a properly authorized administrator must unlock the administrator with the UNLOCK ADMIN command.

ANR0432W **Session** *session number for node node name (client platform)* **refused - insufficient memory.**

Explanation: The server ends the specified session because sufficient memory (virtual memory) is not available.

System action: The server ends the session and continues operation.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see “Appendix A. Allocating Additional Server Memory”.

ANR0433W **Session** *session number for node or administrator ID (client platform)* **refused - insufficient recovery log space.**

Explanation: The server ends the specified client or administrative session because sufficient log space is not available to complete a database transaction.

System action: The server ends the session and continues operation.

User response: To increase the amount of log space available to the server, an authorized administrator can add log volumes using the DEFINE LOGVOLUME command, and extend the size of the log using the EXTEND LOG command.

ANR0434W **Session** *session number for node or administrator ID (client platform)* **refused - insufficient database space.**

Explanation: The server ends the specified client or administrative session because sufficient database space is not available to complete a database transaction.

System action: The server ends the session and continues operation.

User response: To increase the amount of database space available to the server, an authorized administrator can add database volumes using the DEFINE DBVOLUME command, and extend the size of the database using the EXTEND DB command.

ANR0435W **Session** *session number for node node name (client platform)* **refused - internal error detected.**

Explanation: The server ends the specified session because an internal logic error is detected.

System action: The server ends the session and continues operation.

User response: To determine the source of the error, the administrator can examine server messages issued prior to this message. The QUERY ACTLOG command can be used to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0436W Session *session number* **refused - a WDSF client is attempting to access the server using client name *client node name (client platform)*, associated with a non-WDSF client.**

Explanation: The server refuses a client session because a Workstation DataSave Facility (WDSF) client is attempting to access the server using a node name associated with a non-WDSF client. When converting from WDSF, WDSF client programs cannot be used to access the server with a specific node name once the non-WDSF client program has been used to access the server with that node name.

System action: Server operation continues.

User response: Access the server using a non-WDSF client program for the node name.

ANR0437W Session *session number* **for node *client node name (client platform)* encountered an internal server error while checking license compliance.**

Explanation: The server encountered an internal error in determining if the server is in compliance with license terms.

System action: The client session is ended.

User response: Use the QUERY LICENSE and QUERY STATUS commands to determine if the server is in compliance with license terms. Start an AUDIT LICENSES process to readjust server license information. When this process completes you may restart the session. If the problem persists, contact your service representative.

ANR0438W Session *session number* **archive operation for client *client node name (client platform)* has been denied - Server is not in compliance with license terms.**

Explanation: The server refuses a client archive operation because the current server configuration is not in compliance with license terms.

System action: Server operation continues. Clients may perform any action except backup or archive.

User response: Use the QUERY LICENSE command to determine the license terms that are no longer in compliance.

ANR0439W Session *session number* **backup operation for client *client node name (client platform)* has been denied - Server is not in compliance with license terms.**

Explanation: The server refuses a client backup operation because the current server configuration is not in compliance with license terms.

System action: Server operation continues. Clients may perform any action except backup or archive.

User response: Use the QUERY LICENSE command to determine the license terms that are no longer in compliance.

ANR0440W Protocol error on session *session number* **for node *client node name (client platform)* - invalid verb header received.**

Explanation: The server detects a protocol error on the specified session because an invalid verb header has been received from the client. Verb headers always precede communication sent to the server from the client or from the server to the client.

System action: The server ends the client session.

User response: Correct the programming error in the client program if it has been written by your installation using WDSF verbs. Otherwise, contact your service representative.

ANR0441W Protocol error on session *session number* **for node *client node name (client platform)* - invalid data length received.**

Explanation: The server detects a protocol error on the specified session because an invalid verb length has been received from the client.

System action: The server ends the client session.

User response: Correct the programming error in the client program if it has been written by your installation using WDSF verbs. Otherwise, contact your service representative.

ANR0442W Protocol error on session *session number* **for node *client node name (client platform)* - invalid stream mode switch.**

Explanation: The server detects a protocol error on the specified session because the client has attempted an illegal stream operation.

System action: The server ends the client session.

User response: Correct the programming error in the client program if it has been written by your installation. Otherwise, contact your service representative.

ANR0443W Protocol error on session *session number* **for node *client node name (client platform)* - invalid "*field name*" field found in "*verb name*" verb (*offset* *offset position*).**

Explanation: The server detects a protocol error on the specified session because an invalid field has been found in a verb sent from the client node.

System action: The server ends the client session.

User response: Correct the programming error in the client program if it has been written by your installation using WDSF verbs. Otherwise, contact your service representative.

ANR0444W Protocol error on session *session number* for node *client node name (client platform)* - out-of-sequence verb (type *verb name*) received.

Explanation: The server detects a protocol error on the specified session because a verb has been received that does not adhere to the client-server exchange sequence.

System action: The server ends the client session.

User response: If the client generating the error is not an API client, contact your service representative. If the client generating the error is an API client, contact the owner of the API client. If the client generating the error is a client that you have created using WDSF verbs, correct the programming error in your client program.

ANR0445W Protocol error on session *session number* for node *client node name (client platform)* - maximum group transaction size exceeded.

Explanation: The server detects a protocol error on the specified session because the client has attempted to group more than the maximum database update operations in a single database transaction.

System action: The server ends the client session.

User response: Correct the programming error in the client program if it has been written by your installation using WDSF verbs. Otherwise, contact your service representative.

ANR0446W Session *session number* client *client node name* compression method unsupported - Compression forced OFF. Please obtain the latest level of the client code.

Explanation: The client is using a compression method that is no longer supported by the Server.

System action: Server operation continues. The client's backup operation continues, without compressing the data.

User response: The compression method used by the client is no longer supported. In order to use compression, the client needs to be upgraded to a client service level that supports the newer compression method.

ANR0447W Session *session number* space management migration operation for client *client node name (client platform)* has been denied - Server is not in compliance with license terms.

Explanation: The server refuses a client space management migration operation because the current server configuration is not in compliance with license terms.

System action: Server operation continues. Clients may perform any action migration except backup, archive, or space-managed file migration.

User response: Use the QUERY LICENSE command to determine the license terms that are no longer in compliance.

ANR0448W Session *session number* space management migration operation for client *client node name (client platform)* has been denied - server is not licensed for space management support.

Explanation: The server refuses a client space management migration operation because the server is not licensed to support space-managed clients.

System action: Server operation continues.

User response: Licenses to support space-managed clients can be obtained from your service provider or re-seller. The REGISTER LICENSE command can be used with these licenses to enable space management support.

ANR0449W Session *session number* space management migration operation for client *client node name (client platform)* is in violation of server license terms - server is not licensed for space management support.

Explanation: The server warns about a client space management migration operation because the server is not licensed to support space-managed clients.

System action: Server operation continues.

User response: Licenses to support space-managed clients can be obtained from your service provider or re-seller. The REGISTER LICENSE command can be used with these licenses to enable space management support.

ANR0450W Session *session number* for server *server name (client platform)* refused - server name not defined for server to server communications.

Explanation: The server refuses a request to start a server session because the requesting server name is not defined in the server database, or the requesting

server definition does not have a SERVERPASSWORD, or a password or node name is not setup for virtual volume use on the source server.

System action: Server operation continues.

User response: Register the requesting server name with the server before establishing a session, or update the existing requesting server definition and set a SERVERPASSWORD. An authorized administrator must use the DEFINE SERVER or UPDATE SERVER command to register the requesting server and set the password. For a virtual volume environment, the source server must have a definition for the target server which includes a node name and password.

ANR0451W Session *session number* for server *server name (server platform)* refused - invalid password submitted.

Explanation: The server refuses a request to start a server session because an invalid password has been submitted during sign-on processing. The server will continue to deny access attempts by that server until valid passwords are submitted.

System action: Server operation continues.

User response: Set the proper passwords. If the password has been changed on either server, an authorized administrator can set new passwords by using the UPDATE SERVER command with the SERVERPASSWORD parameter.

ANR0452W Session for server *server name* refused - server name not defined for server to server communications.

Explanation: The server refuses a request to start a server to server session because a server name is not defined in the server database, or the server definition does not have a SERVERPASSWORD. Server to server communications using the serverpassword requires that the each server has had a server definition for the other server.

System action: Server operation continues.

User response: Register the server names on both servers before establishing a session, or update the server's existing server definition and set a SERVERPASSWORD. An authorized administrator must use the DEFINE SERVER or UPDATE SERVER command register the servers and set the passwords.

ANR0453W Server to server session refused - no password defined.

Explanation: The server to server session cannot be initiated because no server password has been defined for this server.

System action: Server operation continues.

User response: Define a server password with the SET SERVERPASSWORD command and retry the command.

ANR0454E Session rejected by server *server name*, reason: *rejection reason*.

Explanation: The server has attempted to open a session with the shown server. The session was rejected for the indicated reason.

System action: The operation fails.

User response: Check both the servers for any additional messages that might further describe the reason the session was rejected. For a reason of AUTHENTICATION FAILURE, ensure that all passwords have been set correctly on both servers. The password for the server (set by SET SERVERPASSWORD on server X) and the password in the server definition (set by DEFINE or UPDATE SERVER X SERVERPASSWORD=) are the same password. For a reason of VERIFICATION FAILURE, use the QUERY SERVER command to determine that the HLADDRESS and LLADDRESS of the target server are correct. If they are not, correct them with the UPDATE SERVER command. If they are correct, resynchronize with the target server by issuing the UPDATE SERVER FORCESYNC=YES. For a reason of COMMUNICATION FAILURE ensure that the target server is available and that TCPIP is available on both servers. For a reason of NO RESOURCE, ensure that the receiving server is enabled, has sufficient DB, LOG, and memory resource to support the source server session. For a reason of INTERNAL ERROR, use the messages on the target server to determine the problem and contact your service representative. Retry the failing operation.

ANR0455W Invalid Command *command name* for SNMP session.

Explanation: An SNMP administrative session attempted to run a command which is not an macro invocation. SNMP administrative sessions are only allowed to issue macro commands.

System action: The server ends the client session.

User response: Enter commands through the SNMP administrative interface which are macros defined on the server.

ANR0456W Session rejected for server name *server name* at *High level address* *Low level address* does not match.

Explanation: The server name at the address specified does not match the name in the server definition. The connection is not established.

System action: The server continues.

User response: Ensure the HLADDRESS and

LLADDRESS in the define server command are correct, and that the servername on the server being contacted matches the name used in the DEFINE SERVER command.

ANR0457W Session for server *server name* refused - crossdefine is not allowed on this server.

Explanation: The server refuses a request to start a server to server session for crossdefine because it is not allowed on this server. The server will deny any sessions for crossdefine until crossdefine is allowed on this server.

System action: Server operation continues.

User response: An authorized administrator must use the SET CROSSDEFINE ON command to allow cross registration of servers.

ANR0458S Server *server name* does not support access by the Storage Agent.

Explanation: The storage agent attempted to contact a Database Server, but the server contacted was not at the correct level.

System action: The Storage Agent terminates.

User response: Specify a correct Database Server in the devconfig file for the Storage Agent.

ANR0459W Signon for administrator *administrator name* refused - invalid administrator name and/or password submitted.

Explanation: The server refuses a request to start an administrative session because an invalid administrator name and/or password has been submitted by the user during sign-on processing. The server will continue to deny access attempts by this administrator until a valid password is submitted, or until the administrator is locked due to maximum number of invalid password attempts being exceeded.

System action: Server operation continues.

User response: Enter the proper password. If the password has been forgotten by the user, an authorized administrator can assign a new password by using the UPDATE ADMIN command.

ANR0460W Open registration failed for session *session number* - node name *node name (client platform)* already exists.

Explanation: The server refuses a client session during open registration because the client has specified a node name that is already registered on the server.

System action: Server operation continues.

User response: The client program user must specify a

different node name for the client in the client options file.

ANR0461W Open registration failed for session *session number* for node *node name (client platform)* - policy domain STANDARD does not exist.

Explanation: The server refuses a client session during open registration because the STANDARD policy domain does not exist. All nodes added to the server database under open registration are automatically assigned to the STANDARD policy domain. This policy domain must be defined and have an active policy set to support open registration.

System action: Server operation continues.

User response: If you want to support open registration, define a policy domain using the DEFINE DOMAIN command with the name STANDARD and activate a valid policy set in the domain. You can issue the UPDATE NODE command to move nodes to different policy domains after the nodes have registered themselves through open registration.

ANR0462W Open registration failed for session *session number* for node *node name (client platform)* - invalid node name.

Explanation: The server refuses a client session during open registration because the node name specified by the client is not valid.

System action: Server operation continues.

User response: Specify a node name in the options file of the client program that contains valid characters and does not exceed the maximum length in size. Refer to *Backup-Archive Clients Installation and User's Guide* for a description of the node name restrictions.

ANR0463W Open registration failed for session *session number* for node *node name (client platform)* - invalid password.

Explanation: The server refuses a client session during open registration because the password name specified by the user is not valid.

System action: Server operation continues.

User response: Specify a password that uses valid characters and is less than the maximum length in size. Refer to *Backup-Archive Clients Installation and User's Guide* for a description of the password restrictions.

ANR0464W Open registration failed for session *session number* for node *node name (client platform)* - exceeded number of nodes available under license terms.

Explanation: The server detected an attempt to

register more nodes than allowed by the terms of the current license.

System action: Server operation continues, but the REGISTER NODE command fails, and the node is not registered.

User response: Use the QUERY LICENSE command to determine the license terms that are no longer in compliance.

ANR0465W Open registration failed for session *session number for node node name (client platform)* - policy domain STANDARD does not have an ACTIVE policy set.

Explanation: The server refuses a client session during open registration because the STANDARD policy domain does not have an active policy set. All nodes added to the server database under open registration are automatically assigned to the STANDARD policy domain. This policy domain must be defined and have an active policy set to support open registration.

System action: Server operation continues.

User response: If you want to support open registration, define a policy domain using the DEFINE DOMAIN command with the name STANDARD and activate a valid policy set in the domain. You can issue the UPDATE NODE command to move nodes to different policy domains after the nodes have registered themselves through open registration.

ANR0466E The SETSTORAGESEVER command did not complete successfully.

Explanation: The SETSTORAGESEVER command encountered an error and did not complete successfully.

System action: Storage agent operation terminates.

User response: Please review prior error messages and take the necessary corrective actions.

ANR0467I The SETSTORAGESEVER command completed successfully.

Explanation: The SETSTORAGESEVER command has completed successfully, and the appropriate device configuration files have been updated.

System action: Storage agent operation terminates.

User response: None

ANR0468E Server-to-server export and import not allowed with server *server name*. Export server is at version *export version*; import server is at version *import version*.

Explanation: An attempt was made to export to an outdated server. The server on which the import is performed must be at the same or later level than the

server from which the data was exported.

System action: The export operation ends and server operation continues.

User response: Export to a server that is at the same or later level.

ANR0469W Session *session number for node node name (client platform)* refused - client is not configured for archive retention protection.

Explanation: The server refuses a client session because the client is not configured for archive retention protection.

System action: Server operation continues.

User response: Either disable archive retention protection on the server or configure the client for archive retention protection.

ANR0470W Session *session number for administrator administrator name* refused - administrator password has expired.

Explanation: The server refuses the specified session because the administrator's password has expired.

System action: Server operation continues.

User response: Upon receipt of this error condition, the client program immediately reconnects to the server specifying a password update session and prompts the user for a new password. After the user enters a new password, the client reconnects to the server for normal operations. Alternatively, an authorized administrator can update the client password using the UPDATE ADMIN command.

ANR0473W Session *session number for administrator administrator ID (client platform)* refused - administrator name does not have the correct level of authority over client node.

Explanation: The server refuses a request to start an administrative session because the administrator name does not have appropriate authority over the node.

System action: Server operation continues.

User response: Use command GRANT AUTHORITY to grant appropriate authority to the current administrator ID.

ANR0474W Session *session number for administrator administrator ID (administrator platform)* was refused because administrators are not allowed to initiate sessions on the client port.

Explanation: The server did not start the specified

administrative session because the administrator connected to the server on the server port that is used for client sessions, and the option ADMINONCLIENTPORT is set to NO. When different port numbers are used for administrative and client sessions (controlled by the TCPPORT and TCPADMINPORT options), and option ADMINONCLIENTPORT is set to NO, administrative sessions can be started only on the port used for administrative sessions (as specified by the TCPADMINPORT option).

System action: Server operation continues.

User response: Update the client options file to specify the port to be used for administrative sessions. This is typically specified by the TCPADMINPORT option in both client and server option files.

ANR0475W *Session session number for node node name (client platform) refused - node is not allowed to initiate sessions on administrative port.*

Explanation: The server had refused to start a session with the specified client node because the node connected to the server on the server's administrative port. When different port numbers are used for administrative and client sessions, client sessions may be started only on the port used for client sessions.

System action: Server operation continues.

User response: The client option file should be updated to specify the port to be used for client sessions. This is typically specified by TCPPORT option in both client and server option files. The MVS™ server also uses the ICSPOINT option.

ANR0476W *Session session number for node node name (client platform) refused - node is not allowed to initiate sessions.*

Explanation: The server had refused to start a session with the specified client node because the node is not allowed to initiate session. Only server initiated sessions are allowed with this client. The SESSIONINIT parameter of the REGISTER NODE and UPDATE NODE commands control the ability of a client to initiate sessions.

System action: Server operation continues.

User response: An administrator can use the UPDATE NODE command with the SESSIONINIT parameter to specify that the client may initiate sessions. Alternatively, sessions can be scheduled with the client that are started by the server through server-prompted scheduling commands (DEFINE SCHEDULE, DEFINE ASSOCIATION).

ANR0477W *Session session number refused - The client client node name cannot access the server with a platform type of client platform.*

Explanation: A client with a invalid combination of node type and platform type has requested a session with the server. For example, a node id of type NAS can only sign on with a platform type of "TSMNAS", all other node types cannot use this platform type.

System action: The session request is refused. The server operation continues.

User response: Verify that the Id used by a client to sign on has the proper platform type.

ANR0478W *Session request refused. Server is running in standalone mode.*

Explanation: A client has requested a session with the server. The server is running in a mode in which it cannot start client sessions.

System action: The session request is refused. The server operation continues.

User response: No response is required. To reduce or disable the display of this message, you can update the server options before running in standalone mode with the COMMMETHOD NONE option. This will allow the server to run without enabling client connections.

ANR0479W *Session session number for server server name (server platform) terminated - connection with server severed.*

Explanation: If server A has opened a connection with server B, server B's session is ended because the communications link has been closed by a network error or by server A's program.

System action: Server A continues operation.

User response: If server B halts operation or in some way stops communicating with server A, this message will be displayed on server A indicating that the connection was closed suddenly by server B. A network failure can also cause this message to be displayed. If a large number of these messages occur simultaneously, check the network for failure and correct any problems.

ANR0480W *Session session number for node node name (client platform) terminated - connection with client severed.*

Explanation: The specified client session is ended because the communications link has been closed by a network error or by the client program.

System action: Server operation continues.

User response: If a user breaks out of a client program, this message will be displayed on the server

ANR0481W • ANR0486W

as the connection is suddenly closed by the client. A network failure can also cause this message to be displayed. If a large number of these messages occur simultaneously, check the network for failure and correct any problems.

ANR0481W Session *session number* for node *node name (client platform)* terminated - client did not respond within *commtimeout seconds* seconds.

Explanation: The server ends a client session because the client has been holding database locks (a transaction was in progress) and the client has not responded in the number of seconds specified by the COMMTIMEOUT parameter in the server options file.

System action: The server rolls back the transaction that has been in progress and the session is ended. Server operation continues.

User response: If a large number of these messages appear, you may want to increment the value specified for the COMMTIMEOUT value in the server options file and restart the server. The amount of time that it takes for a client to respond is dependent upon the speed and processor load for the client and the network load.

ANR0482W Session *session number* for node *node name (client platform)* terminated - idle for more than *idletimeout minutes* minutes.

Explanation: The server ends a client session because it has been idle for more minutes than specified in the IDLETIMEOUT parameter in the server options file. The client program will automatically attempt to reconnect to the server when necessary.

System action: Server operation continues.

User response: If the problems persists, increase the value specified for the IDLETIMEOUT parameter in the server options file and restart the server. Many times, the client program is idle while waiting for the user to choose an action to perform (for example, backup, archive, restore, or retrieve files). If a user starts the client program and does not choose an action to perform, the session will eventually time out. The client program automatically reconnects to the server when the user chooses an action that requires server participation. Note that a large number of idle sessions can inadvertently prevent other users from connecting to the server, so care should be used when increasing the IDLETIMEOUT parameter.

ANR0483W Session *session number* for node *node name (client platform)* terminated - forced by administrator.

Explanation: The server ends a client session in response to a CANCEL SESSION command issued by an authorized administrator.

System action: The server rolls back any transactions in progress for the terminated client session.

User response: None.

ANR0484W Session *session number* for node *node name (client platform)* terminated - protocol violation detected.

Explanation: The server ends the specified session because a communications protocol error by the client has been detected.

System action: The server ends the client session.

User response: Examine the client message to determine the problem. Correct the programming error in the client program. If the error cannot be isolated and resolved, contact your service representative.

If this session is a proxied LAN-Free session for a storage agent, this error may be the result of a mount point or volume preemption on the storage agent. Review the messages logged by the storage agent to determine if a storage agent action caused this to occur.

ANR0485W Session *session number* for node *node name (client platform)* terminated - sufficient memory is not available.

Explanation: The server ends the specified session because sufficient memory (virtual memory) is not available.

System action: The server ends the session and continues operation.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0486W Session *session number* for node *node name (client platform)* terminated - internal error detected.

Explanation: The specified client session is ended by the server because an internal processing error has been detected on the server. A programming error may have occurred in the server program.

System action: The session is ended and server operation continues.

User response: If this session is a proxied LAN-Free session for a storage agent, this error may be the result of a mount point or volume preemption on the storage agent. Review the messages logged by the storage agent to determine if a storage agent action caused this to occur.

If the cause of the error can not be determined after reviewing the activity log, contact your service representative.

ANR0487W Session *session number* for node *node name (client platform)* terminated - preempted by another operation.

Explanation: The server ends a client session in response to a cancel request issued by a higher priority operation that needed the mount point that the client was using.

System action: The server rolls back any transactions in progress for the terminated client session.

User response: Reissue the operation. If this message appears frequently, consider increasing the mountlimit value for the affected device class.

ANR0488W Session *session number* for node *node name (client platform)* terminated - transfer rate is less than (*transfer rate*) and more than (*elapsed time since first data transfer*) minutes have elapsed since first data transfer.

Explanation: The server is canceling client session number *session number*. Depending on the state of the session, it may take a while for the session to be canceled. The server ends a client session because it has been active for more minutes than specified in the THROUGHPUTTIMETHRESHOLD parameter in the server options file and the data transfer rate is less than the amount specified with the THROUGHPUTDATATHRESHOLD parameter in the server options file. The client is transferring data to the server at an abnormally slow rate and may have become a bottleneck for handling data from other clients. If the client has caused log records to be written, it is possible that this client will prevent log space reclamation.

System action: The session is canceled and server operation continues.

User response: If a low data transfer rate is not a problem, the THROUGHPUTTIMETHRESHOLD or THROUGHPUTDATATHRESHOLD parameters in the server options file can be set to zero - this will disable the throughput check. The change can be made without taking down the server and restarting it by using the SETOPT THROUGHPUTTIMETHRESHOLD or the SETOPT THROUGHPUTDATATHRESHOLD commands. If a low data transfer rate is not expected, external causes should be investigated. This would include network problems and problems in accessing data on the client node. The client program may automatically reconnect to the server, so this message may appear on subsequent sessions until the data transfer problem is resolved. The default server operation is not to perform a throughput check.

ANR0489W Session *session number* refused for client *node name* - NAS type nodes are not supported by a storage agent.

Explanation: The specified client tried to connect to a storage agent. The storage agent does not support a node that is defined as TYPE=NAS.

System action: The session request is refused. The server operation continues.

User response: The client should be re-configured to not try LAN-free operations. This may be done by setting UPDATE NODE ENABLELANFREE=NO for the client.

ANR0490I Canceling session *session number* for node *node name (client platform)* .

Explanation: The server is canceling client session number *session number*. This message is displayed in response to the CANCEL SESSION command. Depending on the state of the session, it may take a while for the session to be canceled.

System action: The session is canceled and server operation continues.

User response: None.

ANR0491I No matching session(s) found to cancel.

Explanation: The server cannot find any sessions to cancel matching the specifications entered in the CANCEL SESSION command.

System action: Server operation continues.

User response: Use the QUERY SESSION command to ensure that the session you wish to cancel is connected. Reissue the command using the appropriate session number to cancel the client session.

ANR0492I All drives in use. Session *session number* for node *node name (client platform)* being preempted by higher priority operation.

Explanation: When a high priority operation attempted to find an available drive, all the drives were being used. To free up a drive for this operation, the client session identified is being cancelled by the system.

System action: The lower priority client session is cancelled to free up a mount point (drive).

User response: When a drive again becomes available, restart the session that was cancelled. This session was most likely a backup/archive session and you may just want to let it restart automatically during its next scheduled backup window. If this message appears frequently, you may want to increase the number of drives available. See the MOUNTLIMIT parameter on the UPDATE DEVCLASS command.

ANR0493I Restore session *session number* canceled.

Explanation: The specified session was canceled with the CANCEL RESTORE command.

System action: The restore session is canceled and server operation continues.

User response: None.

ANR0494I Volume *volume name* in use. Session *session number* for node *node name* (*client platform*) being preempted by higher priority operation.

Explanation: When a high priority operation attempted to acquire a specific volume, it was being used. To free the volume for this operation, the client session identified is being cancelled by the system.

System action: The lower priority client session is cancelled to free up the volume.

User response: Restart the session that was cancelled, it will wait until the higher priority operation if finished with the volume. This cancelled session was most likely a backup/archive session and you may just want to let it restart automatically during its next scheduled backup window.

ANR0495I Cannot cancel the specified EXPORT/IMPORT session.

Explanation: The server cannot cancel the session specified in the CANCEL SESSION command.

System action: Server operation continues.

User response: Export/Import sessions cannot be canceled using CANCEL SESSION. The user should use the CANCEL PROCESS command to terminate the EXPORT/IMPORT operation.

ANR0496E Session *session number* operation for client *client node name* (*client platform*) has been denied because verb (*type verb name*) is not allowed when archive retention is active.

Explanation: The server refuses the specified client operation because archive retention protection is active.

System action: Server operation continues.

User response: Do not send the specified operation to the server when archive retention protection is active.

ANR0497W Session request refused from non-Express client.

Explanation: A non-Express client has requested a session with the Express server. Only connections from an Express client will be accepted by an Express server.

System action: The session request is refused. The server operation continues.

User response: None.

ANR0498W Session *session number* refused for client *node name* because restore DB is in progress.

Explanation: Restore DB is in progress, only connection from Client related to restore DB are allowed.

System action: The session request is refused. The server Restore DB operation continues.

User response: None.

ANR0500W Transaction failed for session *session number* for node *node name* (*client platform*) - invalid password submitted.

Explanation: The server ends a password update transaction because the user has not correctly specified the current password.

System action: Server operation continues.

User response: Update your password by correctly specifying the current password. If the current password has been misplaced, the administrator can reassign a password for the client by using the UPDATE NODE or UPDATE ADMIN command.

ANR0501W Transaction failed for session *session number* for node *node name* (*client platform*) - invalid policy binding specified.

Explanation: The server ends a database update transaction for the specified session because an invalid management class has been specified for a file or directory object.

System action: The specified session is ended and server operation continues.

User response: Correct the programming error in the client program if it has been written by your installation using WDSF verbs. Otherwise, contact your service representative.

ANR0502E Transaction failed for session *session number* for node *node name* (*client platform*) - A storage pool for the target destination is associated with a device class that has a Centera device type.

Explanation: The server ends a database update transaction for the specified session because an invalid management class has been specified. Centera device types may be used only for archive objects.

System action: The specified session is ended and server operation continues.

User response: Ensure that Centera device types are associated with device classes that are used only for archive operations. The UPDATE COPYGROUP command can be used to update copy groups associated with space management and/or backup storage pools so that they point to valid destinations.

ANR0510I Session *session number* opened input volume *volume name*.

Explanation: The indicated session has opened the specified volume for input processing.

System action: Processing continues.

User response: None.

ANR0511I Session *session number* opened output volume *volume name*.

Explanation: The indicated session has opened the specified volume for output processing.

System action: Processing continues.

User response: None.

ANR0512I Process *process number* opened input volume *volume name*.

Explanation: The indicated process has opened the specified volume for input processing. You may or may not see an associated ANR0515I message for this process/volume combination, since some volumes are shared between multiple processes.

System action: Processing continues.

User response: None.

ANR0513I Process *process number* opened output volume *volume name*.

Explanation: The indicated process has opened the specified volume for output processing. You may not see an associated ANR0515I message for this process/volume combination, since some volumes are shared between multiple processes.

System action: Processing continues.

User response: None.

ANR0514I Session *session number* closed volume *volume name*.

Explanation: The indicated session has finished using the specified volume.

System action: Processing continues.

User response: None.

ANR0515I Process *process number* closed volume *volume name*.

Explanation: The indicated process has finished using the specified volume. It is possible that the process indicated was not the process that opened the volume.

System action: Processing continues.

User response: None.

ANR0516E SQL processing for statement *statement* failed.

Explanation: The indicated select statement failed. The failure was caused by a syntax error with the statement itself.

System action: The select statement failed.

User response: Review the server activity log for message ANR0162W for an explanation of the error that caused this statement to fail.

ANR0520W Transaction failed for session *session number* for node *node name* (client platform) - storage pool *pool name* is not defined.

Explanation: The server rolls back a database update transaction for the specified session because the destination specified for a management class copy group specifies the named storage pool, but that storage pool does not exist.

System action: Server operation continues.

User response: An administrator with policy authority over the client policy domain must correct management class definitions so that copy group destinations refer to defined storage pools, or the specified storage pool must be created by an authorized administrator.

ANR0521W Transaction failed for session *session number* for node *node name* (client platform) - object excluded by size in storage pool *pool name* and all successor pools.

Explanation: The server ends a database update transaction for the specified session because the size of a file sent from the client node is larger than that allowed in the storage pool specified in the client's management class copy group. No successor storage pools to the one specified on the copy group can accept the large file.

System action: The specified session is ended and server operation continues.

User response: If the client is not using compression to send files to the host, turn compression on for the client (using the UPDATE NODE command) to try and resolve the problem. Otherwise, the maximum file size

for one or more of the storage pools in the storage hierarchy can be increased to accommodate the file. An authorized administrator can increase the MAXSIZE parameter by issuing the UPDATE STGPOOL command.

ANR0522W Transaction failed for session *session number* for node *node name (client platform)* - no space available in storage pool *pool name* and all successor pools.

Explanation: The server ends a database update transaction for the specified session because the storage pool specified in the client's management class copy group does not contain enough free space to hold the files sent from the client. Successor storage pools to the one specified on the copy group do not contain enough free space.

System action: The specified session is ended and server operation continues.

User response: An authorized administrator can issue the DEFINE VOLUME command to add storage to one or more storage pools in the storage hierarchy. This action may also involve creating storage space by using an operating system specific utility.

ANR0523W Transaction failed for session *session number* for node *node name (client platform)* - error on output storage device.

Explanation: The server ends a database update transaction for the specified client because an I/O error has been encountered by the server in writing to a device.

System action: The specified session is ended and server operation continues.

User response: Query the activity log to find messages preceding this one that specify the failing device. Storage pool volumes can be varied offline (by using the VARY command), or the server may need to be halted to correct the hardware problem. After the problem is corrected, the client should retry the operation.

ANR0524W Transaction failed for session *session number* for node *node name (client platform)* - data transfer interrupted.

Explanation: The database transaction associated with session *session number* was aborted because data transfer to or from data storage was interrupted by an external event.

System action: The session is canceled and server operation continues.

User response: Examine the messages issued prior to this message to determine why the data transfer was

interrupted. Attempt the client operation again if the problem can be resolved.

ANR0525W Transaction failed for session *session number* for node *node name (client platform)* - storage media inaccessible.

Explanation: The server ends a transaction for the specified session because storage volumes are not available in the storage pools in which the client's files are to be stored.

System action: The server ends the specified session and server operation continues.

User response: An authorized administrator can issue the DEFINE VOLUME command to add storage to one or more storage pools in the storage hierarchy. The VARY ONLINE command can be used to vary offline storage volumes online in the storage hierarchy to make them available to client nodes for file storage.

ANR0526W Transaction failed for session *session number* for node *node name (client platform)* - sufficient recovery log space is not available.

Explanation: The server ends a database update transaction for the specified session because sufficient log space is not available on the server.

System action: The server ends the specified session and server operation continues.

User response: An authorized administrator can issue the DEFINE LOGVOLUME command to add volumes for use by the log, and can issue the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR0527W Transaction failed for session *session number* for node *node name (client platform)* - sufficient database space is not available.

Explanation: The server ends a database update transaction for the specified session because sufficient database space is not available on the server.

System action: The server ends the specified session and server operation continues.

User response: An authorized administrator can issue the DEFINE DBVOLUME command to add volumes for use by the database, and can issue the EXTEND DB command to extend the size of the database so that the new volumes are used.

ANR0528W Transaction failed for session *session number* for node *node name (client platform)* - thread resource not available.

Explanation: The server ends a database update

transaction for the specified session because sufficient memory is not available for starting additional processes on the server.

System action: The server ends the specified session and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see “Appendix A. Allocating Additional Server Memory”.

ANR0529W Transaction failed for session *session number* for node *node name* (client platform) - insufficient memory.

Explanation: The server ends a database update transaction for the specified session because sufficient memory is not available on the server.

System action: The server ends the specified session and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see “Appendix A. Allocating Additional Server Memory”.

ANR0530W Transaction failed for session *session number* for node *node name* (client platform) - internal server error detected.

Explanation: The server ends a database update transaction for the specified session because an internal logic error is detected.

System action: The server ends the specified session and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0531W Transaction failed for session *session number* for node *node name* (client platform) - invalid file space identifier specified by client.

Explanation: The server ends a database update transaction for the specified session because the file space identified by the client for the transaction does not exist.

System action: This action usually occurs when a client is operating on a file space that is currently being deleted as a result of an administrative command or client action. The server ends the specified session and server operation continues.

User response: Use the QUERY PROCESS command to monitor and wait for any file space deletion

processes to complete, or cancel the process if you do not want to delete the file space. Try the client action again after this action has been taken.

ANR0532W Diagnostic(ID): Transaction *transaction ID* was aborted for session *session number* for node *node name* (client platform).

Explanation: An error has been detected during a transaction commit for the specified session. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR0533W Transaction failed for session *session number* - compression method used by client not supported. Please obtain the latest level of the client code.

Explanation: The server ends the transaction for the specified session because the compression method that is used by the client is no longer supported by the server.

System action: The server ends the specified session and server operation continues.

User response: The client must either backup the data with compression turned off, or upgrade to a client that supports the newer compression method. If the client is a WDSF client, upgrade to a non-WDSF client in order to use the compression performed by the client.

ANR0534W Transaction failed for session *session number* for node *node name* (client platform) - size estimate exceeded and server is unable to obtain additional space in storage pool *pool name*.

Explanation: The server ends a database update transaction for the specified session because the size estimate provided by the client is too small. The server has attempted to obtain additional space in the indicated storage pool, but was unable to do so.

System action: The specified session is ended and server operation continues. If *pool name* is a random access storage pool with caching enabled, it is also possible that additional space can be made available in this storage pool by eliminating cached files. When the server allocates space based on the size estimate provided by the client, it frees space occupied by cached files if this space is needed to obtain the estimated space. However, if the server later determines that the file size estimate was too low, it attempts to obtain additional space that is not utilized, but does not

delete cached files to do so. If the client sending the data has the option COMPRESSALWAYS YES set, it is possible that a file grew during the compression operation and when the client sent it to the server it exceeded the space available in storage pool *pool name*.

User response: This message may indicate that there is no additional space in *pool name*. The following are possible circumventions:

An authorized administrator can issue the DEFINE VOLUME command to add storage to this pool.

If the suspected cause of the failure is that *pool name* is a DISK storage pool and that space in use by cached files was not freed, turn off caching for the storage pool and issue the MOVE DATA command for the volumes in pool *pool name*.

If the suspected cause of the failure is that a file grew in size during compression on the client, another possible circumvention is to set the COMPRESSALWAYS option in the client options file to NO and retry the operation. This may allow the client to accurately report the file size and possibly avoid the out of space condition in the storage pool.

ANR0535W Transaction failed for session *session number* for node *node name* (client platform) - insufficient mount points available to satisfy the request.

Explanation: The server was unable to allocate sufficient mount points to process the transaction.

System action: The operation is ended and server operation continues.

User response: If necessary, make more mount points available or validate your device class and library configuration.

ANR0536W Transaction failed for session *session number* for node *node name* (client platform) - down-level client does not support format of stored files.

Explanation: A client attempts to perform an operation involving files that are stored in a format that is not supported by that client level.

System action: The operation is ended and server operation continues.

User response: Upgrade the client to a later level.

ANR0537E Transaction failed for session *session number* for node *node name* (client platform) - filespace name cannot be renamed from or to a Unicode name.

Explanation: The server ends a database update transaction for the specified session because a file space was attempted to be renamed to or from unicode.

System action: The server ends the specified transaction and server operation continues.

User response: Do not attempt to rename a unicode file space to a non-unicode name or a non-unicode file space to a unicode name.

ANR0538I A resource waiter has been aborted.

Explanation: The server aborts a resource wait because of waiting too long for a resource to become available. This could cause a process or session to fail. If this causes a process or a session to fail then there will be other messages at this time indicating which process or session has failed. Resources are internal server resources such as locks and synchronization objects.

System action: The server terminates the resource with request and server operation continues.

User response: Either a server deadlock situation has occurred or the resource timeout value is set too low. Check the setting for the RESOURCETIMEOUT server option and increase the value. If the problem persists with a higher timeout then contact your service representative.

ANR0539W Transaction failed for session *session number* for node *node name*. This node has exceeded its maximum number of mount points.

Explanation: The server ends the transaction because the node requires mount points to store data, and either the node is not allowed to acquire any mount points, or the node is already using the maximum number of mount points allowed for the node. The maximum number of mount points a node is allowed to use on the server is controlled by the setting of the MAXNUMMP parameter on the REGISTER NODE or UPDATE NODE command.

System action: The server ends the specified session and server operation continues.

User response: If the number of mount points that the node is allowed to use on the server are already acquired, reduce the number of client sessions for the specified node that are running concurrently. For example, decrease the value of the client option RESOURCEUTILIZATION. If sufficient mount points (for example, drives) are available to satisfy the data store operations, issue the UPDATE NODE command to increase the value of the MAXNUMMP parameter.

If the node is not allowed to acquire any mount points (the node's MAXNUMMP option is set to zero), issue the UPDATE NODE command to change the value of the MAXNUMMP parameter.

ANR0540W Retrieve or restore failed for session
session number for node node name (client platform) - data integrity error detected.

Explanation: The server ends a file retrieval operation for the specified session because an internal database integrity error has been encountered on the server.

System action: The server ends the specified session and continues operation.

User response: Contact your service representative.

ANR0541W Retrieve or restore failed for session
session number for node node name (client platform) - error on input storage device.

Explanation: The server ends a client retrieval or restore operation for the specified session because an I/O error has been encountered by the server in reading from a device.

System action: The server ends the specified session and server operation continues.

User response: Query the activity log to find messages preceding this one that specify the device that is failing. Storage pool volumes can be varied offline (by using the VARY OFFLINE command), or the server may need to be shut down by using the HALT command to correct the hardware problem. After the problem is corrected, the client may try the operation again.

ANR0542W Retrieve or restore failed for session
session number for node node name (client platform) - storage media inaccessible.

Explanation: The server ends a client retrieval or restore operation for the specified session because a needed storage pool volume has been varied offline or the storage pool is unavailable.

System action: The server ends the specified session and server operation continues.

User response: Use the VARY ONLINE command to vary offline storage volumes online in the storage hierarchy and make them available to client nodes for file storage. If all volumes are online, check the ACCESS parameter of the storage pool. If the access mode is UNAVAILABLE, use the UPDATE STGPPOOL command to update it to READONLY or READWRITE.

ANR0543W Retrieve or restore failed for session
session number for node node name (client platform) - data transfer interrupted.

Explanation: The database transaction associated with session *session number* was aborted because data transfer to or from data storage was interrupted by an external event.

System action: The session is canceled and server operation continues.

User response: Examine the messages issued prior to this message to determine why the data transfer was interrupted. Attempt the client operation again, if the problem can be resolved.

ANR0544W Retrieve or restore failed for session
session number for node node name (client platform) - thread resource not available.

Explanation: The server ends a file retrieval or restore operation for the specified session because sufficient memory is not available for starting additional processes on the server.

System action: The server ends the specified session and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0545W Retrieve or restore failed for session
session number for node node name (client platform) - insufficient memory.

Explanation: The server ends a file retrieval or restore operation for the specified session because sufficient memory is not available on the server.

System action: The server ends the specified session and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0546W Retrieve or restore failed for session
session number for node node name (client platform) - internal server error detected.

Explanation: The server ends a file retrieval or restore operation for the specified session because an internal logic error is detected in the server program.

System action: The server ends the specified session and continues operation.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0547E Invalid data was encountered in the command processor output stream: output formatting terminated for the last command entered.

Explanation: The server console session encounters an error in formatting output from a command.

System action: The command output is discarded and server operation continues.

User response: Use the server QUERY command to determine if the command you entered had the desired affect in the server. Use the QUERY ACTLOG command to see if a server error condition (like out of memory) occurred prior to the command. Resolve the error if it is found. Contact your service representative if you cannot resolve the error, or if an error is not found.

ANR0548W Retrieve or restore failed for session *session number* for node *node name (client platform)* processing file space *filespace filespace id* for file *file name* stored as storage repository - error detected.

Explanation: The server ends a file retrieval operation for the specified session because an error has been encountered on the server. Some common reasons for the error are:

- The input volume is unavailable
- The storage pool is unavailable
- Data is corrupted on the input volume
- Hardware or media failure has occurred
- Database corruption

System action: The server ends the specified session and continues operation.

User response: Try the restore or retrieve operation again, and if the file is also backed up in a copy storage pool, the operation will attempt to read the file from the alternate location. If retry of the restore or retrieve operation continues to fail examine any prior error messages to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages if needed. Correct the problem and try the restore or retrieve again. You can also refer to the *Problem Determination Guide* for problem determination hints and information. If retry of the restore or retrieve operation continues to fail contact your service representative.

ANR0549W Transaction failed for session *session number* for node *node name (client platform)* - no existing restore session found.

Explanation: A client attempted to start an additional no query restore session to increase restore throughput, but the original restore session was not found.

System action: The operation is ended and server operation continues.

User response: Check the status of the original restore. It may have already completed or been cancelled. The QUERY SESSION command and the QUERY RESTORE commands can provide information about existing sessions and restore sessions which are restartable.

ANR0550E The client operation failed for session *session number* for node *node name (client platform)* - see previous error messages.

Explanation: The indicated operation has failed. This message is always preceded by one or more other error messages which provide more detail about why the command failed.

System action: The operation is ended and server operation continues.

User response: Examine the previous error messages to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages if needed. Correct the problem and try the command again.

ANR0551E The client operation failed for session *session number* for node *node name (client platform)* - lock conflict.

Explanation: An operation that requires the server to lock a system resource has been initiated. The operation cannot be executed because the resource is already in use by another command or process.

System action: The server does not process the command.

User response: Try the command again at a later time.

ANR0552E Client operation failed for session *session number* for node *node name (client platform)* - destination storage pool *storage pool* was skipped.

Explanation: The indicated client operation failed because the destination storage pool was skipped. A storage pool may be skipped because it does not have enough available space, or because it has a MAXSIZE value that is less than the size of the object to be inserted.

System action: The operation fails.

User response: Ensure that the destination storage pool is available, has an adequate MAXSIZE setting, and has adequate space. The MAXSIZE setting may be changed using the UPDATE STGPOOL command. Space may be added to the storage pool by checking in scratch volumes or defining new volumes in the storage pool. If volumes in the destination storage pool are offline, use the VARY ONLINE command to vary them online and make them available for use. Correct the problem and try the command again.

ANR0553E Client operation failed for session *session number* - Administrator *administrator name* does not have adequate authority over node *node name*.

Explanation: The specified administrator does not have the proper authority necessary to perform this

operation on the specified node.

System action: The server does not perform the query.

User response: Issue the command from a properly authorized administrator ID, or contact the system administrator to have additional authority granted to the current administrator ID.

ANR0554E *command name:* **The parameter name parameter is only valid if the TOSERVER parameter is specified.**

Explanation: The command failed because the TOSERVER parameter was not specified.

System action: The command fails and server operation continues.

User response: Reissue the command and specify the TOSERVER parameter. For information on valid values for the command parameter, refer to the *Administrator's Reference* for your particular platform.

ANR0555E *command name:* **The parameter name parameter cannot be specified when the TOSERVER parameter is specified.**

Explanation: The command failed because the TOSERVER parameter was not specified.

System action: The command fails and server operation continues.

User response: Reissue the command and omit the TOSERVER parameter. For information on valid values for the parameter for the command parameter, refer to the *Administrator's Reference* for your particular platform.

ANR0556E *command name:* **DATES=RELATIVE parameter value cannot be specified when merging imported files using the MERGE=YES parameter value.**

Explanation: When importing files and merging them into existing file spaces, the DATES=RELATIVE parameter value cannot be specified.

System action: The command fails and server operation continues.

User response: Reissue the command and omit the DATES=RELATIVE parameter. For information on valid values for the parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0557I *Import command:* **An invalid export record (version *version*, copy type *copy type*, object type *object type*) was found.**

Explanation: An invalid import record was found for the specified version, copy type and object type. The

object will be skipped, and import processing will continue.

System action: Server operation continues.

User response: Issue QUERY ACTLOG to determine the source of the error.

ANR0558W **Import processing did not create a proxynode association for nodes *node_id_target* and *node_id_agent*.**

Explanation: Import processing did not create a proxynode association between the two nodes. The association fails if either of the nodes does not exist on the server, or if import processing was not allowed to complete.

System action: The server does not create the specified proxynode association.

User response: Verify that both nodes were imported properly and issue the import command again. Or, use the GRANT PROXYNODE command to manually create the proxynode association.

ANR0559E **Too many domains are specified on the EXPORT NODE command.**

Explanation: The maximum length of the domain list cannot exceed approximately 1400 characters.

System action: The EXPORT command is ended.

User response: If you specified DOMAIN=* on the command, issue the command again without specifying the domain to let it default to all domains. If you specified a domain list, then split up the EXPORT into multiple export commands to reduce the number of domains specified on the command.

ANR0560E *Import command:* **Unable to decrypt encrypted password or key.**

Explanation: The server is not able to decrypt the password associated with a node or administrator, or the client encryption key associated with an object being imported. The password or key was encrypted with the AES encryption standard, but the server does not support AES.

System action: The object is not imported.

User response: Rerun the export command, specifying the ENCRyptionstrength=DES option. Or, rerun the import on a server that supports AES.

ANR0561E *Export command:* **Process aborted - sign on to server, target server name, failed.**

Explanation: The server export process encountered an error in establishing a communication session with the target server.

System action: The export process ends and server operation continues.

User response: Check the activity log and server console for messages that indicate a failure or problem on the server issuing this command and on the target server. Next, check the server definition, administrator name, and password on both the server issuing the command and the server specified. Also, check the communication connection between the two servers. And finally, verify that the target server specified is running. If the problem is not resolved, contact your service representative.

ANR0562I *Export command: Data transfer complete, deleting temporary data.*

Explanation: The server export process has completed writing data to the target media or server. Temporary data used during the operation is now being deleted from the database.

System action: The export process continues until all temporary data is removed.

User response: None.

ANR0563W *NDMP restore failed for node node name, file space filespace.*

Explanation: The server ends a restore operation for the specified NAS node because an error has been encountered on the server. Some common reasons for the error are:

- The input volume is unavailable
- The storage pool is unavailable
- Data is corrupted on the input volume
- Hardware or media failure has occurred
- The server database is corrupted

System action: The server ends the restore operation.

User response: Examine any prior error messages to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages if needed. Correct any problem and try the restore again. You can also refer to the *Problem Determination Guide* for problem determination hints and information. If the data is also backed up in a copy storage pool, the retry operation will attempt to read the file from the alternate location. If retry of the restore operation continues to fail contact your service representative.

ANR0564E *Restartable restore request failed for session session number, restartable restore session restore session number - sessions are active from the original restore.*

Explanation: A client attempted to restart a restartable no query restore session; However, sessions from the original no query restore invocation are still active.

Both the current and restartable restore session numbers are shown.

System action: The restartable restore request is ended and server operation continues. The restore's restartability status does not change.

User response: Check the status of the original restore. The QUERY RESTORE command can be used to show the status of restartable restores. The restartable restore session number is the one for which sessions were found to be running. Sessions may be active on either the server or a storage agent. Restartable restores may be cancelled by issuing the CANCEL RESTORE command, after which the restore may be retried. Once CANCEL RESTORE is issued for a restore session, it is not eligible to be restarted.

ANR0565W *Retrieve or restore failed for session session number for node node name (client platform). The storage volume volume name is inaccessible.*

Explanation: The server ends a client retrieval or restore operation for the specified session because a needed storage pool volume has been varied offline.

System action: The server ends the specified session and server operation continues.

User response: Use the VARY ONLINE command to vary offline storage volumes online, and make them available to client nodes for file storage.

ANR0566W *Retrieve or restore failed for session session number for node node name (client platform) - file was deleted from data storage during retrieval.*

Explanation: The server ends a file retrieval operation for the specified session because the file has been deleted from data storage by another process before retrieval is complete.

System action: The server ends the specified session and continues operation.

User response: Contact your administrator to find out if DELETE FILESPACE, DELETE VOLUME, or inventory expiration processes are running; these processes can delete data storage files during retrieval. Reissue the restore or retrieve operation and specify a different file version.

ANR0567W *Retrieve or restored failed for session session number for node node name (client platform) - insufficient mount points available to satisfy the request.*

Explanation: The server was unable to allocate sufficient mount points to process the retrieve or restore operation.

System action: The operation is ended and server operation continues.

User response: If necessary, make more mount points available.

ANR0568W Session *session number* for admin *admin name (client platform)* terminated - connection with client severed.

Explanation: The specified admin session is ended because the communications link has been closed by a network error or by the client program.

System action: Server operation continues.

User response: If a user breaks out of a client program, this message will be displayed on the server as the connection is suddenly closed by the client. A network failure can also cause this message to be displayed. If a large number of these messages occur simultaneously, check the network for failure and correct any problems.

ANR0569I Object not processed for *node name*: *type=type*, *file space=filespace name*, *object=object name*.

Explanation: An error occurred. The object for *node name*, identified by *type*, *file space* and *object name* was not processed.

System action: Server action is defined by the error that occurred.

User response: Issue QUERY ACTLOG to determine the source of the error.

ANR0570E Export command: Invalid value for DURUNITS parameter detected while exporting administrative schedule *schedule name* - default or existing value is used during import.

Explanation: During processing of command *export command*, an invalid value is encountered for the DURUNITS parameter for administrative schedule *schedule name*.

System action: Export processing continues, but the exported data contains an unknown DURUNITS value for this schedule. If this data is imported, the server uses the default or existing DURUNITS value.

User response: Update the DURUNITS value for this schedule and restart the export command. Alternatively, the export data with the unknown value can be used, and the DURUNITS value can be checked and updated after import processing has been performed.

ANR0571E Export command: Invalid value for PERUNITS parameter detected while exporting administrative schedule *schedule name* - default or existing value is used during import.

Explanation: During processing of command *export command*, an invalid value is encountered for the PERUNITS parameter for administrative schedule *schedule name*.

System action: Export processing continues, but the exported data will contain an unknown PERUNITS value for this schedule. If this data is imported, the server uses the default or existing PERUNITS value.

User response: Update the PERUNITS value for this schedule and restart the export command. Alternatively, use the export data with the unknown value, and check and update the PERUNITS value after import processing has been performed.

ANR0572E Export command: Invalid value for DAYOFWEEK parameter detected while exporting administrative schedule *schedule name* - default or existing value is used during import.

Explanation: During processing of command *export command*, an invalid value is encountered for the DAYOFWEEK parameter for administrative schedule *schedule name*.

System action: Export processing continues, but the exported data contains an unknown DAYOFWEEK value for this schedule. If this data is imported, the server uses the default or existing DAYOFWEEK value.

User response: Update the DAYOFWEEK value for this schedule and restart the export command. Alternatively, use the export data with the unknown value, and check and update the DAYOFWEEK value after import processing has been performed.

ANR0573I Export/import command: Processing administrative schedule *schedule name*.

Explanation: The background export or import process to service the command *export/import command* is currently processing the schedule definition information for administrative schedule *schedule name*.

System action: Export or import processing for the command continues.

User response: None.

ANR0574E Import command: Invalid value for DURUNITS or PERUNITS parameter in exported data for administrative schedule *schedule name*.

Explanation: During preview processing of command *import command*, an invalid value is encountered for the

DURUNITS or PERUNITS parameter for administrative schedule *schedule name*.

System action: Processing of the command continues. If a later command is issued that causes the data to be imported, the default or existing values are used for DURATION, DURUNITS, PERIOD, and PERUNITS.

User response: If the data is imported with a later command, verify that the correct values for DURATION, DURUNITS, PERIOD, and PERUNITS are used for this schedule.

ANR0575E *Import command: Invalid value for DAYOFWEEK parameter in exported data for administrative schedule *schedule name*.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the DAYOFWEEK parameter for administrative schedule *schedule name*.

System action: Processing of the command continues. If a later command is issued that causes the data to be imported, the default or existing DAYOFWEEK value is used.

User response: If the data is imported with a later command, verify that the correct DAYOFWEEK value is used for this schedule.

ANR0576E *Import command: Invalid value for DURUNITS or PERUNITS parameter in exported data - administrative schedule *schedule name* defined with default values for DURATION, DURUNITS, PERIOD, and PERUNITS.*

Explanation: During processing of command *import command*, an invalid value is encountered for the DURUNITS or PERUNITS parameter for administrative schedule *schedule name*.

System action: Processing of the command continues, by using the default values for DURATION, DURUNITS, PERIOD, and PERUNITS.

User response: Verify that the correct values have been used for DURATION, DURUNITS, PERIOD, and PERUNITS. Update these values, if necessary.

ANR0577E *Import command: Invalid value for DAYOFWEEK parameter in exported data - administrative schedule *schedule name* defined with default DAYOFWEEK value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the DAYOFWEEK parameter for administrative schedule *schedule name*.

System action: Processing of the command continues,

by using the default DAYOFWEEK value for this schedule.

User response: Verify that the correct DAYOFWEEK value has been used for this schedule. Update this value, if necessary.

ANR0578E *Import command: Invalid value for DURUNITS or PERUNITS parameter in exported data - existing values for DURATION, DURUNITS PERIOD, and PERUNITS for administrative schedule *schedule name* were not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the DURUNITS or PERUNITS parameter for administrative schedule *schedule name*.

System action: Processing of the command continues, by using the existing values for DURATION, DURUNITS, PERIOD, and PERUNITS.

User response: Verify that the correct values have been used for DURATION, DURUNITS, PERIOD, and PERUNITS. Update these values, if necessary.

ANR0579E *Import command: Invalid value for DAYOFWEEK parameter in exported data - existing DAYOFWEEK value for administrative schedule *schedule name* was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the DAYOFWEEK parameter for administrative schedule *schedule name*.

System action: Processing of the command continues, by using the existing DAYOFWEEK value for this schedule.

User response: Verify that the correct DAYOFWEEK value has been used for this schedule. Update this value, if necessary.

ANR0580E *Export command: Invalid value for SPACEMGTECHNIQUE parameter detected while exporting management class *management class name* in domain *domain name*, set *policy set name* - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the SPACEMGTECHNIQUE parameter for management class *management class name* in domain *domain name*, policy set *policy set name*.

System action: Export processing continues, but the exported data contains an unknown SPACEMGTECHNIQUE value for this management class. If this data is imported, the default or existing SPACEMGTECHNIQUE value is used.

User response: Update the SPACEMGTECHNIQUE value for this copy group and restart the export. Alternatively, use the export data with the unknown value, and check and update the SPACEMGTECHNIQUE value after import processing has been performed.

ANR0581E *Export command: Invalid value for MIGREQUIRESBKUP parameter detected while exporting management class *management class name* in domain *domain name*, set *policy set name* - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the MIGREQUIRESBKUP parameter for management class *management class name* in domain *domain name*, policy set *policy set name*.

System action: Export processing continues, but the exported data contains an unknown value for this management class. If this data is imported, the default or existing MIGREQUIRESBKUP value is used.

User response: Update the MIGREQUIRESBKUP value for this copy group and restart the export. Alternatively, use the export data with the unknown value, and check and update the MIGREQUIRESBKUP value after import processing has been performed.

ANR0582E *Import command: Invalid value for SPACEMGTECHNIQUE parameter in exported data for management class *management class name* in domain *domain name*, set *policy set name*.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the SPACEMGTECHNIQUE parameter for management class *management class name*, in policy domain *domain name*, policy set *policy set name*.

System action: Processing of the command continues. If a later command is issued that causes the data to be imported, the default or existing SPACEMGTECHNIQUE value is used.

User response: None. If the data is imported with a later command, verify that the correct SPACEMGTECHNIQUE value is used for this management class.

ANR0583E *Import command: Invalid value for SPACEMGTECHNIQUE parameter in exported data - management class *management class name* in domain *domain name*, set *policy set name* defined with default SPACEMGTECHNIQUE value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the SPACEMGTECHNIQUE parameter for management

class *management class name*, in policy domain *domain name*, policy set *policy set name*.

System action: Processing of the command continues, by using the default SPACEMGTECHNIQUE value for this management class.

User response: Verify that the correct SPACEMGTECHNIQUE value has been used for this management class. Update this value, if necessary.

ANR0584E *Import command: Invalid value for SPACEMGTECHNIQUE parameter in exported data - SPACEMGTECHNIQUE value for management class *management class name* in domain *domain name*, set *policy set name* was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the SPACEMGTECHNIQUE parameter for management class *management class name*, in policy domain *domain name*, policy set *policy set name*.

System action: Processing of the command continues, by using the existing SPACEMGTECHNIQUE value for this management class.

User response: Verify that the correct SPACEMGTECHNIQUE value has been used for this management class. Update this value, if necessary.

ANR0585E *Import command: Invalid value for MIGREQUIRESBKUP parameter in exported data for management class *management class name* in domain *domain name*, set *policy set name*.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the MIGREQUIRESBKUP parameter for management class *management class name*, in policy domain *domain name*, policy set *policy set name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing MIGREQUIRESBKUP value is used.

User response: None. If the data is imported with a later command, verify that the correct MIGREQUIRESBKUP value is used for this management class.

ANR0586E *Import command: Invalid value for MIGREQUIRESBKUP parameter in exported data - management class *management class name* in domain *domain name*, set *policy set name* defined with default MIGREQUIRESBKUP value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the MIGREQUIRESBKUP parameter for management class

management class name, in policy domain *domain name*, policy set *policy set name*.

System action: Processing of the command continues, by using the default MIGREQUIRESBKUP value for this management class.

User response: Verify that the correct MIGREQUIRESBKUP value has been used for this management class. Update this value, if necessary.

ANR0587E *Import command: Invalid value for MIGREQUIRESBKUP parameter in exported data - MIGREQUIRESBKUP value for management class *management class name* in domain *domain name*, set policy set name was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the MIGREQUIRESBKUP parameter.

System action: Processing of the command continues, by using the existing MIGREQUIRESBKUP value for this management class.

User response: Verify that the correct MIGREQUIRESBKUP parameter has been used for this management class. Update this value, if necessary.

ANR0588E *Import command: Server is down-level compared to export data version *version number*.*

Explanation: An attempt is made to import data to a down-level server. The server on which the import is performed must be at the same or later level than the server from which the data was exported.

System action: The import process ends and server operation continues.

User response: Import to a server that is at the same or later level than the server from which the export was performed.

ANR0589E *Import command: Preview processing terminated abnormally - server is down-level.*

Explanation: Processing for the command *import command* in preview mode ends when it is determined that the server is down-level compared to the export data.

System action: Import processing ends and server operation continues.

User response: Import to a server that is at the same or later level than the server from which the export was performed.

ANR0590E *Import command: Processing terminated abnormally - server is down-level.*

Explanation: Processing for the command *import command* ends when it is determined that the server is down-level compared to the export data.

System action: Import processing ends and server operation continues.

User response: Import to a server that is at the same or later level than the server from which the export was performed.

ANR0591E *Export/import command: Invalid value for FILELIST parameter - parameter value.*

Explanation: The value (*parameter value*) specified for the FILELIST parameter in command *export/import command* is not a valid value for this parameter.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid FILELIST parameter. For information on valid values for the FILELIST parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0592E *Export/import command: Invalid value for table of contents parameter - parameter value.*

Explanation: The value (*parameter value*) specified for the table of contents (TOC) parameter in command *export/import command* is not a valid value for this parameter.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid TOC parameter. For information on valid values for the TOC parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0593E *Export/import command: Invalid value for NOSPAN parameter - parameter value.*

Explanation: The value (*parameter value*) specified for the NOSPAN parameter in command *export/import command* is not a valid value for this parameter.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid NOSPAN parameter. For information on valid values for the NOSPAN parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0594E *device class:* **NOSPAN parameter can only be used with a 3590 device class.**

Explanation: The device class specified must be a 3590 device class when NOSPAN is set to True.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid NOSPAN/Device Class parameter. For information on valid values for the NOSPAN parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0595W **The server deleted *object count* objects that were part of incomplete groups.**

Explanation: After importing data that was exported from another server, the server deletes any objects that are part of incomplete groups. Incomplete groups may be a result of importing from media written by an export operation that failed. Incomplete groups may also be a result of a failed import operation.

System action: Server operation continues.

User response: Ensure that the export and import operations run to completion. If any errors are observed, correct them and run again the export or import or both, as needed.

ANR0596W **Space-managed object *object name* for client node *node name*, *filesystem* *filesystem name* already exists on the server - it will be skipped.**

Explanation: While attempting to import a spaced-managed object, the server discovers that the object already exists. The space-managed object is skipped.

System action: Server operation continues.

User response: None.

ANR0597W **IMPORT: Space management attributes in management class *management class name* for domain *domain name* is not defined - default management class will be used.**

Explanation: During import processing, the server finds that the space management attributes for a space-managed file being imported does not exist in the active policy set for the domain to which the node is assigned.

System action: The default management class for the node's policy domain is bound to the space-managed file and import processing continues.

User response: If you want to define the missing management class, an authorized administrator may

cancel the import operation, define the missing space management attributes or management class for the domain, and process the import operation again.

ANR0598W **IMPORT: Space management attributes not found for default management class in domain *domain name* - space managed files bound to management class *management class name* in this domain cannot be imported.**

Explanation: During import processing, the server finds that a management class bound to a space-managed file being imported does not exist in the active policy set for the domain to which the node is assigned. When trying to rebind the space-managed file to the default management class for the domain, the server finds that the space-managed attributes are not defined for the default management class.

System action: The file is not imported; import processing continues.

User response: If you want to define the missing copy group, an authorized administrator may cancel the import operation, define the missing space management attributes or management class for the domain, and process the import operation again.

ANR0599E *Export/import command:* **Invalid volume name *volume name* specified for device class *device class name*.**

Explanation: One of the volume names specified in the VOLUMENAMES parameter for an import or export command is not a valid volume name for the device class specified in the DEVCLASS parameter.

System action: The export or import command fails.

User response: Specify volume names in the VOLUMENAMES parameter that are valid for the device class specified in the DEVCLASS parameter.

ANR0600I *Export command:* **No matching policy domains found for exporting.**

Explanation: The background export process does not find any policy domains that match the specification entered in the *export command*.

System action: The export process continues and no policy domains are exported from the server.

User response: None.

ANR0601I *Export command:* **No policy sets found in policy domain *domain name* for exporting.**

Explanation: The background export process does not find any policy sets defined in domains matching *domain name*.

ANR0602I • ANR0611I

System action: The export process continues and no policy sets are exported from the domain.

User response: None.

ANR0602I *Export command: No management classes were found in policy domain *domain name* for exporting.*

Explanation: The background export process does not find any management classes defined in policy domains matching *domain name*.

System action: The export process continues and no management classes are exported from the domain.

User response: None.

ANR0603I *Export command: No copy groups were found in policy domain *domain name* for exporting.*

Explanation: The background export process does not find any copy groups defined in policy domains matching *domain name*.

System action: The export process continues and no copy groups are exported from the domain.

User response: None.

ANR0604I *Export command: No schedules were found in policy domain *domain name* for exporting.*

Explanation: The background export process does not find any schedules defined for policy domains matching *domain name*.

System action: The export process continues and no schedules are exported for the domain.

User response: None.

ANR0605I *Export command: No schedule associations were found in policy domain *domain name* for exporting.*

Explanation: The background export process does not find any schedule node associations defined for policy domains matching *domain name*.

System action: The export process continues and no schedule associations are exported for the domain.

User response: None.

ANR0606I *Export command: No node definitions were found for exporting.*

Explanation: The background export process does not find any node definitions to export as specified in the command *export command*.

System action: The export process continues.

User response: None.

ANR0607I *Export command: No administrator definitions were found for exporting.*

Explanation: The background export process does not find any administrator definitions to export as specified in the command *export command*.

System action: The export process continues.

User response: None.

ANR0608I *Export command: No file spaces were found for exporting.*

Explanation: The background export process does not find any file space definitions to export as specified in the command *export command*.

System action: The export process continues.

User response: None.

ANR0609I *Command started as process *process ID*.*

Explanation: A background process has been started to service the command *command*. The background process is defined as process *process ID*.

System action: Server operation continues.

User response: To query the progress of the background process, use the QUERY PROCESS command. To cancel the background process, use the CANCEL PROCESS command. Use the *process ID* number to specify this specific process.

ANR0610I *Command started by administrator name as process *process ID*.*

Explanation: A background process has started to service the command *command* entered by administrator *administrator name*. The background process is defined as process *process ID*.

System action: Server operation continues.

User response: To query the progress of the background process, use the QUERY PROCESS command. To cancel the background process, use the CANCEL PROCESS command. Use the *process ID* number to specify this specific process.

ANR0611I *Command started by administrator name as process *process ID* has ended.*

Explanation: The background process to service the command *command* by administrator *administrator name* has completed processing.

System action: The specified process ends, and server operation continues.

User response: None.

ANR0612I *Import command: Reading EXPORT SERVER data from server server name exported export date export time.*

Explanation: The background import process to service the command *import command* is importing information exported from server *server name* with the EXPORT SERVER command on *export date* at *export time*.

System action: Import processing continues.

User response: None.

ANR0613I *Import command: Reading EXPORT POLICY data from server server name exported export date export time.*

Explanation: The background import process to service the command *import command* is importing information exported from server *server name* with the EXPORT POLICY command on *export date* at *export time*.

System action: Import processing continues.

User response: None.

ANR0614I *Import command: Reading EXPORT ADMIN data from server server name exported export date export time.*

Explanation: The background import process to service the command *import command* is importing information exported from server *server name* with the EXPORT ADMIN command on *export date* at *export time*.

System action: Import processing continues.

User response: None.

ANR0615I *Import command: Reading EXPORT NODE data from server server name exported export date export time.*

Explanation: The background import process to service the command *import command* is importing information exported from server *server name* with the EXPORT NODE command on *export date* at *export time*.

System action: Import processing continues.

User response: None.

ANR0616I *Export/import command: Preview processing completed successfully.*

Explanation: The background export or import process to service the command *export/import command* in preview (Preview=Yes) mode has completed successfully.

System action: Export or import processing for the command completes. Statistics on the projected number

and type of objects moved, together with the projected total number of bytes copied, are displayed on the server console following this message.

User response: None.

ANR0617I *Export/import command: Processing completed with status status.*

Explanation: The background export or import process to service the command *export/import command* has completed with status *status*. If the status is INCOMPLETE, some files have been skipped due to errors reading or writing the file.

System action: Export or import processing for the command completes. Statistics on the number and type of objects moved, together with the total number of bytes copied, are displayed on the server console following this message. A summary of the number of files that were skipped is also displayed.

User response: None.

ANR0618I *Export/import command: Preview processing canceled before completion.*

Explanation: The background export or import process to service the command *export/import command* in preview (Preview=Yes) mode has been canceled with the CANCEL PROCESS command.

System action: Export or import processing for the command ends. Statistics on the projected number and type of objects moved, together with the projected total number of bytes copied, are displayed on the server console following this message.

User response: None.

ANR0619I *Command: Processing canceled before completion.*

Explanation: The background process to service the command *command* has been canceled with the CANCEL PROCESS command.

System action: Processing for the command *command* ends. Statistics on the number and type of objects moved, together with the total number of bytes copied, are displayed on the server console following this message.

User response: None.

ANR0620I *Export/import command: Copied number domain(s).*

Explanation: The background export or import process to service the command *export/import command* copies *number* policy domain definitions from the server database to export media or from export media into the server database. Data is not actually moved if

ANR0621I • ANR0627I

Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0621I *Export/import command: Copied number policy sets.*

Explanation: The background export or import process to service the command *export/import command* copies *number* policy set definitions from the server database to export media or from export media into the server database. Data is not actually moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0622I *Export/import command: Copied number management classes.*

Explanation: The background export or import process to service the command *export/import command* copies *number* management class definitions from the server database to export media or from export media into the server database. Data is not moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0623I *Export/import command: Copied number copy groups.*

Explanation: The background export or import process to service the command *export/import command* copies *number* copy group definitions from either the server database to export media or from export media into the server database. Data is not moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0624I *Export/import command: Copied number schedules.*

Explanation: The background export or import process to service the command *export/import command* copies *number* schedule definitions from either the server database to export media or from export media into the server database. Data is not moved if

Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0625I *Export/import command: Copied number administrators.*

Explanation: The background export or import process to service the command *export/import command* copies *number* administrator definitions from either the server database to export media or from export media into the server database. Data is not moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0626I *Export/import command: Copied number node definitions.*

Explanation: The background export or import process to service the command *export/import command* copies *number* client node definitions from the server database to export media or from export media into the server database. Data is not moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0627I *Export/import command: Copied filespace number file spaces archive number archive files, backup number backup files, and spacemg number space managed files.*

Explanation: The background export or import process to service the command *export/import command* copies *filespace number* client file space definitions, *archive number* archive file copies, *backup number* backup file copies, and *spacemg number* space-managed files from either the server database to export media or from import media into the server database. Data is not actually moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0629I *Export/import command: Copied number bytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* bytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. Data is not moved if Preview=Yes is specified in the command *export/import command*. This figure can be used during export preview processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0630I *Export/import command: Copied number kilobytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* kilobytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. This figure can be used during export preview processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0631I *Export/import command: Copied number megabytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* megabytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. This figure can be used during export preview processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0632I *Export/import command: Copied number gigabytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* gigabytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. This figure can be used during export preview

processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0633I *Export/import command: Copied number terabytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* terabytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. This figure can be used during export preview processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0634I *Export/import command: Detected number errors.*

Explanation: The background export or import process to service the command *export/import command* detects *number* errors while copying information from the server database and data storage to the export media or from the export media to the server database and data storage.

System action: Export or import processing for the command completes. Server operation continues.

User response: Examine the server messages issued prior to this message to view the error. Use the QUERY ACTLOG command to view the activity log and search for messages.

ANR0635I *Export/import command: Processing node node name in domain domain name.*

Explanation: The background export or import process to service the command *export/import command* is currently processing the client node definition information for node *node name*. The node will be imported to domain *domain name*.

System action: Export or import processing for the command continues.

User response: None.

ANR0636I *Import command: Processing file space*
filesystem name for node node name as file
space new filesystem name.

Explanation: The background import process to service the command *import command* is currently processing the client file space definition information for file space *filesystem name* belonging to client node *node name*. The file space is imported under the name *new filesystem name*. During import processing, file spaces defined for clients are not replaced, and file copy information in the file spaces are imported to new file space names so that client file copies are not mixed with existing definitions. Import processing can then create file spaces with names generated by the import processor for client nodes that existed prior to the import operation.

System action: Import processing for the command continues.

User response: None; however, clients may want to examine the contents of the file space with the name *new filesystem name* so that they know where certain file copies are kept.

ANR0637I *Export/import command: Processing file*
space filesystem name for node node name
fsId filesystem id .

Explanation: The background export or import process to service the command *export/import command* is currently processing client node file space information for file space *filesystem name* belonging to client node *node name*.

System action: Export or import processing for the command continues.

User response: None.

ANR0638I *Export/import command: Processing*
administrator administrator name.

Explanation: The background export or import process to service the command *export/import command* is currently processing the administrator definition information for administrator *administrator name*.

System action: Export or import processing for the command continues.

User response: None.

ANR0639I *Export/import command: Processing*
domain domain name.

Explanation: The background export or import process to service the command *export/import command* is currently processing the policy domain definition information for domain *domain name*.

System action: Export or import processing for the command continues.

User response: None.

ANR0640I *Export/import command: Processing policy*
set set name in policy domain domain
name.

Explanation: The background export or import process to service the command *export/import command* is currently processing the policy set definition information for policy set *set name* belonging to policy domain *domain name*.

System action: Export or import processing for the command continues.

User response: None.

ANR0641I *Export/import command: Processing*
management class class name in domain
domain name, set set name.

Explanation: The background export or import process to service the command *export/import command* is currently processing the management class definition information for management class *class name* belonging to policy set *set name* in policy domain *domain name*.

System action: Export or import processing for the command continues.

User response: None.

ANR0642I *Export/import command: Processing*
backup copy group in domain domain
name, set set name, management class
class name.

Explanation: The background export or import process to service the command *export/import command* is currently processing the backup copy group definition information for management class *class name* belonging to policy set *set name* in policy domain *domain name*.

System action: Export or import processing for the command continues.

User response: None.

ANR0643I *Export/import command: Processing*
archive copy group in domain domain
name, set set name, management class
class name.

Explanation: The background export process to service the command *export/import command* is currently processing the archive copy group definition information for management class *class name* belonging to policy set *set name* in policy domain *domain name*.

System action: Export processing for the command continues.

User response: None.

ANR0644I *Export command: Processing copy group of unknown type in domain domain name, set set name, management class class name.*

Explanation: The background export or import process to service the command *export command* is currently processing copy group definition information for management class *class name* belonging to policy set *set name* in policy domain *domain name*. The type of copy group being processed is unknown.

System action: Export or import processing for the command continues. The import or export process assumes that the copy group is a backup copy group.

User response: After policy definitions are imported, use the QUERY MGMTCLASS and QUERY COPYGROUP commands to query the server definitions for management class *class name* to ensure that the copy groups defined have the desired attributes and types. Alternatively, the copy group can be deleted and defined with the correct type, and then the export command can be issued again.

ANR0645I *Export/import command: Processing schedule schedule name in domain domain name.*

Explanation: The background export or import process to service the command *export/import command* is currently processing the schedule definition information for schedule *schedule name* belonging to policy domain *domain name*.

System action: Export or import processing for the command continues.

User response: None.

ANR0646I *Export/import command: message*

Explanation: The background export or import process to service the command *export/import command* has received the message *message* from the server.

System action: Export or import processing for the command continues, but errors may have been encountered.

User response: Examine the documentation for the message *message* and resolve the problem reported.

ANR0647I **Cancel in progress**

Explanation: The export or import operation has been canceled and will end when resources have been freed for the background process. This message may be displayed in response to a QUERY PROCESS command for an export or import operation.

System action: Server operation continues.

User response: None.

ANR0648I **Have copied the following:**

Explanation: The export or import operation has copied the number and types of objects displayed. This message may be displayed in response to a QUERY PROCESS command for an export or import operation.

System action: Server operation continues.

User response: None.

ANR0649I *Import command: Domain domain name does not exist - the system will attempt to import node node name to domain STANDARD.*

Explanation: The background import process to service the command *import command* is currently processing client node *node name*. This node was assigned to domain *domain name* at the time of export. However, domain *domain name* does not exist on the server to which the import is being performed.

System action: Import processing continues, but node *node name* will be assigned to domain STANDARD during import unless one of the following conditions exist:

- Preview=Yes
- Node *node name* is already registered and Replacedefs=No
- Domain STANDARD does not exist

User response: If Preview=Yes, consider defining domain *domain name* before nodes are actually imported. Otherwise, domain *domain name* can be created after the node is imported and the UPDATE NODE command can be used to assign the node to domain *domain name*.

ANR0650W **IMPORT: Archive copygroup copy group name in management class management class name for domain domain name is not defined, default management class will be used.**

Explanation: During import processing, the server finds that a management class or copy group bound to an archive file being imported does not exist in the active policy set for the domain to which the node is assigned.

System action: The default management class for the node's policy domain is bound to the archive file and import processing continues.

User response: If you want to define the missing management class, an authorized administrator may cancel the import operation, define the missing management class or copy group for the domain, and process the import operation again.

ANR0651W **IMPORT: Backup copygroup** *copy group name in management class management class name* **for domain** *domain name* **is not defined, default management class will be used.**

Explanation: During import processing, the server finds that a management class or copy group bound to a backup file being imported does not exist in the active policy set for the domain to which the node is assigned.

System action: The default management class for the node's policy domain is bound to the backup file copy and import processing continues.

User response: If you want to define the missing management class, an authorized administrator may cancel the import operation, define the missing management class or copy group for the domain, and process the import operation again.

ANR0652W **IMPORT: Archive copygroup not found for default management class in domain** *domain name* **- archive files bound to management class** *management class name* **in this domain cannot be imported.**

Explanation: During import processing, the server finds that a management class or copy group bound to an archive file being imported does not exist in the active policy set for the domain to which the node is assigned. When trying to rebind the archive file to the default management class for the domain, the server finds that an archive copy group is not defined for the default management class.

System action: The file is not imported; import processing continues.

User response: If you want to define the missing copy group, an authorized administrator may cancel the import operation, define the missing management class or copy group for the domain, and process the import operation again.

ANR0653W **IMPORT: Backup copygroup not found for default management class in domain** *domain name* **- backup files bound to management class** *management class name* **in this domain cannot be imported.**

Explanation: During import processing, the server finds that a management class or copy group bound to a backup file being imported does not exist in the active policy set for the domain to which the node is assigned. When trying to rebind the backup file to the default management class for the domain, the server finds that a backup copy group is not defined for the default management class.

System action: The file is not imported; import processing continues.

User response: If you want to define the missing copy group, an authorized administrator may cancel the import operation, define the missing management class or copy group for the domain, and process the import operation again.

ANR0654I **Restartable export command with export identifier** *exportID* **started as process** *process ID*.

Explanation: A background process was started to service the command *command*. The background process is defined as process *process ID*.

System action: Server operation continues.

User response: To query the progress of the background server-to-server export process, issue the QUERY PROCESS or QUERY EXPORT command. To suspend the process, issue the SUSPEND EXPORT command. To cancel the background process, issue the CANCEL PROCESS command. Use the *process ID* number to specify this specific process.

ANR0655W *Command: Retrieve or restore failed - file was deleted from data storage during retrieval.*

Explanation: The server ends a file retrieval operation for the specified command because the file has been deleted from data storage by another process before retrieval is complete.

System action: The server ends the command and continues operation.

User response: Contact your administrator to find out if DELETE FILESPACE, DELETE VOLUME, or inventory expiration processes are running; these processes can delete data storage files during retrieval. Reissue the command after these processes have been completed or canceled.

ANR0656W *Export/import command: Skipped* *archive number* **archive files, backup number backup files, and spacemg number space managed files.**

Explanation: The background export or import process to service the command *export/import command* skipped *archive number* archive file copies, *backup number* backup file copies, and *spacemg number* space-managed files from either the server database to export media or from import media into the server database. Data is not actually moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: Check previous messages for the names of the files that were not exported or imported, and problem determination information.

ANR0657W *Export command: Invalid authorization rule type rule type encountered for file space filespace name fsId filespace id in node node name - both backup and archive will be assumed during import.*

Explanation: During import processing, the server encounters an invalid file space authorization rule type for the indicated file space and node.

System action: Server operation continues.

User response: After import processing is completed, ask the user of node *node name* to query the access rules and ensure that they are specified as desired. The user should correct any rules that grant access to objects that the user does not want others to access.

ANR0658W *Export command: The password for administrator administrator name could not be obtained. The value 'password value' will be assumed: The system administrator may wish to change this password after importing administrator administrator name.*

Explanation: During processing of command *export command*, the export processor cannot obtain the password for administrator *administrator name*. The value *password value* is assigned as the password for the administrator on the export media.

System action: Processing of the command continues.

User response: After the administrative definition has been imported to another server, an authorized administrator should use the UPDATE ADMIN command to set a password for the administrator *administrator name*.

ANR0659W *Export command: The password for node node name could not be obtained. The value 'password value' will be assumed: The system administrator may wish to change this password after importing node node name.*

Explanation: During processing of command *export command*, the export processor cannot obtain the password for client node *node name*. The value *password value* is assigned as the password for the client node on the export media.

System action: Processing of the command continues.

User response: After the client node definition has been imported to another server, an authorized administrator should use the UPDATE NODE command to set a password for the node *node name*.

ANR0660E *Command: Insufficient memory available in accessing data storage.*

Explanation: The server encounters a memory shortage in accessing data storage during command *command* operation.

System action: The command *command* operation ends and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0661E *Command: Internal error encountered in accessing data storage.*

Explanation: The server encounters an internal error in accessing data storage while processing command *command* operation.

System action: The command *command* operation is ended and server operation continues.

User response: Use the QUERY ACTLOG command to examine messages prior to this error to determine the cause of the data storage failure. If the failure can be found and resolved, reissue the command *command* operation. If the failure cannot be found, contact your service representative for assistance in resolving the problem.

ANR0662E *Command: Output error encountered in accessing data storage.*

Explanation: The command *command* operation ends because an error has been encountered by the server in writing to a device. Possible reasons include:

- I/O error writing to a device
- No storage space.
- Incompatible storage pool data format.

System action: The command *command* operation ends and server operation continues.

User response: Query the activity log to find messages preceding this one to determine the cause of the error. After the problem is corrected, the command can be retried.

ANR0663E *Command: Data transfer was interrupted in accessing data storage.*

Explanation: The database transaction associated with command *command* operation failed because data transfer to or from data storage was interrupted by an external event.

System action: The command *command* operation is ended and server operation continues.

User response: Examine the messages issued prior to this message to determine why the data transfer was

interrupted. Reissue the command *command* after the problem is resolved.

ANR0664E *Export/import command: Media not accessible in accessing data storage.*

Explanation: The server ends a transaction for an export or import operation because storage volumes are not available in the storage pools in which the client files are to be stored.

System action: The server ends the export or import operation and server operation continues.

User response: An authorized administrator can issue the DEFINE VOLUME command to add storage to one or more storage pools in the storage hierarchy. The VARY ONLINE command can be used to vary offline storage volumes online in the storage hierarchy to make them available for file storage.

ANR0665W *Import command: Transaction failed - storage pool *pool name* is not defined.*

Explanation: The server rolls back a database update transaction for an import operation because the destination specified for a management class copy group specifies the named storage pool, but that storage pool does not exist.

System action: The import operation is ended and server operation continues.

User response: An administrator with policy authority over the client policy domain must correct management class definitions so that copy group destinations refer to defined storage pools, or the specified storage pool must be created by an authorized administrator.

ANR0666W *Import command: Transaction failed - object excluded by size in storage pool *pool name* and all successor pools.*

Explanation: The server ends a database update transaction for an import operation because the size of an imported file is larger than that allowed in the storage pool specified in the bound management class copy group for the file. No successor storage pools to the one specified on the copy group can accept the large file.

System action: The import operation is ended and server operation continues.

User response: The maximum file size for one or more of the storage pools in the storage hierarchy can be increased to accommodate the file. An authorized administrator can increase the MAXSIZE parameter by issuing the UPDATE STGPOOL command. Alternatively, the appropriate copygroup definition can be updated so that a different destination storage pool is specified.

ANR0667W *Import command: Transaction failed - no space available in storage pool *pool name* and all successor pools.*

Explanation: The server ends an import operation because the storage pool specified in a management class copy group does not contain enough free space to hold the files being imported. Successor storage pools to the one specified on the copy group do not contain enough free space.

System action: The import operation is ended and server operation continues.

User response: An authorized administrator can issue the DEFINE VOLUME command to add storage to one or more storage pools in the storage hierarchy.

ANR0668W *Export/import command: Transaction failed - error on output storage device.*

Explanation: The server ends an export or import operation for the specified session because an I/O error has been encountered by the server in writing to a device.

System action: The server ends the export or import operation and server operation continues.

User response: Query the activity log to find messages preceding this one that specify the device that is failing. Storage pool volumes can be varied offline (by using the VARY OFFLINE command), or the server may need to be shut down by using the HALT command to correct the hardware problem. After the problem is corrected, the client may be able to try the operation again.

ANR0669W *Export/import command: Transaction failed - data transfer interrupted.*

Explanation: The database transaction associated with an export or import operation failed because data transfer to or from data storage was interrupted by an external event.

System action: The export or import operation is ended and server operation continues.

User response: Examine the messages issued prior to this message to determine why the data transfer was interrupted. Attempt the export/import operation again after problem is resolved.

ANR0670W *Export/import command: Transaction failed - storage media inaccessible.*

Explanation: The server ends a transaction for an export or import operation because storage volumes are not available in the storage pools in which the client files are to be stored.

System action: The server ends the export or import operation and server operation continues.

User response: An authorized administrator can issue the DEFINE VOLUME command to add storage to one or more storage pools in the storage hierarchy. The VARY ONLINE command can be used to vary offline storage volumes online in the storage hierarchy to make them available for file storage.

ANR0671W *Export/import command: Transaction failed - sufficient recovery log space is not available.*

Explanation: The server ends a database update transaction for an export or import operation because sufficient log space is not available on the server.

System action: The server ends the export or import operation and server operation continues.

User response: An authorized administrator can issue the DEFINE LOGVOLUME command to add volumes for use by the log, and the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR0672W *Export/import command: Transaction failed - sufficient database space is not available.*

Explanation: The server ends a database update transaction for an export or import operation because sufficient database space is not available on the server.

System action: The server ends the export or import operation and server operation continues.

User response: An authorized administrator can issue the DEFINE DBVOLUME command to add volumes for use by the database, and the EXTEND DB command to extend the size of the log so that the new volumes are used.

ANR0673W *Export/import command: Data storage retrieve or restore failed - error detected.*

Explanation: The server ends an export or import operation because an error has been encountered on the server. Some common reasons for the error are:

- The input volume is unavailable
- The storage pool is unavailable
- Data is corrupted on the input volume
- Hardware or media failure has occurred
- Database corruption

System action: The server ends the export or import operation and continues operation.

User response: Examine any prior error messages to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages if needed. Correct the problem and try the restore or retrieve again. You can also refer to the *Problem Determination Guide* for problem determination

hints and information. If retry of the operation continues to fail contact your service representative.

ANR0674W *Export command: Retrieve failed - error on input storage device.*

Explanation: The server ends an export operation for the specified session because an I/O error has been encountered by the server in reading from a device. The object for which the I/O was issued is reported in a later message.

System action: Export processing skips this file, and continues operation.

User response: Query the activity log to find messages preceding this one that specify the device that is failing. Storage pool volumes can be varied offline (by using the VARY OFFLINE command), or the server may need to be shut down with the HALT command to correct the hardware problem.

ANR0675E **EXPORT/IMPORT: Error starting the Export/Import Session.**

Explanation: The server export/import process is not able to start the session to export information from the server or import information into the server.

System action: The export or import process ends and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0676E **EXPORT/IMPORT: Invalid Communications Buffer State in SEND.**

Explanation: The server export/import process encounters a communications error in transferring information to or from the server.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0677E **EXPORT/IMPORT: Invalid Communications Buffer State in RECEIVE.**

Explanation: The server export/import process encounters a communications error in transferring information to or from the server.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0678E EXPORT/IMPORT: Communications Failure in Sending "verb type" verb.

Explanation: The server export/import process encounters a communications error in using the *verb type* verb to transfer information to or from the server.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0679E EXPORT/IMPORT: Communications Failure in Receiving "verb type" verb.

Explanation: The server export/import process encounters a communications error in using the *verb type* verb to transfer information to or from the server.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0681E EXPORT/IMPORT: Authentication Failure.

Explanation: The server export/import process encounters an authentication error in transferring information to or from the server.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0682E EXPORT/IMPORT: Communications Failure in Sending "verb type" verb (command).

Explanation: The server export/import process encounters a communications error in using the *verb type* verb to issue command *command*.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0683E EXPORT/IMPORT: Receive Buffer overflow.

Explanation: The server export/import process encounters an overflow error in transferring information to or from the server.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0684E EXPORT/IMPORT: Communications failure: bad verb received (verb type).

Explanation: The server encounters an invalid communications verb during export or import processing and is not able to continue processing.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0685E EXPORT/IMPORT: Internal error: Invalid table output handle detected.

Explanation: The server export/import process encounters an internal error in transferring information to or from the server.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0686E Export/import command: Transaction failure - could not start database transaction.

Explanation: During processing of command *export/import command*, a database transaction cannot be started in the server database.

System action: Processing of the command terminates.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0687E Export/import command: Transaction failure - could not commit database transaction.

Explanation: During processing of command *export/import command*, a database transaction cannot be committed to the server database.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0688E Export/import command: Transaction failure - commit called when no transaction started.

Explanation: During processing of command *export/import command*, a database transaction cannot be

started in the server database.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0689W *Import command: Client platform type (platform type) for imported node node name conflicts with an existing node with the same name - the node will not be imported.*

Explanation: During import processing, the server encounters an imported node definition that has the same name as an existing node, but has a different client platform type (for example, OS/2® or AIX®). Because file data may not be compatible across different client platforms, the node is not imported.

System action: Import processing continues, and the named node is skipped by import processing.

User response: If you want to import the named node, cancel the import process, rename the existing node to a new name by using the RENAME NODE command, and run the import again. After you have imported the node, use the RENAME NODE command to set the node names as you desire.

ANR0690E *Export/import command: Transaction failure - server aborted the transaction (abort code).*

Explanation: During processing of command *export/import command*, a database transaction cannot be committed in the server database. The reason code *abort code* is returned.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0691E *Export command: Error abort code writing export data.*

Explanation: During processing of command *export command*, an input/output error occurs when writing the exported information to the export media.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the

activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0692E *Command: Out of space on sequential media, scratch media could not be mounted.*

Explanation: During command *command* processing, the process encounters an out-of-space condition writing to the sequential media. Command *command* ends when there is no more space on the sequential media for storing data and SCRATCH=NO has been specified on command *command*.

System action: Command *command* processing ends. Server processing continues.

User response: Reissue the command and specify SCRATCH=YES or specify additional volume names on the command.

ANR0693E *Import command: Error abort code reading export data.*

Explanation: During processing of command *import command*, an input/output error occurs when reading the exported information from the export media.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0694E *Import command: Invalid record format (format code) detected on import.*

Explanation: During processing of command *import command*, an invalid record type is detected when reading the exported information from the export media.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0695E *Export command: Unexpected error error code encountered in receiving table output data.*

Explanation: During processing of command *export command*, an unexpected error is detected.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0696E *Export command: Output table error encountered - 0 columns reported in the table.*

Explanation: During processing of command *export command*, an unexpected error is detected.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0697E *Export command: Output table error encountered - not positioned to the first column in the table.*

Explanation: During processing of command *export command*, an unexpected error is detected.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0698E *Export/import command: Invalid value for FILEDATA parameter - parameter value.*

Explanation: The value (*parameter value*) specified for the FILEDATA parameter in command *export/import command* is not a valid value for this parameter.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid FILEDATA parameter. For information on valid values for the FILEDATA parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0699E *Export/import command: Device class DISK cannot be specified for this command.*

Explanation: The DEVCLASS value DISK cannot be specified for the command *export/import command*.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid device class. Issue the QUERY DEVCLASS command for a list of valid device classes for the server.

ANR0700E *Export/import command: Invalid value for PREVIEW parameter - parameter value.*

Explanation: The value (*parameter value*) specified for the PREVIEW parameter in command *export/import command* is not a valid value for this parameter.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid PREVIEW parameter. For information on valid values for the PREVIEW parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0701E *Export/import command: Invalid value for SCRATCH parameter - parameter value.*

Explanation: The value (*parameter value*) specified for the SCRATCH parameter in command *export/import command* is not a valid value for this parameter.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid SCRATCH parameter. For information on valid values for the SCRATCH parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0705E *Export command: The VOLUMENAMES parameter must be specified when SCRATCH=NO is specified.*

Explanation: The SCRATCH parameter is specified as NO for the command *export command* but the VOLUMENAMES parameter is not specified. When scratch volumes are not allowed, the VOLUMENAMES parameter must be specified to indicate the volumes that can be used for the command.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid VOLUMENAMES parameter. For information on valid parameter values for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0706E *Export command: A device class must be specified unless PREVIEW=YES is specified.*

Explanation: The DEVCLASS parameter is not specified in the command *export command*. Unless

PREVIEW=YES is specified, a DEVCLASS value must be specified.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid device class. Issue the QUERY DEVCLASS command for a list of valid device classes for the server.

ANR0707E *Export command: The FILESPACE parameter cannot be specified.*

Explanation: The FILESPACE parameter is specified for the command *export command*, but the FILEDATA parameter is specified as NONE, or is not specified and defaults to NONE. File spaces are only copied if the FILEDATA parameter is specified with a value other than NONE.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid FILEDATA parameter. For information on valid parameter values for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0708E *Import command: The FILESPACE parameter cannot be specified unless the FILEDATA parameter specifies that files should be imported.*

Explanation: The FILESPACE parameter is specified for the command *import command*, but the FILEDATA parameter is specified as NONE, or is not specified and defaults to NONE. File spaces are only copied if the FILEDATA parameter is specified with a value other than NONE.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid FILEDATA parameter. For information on valid parameter values for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0709E *Command: No matching nodes registered in the specified domains.*

Explanation: The DOMAIN parameter has been specified for this command, but no nodes matching the node name specification are found in the domains specified.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid combination of node and domain names. Use the QUERY NODE command to view the names of nodes in the domains that you are interested in exporting.

ANR0710E *Command: Unable to start background process.*

Explanation: The server command processor is not able to start a background process to perform the command *command*.

System action: The command process ends and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0711E *Import command: Unable to start import process.*

Explanation: The server import command processor is not able to start a background process to perform the import operation.

System action: The export or import process ends and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0712E *Import command: Invalid value for DATES parameter - parameter value.*

Explanation: The value (*parameter value*) specified for the DATES parameter in command *import command* is not a valid value for this parameter.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid DATES parameter. For information on valid values for the DATES parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0713E *Import command: Invalid value for REPLACEDEFS parameter - parameter value.*

Explanation: The value (*parameter value*) specified for the REPLACEDEFS parameter in command *import command* is not a valid value for this parameter.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid REPLACEDEFS parameter. For information on valid values for the REPLACEDEFS parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR0714E *Import command: The EXTFILE device class cannot be specified when the VOLUMENAMES parameter is specified.*

Explanation: An invalid combination of parameters has been entered for command *import command*. The EXTFILE device class cannot be used in combination with the VOLUMENAMES parameter.

System action: The command fails and server operation continues.

User response: Reissue the command with the correct syntax.

ANR0715E *Import command: A device class must be specified.*

Explanation: The command *import command* has been specified, but does not include specification of the DEVCLASS parameter. The DEVCLASS parameter must be specified for this command.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid device class. For a list of valid device classes for the server, issue the QUERY DEVCLASS command.

ANR0716E *Import command: Invalid export data detected.*

Explanation: The command *import command* encounters invalid data on the export media while trying to import server information.

System action: The command fails and server operation continues.

User response: Ensure that the mounted export tapes are in the correct order (mounted in the same order as they were mounted during export). Reissue the command, and mount the tapes in the correct order. If the VOLUMENAMES parameter has been specified, make sure that the volume names in the command are specified in the correct order.

ANR0717E *Export/import command: Preview processing terminated abnormally - communications send or receive failed.*

Explanation: Processing for the command *export/import command* in preview mode has been terminated when an internal communications error is encountered in the server.

System action: Export/import processing is ended and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the

activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0718E *Export/import command: Processing terminated abnormally - communications send or receive failed.*

Explanation: Processing for the command *export/import command* ends when an internal communications error is encountered in the server.

System action: Export/import processing is ended and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0719E *Export/import command: Preview processing terminated abnormally - insufficient memory.*

Explanation: Processing for the command *export/import command* in preview mode is ended because sufficient memory is not available on the server.

System action: Export/import processing is ended and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0720E *command: Processing terminated abnormally - insufficient memory.*

Explanation: Processing for the command ends because sufficient memory is not available on the server.

System action: Command processing is ended and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0721E *Export/import command: Preview processing terminated abnormally - unexpected verb received from server.*

Explanation: Processing for the command *export/import command* in preview mode ends when an internal communications error is encountered in the server.

System action: Export/import processing ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0722E *Export/import command: Processing terminated abnormally - unexpected verb received from server.*

Explanation: Processing for the command *export/import command* ends when an internal communications error is encountered in the server.

System action: Export/import processing ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0723E *Export/import command: Preview processing terminated abnormally - transaction failure.*

Explanation: Processing for the command *export/import command* in preview mode ends when a database transaction error is encountered in the server.

System action: Export/import processing ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0724E *Export/import command: Processing terminated abnormally - transaction failure.*

Explanation: Processing for the command *export/import command* ends when a database transaction error is encountered in the server.

System action: Export/import processing ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0725E *Export/import command: Preview processing terminated abnormally - authentication failure.*

Explanation: Processing for the command *export/import command* in preview mode ends when an authentication error is encountered in the server.

System action: Export/import processing ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0726E *Export/import command: Processing terminated abnormally - authentication failure.*

Explanation: Processing for the command *export/import command* ends when an authentication error is encountered in the server.

System action: Export/import processing ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0727E *Export/import command: Preview processing terminated abnormally - internal error.*

Explanation: Processing for the command *export/import command* in preview mode ends when an internal error is encountered in the server.

System action: Export/import processing ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0728E *Export/import command: Processing terminated abnormally - internal error.*

Explanation: Processing for the command *export/import command* ends when an internal error is encountered in the server.

System action: Export/import processing ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0729E *Import command: Syntax error from command 'server command'.*

Explanation: During processing of the command *import command*, an internal syntax error is encountered in the server.

System action: Import processing continues, but the indicated command will have no effect.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. After import processing is complete, it may be necessary to issue additional commands manually to obtain the necessary definitions.

ANR0730E *Import command: Internal error from command 'server command'.*

Explanation: Processing for the command *import command* ends when an internal command error is encountered in the server.

System action: Import processing ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0731E *Import command: Invalid value for COMPRESSION parameter in exported data for node node name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the COMPRESSION parameter for node *node name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing COMPRESSION value is used.

User response: None. If the data is imported with a later command, verify that the correct COMPRESSION value is used for this node.

ANR0732E *Import command: Invalid value for ARCHDELETE parameter in exported data for node node name.*

Explanation: During preview processing of command

import command, an invalid value is encountered for the ARCHDELETE parameter for node *node name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing ARCHDELETE value is used.

User response: None. If the data is imported with a later command, verify that the correct ARCHDELETE value is used for this node.

ANR0733E *Import command: Invalid value for BACKDELETE parameter in exported data for node node name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the BACKDELETE parameter for node *node name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing BACKDELETE value is used.

User response: None. If the data is imported with a later command, verify that the correct BACKDELETE value is used for this node.

ANR0734E *Import command: Invalid value for COMPRESSION parameter in exported data - node node name registered with default COMPRESSION value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the COMPRESSION parameter for node *node name*.

System action: Processing of the command continues, by using the default COMPRESSION value for this node.

User response: Verify that the correct COMPRESSION value has been used for this node. Update this value, if necessary.

ANR0735E *Import command: Invalid value for ARCHDELETE parameter in exported data - node node name registered with default ARCHDELETE value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the ARCHDELETE parameter for node *node name*.

System action: Processing of the command continues, by using the default ARCHDELETE value for this node.

User response: Verify that the correct ARCHDELETE value has been used for this node. Update this value, if necessary.

ANR0736E *Import command: Invalid value for BACKDELETE parameter in exported data - node `node name` registered with default BACKDELETE value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the BACKDELETE parameter for node *node name*.

System action: Processing of the command continues, by using the default BACKDELETE value for this node.

User response: Verify that the correct BACKDELETE value has been used for this node. Update this value, if necessary.

ANR0737E *Import command: Invalid value for COMPRESSION parameter in exported data - existing COMPRESSION value for node `node name` was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the COMPRESSION parameter for node *node name*.

System action: Processing of the command continues, by using the existing COMPRESSION value for this node.

User response: Verify that the correct COMPRESSION value has been used for this node. Update this value, if necessary.

ANR0738E *Import command: Invalid value for ARCHDELETE parameter in exported data - existing ARCHDELETE value for node `node name` was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the ARCHDELETE parameter for node *node name*.

System action: Processing of the command continues, by using the existing ARCHDELETE value for this node.

User response: Verify that the correct ARCHDELETE value has been used for this node. Update this value, if necessary.

ANR0739E *Import command: Invalid value for BACKDELETE parameter in exported data - existing BACKDELETE value for node `node name` was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the BACKDELETE parameter for node *node name*.

System action: Processing of the command continues, by using the existing BACKDELETE value for this node.

User response: Verify that the correct BACKDELETE

value has been used for this node. Update this value, if necessary.

ANR0740E *Import command: Invalid value for TYPE parameter in exported data for copy group `copy group name` in domain `domain name`, set `policy set name`, management class `management class name` - backup is assumed.*

Explanation: During processing of command *import command*, an invalid value is encountered for the TYPE parameter for copy group *copy group*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues. Based upon other copy group parameters, a copy group type of backup is assigned.

User response: Verify that the assigned TYPE value of backup for this copy group is correct.

ANR0741E *Import command: Invalid value for TYPE parameter in exported data for copy group `copy group name` in domain `domain name`, set `policy set name`, management class `management class name` - archive is assumed.*

Explanation: During processing of command *import command*, an invalid value is encountered for the TYPE parameter for copy group *copy group*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues. Based upon other copy group parameters, a copy group type of archive is assigned.

User response: Verify that the assigned TYPE value of archive for this copy group is correct.

ANR0742E *Import command: Invalid value for TYPE parameter in exported data for copy group `copy group name` in domain `domain name`, set `policy set name`, management class `management class name` - this copy group will not be imported.*

Explanation: During processing of command *import command*, an invalid value is encountered for the TYPE parameter for copy group *copy group*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues. However, this copy group is not imported because a TYPE value cannot be assigned.

User response: Manually define this copy group, if necessary.

ANR0743E *Import command: Invalid value for MODE parameter in exported data for archive copy group copy group name in domain domain name, set policy set name, management class management class name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the MODE parameter for archive copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing MODE value is used.

User response: None. If the data is imported with a later command, verify that the correct MODE value is used for this archive copy group.

ANR0744E *Import command: Invalid value for MODE parameter in exported data for backup copy group copy group name in domain domain name, set policy set name, management class management class name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the MODE parameter for backup copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing MODE value is used.

User response: None. If the data is imported with a later command, verify that the correct MODE value is used for this backup copy group.

ANR0745E *Import command: Invalid value for SERIALIZATION parameter in exported data for archive copy group copy group name in domain domain name, set policy set name, management class management class name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the SERIALIZATION parameter for archive copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing SERIALIZATION value is used.

User response: None. If the data is imported with a later command, verify that the correct SERIALIZATION value is used for this archive copy group.

ANR0746E *Import command: Invalid value for SERIALIZATION parameter in exported data for backup copy group copy group name in domain domain name, set policy set name, management class management class name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the SERIALIZATION parameter for backup copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing SERIALIZATION value is used.

User response: None. If the data is imported with a later command, verify that the correct SERIALIZATION value is used for this backup copy group.

ANR0747E *Import command: Invalid value for MODE parameter in exported data - archive copy group copy group name in domain domain name, set policy set name, management class management class name defined with default MODE value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the MODE parameter for archive copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues, by using the default MODE value for this archive copy group.

User response: Verify that the correct MODE value has been used for this copy group. Update this value, if necessary.

ANR0748E *Import command: Invalid value for MODE parameter in exported data - backup copy group copy group name in domain domain name, set policy set name, management class management class name defined with default MODE value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the MODE parameter for backup copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues, by using the default MODE value for this backup copy group.

User response: Verify that the correct MODE value has been used for this copy group. Update this value, if necessary.

ANR0749E *Import command: Invalid value for **SERIALIZATION** parameter in exported data - archive copy group* *copy group name in domain domain name, set policy set name, management class management class name defined with default **SERIALIZATION** value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the **SERIALIZATION** parameter for archive copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues, by using the default **SERIALIZATION** value for this archive copy group.

User response: Verify that the correct **SERIALIZATION** value has been used for this copy group. Update this value, if necessary.

ANR0750E *Import command: Invalid value for **SERIALIZATION** parameter in exported data - backup copy group* *copy group name in domain domain name, set policy set name, management class management class name defined with default **SERIALIZATION** value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the **SERIALIZATION** parameter for backup copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues, by using the default **SERIALIZATION** value for this backup copy group.

User response: Verify that the correct **SERIALIZATION** value has been used for this copy group. Update this value, if necessary.

ANR0751E *Import command: Invalid value for **MODE** parameter in exported data - existing **MODE** value for archive copy group* *copy group name in domain domain name, set policy set name, management class management class name was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the **MODE** parameter for archive copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues, by using the existing **MODE** value for this archive copy group.

User response: Verify that the correct **MODE** value has been used for this copy group. Update this value, if necessary.

ANR0752E *Import command: Invalid value for **MODE** parameter in exported data - existing **MODE** value for backup copy group* *copy group name in domain domain name, set policy set name, management class management class name was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the **MODE** parameter for backup copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues, by using the existing **MODE** value for this backup copy group.

User response: Verify that the correct **MODE** value has been used for this copy group. Update this value, if necessary.

ANR0753E *Import command: Invalid value for **SERIALIZATION** parameter in exported data - existing **SERIALIZATION** value for archive copy group* *copy group name in domain domain name, set policy set name, management class management class name was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the **SERIALIZATION** parameter for archive copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues, by using the existing **SERIALIZATION** value for this archive copy group.

User response: Verify that the correct **SERIALIZATION** value has been used for this copy group. Update this value, if necessary.

ANR0754E *Import command: Invalid value for **SERIALIZATION** parameter in exported data - existing **SERIALIZATION** value for backup copy group* *copy group name in domain domain name, set policy set name, management class management class name was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the **SERIALIZATION** parameter for backup copy group *copy group name*, in policy domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Processing of the command continues, by using the existing SERIALIZATION value for this backup copy group.

User response: Verify that the correct SERIALIZATION value has been used for this copy group. Update this value, if necessary.

ANR0755E *Import command: Invalid value for ACTION parameter in exported data for schedule schedule name in domain domain name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the ACTION parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing ACTION value is used.

User response: If the data is imported with a later command, verify that the correct ACTION value is used for this schedule.

ANR0756E *Import command: Invalid value for DURUNITS or PERUNITS parameter in exported data for schedule schedule name in domain domain name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the DURUNITS or PERUNITS parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing values are used for DURATION, DURUNITS, PERIOD, and PERUNITS.

User response: If the data is imported with a later command, verify that the correct values for DURATION, DURUNITS, PERIOD, and PERUNITS are used for this schedule.

ANR0757E *Import command: Invalid value for DAYOFWEEK parameter in exported data for schedule schedule name in domain domain name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the DAYOFWEEK parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing DAYOFWEEK value is used.

User response: If the data is imported with a later command, verify that the correct DAYOFWEEK value is used for this schedule.

ANR0758E *Import command: Invalid value for ACTION parameter in exported data - schedule schedule name in domain domain name defined with default ACTION value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the ACTION parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues, by using the default ACTION value for this schedule.

User response: Verify that the correct ACTION value has been used for this schedule. Update this value, if necessary.

ANR0759E *Import command: Invalid value for DURUNITS or PERUNITS parameter in exported data - schedule schedule name in domain domain name defined with default values for DURATION, DURUNITS, PERIOD, and PERUNITS.*

Explanation: During processing of command *import command*, an invalid value is encountered for the DURUNITS or PERUNITS parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues, by using the default values for DURATION, DURUNITS, PERIOD, and PERUNITS.

User response: Verify that the correct values have been used for DURATION, DURUNITS, PERIOD, and PERUNITS. Update these values, if necessary.

ANR0760E *Import command: Invalid value for DAYOFWEEK parameter in exported data - schedule schedule name in domain domain name defined with default DAYOFWEEK value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the DAYOFWEEK parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues, by using the default DAYOFWEEK value for this schedule.

User response: Verify that the correct DAYOFWEEK value has been used for this schedule. Update this value, if necessary.

ANR0761E *Import command: Invalid value for ACTION parameter in exported data - existing ACTION value for schedule schedule name in domain domain name was not updated.*

Explanation: During processing of command *import*

command, an invalid value is encountered for the ACTION parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues, by using the existing ACTION value for this schedule.

User response: Verify that the correct ACTION value has been used for this schedule. Update this value, if necessary.

ANR0762E *Import command: Invalid value for DURUNITS or PERUNITS parameter in exported data - existing values for DURATION, DURUNITS PERIOD, and PERUNITS for schedule schedule name in domain domain name were not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the DURUNITS or PERUNITS parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues, by using the existing values for DURATION, DURUNITS, PERIOD, and PERUNITS.

User response: Verify that the correct values have been used for DURATION, DURUNITS, PERIOD, and PERUNITS. Update these values, if necessary.

ANR0763E *Import command: Invalid value for DAYOFWEEK parameter in exported data - existing DAYOFWEEK value for schedule schedule name in domain domain name was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the DAYOFWEEK parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues, by using the existing DAYOFWEEK value for this schedule.

User response: Verify that the correct DAYOFWEEK value has been used for this schedule. Update this value, if necessary.

ANR0764E *Import command: Invalid lock status detected while importing node node name - this node will not be locked.*

Explanation: During processing of command *import command*, an invalid value is encountered for the lock status for node *node name*.

System action: Processing of the command continues, but the node is not locked.

User response: An administrator with the proper authorization must issue the LOCK NODE command, if necessary.

ANR0765E *Import command: Invalid lock status detected while importing administrator administrator name - this administrator will not be locked.*

Explanation: During processing of command *import command*, an invalid value is encountered for the lock status for administrator *administrator name*.

System action: Processing of the command continues, but the administrator is not locked.

User response: An administrator with the proper authorization must issue the LOCK ADMIN command, if necessary.

ANR0766E *Export command: Invalid value for TYPE parameter detected while exporting copy group copy group name in domain domain name, set policy set name, management class management class name - system will attempt to assign value during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the TYPE parameter for copy group *copy group name*, in domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Export processing continues, but the exported data contains an unknown TYPE value for this copy group. If this data is imported, the system attempts to assign a TYPE value based upon values for other copy group parameters.

User response: Delete and define this copy group to eliminate the invalid data, and then restart the export command. Alternatively, use the export data with the unknown value, and the system will attempt to assign a TYPE during import processing.

ANR0767E *Export command: Invalid value for MODE parameter detected while exporting copy group copy group name in domain domain name, set policy set name, management class management class name - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the MODE parameter for copy group *copy group name* in domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Export processing continues, but the exported data contains an unknown MODE value for this copy group. If this data is imported, the default or existing MODE value is used.

User response: Update the MODE value for this copy group and restart the export command. Alternatively, use the export data with the unknown value, and check

and update the MODE value after import processing has been performed.

ANR0768E *Export command: Invalid value for SERIALIZATION parameter detected while exporting copy group copy group name in domain domain name, set policy set name, management class management class name - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the SERIALIZATION parameter for copy group *copy group name*, in domain *domain name*, policy set *policy set name*, management class *management class name*.

System action: Export processing continues, but the exported data contains an unknown SERIALIZATION value for this copy group. If this data is imported, the default or existing SERIALIZATION value is used.

User response: Update the SERIALIZATION value for this copy group and restart the export command. Alternatively, use the export data with the unknown value, and check and update the SERIALIZATION value after import processing has been performed.

ANR0769E *Export command: Invalid value for ACTION parameter detected while exporting schedule schedule name in domain domain name - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the ACTION parameter for schedule *schedule name* in domain *domain name*.

System action: Export processing continues, but the exported data will contain an unknown ACTION value for this schedule. If this data is imported, the default or existing ACTION value is used.

User response: Update the ACTION value for this schedule and restart the export command. Alternatively, use the export data with the unknown value, and check and update the ACTION value after import processing has been performed.

ANR0770E *Export command: Invalid value for DURUNITS parameter detected while exporting schedule schedule name in domain domain name - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the DURUNITS parameter for schedule *schedule name* in domain *domain name*.

System action: Export processing continues, but the exported data contains an unknown DURUNITS value

for this schedule. If this data is imported, the default or existing DURUNITS value is used.

User response: Update the DURUNITS value for this schedule and restart the export command. Alternatively, use the export data with the unknown value, and check and update the DURUNITS value after import processing has been performed.

ANR0771E *Export command: Invalid value for PERUNITS parameter detected while exporting schedule schedule name in domain domain name - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the PERUNITS parameter for schedule *schedule name* in domain *domain name*.

System action: Export processing continues, but the exported data will contain an unknown PERUNITS value for this schedule. If this data is imported, the default or existing PERUNITS value is used.

User response: Update the PERUNITS value for this schedule and restart the export command. Alternatively, use the export data with the unknown value, and check and update the PERUNITS value after import processing has been performed.

ANR0772E *Export command: Invalid value for DAYOFWEEK parameter detected while exporting schedule schedule name in domain domain name - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the DAYOFWEEK parameter for schedule *schedule name* in domain *domain name*.

System action: Export processing continues, but the exported data contains an unknown DAYOFWEEK value for this schedule. If this data is imported, the default or existing DAYOFWEEK value is used.

User response: Update the DAYOFWEEK value for this schedule and restart the export command. Alternatively, use the export data with the unknown value, and check and update the DAYOFWEEK value after import processing has been performed.

ANR0773E *Export command: Invalid lock status detected while exporting administrator administrator name - this administrator will not be locked during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the lock status for administrator *administrator name*.

System action: Export processing continues, but the exported data contains an unknown lock status for this

administrator. If this data is imported, the administrator will not be locked.

User response: An administrator with the proper authorization must issue the LOCK NODE or UNLOCK NODE command to achieve the desired lock status, and then restart the export command. Alternatively, use the export data with the unknown status, and issue a LOCK ADMIN or UNLOCK ADMIN command after import processing has been performed.

ANR0774E *Export command: Invalid value for COMPRESSION parameter detected while exporting node `node name` - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the COMPRESSION parameter for node *node name*.

System action: Export processing continues, but the exported data contains an unknown COMPRESSION value for this node. If this data is imported, the default or existing COMPRESSION value is used.

User response: Update the COMPRESSION parameter for this node and restart the export command. Alternatively, use the export data with the unknown value, and check and update the COMPRESSION value after import processing has been performed.

ANR0775E *Export command: Invalid lock status detected while exporting node `node name` - this node will not be locked during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the lock status for node *node name*.

System action: Export processing continues, but the exported data contains an unknown lock status for this node. If this data is imported, the node will not be locked.

User response: Lock or unlock the node to achieve the desired lock status, and then restart the export command. Alternatively, use the export data with the unknown status, and lock or unlock the node after import processing has been performed.

ANR0776E *Export command: Invalid value for ARCHDELETE parameter detected while exporting node `node name` - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the ARCHDELETE parameter for node *node name*.

System action: Export processing continues, but the exported data contains an unknown ARCHDELETE value for this node. If this data is imported, the default

or existing ARCHDELETE value is used.

User response: Update the ARCHDELETE parameter for this node and restart the export command. Alternatively, use the export data with the unknown value, and check and update the ARCHDELETE value after import processing has been performed.

ANR0777E *Export command: Invalid value for BACKDELETE parameter detected while exporting node `node` - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the BACKDELETE parameter for node *node name*.

System action: Export processing continues, but the exported data contains an unknown BACKDELETE value for this node. If this data is imported, the default or existing BACKDELETE value is used.

User response: Update the BACKDELETE parameter for this node and restart the export command. Alternatively, use the export data with the unknown value, and check and update the BACKDELETE value after import processing has been performed.

ANR0778E *Command: Error encountered in accessing data storage - device class `device class name` is not defined.*

Explanation: During command *command* processing, an error occurred because the specified device class is not defined.

System action: The command *command* is ended and server operation continues.

User response: Make sure the specified device class is defined.

ANR0779E *Command: Error encountered in accessing data storage - disk volume specified.*

Explanation: During command *command* processing, an error occurred because a specified volume is a disk volume rather than a tape volume.

System action: The command *command* is ended and server operation continues.

User response: Make sure that all volumes specified for the command *command* are tape volumes.

ANR0780E *Export/import command: Process aborted - a server communications session could not be established.*

Explanation: The server export/import process encounters an internal error in establishing an intermemory communications session with other server components.

System action: The export or import process ends and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory". If the error is not resolved, contact your service representative.

ANR0781E *Export/import command: Process aborted - server sign on failed.*

Explanation: The server export/import process encounters an internal error in establishing an intermemory communications session with other server components.

System action: The export or import process ends and server operation continues.

User response: Contact your service representative.

ANR0782E *Export/import command: Process aborted - a server data storage session could not be established (rc return code).*

Explanation: The server export/import process encounters an internal error in establishing a session with the data storage services.

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0783E *Export/import command: Process aborted - a server data storage Export/Import stream could not be established (rc return code).*

Explanation: The server export/import process encounters an internal error in establishing a session with the data storage services.

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0784E *Export/import command: Process aborted - internal error detected with the Export/Import level: level number.*

Explanation: The server export/import process encounters an internal error in evaluating the export/import level (SERVER, NODE, ADMIN, POLICY).

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0785E *Import command: Invalid record type xrecord type read from export data.*

Explanation: The server export/import process encounters an internal error in reading data from the export media. An invalid record type of *record type* is encountered during the read operation.

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0786E *Import command: Invalid export version version number in exported data.*

Explanation: The server import process encounters an internal error in reading data from the export media. An invalid export version number (*version number*) is encountered during the read operation.

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0787E *Import command: Import of file space filespace name in node node name aborted by server (abort reason).*

Explanation: The server import process encounters an internal error in importing file space *filespace name* for client node *node name*. The reason code *abort reason* is encountered.

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0788E *Import command: Error error code during import of data storage data.*

Explanation: The server import process encounters an internal data storage error. The error code *error code* is encountered.

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0789E *Import command: Failure in normalizing transaction identifier for sending to the server.*

Explanation: The server import process encounters an internal database transaction error in importing information into the server database.

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0790E *Import command: Error in absorbing data records.*

Explanation: The server import process encounters an internal error in importing information into the server database.

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0791E *Export/import command: Protocol error - verb "verb type" with length verb length received, expected "expected type".*

Explanation: The server export or import process encounters an internal protocol error in exporting information from or importing information into the server database. The verb *verb type* is encountered with a length of *verb length* when a verb type of *expected type* was expected.

System action: The export or import process ends and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0792E *Import command: Invalid copy type encountered in an imported file space authorization rule for node node name, file space filespace name - a type of BACKUP will be assumed.*

Explanation: During import processing for command *import command*, an invalid copy type is encountered for an authorization rule that grants access for file space *filespace name* on node *node name*. Authorization rules typically specify copy types of backup or archive, depending on whether backup file access or archive file access is granted by the file space owner to other users. Because the imported information for the rule is ambiguous, the server assumes that the rule is for backup data.

System action: The import process continues.

User response: The user for node *node name* should query the access rules for the specified node name after the import process has completed, and correct or delete any access rules that are in error or not needed.

ANR0793E *Export/import command: Preview processing terminated abnormally - error accessing data storage.*

Explanation: The server encountered an internal error in accessing data storage while executing an import or export preview operation.

System action: The export or import operation is ended and server operation continues.

User response: Use the QUERY ACTLOG command to examine messages prior to this error to determine the cause of the data storage failure. If you find and resolve the error, retry the export or import operation. If you cannot find the error, contact your service representative for assistance in resolving the problem.

ANR0794E *Export/import command: Processing terminated abnormally - error accessing data storage.*

Explanation: The server encountered an internal error in accessing data storage while executing an import or export operation.

System action: The export or import operation is ended and server operation continues.

User response: Use the QUERY ACTLOG command to examine messages prior to this error to determine the cause of the data storage failure. If the import or export operation involves a session with another server, run the QUERY ACTLOG command to examine messages on the other server as well. Messages on the other server can help you troubleshoot the error on the local server. If you find and resolve the error, retry the export or import operation. If you cannot find the error, contact your service representative for assistance in resolving the problem.

ANR0795E *Command: Error encountered in accessing data storage - invalid volume name specified.*

Explanation: The server encounters an error in accessing data storage while processing command *command*. The error occurred because an attempt has been made to access a volume with an invalid name.

System action: The command *command* operation is ended and server operation continues.

User response: Issue the command with a valid volume name.

ANR0796E *Command: Error encountered in accessing data storage - insufficient number of mount points available for removable media.*

Explanation: During command *command* processing, the server cannot allocate sufficient mount points.

System action: The command *command* operation is ended and server operation continues.

User response: If necessary, make more mount points available.

ANR0797E *Command: Error encountered in accessing data storage - required volume was not mounted.*

Explanation: During command *command* processing, a required volume cannot be mounted. The mount request may have been canceled.

System action: The command *command* operation is ended and server operation continues.

User response: Issue the command again and make

sure the necessary volumes are accessible.

ANR0798E *Import command: Error encountered in accessing data storage - volume cannot be used.*

Explanation: During import processing, a volume has been mounted but cannot be used.

System action: The import operation is ended and server operation continues.

User response: Query the activity log for messages preceding this one that give additional information. Make sure a usable volume is specified and mounted.

ANR0799E *Command: Error encountered in accessing data storage - volume already in use.*

Explanation: During command *command* processing, a volume cannot be used because it is already defined in a storage pool, or has been previously used by an export, database dump, or database backup operation (as recorded in the volume history) or is in use by another process.

System action: The command *command* operation is ended and server operation continues.

User response: Specify a volume that is not in use or defined in a storage pool, and that has not been previously used for an export, database dump, or database backup operation as recorded in the server volume history information. Use the QUERY VOLUME command to display the names of volumes that are defined to server storage pools. Use the QUERY VOLHISTORY command to display the names of volumes that have been used for export, database dump, or database backup operations.

ANR0800I *Command command for node node name started as process process ID.*

Explanation: A file space deletion process has started to delete one or more file spaces for the specified node. The process is assigned the ID specified in the message.

System action: The server starts a background process to perform the operation in response to the DELETE FILESPACE command entered by an administrator.

User response: To obtain status on the file space deletion process, issue the QUERY PROCESS command. The process may be canceled with the CANCEL PROCESS command.

ANR0801I **DELETE FILESPACE** *filesystem name for node node name started as process process ID.*

Explanation: The specified client node has started a file space deletion process (on the server) to delete one

or more file spaces. The process has been assigned the ID specified in the message.

System action: The server starts a background process to perform the operation in response to a request from the client node.

User response: To obtain status on the file space deletion process, issue the QUERY PROCESS command. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR0802I **DELETE FILESPACE** *filespace name*
(**backup/archive data**) **for node** *node name*
started.

Explanation: A background server process has started (on the server) to delete the specified file space belonging to the node indicated. If a file space name is not included in the message, all file spaces belonging to the node are deleted.

System action: The background process deletes backup and archive objects for the specified file space while server operation continues.

User response: To obtain status on the file space deletion process, issue the QUERY PROCESS command. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR0803I **DELETE FILESPACE** *filespace name*
(**backup data**) **for node** *node name*
started.

Explanation: A background server process has started (on the server) to delete backup objects in the specified file space belonging to the node indicated. If a file space name is not included in the message, then the backup objects for all file spaces that belong to the node are deleted.

System action: The background process deletes backup objects for the specified file space while server operation continues.

User response: To obtain status on the file space deletion process, issue the QUERY PROCESS command. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR0804I **DELETE FILESPACE** *filespace name*
(**archive data**) **for node** *node name* **started.**

Explanation: A background server process has started (on the server) to delete archive objects in the specified file space belonging to the node indicated. If a file space name is not included in the message, then the archive objects for all file spaces that belong to the node are deleted.

System action: The background process deletes archive objects for the specified file space while server operation continues.

User response: To obtain status on the file space deletion process, issue the QUERY PROCESS command. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR0805I **DELETE FILESPACE** *filespace name*
canceled for node *node name*: *number of*
objects **objects deleted.**

Explanation: A background server process that has been deleting file space data for the indicated node is canceled by the CANCEL PROCESS command. The number of objects deleted before the cancel ended the operation are reported in the message.

System action: The server process is ended and server operation continues.

User response: No action is required. An authorized administrator can issue the DELETE FILESPACE command to delete remaining objects in the file space.

ANR0806I **DELETE FILESPACE** *filespace name*
complete for node *node name*: *number of*
objects **objects deleted.**

Explanation: A server process deleting file space data for the node specified has completed. The total number of objects deleted is reported in the message.

System action: The server process is ended and server operation continues.

User response: None.

ANR0811I **Inventory client file expiration started as**
process *process ID*.

Explanation: The server has started roll-off processing to remove expired client backup and archive file copies, based on the management class policy that is bound to the files. The copy group retention and version parameters for each file's copy group are used by the server to determine if copies are to be deleted from the server. The expiration process was started as process number *process ID*, and may be queried or canceled with the QUERY PROCESS or CANCEL PROCESS commands, respectively.

System action: The expiration process is now cancellable. Server operation continues.

User response: None.

ANR0812I **Inventory file expiration process** *process*
ID **completed: processed** *number of nodes*
nodes, examined *number of objects*
objects, deleting *number of backup objects*
backup objects, number of archive objects
archive objects, number of DB backup
volumes **DB backup volumes, and number**
of recovery plan files **recovery plan files.**
retry count **objects were retried and error**

count errors were encountered.

Explanation: Server roll-off processing has completed. The number of client objects examined and deleted, based on management class policy, are displayed in the message. A total error count is also displayed. The number of DB backup volumes deleted is based on the value specified on the SET DRMDBBACKUPEXPIREDDAYS. The number of recovery plan files deleted is based on the value specified on the SET DRMRPFEXPIREDDAYS. Server roll-off processing deletes the DB backup volumes and recovery plan files only if DRM is licensed on the server and the volumes or plan files are created on the server to server virtual volumes.

System action: The roll-off process is ended and server operation continues.

User response: If the error count is not equal to 0, examine messages that may have been issued in the activity log to determine the cause for the errors.

ANR0813I **Inventory file expiration process** *process ID canceled prior to completion:* **processed** *number of nodes* **nodes**, **examined** *number of objects* **objects**, **deleting** *number of backup objects* **backup objects**, *number of archive objects* **archive objects**, *number of DB backup volumes* **DB backup volumes**, and *number of recovery plan files* **recovery plan files**. *retry count* **objects were retried and error count errors were encountered.**

Explanation: The inventory file expiration process was canceled by an administrator. The number of objects examined and deleted prior to the cancelation are reported. A total error count is also displayed.

System action: The server ends the file expiration process.

User response: None.

ANR0814I **Expiration retry** *retry number of maximum retries in number of seconds* **seconds.**

Explanation: Server roll-off processing has encountered an error in attempting to remove expired client file copies from the server database. The operation will be tried again in the number of seconds indicated.

System action: The server waits for the number of seconds indicated and retries the file expiration operation.

User response: Expiration retry processing occurs when the server database is full, the log is full, or sufficient server memory is not available to continue processing. Use the QUERY ACTLOG command to look for messages issued prior to this one that indicate the type of error encountered. If the server is out of

database space, issue the DEFINE DBVOLUME and EXTEND DB commands to add volumes to the server database and extend the database size. If the server is out of log space, issue the DEFINE LOGVOLUME and EXTEND LOG commands to add volumes to the server log and extend the log size. If the server is low on memory, allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0815I **Expiration retry in progress.**

Explanation: The server is retrying an operation during client file roll-off processing. Expiration retry processing occurs when the server database is full, the log is full, or sufficient server memory is not available to continue processing.

System action: The roll-off operation is retried.

User response: Use the QUERY ACTLOG command to look for messages issued prior to this one that indicate the type of error encountered. If the server is out of database space, issue the DEFINE DBVOLUME and EXTEND DB commands to add volumes to the server database and extend the database size. If the server is out of log space, issue the DEFINE LOGVOLUME and EXTEND LOG commands to add volumes to the server log and extend the log size. If the server is low on memory, allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0816I **Expiration retry was successful.**

Explanation: In accordance with management class policy, server roll-off processing has been successful in retrying a client file expiration.

System action: Server roll-off processing continues.

User response: None.

ANR0818I **Waiting to retry expiration because of insufficient resources.**

Explanation: The server inventory expiration process is waiting to retry expiration processing that failed because of insufficient memory, database, or log resources on the server.

System action: Server operation continues. The expiration processing is reattempted automatically.

User response: Use the QUERY ACTLOG command to examine messages issued prior to this one, which indicated the resource that is not available to the expiration process. Correct the shortage.

ANR0819I Cancel in progress

Explanation: This message is displayed in response to a QUERY PROCESS command, and indicates that an inventory expiration process has been canceled. The process will end shortly.

System action: The expiration process terminates and server operation continues.

User response: None.

ANR0820I Sorting information for *number* objects has been deleted.

Explanation: A background server process has deleted sorting information for *number* files from the server database. This process is started during initialization to remove any sorting information which is left over from previous export operations.

System action: The actual backup or archive objects were not deleted, but only information used to sort these objects during the previous export operation.

User response: None.

ANR0821E Filespace identifier *fsId* is not valid.

Explanation: The identifier assigned for a filespace is out of range.

System action: The file space is not added.

User response: Contact your service representative.

ANR0822I *command: Filespace filespace name (fsId=filespace id) successfully renamed to new filespace name for node node name.*

Explanation: The file space specified was renamed to the new name specified for the node. This message is displayed in response to successful completion of the RENAME FILESPACE command.

System action: The system renames the file space for the node as indicated

User response: None.

ANR0823E *command: Filespace filespace name cannot be renamed to new filespace name, a filespace with this name already exists for node node name.*

Explanation: The file space name specified as a target name for the command was found to already exist for the node specified. The command fails.

System action: Server operation continues, the command fails.

User response: Reissue the command with a different target filespace name

ANR0824I Delete Filespace *filespace name* (space-managed data) for node *node name* started.

Explanation: A background server process has started (on the server) to delete space-managed objects in the specified file space belonging to the node indicated. If a file space name is not included in the message, then the space-managed objects for all file spaces that belong to the node are deleted.

System action: The background process deletes space-managed objects for the specified file space while server operation continues.

User response: To obtain status on the file space deletion process, issue the QUERY PROCESS command. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR0826I DELETE FILESPACE *filespace name* for node *node name* encountered a transaction failure.

Explanation: A background server process that has been deleting file space data for the indicated node encountered a transaction failure.

System action: The server process is retried if the maximum number of retry attempts have not been exceeded.

User response: Transaction failure usually indicates that a database deadlock was detected during file space deletion. These deadlock conditions are sometimes encountered when multiple file space deletion processes are running at the same time. No action is required unless the DELETE FILESPACE terminates without completing the deletion process (see message ANR0828).

ANR0827I DELETE FILESPACE *filespace name* will be retried for node *node name*.

Explanation: A file space deletion process for the node indicated is being retried because an error was encountered.

System action: The server process is retried.

User response: None.

ANR0828W DELETE FILESPACE *filespace name* for node *node name* terminated before completion due to transaction failure: *number of objects* objects deleted.

Explanation: A background server process that has been deleting file space data for the indicated node is terminated prematurely because of transaction failure. The number of objects deleted before the operation ended are reported in the message.

System action: The server process is ended and server operation continues.

User response: Termination of this process because of transaction failure usually indicates that a database deadlock was detected during file space deletion. These deadlock conditions are sometimes encountered when multiple file space deletion processes are running at the same time. The command should be started again when fewer file space deletion processes are active. An authorized administrator can issue the DELETE FILESPACE command to delete remaining files in the file space(s).

ANR0829E *Command: Invalid combination of TYPE and DATA parameters.*

Explanation: The specified command has been issued with an invalid combination of the TYPE and DATA parameters. DATA=IMAGES can only be specified if TYPE=ANY or TYPE=BACKUP.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid combination of parameters.

ANR0830W *Management class *class name* in domain *domain name* used by node *node name* in file space *filespace name* is no longer active, or no longer has a BACKUP copy group: DEFAULT management class attributes will be used for expiration.*

Explanation: During policy roll-off processing, the server has found a client file copy whose management class or backup copy group no longer exists.

System action: The server obtains the DEFAULT management class for the specified domain and uses its backup copy group version and retention parameters to determine if file copies need to be expired.

User response: No action is required. A policy administrator with authority over the specified domain may use the DEFINE COPYGROUP, DEFINE MGMTCLASS, and ACTIVATE POLICY commands to define and activate a policy set that contains definitions for the missing management class or copy group.

ANR0831W *The DEFAULT management class *class name* in domain *domain name* does not have a BACKUP copy group: GRACE PERIOD will be used for expiration.*

Explanation: During policy roll-off processing, the server found a client file copy whose management class or backup copy group no longer exists. The DEFAULT management class for the indicated policy domain does not contain a backup copy group; therefore, the server uses the GRACE PERIOD retention value defined for the specified policy domain to determine if client file

copies need to be expired and removed from the server database.

System action: The server obtains the GRACE PERIOD retention values for the specified domain and then determines if backup file copies need to be expired.

User response: No action is required. A policy administrator with authority over the specified domain may use the DEFINE COPYGROUP, DEFINE MGMTCLASS, and ACTIVATE POLICY commands to define and activate a policy set that contains definitions for the missing management class or backup copy group.

ANR0832W *Management class *class name* in domain *domain name* used by node *node name* in file space *filespace name* is no longer active, or no longer has an ARCHIVE copy group: DEFAULT management class attributes will be used for expiration.*

Explanation: During policy roll-off processing, the server found a client file copy whose management class or archive copy group no longer exists.

System action: The server obtains the DEFAULT management class for the specified domain and uses its archive copy group retention parameter to determine if file copies need to be expired.

User response: No action is required. A policy administrator with authority over the specified domain may use the DEFINE COPYGROUP, DEFINE MGMTCLASS, and ACTIVATE POLICY commands to define and activate a policy set that contains definitions for the missing management class or copy group.

ANR0833W *The DEFAULT management class *class name* in domain *domain name* does not have an ARCHIVE copy group: GRACE PERIOD will be used for expiration.*

Explanation: During policy roll-off processing, the server found a client file copy whose management class or archive copy group no longer exists. The DEFAULT management class for the indicated policy domain does not contain an archive copy group; therefore, the server uses the GRACE PERIOD retention value defined for the specified policy domain to determine if client file copies need to be expired and removed from the server database.

System action: The server obtains the GRACE PERIOD retention values for the specified domain and then determines if archive file copies need to be expired.

User response: No action is required. A policy administrator with authority over the specified domain may use the DEFINE COPYGROUP, DEFINE MGMTCLASS, and ACTIVATE POLICYSET commands

to define and activate a policy set that contains definitions for the missing management class or backup copy group.

ANR0834W Inventory client file expiration cannot start because of insufficient memory - will retry in *number of seconds* seconds.

Explanation: The server inventory expiration process is pausing to retry an operation that failed because sufficient memory is not available on the server.

System action: Server operation continues; the expiration process will be retried after the stated delay.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see “Appendix A. Allocating Additional Server Memory”.

ANR0835W Management class *class name* in domain *domain name* is no longer active, or no longer has a BACKUP copy group, or no longer has an ARCHIVE copy group. DEFAULT management class used to delete *number of backup files* backup files and *number of archive files* archive files. Retention grace period used to delete *number of backup files* backup files and *number of archive files* archive files.

Explanation: During policy roll-off processing, the server found a management class or backup copy group or archive copy group that no longer exists. When a management class or backup copy group no longer exists, the number of backup client file copies that have been deleted using the default management class or the retention grace period is displayed in the message. When a management class or archive copy group no longer exists, the number of archive client files that have been deleted using the default management class or the retention grace period is displayed in the message.

System action: The server obtains the DEFAULT management class for the specified domain and uses its backup copy group or archive copy group version and retention parameters to determine if file copies need to be expired. If, however, the needed backup copy group or archive copy group does not exist in the DEFAULT management class, the server will use the retention grace period for the domain.

User response: No action is required. This message is only issued when expiration processing has been started with the QUIET option to suppress detailed messages. Expiration processing can be started without the QUIET option to see the detailed messages which will indicate specific node and filesystems and will further distinguish between backup and archive copy groups. A policy administrator with authority over the specified domain may use the DEFINE COPYGROUP, DEFINE MGMTCLASS, and ACTIVATE POLICY

commands to define and activate a policy set that contains definitions for the missing management class or copy group.

ANR0836W No query restore processing session *session id* for node *node name* and filesystem *name* failed to retrieve file *high-level file name* *low-level file name* - file being skipped.

Explanation: The no query restore processing for the session listed relating to the specified node name and filesystem failed to retrieve the specified file. An error occurred while retrieving this file so it will be skipped.

System action: The no query restore operation continues.

User response: Determine the cause of the file retrieve failure and correct it. After this situation is correct, the client can do a restore of the specific file that was skipped.

ANR0837I Inventory file expiration process *process ID* was terminated after exceeding the duration limit of *duration* minutes: processed *number of nodes* nodes, examined *number of objects* objects, deleting *number of backup objects* backup objects, *number of archive objects* archive objects, *number of DB backup volumes* DB backup volumes, and *number of recovery plan files* recovery plan files. *retry count* objects were retried and *error count* errors were encountered.

Explanation: An administrator or schedule issued the command EXPIRE INVENTORY ... DURATION=*xxx*, where *xxx* is the number of minutes for the expire inventory process to run. That *xxx* number of minutes has been reached, so the expire inventory process ends.

System action: The expire inventory process ends.

User response: None.

ANR0838I Pass *pass* of group table conversion processing beginning.

Explanation: The contents of the group information tables needs to be updated before the server can fully initialize. This is an informational message indicating that processing has begun for a particular pass of the conversion.

System action: Server processing continues.

User response: None.

ANR0839I Pass *pass* of group table conversion processing complete.

Explanation: The contents of the group information tables have been successfully converted for the specified pass.

System action: If all passes of the conversion are complete, server processing continues. If not, additional passes will be performed.

User response: None.

ANR0840I Converting group table information for node *node*.

Explanation: The group table information for the displayed node is being converted.

System action: Server processing continues

User response: None.

ANR0844E Command: *node name* is not a backup-archive node.

Explanation: The specified node name is not a backup-archive node.

System action: Processing fails for the command. Server operation continues.

User response: Reissue the command with a valid node name.

ANR0847I CLEANUP BACKUPGROUPS evaluated *number of groups groups*, and deleted *groups deleted orphan groups with members deleted members deleted*.

Explanation: The CLEANUP BACKUPGROUPS has finished processing, and has deleted the specified number of orphan groups and members.

System action: Processing continues.

User response: None.

ANR0848W Expiration failed to delete *file type file file name* for node *node name* and *filesystem filesystem name* - file will be skipped.

Explanation: The expiration process was unable to delete the indicated file. The file will be skipped by expiration.

System action: The expiration process continues.

User response: Try expiration again to determine if the cause of the deletion failure was an intermittent problem or if it is a permanent problem. If after a subsequent expiration attempt the file still is not deleted, contact your service representative.

ANR0849E Command: **Not permitted for node** *Node Name* - node of type SERVER.

Explanation: The indicated DELETE FILESPACE process is not started because the node specified is of NODETYPE=SERVER. A DELETE FILESPACE may only be processed for nodes of this type with the TYPE=SERVER parameter specified.

System action: The DELETE FILESPACE command is ended and server processing continues.

User response: If this file space must be deleted, Reissue the command with the TYPE parameter set to TYPE=SERVER. Please use caution when using the TYPE=SERVER parameter as this can impact the availability of data for the server that owns these files.

ANR0850E Command: **Cannot Start** *process name* Process.

Explanation: The indicated DELETE FILESPACE process cannot be started on the server.

System action: The DELETE FILESPACE command is ended and server processing continues.

User response: This usually indicates that sufficient server memory is not available on the server. Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0851E Cannot start delete file space thread for node *node name*.

Explanation: The indicated DELETE FILESPACE process cannot be started on the server. Sufficient memory on the server may not be available.

System action: The DELETE FILESPACE command is ended and server processing continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0852E Command: **No matching file spaces found for node** *node name*.

Explanation: The server did not find any file spaces for the node indicated matching the names specified in the command.

System action: The server ends the command.

User response: Enter the command with file space names that refer to defined file spaces for the specified node. Note that file space names are case sensitive. Enter them by using exactly the same uppercase and lowercase characters that match the file space name defined on the server. Use the QUERY FILESPACE

command to determine which file spaces are defined for a node on the server.

ANR0853E Transaction failed in file space deletion, DELETE FILESPACE process aborted.

Explanation: A database transaction fails while the server is deleting file space data.

System action: The server ends the file space deletion process.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0854E Inventory file space query failure, DELETE FILESPACE process aborted.

Explanation: The server encounters an error in querying the inventory database during a file space deletion process.

System action: The server ends the file space deletion process.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0855E Server LOG space exhausted, DELETE FILESPACE process aborted.

Explanation: Insufficient server log space has been encountered during file space deletion processing.

System action: The server ends the file space deletion process.

User response: To increase the amount of log space available to the server, an authorized administrator can add log volumes by using the DEFINE LOGVOLUME command, and can extend the size of the log by using the EXTEND LOG command.

ANR0856E Server database space exhausted, DELETE FILESPACE process aborted.

Explanation: Insufficient server database space has been encountered during file space deletion processing.

System action: The server ends the file space deletion process.

User response: To increase the amount of database space available to the server, an authorized administrator can add log volumes using the DEFINE DBVOLUME command and can extend the size of the

database using the EXTEND DB command.

ANR0857E Data storage session failure, DELETE FILESPACE process aborted.

Explanation: The server encounters an error accessing data storage during file space deletion processing.

System action: The server ends the file space deletion process.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0858E Inventory object search failure, DELETE FILESPACE process aborted.

Explanation: The server encounters an error accessing the inventory database during file space deletion processing.

System action: The server ends the file space deletion process.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0859E Data storage object erasure failure, DELETE FILESPACE process aborted.

Explanation: The server encounters an error in removing file copies from data storage during file space deletion processing.

System action: The server ends the file space deletion process.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0860E Expiration process *process ID* terminated due to internal error: examined *number of objects* objects, deleting *number of backup objects* backup objects, *number of archive objects* archive objects, *number of DB backup volumes* DB backup volumes, and *number of recovery plan files* recovery plan files. *retry count* objects were retried and *error count* errors were encountered.

Explanation: The server encounters an internal error

during file expiration processing. The number of files examined and deleted prior to the error are reported. A total error count is also displayed.

System action: The server ends the expiration process.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0861E Transaction failed in expiration, inventory expiration aborted.

Explanation: The server encounters a database transaction failure during policy roll-off processing.

System action: The server ends roll-off processing.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0862E Expiration processing suspended - insufficient memory.

Explanation: The server ends policy roll-off processing because sufficient server memory is not available.

System action: The server ends policy roll-off processing and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0863E Expiration processing suspended - insufficient DB space.

Explanation: The server ends policy roll-off processing because sufficient server database space is not available.

System action: The server ends policy roll-off processing and server operation continues.

User response: To increase the amount of database space available to the server, an authorized administrator can add database volumes by using the DEFINE DBVOLUME command and can extend the size of the database using the EXTEND DB command.

ANR0864E Expiration processing suspended - insufficient LOG space.

Explanation: The server ends policy roll-off processing because sufficient server log space is not available.

System action: The server ends policy roll-off

processing and server operation continues.

User response: To increase the amount of log space available to the server, an authorized administrator can add log volumes by using the DEFINE LOGVOLUME command and can extend the size of the log by using the EXTEND LOG command.

ANR0865E Expiration processing failed - internal server error.

Explanation: Server retry processing during policy roll-off fails.

System action: The server ends policy roll-off processing.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the server is out of database space, issue the DEFINE DBVOLUME and EXTEND DB commands to add volumes to the server database and extend the database size. If the server is out of log space, issue the DEFINE LOGVOLUME and EXTEND LOG commands to add volumes to the server log and extend the log size. If the server is low on memory, allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory". If the error cannot be isolated and resolved, contact your service representative.

ANR0866E Expiration processing retries failed - no success after *maximum retries* retries.

Explanation: Server policy roll-off processing ends because retry processing has not been successful in expiring client file copies from the server database.

System action: The server ends policy roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the server is out of database space, issue the DEFINE DBVOLUME and EXTEND DB commands to add volumes to the server database and extend the database size. If the server is out of log space, issue the DEFINE LOGVOLUME and EXTEND LOG commands to add volumes to the server log and extend the log size. If the server is low on memory, allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory". If the error cannot be isolated and resolved, contact your service representative.

ANR0867E Unable to open policy domain for node *node name* during server operation.

Explanation: Policy roll-off processing on the server encounters an error while obtaining policy information related to the specified node.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0868E Cannot find management class name for ID *management class ID*.

Explanation: Policy roll-off processing on the server encounters an error while obtaining policy information.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0869E Cannot find policy domain for node *node ID*.

Explanation: Policy roll-off processing on the server encounters an error while obtaining policy information related to the specified node.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0870E Cannot find node name for node *node ID*.

Explanation: Policy roll-off processing on the server encounters a database error in obtaining information for a client node.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot

be isolated and resolved, contact your service representative.

ANR0871E Cannot find file space name for node *node ID*, file space *file space ID*.

Explanation: Policy roll-off processing on the server encounters a database error in obtaining information for a client node.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0872E Grace Period retention for domain *domain name* could not be obtained.

Explanation: Policy roll-off processing on the server encounters a database error in obtaining GRACE PERIOD values for the specified policy domain.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0873E Invalid copy type encountered in expiring files: *copytype ID*

Explanation: Policy roll-off processing on the server encounters a database error in obtaining copy group information.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0874E Backup object *object.ID* not found during inventory processing.

Explanation: Inventory processing on the server encounters a database error in obtaining backup information in data storage.

System action: The server ends roll-off processing, or client session(s) and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0875E Archive object *object.ID* not found during expiration processing.

Explanation: Policy roll-off processing on the server encounters a database error in obtaining archive information in data storage.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0876E Data storage erasure failed during expiration processing.

Explanation: Policy roll-off processing on the server encounters a database error while deleting information from data storage.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0877E Copy type not backup for object *object.ID*.

Explanation: Policy roll-off processing on the server encounters a database error in accessing inventory information.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0878E Entry for backup object *object.ID* not found.

Explanation: Policy roll-off processing on the server

encounters a database error in accessing inventory information.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0879E Error opening inventory file space query.

Explanation: Policy roll-off processing on the server encounters a database error in accessing inventory information.

System action: The server ends roll-off processing and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR0880E *Filespace command:* No matching file spaces.

Explanation: The server did not find any file space names matching the specifications entered in the *filespace command*.

System action: Server operation continues.

User response: Use the QUERY FILESPACE command to determine which file spaces are defined on the server. Note, that file space names are case sensitive. Reissue the file space command and specify the proper file space name (in proper case).

ANR0881E Policy Error : the GRACE PERIOD archive retention value could not be obtained for domain *domain ID* during client inventory processing.

Explanation: The server encounters an internal error in accessing policy information.

System action: The operation is ended and server operation continues.

User response: Contact your service representative.

ANR0882E Policy Error: Unable to open policy domain for node *node name* during client inventory query processing.

Explanation: The server encounters an internal error in accessing policy information.

System action: The client operation is ended and server operation continues.

User response: Contact your service representative.

ANR0883E Cannot obtain node name for node *node ID*.

Explanation: The server encounters an internal error in accessing client node information.

System action: The operation is ended and server operation continues.

User response: Contact your service representative.

ANR0884E Error code during deletion of sorting information for *number* objects.

Explanation: A background server process encountered an internal error after deleting sorting information for *number* files from the server database. This process is started during initialization to remove any sorting information which is left over from previous export operations.

System action: The backup or archive objects were not deleted. Only the information used to sort these objects during the previous export operation was deleted. The background process was terminated before all sorting information had been deleted. The system will not perform further export processing of file data until this problem has been resolved.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. Then restart the server. If the error cannot be isolated and resolved, contact your service representative.

ANR0885I Import command: Processing management class *management class name* for domain *domain name* and policy set *policy set name* as management class *new management class name*.

Explanation: The background import process to service the command *import command* is currently processing the policy information for management class *management class name* in domain *domain name* and policy set *policy set name*. The management class is imported under the name *new management class name*. During import processing, management classes defined as either DEFAULT or GRACE_PERIOD must be renamed so that the management class does not conflict with existing server policy conventions. Import processing is then able to import file data by using the renamed management class.

System action: Import processing for the command continues.

User response: None. However, an administrator may

want to examine the policy definitions for *new management class name* so they are aware of the management classes that may be used if the policy set containing this management class is activated.

ANR0886E Management class *class name* in domain *domain name* used by node *node name* in file space *filesystem name* has no BACKUP copy group with id *copy group id*; Expiration will not be performed for files from this node and filesystem that are bound to this management class and copy group id.

Explanation: During policy roll-off processing, the server finds a client file copy with a management class or a backup copy group that no longer exists.

System action: The server skips the files in error.

User response: For programming support, contact your service representative.

ANR0887E Management class *class name* in domain *domain name* used by node *node name* in file space *filesystem name* has no archive copy group with id *copy group id*. Server operation will not be performed for files from this node and filesystem that are bound to this management class and copy group id.

Explanation: During policy roll-off processing, the server finds a client file copy with a management class or an archive copy group that no longer exists.

System action: The server skips the specified files.

User response: For programming support, contact your service representative.

ANR0888E SQL commands cannot be issued from the server console.

Explanation: An SQL command was issued from the server console. SQL commands cannot be issued from the server console because they may require a long time complete and the server console should be available to control other server functions.

System action: The server ignores the command and continues processing.

User response: Issue the SQL command from an administrative client.

ANR0889E The server is not licensed for Central Administration functions. This includes the ability to issue SQL commands.

Explanation: An SQL command was issued but the server is not licensed to support Central Administrative functions, including SQL query support.

System action: The server ignores the command and continues processing.

User response: If you have purchased the Central Administration license, use the REGISTER LICENSE command to enable the license on the server. If you have not purchased the license and wish to do so, contact your service representative.

ANR0890I *Export/import command: Processing optionset optionset name.*

Explanation: The background export or import process to service the command *export/import command* is currently processing optionset definition information.

System action: Export or import processing for the command continues.

User response: None.

ANR0891I *Export/import command: Copied number optionset definitions.*

Explanation: The background export or import process to service the command *export/import command* copies *number* client optionset definitions from the server database to export media or from export media into the server database. Data is not moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR0892I *Export command: No matching option sets found for exporting.*

Explanation: The background export process does not find any client option sets for *export command*.

System action: The export process continues with no option sets from the server.

User response: None.

ANR0893I *Are you sure that you want to accept the current system date as valid ?*

Explanation: This message is displayed when the ACCEPT DATE command has been issued to confirm that you want to accept the date on the system as valid. Accepting an invalid date can cause any of the following problems: Premature deletion of data Excessive retention of data Scheduling problems Event record problems Password expiration problems.

System action: The command waits for you to confirm the action.

User response: Specify Yes if you want to accept the system date as valid, or No if you do not want to execute the command.

ANR0894I *Current system has been accepted as valid.*

Explanation: This message is displayed when the ACCEPT DATE command has been issued and the date has been accepted as valid by the server.

System action: The current system date is accepted as valid by the server. The server will begin processing using the current system date.

User response: Issue the ENABLE SESSIONS ALL command to allow client, server and administrative sessions to start.

ANR0895E *Command: Cannot Start process name Process.*

Explanation: The indicated process cannot be started on the server.

System action: The specified command is ended and server processing continues.

User response: This usually indicates that sufficient server memory is not available on the server. Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR0900I *Processing options file filespec.*

Explanation: At server initialization, the server is reading the server options file whose name is shown in the message.

System action: The server reads and processes the options in this file.

User response: None.

ANR0901W *Invalid option statement found in file filespec.*

Explanation: While processing the server options file named, the server has encountered an invalid statement. The invalid statement type is shown in the message. The lines following this message provide more information.

System action: The server ignores the statement in error. Server initialization continues. The default value is used for any missing or ignored options.

User response: Ignore the error, or use a text editor to correct the error and restart the server.

ANR0902W *Unsupported keyword found in file filespec.*

Explanation: While processing the server options file named, the server has encountered an invalid keyword on an option statement. The lines following this message provide more information.

System action: The server ignores the option statement in error. Server initialization continues. The default value is used for any missing or ignored options.

User response: Ignore the error, or use a text editor to correct the error and restart the server.

ANR0903W Excessive option statement found in file *filespec*.

Explanation: While processing the specified server options file, the server has encountered more of the named statement type than can be processed.

System action: The server ignores the extra statement. Server initialization continues.

User response: Ignore the error, or use a text editor to correct the error and restart the server.

ANR0904W Duplicate option statement found in file *filespec*.

Explanation: While processing the server options file named, the server has encountered a duplicate statement of the type shown.

System action: The server ignores the duplicate statement. Server initialization continues.

User response: Ignore the error, or use a text editor to correct the error and restart the server.

ANR0905W Options file *filespec* not found.

Explanation: At server initialization, the server is unable to locate the server options file named.

System action: The server uses the default values for all options. Server initialization continues.

User response: If the default values are acceptable, ignore the error. Otherwise, move a valid server options file to the proper location, rename a valid options file to the proper name, or use a text editor to build the proper server options file, and then restart the server.

ANR0909E Insufficient memory to process options file.

Explanation: At server initialization, the server is unable to process the server options file due to insufficient memory.

System action: Server initialization ends.

User response: Restart the server with more memory available. Refer to the *Administrator's Guide* for your particular platform.

ANR0910W Archive entries for *nodeName* are already converted.

Explanation: Archive entries for *nodeName* have already been converted to the description tables. They will not be converted again.

System action: Server operation continues.

User response: To force the reconversion of the archive entries for *nodeName*, use the FORCE=Yes option to the CONVERT ARCHIVE command.

ANR0911I Archive conversion processing for *node name* completed successfully. The description tables have *description count* descriptions, *directory count* directories, *file count* and files and *object set count* object sets.

Explanation: CONVERT ARCHIVE for the specified node completed successfully. The node can now query for archive objects specifying a non-wildcarded description.

System action: Processing continues.

User response: None.

ANR0912I Undo conversion processing for node *node name* completed successfully. The node is no longer converted.

Explanation: UNDO ARCHCONVERSION was issued for the specified node. The node will no longer use the archive description tables.

System action: Processing continues.

User response: None.

ANR0913E Archive conversion processing for node *node name* did not complete (*result*).

Explanation: Archive conversion for the indicated node did not complete because of the specified result.

System action: Archive conversion ends. Server processing continues.

User response: Check previous messages for error conditions.

ANR0914E *Diagnostic(ID): a request failed because object (object name), size (size), exceeds the maximum size of maximum size.*

Explanation: The size of the specified object exceeds the maximum size defined for that object. The server cannot handle the new object.

System action: The activity that generated this error fails.

User response: Determine why the new object's length

ANR0915E • ANR0925E

exceeds the maximum specified for the object. Reduce the length of the object.

ANR0915E Unable to open language *language name* for message formatting.

Explanation: The server is unable to open the specified message repository.

System action: Server initialization continues with the default message repository.

User response: Ensure that a valid language is specified in the LANGUAGE option of the server options file. If a change is made to the options file, restart the server to activate changes.

ANR0916I *Product Name* distributed by *Company* is now ready for use.

Explanation: The server has completed startup processing and is now ready for use.

System action: None.

User response: None.

ANR0917W Session *session number* for node *node name* (*client platform*) - in domain *domain name* failed because of policy length.

Explanation: The client cannot handle very long policies.

System action: The client operation is ended and server operation continues.

User response: Upgrade the client to the latest level, or activate a policy set with fewer management classes.

ANR0918E Inventory operation for node *node name* terminated - lock conflict.

Explanation: During the indicated operation, the server needs to obtain a lock that is not available.

System action: The indicated operation ends.

User response: Restart the operation.

ANR0919E Filespace name *fsName* with length *length* was encountered for nodes *node list*.

Explanation: The specified filesystem name was found for the nodes in the list. The name is not allowed. The error may occur while processing an administrative command or client request.

System action: Server processing continues.

User response: If the error occurs during processing for an administrative command such as EXPORT NODE or RENAME FILESPACE, rename the filesystem for the nodes in the list using a valid name. If found

while processing a client request, contact your service representative.

ANR0920I Tracing is now active to standard output.

Explanation: In response to a TRACE START command, server trace records are being written to the standard output destination (usually the server console).

System action: None.

User response: None.

ANR0921I Tracing is now active to file *file spec*.

Explanation: In response to a TRACE START command, server trace records are being written to the file named.

System action: None.

User response: None.

ANR0922I Trace ended.

Explanation: In response to a TRACE END command, server trace records are no longer being written.

System action: None.

User response: None.

ANR0923E Tracing is inactive.

Explanation: A TRACE END command has been entered, but tracing is not active.

System action: The command is ignored.

User response: If tracing is desired, use the TRACE ENABLE and TRACE START commands to activate server tracing.

ANR0924E Tracing is already active to file *file spec*.

Explanation: A TRACE BEGIN command has been entered, but tracing is already active to the file named.

System action: The command is ignored.

User response: If the current trace output file is acceptable, no action is required. Otherwise use the TRACE END command to stop tracing and then reissue the TRACE BEGIN command as desired.

ANR0925E Tracing is already active to standard output.

Explanation: A TRACE BEGIN command has been entered, but tracing is already active to the standard output destination (usually the server console).

System action: The command is ignored.

User response: If the current trace output destination is acceptable, no action is required. Otherwise use the TRACE END command to stop tracing and then reissue the TRACE BEGIN command as desired.

ANR0926E Missing or invalid TRACE command parameter.

Explanation: The TRACE command issued contains an invalid parameter, or is missing a required parameter.

System action: The command is ignored.

User response: Reissue the command with the proper parameters.

ANR0927E Unknown trace class keyword - class.

Explanation: A TRACE ENABLE command has been entered which specifies an unknown trace class.

System action: The command is ignored.

User response: Reissue the TRACE command with the correct class.

ANR0928E Unable to open trace file *file spec* for appending.

Explanation: A TRACE BEGIN command specifies an output file, but the server cannot write to that file.

System action: The command is ignored.

User response: Check the file for proper access permissions, or reissue the TRACE command specifying a different output file.

ANR0929E Insufficient memory to activate tracing.

Explanation: A TRACE BEGIN command has been entered, but the server has insufficient memory available to activate tracing.

System action: The command is ignored.

User response: If tracing is required, make more memory available to the server then restart the server.

ANR0936E Session *session ID* for *session name* failed sending verb *verb name* because client not able to handle extended qualifier attribute.

Explanation: A server was going to send the reported verb for the indicated session but was not able to send it. The verb could not be sent to the client because it contains extended information about the low-level qualifier. The extended low-level qualifier is used to store names up to 512 bytes in length. The client that this verb was supposed to be sent to does not support the extended low-level qualifier information.

System action: The send of the verb to the reported

session fails and this server operation will fail and report a communication error.

User response: The client session reported needs to have the installed client upgraded to TSM version 5.1.5 or higher in order to support the extended low-level qualifier.

ANR0937I Expiration process *process ID* is ending.

Explanation: The expiration process referenced is ending either because it has been cancelled or because it has completed the necessary actions. This message is only issued in the case where expiration was processing a long-running operation, such as deleting a group of related files (for example, a backup group). This message indicates the time when the long-running operation ended.

System action: None.

User response: None.

ANR0939E Error *error code* occurred while locating base object (*baseIdHi.baseIdLo*) for subfile (*subfileIdHi.subfileIdLo*): Node *node name*, File space *filespace name*, Type *file type*, File name *file name*.

Explanation: Export processing did not find the base object for the specified subfile. Export processing does not continue.

System action: Export processing stops. Server operation continues.

User response: Audit the database to correct the entries.

ANR0940I Cancel request accepted for process *process ID*.

Explanation: A CANCEL PROCESS command has been entered for the specified process. Some processes will experience a delay before they terminate. This delay may be lengthy for processes that involve remote data movement.

System action: None.

User response: None.

ANR0941I Command: Cancel for process *process ID* is already pending.

Explanation: A CANCEL PROCESS command has been entered for the specified process, but a cancel is already pending for that process.

System action: The server ignores the command.

User response: None.

ANR0942E *Command:* **Process process ID cannot be found.**

Explanation: A CANCEL PROCESS command has been entered for the specified process, but the process is not active. Either the process has already ended or the wrong process number has been entered.

System action: The server ignores the command.

User response: If the wrong process number has been entered, reissue the command with the correct process number.

ANR0943E *Command:* **Process process ID could not be canceled.**

Explanation: A CANCEL PROCESS command has been entered for the specified process, but the process specified is an automatic process, such as migration or reclamation, that cannot be canceled.

System action: The server ignores the command.

User response: None.

ANR0944E *Command:* **No active processes found.**

Explanation: A QUERY PROCESS command has been entered, and no processes are active.

System action: The server ignores the command.

User response: None.

ANR0945W *Diagnostic(ID):* **Transaction transaction ID was aborted for process process ID.**

Explanation: An error is detected during transaction commit for the specified process. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR0946E **Archive processing fails: Object objJdHi.objJdLo not found.**

Explanation: Archive processing fails because the specified object was not found. An archive request is completed in stages. The object may have been deleted by an archive delete request, delete filespace or expiration that began and completed between these stages.

System action: System processing continues.

User response: Check the client log for error and retry messages. Reissue the archive request if the retry failed.

ANR0947E **Error writing to trace file file spec.**

Explanation: An error occurred while writing to the specified trace file.

System action: Trace is disabled.

User response: Check the file for proper access permissions, or for the out of space issue for the trace file. Once this is corrected, reissue the TRACE BEGIN command, specifying either the same or a different output file.

ANR0952W **The filespace Filespace name cannot be included in the backup set because it contains encrypted data.**

Explanation: Data from the filespace cannot be included in the backup set because the filespace contains encrypted data.

System action: The filespace is skipped.

User response: None.

ANR0953W *Audit command:* **Redundant encryption keys for the archive object (object.ID) do not match.**

Explanation: The encryption key stored for the archive object in the Object.Ids table does not match the encryption key stored in the Archive.Objects table. The audit command is not able to determine which key is the correct key.

System action: The object's encryption keys are not modified.

User response: Contact your service representative.

ANR0954W *Audit command:* **Redundant encryption keys for the backup object (object.ID) do not match.**

Explanation: The encryption key stored for the backup object in the Object.Ids table does not match the encryption key stored in the Backup.Objects table. The audit command is not able to determine which key is the correct key.

System action: The object's encryption keys are not modified.

User response: Contact your service representative.

ANR0955I **DELETE FILESPACE filespace name for node node name failed deletion because of a restartable restore session.**

Explanation: The reported node and filespace have a restartable restore session active or restartable. A filespace cannot be deleted while the restartable restore session exists.

System action: The server process is retried if the

maximum number of retry attempts have not been exceeded.

User response: Use the QUERY RESTORE command to view active and restartable restores sessions for this filesystem. Either wait for the sessions to complete or cancel the sessions with the CANCEL RESTORE command, and reissue the DELETE FILESPACE command. To view restartable restore sessions issue the command QUERY RESTORE. Either:

- wait to reissue the DELETE FILESPACE command after this restartable restore has completed
- cancel the restartable restore session with the CANCEL RESTORE command

ANR0956I *Audit command: Active version for inactive inventory object (object.ID) does not exist. The expiring object entry must be corrected.*

Explanation: A database audit process found an expiring object entry for an inactive inventory object that indicates an active version of the object exists, but the active version does not exist. Because FIX=NO has been specified for the command, the expiring object entry is not corrected.

System action: Audit processing continues.

User response: None.

ANR0957I *Audit command: Active version for inactive inventory object (object.ID) does not exist. The expiring object entry will be corrected.*

Explanation: A database audit process found an expiring object entry for an inactive inventory object that indicates an active version of the object exists, but the active version does not exist. Because FIX=YES has been specified for the command, the expiring object entry will be corrected.

System action: Audit processing continues.

User response: None.

ANR0958I *CLEANUP BACKUPGROUPS evaluated objectcount group objects, found errorcount errors, and deleted deleted group objects with completion state state.*

Explanation: The CLEANUP BACKUPGROUPS utility ended with the presented state.

System action: Server operation continues.

User response: None.

ANR0959I *Conversion of grouping table is percent done percent complete.*

Explanation: An internal data base table is being converted, and the conversion process is the indicated amount complete.

System action: Server processing continues.

User response: None.

ANR0960I *Process process ID waiting for mount point in device class device class name.*

Explanation: The process whose ID is shown has begun to wait for a mount point that can be used for a volume in the device class shown.

System action: The process waits for the mount point.

User response: Respond to any mount requests.

ANR0961I *Process process ID waiting for multiple mount points in device class device class name.*

Explanation: The process whose ID is shown has begun to wait for multiple mount points that can be used for a volume in the device class shown.

System action: The process waits for the mount points.

User response: Respond to any mount requests.

ANR0962I *Process process ID waiting for mount points in device classes device class name and device class name.*

Explanation: The process whose ID is shown has begun to wait for mount points that can be used for a volume in the two device classes shown.

System action: The process waits for the mount points.

User response: Respond to any mount requests.

ANR0963I *Process process ID waiting for mount of input volume volume name.*

Explanation: The process whose ID is shown has begun to wait for the mount of the input volume shown.

System action: The process waits for the mount.

User response: Respond to any mount requests.

ANR0964I *Process process ID waiting for mount of output volume volume name.*

Explanation: The process whose ID is shown has begun to wait for the mount of the output volume shown.

System action: The process waits for the mount.

User response: Respond to any mount requests.

ANR0965I Process *process ID* waiting for mount of scratch volume.

Explanation: The process whose ID is shown has begun to wait for the mount of a scratch volume.

System action: The process waits for the mount.

User response: Respond to any mount requests.

ANR0966I Process *process ID* waiting for access to input volume *volume name*.

Explanation: The process whose ID is shown has begun to wait for availability of the input volume shown.

System action: The process waits for the volume to become available.

User response: None.

ANR0967I Process *process ID* waiting for access to output volume *volume name*.

Explanation: The process whose ID is shown has begun to wait for availability of the output volume shown.

System action: The process waits for the volume to become available.

User response: None.

ANR0969E The server database must be formatted and loaded or restored before the server can be started.

Explanation: The server has been restarted after toleration of a zero bit mismatch error. In order to start the server, you must recover the database with a process that includes a DSMSERV FORMAT. Perform one of the following procedures. Either do these steps:

1. Format the volumes using DSMSERV FORMAT
2. Restore the database using DSMSERV RESTORE DB

Or do these steps:

1. Unload the database using DSMSERV UNLOADDB
2. Format the volumes using DSMSERV FORMAT
3. Load the database using DSMSERV LOADDDDB

Note: Do not use DSMSERV DUMPDB on the database for this recovery.

System action: Server initialization stops.

User response: Perform one of the database recovery actions.

ANR0980E The server database must be audited with FIX=YES before the server can be started.

Explanation: The server has been restarted after a DSMSERV LOADDB command processed a database image that was known to have inconsistencies. In order to bring the database back to a consistent state, you must run the AUDITDB command.

System action: Server initialization stops.

User response: Issue the DSMSERV AUDITDB FIX=YES command. For complete details on this command, refer to the *Administrator's Reference*.

ANR0981E The server database must be restored before the server can be started.

Explanation: This message is issued in one of two cases: 1) The server has been restarted after an incomplete RESTORE DB. In order to start the server, you must restore the database to a consistent state using the DSMSERV RESTORE DB command; 2) During server operation, an error condition occurred such that the TSM server cannot continue. This message is issued, and the server halts. Before you can start the server again, you need to use the DSMSERV RESTORE DB command to restore the database.

System action: Server initialization stops, or the server stops.

User response: If there are other messages issued with this error message which have instructions associated with them, follow the instructions in those messages. Then issue the DSMSERV RESTORE DB command. For complete details on this command, refer to the *Administrator's Reference*. After the DSMSERV RESTORE DB command completes successfully, restart the TSM server.

ANR0982E The server database must be initialized before the database can be loaded.

Explanation: The server database must be initialized before it can be loaded with the LOADDB parameter, by issuing the DSMSERV LOADFORMAT command. The server database is not currently in the initialized state.

System action: Server LOADDB processing stops.

User response: Issue the DSMSERV LOADFORMAT command. For complete details on this command, refer to the *Administrator's Reference*.

ANR0983W The server database was recorded by a down-level version of the server program. The UPGRADEDDB parameter is required to start the server and automatically upgrade the database contents to the current server version. Please refer to installation instructions for precautionary backup procedures prior to doing this.

Explanation: At server startup, the server has discovered that the database information was written by an earlier version of the server program and is not compatible with this version. To automatically upgrade the server database to this version of the server program, the UPGRADEDDB parameter must be specified when starting the server.

System action: The server ends.

User response: Refer to installation instructions for specific information on precautionary measures that you may want to take to back up the database prior to upgrading it to the current server level. After you have taken these measures, start the server and specify the UPGRADEDDB parameter. This parameter only needs to be specified once to start the server, and should NOT be included in any automated programs that start the server.

ANR0984I Process *process ID* for *process name* started in the *process state* at *process start time*.

Explanation: The process whose ID is shown has been started for the process indicated by the process name running in the indicated state.

System action: None.

User response: None.

ANR0985I Process *process ID* for *process name* running in the *process state* completed with completion state *completion state* at *process start time*.

Explanation: A completion state of FAILURE indicates that the operation encountered an error condition or terminated before completion. A completion state of SUCCESS indicates that the operation ran to completion, but in some situations may have encountered and reported conditions that would affect the outcome of the operation.

System action: None.

User response: If the completion state is FAILURE, then review the activity log and the event log to try to determine the cause of the failure. If the completion state is SUCCESS, the activity log and the event log can still be checked for warning messages regarding conditions that could have affected the operation.

ANR0986I Process *process ID* for *process name* running in the *process state* processed *items processed* items for a total of *bytes processed* bytes with a completion state of *completion state* at *process start time*.

Explanation: A completion state of FAILURE indicates that the operation encountered an error condition or terminated before completion. A completion state of SUCCESS indicates that the operation ran to completion, but in some situations may have encountered and reported conditions that would affect the outcome of the operation.

System action: None.

User response: If the completion state is FAILURE, then review the activity log and the event log to try to determine the cause of the failure. If the completion state is SUCCESS, the activity log and the event log can still be checked for warning messages regarding conditions that could have affected the operation.

ANR0987I Process *process ID* for *process name* running in the *process state* processed *items processed* items with a completion state of *completion state* at *process start time*.

Explanation: A completion state of FAILURE indicates that the operation encountered an error condition or terminated before completion. A completion state of SUCCESS indicates that the operation ran to completion, but in some situations may have encountered and reported conditions that would affect the outcome of the operation.

System action: None.

User response: If the completion state is FAILURE, then review the activity log and the event log to try to determine the cause of the failure. If the completion state is SUCCESS, the activity log and the event log can still be checked for warning messages regarding conditions that could have affected the operation.

ANR0988I Process *process ID* for *process name* running in the *process state* processed *bytes processed* bytes with a completion state of *completion state* at *process start time*.

Explanation: A completion state of FAILURE indicates that the operation encountered an error condition or terminated before completion. A completion state of SUCCESS indicates that the operation ran to completion, but in some situations may have encountered and reported conditions that would affect the outcome of the operation.

System action: None.

User response: If the completion state is FAILURE, then review the activity log and the event log to try to

determine the cause of the failure. If the completion state is SUCCESS, the activity log and the event log can still be checked for warning messages regarding conditions that could have affected the operation.

ANR0989E The server database must be inserted or restored before the server can be started.

Explanation: The server is restarted after the LOADFORMAT command is run. To start the server, you must upgrade the database by issuing DSMSEV INSERTDB or else the database needs to be restored using the DSMSEV RESTORE DB command.

System action: Server initialization stops.

User response: Issue the DSMSEV INSERTDB or DSMSEV RESTORE DB command. For complete details on these commands, refer to the *Administrator's Reference*. Alternatively, the server can be installed using the DSMSEV FORMAT command in order to prepare it for regular use without needing to upgrade an earlier version server with the DSMSEV INSERTDB command or restoring the database with the DSMSEV RESTORE DB command.

ANR0990I Server restart-recovery in progress.

Explanation: The server has been restarted after a halt or system failure. If necessary, the server performs recovery processing in order to bring the system back to a consistent state.

System action: Server initialization continues.

User response: None.

ANR0991I *server* shutdown complete.

Explanation: In response to a HALT command, the server or storage agent has completed its termination processing.

System action: The server or storage agent ends.

User response: None.

ANR0992I Server's database formatting complete.

Explanation: The server formatting procedure has completed successfully. The server is now available for normal operation.

System action: Server completes formatting processing.

User response: None.

ANR0993I Server initialization complete.

Explanation: The server has been restarted after a halt or system failure. It is now ready to resume normal operation.

System action: Server completes initialization.

User response: None.

ANR0994W This server has not been properly installed.

Explanation: The server was started for normal operation, but had not yet been installed.

System action: The server ends.

User response: Install the server properly before starting it.

ANR0995W This version of the server program is down-level with respect to the information recorded on disk; a newer version of the program should be used.

Explanation: At server startup, the server has discovered that the disk information was written by a later version of the server program. This version of the server program should not be used.

System action: The server ends.

User response: Start a version of the server program that is at the same level as the prior server program used.

ANR0996W The information on disk was recorded by a down-level version of the server program; reinstallation is required to use this version.

Explanation: At server startup, the server has discovered that the disk information was written by an earlier version of the server program and is not compatible with this version.

System action: The server ends.

User response: Install this version of the server to bring the information up to the level of the program being used.

ANR1000I Migration process *process ID* started for storage pool *storage pool name* automatically or manually, **highMig**=*highMig value*, **lowMig**=*lowMig value*, **duration**=*duration*.

Explanation: Because the high migration threshold for the storage pool shown has been exceeded, a process has been started to migrate files from the storage pool. Note: a duration value of No means that the duration is not specified and hence the migration runs without duration.

System action: Data is moved from this storage pool to the next (target) pool.

User response: None.

ANR1001I Migration process *process ID* ended for storage pool *storage pool name*.

Explanation: A migration process for the named storage pool ends. This action can occur because the low migration threshold for the storage pool has been reached, there are no more nodes with files to be migrated, there are no more volumes to be migrated, or the duration specified has been reached.

System action: None.

User response: None.

ANR1002I Migration for storage pool *storage pool name* will be retried in *number of seconds* seconds.

Explanation: Because of a problem encountered attempting migration for the named storage pool, migration is delayed but will be retried after the time period shown.

System action: The server waits for the specified period and then retries migration for the storage pool. This delay applies to a single migration process. After a number of unsuccessful retries, the server will automatically cancel the process. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: If possible, correct the condition that has caused delayed migration.

ANR1003I Migration retry delay ended; checking migration status for storage pool *storage pool name*.

Explanation: Because migration for the indicated storage pool had been delayed due to a problem, the system waited before retrying. The retry wait period has ended, and the system will now retry migration.

System action: Migration processing for the storage pool resumes.

User response: None.

ANR1004I Server formatting complete, database ready for loading.

Explanation: The server formatting procedure has completed successfully. The server is ready to be loaded by issuing the DSMSEV LOADDB or the DSMSEV RESTORE DB command.

System action: Server completes formatting processing.

User response: The DSMSEV LOADDB or the DSMSEV RESTORE DB command is required to load the database before the server will be ready for use. For complete details on these commands, refer to the *Administrator's Reference*.

ANR1013I During a store operation, the server is switching to a next pool in the storage hierarchy. The next storage pool will inherit the simultaneous write configuration from the destination primary storage pool.

Explanation: If during a backup, archive, client migration, or server import operation, the server must write data to a next pool in a storage pool hierarchy, the following rules will apply:

1. If the destination storage pool specified in the management class copy group has one or more copy storage pools associated with it for simultaneous write operations:
 - a. The server will write the data to the next storage pool and to the copy pools that are associated with the original destination primary storage pool.
 - b. The setting of the COPYCONTINUE attribute of the original destination primary pool will be inherited by the next pool.
 - c. If the next pool is configured for simultaneous write operations, the copy storage pools associated with the next pool will be ignored as well as the value of its COPYCONTINUE attribute.
2. If the primary storage pool specified in the management class copy group does not have copy pools associated with it for simultaneous write operations:
 - a. The server will write the data to the next storage pool.
 - b. If the next pool is configured for simultaneous write operations, the copy pools associated with the next pool will be ignored.

System action: The server operation continues.

User response: None. Refer to the *Administrator's Guide* for details about simultaneous write configurations.

ANR1014W The *pool type* storage pool *pool name* is either not available, or does not have enough space for a simultaneous write operation.

Explanation: During a backup, archive, client migration, or import operation that is using simultaneous write, the server cannot write data to the specified storage pool. Possible reasons include:

- The storage pool is unavailable.
- There is not enough space available in the specified storage pool.

System action: The result of the simultaneous write operation depends on the setting of the COPYCONTINUE attribute of the original destination primary pool destination:

ANR1015I • ANR1022W

- If the value of the COPYCONTINUE attribute of the destination primary pool is YES, the server will stop writing to the failing copy pool for the remainder of the session, but continue storing files into a primary pool in the storage hierarchy and any other remaining copy pools.
- If the value of the COPYCONTINUE attribute of the destination primary pool is NO, the server will fail the transaction and discontinue the operation.

Refer to the *Administrator's Guide* for details about the simultaneous write COPYCONTINUE attribute.

User response: Ensure the copy storage pool is set for READWRITE access. If needed, make more space available in the copy storage pool. After the problem is corrected, take one of the following actions:

- If the value of the COPYCONTINUE attribute of the destination primary pool is YES, issue the BACKUP STGPOOL commands to back up any files in primary storage pools in the storage pool hierarchy that have not been copied to the copy pool that failed.
- If the value of the COPYCONTINUE attribute of the destination primary pool is NO, run the simultaneous write operation again.

ANR1015I Storage pool *pool name* has pending bytes duplicate bytes pending removal.

Explanation: The number of bytes indicated have been identified as duplicate bytes in the storage pool, but the volumes on which the data resides have not yet been reclaimed.

System action: None

User response: None

ANR1016W Fibre Channel adapters on the system cannot be opened.

Explanation: Due to problems with the HBA API or Fibre Channel HBA driver, the HBA API function cannot open any Fibre Channel host bus adapters (HBAs) on the system.

System action: None.

User response: The Tivoli Storage Manager SAN discovery function is not working. Check your Fibre Channel host bus adapter (HBA) vendor and upgrade your HBA API or Fibre Channel HBA driver version. For a list of supported HBAs and required driver levels by operating system, go to <http://WWW.IBM.COM/SUPPORT>.

ANR1018I Volume deduplication process *process ID* started for storage pool *storage pool name*, identify processes=*number of identify processes*.

Explanation: A volume deduplication process was

started for the storage pool shown.

System action: None.

User response: None.

ANR1019W Unable to get the node attributes for *node name*.

Explanation: The HBA API function cannot obtain the node's attributes. Removing devices from the SAN without reconfiguring the system can cause this problem.

System action: None.

User response: SAN discovery is not working for this device. Check the device configuration on the system.

ANR1020W Migration process *process ID* terminated for storage pool *storage pool name* - process canceled.

Explanation: During migration for the indicated storage pool, a process performing the migration has been canceled.

System action: The migration process is terminated. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: None.

ANR1021W Migration process *process ID* terminated for storage pool *storage pool name* - storage media inaccessible.

Explanation: During migration for the indicated storage pool, a required volume could not be mounted.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: One possible cause for this failure is that the access state for the target volume or storage pool for this operation is not set to READWRITE. Check the access state for the requested output volume and storage pool and ensure they are set to ACCESS=READWRITE.

ANR1022W Migration process *process ID* terminated for storage pool *storage pool name* - excessive read errors encountered.

Explanation: During migration for the indicated storage pool, read errors occur that prevented the migration from continuing.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again. If other migration processes are executing for the named storage pool, these

processes will continue migration.

User response: If possible, correct the cause of the read errors.

ANR1023W Migration process *process ID* terminated for storage pool *storage pool name* - excessive write errors encountered.

Explanation: During migration for the indicated storage pool, write errors occur that prevent the migration from continuing.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: If possible, correct the cause of the write errors.

ANR1024W Migration process *process ID* terminated for storage pool *storage pool name* - data transfer interrupted.

Explanation: During migration for the indicated storage pool, a data transfer operation was interrupted and could not be continued.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: If possible, correct the cause of the interruption.

ANR1025W Migration process *process ID* terminated for storage pool *storage pool name* - insufficient space in subordinate storage pool.

Explanation: During migration for the indicated storage pool, the server cannot move the data from the storage pool, because there is not enough space on the next storage pool to hold it.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again.

User response: Make more space available in the next storage pool, or use the UPDATE STGPOOL command to change the next storage pool to one with more space.

ANR1026W Migration process *process ID* terminated for storage pool *storage pool name* - unable to move file to subordinate storage pool due to exclusion by size.

Explanation: During migration for the indicated storage pool, the server cannot move the data from the

storage pool, because a file is larger than what is allowed on the next storage pool.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: Use the UPDATE STGPOOL command to change the next storage pool maximum file size or to change the next storage pool target.

ANR1027W Migration process *process ID* terminated for storage pool *storage pool name* - sufficient recovery log space is not available.

Explanation: During migration for the indicated storage pool, the server runs out of recovery log space.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again.

User response: If necessary, make more server recovery log space available.

ANR1028W Migration process *process ID* terminated for storage pool *storage pool name* - sufficient database space is not available.

Explanation: During migration for the indicated storage pool, the server runs out of database space.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again.

User response: If necessary, make more server database space available.

ANR1029W Migration process *process ID* terminated for storage pool *storage pool name* - lock conflict.

Explanation: During migration for the indicated storage pool, the server needs to obtain a lock that is not available.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: Wait for the server to retry the migration.

ANR1030W Migration process *process ID* terminated for storage pool *storage pool name* - thread resource not available.

Explanation: During migration for the indicated storage pool, the server cannot start a thread for the migration process.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: Wait for the server to retry the migration. If the error persists, it may indicate a shortage of server memory.

ANR1031W Migration process *process ID* terminated for storage pool *storage pool name* - sufficient memory is not available.

Explanation: During migration for the indicated storage pool, there is not enough server memory available.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again.

User response: If necessary, make more memory available to the server.

ANR1032W Migration process *process ID* terminated for storage pool *storage pool name* - internal server error detected.

Explanation: During migration for the indicated storage pool, the server encounters an internal error.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: Contact your service representative.

ANR1033W Migration process *process ID* terminated for storage pool *storage pool name* - transaction aborted.

Explanation: During migration for the indicated storage pool, the server detected an error while attempting to commit a transaction. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The indicated migration process ends. The server waits for the retry period to expire and then tries the migration again. If other migration processes are executing for the named storage pool, these processes will continue migration.

User response: Check for additional messages and eliminate the condition that caused the failed transaction.

ANR1034W Files stored on volume *volume name* cannot be migrated - volume is offline or access mode is "unavailable" or "destroyed".

Explanation: During migration, files on the indicated volume cannot be migrated either because the volume has been varied offline or because of the volume's access mode.

System action: The server continues migration processing, but skips files stored on the indicated volume.

User response: If necessary, use the VARY ON or UPDATE VOLUME command for this volume.

ANR1040I Space reclamation started for volume *volume name*, storage pool *storage pool name* (process number *process ID*).

Explanation: The percentage of reclaimable space on the volume shown has reached the reclaim percentage specified for the storage group; as a result, data from the volume is moved to another volume so that the volume can be reclaimed.

System action: The server starts volume space reclamation.

User response: None.

ANR1041I Space reclamation ended for volume *volume name*.

Explanation: Space reclamation for the volume named is complete.

System action: None.

User response: None.

ANR1042I Space reclamation for storage pool *storage pool name* will be retried in *number of seconds* seconds.

Explanation: Because of a problem encountered attempting space reclamation for the named storage pool, reclamation stops but will be retried after the time period shown. After a number of unsuccessful retries, the process will be automatically cancelled.

System action: The system waits for the specified period and then retries space reclamation for the storage pool.

User response: If possible, correct the condition that has stopped reclamation.

ANR1043I Space reclamation retry delay ended; checking volume reclamation status for storage pool *storage pool name*.

Explanation: Because space reclamation for the indicated storage pool had been stopped due to a problem, the system waited before retrying. The retry wait period has ended, and the system can now retry space reclamation.

System action: Reclamation for the pool begins.

User response: None.

ANR1044I Removable volume *volume name* is required for space reclamation.

Explanation: During space reclamation processing, the server determines that a removable volume is required in order to complete processing.

System action: The server attempts to mount the removable volume.

User response: Respond to any mount request for the indicated volume.

ANR1045E Reclamation has ended for volume *volume name*. The files on the volume are too large for the target storage pool, *storage pool name*.

Explanation: During reclamation for the indicated volume, the server cannot move the data from the volume because a file is larger than allowed for the indicated storage pool.

System action: Reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: Use the UPDATE STGPOOL command to change the value of the MAXSIZE parameter for the storage pool. Specify the value as NOLIMIT, or specify a value larger than the largest file to be reclaimed.

ANR1046E *command*: Database upgrade not currently supported for this server because it uses backup sets.

Explanation: The current version of the TSM 6.1 server does not support backup sets. However, the server being upgraded uses backup sets, and so cannot be upgraded at this time. Note that this is a temporary limitation that will be lifted in a future TSM 6.1 Server Fix Pack.

System action: The command ends without inserting any data into the database.

User response: Rerun the command using a version of the TSM 6.1 server that supports backup sets.

ANR1047E *command*: Database upgrade not currently supported for this server because it uses NAS backups with TOCs.

Explanation: The current version of the TSM 6.1 server does not support NAS backups that use a table of contents (TOC). However, the server being upgraded uses TOCs, and so cannot be upgraded at this time. Note that this is a temporary limitation that will be lifted in a future TSM 6.1 Server Fix Pack.

System action: The command ends without inserting any data into the database.

User response: Rerun the command using a version of the TSM 6.1 server that supports NAS backups with TOCs.

ANR1048E *command*: Protocol error - out-of-sequence verb (type *verb name*) received.

Explanation: The server detects a protocol error while upgrading the database because a verb has been received that does not adhere to the defined verb sequence. This error may be the result of using a version of the DSMUPGRD utility that is not compatible with the TSM 6.1 version to which you are upgrading.

System action: The command ends without inserting any data into the database.

User response: Rerun the command using a version of the server compatible with the version of DSMUPGRD used to extract the data. Or reextract the data using an older version of DSMUPGRD that is compatible with the version of the server.

ANR1049W The server is unable to obtain number-formatting information from the system-locale attributes. The server substitutes alternate number format *nbrFmt*.

Explanation: The server is unable to format some numbers because it is unable to obtain a valid thousand and decimal separator value from the system locale.

System action: The server continues. An alternate number format is used. Numbers are displayed using a comma character as the thousand separator and a period character as the decimal separator.

User response: Check whether errors occurred during server initialization that might indicate a problem initializing the locale. Check whether the server is running in a locale supported by the server. If it is not, restart the server in a supported locale.

ANR1053E *Command: Invalid process number - processIdvalue*

Explanation: A QUERY EXPORT command was issued that specifies an invalid process number.

System action: The server does not process the command.

User response: Reissue the command with a valid process number.

ANR1054E *Command: Invalid export operation state - export state*

Explanation: A QUERY EXPORT command was issued that specifies an invalid export state.

System action: The server does not process the command.

User response: Reissue the command with a valid export operation state.

ANR1055E *Command: Invalid export session identifier name - export sess name.*

Explanation: The issued command specifies an invalid export session identifier.

System action: The server does not process the command.

User response: Reissue the command with a valid export session identifier.

ANR1056E *command name: The PROCESS parameter is not valid if an export identifier is specified.*

Explanation: The command failed because of an invalid combination of arguments.

System action: The command fails and server operations continue.

User response: Reissue the command with a valid set of parameters. For information on valid values for the command parameter, refer to the *Administrator's Reference* for your particular platform.

ANR1057E *command name: The PROCESS parameter is not valid when the STATE parameter is specified with a value of INITIALIZING or SUSPENDED*

Explanation: The command failed because of an invalid combination of arguments.

System action: The command fails and server operations continue.

User response: Reissue the command with a valid set of parameters. For information on valid values for the command parameter, refer to the *Administrator's*

Reference for your particular platform.

ANR1058E *command name: TODATE must be specified when TOTIME is specified.*

Explanation: A command supporting the TODATE and TOTIME parameters was issued with the TOTIME parameter specified but without the TODATE parameter. When the TOTIME parameter is used, the TODATE parameter must be specified.

System action: The server ignores the command and continues processing.

User response: Reissue the command and specify both the TODATE and TOTIME parameters.

ANR1059I **Selective restore of NAS node *nodename*, file system *file system*, started as process *process ID* by administrator *administrator*. Specified files and/or directory trees will be restored to destination *destination*.**

Explanation: A restore is started for the indicated file system of a NAS node. The operation is initiated by the administrator shown. Selected files and/or directory trees specified by the administrator will be restored to the indicated destination.

System action: The indicated process is started.

User response: None.

ANR1060W **Error initiating space reclamation for storage pool *storage pool name* - lock conflict.**

Explanation: While attempting to initiate space reclamation for the indicated storage pool, the server needs to obtain a lock that is not available.

System action: Space reclamation stops. The server waits for the retry period to expire and then tries the reclamation again.

User response: Wait for the server to retry the reclamation.

ANR1061W **Error initiating space reclamation for storage pool *storage pool name* - sufficient memory is not available.**

Explanation: During an attempt to initiate space reclamation for the indicated storage pool, there is not enough server memory available.

System action: Space reclamation stops. The server waits for the retry period to expire and then tries the reclamation again.

User response: If necessary, make more memory available to the server.

ANR1062W Error initiating space reclamation for storage pool *storage pool name* - internal server error detected.

Explanation: During an attempt to initiate space reclamation for the indicated storage pool, an internal server error is encountered.

System action: Space reclamation stops. The server will wait for the retry period to expire and then tries the reclamation again.

User response: Contact your service representative.

ANR1063I Full backup of NAS node *nodename*, file system *file system*, started as process *process ID* by administrator *administrator*.

Explanation: A full backup is started for the indicated file system of a NAS node. The operation is initiated by the administrator shown.

System action: The indicated process is started.

User response: None.

ANR1064I Differential backup of NAS node *nodename*, file system *file system*, started as process *process ID* by administrator *administrator*.

Explanation: A differential backup is started for the indicated file system of a NAS node. Only files that have changed since the last full backup will be processed. The operation is initiated by the administrator shown.

System action: The indicated process is started.

User response: None.

ANR1065I Restore of NAS node *nodename*, file system *file system*, started as process *process ID* by administrator *administrator*. A full image for this file system will be restored to destination *destination*.

Explanation: A restore is started for the indicated file system of a NAS node. The operation is initiated by the administrator shown. The restore will be performed using a full image of this file system. The file system will be restored to the indicated destination.

System action: The indicated process is started.

User response: None.

ANR1066I Restore of NAS node *nodename*, file system *file system*, started as process *process ID* by administrator *administrator*. A full image plus a differential image for this file system will be restored to destination *destination*.

Explanation: A restore is started for the indicated file system of a NAS node. The operation is initiated by the administrator shown. The restore will be performed using a full image plus a differential image of this file system. The file system will be restored to the indicated destination.

System action: The indicated process is started.

User response: None.

ANR1067I Operation process *process ID* completed.

Explanation: The indicated operation completed.

System action: The indicated process ends.

User response: None.

ANR1068W Operation process *process ID* terminated - process cancelled.

Explanation: During the indicated operation, a background process was cancelled.

System action: The indicated process ends.

User response: None.

ANR1069E Operation process *process ID* terminated - insufficient number of mount points available for removable media.

Explanation: During the indicated operation, the server could not allocate sufficient mount points for the volumes required.

System action: The indicated process ends.

User response: If necessary, make more mount points available.

ANR1070E Operation process *process ID* terminated - write errors encountered.

Explanation: During the indicated operation, write errors prevent the operation from continuing.

System action: The indicated process ends.

User response: If possible, correct the cause of the errors and restart the operation.

ANR1071E Operation process *process ID* terminated - read errors encountered.

Explanation: During the indicated operation, read errors prevent the operation from continuing.

System action: The indicated process ends.

User response: If possible, correct the cause of the errors and restart the operation.

ANR1072E *Operation process process ID terminated - insufficient space in destination storage pool.*

Explanation: During the indicated operation, there is not enough space available in the destination storage pool.

System action: The indicated process ends.

User response: Make more space available in the storage pool and restart the operation.

ANR1073E *Operation process process ID terminated - sufficient recovery log space is not available.*

Explanation: During the indicated operation, the server runs out of recovery log space.

System action: The indicated process ends.

User response: If necessary, make more server recovery log space available.

ANR1074E *Operation process process ID terminated - sufficient database space is not available.*

Explanation: During the indicated operation, the server runs out of database space.

System action: The indicated process ends.

User response: If necessary, make more server database space available.

ANR1075E *Operation process process ID terminated - lock conflict.*

Explanation: During the indicated operation, the server needs to obtain a lock that is not available.

System action: The indicated process ends.

User response: Restart the operation.

ANR1076E *Operation process process ID terminated - sufficient memory is not available.*

Explanation: During the indicated operation, not enough server memory is available.

System action: The indicated process ends.

User response: If necessary, make more memory available to the server, and then restart the operation.

ANR1077E *Operation process process ID terminated - transaction aborted.*

Explanation: During the indicated operation, the server detected an error while attempting to commit a transaction. This message should be preceded by other

messages that give additional information about the failed transaction.

System action: The indicated process ends.

User response: Check for additional messages and eliminate the condition that caused the failed transaction.

ANR1078E *Operation process process ID terminated - internal server error detected.*

Explanation: During the indicated operation, the server encounters an internal error.

System action: The indicated process ends.

User response: Contact your service representative.

ANR1079I *Server-free backup of node nodename, file system file system, started as process process ID by administrator administrator.*

Explanation: The administrator initiates a server-free backup of the node's file system.

System action: The indicated process is started.

User response: None.

ANR1080W *Space reclamation is ended for volume volume name. The process is canceled.*

Explanation: During space reclamation for the indicated volume, the process performing the reclamation has been canceled.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: None.

ANR1081E *Space reclamation is ended for volume volume name. Storage media is inaccessible.*

Explanation: During space reclamation for the indicated volume, a required volume cannot be mounted.

System action: Space reclamation of the volume stops. If other reclamation processes are executing, these processes will continue the reclamation.

User response: None.

ANR1082E *Space reclamation is ended for volume volume name. There is an insufficient number of mount points available for removable media.*

Explanation: During space reclamation for the indicated volume, the server could not allocate sufficient mount points for the volumes required.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: If necessary, make more mount points available.

ANR1083E **Space reclamation is ended for volume *volume name*. Excessive read errors were encountered.**

Explanation: During space reclamation for the indicated volume, read errors occur that prevent reclamation from continuing.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: If possible, determine and correct the cause of the read errors.

ANR1084E **Space reclamation is ended for volume *volume name*. Excessive write errors were encountered.**

Explanation: During space reclamation for the indicated volume, write errors occur that prevent reclamation from continuing.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: If possible, determine and correct the cause of the write errors.

ANR1085E **Space reclamation is ended for volume *volume name*. Data transfer was interrupted.**

Explanation: During space reclamation for the indicated volume, a data transfer operation has been interrupted and cannot be continued.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: If possible, determine and correct the cause of the interruption.

ANR1086E **Space reclamation is ended for volume *volume name*. There is insufficient space in storage pool.**

Explanation: During space reclamation for the indicated volume, the server determines that data cannot be moved from the volume due to insufficient space on other volumes in the storage pool.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: Make more space available on other volumes in the storage pool.

ANR1087E **Space reclamation is ended for volume *volume name*. Sufficient recovery log space is not available.**

Explanation: During space reclamation for the indicated volume, the server runs out of recovery log space.

System action: Space reclamation stops.

User response: If necessary, make more server recovery log space available.

ANR1088E **Space reclamation is ended for volume *volume name*. Sufficient database space is not available.**

Explanation: During space reclamation for the indicated volume, the server runs out of database space.

System action: Space reclamation stops.

User response: If necessary, make more server database space available.

ANR1089E **Space reclamation is ended for volume *volume name*. There is a lock conflict.**

Explanation: During space reclamation for the indicated volume, the server needed to obtain a lock that is not available.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: Wait for the server to try the reclamation again.

ANR1090E **Space reclamation is ended for volume *volume name*. Thread resource is not available.**

Explanation: During space reclamation for the indicated volume, the server cannot start a thread for the reclamation process.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: Wait for the server to try the reclamation again. If the error persists, it might indicate a shortage of server memory.

ANR1091E Space reclamation is ended for volume *volume name*. Sufficient memory is not available.

Explanation: During space reclamation for the indicated volume, there was not enough server memory available.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: If necessary, make more memory available to the server.

ANR1092E Space reclamation is ended for volume *volume name*. An internal server error was detected.

Explanation: During space reclamation for the indicated volume, the server encounters an internal error.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: Contact your service representative.

ANR1093E Space reclamation is ended for volume *volume name*. The transaction is ended.

Explanation: During space reclamation for the indicated volume, the server detected an error while attempting to commit a transaction.

System action: Space reclamation of the volume stops. If other reclamation processes are running, these processes will continue the reclamation.

User response: Check for additional messages and eliminate the condition that caused the failed transaction.

ANR1094E Invalid destination storage pool *storage pool name* specified for storage of an object using data mover *data mover*.

Explanation: While attempting to store an object using the indicated data mover, the server determined that the indicated storage pool was invalid for this operation. The indicated storage pool is used because it is specified as the copy group destination of the assigned management class.

This storage pool could be invalid for any of the following reasons:

- The storage pool is not defined
- The storage pool is a random-access storage pool and this operation requires a sequential-access storage pool
- The storage pool is not a primary storage pool

- The storage pool has a NATIVE or NONBLOCK data format, which is not supported for this operation
- The storage pool is not a NONBLOCK data format, which is required for server-free operations
- The data format of the storage pool does not match the data format of the data mover

System action: The operation fails.

User response: This message usually indicates a configuration problem with either the storage pool or the policy. Ensure that the destination storage pool has appropriate attributes, including data format, for this operation. Check the copy group of the assigned management class. If the destination is incorrect, either assign a new management class, or change the destination in the copy group and activate the changed policy. Also, consider whether you must define a new storage pool or data mover.

ANR1095E Data mover operation for node *node name* and file space *filespace name* cannot be started - an operation involving this node and file space is already in progress.

Explanation: A request has been made to use a data mover to perform an operation involving the indicated node and file space. The indicated file space was either specified as the source for a backup operation or the destination location for a restore operation. However, a data mover operation involving that node and file space is already in progress; the indicated file space is either the source for a currently running backup operation or is the destination for a currently running restore operation. To avoid possible conflicts, the new operation is not performed.

System action: The operation fails.

User response: Allow the current operation to complete before starting a new operation for this node and file space.

ANR1096E Operation process *process ID* terminated - storage media inaccessible.

Explanation: During the indicated operation, a required volume cannot be mounted.

System action: The indicated process ends.

User response: If possible, correct the problem and restart the operation.

ANR1097E Operation process *process ID* terminated - data transfer interrupted.

Explanation: During the indicated operation, a data transfer operation is interrupted and cannot be continued.

System action: The indicated process ends.

User response: If possible, correct the problem and restart the operation.

ANR1098E *Operation process process ID terminated - file deleted from data storage during retrieval.*

Explanation: During the indicated operation, a file was deleted from data storage during retrieval.

System action: The indicated process ends.

User response: None.

ANR1099E *Operation process process ID terminated - thread resource not available.*

Explanation: During the indicated operation, the server cannot start a thread.

System action: The indicated process ends.

User response: The problem may indicate a shortage of memory. If necessary, make more memory available to the server, and then restart the operation.

ANR1100I *Migration started for volume volume name, storage pool storage pool name (process number process ID).*

Explanation: Because the high migration threshold for the indicated storage pool has been exceeded, migration of files from the volume shown begins.

System action: The system moves the data from this volume to the next (target) pool.

User response: None.

ANR1101I *Migration ended for volume volume name.*

Explanation: Because the low migration threshold for the indicated storage pool has been reached, migration of files from the indicated volume ends.

System action: None.

User response: None.

ANR1102I *Removable volume volume name is required for migration.*

Explanation: During migration processing, the server determines that a removable volume is required in order to complete processing.

System action: The server attempts to mount the removable volume.

User response: Respond to any mount request for the indicated volume.

ANR1103E *Operation process process ID terminated - server-free input/output errors encountered.*

Explanation: During the indicated operation, input/output errors were encountered which prevent the operation from continuing.

System action: Server processing continues.

User response: Check previous messages for problem determination information.

ANR1104E *Operation process process ID terminated - NDMP session errors encountered.*

Explanation: During the indicated operation, the NDMP session with the NAS file server reported errors which prevent the operation from continuing.

System action: The indicated process ends.

User response: Check the NDMP logs for the NAS file server and, if possible, correct the cause of the errors and restart the operation.

ANR1106W *An incorrect destination storage pool storage pool name was specified for storing a table of contents for an image. A table of contents will not be created for the image.*

Explanation: While attempting to store an image object, the server determined that the indicated table of contents (TOC) destination storage pool was invalid. The indicated storage pool is used because it is specified as the copy group TOC destination of the assigned management class.

This storage pool could be invalid for any of the following reasons:

- The storage pool is not defined
- The storage pool is not a primary storage pool
- The storage pool has a data format other than NATIVE or NONBLOCK

System action: The operation continues because TOC creation is preferred, but not required. A TOC will not be created for the stored image object.

User response: This message usually indicates a configuration problem with either the storage pool or the policy. Ensure that the TOC destination storage pool has appropriate attributes, including data format. Check the copy group of the assigned management class. If the TOC destination is incorrect, either assign a new management class, or change the TOC destination in the copy group and activate the changed policy.

ANR1107E An incorrect destination storage pool *storage pool name* was specified for storage of a table of contents for an image object. The backup operation fails.

Explanation: While attempting to store an image object, the server determined that the indicated table of contents (TOC) destination storage pool was invalid. The indicated storage pool is used because it is specified as the copy group TOC destination of the assigned management class.

This storage pool could be invalid for any of the following reasons:

- The storage pool is not defined
- The storage pool is not a primary storage pool
- The storage pool has a data format other than NATIVE or NONBLOCK

System action: The operation fails.

User response: This message usually indicates a configuration problem with either the storage pool or the policy. Ensure that the TOC destination storage pool has appropriate attributes, including data format. Check the copy group of the assigned management class. If the TOC destination is incorrect, either assign a new management class, or change the TOC destination in the copy group and activate the changed policy.

ANR1108W The server is unable to create a table of contents for node *node name*, file space *file space* in storage pool *storage pool name*.

Explanation: While attempting to create a table of contents (TOC) for the specified node and file space in the indicated TOC destination pool, a failure occurred.

System action: The operation continues because TOC creation is preferred, but not required. A TOC will not be created for the stored image object.

User response: Look for previous messages giving a specific reason for the failure. Take corrective action as appropriate.

ANR1109W *Command: A table of contents was requested, but there is no table of contents destination storage pool specified. The table of contents will not be created, but the operation continues.*

Explanation: While preparing to create a table of contents (TOC), the server determined that the TOC destination storage pool is not specified in the backup copy group for the assigned management class.

System action: The operation continues because TOC creation is preferred, but not required. A TOC will not be created.

User response: This message indicates a configuration

problem with the policy. Either assign a new management class with appropriate attributes, or correct the assigned management class by setting the TOC destination in the backup copy group and activating the changed policy.

ANR1110E *Command: A table of contents was requested, but there is no table of contents destination storage pool specified. The table of contents can not be created and the operation fails.*

Explanation: While preparing to create a table of contents (TOC), the server determined that the TOC destination storage pool is not specified in the backup copy group for the assigned management class.

System action: The operation fails.

User response: This message indicates a configuration problem with the policy. Either assign a new management class with appropriate attributes, or correct the assigned management class by setting the TOC destination in the backup copy group and activating the changed policy. If a TOC is not required, change the value of the TOC parameter on the command.

ANR1111E *Command: An incorrect message number, message number, was specified.*

Explanation: A MSGSTACKTRACE ENABLE or MSGSTACKTRACE DISABLE command has been entered that specifies an invalid message number. Messages must be between 3 and 8 digits. No letters are allowed on message numbers.

System action: The server does not process the command.

User response: Reissue the command with a valid message number.

ANR1112W *Command: No table of contents destination storage pool available for backup set for node *Node name* (data type *data type*). The table of contents will not be created.*

Explanation: While preparing to create a table of contents (TOC), the server determined that the TOC destination storage pool is not specified in the backup copy group for the assigned management class.

System action: The operation continues because TOC creation is preferred, but not required. A TOC will not be created.

User response: This message indicates a configuration problem with the policy. Either assign a new management class with appropriate attributes, or correct the assigned management class by setting the TOC destination in the backup copy group and activating the changed policy.

ANR1113E *Command:* **No table of contents destination storage pool available for backup set for node *Node name* (data type *data type*). The backup set will not be generated.**

Explanation: While preparing to create a table of contents (TOC), the server determined that the TOC destination storage pool is not specified in the backup copy group for the assigned management class.

System action: The operation fails.

User response: This message indicates a configuration problem with the policy. Either assign a new management class with appropriate attributes, or correct the assigned management class by setting the TOC destination in the backup copy group and activating the changed policy. If a TOC is not required, change the value of the TOC parameter on the command.

ANR1114E *Command:* **No nodes or data types are eligible for backup set generation.**

Explanation: None of the specified nodes or data types are eligible to be included in the backup set.

System action: The operation fails.

User response: Check previous messages for problem determination information.

ANR1115W *Error initiating migration for storage pool *storage pool name* - lock conflict.*

Explanation: While trying to start migration for the indicated storage pool, the server needs to obtain a lock that is not available.

System action: Migration stops. The server waits for the retry period to expire and then tries the migration again.

User response: Wait for the server to retry the migration.

ANR1116W *Error initiating migration for storage pool *storage pool name* - sufficient memory is not available.*

Explanation: While trying to start migration for the indicated storage pool, there is not enough server memory available.

System action: Migration stops. The server waits for the retry period to expire and then tries the migration again.

User response: If necessary, make more memory available to the server.

ANR1117W *Error initiating migration for storage pool *storage pool name* - internal server error detected.*

Explanation: While trying to start migration for the indicated storage pool, the server encounters an internal error.

System action: Migration stops. The server waits for the retry period to expire and then tries the migration again.

User response: Contact your service representative.

ANR1118I *Command:* **Table of contents successfully generated for node *Node name*, backup set *backup set name*.**

Explanation: You requested a table of contents to be generated for the specified backup set and data type. The table of contents was successfully generated.

System action: Server operation continues.

User response: None.

ANR1119W *Command:* **Table of contents already exists for node *Node name*, backup set *backup set name* (data type *data type*). The table of contents will not be created.**

Explanation: You requested a table of contents to be generated for the specified backup set and data type, but the table of contents already exists.

System action: The server will not generate a table of contents for this backup set and data type.

User response: If the specified backup set name and data type are not correct, re-issue the command with the correct parameters.

ANR1120W *Migration is ended for volume *volume name*. The process is canceled.*

Explanation: During migration for the indicated volume, the process performing the migration has been canceled.

System action: The migration process stops. If other migration processes are running, these processes will continue migration.

User response: None.

ANR1121E *Migration is ended for volume *volume name* - storage. Media is inaccessible.*

Explanation: During migration for the indicated volume a required volume cannot be mounted.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: One possible cause for this failure is that the access state for the target volume or storage pool for this operation is not set to READWRITE. Check the access state for the requested output volume and storage pool and ensure they are set to ACCESS=READWRITE.

ANR1122E Migration is ended for volume *volume name*. An insufficient number of mount points are available for removable media.

Explanation: During migration for the indicated volume the server could not allocate sufficient mount points for the volumes required.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: If necessary, make more mount points available.

ANR1123E Migration is ended for volume *volume name*. Excessive read errors were encountered.

Explanation: During migration for the indicated volume, read errors occurred that prevent the migration from continuing.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: If possible, correct the cause of the read errors.

ANR1124E Migration is ended for volume *volume name*. Excessive write errors were encountered.

Explanation: During migration for the indicated volume, write errors occurred that prevent the migration from continuing.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: If possible, correct the cause of the write errors.

ANR1125E Migration is ended for volume *volume name*. Data transfer is interrupted.

Explanation: During migration for the indicated volume a data transfer operation was interrupted and could not be continued.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: If possible, determine and correct the cause of the interruption.

ANR1126E Migration is ended for volume *volume name*. There is insufficient space in subordinate storage pools.

Explanation: During migration for the indicated volume, the server cannot move the data from the volume because there is not enough space on the next storage pool to hold it.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: Make more space available in the next storage pool, or use the UPDATE STGPOOL command to change the next storage pool to one with more space.

ANR1127E Migration is ended for volume *volume name*. - The server is unable to move files to subordinate storage pools because the files are too large.

Explanation: During migration for the indicated volume, the server cannot move the data from the volume because a file size is larger than allowed on the next storage pool.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: Use the UPDATE STGPOOL command to change the next storage pool maximum file size or to change the next storage pool target.

ANR1128E Migration is ended for volume *volume name*. Sufficient recovery log space is not available.

Explanation: During migration for the indicated volume, the server runs out of recovery log space.

System action: Migration stops.

User response: If necessary, make more server recovery log space available.

ANR1129E Migration is ended for volume *volume name*. Sufficient database space is not available.

Explanation: During migration for the indicated volume pool, the server runs out of database space.

System action: Migration stops.

User response: If necessary, make more server database space available.

ANR1130E Migration is ended for volume *volume name*. There is a lock conflict.

Explanation: During migration for the indicated volume, the server needs to obtain a lock that is not available.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: Wait for the server to try the migration again.

ANR1131E Migration is ended for volume *volume name*. A thread resource is not available.

Explanation: During migration for the indicated volume, the server cannot start a thread for the migration process.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: Wait for the server to try the migration again. If the error persists, it might indicate a shortage of server memory.

ANR1132E Migration is ended for volume *volume name*. Sufficient memory is not available.

Explanation: During migration for the indicated volume, there is not enough server memory available.

System action: Migration stops.

User response: If necessary, make more memory available to the server.

ANR1133E Migration is ended for volume *volume name*. An internal server error is detected.

Explanation: During migration for the indicated volume, the server encounters an internal error.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: Contact your service representative.

ANR1134E Migration is ended for storage pool *storage pool name*. There is an insufficient number of mount points available for removable media.

Explanation: During migration for the indicated storage pool the server could not allocate sufficient mount points in the next storage pool.

System action: Migration stops. The server waits for

the retry period to expire and then tries the migration again.

User response: If necessary, make more mount points available.

ANR1135E Migration is ended for volume *volume name*. The transaction is ended.

Explanation: During migration for the indicated volume, the server detected an error while attempting to commit a transaction.

System action: Migration of the volume stops. If other migration processes are running, these processes will continue migration.

User response: Check for additional messages and eliminate the condition that caused the failed transaction.

ANR1136W Operation process *process ID* completed - There is no data to process for the differential backup of NAS node *node name*, file space *file space*.

Explanation: The NAS file server reported zero bytes stored at the conclusion of an NDMP backup of the specified file space. The command ends without updating the server's database.

System action: The indicated process ends.

User response: None.

ANR1137E Operation process *process ID* terminated - object excluded by size in destination storage pool and all successor pools.

Explanation: During the indicated operation, the size of a file sent from the client node is larger than that allowed in the destination storage pool. No successor storage pools can accept the large file.

System action: The indicated process ends.

User response: Increase the maximum file size for one or more of the storage pools in the storage hierarchy to accommodate the file. An authorized administrator can increase the MAXSIZE parameter by issuing the UPDATE STGPOOL command.

ANR1138I *entries* were created for the no-query restore with timestamp *timestamp*.

Explanation: The no-query restore operation identified by the timestamp now has the indicated number of entries in the Restore.Srvobj table. This no-query restore operation continues to find restore candidates until the server issues message ANR1183I.

System action: The server operation continues.

User response: This informational message reports that the no-query restore operation is still searching for

ANR1139E • ANR1147W

candidates. You can cancel the restore operation by issuing the CANCEL RESTORE or CANCEL SESSION command.

ANR1139E The *command name* command failed because no data was returned from the database manager.

Explanation: An attempt to gather database statistics from the database manager failed. This can occur if the buffer pool monitor switch (DFT_MON_BUFPOOL) has been set off. The buffer pool monitor switch controls the collection of database statistics.

System action: The command fails and the server operation continues.

User response: Set the buffer pool monitor switch (DFT_MON_BUFPOOL) to 'ON'. If the switch is already on, contact your support representative.

ANR1140I Move data process started for volume *volume name* (process ID *process ID*).

Explanation: As a result of a MOVE DATA command, a process begins to move data from the volume shown.

System action: The server moves all data from the volume.

User response: None.

ANR1141I Move data process ended for volume *volume name*.

Explanation: The MOVE DATA command for the volume shown completes.

System action: None.

User response: None.

ANR1142I Moving data for collocation cluster *cluster number* of total clusters on volume *volume name*.

Explanation: As a result of a MOVE DATA command, data moves from the volume indicated to new volumes; the message shows the total number of clusters (data objects) on the volume and the current cluster being processed.

System action: None.

User response: None.

ANR1143W Move data process terminated for volume *volume name* - process canceled.

Explanation: During move data processing for the indicated volume, the process performing the move data was canceled. It is possible that the server may issue this message more than once while the server is ending this process.

System action: The server ends the MOVE DATA command.

User response: None.

ANR1144W Move data process terminated for volume *volume name* - storage media inaccessible.

Explanation: During move data processing for the indicated volume, a required volume cannot be mounted.

System action: The server ends the MOVE DATA command.

User response: None.

ANR1145W Move data process terminated for volume *volume name* - insufficient number of mount points available for removable media.

Explanation: During move data processing for the indicated volume, the server could not allocate sufficient mount points for the volumes required.

System action: The server ends the MOVE DATA command.

User response: If necessary, make more mount points available.

ANR1146W Move data process terminated for volume *volume name* - excessive read errors encountered.

Explanation: During move data processing for the indicated volume, read errors occurred that prevented the move from continuing.

System action: The server ends the MOVE DATA command.

User response: If possible, correct the cause of the read errors and then reissue the MOVE DATA command.

ANR1147W Move data process terminated for volume *volume name* - excessive write errors encountered.

Explanation: During move data processing for the indicated volume, write errors occurred that prevented the move from continuing.

System action: The server ends the MOVE DATA command.

User response: If possible, correct the cause of the write errors and then reissue the MOVE DATA command.

ANR1148W Move data process terminated for volume *volume name* - data transfer interrupted.

Explanation: During move data processing for the indicated volume a data transfer operation was interrupted and could not be continued.

System action: The server ends the MOVE DATA command.

User response: If possible, determine and correct the cause of the interruption.

ANR1149W Move data process terminated for volume *volume name* - insufficient space in target storage pool.

Explanation: During move data processing for the indicated volume, the server cannot move the data from the volume, because there is not enough space on the destination storage pool to hold it or the access for the storage pool is either unavailable or readonly.

System action: The server ends the MOVE DATA command.

User response: Make more space available in the next storage pool, or specify a storage pool with more space, and reissue the MOVE DATA command.

ANR1150W Move data process terminated for volume *volume name* - unable to move file to target storage pool due to exclusion by size.

Explanation: During move data processing for the indicated volume, the server cannot move the data from the volume because a file size is larger than allowed on the next storage pool.

System action: The server ends the MOVE DATA or MOVE NODEDATA command.

User response: Use the UPDATE STGPOOL command to change the next storage pool maximum file size or to change the next storage pool target, and then reissue the MOVE DATA or MOVE NODEDATA command.

ANR1151W Move data process terminated for volume *volume name* - sufficient recovery log space is not available.

Explanation: During move data processing for the indicated volume, the server runs out of recovery log space.

System action: The server ends the MOVE DATA command.

User response: If necessary, make more server recovery log space available.

ANR1152W Move data process terminated for volume *volume name* - sufficient database space is not available.

Explanation: During move data processing for the indicated volume, the server runs out of database space.

System action: The server ends the MOVE DATA command.

User response: If necessary, make more server database space available.

ANR1153W Move data process terminated for volume *volume name* - lock conflict.

Explanation: During move data processing, the server was unable to obtain the volume specified because a lock was not available or a restartable restore is active for data on the volume and has it locked. .

System action: The server ends the MOVE DATA command.

User response: Check for restartable restores by issuing the QUERY RESTORE command. If the volume specified contains any data from the node and filespace identified by the QUERY RESTORE command, the MOVE DATA command will fail. The restartable restores must complete or be cancelled before the MOVE DATA command can succeed.

If the volume does not contain data from the node and filespace identified by the QUERY RESTORE command, the reissue the MOVE DATA command.

ANR1154W Move data process terminated for volume *volume name* - thread resource not available.

Explanation: During move data processing for the indicated volume, the server cannot start a thread for the migration process.

System action: The server ends the MOVE DATA command.

User response: Reissue the MOVE DATA command. If the error persists, it may indicate a shortage of server memory.

ANR1155W Move data process terminated for volume *volume name* - sufficient memory is not available.

Explanation: During move data processing for the indicated volume, there is not enough server memory available.

System action: The server ends the MOVE DATA command.

User response: If necessary, make more memory

available to the server, and then reissue the MOVE DATA command.

ANR1156W Move data process terminated for volume *volume name* - internal server error detected.

Explanation: During move data processing for the indicated volume, the server encounters an internal error.

System action: The server ends the MOVE DATA command.

User response: Contact your service representative.

ANR1157I Removable volume *volume name* is required for move process.

Explanation: During move data or move node data processing, the server determines that the indicated removable volume is required in order to complete processing.

System action: The server attempts to mount the removable volume.

User response: Respond to any mount request for the indicated volume.

ANR1160W Transaction was aborted for volume *volume name*.

Explanation: An error was detected during transaction commit. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR1161W The move process is skipping a damaged file on volume *volume name*:
Node *node name*, **Type** *file type*, **File space** *filespace name*, **File name** *file name*.

Explanation: During the move process, a file is encountered that was previously found to be damaged. If this file is part of an aggregate, the entire aggregate was previously marked damaged, possibly because an error was detected for some other file within the aggregate.

System action: The damaged file is not moved.

User response: Perform the following actions:

- Audit the indicated volume with FIX=NO to verify that the file is damaged. The audit will reset the file status if the file is found to be undamaged during

the audit. If the file is part of an aggregate, the audit will reset the aggregate status if the entire aggregate is found to be undamaged.

- If this volume is in a primary storage pool that has previously been backed up to a copy storage pool, attempt to restore damaged files by using the RESTORE STGPOOL command.

ANR1162W Space reclamation skipping damaged file on volume *volume name*: **Node** *node name*, **Type** *file type*, **File space** *filespace name*, **File name** *file name*.

Explanation: During reclamation, a file is encountered that was previously found to be damaged. If this file is part of an aggregate, the entire aggregate was previously marked damaged, possibly because an integrity error was detected for some other file within the aggregate.

System action: The damaged file is not moved.

User response: Audit the indicated volume with FIX=NO to verify that the file is damaged. The audit will reset the file status if the file is found to be undamaged during the audit. If the file is part of an aggregate, the audit will reset the aggregate status if the entire aggregate is found to be undamaged. If this volume is in a primary storage pool that has previously been backed up to a copy storage pool, attempt to restore damaged files by using the RESTORE STGPOOL command.

ANR1163W Offsite volume *volume name* still contains files which could not be moved.

Explanation: During processing of a MOVE DATA command or reclamation, the server determined that the indicated offsite volume contained one or more files that could not be moved. One or more files could not be copied from the other available volumes.

The server might not move some files if the storage pool is collocated and the volume being moved or reclaimed contains files that require different output volumes. The server will skip these files and no messages are issued identifying the skipped files. The files are skipped to honor the collocation attribute of the storage pool.

System action: None.

User response: Check for messages indicating reasons why files could not be moved. To complete the move operation, you have several options:

- Bring the volume back on site and reissue a MOVE DATA command to reclaim the volume.
- Make the primary volumes available and reissue a MOVE DATA command to reclaim the volume.
- Delete the files by using the DELETE VOLUME command.

If, however, the server is skipping files to honor the collocation attribute of the storage pool, run the MOVE DATA command, or wait until reclamation runs again. In either case, the server will move files to the appropriate output volumes until the volume being moved or reclaimed is empty. It might take more than one attempt to totally empty the volume.

ANR1165E **Error detected for file in storage pool**
storage pool name: Node node name, Type file type, File space filespace name, fsId filespace id, File name file name.

Explanation: The server has detected an error for the indicated file.

System action: The file will be marked damaged in the server database, and will not be accessed for future operations. If this file is part of an aggregate, the entire aggregate will be marked damaged. If a usable copy of the file exists in another storage pool, that copy may be accessed for future operations involving the file. The file is marked as damaged during a read operation, such as client restore or retrieve, or during server processes such as migration, backup storage pool, move data, or reclamation.

User response: If the indicated storage pool is a primary pool, and a usable copy of the file exists in a copy storage pool, you can recreate the file in the primary pool using the RESTORE STGPOOL command. If the indicated storage pool is a copy storage pool, it is possible that the primary copy of the file is usable, but was not accessed because the access mode for the primary storage pool or volume is unavailable. If this is the case, the primary copy of the file may be made accessible by changing the access mode of the primary pool or volume.

ANR1166E **Move Data for offsite volume cannot copy damaged file in storage pool**
storage pool name: Node node name, Type file type, File space filespace name, fsId filespace id, File name file name.

Explanation: A move data process for an offsite volume cannot locate an undamaged copy of the specified file in any storage pool accessible by the server. If this file is part of an aggregate, the process could not locate an undamaged copy of the aggregate to which the file belongs.

System action: The file will be skipped and will not be moved from the offsite volume.

User response: The indicated storage pool is a primary pool that contains a damaged copy of the file. The only usable copy of the file may now only reside on the offsite volume that was involved in the move data process. If you bring this volume back onsite, you can recreate the file in the primary pool by using the RESTORE STGPOOL command. After the restore, you can reissue the MOVE DATA command.

ANR1167E **Space reclamation for offsite volume volume name cannot copy damaged file in storage pool**
storage pool name: Node node name, Type file type, File space filespace name, fsId filespace id, File name file name.

Explanation: A reclamation process of offsite volumes cannot locate an undamaged copy of the specified file in any storage pool accessible by the server. If this file is part of an aggregate, the process could not locate an undamaged copy of the aggregate to which the file belongs.

System action: The file is skipped and will not be moved from the offsite volume.

User response: The indicated storage pool is a primary pool that contains a damaged copy of the file. The only usable copy of the file may now only reside on an offsite volume that was involved in the reclamation process, but was not totally reclaimed. If you bring this volume back onsite, you can recreate the file in the primary pool by using the RESTORE STGPOOL command.

ANR1168W **Migration skipping damaged file on volume**
volume name: Node node name, Type file type, File space filespace name, fsId filespace id, File name file name.

Explanation: During migration, a file is encountered that was previously found to be damaged. If this file is part of an aggregate, the entire aggregate was previously marked damaged, possibly because an integrity error was detected for some other file within the aggregate.

System action: The damaged file will not be moved.

User response: Audit the indicated volume with FIX=NO to verify that the file is damaged. The audit will reset the file status if the file is found to be undamaged during the audit. If the file is part of an aggregate, the audit will reset the aggregate status if the entire aggregate is found to be undamaged. If this volume is in a primary storage pool that has previously been backed up to a copy storage pool, you can also attempt to restore damaged files by using the RESTORE STGPOOL command.

ANR1169W **Lock conflict on movement of offsite file - file is skipped.**

Explanation: During migration, reclamation, or move data processing of a volume that is offsite, a copy of the file that resides in a primary disk storage pool is locked by another process.

System action: The file is skipped and the process will try to find another copy of the file in a copy storage pool. If another copy cannot be used, the move operation on the volume may be incomplete.

User response: If a move operation was incomplete, try repeating the operation.

ANR1170E Out of Space in target copy storage pool: *copy storage pool name.*

Explanation: During reclamation, or move data processing of a volume that is offsite, there was no volume available in the specified target copy storage pool.

System action: The operation is terminated.

User response: Define volumes to the copy storage pool or raise the MAXSCRATCH value.

ANR1171W Unable to move files associated with node *node name*, filespace *filespace name* fsId *filespace id* on volume *volume name* due to restore in progress.

Explanation: During movement of data (migration, reclamation, move data) from a sequential volume, one or more files were encountered that were locked by a restore operation.

System action: The files are not moved, but are skipped.

User response: Use the QUERY RESTORE FORMAT=DETAILED command to determine if the restore operation is active or is in restartable state. A restartable restore operation will keep the files locked from movement until the RESTOREINTERVAL is reached. QUERY OPTION will display this interval. You may wish to lower the RESTOREINTERVAL to cause a restartable restore operation to be removed and free up the locked files. The RESTOREINTERVAL is a server option. If you received this message due to a MOVE DATA operation, reissue the MOVE DATA command after the restore operation has completed in order to move any remaining files.

ANR1172E Move Data for offsite volume cannot copy file in storage pool *storage pool name*: Node *node name*, Type *file type*, File space *filespace name*, fsId *filespace id*, File name *file name*.

Explanation: A move data process for an offsite volume cannot locate a copy of the specified file in any storage pool accessible by the server. If this file is part of an aggregate, the process could not locate copy of the aggregate to which the file belongs on an accessible volume.

System action: The file will be skipped and will not be moved from the offsite volume.

User response: The indicated storage pool is a primary pool that should contain a primary copy of the file. Perhaps the volume on which that file resides is on a destroyed volume. The only usable copy of the file may now only reside on the offsite volume that was

involved in the move data process. If you bring this volume back onsite, you can recreate the file in the primary pool by using the RESTORE STGPOOL command. After the restore, you can reissue the MOVE DATA command.

ANR1173E Space reclamation for offsite volume(s) cannot copy file in storage pool *storage pool name*: Node *node name*, Type *file type*, File space *filespace name*, fsId *filespace id*, File name *file name*.

Explanation: A reclamation process of offsite volumes cannot locate a copy of the specified file in any storage pool accessible by the server. If this file is part of an aggregate, the process could not locate a copy of the aggregate to which the file belongs on an accessible volume.

System action: The file is skipped and will not be moved from the offsite volume.

User response: The indicated storage pool is a primary pool that should contain a copy of the file. Perhaps the volume on which that file resides is on a destroyed volume. The only usable copy of the file may now only reside on an offsite volume that was involved in the reclamation process, but was not totally reclaimed. If you bring this volume back onsite, you can recreate the file in the primary pool by using the RESTORE STGPOOL command.

ANR1174W One or more cached files were not deleted on volume *volume name*.

Explanation: The MOVE DATA command could not delete one or more cached files on the disk volume shown. Migration was probably running at the same time, creating cached files while the MOVE DATA command was trying to delete them.

System action: The MOVE DATA command ran to completion.

User response: If you want the remaining cached files removed from the disk volume, reissue the MOVE DATA command.

ANR1175W Volume *volume name* contains files which could not be reclaimed.

Explanation: After reclamation of the indicated volume, it still contains one or more files that could not be reclaimed. These files were skipped because of read errors, or because the files are marked damaged.

System action: The volume is marked unavailable so it will not be chosen again for reclamation.

User response:

- Use the UPDATE VOLUME command to set the volume access to readonly.

- Try using the MOVE DATA command to manually reclaim the volume.
- If files still exist on the volume, audit the volume using AUDIT VOLUME FIX=YES.
- Try using the MOVE DATA command again.
- Use the RESTORE VOLUME command to restore files marked damaged.

ANR1176I Moving data for collocation set *set number* of total sets on volume *volume name*.

Explanation: As a result of a move operations, such as MOVE DATA, MOVE NODEDATA, migration, or reclamation, the server is moving data from the volume indicated to new volumes. This message shows the total sets of data on the volume to be processed. Depending upon the collocation setting of the destination storage pool, a set can be file spaces that belong to the same collocation group, file spaces for a node, or a single file space.

System action: None.

User response: None.

ANR1178I Copying active files from primary storage pool *primary pool name* to active data pool *active data pool name* started as process *process ID*.

Explanation: A process has been started to copy active data from a primary storage pool to the indicated active data.

System action: For every noncached, active file in the primary pool, a copy is made in the active data pool, if a copy of that file does not already exist.

User response: None.

ANR1179I Preview of copying active files from primary storage pool *primary pool name* to active data pool *active data pool name* started as process *process ID*.

Explanation: A preview process has been started to copy active data from a primary storage pool to the indicated active data pool.

System action: Preview information about the COPY ACTIVATEDATA operation is collected and displayed, but files are not copied.

User response: None.

ANR1180W Access mode for volume *volume name* has been set to "unavailable" due to file read or integrity errors.

Explanation: During processing of a storage pool volume, input/output or other errors occur that force

the server to mark the volume unavailable for further processing.

System action: The server sets the volume status to unavailable.

User response: Correct the errors that set the volume to unavailable, or use the DELETE VOLUME command to remove it from the system.

ANR1181E *Diagnostic(ID):* Data storage transaction *transaction ID* was aborted.

Explanation: A database transaction failed because of an error that was detected during data storage processing. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The server operation that encountered this error during data storage processing fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction.

ANR1182I Removable volume *volume name* is required for a restore request from session *session id*.

Explanation: A restore request will need a removable volume. This message is issued as soon as the server determines that the volume will be needed. A mount request will be made when the volume is actually needed for processing. When the first pass determination of needed volumes is complete, message ANR1183I will be issued. However, it is possible that additional volumes will be needed later, as indicated in the explanation for message ANR1183I. This message is not issued for DISK device class volumes nor is it issued for FILE device class volumes.

System action: The server continues processing.

User response: Respond to any mount request for the indicated volume.

ANR1183I Initial determination of removable volumes required for a restore request from session *session id* is complete. Additional volumes may still be required.

Explanation: The first pass determination of needed volumes is complete for the indicated restore session. It is possible that additional volumes will be needed as individual objects are restored. This can happen for a variety of reasons. Examples of such reasons include: 1. An object spanning from one volume to another, where the second volume is not needed for any other objects during this restore session. 2. An object is found to be damaged and a copy storage pool volume is needed to complete the restore. 3. A volume is unavailable and a

ANR1184I • ANR1213I

copy storage pool volume is needed to complete the restore.

System action: The server continues processing.

User response: Respond to any mount request for any additional volumes.

ANR1184I Copy active data process *process ID* ended for storage pool *storage pool name*.

Explanation: A COPY ACTIVATEDATA process for the named primary storage pool has ended.

System action: None.

User response: None.

ANR1185I Copy active data process *process ID* terminated for storage pool *storage pool name* - process canceled.

Explanation: While copying active data from the indicated primary storage pool, a process performing the operation has been canceled.

System action: If other copy active data processes are executing for the named storage pool, these processes continue.

User response: None.

ANR1186I Restore of node *nodename*, file system *file system*, started as process *process ID* by administrator *administrator*. A full image for this file system will be restored to destination *destination*.

Explanation: The administrator initiates a restore of the node's file system. The restore will be performed using a full image of this file system. The file system will be restored to the indicated destination.

System action: The indicated process is started.

User response: None.

ANR1189I Removable volume *volume name* is required for copying active data.

Explanation: During processing of a COPY ACTIVATEDATA command, the server determines that a removable volume is required.

System action: Unless this is a preview process, the server attempts to mount the removable volume.

User response: Respond to any mount request for the indicated volume.

ANR1199I Removable volume *volume name* is required for audit process.

Explanation: During audit volume processing for the indicated volume, the server determines that a removable volume is required in order to complete processing.

System action: The server attempts to mount the removable volume.

User response: Respond to any mount request for the indicated volume.

ANR1210I Backup of primary storage pool *primary pool name* to copy storage pool *copy pool name* started as process *process ID*.

Explanation: A process has been started to back up a primary storage pool to the indicated copy storage pool.

System action: For every noncached file in the primary pool, a backup copy is made in the copy pool, if a copy of that file does not already exist.

User response: None.

ANR1211I Backup preview of primary storage pool *primary pool name* to copy storage pool *copy pool name* started as process *process ID*.

Explanation: A preview process has been started to back up a primary storage pool to the indicated copy storage pool.

System action: Preview information about the backup operation is collected and displayed, but files are not backed up.

User response: None.

ANR1212I Backup process *process ID* ended for storage pool *storage pool name*.

Explanation: A backup process for the named primary storage pool has ended.

System action: None.

User response: None.

ANR1213I Backup process *process ID* terminated for storage pool *storage pool name* - process canceled.

Explanation: During backup of the indicated primary storage pool, a process performing the backup has been canceled.

System action: If other backup processes are executing for the named storage pool, these processes continue.

User response: None.

ANR1214I Backup of primary storage pool *primary pool name* to copy storage pool *copy pool name* has ended. Files Backed Up: number of files, Bytes Backed Up: number of bytes, Unreadable Files: number of unreadable files, Unreadable Bytes: number of bytes in unreadable files.

Explanation: Backup processing for the specified storage pool has ended with the results shown.

System action: None.

User response: Examine previous messages to determine whether all backup processes ended successfully.

ANR1215I Backup preview of primary storage pool *primary pool name* to copy storage pool *copy pool name* has ended. Files Backed Up: number of files, Bytes Backed Up: number of bytes.

Explanation: Backup preview processing for the specified storage pool has ended with the results shown.

System action: None.

User response: None.

ANR1216E Command: Process *process ID* terminated - storage media inaccessible.

Explanation: During backup processing, a required volume could not be mounted.

System action: The indicated backup process ends.

User response: None.

ANR1217E Command: Process *process ID* terminated - insufficient number of mount points available for removable media.

Explanation: During backup processing, the server could not allocate sufficient mount points for the volumes required.

System action: The indicated backup process ends.

User response: If necessary, make more mount points available.

ANR1218E Command: Process *process ID* terminated - excessive read errors encountered.

Explanation: During backup processing, read errors occur that prevent the backup from continuing.

System action: The indicated backup process ends.

User response: If possible, correct the cause of the read errors and reissue the backup command.

ANR1219E Command: Process *process ID* terminated - excessive write errors encountered.

Explanation: During backup processing, write errors occur that prevent the backup from continuing.

System action: The indicated backup process ends.

User response: If possible, correct the cause of the write errors and reissue the backup command.

ANR1220E Command: Process *process ID* terminated - data transfer interrupted.

Explanation: During backup processing, a data transfer operation was interrupted and could not be continued.

System action: The indicated backup process ends.

User response: If possible, correct the cause of the interruption and reissue the backup command.

ANR1221E Command: Process *process ID* terminated - insufficient space in target storage pool *pool name*.

Explanation: During backup processing, the server cannot copy data to the specified copy or active-data storage pool because not enough space is available in the specified copy or active-data storage pool, or, the access for the copy or active-data storage pool is either unavailable or readonly.

System action: The indicated backup process ends.

User response: Make more space available in the copy or active-data storage pool and reissue the backup command, or reissue the backup command and specify another copy or active-data storage pool with more space.

ANR1222E Command: Process *process ID* terminated - sufficient recovery log space is not available.

Explanation: During backup processing, the server runs out of recovery log space.

System action: The indicated backup process ends.

User response: If necessary, make more server recovery log space available.

ANR1223E Command: Process *process ID* terminated - sufficient database space is not available.

Explanation: During backup processing, the server runs out of database space.

System action: The indicated backup process ends.

User response: If necessary, make more server database space available.

ANR1224E *Command:* **Process process ID terminated - lock conflict.**

Explanation: During backup processing, the server needs to obtain a lock that is not available.

System action: The indicated backup process ends.

User response: Reissue the backup command.

ANR1225E *Command:* **Process process ID terminated - thread resource not available.**

Explanation: During backup processing, the server cannot start a thread.

System action: The indicated backup process ends.

User response: Reissue the backup command. If the error persists, it may indicate a shortage of server memory.

ANR1226E *Command:* **Process process ID terminated - sufficient memory is not available.**

Explanation: During backup processing, not enough server memory is available.

System action: The indicated backup process ends.

User response: If necessary, make more memory available to the server, and then reissue the backup command.

ANR1227E *Command:* **Process process ID terminated - internal server error detected.**

Explanation: During backup processing, the server encounters an internal error.

System action: The indicated backup process ends.

User response: Contact your service representative.

ANR1228I **Removable volume *volume name* is required for storage pool backup.**

Explanation: During processing of a BACKUP STGPOOL command, the server determines that a removable volume is required.

System action: Unless this is a preview process, the server attempts to mount the removable volume.

User response: Respond to any mount request for the indicated volume.

ANR1229W **Volume *volume name* cannot be backed up to a copy storage pool or copied to an active-data storage pool.- the volume is offline, in use by another process, not currently mountable, or access mode is "unavailable" or "destroyed".**

Explanation: During storage pool backup or the

copying of active data, the contents of a volume cannot be backed up or copied if one of the following conditions exists:

- The volume is offline.
- The volume is in use by another process.
- The volume cannot be mounted.
- The access mode of the volume does not allow the operation.

System action: The server continues backup processing, but skips the indicated volume.

User response: Take one of the following actions:

- If the volume is offline, issue the VARY ONLINE command for the indicated volume.
 - If the access mode of the volume is unavailable, issue the UPDATE VOLUME command to change the access mode to readwrite or readonly. If the access mode of the volume is destroyed, verify with an administrator whether the access mode should be updated. If it should, issue the UPDATE VOLUME command to change the access mode to readwrite or readonly.
 - If the volume is in use by another process, wait for that process to complete, and then retry the BACKUP STGPOOL command or the COPY ACTIVATEDATA command.
 - If the volume is not currently mountable, verify that the drive can mount the volume, and then retry the BACKUP STGPOOL command or the COPY ACTIVATEDATA command.
-

ANR1230I **Restore of primary storage pool *primary pool name* started as process *process ID*.**

Explanation: A process has been started to restore the indicated primary storage pool.

System action: Non-cached files that reside in the named primary storage pool are restored if either of the following criteria are met:

- The file is stored on a volume whose access mode is destroyed
- The primary file has been identified as having data-integrity errors during a previous operation

User response: None.

ANR1231I **Restore preview of primary storage pool *primary pool name* started as process *process ID*.**

Explanation: A preview process has been started to restore a primary storage pool.

System action: Preview information about the restore operation is collected and displayed, but files are not restored. The restore preview includes noncached files that reside in the specified primary storage pool and that meet either of the following conditions:

- The file is stored on a volume whose access mode is destroyed
- The primary file has been identified as having data-integrity errors during a previous operation

User response: None.

ANR1232I Restore of volumes in primary storage pool *primary pool name* started as process *process ID*.

Explanation: A process has been started to restore one or more volumes in the indicated primary storage pool.

System action: Noncached files that reside on selected volumes in the primary storage pool are restored.

User response: None.

ANR1233I Restore preview of volumes in primary storage pool *primary pool name* started as process *process ID*.

Explanation: A preview process has been started to restore one or more volumes in the indicated primary storage pool.

System action: Preview information about the restore operation is collected and displayed, but files are not restored. The restore preview includes noncached files that reside on selected volumes in the primary storage pool.

User response: None.

ANR1234I Restore process *process ID* ended for storage pool *storage pool name*.

Explanation: A restore process for the named primary storage pool has ended.

System action: None.

User response: None.

ANR1235I Restore process *process ID* ended for volumes in storage pool *storage pool name*.

Explanation: A restore process for volumes in the named primary storage pool has ended.

System action: None.

User response: None.

ANR1236I Restore process *process ID* terminated for storage pool *storage pool name* - process canceled.

Explanation: During restore of the indicated primary storage pool, a process performing the restore has been canceled.

System action: If other restore processes are executing

for the named storage pool, these processes continue.

User response: None.

ANR1237I Restore process *process ID* terminated for volumes in storage pool *storage pool name* - process canceled.

Explanation: During restore of volumes in the indicated primary storage pool, a process performing the restore has been canceled.

System action: If other restore processes are executing for the volumes, these processes continue.

User response: None.

ANR1238I Restore of primary storage pool *primary pool name* has ended. Files Restored: *number of files*, Bytes Restored: *number of bytes*, Unreadable Files: *number of unreadable files*, Unreadable Bytes: *number of bytes in unreadable files*.

Explanation: Restore processing for the specified storage pool has ended with the results shown.

System action: None.

User response: Examine previous messages to determine whether all restore processes ended successfully.

ANR1239I Restore preview of primary storage pool *primary pool name* has ended. Files Restored: *number of files*, Bytes Restored: *number of bytes*.

Explanation: Restore preview processing for the specified storage pool has ended with the results shown.

System action: None.

User response: None.

ANR1240I Restore of volumes in primary storage pool *primary pool name* has ended. Files Restored: *number of files*, Bytes Restored: *number of bytes*, Unreadable Files: *number of unreadable files*, Unreadable Bytes: *number of bytes in unreadable files*.

Explanation: Restore processing for volumes in the specified storage pool has ended with the results shown.

System action: None.

User response: Examine previous messages to determine whether all restore processes ended successfully.

ANR1241I Restore preview of volumes in primary storage pool *primary pool name* has ended. **Files Restored:** *number of files*, **Bytes Restored:** *number of bytes*.

Explanation: Restore preview processing for volumes in the specified storage pool has ended with the results shown.

System action: None.

User response: None.

ANR1242E *Command: Process process ID terminated - storage media inaccessible.*

Explanation: During restore processing, a required volume could not be mounted.

System action: The indicated restore process ends.

User response: Verify that the copy and primary storage pools and volumes being accessed are available. Check the ACCESS parameter for both of the storage pools and all related volumes to ensure the ACCESS state is not preventing access.

ANR1243E *Command: Process process ID terminated - insufficient number of mount points available for removable media.*

Explanation: During restore processing, the server could not allocate sufficient mount points for the volumes required.

System action: The indicated restore process ends.

User response: If necessary, make more mount points available.

ANR1244E *Command: Process process ID terminated - excessive read errors encountered.*

Explanation: During restore processing, read errors occur that prevent the restore from continuing.

System action: The indicated restore process ends.

User response: If possible, correct the cause of the read errors and reissue the restore command.

ANR1245E *Command: Process process ID terminated - excessive write errors encountered.*

Explanation: During restore processing, write errors occur that prevent the restore from continuing.

System action: The indicated restore process ends.

User response: If possible, correct the cause of the write errors and reissue the restore command.

ANR1246E *Command: Process process ID terminated - data transfer interrupted.*

Explanation: During restore processing, a data transfer operation was interrupted and could not be continued.

System action: The indicated restore process ends.

User response: If possible, correct the cause of the interruption and reissue the restore command.

ANR1247E *Command: Process process ID terminated - insufficient space in target primary storage pool.*

Explanation: During restore processing, the server cannot copy data to the target primary storage pool, because not enough space is available in the target pool.

System action: The indicated restore process ends.

User response: Make more space available in the target primary storage pool, and then reissue the restore command.

ANR1248E *Command: Process process ID terminated - sufficient recovery log space is not available.*

Explanation: During restore processing, the server runs out of recovery log space.

System action: The indicated restore process ends.

User response: If necessary, make more server recovery log space available.

ANR1249E *Command: Process process ID terminated - sufficient database space is not available.*

Explanation: During restore processing, the server runs out of database space.

System action: The indicated restore process ends.

User response: If necessary, make more server database space available.

ANR1250E *Command: Process process ID terminated - lock conflict.*

Explanation: During restore processing, the server needs to obtain a lock that is not available.

System action: The indicated restore process ends.

User response: Reissue the restore command.

ANR1251E *Command:* **Process process ID terminated - thread resource not available.**

Explanation: During restore processing, the server cannot start a thread.

System action: The indicated restore process ends.

User response: Reissue the restore command. If the error persists, it may indicate a shortage of server memory.

ANR1252E *Command:* **Process process ID terminated - sufficient memory is not available.**

Explanation: During restore processing, there is not enough server memory available.

System action: The indicated restore process ends.

User response: If necessary, make more memory available to the server; and then reissue the restore command.

ANR1253E *Command:* **Process process ID terminated - internal server error detected.**

Explanation: During restore processing, the server encounters an internal error.

System action: The indicated restore process ends.

User response: Contact your service representative.

ANR1254I **Removable volume *volume name* is required for restore processing.**

Explanation: During processing of a RESTORE STGPOOL or RESTORE VOLUME command, the server determines that a removable volume is required.

System action: Unless this is a preview process, the server attempts to mount the removable volume.

User response: Respond to any mount request for the indicated volume.

ANR1255W **Files on volume *volume name* cannot be restored - access mode is "unavailable" or "offsite".**

Explanation: During processing of a RESTORE STGPOOL or RESTORE VOLUME command, files on a copy storage pool volume cannot be restored because of the volume's access mode.

System action: The server continues restore processing, but skips the indicated volume.

User response: If the volume is stored at an offsite location, bring the volume onsite. Use the UPDATE VOLUME command to change the access mode for the volume and restart the restore command.

ANR1256W **Volume *volume name* contains files that could not be restored.**

Explanation: During processing of a RESTORE STGPOOL or RESTORE VOLUME command, the server determines that the indicated volume contains one or more files that could not be restored. If this is a preview operation, this message indicates that a restorable backup copy cannot be found for one or more files on the indicated volume. If this is an actual restore operation, this message could result if any of the following conditions exist for a file on the indicated volume:

- A restorable backup copy cannot be found for the file.
- A restorable backup copy of the file exists, but is located on a copy storage pool volume whose access mode is unavailable or offsite.
- During restore processing, a backup copy was selected for restore processing, but was deleted or moved before the file was actually restored. This action could occur as a result of MOVE DATA, DELETE VOLUME, AUDIT VOLUME FIX=YES, or reclamation processing of a copy storage pool volume while the restore was in progress.
- A restorable backup copy of the file exists, but is on a copy storage pool volume that cannot be accessed since no drive path exists.

System action: None.

User response: If this was an actual restore operation, check for messages indicating that files could not be restored because a copy storage pool volume was unavailable or offsite. Check to see if a move data, delete volume, audit volume, or reclamation process occurred for a copy storage pool while the restore was in progress. If either of these conditions existed, correct the situation and reissue the restore command.

ANR1257W **Storage pool backup skipping damaged file on volume *volume name*: Node *node name*, Type *file type*, File space *filespace name*, fsId *filespace id*, File name *file name*.**

Explanation: During storage pool backup, a file is encountered that was previously found to be damaged. If this file is part of an aggregate, the entire aggregate was previously marked damaged, possibly because an integrity error was detected for some other file within the aggregate.

System action: The damaged file will not be backed up.

User response: Audit the indicated volume with FIX=YES. The audit will verify whether or not the file is damaged and perform one of the following actions:

- If the the file is found to be undamaged, the audit will reset the file status. If the file is part of an

aggregate, the audit will reset the aggregate status if the entire aggregate is found to be undamaged.

- If the file is found to be damaged and the file had not previously been backed up to a copy storage pool, the audit will delete the file.
- If the file is found to be damaged and the file has previously been backed up to a copy storage pool, the audit will report the file as damaged and you must use the RESTORE STGPOOL command to recover the file.

ANR1258W Files on volume *volume name* needed for move data cannot be accessed - access mode is "unavailable", "offsite", or "destroyed".

Explanation: During a move data operation, files on a storage pool volume cannot be copied because of the volume's access mode. The server cannot move data on a volume that has an access mode of "unavailable", "offsite", or "destroyed".

System action: The server continues move data processing, but one or more files were not moved from the volume.

User response: If the specified volume can be made available, use the UPDATE VOLUME command to change the access mode for the volume and reissue the MOVE DATA or MOVE NODEDATA command.

ANR1259W Files on volume *volume name* needed for offsite reclamation cannot be accessed - access mode is "unavailable" or "offsite".

Explanation: During reclamation processing of an offsite volume, files on a storage pool volume cannot be copied because of the volume's access mode.

System action: The server continues reclamation, but one or more files were not moved from an offsite volume, which prevents it from being reclaimed.

User response: If the specified volume can be made available, use the UPDATE VOLUME command to change the access mode for the volume and initiate reclamation again by updating the reclamation threshold for the copy storage pool.

ANR1260W Volume *volume name* contains one or more damaged, primary files.

Explanation: This message is issued during RESTORE STGPOOL processing. The indicated volume contains one or more primary, noncached files that have previously been found to be damaged.

System action: If this is not a preview operation, the restore processing attempts to restore the damaged files from copies located in a copy storage pool. If this is a preview operation, no system action is taken.

User response: You can take the following actions:

- Issue the QUERY CONTENT command with DAMAGED=YES to obtain a list of damaged files on the indicated volume.
- Audit the indicated volume with FIX=NO to verify that the files are damaged; the audit will reset the status of any files that are found to be undamaged during the audit.
- If this message was issued during a restore preview operation, attempt to restore the damaged files using the RESTORE STGPOOL command.
- Audit the indicated volume with FIX=YES to delete the damaged files from the database.

ANR1263I *command*: Processing completed successfully.

Explanation: The background process to service the command *command* has completed successfully.

System action: Processing for the command completes. Statistics on the number and type of objects moved, together with the total number of bytes copied, are displayed on the server console following this message.

User response: None.

ANR1264I *Command*: Processing canceled before completion.

Explanation: The background process to service the command *command* has been canceled with the CANCEL PROCESS command.

System action: Processing for the command *command* ends. Statistics on the number and type of objects moved, together with the total number of bytes copied, are displayed on the server console following this message.

User response: None.

ANR1265E *Salvage volume command*: Processing terminated abnormally - error accessing data storage.

Explanation: The server encountered an internal error in accessing data storage while executing a salvage volume operation.

System action: The operation is ended and server operation continues.

User response: Use the QUERY ACTLOG command to examine messages prior to this error to determine the cause of the data storage failure. If you find and resolve the error, retry the operation. If you cannot find the error, contact your service representative for assistance in resolving the problem.

ANR1266E *Salvage volume command:* **Processing terminated abnormally - volume not a storage pool volume.**

Explanation: The server encountered an internal error in accessing data storage while executing a salvage volume operation. The error occurred because an attempt has been made to access a volume that was not a storage pool volume.

System action: The command *command* operation is ended and server operation continues.

User response: Issue the command with a valid volume name.

ANR1267I *Salvage volume command:* **Processed number volume(s).**

Explanation: The background process to service the command *Salvage volume command* inspected *number* input volumes.

System action: Salvage processing for the command completes. Server operation continues.

User response: None.

ANR1268I *Salvage volume command:* **Recovered number byte(s).**

Explanation: The background process to service the command *Salvage volume command* recovered *number* bytes worth of data.

System action: Salvage processing for the command completes. Server operation continues.

User response: None.

ANR1269I *Salvage volume command:* **Recovered number file(s).**

Explanation: The background process to service the command *Salvage volume command* recovered *number* files.

System action: Salvage processing for the command completes. Server operation continues.

User response: None.

ANR1270I *Salvage volume command:* **File (internal file identifier/internal file identifier) recovered.**

Explanation: The background process to service the command *Salvage volume command* recovered a file. The new file was given a new, system generated name based on the *internal file identifier* and the name of the volume from which the file was recovered. The *internal file identifier* is the identifier by which the file was known to the server before the file was deleted.

System action: Salvage processing for the command completes. Server operation continues.

User response: None.

ANR1271I *Salvage volume command:* *** number bytes recovered from volume volume.**

Explanation: The background process to service the command *Salvage volume command* recovered a file from the volume *volume*. The *number* of bytes recovered from the *volume* is listed.

System action: Salvage processing for the command completes. Server operation continues.

User response: None.

ANR1272I *Salvage volume command:* *** File is complete - it began and ended on volume volume.**

Explanation: The background process to service the command *Salvage volume command* recovered a file from the volume *volume*. The file was completely contained on *volume*.

System action: Salvage processing for the command completes. Server operation continues.

User response: None.

ANR1273I *Salvage volume command:* *** File is incomplete - it began on volume volume but did not end.**

Explanation: The background process to service the command *Salvage volume command* recovered a file from the volume *volume*. The file was not completely contained on *volume*. Although the file began on this volume, it spanned out to a different volume.

System action: Salvage processing for the command completes. Server operation continues.

User response: None.

ANR1274I *Salvage volume command:* *** File is incomplete - it ended on volume volume but did not begin there.**

Explanation: The background process to service the command *Salvage volume command* recovered a file from the volume *volume*. The file was not completely contained on *volume*. Although the file ended on this volume, it spanned in from a different volume.

System action: Salvage processing for the command completes. Server operation continues.

User response: None.

ANR1275I *Salvage volume command: * File is incomplete - it did not began or end on volume volume.*

Explanation: The background process to service the command *Salvage volume command* recovered a file from the volume *volume*. The file was not completely contained on *volume*. It spanned in from one volume and spanned out to a another.

System action: Salvage processing for the command completes. Server operation continues.

User response: None.

ANR1276E *Command: Process terminated - sufficient memory is not available.*

Explanation: During salvage processing, not enough server memory is available.

System action: The salvage process ends.

User response: If necessary, make more memory available to the server, and then reissue the salvage command.

ANR1277E *Command: Process terminated - the default management class in the active policy set in policy domain domain name does not contain an archive copy group. Unable to continue with salvage.*

Explanation: The background process to service the command *Salvage volume command* was unable to recover any files because the default management class in the active policy set in *policy domain* does not contain an archive copy group.

System action: The salvage process ends.

User response: Add an archive copy group to the default management class in the active policy set of the specified domain, and then reissue the salvage command.

ANR1278I *Occupancy is incorrect for storage pool storage pool name. Occupancy is being reset.*

Explanation: The server has detected incorrect occupancy information.

System action: The server recalculates the occupancy value based on current storage pool information.

User response: None.

ANR1279I *Occupancy is incorrect for volume name volume name. Occupancy is being reset.*

Explanation: The server has detected incorrect occupancy information.

System action: The server recalculates the occupancy

value based on current sequential volume information.

User response: None.

ANR1280E *Command: Process process ID terminated - transaction aborted.*

Explanation: During backup processing, the server detected an error while attempting to commit a transaction. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The indicated backup process ends.

User response: Check for additional messages and eliminate the condition that caused the failed transaction.

ANR1281E *Command: Process process ID terminated - transaction aborted.*

Explanation: During restore processing, the server detected an error while attempting to commit a transaction. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The indicated restore process ends.

User response: Check for additional messages and eliminate the condition that caused the failed transaction.

ANR1282I *Logical occupancy is incorrect for storage pool storage pool name. Logical occupancy is being reset.*

Explanation: The server has detected incorrect logical occupancy information.

System action: The server recalculates the logical occupancy value based on current storage pool information.

User response: None.

ANR1283I *File count is incorrect for storage pool storage pool name - file count is being reset.*

Explanation: The server has detected an incorrect count of the number of files within this storage pool.

System action: The server will correct this information.

User response: None.

ANR1284I *Move node data started as process process ID.*

Explanation: A process has been started to move data by node.

System action: The indicated process has started.

User response: To query the progress of the process, use the QUERY PROCESS command. To cancel the background process, use the CANCEL PROCESS command. Use the *process ID* number to specify this process.

ANR1288I Move node data process *process ID* ended for storage pool *storage pool name*.

Explanation: A move node data process for the named storage pool has ended.

System action: None.

User response: None.

ANR1289I Move node data process *process ID* terminated for the storage pool *storage pool name* - process canceled.

Explanation: During move node data processing in the indicated storage pool, the process performing the move node data has been canceled.

System action: If other move node data processes are executing for the storage pool, these processes continue.

User response: None.

ANR1290I Move node data from storage pool *storage pool name* to storage pool *storage pool name* has ended. Files Moved: *number of files*, Bytes Moved: *number of bytes*, Unreadable Files: *number of unreadable files*, Unreadable Bytes: *number of bytes in unreadable files*.

Explanation: Move node processing for the specified storage pool has ended with the displayed results.

System action: None.

User response: Examine previous messages to determine whether all move node data processes ended successfully.

ANR1291E Audit command: Incorrect information detected in a schedule event record for node *nodename*, domain *domain*, schedule *schedule*. Specify FIX=YES to delete the record.

Explanation: A database audit process detects incorrect information for a schedule event record.

System action: Audit processing continues.

User response: Rerun the AUDITDB operation specifying FIX=YES so that the incorrect schedule event record can be deleted.

ANR1292E Audit command: Incorrect information detected in a schedule event record for node *nodename*, domain *domain*, schedule *schedule*. The record will be deleted.

Explanation: A database audit process detects incorrect information for a schedule event record. The record will be deleted. A subsequent QUERY EVENT will report this event as "Missed."

System action: Audit processing continues.

User response: None.

ANR1293E Space-reclamation process *process number*: Fifty files in offsite storage-pool volumes do not have copies in accessible storage pools.

Explanation: More files in offsite storage-pool volumes might exist for which copies cannot be located. If this is the case, message ANR1173E is not displayed.

System action: The Tivoli Storage Manager server skips files that do not have copies. The server does not move the files from offsite storage-pool volumes.

User response: To view detailed information about all the files that are skipped during the space-reclamation process, enable trace AFUNAVAILABLE and look in the trace log.

ANR1294I Process *process ID* skipped *skipped files* files on volume *volume name* because of deduplicated files.

Explanation: While moving or copying files from the sequential FILE volume shown to a DISK storage pool, files that had deduplicated extents were encountered. As a result, the files were skipped.

The sequential FILE volume shown is assigned to a storage pool that has deduplication enabled or at one time had deduplication enabled. Some of the files on the volume have deduplicated extents and can not be moved or copied to the DISK storage pool.

System action: The server moves or copies all files from the volume that do not have deduplicated extents. Those files that do have deduplicated extents are skipped.

User response: If attempting a MOVE DATA/NODEDATA to move the files with deduplicated extents to the DISK storage pool, one must first perform a MOVE DATA/NODEDATA to another sequential storage pool that does not have deduplication enabled. This move will restore the deduplicated files to their complete state in the target storage pool. Once all deduplicated data has been moved, perform a MOVE DATA or MOVE NODEDATA to the DISK storage pool from the target storage pool. It is recommended to use a FILE storage pool as the target.

If attempting a RESTORE STGPOOL/VOLUME to copy the files with deduplicated extents, one must first perform a RESTORE STGPOOL/VOLUME to another sequential storage pool that does not have deduplication enabled. This will restore the deduplicated files to their complete state in the target storage pool. Once all deduplicated data has been restored, perform a MOVE DATA/NODEDATA to the DISK storage pool from the target storage pool. It is recommended to use a FILE storage pool as the target.

ANR1295W An attempt to set end reclamation date for WORM volume *volume name* to end reclamation date *failed*. end reclamation date set to *SnapLock retention date*.

Explanation: Tivoli Storage Manager computes and attempts to set the end reclamation date for a volume based on the RETMIN and RETVER COPYGROUP attributes. When setting the end reclamation date for the named volume, the Network Appliance SnapLock file system was unable to fulfil the request. It was, however, able to set the date to the Snaplock retention date, which is farther in the future than the requested date. This is probably due to how the SnapLock NAS file server's retention date is configured.

This warning message is only issued once per volume, when this condition is detected when data is first placed on the volume.

System action: The operation continues.

User response: Verify that the Tivoli Storage Manager COPYGROUP attributes and the retention settings of the Network Appliance file system are consistent with your requirements for WORM volume storage.

ANR1296W Storage pool *storage pool name* does not contain WORM FILE volumes.

Explanation: This message might be issued during the definition or updating of a storage pool, or during BACKUP or RESTORE STGPOOL commands, or in other such situations when it is determined that data on WORM volumes might be moved to other media. It names a storage pool that does not contain WORM FILE volumes.

When it is issued during the DEFINE and UPDATE STGPOOL commands, it indicates that the storage pool being defined or updated is being configured with WORM FILE volumes (Reclamationtype is SnapLock), but other storage pools being specified on the storage pool definition (for example, the Next or Reclaim or Copy storage pool parameters) do not contain WORM FILE volumes (Reclamationtype is Threshold). Such configurations might cause data on those WORM FILE volumes to be moved to a storage pool that does not support WORM FILE volumes.

For other situations, this message might be issued when there will be a movement of data from a storage

pool with WORM FILE volumes (Reclamationtype is SnapLock) to a storage pool that does not have WORM FILE volumes (Reclamationtype is Threshold).

The server allows this type of movement, but the customer needs to be aware that if data is moved from a WORM FILE volume to another type of media, the data may no longer be protected from inadvertent or malicious deletion. In addition, if this data is on WORM volumes to meet data retention and protection requirements for certain legal purposes and is moved to other media, the data might no longer meet those requirements.

System action: The command continues.

User response: Verify that the storage pools being used meet your requirements for data protection and retention.

ANR1297E Storage pools with RECLAMATIONTYPE=SNAPLOCK can only be defined on servers with archive data retention protection enabled.

Explanation: Defining storage pools with RECLAMATION=SNAPLOCK is only supported on a server with archive data protection enabled.

System action: The define storage pool command fails.

User response: Define the storage pool with RECLAMATIONTYPE=THRESHOLD on this server. Or else enable archive data retention protection on this server, and try the command again.

ANR1298W The server encountered an error in attempting to delete an object in a Centera storage device. The Centera representation of the name is *Centera object string*. The server was keeping track of the object in volume id *volume id*. The return code received was *return code*.

Explanation: The server failed to delete an object in a Centera storage device after server records concerning the object were deleted. The object is no longer accessible through the server. The object continues to occupy space in the Centera storage device. The return code that is returned is either from the server interface to Centera services, or it can be directly from the Centera device.

System action: The server continues operation, and the object is logically deleted within the server, but continues to occupy space in the Centera device.

User response: The server can continue to operate in spite of this error. Centera service can be required if the volume of unpurged objects becomes a problem.

ANR1299E The server encountered an invalid storage format while attempting a partial object retrieve for object *seg_id_hi,seg_id_lo*.

Explanation: A partial object retrieve was attempted on a file that was stored in a format that does not support partial object retrieves.

System action: The transaction ends and the retrieve request fails.

User response: Try the retrieve again, using a regular or full retrieve instead of a partial object retrieve.

ANR1300I VARY ONLINE command initiated for disk volume *volume name*.

Explanation: A VARY ONLINE command has caused a vary-on process to be started for the volume specified.

System action: The volume is varied online.

User response: None.

ANR1301I VARY OFFLINE command initiated for disk volume *volume name*.

Explanation: A VARY OFFLINE command has caused a vary-off process to be started for the volume specified.

System action: The volume is varied offline.

User response: None.

ANR1302E Disk volume *volume name* is already online.

Explanation: A VARY ONLINE command specified a volume that was already online.

System action: None.

User response: None.

ANR1303E Disk volume *volume name* is already offline.

Explanation: A VARY OFFLINE command specified a volume that was already offline.

System action: None.

User response: None.

ANR1304E Disk volume *volume name* is currently in use.

Explanation: A VARY OFFLINE command specified a volume that is currently in use and cannot be varied offline at this time.

System action: None.

User response: Try the command again at a later time, or attempt to determine how it is currently being used and free it.

ANR1305I Disk volume *volume name* varied online.

Explanation: The specified volume has been varied online as the result of a VARY ONLINE command.

System action: None.

User response: None.

ANR1306I Disk volume *volume name* varied online (read-only).

Explanation: The specified volume has been varied online in read-only mode as the result of a VARY ONLINE command.

System action: None.

User response: None.

ANR1307I Disk volume *volume name* varied offline.

Explanation: The specified volume has been varied offline as the result of a VARY OFFLINE command.

System action: None.

User response: None.

ANR1308W Storage agent not synchronized with server - restart needed.

Explanation: The storage agent has detected that a policy, storage pool, device class, or other attributes that is read from the server at initialization is no longer valid.

System action: The operation of the storage agent continues. Depending upon what has changed on the server the storage agent behavior may be unpredictable and other failures may result.

User response: The storage agent should be halted and restarted to synchronize the storage agent with the server.

ANR1309W Shred value zero for storage pool *storage pool name* may render deleted data non shreddable.

Explanation: This message is issued during the define or update of a storage pool when a SHRED value of zero has been found with a storage pool in the storage pool hierarchy.

The server allows this type of operation, but the administrator needs to be aware that if data is stored or moved to the affected storage pool, the data cannot be shredded after deletion.

When it is issued during the DEFINE command, it

indicates that the storage pool definition is being configured with a non zero SHRED value, however other storage pools being specified on the definition (for example, the Next or Reclaim or Copy storage pool parameters) have a SHRED value of zero.

When issued during the UPDATE command, it indicates the specified storage pool may be altering the SHRED value from non zero to zero or that the specified Copy, Next or Reclaim storage pool has a SHRED value zero. Such configurations may result in data to become non shreddable if data from the primary random access storage pool is moved to one of the storage pools with a zero SHRED value.

System action: The command continues.

User response: Verify that the storage pools being used meet your requirements for data protection.

ANR1310E Vary-on failed for disk volume *volume name* - insufficient memory.

Explanation: A VARY ONLINE command has been issued for the disk volume specified, but sufficient memory is not available to process the command.

System action: The volume is not varied online.

User response: Reissue the command at a later time, or make more memory available to the server.

ANR1311E Vary-on failed for disk volume *volume name* - unable to access disk device.

Explanation: A VARY ONLINE command has been issued for the disk volume specified, but the server is unable to access the disk.

System action: The volume is not varied online.

User response: Attempt to determine the cause of the inability to access the volume and correct the problem.

ANR1312E Vary-on failed for disk volume *volume name* - error reading disk.

Explanation: A VARY ONLINE command has been issued for the disk volume specified but the server encounters an error reading the disk.

System action: The volume is not varied online.

User response: Attempt to determine the cause of the read error and correct the problem.

ANR1313E Vary-on failed for disk volume *volume name* - unsupported block size (*block size*).

Explanation: A VARY ONLINE command has been issued for the disk volume specified, but the volume is formatted with a block size that cannot be used.

System action: The volume is not varied online.

User response: Reformat the disk with a block size that is an evenly divisible by 4096.

ANR1314E Vary-on failed for disk volume *volume name* - reduced capacity (was *count* blocks, now *count* blocks).

Explanation: A VARY ONLINE command has been issued for the disk volume specified, but the size of the volume does not match the size expected.

System action: The volume is not varied online.

User response: Restore the volume or otherwise correct the disk volume size, and reissue the command.

ANR1315E Vary-on failed for disk volume *volume name* - invalid label block.

Explanation: A VARY ONLINE command has been issued for the disk volume specified, but the label block of the volume is invalid or cannot be read.

System action: The volume is not varied online.

User response: Restore or reformat the disk volume.

ANR1316E Vary-on failed for disk volume *volume name* - internal error detected.

Explanation: A VARY ONLINE command has been issued for the disk volume specified, but fails due to an internal server error.

System action: The volume is not varied online.

User response: Contact your service representative.

ANR1317E Command: Storage pool *storage pool name* is not a shreddable pool.

Explanation: The command indicated specifies the name of a storage pool which is not a shreddable pool. The command syntax requires that SHREDTONOSHRED=YES be specified when data is moved from a shreddable storage pool to a non shreddable storage pool.

System action: The server does not process the command.

User response: Reissue the command with SHREDTONOSHRED=YES.

ANR1318I Copying active data from primary storage pool *primary pool name* to active data pool *active data pool name* has ended. Files Copied Up: *number of files*, Bytes Copied Up: *number of bytes*, Unreadable Files: *number of unreadable files*, Unreadable Bytes: *number of bytes in unreadable files*.

Explanation: Copy active data processing for the

specified storage pool has ended with the results shown.

System action: None.

User response: Examine previous messages to determine whether all copy active data processes ended successfully.

ANR1319I Preview of copying active data from primary storage pool *primary pool name* to active data pool *active data pool name* has ended. Files Copied: *number of files*, Bytes Copied: *number of bytes*.

Explanation: Preview of copy active data processing for the specified storage pool has ended with the results shown.

System action: None.

User response: None.

ANR1320W Vary-on not possible for disk volume *volume name* - access state is "unavailable".

Explanation: A VARY ONLINE command has been issued for the disk volume specified, but the status of the volume is unavailable.

System action: The volume is not varied online.

User response: If necessary, use the UPDATE VOLUME command to change the status of the volume, and reissue the command.

ANR1321W Vary-on not possible for disk volume *volume name* - access state is "destroyed".

Explanation: A VARY ONLINE command has been issued for the disk volume specified, but the status of the volume is destroyed.

System action: The volume is not varied online.

User response: If necessary, use the UPDATE VOLUME command to change the status of the volume, and reissue the command.

ANR1322W The shredding mode is already *shredding mode*.

Explanation: A SETOPT SHREDDING command was issued to change the shredding mode, but the new mode is the same as the existing mode.

System action: The shredding mode is unchanged.

User response: None.

ANR1323E Command SHRED DATA is invalid for automatic shredding mode.

Explanation: A SHRED DATA command was issued while shredding mode is set to Automatic.

System action: The command is ignored.

User response: Set the shredding mode to Manual or wait for automatic shredding to shred the data.

ANR1324E Process *process number* is already running a SHRED DATA.

Explanation: A SHRED DATA command was issued while another SHRED DATA process is still executing. Only a single SHRED DATA process is allowed at any time.

System action: The command is ignored.

User response: Wait for the current SHRED DATA process to finish, and issue the command again.

ANR1325W Shreddable object for *node name*: *type=type*, *file space=filespace name*, *object=object name* skipped.

Explanation: The object for *node name*, identified by *type*, *file space* and *object name* was found in a shreddable storage pool and is skipped, however the EXPORT continues.

System action: The server process continues exporting and will skip all shreddable objects.

User response: Specify the ALLOWSHREDDABLE=YES parameter when exporting objects from a shreddable storage pool. Using this option forces EXPORT to process all objects, including objects found in shreddable storage pools.

ANR1326I Shredding process complete after shredding *shredded bytes bytes* and skipping *skipped bytes bytes*.

Explanation: The shredding process has completed. The amount of data successfully shredded and the amount of data that was skipped are reported.

System action: Server operation continues. If any data was skipped, the server will attempt to shred it the next time shredding runs.

User response: None.

ANR1327I Automatic shredding stopped. Total bytes shredded was *shredded bytes* and total bytes skipped was *skipped bytes bytes*.

Explanation: The automatic shredding process has ended. The amount of data successfully shredded and skipped during automatic shredding is reported.

System action: Server operation continues. If any data was skipped, the server will attempt to shred it the next time shredding runs.

User response: None.

ANR1328E The server has detected an attempt to restore or retrieve a shredded object.

Explanation: An attempt was made to retrieve or restore an object which has already been shredded. This can happen if your database was recently restored, and data which existed at the time of the database backup has since been erased and shredded.

System action: Server operation continues.

User response: Perform an AUDIT VOLUME operation on the volume containing the shredded data.

ANR1329I Automatic shredding started.

Explanation: The automatic shredding of deleted objects is starting.

System action: Server operation continues.

User response: None.

ANR1330E The server has detected possible corruption in an object being restored or moved. The actual values for the incorrect frame are: magic *magic* hdr version *ver* hdr length *hdrLen* sequence number *seqNum* data length *length* server id *srvid* segment id *segId* crc *crc*.

Explanation: An invalid frame has been detected. This may indicate corruption within the object being restored or moved.

System action: The object is not restored or moved.

User response: Please retry the failing operation. If the operation fails again, please contact your service representative and provide the information from this message.

ANR1331E Invalid frame detected. Expected magic *magic* sequence number *seqNum* server id *servId* segment id *segId*.

Explanation: This message indicates the expected values when an invalid frame is detected.

System action: None.

User response: If contacting support, please provide the information from this message.

ANR1332W Shredding cancelled prior to completion. Total bytes shredded was *shredded bytes* and total bytes skipped was *skipped bytes*.

Explanation: The shredding process was cancelled either because the specified duration has elapsed, or because the CANCEL PROCESS command was used to cancel it. The amount of data successfully shredded and skipped is reported.

System action: Server operation continues. If any data was skipped or not processed, the server will attempt to shred it the next time shredding runs.

User response: None.

ANR1335E *command:* Database *database name* cannot be the target of an upgrade because it is not empty.

Explanation: The DSMSERV INSERTDB operation cannot insert data into the specified database because the database already contains data from another server.

Possible causes for this error include:

- The wrong database was specified in the DATABASEALIAS option in the server's options file.
- The database was formatted using the DSMSERV FORMAT command instead of the DSMSERV LOADFORMAT command.

System action: The DSMSERV INSERTDB command terminates.

User response: Verify that the correct database name is specified in the server's options file. If the correct database is specified, and the database is not in use by a different TSM server, then drop the database and recreate it using the DSMSERV LOADFORMAT command before rerunning the DSMSERV INSERTDB command.

ANR1336I *command:* Ready for connections from the source server. Remaining time: *remaining time*

Explanation: The command has completed its initialization, and is ready to begin receiving database information from the source server.

System action: The command will continue to wait until the source server establishes a server-to-server connection and begins sending database information, or until the specified amount of time has passed.

User response: Initiate a session from the source server.

ANR1337I A *trigger type* trigger has been removed.

Explanation: The DSMSERV INSERTDB command encountered a database backup trigger, a database space trigger, or recovery log space trigger, and removed it as part of the database upgrade process.

System action: The trigger is deleted from the upgraded database.

User response: None.

ANR1338E One or more constraint violations were detected. Examine log file *log file name* for details.

Explanation: The DSMSERV INSERTDB command encountered one or more instances where data being inserted into the database violated a constraint or was otherwise invalid. Information about the error, along with the data that caused the error, was logged in the specified log file.

System action: The offending row was not inserted into the database. Instead, the contents of the row were written to the specified log file along with additional information about the specific error.

User response: Because some data was not inserted into the database, the database is in an inconsistent state. The server should not be started until the problem is corrected.

Contact your service representative for assistance in correcting the problem. You may be directed to examine the log file, and in some cases, correct the erroneous data and insert it into the database. However, due to the sensitive nature of the database, you should never attempt to do this unless directed to do so by your service representative.

ANR1339W Session *session id* underestimated a size allocation request - *additional space*MB more space was allocated to allow the operation to continue.

Explanation: This session required *additional space* megabytes of space in order for the operation to continue. The client is responsible for accurately reporting the size of a file to be stored to the server. The size reported by the client is used to reserve space in the DISK storage pool to store this file. If this size is underestimated, the server may not be able to allocate the additional space needed for this file to continue with this operation.

System action: None, the operation was able to continue.

User response: The installed version of the client for this node should be evaluated. In most cases, if a client has underestimated the sizes of files reported to the server, this may have been corrected in a newer version of the client. If this is an application using the TSM API

that is not an IBM product, contact the vendor for the application to have this corrected.

ANR1340I Scratch volume *volume name* is now defined in storage pool *storage pool name*.

Explanation: The scratch volume specified has been added to the storage pool shown.

System action: None.

User response: None.

ANR1341I Scratch volume *volume name* has been deleted from storage pool *storage pool name*.

Explanation: The scratch volume specified is no longer in use and has been removed from the indicated storage pool.

System action: None.

User response: None.

ANR1342I Scratch volume *volume name* is now pending - volume will be deleted from storage pool *storage pool name* after the reuse delay period for this storage pool has elapsed.

Explanation: All files have been deleted from the indicated scratch volume. The volume will not be removed from the storage pool until the reuse delay time period for the indicated storage pool has elapsed. If the storage pool does not have a reuse tdelay specified, the indicated volume was emptied after it had been requested by another process. It will be in the full or filling state if the process places more data on the tape, or it will be removed from the storage pool after it is no longer required.

System action: None.

User response: None.

ANR1343I Unable to delete scratch volume *volume name*.

Explanation: A scratch volume cannot be deleted from the server and returned to scratch at this time because all the locks have not been released. A number of retries have been attempted.

System action: None

User response: The scratch volume will be automatically deleted when the server is restarted. Or, you may manually delete this volume later, using the DELETE VOLUME command.

ANR1344I Volume *volume name* cannot be reused.
Remove the volume from server storage.

Explanation: A volume that was full and is now empty cannot be reused by the server because the volume is on WORM media.

System action: The volume is in a state where the access mode is READONLY, the status is FULL, and the percent utilized is 0. The server considers the volume to be empty when calculating the occupancy and utilization fields for the volume.

User response: The volume remains in the library and in the storage pool, with the attributes described in the System Action section. If this is not a volume in a RECLAMATIONTYPE=SNAPLOCK storage pool, you may remove the volume by performing these steps:

1. Remove the volume from the storage pool by issuing the DELETE VOLUME command.
2. Remove the volume from the library by issuing the CHECKOUT LIBVOLUME command.

If this is a volume in a RECLAMATIONTYPE=SNAPLOCK storage pool, you cannot remove the volume. Rather, allow Tivoli Storage Manager reclamation processing to delete the volume.

ANR1345I Volume *volume name* cannot be reused by other applications and will remain in the storage pool.

Explanation: A WORM (write-once-read-many) volume that has been written by the server cannot be used by other applications. This volume was not full and has been emptied due to expiration, delete commands, or transaction failure.

System action: The volume remains in the storage pool to be reused by IBM Tivoli Storage Manager, unless it is manually deleted. The remaining space on the volume will be used in the normal course of server operation.

User response: If the volume is no longer to be used, manually delete it from the storage pool.

ANR1346E Export/import command: Preview processing terminated abnormally - error accessing data storage.

Explanation: The server encountered an internal error in accessing data storage while executing an import or export preview operation.

System action: The export or import operation is ended and server operation continues.

User response: Use the QUERY ACTLOG command to examine messages prior to this error to determine the cause of the data storage failure. If you find and resolve the error, retry the export or import operation. If you cannot find the error, contact your service representative for assistance in resolving the problem.

ANR1347E Export/import command: Processing terminated abnormally - error accessing data storage.

Explanation: The server encountered an internal error in accessing data storage while executing an import or export operation.

System action: The export or import operation is ended and server operation continues.

User response: Use the QUERY ACTLOG command to examine messages prior to this error to determine the cause of the data storage failure. If you find and resolve the error, retry the export or import operation. If you cannot find the error, contact your service representative for assistance in resolving the problem.

ANR1348I Export Operation information for *number* objects has been deleted.

Explanation: A background server process deleted export operation information for *number* files from the server database. This process started during initialization to remove any unneeded export information.

System action: The actual backup or archive objects were not deleted. Only information used to sort these objects during the previous export operation was deleted.

User response: None.

ANR1349E Error code during deletion of export operation information for *number* objects.

Explanation: A background server process encountered an internal error after deleting export operation information for *number* files from the server database. This process started during initialization to remove any sorting information which is left over from previous export operations.

System action: The backup or archive objects were not deleted. Only the information used to sort these objects during the previous export operation was deleted. The background process was terminated before all sorting information was deleted. The system will not perform further export processing of file data until this problem is resolved.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages, then restart the server. If the error cannot be isolated and resolved, contact your service representative.

ANR1350E *Command: Invalid time range specified.*
FROM: *fromdate fromtime* **TO:** *todate*
totime.

Explanation: A command was issued that specifies an invalid FROM and TO date or time range. This error can occur when the FROM date or time is not before the TO date or time.

System action: The server does not process the command.

User response: Reissue the command with a valid date or time range.

ANR1351I *Export/import command: Processing suspended with status* *status.*

Explanation: The background process to service the command *command* was suspended with a SUSPEND command.

System action: Processing for the command *command* stops. Statistics on the number and type of objects moved, together with the total number of bytes copied, are displayed on the server console following this message.

User response: None.

ANR1352I *Command started by administrator name as process* *process ID has been suspended.*

Explanation: The background process to service the command *command* by administrator *administrator name* suspended processing.

System action: The specified process suspends, and server operations continue.

User response: None.

ANR1353I *Command: Cannot cancel the EXPORT operation with export identifier* *exportId.*
The operation is currently active.

Explanation: The server cannot cancel the export operation specified in the CANCEL EXPORT command because it is currently running as an active process.

System action: Server operations continue.

User response: Only suspended EXPORT operations may be cancelled by issuing the CANCEL EXPORT command. Issue the QUERY EXPORT command to identify the current state of the EXPORT operation.

ANR1354I *command name: The EXPORTIdentifier parameter is not supported when the FILEDATA parameter is set to NONE.*
Running as non-restartable export.

Explanation: The EXPORTIdentifier parameter is ignored while the command continues.

System action: The command runs and server operations continue.

User response: None.

ANR1355I *command name: An export operation already exists with the*
EXPORTIdentifier *export ID.*

Explanation: The export command fails.

System action: The command fails and server operations continue.

User response: Reenter the export command with an unused export identifier.

ANR1356I *Command: Cannot restart the EXPORT operation with export identifier* *exportId.*
The operation is currently active.

Explanation: The server cannot restart the export operation specified in the RESTART EXPORT command because the export operation is currently running as an active process.

System action: Server operations continue.

User response: Only suspended Export operations may be restarted using RESTART EXPORT command. Issue the QUERY EXPORT command to identify the current state the EXPORT operation.

ANR1357I *command name: The EXPORTIdentifier parameter is not supported when the*
PREVIEWIMPORT parameter is
specified. Running as non-restartable
export.

Explanation: The EXPORTIdentifier parameter is ignored while the command continues.

System action: The command runs and server operations continue.

User response: None.

ANR1358I **Export Identifier:** *Export Id*

Explanation: This is a restartable export operation that can be referenced by the displayed EXPORTIdentifier parameter.

System action: Server operations continue

User response: None.

ANR1359I **Suspend in progress**

Explanation: The server-to-server export operation has been suspended and will stop when resources have been freed for the background process. This message may be displayed in response to a QUERY PROCESS command for an export operation.

ANR1360I • ANR1369E

System action: Server operation continues.

User response: None.

ANR1360I Output volume *volume name* opened (sequence number *sequence number*).

Explanation: During a sequential data operation, the volume specified has been opened for output as the volume number shown.

System action: None.

User response: None.

ANR1361I Output volume *volume name* closed.

Explanation: During a sequential data operation, the volume specified has been closed because the export or dump is complete.

System action: None.

User response: None.

ANR1362I Output volume *volume name* closed (full).

Explanation: During a sequential data operation, the volume specified has been closed because the volume is full.

System action: None.

User response: None.

ANR1363I Input volume *volume name* opened (sequence number *sequence number*).

Explanation: Because of a sequential data operation, the volume specified has been opened for input as the volume number shown.

System action: None.

User response: None.

ANR1364I Input volume *volume name* closed.

Explanation: During a sequential data operation, the volume specified has been closed because the operation is complete.

System action: None.

User response: None.

ANR1365I Volume *volume name* closed (end reached).

Explanation: During a sequential data operation, the volume specified has been closed because processing of the volume is complete.

System action: None.

User response: None.

ANR1366W Input volume *volume name* contains an invalid identifier.

Explanation: During a sequential data operation, the volume specified has been mounted but contains an invalid identifier.

System action: The volume is not used.

User response: Make sure you specified the correct volume for the operation. If a LOADDDB operation was being performed on MVS, the command syntax may be specified by using a ddname or by specifying a device class name. You must use the same method that was used when the database was originally dumped. If you did not, this error message will be displayed. Try loading the data base by using the other method of syntax (ddname).

ANR1367W Import volume *volume name* was written by a different export process.

Explanation: During an IMPORT operation, the volume specified has been mounted but contains an export identifier that does not match the import process.

System action: The volume is not used.

User response: Supply a volume created by the proper export process.

ANR1368W Input volume *volume name* contains sequence number *sequence number*; volume sequence number *sequence number* is required.

Explanation: During a sequential data operation, the volume specified has been mounted but contains the wrong volume sequence number.

System action: The volume is not used.

User response: Supply the volume with the proper sequence number. The volume history file can help you choose the correct volume.

ANR1369E Input volume *volume name* contains Version 1 dump.

Explanation: During a sequential data operation, the volume specified has been mounted but appears to contain a version 1 database dump.

System action: The volume is not used. The operation is terminated.

User response: Make sure you specified the correct volume for the operation. A Version 1 database dump may not be loaded into a Version 2 server. The Version 1 database dump must only be loaded into a Version 1 server.

ANR1370E **Insufficient number of mount points available in device class** *device class name*.

Explanation: During IMPORT or EXPORT processing, the server cannot allocate sufficient mount points for the device class specified. The device class associated with the EXPORT or IMPORT drive only has a mount limit of one. The operation needs to read or write file data from or to the same device class because file data is being imported or exported.

System action: The IMPORT or EXPORT command is ended and server operation continues.

User response: Make more mount points available.

ANR1371I **Command: The export operation with export identifier** *Export Id* **has been deleted.**

Explanation: The suspended server-to-server export operation has been deleted. This operation may no longer be restarted. This message is displayed in response to a CANCEL EXPORT command.

System action: Server operation continues.

User response: None.

ANR1372I **Suspend export request accepted for export process with export Identifier** *Export Id (process process ID)*.

Explanation: A SUSPEND EXPORT command has been entered for the specified server-to-server export process. Some processes will experience a delay before they suspend. This delay may be lengthy for processes that involve remote data movement.

System action: None.

User response: None.

ANR1373I **Process** *process Id* **for Command has been suspended on source server.**

Explanation: The background import process has been suspended on the source server.

System action: The specified process ends, and server operation continues.

User response: None.

ANR1374I **Process** *process Id* **for Command has been canceled on source server.**

Explanation: The background import process has been canceled on the source server.

System action: The specified process ends, and server operation continues.

User response: None.

ANR1375I **Command: Cannot suspend the export operation** *export Id* **because the current state is not valid.**

Explanation: This message is returned in response to a SUSPEND EXPORT command which specified an export operation that is not currently suspendible. The export operation may not be running, or it may be in the process of being suspended.

System action: The specified command fails, and server operation continues.

User response: None.

ANR1376I **Analyst authority has been revoked for administrator** *administrator name*.

Explanation: The DSMSEV INSERTDB command encountered an administrator with analyst authority, and revoked the authority as part of the database upgrade process.

System action: The analyst authority is revoked.

User response: None.

ANR1377I **Analyst authority has been revoked for administrator id** *administrator id*.

Explanation: The DSMSEV INSERTDB command encountered an administrator with analyst authority, and revoked the authority as part of the database upgrade process.

System action: The analyst authority is revoked.

User response: None.

ANR1378I **command: No connection was received after** *session wait time* **minutes.**

Explanation: The command waited the specified amount of time for the source server to connect, but no connection was established.

System action: The command terminates.

User response: Rerun the command. Either specify a larger value for the SESSWAIT parameter, or establish a connection from the source server more quickly.

ANR1379I **command: Read** *bytes* **bytes and inserted database entries** *database entries in elapsed time* **(read rate megabytes per hour).**

Explanation: The command read the indicated number of bytes, and wrote the indicated number of database entries.

System action: None.

User response: None.

ANR1380I The buffer pool monitor switch is enabled.

Explanation: The server has turned the buffer pool monitor switch to 'ON'.

System action: Server continues processing.

User response: No action is required.

ANR1381W The buffer pool monitor switch is disabled 'OFF'. A manual update might be needed.

Explanation: The server failed to turn the buffer pool monitor switch to 'ON'.

System action: Server continues processing.

User response: No action is required at this time. But a manual update might be needed before executing command 'Q DBS' or 'Q DB F=D'. Refer to message 1139I.

ANR1382E The server failed with error code *return code* when attempting to update a database parameter.

Explanation: Cannot update a database parameter with the value specified in the server options file.

System action: The server initialization fails.

User response: Examine the server messages issued prior to this message to determine the source of the error. Contact your service representative for further

ANR1383I Memory usage by the database is limited to *instance memory in MBMB*.

Explanation: The memory dedicated to TSM server database was set successfully.

System action: Server continues processing.

User response: None.

ANR1384E The update to set memory used by TSM server database to *instance memory in MBMB* failed.

Explanation: Attempt to set memory dedicated to TSM server database failed.

System action: Server operation continues.

User response: Collect all messages prior to this one and contact your service representative for further assistance.

ANR1385E The database name is either invalid or missing in the server option file.

Explanation: While attempting to format a database, the Tivoli Storage Manager server has found that the database name is either invalid or missing.

System action: Server format stops.

User response: Before reissuing the command to format the database, check the following items:

- Ensure that the server options file has a valid name for for Tivoli Storage Manager server database. The database name is specified with the DATABASEALIAS option. The database name is a unique character string containing from one to eight letters, numbers, or keyboard characters. The name can contain any of the following characters: a-z, A-Z, 0-9, @, #, and \$.
 - Ensure that the command is using the correct options file for the server. If you are using the -o option with the command to specify a server options file, ensure that the name and location of the file is correct.
-

ANR1386I Beginning schema verification for the database insert process.

Explanation: The database insert process is verifying that the database schema is correct.

System action: The server will verify the correctness of the database schema before inserting any database records.

User response: None.

ANR1387I Schema verification for the database insert process has completed.

Explanation: The database insert process has successfully verified that the database schema is correct.

System action: If CHECKSCHEMA=YES was specified then the database insert process will begin inserting records into the database.

User response: None.

ANR1388E Schema verification for the database insert process detected inconsistencies.

Explanation: Inconsistencies were detected during database schema verification.

System action: The database insert process terminates.

User response: Contact your service representative.

ANR1389I The database insert process is terminating because CHECKSCHEMA=ONLY was specified.

Explanation: The database insert process is terminating after verifying the database schema because the CHECKSCHEMA=ONLY parameter was specified.

System action: The database insert process terminates.

User response: Rerun the command without specifying the CHECKSCHEMA=ONLY parameter.

ANR1390E Column *source column name (source column number)* in legacy table *source table name* is mapped to an invalid column (*target column number*) in target table *target table name (maximum column is table size)*.

Explanation: The database insert process has detected a discrepancy while verifying the data base schema. A column in the source database table was mapped to an invalid column in the target table. The target column number is higher than the number of columns in the target table.

System action: The database insert process terminates.

User response: Contact your service representative.

ANR1391E Column *source column name (source column number)* in legacy table *source table name* is mapped to the wrong column *target column name (target column number)* in target table *target table name*.

Explanation: The database insert process has detected a discrepancy while verifying the data base schema. A column in the source database table was mapped to the wrong column in the target table.

System action: The database insert process terminates.

User response: Contact your service representative.

ANR1392E Column *target column name (target column number)* in target table *target table name* is not set by upgrade, but does not allow NULLs and has no default value.

Explanation: The database insert process has detected a discrepancy while verifying the data base schema. A column in the target database table is not set, does not have a default value and does not allow NULLs.

System action: The database insert process terminates.

User response: Contact your service representative.

ANR1393I Memory usage by the database is set to AUTOMATIC.

Explanation: The memory dedicated to TSM server database was set to automatic successfully.

System action: Server continues processing.

User response: None.

ANR1394E The update to set memory used by TSM server database to AUTOMATIC failed.

Explanation: Attempt to set memory dedicated to TSM server database to automatic failed.

System action: Server operation continues.

User response: Collect all messages prior to this one and contact your service representative for further assistance.

ANR1395I *Insertdb command:* Process *process number*, database insert, has completed.

Explanation: The database insert process *process number* has completed.

System action: Database insert processing ends.

User response: None.

ANR1396E *Insertdb command:* Process *process number*, database insert, has completed with errors.

Explanation: The database insert process *process number* has completed, but errors were encountered by the process.

System action: Database insert processing ends.

User response: Review any messages that were issued by the process, and take corrective action as appropriate.

ANR1397I *Insertdb command:* Found *number of database objects* database objects.

Explanation: This message indicates the total number of database objects that were found during database insert processing.

System action: Server processing continues.

User response: None.

ANR1398I *Insertdb command:* Processed *number of database objects* database objects.

Explanation: This message indicates the total number of database objects that were successfully processed during database insert processing.

System action: Server processing continues.

User response: None.

ANR1399I *Insertdb command: Failed to process number of database objects* **database objects.**

Explanation: This message indicates the total number of database objects that were not successfully processed during database insert processing.

System action: Server processing continues.

User response: None.

ANR1400W *Mount request denied for volume volume name - mount canceled.*

Explanation: The volume shown cannot be mounted because the mount request has been canceled.

System action: The volume is not mounted.

User response: None.

ANR1401W *Mount request denied for volume volume name - mount failed.*

Explanation: The volume shown cannot be mounted because the mount request cannot be completed successfully. Possible reasons include, an error in device specifications to the server or the mount request timed out.

System action: The volume is not mounted.

User response: If the device specifications (DEFINE DEVCLASS and so forth) are in error, correct them and reissue the command that requested the volume to be mounted.

ANR1402W *Mount request denied for volume volume name - volume unavailable.*

Explanation: The volume shown cannot be mounted because it is not available.

System action: The volume is not mounted.

User response: If the attempted mount occurs in a library sharing environment and the library manager was recently recycled, try again in five minutes. In this case the library manager and library client need a few minutes to reestablish communication and synchronize the mounting information between the two servers.

ANR1403W *Scratch volume mount request denied - mount canceled.*

Explanation: A scratch volume cannot be mounted because the mount request has been canceled.

System action: The scratch volume is not mounted.

User response: None.

ANR1404W *Scratch volume mount request denied - mount failed.*

Explanation: A scratch volume cannot be mounted because the mount request cannot be completed successfully. Possible reasons include, an error in device specifications to the server or the mount request timed out.

System action: The scratch volume is not mounted.

User response: If the device specifications (for example, DEFINE DEVCLASS) are in error, correct them and reissue the command that requested the volume to be mounted.

ANR1405W *Scratch volume mount request denied - no scratch volume available.*

Explanation: A scratch volume cannot be mounted because no scratch volume is available.

System action: The scratch volume is not mounted.

User response: None.

ANR1406E *Simultaneous write operation could not release all the acquired mount points.*

Explanation: A simultaneous write to a primary and copy storage pools failed to release all the acquired mount points. When a simultaneous write operation begins it will attempt to acquire all of the necessary mount points. If a mount point cannot be acquired or the simultaneous write operation has to wait for a mount point, then the operation will release any mount points it has already acquired. This prevents the simultaneous write operation from holding mount points and other mount requests from completing. This message is issued if one of the previously acquired mount points cannot be released.

System action: At least one mount point acquired by simultaneous write operation is not released.

User response: None.

ANR1407W *Scratch volume mount request denied - storage pool pool name has reached maxscratch limit.*

Explanation: A scratch volume cannot be mounted because the storage pool has reached the maximum scratch volume limit allowed by the MAXSCRATCH parameter.

System action: A scratch volume is not mounted.

User response: Use the UPDATE STGPPOOL poolname MAXSCRATCH=xx command command to increase the number of scratch volumes allowed in the storage pool.

ANR1408I *Insertdb command: PREVIEW=YES was specified. No data will be inserted into the database.*

Explanation: PREVIEW=YES was specified on the INSERTDB command. Database data will be read and checked for errors, but no data will be written into the database.

System action: Server processing continues.

User response: None.

ANR1409W *Volume *volume name* already in use - skipped.*

Explanation: During an export or database backup, a volume cannot be used because it is already defined in a storage pool, or has already been used by the current operation, or has been previously used by an export or database backup operation (as recorded in the volume history) or is in use by another process.

System action: The operation continues and the volume is skipped.

User response: Use the QUERY VOLUME command to display the names of volumes that are defined to server storage pools. Use the QUERY VOLHISTORY command to display the names of volumes that have been used for export or database backup operations. If no volume names are displayed using the query commands described above, ensure that the volume identified in this message has not been specified or used more than once in the operation being performed.

ANR1410W *Access mode for volume *volume name* now set to "unavailable".*

Explanation: The status of the volume shown has been set to unavailable.

System action: None.

User response: None.

ANR1411W *Access mode for volume *volume name* now set to "read-only" due to write error.*

Explanation: Because of an unrecoverable write error on the volume shown, the status of the volume has been set to read-only.

System action: None.

User response: None.

ANR1412W *Volume *volume name* access mode is "unavailable".*

Explanation: At server startup, the status of the indicated volume is unavailable.

System action: None.

User response: None.

ANR1413W *Volume *volume name* access mode is "read-only".*

Explanation: At server startup, the status of the indicated volume is read-only.

System action: None.

User response: None.

ANR1414W *Volume *volume name* access mode is "read-only" due to previous write error.*

Explanation: At server startup, the status of the indicated volume is read-only due to an unrecoverable write error, or because an administrator used the UPDATE VOLUME command to set the volume access mode to read-only.

System action: None.

User response: None.

ANR1415W *Volume *volume name* access mode is "destroyed".*

Explanation: At server startup, the status of the indicated volume is destroyed.

System action: None.

User response: None.

ANR1416W *Volume *volume name* access mode is "offsite".*

Explanation: At server startup, the status of the indicated volume is offsite.

System action: None.

User response: None.

ANR1417W *Access mode for volume *volume name* now set to "read-only" due to excessive read error.*

Explanation: Because of an numerous read errors on the volume shown, the status of the volume has been set to read-only.

System action: None.

User response: Use QUERY VOLUME FORMAT=DETAILED for the volume to view the access mode and number of read errors. You may want to use the MOVE DATA command to move the retrievable data from this volume to another volume. For the damaged files, use the RESTORE VOLUME command to restore a readable copy of the file to the storage pool.

ANR1418E *command name:* **Export commands that target another server cannot be issued from the server console.**

Explanation: An EXPORT command that targets another server was issued from the server console. This command cannot be issued from the server console because it requires authentication of the issuing administrator on the target server.

System action: The server ignores the command and continues processing.

User response: Issue the command from an administrative client.

ANR1419E *command name :* **FROMDATE must be specified when FROMTIME is specified.**

Explanation: A command that supports the FROMDATE and FROMTIME parameters was issued with the FROMTIME parameter specified, but without the FROMDATE parameter. When the FROMTIME parameter is used, the FROMDATE parameter must be specified.

System action: The server ignores the command and continues processing.

User response: Reissue the command with both the FROMDATE and FROMTIME parameters specified.

ANR1420W *Read access denied for volume volume name - volume access mode = "unavailable".*

Explanation: An attempt to access the named volume for reading fails because the volume status is unavailable.

System action: The volume is not used for read access.

User response: None.

ANR1421W *Read access denied for volume volume name - volume is offline.*

Explanation: An attempt to access the named volume for reading failed because the volume is offline.

System action: The volume is not used.

User response: None.

ANR1422W *Read access denied for volume volume name - volume access mode="offsite".*

Explanation: An attempt to access the named volume for reading failed because the volume status is offsite.

System action: The volume is not used for read access.

User response: None.

ANR1423W *Scratch volume volume name is empty but will not be deleted - volume access mode is "offsite".*

Explanation: The named scratch volume is empty but will not be deleted at this time because the access mode is offsite.

System action: The volume is not deleted.

User response: After bringing the volume onsite, change the access mode to read-only so the volume will be deleted.

ANR1424W *Read access denied for volume volume name - volume access mode="destroyed".*

Explanation: An attempt to access the named volume for reading failed because the volume status is destroyed.

System action: The volume is not used for read access.

User response: None.

ANR1425W *Scratch volume volume name is empty but will not be deleted - volume state is "mountablenotinlib".*

Explanation: The named scratch volume is empty but will not be deleted at this time because the state of the volume is MOUNTABLENOTINLIB. Possible reasons include, a MOVE MEDIA command was used to check the volume out of the library and the volume was subsequently checked into the library using CHECKIN LIBVOL without first running a MOVE MEDIA command to update the volume state back to MOUNTABLEINLIB state. If this should happen, the QUERY MEDIA will display the volume to be in MOUNTABLEINLIB state since QUERY MEDIA does verify if the volume is actually in the library before displaying the state of the volume.

System action: The volume is not deleted.

User response: The following steps may be used if the volume is to be deleted:

1. Run CHECKOUT LIBVOL to check the affected volume out of the library, the REMOVE=NO option may be used to prevent actual volume movement
2. Run MOVE MEDIA * STG=*
WHERESTATE=MOUNTABLENOTINLIB
WHERESTATUS=EMPTY. When the volume is moved by MOVE MEDIA
WHERESTATE=MOUNTABLENOTINLIB, the scratch empty volume is deleted
3. Check the volume back into the library using CHECKIN LIBVOL command

ANR1426I All legacy FILE volumes have been marked FULL.

Explanation: As part of the conversion of the database to Tivoli Storage Manager version 5.3, all existing non-full volumes of devtype FILE have been marked FULL to keep them from being extended.

System action: All FILE volumes that were not already FULL have been marked FULL and cannot be appended to.

User response: None.

ANR1427E No legacy FILE volumes were marked FULL.

Explanation: As part of the conversion of the database to Tivoli Storage Manager Version 5.3, all existing non-full volumes of devtype FILE were attempted to be made FULL. However, a database error prevented the conversion, and the status of these volumes remains unchanged.

System action: The volumes are not marked FULL.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. Contact your service representative for further assistance.

ANR1428W Shredding access denied for volume *volume name* - volume is offline.

Explanation: An object on the indicated volume cannot be shredded because the volume is offline.

System action: The object is not shredded at this time. When the volume is put back online, another attempt will be made to shred the object.

User response: Determine why the volume is offline, and, if possible, place the volume back online.

ANR1429E Transaction failed for Import process - invalid file space *file space name* for node *node name* was detected.

Explanation: During import processing, the server encounters an invalid file space name.

System action: This action usually occurs when the import is operating on a file space that is currently being deleted as a result of an administrative command or client action. The server ends import operation.

User response: Use the QUERY PROCESS command to monitor and wait for any file space deletion processes to complete, or cancel the process if you do not want to delete the file space. Try the import operation again after this action has been taken.

ANR1430W Retrieval request denied for storage pool *storage pool name* - access mode="unavailable".

Explanation: An attempt was made to retrieve a file from the storage pool shown, but the access mode of the storage pool is unavailable.

System action: The file is not retrieved from this storage pool. If possible, the file is retrieved from another storage pool.

User response: Consider changing the access mode for the storage pool.

ANR1431E An error occurred while writing to side A of volume *volume name*. An attempt will be made to write to side B of this volume.

Explanation: An error occurred while writing to side A of a two-sided volume.

System action: No additional data will be written to side A of this volume. Any remaining space on side A will not be used. An attempt will be made to use the reverse side (side B) of the volume.

User response: None required if the side B can be used successfully. However, the administrator should investigate the cause of the error and may want to move data from this volume.

ANR1432I Updating device configuration information to defined files.

Explanation: The server is updating device configuration information for the files or data sets specified with the DEVCONFIG option in the server options file.

System action: Server operation continues.

User response: None.

ANR1433I Device configuration information successfully written to *file name*.

Explanation: Device configuration information was successfully written to the file specified.

System action: Server operation continues.

User response: None.

ANR1434W No files have been identified for automatically storing device configuration information.

Explanation: The server is unable to automatically update device configuration file. No files were identified using the DEVCONFIG option in the server options file.

System action: Server operation continues.

User response: If you would like to have the server automatically record device configuration information to assist in server recovery, use the DEVCONFIG option in the server options file to specify where device configuration information should be written. If you update the options file, halt and then restart the server so the changes can take effect.

ANR1435E Server could not write device configuration information to *devconfig* file name.

Explanation: While attempting to write device configuration information to defined files, the server cannot write to the file name specified.

System action: The server cannot write device configuration information to the specified file.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that there is sufficient space in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set. After the problem has been corrected, use the BACKUP DEVCONFIG command to write device configuration information to the file.

ANR1436E Device configuration file *devconfig* file name cannot be opened.

Explanation: While attempting to write device configuration information to device configuration files, the server cannot open the file name specified.

System action: The server does not write device configuration information to the file specified.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that there is sufficient space in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set. After the problem has been corrected, use the BACKUP DEVCONFIG command to write device configuration information to the file.

ANR1437E No device configuration files could be used.

Explanation: The server attempts to read device configuration information from defined files and cannot open any of the files.

System action: The operation is ended.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Ensure that the defined device configuration files have been created. If you can start

the server, you can create the files by using the BACKUP DEVCONFIG command. If you cannot start the server, you will need to create a device configuration file by editing the file and adding the appropriate DEFINE commands for the device class, drive, and library definitions. The contents and requirements for this file are described in the *Administrator's Guide*. Make sure that the server has proper authority to read from the defined device configuration files.

ANR1438W Skipping device configuration file: *devconfig* file name.

Explanation: While attempting to read device configuration information from a defined device configuration file, the server encounters problems in processing the definitions included in the file.

System action: The specified file is skipped, and the next one specified in the server options file will be used.

User response: Examine error messages that may have been displayed prior to this message to understand why the file could not be used. When you can start the server again, you can refresh this file by using the BACKUP DEVCONFIG command.

ANR1439E Allocate prohibited - transaction failed.

Explanation: While attempting to preallocate storage on a storage pool, the server detected that the transaction for this operation has previously failed. This error may occur when a large file is selected for backup and the client did not properly estimate the file size. There may not be enough space in the storage pool for the file.

System action: An internal error is reported by the server and the operation being performed is ended.

User response: Examine error messages that may have been displayed prior to this message for more information.

ANR1440I All drives in use. Process *process number* being preempted by higher priority operation.

Explanation: When a high priority operation attempted to find an available drive, all the drives were in use. To make a drive available for this operation, the indicated process is being cancelled by the system.

System action: The lower priority process is cancelled to make a mount point (drive) available.

User response: When a drive again becomes available, restart the process that was cancelled. If the process was a migration or reclamation process, it will be automatically restarted when needed. If this message appears frequently, you may want to increase the number of drives available. See the MOUNTLIMIT

parameter on the UPDATE DEVCLASS command.

ANR1441I Volume *volume name* is in use. Process *process number* being preempted by higher priority operation.

Explanation: When a high priority operation attempted to use a volume, it was in use. To make a volume available for this operation, the indicated process is being cancelled by the system.

System action: The lower priority process is cancelled to the volume available.

User response: Restart the process that was cancelled. It will wait until the higher priority process is finished with the volume. If the cancelled process was a migration or reclamation process, it will be automatically restarted when needed.

ANR1442E Invalid storage pool for store operation: *storage pool*.

Explanation: The storage pool selected for a store operation (for example, backup or archive) was not a NATIVE or NONBLOCK data format storage pool. This may be caused by an incorrect management class being assigned to an object.

System action: The operation fails.

User response: Ensure that the copy group destination storage pool of the assigned management class has the appropriate NATIVE or NONBLOCK data format.

ANR1443W Process *process ID* terminated from session *session id*. A potential drive-contention deadlock was detected.

Explanation: See message.

User response: No action is required.

ANR1444E No device configuration file is defined.

Explanation: No device configuration file is defined. Check DEVCONFIG option in server options file.

System action: The specified configuration parameter is skipped.

User response: Add the DEVCONFIG option to the server options file, specifying a valid file or data set name to use for the device configuration file.

ANR1445I *Insertdb command:* Throughput was *megabytes per hour* megabytes per hour.

Explanation: This message indicates the total throughput (megabytes/hour) during database insert processing.

System action: Server processing continues.

User response: None.

ANR1446I RUNSTATS: Table updating statistics started.

Explanation: This message indicates the update statistics for all tables started.

System action: Server processing continues.

User response: None.

ANR1447W *command name:* The server is not able to begin a new thread to execute the command on line *line number* in parallel. The command will run serially.

Explanation: This message is issued during a RUN command to indicate that thread resources are not available to run the command in parallel. The command will be executed serially.

System action: The SCRIPT continues.

User response: Increase the resources available to the server or reduce the number of parallel commands or scripts that are running on the server at any one time.

ANR1448I *command name:* Beginning serial SCRIPT command execution on line *line number*.

Explanation: This message is issued during a RUN command (VERBOSE=YES) to indicate that a SERIAL command was encountered and following SCRIPT commands will be executed serially.

System action: The SCRIPT command continues.

User response: See the output of the commands following the SERIAL command to determine their results.

ANR1449I *command name:* Beginning parallel SCRIPT command execution on line *line number*.

Explanation: This message is issued during a RUN command (VERBOSE=YES) to indicate that a PARALLEL command was encountered and following SCRIPT commands will be executed in parallel.

System action: The SCRIPT command continues.

User response: See the output of the commands following the PARALLEL command to determine their results.

ANR1450E *command name:* Invalid command script name: *command script name*.

Explanation: An invalid script name was specified for a DEFINE, UPDATE, or DELETE SCRIPT command.

System action: The operation fails.

User response: Reenter the command specifying a valid command name.

ANR1451E *command name: Invalid command: command.*

Explanation: An invalid command was specified for a DEFINE, UPDATE, or DELETE SCRIPT command.

System action: The operation fails.

User response: Reenter the command specifying a valid server command.

ANR1452E *command name: Invalid line number: line number.*

Explanation: An invalid line number was specified for a DEFINE, UPDATE, or DELETE SCRIPT command.

System action: The operation fails.

User response: Reenter the command specifying a valid line number.

ANR1453E *command name: Command script command script name already exists.*

Explanation: The script name specified in a DEFINE SCRIPT command already exists.

System action: The operation fails.

User response: Reenter the command specifying a different command name.

ANR1454I *command name: Command script command script name defined.*

Explanation: The script name specified in a DEFINE SCRIPT command was successfully defined.

System action: None

User response: None

ANR1455E *command name: Command script command script name does not exist.*

Explanation: The script name specified in a DEFINE, UPDATE, or DELETE SCRIPT command does not exist.

System action: The operation fails.

User response: Reenter the command specifying a different command name.

ANR1456I *command name: Command script command script name updated.*

Explanation: The script name specified in an UPDATE SCRIPT command was successfully updated.

System action: None

User response: None

ANR1457I *command name: Command script command script name deleted.*

Explanation: The script name specified in a DELETE COMMAND command was successfully deleted.

System action: None

User response: None

ANR1458I *command name: Line line number was deleted from command script command script name.*

Explanation: The specified line number was deleted from the command script as a result of a DELETE SCRIPT command.

System action: None

User response: None

ANR1459E *command name: Command script command script name, line line number does not exist.*

Explanation: The line in command script name specified in a UPDATE, or DELETE SCRIPT command does not exist.

System action: The operation fails.

User response: Reenter the command specifying a different line number.

ANR1460I *command name: Command script command script name copied to new command script name.*

Explanation: The specified command script was copied to a new script with the COPY SCRIPT command.

System action: None

User response: None

ANR1461I *command name: Executing command script command script name.*

Explanation: The specified command script is being executed as a result of a RUN command.

System action: None

User response: None

ANR1462I *command name: Command script command script name completed successfully.*

Explanation: The specified command script, started with a RUN command, has successfully completed.

System action: None

User response: None

ANR1463E *command name: Command script command script name* **completed in error.**

Explanation: The specified command script, started with a RUN command, encountered errors.

System action: Part or all of the command lines in the script ended in error. Command processing is terminated.

User response: Examine the messages preceding this message to determine the cause of the error. Correct the command script and reissue the command.

ANR1464E *command name: Command script command script name, line line number, parameter parameter number* **was not specified:** *command line.*

Explanation: All parameters required to execute a command script were not specified in the RUN command.

System action: The command fails.

User response: Reenter the RUN command specifying all required parameters.

ANR1465E *command name: Command script command script name, line line number, parameter is invalid:* *command line.*

Explanation: An invalid parameter was encountered in a command script.

System action: The command fails.

User response: Correct the script definition and reexecute the RUN command.

ANR1466I *command name: Command script command script name, Line line number :* *command line.*

Explanation: The specified line for the command script is being executed. The contents of the line being executed are displayed.

System action: None

User response: None

ANR1467E *command name: Command script command script name, did not end in a non-continued line* *command line.*

Explanation: The specified command script did not end in a line that had no continuation character (-).

System action: The command fails.

User response: Correct the specified script so that it ends in a line that is not continued to the next line.

ANR1468E *command name: Command script command script name, continued line is too long*

Explanation: The specified command script with continuation lines is too long to be executed.

System action: The command fails.

User response: Correct the specified command script so that it is shorter.

ANR1469E *command name: Command script command script name, Line line number is an INVALID command :* *command line.*

Explanation: The specified line for the command script is not a valid server command. This message is displayed when a RUN command is executed with the PREVIEW=YES parameter specified.

System action: Command Preview processing fails

User response: Correct the script and reenter the RUN command.

ANR1470I *command name: Command script command script name* **completed successfully (PREVIEW mode).**

Explanation: The specified command script, started with a RUN command, has successfully completed.

System action: None.

User response: None.

ANR1471E *command name: Command script command script name* **completed in error (PREVIEW mode).**

Explanation: The specified command script, started with a RUN command, encountered errors.

System action: Part or all of the command lines in the command script ended in error. Command processing is terminated.

User response: Examine the messages preceding this message to determine the cause of the error. Correct the script and reissue the command.

ANR1472I *command name: Command script command script name* **renamed to new command script name.**

Explanation: The specified command script was renamed with the RENAME SCRIPT command.

System action: None.

User response: None.

ANR1473E *command name:* **A command line cannot be specified when the FILE= parameter is used.**

Explanation: The FILE= parameter was specified in the DEFINE SCRIPT command AND a command line was also specified for the SCRIPT. When the FILE= parameter is specified, a command line cannot be specified.

System action: The command fails.

User response: Reenter the command without the command line OR the FILE= parameter.

ANR1474E *command name:* **A line number cannot be specified when the FILE= parameter is used.**

Explanation: The FILE= parameter was specified in the DEFINE SCRIPT command AND a line number was also specified for the SCRIPT. When the FILE= parameter is specified, a line number cannot be specified.

System action: The command fails.

User response: Reenter the command without the line number OR the FILE= parameter.

ANR1475E *command name:* **File file name could not be opened.**

Explanation: A filename was specified in a command but the specified file could not be opened by the server.

System action: The command fails.

User response: Examine any messages that might appear prior to this one in the activity log to determine if the error can be found. If the file was to exist for use by the command, ensure that the file does exist and that the server has proper authority to access the file. If the file was to be created by the command, ensure that the filesystem has sufficient space and that the server has authority to create the file in the location specified.

ANR1476E *command name:* **File file name contains no data.**

Explanation: The FILE= parameter was specified in a command but the specified file did not contain script command lines.

System action: The command fails.

User response: Add script command lines to the file or specify another file and reenter the command.

ANR1477E *command name:* **The OUTPUTFILE parameter may only be specified when FORMAT=RAW is specified.**

Explanation: The OUTPUTFILE parameter was specified in a QUERY SCRIPT command but the FORMAT parameter did not specify RAW output. When outputting the QUERY to a file, you MUST specify RAW output format.

System action: The command fails.

User response: Reenter the command specifying the proper value for the FORMAT parameter or do not specify the OUTPUTFILE parameter.

ANR1478E *command name:* **Error writing to file file name.**

Explanation: An error was encountered while writing to the file specified.

System action: The command fails.

User response: Examine any messages that might appear prior to this one in the activity log to determine if the error can be found. Ensure that the filesystem has sufficient space and that the server has authority to create the file in the location specified.

ANR1479I *command name:* **Query output was written to file file name.**

Explanation: The output from the specified query was successfully written to the specified file.

System action: The command completes successfully.

User response: None.

ANR1480E *command name:* **Description text is too long.**

Explanation: The specified description text is too long for a command that allows description text to be specified.

System action: The command fails.

User response: Reenter the command specifying a shorter description.

ANR1481E *command name:* **A command line or description must be specified.**

Explanation: An UPDATE SCRIPT command was specified with out a command line (script line) or description text.

System action: The command fails.

User response: Reenter the command specifying a command line or description text.

ANR1482I *command name: Found label statement label on line line number and continuing.*

Explanation: This message is issued during a RUN command (VERBOSE=YES) to indicate that the target label for a GOTO statement was found.

System action: Command processing continues.

User response: None.

ANR1483I *command name: Line line number condition IF(condition) is NOT true - statement is skipped.*

Explanation: This message is issued during a RUN command (VERBOSE=YES) to indicate that the a return code condition check failed and the IF(..) statement is skipped.

System action: Command processing continues.

User response: None.

ANR1484I *command name: Line line number condition IF(condition) is TRUE - statement will be executed.*

Explanation: This message is issued during a RUN command (VERBOSE=YES) to indicate that the a return code condition check succeeded and the IF(..) statement is executed.

System action: Command processing continues.

User response: None.

ANR1485I *command name: Ending SCRIPT with EXIT statement on line line number.*

Explanation: This message is issued during a RUN command (VERBOSE=YES) to indicate that an EXIT statement was encountered and SCRIPT termination will end.

System action: The SCRIPT command ends.

User response: None.

ANR1486I *command name: Executing line line number GOTO label name.*

Explanation: This message is issued during a RUN command (VERBOSE=YES) to indicate that a GOTO statement was encountered and processing will skip to the named label.

System action: SCRIPT processing continues.

User response: None.

ANR1487I *command name: Command return code is symbolic return code (return code severity).*

Explanation: This message is issued during a RUN command (VERBOSE=YES) to indicate the return code that was returned from the latest command.

System action: SCRIPT processing continues.

User response: None.

ANR1488E *command name: Line line number condition IF(condition) is not a valid condition.*

Explanation: This message is issued if an IF() statement in a SCRIPT does not specify proper condition values.

System action: Command processing fails.

User response: Reenter the command using valid conditions for the IF() statement.

ANR1489E *command name: Line line number is a GOTO to a label (label name) that does not exist or is associated with a line prior to line line number.*

Explanation: This message is issued if a GOTO statement in a SCRIPT does not specify a label that exists in the SCRIPT, or that does exist but is associated with a line prior to the line that contains the GOTO statement.

System action: Command processing fails.

User response: Correct the SCRIPT definition and reenter the RUN command.

ANR1490W *command name: Command script command script name does not contain any commands.*

Explanation: The script name specified in a RUN command does not contain any commands.

System action: The RUN operation fails (has nothing to do).

User response: Server command Scripts that contain no commands will not execute. Add command lines to the Script and reenter the RUN command.

ANR1491E **Server command scripts cannot be started from the server console.**

Explanation: A server command script RUN command was issued from the server console. Server command scripts cannot be started from the server console because they may require a long time complete and the server console should be available to control other server functions.

ANR1492E • ANR1501I

System action: The server ignores the command and continues processing.

User response: Start the server command script from an administrative client or schedule it for execution using the administrative command scheduler.

ANR1492E *command name:* **A loop has been detected in server command script RUN commands - command failed.**

Explanation: A server command script DEFINE or UPDATE command has created a situation where one or more scripts invoke each other in a loop that can cause the scripts to run indefinitely.

System action: The command fails to update the server command script.

User response: Server command scripts can invoke each other, but not in a fashion that causes a potential loop in their execution. Specify the scripts in a manner that does not cause them to invoke each other in a loop.

ANR1493E *Command:* **Administrator administrator name is not authorized to update or delete command script command script name.**

Explanation: The specified administrator has entered the indicated command, but this administrator does not have the proper authority necessary to update or delete this command script. If an administrator does not have system authority, they must have previously created or updated the script.

System action: The server does not process the command.

User response: Issue the command from a properly authorized administrator ID, or contact the administrator that created the script.

ANR1494I *command name:* **Command return code is numeric return code.**

Explanation: This message is issued during a RUN command (VERBOSE=YES) to indicate the numeric return code that was returned from the latest command.

System action: SCRIPT processing continues.

User response: None.

ANR1495E *command name:* **command script name is currently running. Update or delete can not be performed.**

Explanation: An UPDATE or DELETE SCRIPT was attempted on a script that is currently running.

System action: The operation fails.

User response: Reenter the command when the script is not running.

ANR1496I

Explanation: The ISSUE MESSAGE command with a severity indicator of INFORMATION was issued.

System action: Server operation continues.

User response: None.

ANR1497W

Explanation: The ISSUE MESSAGE command with a severity indicator of WARNING was issued.

System action: Server operation continues.

User response: None.

ANR1498E

Explanation: The ISSUE MESSAGE command with a severity indicator of ERROR was issued.

System action: Server operation continues.

User response: None.

ANR1499S

Explanation: The ISSUE MESSAGE command with a severity indicator of SEVERE was issued.

System action: Server operation continues.

User response: None.

ANR1500I **Policy domain domain name defined.**

Explanation: In response to the DEFINE DOMAIN command, the policy domain *domain name* has been defined in the server database.

System action: Server operation continues.

User response: None.

ANR1501I **Policy domain domain name deleted.**

Explanation: In response to the DELETE DOMAIN command, the policy domain *domain name* has been deleted from the server database. All policy sets, management classes, copy groups, and schedules related to the domain have also been removed.

System action: Server operation continues.

User response: None.

ANR1502I Policy domain *domain name* updated.

Explanation: In response to the UPDATE DOMAIN command, the policy domain *domain name* has been updated in the server database.

System action: Server operation continues.

User response: None.

ANR1503I Policy domain *domain name* copied to domain *target domain*.

Explanation: In response to the COPY DOMAIN command, the policy domain *domain name* has been copied to a new policy domain named *target domain*. All policy sets, management classes, and copy groups are also copied to the *target domain* policy domain.

System action: Server operation continues.

User response: None.

ANR1504I Command: No matching domains.

Explanation: The server cannot find any policy domains with names that match the specification entered in the command *command*.

System action: Server operation continues.

User response: Reissue the command with a specification that matches an existing policy domain name. Use the QUERY DOMAIN command to obtain a list of the names of existing policy domains.

ANR1505W The BACKUP copy group in management class *management class name* specifies a table of contents destination storage pool : *storage pool name* that does not exist. If this pool does not exist when policy set *policy set name* is activated, the creation of the table of contents may fail for an image backup when this management class is used for the backup.

Explanation: This message may be returned from the DEFINE COPYGROUP, UPDATE COPYGROUP, VALIDATE POLICYSET or ACTIVATE POLICYSET command. During the indicated command processing, the server has found a backup copy group that has a table of contents (TOC) destination referring to an undefined storage pool named *storage pool name*. If this storage pool is undefined when the policy set is activated, the creation of the TOC for an image backup will fail if its TOC creation binds to the management class whose copy groups reference this pool.

System action: Server operation continues.

User response: To locate the copy groups that refer to the undefined storage pool, issue the QUERY COPYGROUP command. To change the TOC

destination to refer to an existing storage pool, issue the UPDATE COPYGROUP command. To define the storage pool, an authorized administrator can issue the DEFINE STGPOOL command.

ANR1506E Command: An incorrect storage pool name - *storage pool name* was specified for the TOC destination.

Explanation: Server processing for the command *command* fails because the storage pool name *pool name* specified for the table of contents (TOC) is an invalid destination storage pool type. A copy storage pool or an active-data storage pool is not a valid copy group TOC destination.

System action: The command fails and server operation continues.

User response: Reissue the command using a storage pool name that is not a copy pool or active-data pool. For a list of names of defined storage pools, issue the QUERY STGPOOL command.

ANR1507I Table of contents load retention is set to *number of minutes* minutes.

Explanation: The number of minutes that the unreferenced table of contents (TOC) data will remain loaded in the server database has been set to the value indicated with the SET TOCLOADRETENTION command.

System action: None.

User response: None.

ANR1508E Command: An incorrect table of contents load retention *retention value* was specified.

Explanation: A SET TOCLOADRETENTION command has been entered that specifies an invalid table of contents (TOC) retention period.

System action: The server does not process the command.

User response: Reissue the command with a valid retention period.

ANR1509E Error writing option *option name* to file *file name*.

Explanation: An error was encountered while writing an option entry to server option file.

System action: The format command fails.

User response: Examine any messages that might appear prior to this one in the activity log to determine if the error can be found. Ensure that the filesystem has sufficient space and that the server has authority to

ANR1510I • ANR1517I

update the server option file then reissue the format command.

ANR1510I Policy set *set name* defined in policy domain *domain name*.

Explanation: In response to the DEFINE POLICYSET command, the policy set named *set name* has been defined in the policy domain named *domain name* in the server database.

System action: Server operation continues.

User response: None.

ANR1511I Policy set *set name* deleted from policy domain *domain name*.

Explanation: In response to the DELETE POLICYSET command, the policy set *set name* has been deleted from the policy domain *domain name* in the server database.

System action: Server operation continues.

User response: None.

ANR1512I Policy set *set name* updated in policy domain *domain name*.

Explanation: In response to the UPDATE POLICYSET command, the policy set *set name* has been updated in the policy domain *domain name* in the server database.

System action: Server operation continues.

User response: None.

ANR1513I Policy set *set name* copied to set *new set name* in policy domain *domain name*.

Explanation: In response to the COPY POLICYSET command, the policy set *set name* has been copied to the policy set *new set name* in the policy domain named *domain name*. All management classes and copy groups are also copied to the policy set *new set name*.

System action: Server operation continues.

User response: None.

ANR1514I Policy set *set name* activated in policy domain *domain name*.

Explanation: In response to the ACTIVATE POLICYSET command, the policy set *set name* has been activated in the policy domain *domain name*. All management class and copy group definitions in the policy set will be used by clients that start sessions after this command is committed. Clients that currently have sessions established with the server will use the policy definitions in the previously active policy set for the domain.

System action: The server replaces the active management class and copy group definitions for the

policy domain with the definitions found in the specified policy set. These values are returned to client nodes that start a session with the server after this command is committed to the server database.

User response: None.

ANR1515I Policy set *set name* validated in domain *domain name* (ready for activation).

Explanation: This message may be displayed in response to a VALIDATE POLICYSET command. The policy set *set name* has been checked in the domain *domain name* to see if the management class and copy group definitions are adequate for activating the policy set. This message indicates that the policy set may be activated. Warning messages may be issued prior to this message if there are discrepancies in the policy set with respect to the set that is currently active in the policy domain.

System action: The server checks its definitions to determine the policy set's qualifications for activation. The server does not activate the policy set.

User response: If you are satisfied with any warning messages that may have been issued prior to this message concerning any possible discrepancies in the policy set, issue the ACTIVATE POLICYSET command to activate the policy set in the policy domain. Otherwise, correct the discrepancies prior to activating the policy set. Before the ACTIVATE POLICYSET command is used to activate the policy set, use the validate command to check policy set contents.

ANR1516E Command: Storage pool *storage pool name* is not enabled for deduplication.

Explanation: The command indicated specifies the name of a storage pool which does not have deduplication enabled. The command requires that deduplication be enabled on the storage pool before the command can execute.

System action: The server does not process the command.

User response: Update the storage pool to allow data deduplication by specifying the parameter DEDUPLICATE=YES. But only do so if you wish to have duplicates of data in the storage pool removed.

ANR1517I Insertdb command: Processed *number of database records* database records.

Explanation: This message indicates the total number of database records that were successfully inserted during database insert processing.

System action: Server processing continues.

User response: None.

ANR1518I *Insertdb command: Read number of bytes bytes.*

Explanation: This message indicates the total number of bytes that were successfully read during database insert processing.

System action: Server processing continues.

User response: None.

ANR1519I *Insertdb command: Elapsed time was elapsed time.*

Explanation: This message indicates the total amount of time that elapsed during database insert processing.

System action: Server processing continues.

User response: None.

ANR1520I **Management class *class name* defined in policy domain *domain name*, set *set name*.**

Explanation: In response to the DEFINE MGMTCLASS command, the management class named *class name* has been defined in the policy set *set name* belonging to the policy domain named *domain name*.

System action: Server operation continues.

User response: None.

ANR1521I **Management class *class name* deleted from policy domain *domain name*, set *set name*.**

Explanation: In response to a DELETE MGMTCLASS command, the management class named *class name* has been deleted from the policy set *set name* belonging to the policy domain *domain name*. All copy groups defined for the management class are also removed.

System action: Server operation continues.

User response: None.

ANR1522I **Management class *class name* updated in policy domain *domain name*, set *set name*.**

Explanation: In response to the UPDATE MGMTCLASS command, the management class named *class name* has been updated in the policy domain *domain name*, policy set *set name*.

System action: Server operation continues.

User response: None.

ANR1523I **Management class *class name* copied to class *new class name* in policy domain *domain name*, set *set name*.**

Explanation: In response to the COPY MGMTCLASS command, the management class named *class name* has

been copied to a new management class named *new class name* in policy set *set name* belonging to policy domain *domain name*. All copy groups defined for management class *class name* are also copied to management class *new class name*.

System action: Server operation continues.

User response: None.

ANR1524I *Insertdb command: Beginning database update phase.*

Explanation: The database insert process has completed inserting database records, and has begun making updates to the inserted records.

System action: Server processing continues.

User response: None.

ANR1525I *command: Updated database entries of database entries database entries in elapsed time.*

Explanation: The command has updated the indicated number of database entries.

System action: None.

User response: None.

ANR1526I *Insertdb command: Building indices and checking table integrity.*

Explanation: The database insert process has begun to create indices and check the integrity of the database tables.

System action: Server processing continues.

User response: None.

ANR1527I *command: Checked database objects of database objects database objects in elapsed time.*

Explanation: The command has checked the integrity of the indicated number of database tables.

System action: None.

User response: None.

ANR1528I **RUNSTATS: Table updating statistics completed in *elapsed time*.**

Explanation: This message indicates the update statistics for all tables completed.

System action: Server processing continues.

User response: None.

ANR1529I Process *process ID* skipped File state deduplicated extent *Extent id* on volume *Volume name*.

Explanation: While moving or copying deduplicated extents from a sequential FILE volume, extents were encountered that were marked deleted or damaged. As a result, the extents were skipped.

System action: The server moves or copies all extents from the volume that are not marked damaged or deleted. The damaged or deleted extents are skipped.

User response: If the deduplicated extent was marked damaged, audit the indicated volume with FIX=NO to verify whether the file is damaged. The audit will reset the file status if the deduplicated extent is not damaged.

If the deduplicated extent has been marked deleted, it is not copied to another storage pool.

ANR1530I Backup copy group *group name* defined in policy domain *domain name*, set *set name*, management class *class name*.

Explanation: In response to the DEFINE COPYGROUP command, a backup copy group named *group name* has been defined for the management class named *class name* in the policy set *set name* belonging to policy domain *domain name*.

System action: Server operation continues.

User response: None.

ANR1531I Backup copy group *group name* deleted from policy domain *domain name*, set *set name*, management class *class name*.

Explanation: In response to the DELETE COPYGROUP command, the backup copy group named *group name* has been deleted from the management class named *class name* in the policy set *set name* belonging to policy domain *domain name*.

System action: Server operation continues.

User response: None.

ANR1532I Backup copy group *group name* updated in policy domain *domain name*, set *set name*, management class *class name*.

Explanation: In response to the UPDATE COPYGROUP command, the backup copy group named *group name* has been updated in the management class named *class name* in the policy set *set name* belonging to policy domain *domain name*.

System action: Server operation continues.

User response: None.

ANR1535I Archive copy group *group name* defined in policy domain *domain name*, set *set name*, management class *class name*.

Explanation: In response to the DEFINE COPYGROUP command, an archive copy group named *group name* has been defined for the management class named *class name* in the policy set *set name* belonging to policy domain *domain name*.

System action: Server operation continues.

User response: None.

ANR1536I Archive copy group *group name* deleted from policy domain *domain name*, set *set name*, management class *class name*.

Explanation: In response to the DELETE COPYGROUP command, the archive copy group named *group name* has been deleted from the management class named *class name* in the policy set *set name* belonging to policy domain *domain name*.

System action: Server operation continues.

User response: None.

ANR1537I Archive copy group *group name* updated in policy domain *domain name*, set *set name*, management class *class name*.

Explanation: In response to the UPDATE COPYGROUP command, the archive copy group named *group name* has been updated in the management class named *class name* in the policy set *set name* belonging to policy domain *domain name*.

System action: Server operation continues.

User response: None.

ANR1538I Default management class *set to class name* for policy domain *domain name*, set *set name*.

Explanation: The default management class for the policy set *set name* in policy domain *domain name* has been set to the management class named *class name*.

System action: If this policy set is activated, clients use this management class for backup-archive processing by default, or if other management classes specified for binding do not exist in the policy set.

User response: None.

ANR1550W Management class *class name* is NOT defined in policy set *set name* but IS defined in the ACTIVE policy set for domain *domain name*: files bound to this management class will be REBOUND to the default management class if/when this set is activated.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation processing, the server has found a management class named *class name* in the currently active policy set, but not defined in the policy set being validated or activated (*set name*). If policy set *set name* is activated, files bound to this management class in domain *domain name* are automatically rebound to the default management class in policy set *set name*.

System action: Server operation continues.

User response: If you do not want files to be rebound to the default management class, define a management class with the name specified in the message for the policy set. To define the proper copy group attributes, reference the management class definition in the ACTIVE policy set or copy the management class *class name* from the ACTIVE policy set to policy set *set name* using the COPY MGMTCLAS command.

ANR1551W **BACKUP copygroup** *group name* in management class *class name* is NOT defined in policy set *set name* but is defined in the ACTIVE policy set for domain *domain name*: files bound to this management class will no longer be backed up if/when *set name* is activated.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation processing, the server has found a backup copy group named *group name* for management class *class name* in the currently active policy set, but the copy group is not defined for the management class in the policy set being validated or activated (*set name*). If policy set *set name* is activated, files bound to management class *class name* in domain *domain name* will no longer be eligible for backup processing.

System action: Server operation continues.

User response: If you want files bound to this management class to be eligible for backup processing, define an archive copy group for management class *class name* by using the DEFINE COPYGROUP command.

ANR1552W **ARCHIVE copygroup** *group name* in management class *class name* is NOT defined in policy set *set name* but is defined in the ACTIVE policy set for domain *domain name*: attempting to archive files specifying this management class will fail if *set name* is activated.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation processing, the server has found an archive copy group named *group*

name for management class *class name* in the currently active policy set, but the copy group is not defined for the management class in the policy set being validated or activated (*set name*). If policy set *set name* is activated, attempting to archive files specifying this management class will fail. Existing archives bound to this management class on the TSM server will be expired based on the defmgmtclass values, or the archive retention grace period for the policy domain, if the default management class does not contain an archive copygroup.

System action: Server operation continues.

User response: To archive files specifying this management class, define an archive copy group for management class *class name* by using the DEFINE COPYGROUP command.

ANR1553W **DEFAULT Management class** *class name* in policy set *domain name set name* does not have a BACKUP copygroup: files will not be backed up by default if this set is activated.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation for policy set *set name* in policy domain *domain name*, the server has found that the default management class named *class name* does not have a backup copy group. This message warns the administrator that activation of this policy set results in client files not being backed up, unless they are bound to a management class (which has a copy group) other than the default.

System action: Server operation continues.

User response: To define a backup copy group for the management class, issue the DEFINE COPYGROUP command. To assign a different default management class for the domain, issue the ASSIGN DEFMGMTCLASS command. Take either action if you want files to be backed up by default.

ANR1554W **DEFAULT Management class** *class name* in policy set *domain name set name* does not have an ARCHIVE copygroup: files will not be archived by default if this set is activated.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation for policy set *set name* in policy domain *domain name*, the server has found that the default management class named *class name* does not have an archive copy group. This message warns the administrator that activation of this policy set will result in client files not being allowed archive processing unless they are bound to a management class (which has an archive copy group) other than the default.

System action: Server operation continues.

User response: To define a backup copy group for the management class, issue the DEFINE COPYGROUP command. To assign a different default management class for the domain, issue the ASSIGN DEFMGMTCLASS command. Take either action if you want files to be eligible for archive processing by default.

ANR1555W The BACKUP copy group in management class *management class name* specifies a destination that does not refer to a defined storage pool: *storage pool name*. If this pool does not exist when policy set *policy set name* is activated, clients will fail when using this management class to backup files to the server.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation for *set name*, the server has found a backup copy group destination that references an undefined storage pool named *pool name*. If this storage pool is undefined when the policy set is activated, backup or archive operations will fail for clients with files bound to the management class whose copy groups reference this pool.

System action: Server operation continues.

User response: To locate the copy groups that refer to the undefined storage pool, issue the QUERY COPYGROUP command. To change the destination to refer to an existing storage pool, issue the UPDATE COPYGROUP command. To define the storage pool, an authorized administrator can issue the DEFINE STGPOOL command.

ANR1556W The ARCHIVE copy group in management class *management class name* specifies a destination that does not refer to a defined storage pool: *storage pool name*. If this pool does not exist when policy set *policy set name* is activated, clients will fail when using this management class to archive files to the server.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation for *set name*, the server has found a archive copy group destination that references an undefined storage pool named *pool name*. If this storage pool is undefined when the policy set is activated, backup or archive operations will fail for clients with files bound to the management class whose copy groups reference this pool.

System action: Server operation continues.

User response: To locate the copy groups that refer to

the undefined storage pool, issue the QUERY COPYGROUP command. To change the destination to refer to an existing storage pool, issue the UPDATE COPYGROUP command. To define the storage pool, an authorized administrator can issue the DEFINE STGPOOL command.

ANR1557W The space management migration destination in management class *management class name* does not refer to a defined storage pool: *storage pool name*. If this pool does not exist when policy set *policy set name* is activated, clients will fail when using this management class to migrate space-managed files to the server.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation for *set name*, the server has found a space management migration destination that references an undefined storage pool named *pool name*. If this storage pool is undefined when the policy set is activated, space management migration operations will fail for clients with files bound to the management class that references this pool.

System action: Server operation continues.

User response: To locate the management class that refers to the undefined storage pool, issue the QUERY MGMTCLASS command. To change the destination to refer to an existing storage pool, issue the UPDATE MGMTCLASS command. To define the storage pool, an authorized administrator can issue the DEFINE STGPOOL command.

ANR1558E The space management migration destination in management class *management class name* in policy set *policy set name* refers to copy storage pool: *storage pool name*. Copy storage pools are not a valid migration destination.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation for *set name*, the server has found a space management migration destination that references a copy storage pool named *pool name*.

System action: Server operation continues. The policy set is not activated.

User response: To locate the management class that refers to the copy storage pool, issue the QUERY MGMTCLASS command. To change the destination to refer to a non-copy storage pool, issue the UPDATE MGMTCLASS command.

ANR1559E The copy group destination for type *copy group type* in management class *management class name* in policy set *policy set name* refers to copy storage pool: *storage pool name*. Copy storage pools are not a valid copy group destination.

Explanation: This message may be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation for *set name*, the server has found a copy group destination that references a copy storage pool named *pool name*.

System action: Server operation continues. The policy set is not activated.

User response: To locate the management class that refers to the copy storage pool, issue the QUERY MGMTCLASS command. To change the destination to refer to a non-copy storage pool, issue the UPDATE MGMTCLASS command.

ANR1560E Command: Invalid policy domain name - *domain name*.

Explanation: Server processing for the command *command* fails because the policy domain name *domain name* specified does not contain valid characters or contains too many characters.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a policy domain name that conforms to these name requirements. For information on the character and length specifications for valid policy domain names, refer to the *Administrator's Reference* for your particular platform.

ANR1561E Command: Missing policy domain name.

Explanation: Server processing for the command *command* fails because the required policy domain parameter has not been specified.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid policy domain name.

ANR1562E Command: Policy domain description exceeds *length limit* characters.

Explanation: Server processing for the command *command* fails because the policy domain description specified is longer than the *length limit* number of characters allowed.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a shorter policy domain description.

ANR1563E Command: Invalid retention period for BACKRETN parameter - *retention value*.

Explanation: Server processing for the copy group command *command* fails because the value (*retention value*) specified for the BACKRETN parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid BACKRETN value. For valid BACKRETN values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1564E Command: Invalid retention period for ARCHRETN parameter - *retention value*.

Explanation: Server processing for the copy group command *command* fails because the value (*retention value*) specified for the ARCHRETN parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid ARCHRETN value. For valid ARCHRETN values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1565E Command: Invalid policy set name - *set name*.

Explanation: Server processing for the command *command* fails because the policy set name *set name* specified does not contain valid characters or contains too many characters.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a policy set name that conforms to valid name requirements. For information on the character and length specifications for valid policy set names, refer to

the *Administrator's Reference* for your particular platform.

ANR1566E *Command: Policy set description exceeds length limit characters.*

Explanation: Server processing for the command *command* fails because the policy set description specified is longer than the *length limit* number of characters allowed.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a shorter policy set description.

ANR1567E *Command: Invalid management class name - class name.*

Explanation: Server processing for the command *command* fails because the management class name *class name* specified does not contain valid characters or contains too many characters.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a management class name that conforms to valid name requirements. For information on the character and length specifications for valid management class names, refer to the *Administrator's Reference* for your particular platform.

ANR1568E *Command: Management class description exceeds length limit characters.*

Explanation: Server processing for the command *command* fails because the management class description specified is longer than the *length limit* number of characters allowed.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a shorter management class description. Refer to the *Administrator's Guide* for your particular platform for more information.

ANR1569E *Command: Invalid copy group name - group name.*

Explanation: Server processing for the command *command* fails because the copy group name *group name*

specified does not contain valid characters or contains too many characters.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a copy group name that conforms to valid name requirements. For information on the character and length specifications for valid copy group names, refer to the *Administrator's Reference* for your particular platform.

ANR1570E *Command: Invalid copy frequency - frequency value.*

Explanation: Server processing for the copy group command *command* fails because the value (*frequency value*) specified for the FREQUENCY parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid FREQUENCY value. For valid FREQUENCY values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1571E *Command: Invalid copy destination - pool name.*

Explanation: Server processing for the command *command* fails because the storage pool name *pool name* specified for the copy group destination or for the table of contents (TOC) destination does not contain valid characters or contains too many characters.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a storage pool name that conforms to valid name requirements. For information on the character and length specifications for valid storage pool names, refer to the *Administrator's Reference* for your particular platform. For a list of names of defined storage pools, issue the QUERY STGPPOOL command.

ANR1572E *Command: Missing copy destination.*

Explanation: Server processing for the copy group command *command* fails because the required copy group destination is not specified.

System action: Database changes for the command are rolled back and server operation continues. The

command is not successful in changing the server database.

User response: Reissue the command and specify the required copy group destination (DEST).

ANR1573E *Command: Invalid copy type - type value.*

Explanation: Server processing for the copy group command *command* fails because the value (*type value*) specified for the TYPE parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid TYPE value. For valid TYPE values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1574E *Command: Invalid version count for VEREXISTS parameter - version value.*

Explanation: Server processing for the copy group command *command* fails because the value (*version value*) specified for the VEREXISTS parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid VEREXISTS value. For valid VEREXISTS values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1575E *Command: Invalid version count for VERDELETED parameter - version value.*

Explanation: Server processing for the copy group command *command* fails because the value (*version value*) specified for the VERDELETED parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid VERDELETED value. For valid VERDELETED values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1576E *Command: Invalid retention period for RETEXTRA parameter - retention value.*

Explanation: Server processing for the copy group command *command* fails because the value (*retention value*) specified for the RETEXTRA parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid RETEXTRA value. For valid RETEXTRA values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1577E *Command: Invalid retention period for RETONLY parameter - retention value.*

Explanation: Server processing for the copy group command *command* fails because the value (*retention value*) specified for the RETONLY parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid RETONLY value. For valid RETONLY values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1578E *Command: Invalid version count for RETVER parameter - retention value.*

Explanation: Server processing for the copy group command *command* fails because the value (*retention value*) specified for the RETVER parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid RETVER value. For valid RETVER values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1579E *Command: Invalid copy mode - mode value.*

Explanation: Server processing for the copy group command *command* fails because the value (*mode value*) specified for the MODE parameter is not valid.

System action: Database changes for the command are

ANR1580E • ANR1585E

rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid MODE value. For valid MODE values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1580E *Command: Invalid copy serialization mode - serialization value.*

Explanation: Server processing for the copy group command *command* fails because the value (*serialization value*) specified for the SERIALIZATION parameter is not valid.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a valid SERIALIZATION value. For valid SERIALIZATION values for the DEFINE COPYGROUP or UPDATE COPYGROUP commands, refer to the *Administrator's Reference* for your particular platform.

ANR1581E *Command: The option option is valid only for backup copy groups.*

Explanation: Server processing for the archive copy group command *command* fails because the *option* specified is only valid for backup copy group definitions.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying valid archive copy group options, or specify TYPE=BACKUP if the intent is to operate on a backup copy group. For valid archive copy group options, refer to the *Administrator's Reference* and *Administrator's Guide* for your particular platform.

ANR1582E *Command: The option option is valid only for archive copy groups.*

Explanation: Server processing for the backup copy group command *command* fails because the *option* specified is only valid for archive copy group definitions.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying valid backup copy group options, or specifying

TYPE=ARCHIVE if the intent is to operate on an archive copy group. For valid backup copy group options, refer to the *Administrator's Reference* and *Administrator's Guide* for your particular platform.

ANR1583E *Command: Copy frequency for archive copy groups must be CMD - frequency value is not valid.*

Explanation: Server processing for the archive copy group command *command* fails because a value other than CMD has been specified for the FREQUENCY parameter. The only value that may be specified for the archive copy group FREQUENCY parameter is CMD.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying CMD for the FREQUENCY parameter, or omitting the FREQUENCY parameter because the default value for FREQUENCY is CMD for archive copy groups. For valid archive copy group options, refer to the *Administrator's Reference* and *Administrator's Guide* for your particular platform.

ANR1584E *Command: Copy mode for archive copy groups must be ABSOLUTE - mode value is not valid.*

Explanation: Server processing for the archive copy group command *command* fails because a value other than ABSOLUTE has been specified for the MODE parameter. The only value that may be specified for the archive copy group MODE parameter is ABSOLUTE.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying ABSOLUTE for the MODE parameter, or omitting the MODE parameter because the default value for MODE is ABSOLUTE for archive copy groups. For valid archive copy group options, refer to the *Administrator's Reference* and *Administrator's Guide* for your particular platform.

ANR1585E *Command: Policy set ACTIVE cannot be modified.*

Explanation: Server processing for the command *command* fails because the policy set name ACTIVE is specified. Objects in the ACTIVE policy set for a domain may only be changed through activation of another policy set.

System action: Database changes for the command are rolled back and server operation continues. The

command is not successful in changing the server database.

User response: Reissue the command specifying a policy set other than ACTIVE. To copy the ACTIVE policy set for a policy domain to another name so that commands may be used to change its contents, issue the COPY POLICYSET command. Then to activate the changes, issue the ACTIVATE POLICYSET command.

ANR1586E *Command: Invalid migration destination - pool name.*

Explanation: Server processing for the command *command* fails because the storage pool name *pool name* specified for the migration destination is a copy pool. A copy pool is not a valid migration destination.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command using a storage pool name that is not a copy pool. For a list of names of defined storage pools, issue the QUERY STGPOOL command.

ANR1587E *Command: Invalid copy group destination - pool name.*

Explanation: Server processing for the command *command* fails because the storage pool name *pool name* specified for the copy group destination is a copy pool or active-data pool. A copy pool or active-data pool is not a valid copy group destination.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command using a storage pool name that is a primary pool, not a copy pool or active-data pool. For a list of names of defined storage pools, issue the QUERY STGPOOL command.

ANR1588W **The value of the ACTIVEDESTINATION parameter received from the configuration manager specifies a storage pool *storage pool name* for domain *domain name* that is not defined on the managed server.**

Explanation: If the storage pool on the managed server is undefined, the value of the ACTIVEDESTINATION parameter for domain *domain name* is not updated.

System action: Server operation continues.

User response: Define an active-data storage pool on the managed server with the same name as that on the configuration manager.

ANR1590E *Command: Policy domain *domain name* is not defined.*

Explanation: Server processing for the command *command* fails because the policy domain name *domain name* specified does not refer to a defined policy domain in the server database.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a policy domain name that is defined in the server database. For a list of the names of defined policy domains in the server database, issue the QUERY DOMAIN command.

ANR1591E *Command: Policy domain *domain name* is already defined.*

Explanation: Server processing for the command *command* fails because the policy domain name *domain name* specified refers to a policy domain that is already defined in the server database.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a policy domain name that is not defined in the server database. For a list of the names of defined policy domains in the server database, issue the QUERY DOMAIN command.

ANR1592E *Command: Policy domain *domain name* still contains at least one policy set.*

Explanation: Server processing for the delete command *command* fails because the policy domain name *domain name* specified refers to a policy domain that still contains at least one policy set.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: To delete the policy set from the policy domain, issue the DELETE POLICYSET command.

ANR1593E *Command: Policy domain *domain name* still contains at least one node.*

Explanation: Server processing for the delete command *command* fails because the policy domain name *domain name* specified refers to a policy domain that still contains at least one node. A policy domain cannot be deleted if one or more client nodes are still assigned to the domain.

ANR1594E • ANR1600E

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: To remove remaining nodes from the policy domain, issue the REMOVE NODE command. After all nodes are removed, issue the delete command again.

ANR1594E *Command: Policy domain domain name has no active policy set.*

Explanation: Server processing for the update or register node command *command* fails because the policy domain name *domain name* specified refers to a policy domain that does not have an active policy set defined. Nodes cannot be assigned to policy domains that do not have an active policy set.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: To activate a policy set for the specified policy domain, issue the ACTIVATE POLICYSET command. After a policy set has been activated, client nodes may be assigned to the policy domain.

ANR1595E *Command: Policy set set name is not defined in policy domain domain name.*

Explanation: Server processing for the command *command* fails because the policy set name *set name* specified does not refer to a defined set in policy domain *domain name* in the server database.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a policy set name that is defined in the policy domain. For a list of the names of defined policy sets in the policy domain, issue the QUERY POLICYSET command.

ANR1596E *Command: Policy set set name is already defined in policy domain domain name.*

Explanation: Server processing for the command *command* fails because the policy set name *set name* specified refers to a policy set that is already defined in policy domain *domain name*.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a

policy set name that is not defined in the policy domain. For a list of the names of defined policy sets in the policy domain, issue the QUERY POLICYSET command.

ANR1597E *policy set command: Policy set set name in domain domain name still contains at least one management class.*

Explanation: The *policy set command* failed because the set still contains at least one management class definition.

System action: The command fails and server operation continues.

User response: Remove the remaining management classes from the policy set and reissue the command.

ANR1598E *Command: No default management class has been assigned for policy set set name in domain domain name.*

Explanation: Server processing for the command *command* fails because the policy set *set name* in policy domain *domain name* does not have a default management class assigned.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: To assign a default management class in the policy set, issue the ASSIGN DEFMGMTCLASS command.

ANR1599E *Command: Management class class name is not defined in policy domain domain name, set set name.*

Explanation: Server processing for the command *command* fails because the management class name *class name* specified does not refer to a defined management class in policy set *set name* belonging to policy domain *domain name*.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a policy set name that is defined in the policy domain. For a list of the names of defined policy sets in the policy domain, issue the QUERY POLICYSET command.

ANR1600E *Command: Management class class name is already defined in policy domain domain name, set set name.*

Explanation: Server processing for the command

command fails because the specified management class name *class name* refers to a management class that is already defined in policy set *set name* belonging to policy domain *domain name*.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a management class name that is not defined in the policy set. For a list of the names of defined management classes in the policy domain and policy set, issue the QUERY MGMTCLASS command.

ANR1602E *Command: Backup copy group group name is not defined in policy domain domain name, set set name, management class class name.*

Explanation: Server processing for the command *command* fails because the backup copy group named *group name* specified for management class *class name* does not refer to a defined backup copy group in policy set *set name* belonging to policy domain *domain name*.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a copy group name that is defined. For a list of the names of defined copy groups and management classes in the policy domain or policy set, issue the QUERY COPYGROUP command.

ANR1603E *Command: Backup copy group group name is already defined in policy domain domain name, set set name, management class class name.*

Explanation: Server processing for the command *command* fails because the specified backup copy group named *group name* refers to a copy group that is already defined for management class (*class name*) in policy set *set name* belonging to policy domain *domain name*.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a copy group that is not defined in the policy set. For a list of the names of defined copy groups for management classes in the policy domain and policy set, issue the QUERY COPYGROUP command.

ANR1604E *Command: Archive copy group group name is not defined in policy domain domain name, set set name, management class class name.*

Explanation: Server processing for the command *command* fails because the archive copy group named *group name* specified for management class *class name* does not refer to a defined archive copy group in policy set *set name* belonging to policy domain *domain name*.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a copy group name that is defined. For a list of the names of defined copy groups and management classes in the policy domain or policy set, issue the QUERY COPYGROUP command.

ANR1605E *Command: Archive copy group group name is already defined in policy domain domain name, set set name, management class class name.*

Explanation: Server processing for the command *command* fails because the specified archive copy group named *group name* refers to a copy group that is already defined for management class *class name* in policy set *set name* belonging to policy domain *domain name*.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command specifying a copy group that is not defined in the policy set. For a list of the names of defined copy groups for management classes in the policy domain and policy set, issue the QUERY COPYGROUP command.

ANR1606E *Out of server LOG space in accessing policy tables.*

Explanation: The server ends a database update transaction for policy information because sufficient log space is not available on the server.

System action: The policy operation is ended and server operation continues.

User response: An authorized administrator can issue the DEFINE LOGVOLUME command to add volumes for use by the log and can issue the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR1607E Out of server DB space in accessing policy tables.

Explanation: The server ends a database update transaction for policy information because sufficient database space is not available on the server.

System action: The policy operation is ended and server operation continues.

User response: An authorized administrator can issue the DEFINE DBVOLUME command to add volumes for use by the database and can issue the EXTEND DB command to extend the size of the database so that the new volumes are used.

ANR1608E Error fetching entry for domain *domain name*, set *set name*.

Explanation: An internal server database error occurs while retrieving policy information for policy set *set name* in domain *domain name*.

System action: The policy operation is ended and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR1609E Policy error: unable to find management class ID for class *class name* in policy set *set name* belonging to domain *domain name*.

Explanation: An internal server database error has been encountered while retrieving policy information for management class *class name* in policy set *set name* belonging to policy domain *domain name*.

System action: The policy operation is ended and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR1610E Internal Server error: invalid copy type *copy type integer* encountered in policy set validation.

Explanation: An internal server database error has been encountered while validating a policy set in response to the VALIDATE POLICYSET or ACTIVATE POLICYSET command.

System action: The policy operation is ended and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR1611E Command: Invalid management class name - *management class name*.

Explanation: Server processing for the command *command* fails because the specified management class name may not be used as a management class name.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify another management class name.

ANR1612E Command: Management class *management class name* in policy set *set name*, domain *domain name* specifies MIGREQUIRESBKUP=YES, but contains no backup copy group.

Explanation: During policy set validation or activation for policy set *set name* in policy domain *domain name*, the server has found that the management class named *class name* specifies the MIGREQUIRESBKUP=YES parameter but does not contain a backup copy group. Policy set validation or activation fails in this case because it would not be possible to ensure that space-managed client files are backed up prior to being migrated to the server.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: To define a backup copy group within the management class, issue the DEFINE COPYGROUP command. To change the MIGREQUIRESBKUP parameter, issue the UPDATE MGMTCLASS command.

ANR1613E Command: Invalid retention initiation - *retention initiation value*.

Explanation: Server processing for the copy group command *command* fails because the value (*retention initiation value*) specified for the RETINIT parameter is not valid.

System action: The command fails.

User response: Issue the command again and specify a valid RETINIT value. For valid RETINIT values for the DEFINE copy group or UPDATE copy group commands, refer to the *Administrator's Reference*.

ANR1614E *Command: Invalid number of days for RETMIN parameter - days value.*

Explanation: The command fails.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Issue the command again and specify a valid RETMIN value. For valid RETMIN values for the DEFINE copy group or UPDATE copy group commands, refer to the *Administrator's Reference*.

ANR1615E *Command: RETVER of NOLIMIT cannot be specified with RETINIT value of EVENT.*

Explanation: Server processing for the copy group command *command* fails because the retain versions value of NOLIMIT is not allowed with the retention initiation value of EVENT. If this is the UPDATE copy group command, at least one of the values might have been defined already.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Issue the command again and specify a valid RETVER or RETMIN value. For valid values for the DEFINE copy group or UPDATE copy group commands, refer to the *Administrator's Reference*.

ANR1616W *Command: the specified RETMIN value (new days) will be ignored because the RETINIT value is CREATION for domain policy set management class.*

Explanation: Processing for the copy group command *command* detected that a retain minimum number of days value was specified either with the retention initiation value of CREATION, or the current retention initiation value stored for the copy group is CREATION. The retain minimum number of days value is not used when the retention initiation value is CREATION. The copy group will be defined or updated, but the RETMIN value will not be stored.

System action: The copy group is defined or updated and system operation continues.

User response: The copy group will be defined or updated, but the retain minimum number of days value will not be stored. If you want to specify a retention initiation value of EVENT, issue the update command again.

ANR1617W *Command: the new RETVER value (new days) is less than the value previously stored (old days) for domain policy set management class.*

Explanation: Processing for the copy group command *command* detected that the new number of days to retain versions is less than the number of days currently stored for the copy group. If archive retention protection is active, the policy set might not activate because the retain versions value is not allowed to decrease.

System action: The copy group is updated and system operation continues.

User response: The copy group will be updated, but the copy group might fail validation when the policy set is validated or activated.

ANR1618W *Command: the new RETMIN value (new days) is less than the value previously stored (old days) for domain policy set management class.*

Explanation: Processing for the copy group command *command* detected that the new retain minimum number of days is less than the number of days currently stored for the copy group. The policy set might not activate when archive retention protection is active, because the retain minimum days value is not allowed to decrease.

System action: The copy group is updated and system operation continues.

User response: The copy group will be updated, but the copy group might fail validation when the policy set is validated or activated.

ANR1619E *The RETVER of NOLIMIT is not allowed with the RETINIT value of EVENT for domain policy set management class.*

Explanation: This message can be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation processing, the server has found the the copy group in the policy has specified an invalid combination of options. Retain versions of NOLIMIT and retention initiation of EVENT are not allowed. The policy will not be validated or activated.

System action: Server operation continues.

User response: Update the RETVER or REINIT values in the copy group. For valid values, refer to the *Administrator's Reference* for your platform.

ANR1620E The new RETVER value (*new days*) is less than the value in the ACTIVE policy (*old days*) for domain policy set management class.

Explanation: This message can be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation processing, the server has found that archive retention protection is active and the copy group has a retain versions value less than the value in the ACTIVE policy set. The policy will not be validated or activated.

System action: Server operation continues.

User response: Update the RETVER value in the copy group.

ANR1621E The new RETMIN value (*new days*) is less than the value in the ACTIVE policy (*old days*) for domain policy set management class.

Explanation: This message can be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation processing, the server has found that archive retention protection is active and the the copy group has a retain minimum days value that is less than the value in the ACTIVE policy set. The policy will not be validated or activated.

System action: Server operation continues.

User response: Update the RETMIN value in the copy group.

ANR1622E Management class *class name* is not defined in policy set *set name*, but is defined in the active policy set for domain *domain name*. Archive retention protection is active, so validation fails.

Explanation: This message can be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation processing, the server found a management class named *class name* in the currently active policy set, but not defined in the policy set being validated or activated (*set name*). When archive retention protection is active, all management classes in the active policy set must be included in the policy set being validated. Policy validation will fail.

System action: Server operation continues.

User response: Define a management class with the name specified in the message for the policy set. To define the proper copy group attributes, reference the management class definition in the active policy set or copy the management class *class name* from the active policy set to the policy set *set name*, using the COPY MGMTCLAS command.

ANR1623E Management class *class name* in policy set *set name* for domain *domain name* does not have an archive copy group. Archive retention protection is active, so validation fails.

Explanation: This message can be returned from the VALIDATE POLICYSET or ACTIVATE POLICYSET command. During policy set validation processing, the server found a management class named *class name* in the policy set being validated or activated (*set name*). The management class does not have an archive copy group. When archive retention protection is active, all management classes in the policy set being validated must have an archive copy group. Policy validation will fail.

System action: Server operation continues.

User response: Define an archive copy group in specified management class, then try the validation again.

ANR1624E Command: Invalid active pool list - active pool list name.

Explanation: Server processing for the command *command* fails because the active pool list *active pool list* specified does not contain valid pool.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Reissue the command and specify a active pool list that conforms to these name requirements. For information on the character and length specifications for valid active-data pool names, refer to the *Administrator's Reference* for your particular platform.

ANR1625E *command*: Server is down-level compared to the version of data being inserted into the database: *data version*.

Explanation: The DSMSERV INSERTDB command encountered data written by a version of the DSMUPGRD EXTRACTDB command that is newer than what is supported by the server version.

System action: The command ends without inserting any data into the database.

User response: Rerun the command using a version of the server compatible with the version of DSMUPGRD used to extract the data. Or reextract the data using an older version of DSMUPGRD that is compatible with the version of the server.

ANR1635I The server machine GUID, *machine GUID*, has initialized.

Explanation: The specified globally unique identifier (GUID) has initialized for the server machine.

System action: Server operation continues.

User response: None.

ANR1636W The server machine GUID changed: old value (*old value*), new value (*new value*).

Explanation: The globally unique identifier (GUID) has changed for the server machine. The old and new values are displayed.

System action: Server operation continues.

User response: None.

ANR1637W Error (*error*) occurred initializing the server machine GUID.

Explanation: An error occurred while initializing the server machine globally unique identifier (GUID).

System action: Server operation continues.

User response: Handle problems appropriately. A write error may occur because the server needs root authority to write the GUID. A read error may occur if the server does not have authority to read the GUID. Other error codes are received from the GUID utility.

ANR1638W Error (*error*) occurred initializing the server machine GUID. Old value was *old GUID*.

Explanation: An error occurred while initializing the server machine globally unique identifier (GUID). The old value is displayed.

System action: Server operation continues.

User response: Handle problems appropriately. A write error may occur because the server needs root authority to write the GUID. A read error may occur if the server does not have authority to read the GUID. Other error codes are received from the GUID utility.

ANR1639I Attributes changed for node *nodeName*: *changed attribute list*.

Explanation: The TCP/IP name or address, or the globally unique identifier (GUID) has changed for the specified node. The old and new values are displayed for entries that have changed.

System action: Server operation continues.

User response: None.

ANR1640E There is no data mover defined for node *node name*.

Explanation: To perform the requested operation, the specified node must have an associated data mover defined.

System action: The requested operation fails.

User response: Define a data mover for the node and retry the operation.

ANR1641E *command*: The node *node name* has a type that is not allowed for this command.

Explanation: The node is not the correct type to be used with this command.

System action: The command fails.

User response: Re-run the command with a node of the correct type.

ANR1642E *command*: The node *node name* is locked.

Explanation: The node is locked and cannot be used in this command.

System action: The command fails.

User response: Unlock the node and re-run the command.

ANR1643I *Command*: All file spaces for node *node name*, will be moved.

Explanation: The server will attempt to move data for all the file spaces for the specified node name based on the criteria entered in the MOVE NODEDATA command.

System action: Server moves data for the indicated node.

User response: None.

ANR1644E *Command*: Move node data operation already in progress for storage pool *storage pool*.

Explanation: A command has been issued to move node data for the specified storage pool but there is already a move node data operation in progress for one or more nodes that have been specified for that same storage pool.

System action: The server does not process the command.

User response: Check the activity log for a previous MOVE NODEDATA command to determine what processes for moving node data are in progress for the storage pool. Reissue the command for the node(s) and storage pool you desire that are not already in progress,

ANR1645I • ANR1652E

or, reissue the command after the move node data process ends.

ANR1645I *Command: Data for node node name, filesystem filename, FSID filename ID will be moved.*

Explanation: The server will move data for the specified filename and node name based on the criteria entered in the MOVE NODEDATA command.

System action: The server moves data for the specified node and filesystems.

User response: None.

ANR1646I *Command: Node Node name, no filesystems found to move for this node.*

Explanation: A node and filename were entered in a MOVE NODEDATA command but no filesystems were found for the specified node.

System action: The server continues to move other filesystems for any other nodes specified in the MOVE NODEDATA command.

User response: None.

ANR1647E *Cannot find file space name for node node ID, file space filename ID.*

Explanation: The server could not obtain filename information for that node.

System action: The server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR1648W *Command: This command will move data for nodes stored in volumes in storage pool source storage pool to other volumes within the same storage pool; the data will be inaccessible to users until the operation completes.*

Explanation: A MOVE NODEDATA command has been entered that will move data to other volumes in the same storage pool. While the data is being moved, it will not be available to users.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to continue or 'N' to end the process.

ANR1649W *Command: This command will move data for nodes stored in storage pool source storage pool to storage pool destination storage pool; the data will be inaccessible to users until the operation completes.*

Explanation: A MOVE NODEDATA command has been entered that will move data from the source storage pool to the destination storage pool shown. While the data is being moved it, will not be available to users.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to continue or 'N' to end the process.

ANR1650E *Server server name is not defined.*

Explanation: The *server name* was not created using the DEFINE SERVER command. This entry was created using the REGISTER NODE NODETYPE=SERVER command and is not a valid reference.

System action: The current action for the device class referring to this server fails.

User response: The device class referring to this node as the SERVERNAME should be updated to refer to a valid server entry. Specifically, it should refer to an entry created using the DEFINE SERVER command.

ANR1651E *Server information for server name is not available.*

Explanation: The information for *server name* was not available.

System action: The current server action fails.

User response: Please review any other messages prior to this message to determine the cause of the failure.

ANR1652E *Server information for server name could not be read from a device configuration file.*

Explanation: An attempt to a server definition for *server name* from any device configuration files failed.

System action: The current action for the device class referring to this server fails.

User response: Please verify the existence of a device configuration file and the DEFINE SERVER stanza within that file.

ANR1653E Resource lock acquisition for server *server name* failed.

Explanation: The acquisition of the resource lock for server *server name* failed.

System action: The current action for the device class referring to this server fails.

User response: Retry the action referring to the device class that refers to this server name. If the lock failure persists, please contact your service representative.

ANR1654E Server *server name* will not be written to a device configuration file.

Explanation: An error occurred accessing the information for *server name* while trying to write this information to a device configuration file.

System action: This DEFINE SERVER entry is not processing.

User response: Verify that the necessary DEFINE SERVER entries were written to a device configuration file. If this error persists, please contact your service representative.

ANR1655E Failure processing password for Server *server name* when writing a device configuration file.

Explanation: An error occurred processing the password for *server name* while trying to write this information to a device configuration file.

System action: This DEFINE SERVER entry is written to the device configuration file without the password.

User response: The password needs to be specified after PASSWORD= for this DEFINE SERVER entry in the device configuration file.

ANR1656E Failure writing server definitions to a device configuration file.

Explanation: An error occurred writing the server information to a device configuration file.

System action: The BACKUP DEVCONFIG action fails.

User response: Check that the device configuration file exists and that the file system the file resides on is not out of space.

ANR1657E Command: Invalid server or group name - *server or group name*.

Explanation: The command shown specifies an invalid server or server group name.

System action: The server does not process the command.

User response: Reissue the command with a valid name.

ANR1658E Command: Failure determining NODENAME for server *server name*.

Explanation: The command shown was unable to determine a node name either from the NODENAME= parameter on this command or from the server name previously set using the SET SERVERNAME command.

System action: The server does not process the command.

User response: Reissue the command with a valid node name parameter or else update the server name using the SET SERVERNAME command so that a valid name is available.

ANR1659E Command: Server or server group *server or group name* is already defined.

Explanation: A DEFINE SERVER or DEFINE SERVERGROUP command has been entered that specifies a server or server group name that already exists. The name specified must be a unique name. It must not duplicate a node name used by a registered node, a server name used by a defined server, or a server group name used by a defined server group.

System action: The server does not process the command.

User response: To define the server or server group, reissue the command and specify a different name.

ANR1660I Server *server name* defined successfully.

Explanation: The requested server has been defined to the system in response to a DEFINE SERVER command.

System action: None.

User response: None.

ANR1661I Server *server name* deleted.

Explanation: In response to a DELETE SERVER command, the requested server has been removed from the system.

System action: None.

User response: None.

ANR1662I Server *server name* updated.

Explanation: One or more attributes of a server have been updated by an UPDATE SERVER command.

System action: None.

User response: None.

ANR1663E *command: Server server name not defined*

Explanation: The server *server name* is not defined to the system.

System action: The command fails.

User response: None.

ANR1664W *Command: Server server name is currently in use.*

Explanation: The command shown specifies a server that is currently in use. The server is referenced by one or more of the following: a device class of DEVTYPE=SERVER that specifies this server for the 'SERVERNAME=' parameter, it is defined as the event server, or a connection with this server is currently open and in use.

System action: The server does not process the command.

User response: Reissue the command at a later time. In order to delete the server specified, it must not be currently connected to the server, it may not be referenced in a device class, and it can not be defined to be the event server.

ANR1665E *command: Failure updating password for server server name.*

Explanation: An error occurred updating the password for *server name*.

System action: The command fails.

User response: Re-try the command specifying a different password.

ANR1666E *command: FILEAGGR not allowed with NODETYPE=SERVER.*

Explanation: The FILEAGGR= parameter may not be specified with the NODETYPE=SERVER parameter also being specified.

System action: The command fails.

User response: Reissue the command command without the FILEAGGR= parameter if this is a NODETYPE=SERVER.

ANR1667E *command: Action not permitted against node node name.*

Explanation: The command is not permitted against the entry for node *node name*. This node entry has a NODETYPE of SERVER.

System action: The command fails.

User response: None.

ANR1668E *command: Not allowed for server server name.*

Explanation: The DELETE SERVER command is not permitted for server *server name*. The specified server is either the event server or else it is a node entry rather than a server definition.

System action: The command fails.

User response: If the specified server is the event server, and you want to delete it, issue the DELETE EVENTSERVER command and then reissue the DELETE SERVER command. To remove a node entry, issue the REMOVE NODE command for the specified name.

ANR1669I *Server event server name is defined as the event server.*

Explanation: The specified server is defined.

System action: None.

User response: None.

ANR1670E *Server event server name is already defined as the event server. You must issue the DELETE EVENTSERVER command before defining a new event server.*

Explanation: An event server is already defined.

System action: The command fails.

User response: Delete the existing Event Server and try the command again.

ANR1671I *The event server definition has been deleted.*

Explanation: The event server definition has been deleted.

System action: None.

User response: If an event server definition is desired, use the DEFINE EVENTSERVER command.

ANR1672I *No event server is currently defined.*

Explanation: A query was issued to get the name of the event server; however, no event server is currently defined.

System action: None.

User response: If an event server definition is desired, use the DEFINE EVENTSERVER command.

ANR1673I **Server group** *group name* **defined successfully.**

Explanation: The requested server group is defined to the system in response to a DEFINE SERVERGROUP command.

System action: None.

User response: None.

ANR1674I **Member** *member name* **defined successfully in server group** *group name*.

Explanation: The requested member is defined in the server group in response to a DEFINE GRPMEMBER command.

System action: None.

User response: None.

ANR1675I **Server group** *server group name* **deleted.**

Explanation: The requested server is removed from the system in response to a DELETE SERVERGROUP command.

System action: None.

User response: None.

ANR1676I **Member** *member name* **deleted from server group** *server group name*.

Explanation: The requested member is removed from the server group in response to a DELETE GRPMEMBER command,

System action: None.

User response: None.

ANR1677I **Server group** *server group name* **updated.**

Explanation: One or more attributes of a server group is updated by an UPDATE SERVERGROUP command.

System action: None.

User response: None.

ANR1678I **Server group** *original server group name* **renamed** *new server group name*.

Explanation: A server group is renamed by a RENAME SERVERGROUP command. The original name is not valid.

System action: None.

User response: None.

ANR1679E **Command:** **Server group** *server group name* **not defined.**

Explanation: The server *server group name* is not defined to the system.

System action: The command fails.

User response: Retry the command specifying an existing group.

ANR1680E **Command:** **Member** *member name* **not defined in server group** *server group name*.

Explanation: The member *member name* is not defined in server group *server group name*.

System action: The command fails.

User response: Retry the command specifying an existing member of the group.

ANR1681E **Command:** **Member** *member name* **is already in server group** *server group name*.

Explanation: The member *member name* is defined in server group *server group name*.

System action: The command fails.

User response: Retry the command and specify a new member name.

ANR1682E **A group cannot be a member of itself.**

Explanation: The member and group name are the same. A group may not be a member of itself.

System action: The command fails.

User response: Retry the command and specify another member name.

ANR1683E **Command:** **Member** *member name* **not defined.**

Explanation: The member *member name* is not defined to the system. Server group members must be a defined server or server group.

System action: The command fails.

User response: Retry the command specifying existing server or group.

ANR1684E **Route:command:** **Routed commands cannot be routed.**

Explanation: The command part of a routed command may not contain route information itself. The allowable syntax for routed commands is “:”. The command may not contain route information. Only one level of routing is allowed.

System action: Routed commands where the command portion contains additional routing information are not processed.

User response: Reissue the command without specifying route information in the command portion of this routed command.

ANR1685I **Server group** *server group* **copied to server group** *new server group*.

Explanation: This message is displayed in response to the COPY SERVERGROUP command. The server group named *server group* is copied to the server group named *new server group*.

System action: None.

User response: None.

ANR1686I **Member** *member name* **moved from server group** *group name* **to server group** *new group name*.

Explanation: The requested member *member name* is moved from server group *group name* to the server group *new server group* in response to a MOVE GRPMEMBER command.

System action: None.

User response: None.

ANR1687I **Output for command** '*command*' **issued against server** *server name* **follows:**

Explanation: The output for the command issued against the indicated server follows this message.

System action: None.

User response: None.

ANR1688I **Output for command** '*command*' **issued against server** *server name* **completed.**

Explanation: This message marks the end of the output for the command specified that was issued against the indicated server.

System action: None.

User response: None.

ANR1689E **Output for command** '*command*' **issued against server** *server name* **terminated.**

Explanation: An error condition occurred causing the output for the command issued against the specified server to be terminated.

System action: None.

User response: Retry the command against the requested server once the error condition has been resolved. If the cause of the error can not be

determined, please contact your local service representative.

ANR1690E **Error sending command** '*command*' **to server** *server name*.

Explanation: An error was encountered sending the specified command to the server indicated.

System action: None.

User response: Retry the command against the requested server once the error condition has been resolved. If the cause of the error can not be determined, please contact your local service representative.

ANR1691E **Error receiving response from server** *server name* **for command** '*command*'.

Explanation: An error was encountered receiving the response from the server indicated for the command that was issued against it.

System action: None.

User response: Retry the command against the requested server once the error condition has been resolved. If the cause of the error can not be determined, please contact your local service representative.

ANR1692E **Response for command** '*command*' **from server** *server name* **contains invalid data.**

Explanation: The output returned from the specified server for the command that was issued, contains invalid output. The command response can not be processed.

System action: Output processing for this command response terminates.

User response: Please contact your local service representative.

ANR1693E **Unable to issue command** '*command*' **against server** *server name* **- failure starting thread.**

Explanation: A thread could not be started to issue the specified command against the server indicated.

System action: This command is not issued against the server specified. The process will attempt to issue the command against any other servers that were specified for the command routing information.

User response: Examine the server messages issued prior to this message to determine the source of the error. Retry routing this command to the indicated server after the cause of the error has been determined and resolved. If the error cannot be isolated and resolved, contact your service representative.

ANR1694I Server *server name* processed command '*command*' and completed successfully.

Explanation: The server indicated processed the command successfully.

System action: None.

User response: None.

ANR1695W Server *server name* processed command '*command*' but completed with warnings.

Explanation: The server indicated processed the command but encountered warnings. However, the warnings did not prevent the execution of the command.

System action: None.

User response: None.

ANR1696E Server *server name* attempted to process command '*command*' but encountered errors.

Explanation: The server indicated processed the command but encountered errors. These errors prevented the successful completion of the command.

System action: None.

User response: Examine any error messages issued on either the server sending the command or else the server executing the command to determine the cause of the failure. Reissue the command once these errors are corrected.

ANR1697I Command '*command*' processed by total number for servers **server(s): number of successful servers successful, number of servers with warnings with warnings, and number of servers with errors with errors.**

Explanation: The indicated command was processed by the number of servers specified. For the total number of servers, the number indicated were successful, the number indicated encountered a warning condition but processed anyway, and finally, the number indicated encountered errors and could not process.

System action: None.

User response: None.

ANR1698I Command '*command*' was not issued against any other servers.

Explanation: The indicated command was not issued against any other server. Either the routing information did not resolve to any valid servers or else failures occurred issuing the command against the required servers.

System action: None.

User response: Check to see that valid route information was provided for the command or else check the activity log for error messages that indicate why the command was not issued to the other servers.

ANR1699I Resolved route information to number of servers **server(s) - issuing command command against server(s).**

Explanation: The route information was resolved to the number of servers indicated. The specified command will be issued against those servers.

System action: None.

User response: None.

ANR1700E Unable to resolve '*route information*' to any server(s).

Explanation: The route information provided for this command did not resolve to any server names or group names. Because of this, the command will not be issued.

System action: None.

User response: Examine the route information provided. Reissue the command providing correct route information.

ANR1701E Command: **No matching servers defined.**

Explanation: No matching servers are found for the specified command.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify different servers.

ANR1702W Skipping '*server name*' - unable to resolve to a valid server name.

Explanation: The server name specified is being skipped because it could not be resolved to a valid server name.

System action: None.

User response: Reissue the command providing the correct server name.

ANR1703E Failure resolving server names.

Explanation: An error occurred while resolving the server names. Specifically, the resolution of the server names has terminated because of a significant failure.

System action: None.

User response: Check the activity log and server console for other messages about the cause of the

failure. Once the cause has been resolved, reissue the command.

ANR1704E Failure obtaining or using credentials for administrator *admin name*.

Explanation: An error occurred obtaining or using the credentials for the administrator referenced.

System action: Command processing fails.

User response: If the administrator SERVER_CONSOLE was being used for a PING or VALIDATE LANFREE command, the command may fail. The administrator SERVER_CONSOLE is not able to perform these commands where the source server, the target server, or both servers have authentication enabled. The command should be retried using an administrator other than SERVER_CONSOLE.

Check the activity log and server console for other messages about the cause of the failure. Once the cause has been resolved, reissue the command.

ANR1705W Ping for server '*server name*' was not able to establish a connection.

Explanation: The ping command was unable to establish a connection to the server specified. This could indicate a problem on the server issuing the ping, a problem with the communication connection between the two servers, or else it is a problem with the other server.

System action: None.

User response: Check the activity log and server console for messages that indicate a failure or problem on the server issuing this command. Next, check the communication connection between the two servers. Also, check the server definition and password on both the server issuing the command and the server specified. And finally, verify that the server specified is running.

ANR1706I Ping for server '*server name*' was able to establish a connection.

Explanation: The ping command was able to establish a connection to the server specified.

System action: None.

User response: Check the activity log and server console for messages that indicate a failure or problem on the server issuing this command. Next, check the communication connection between the two servers. And finally, verify the operation of the server specified.

ANR1707I Server information not complete, crossdefine not allowed.

Explanation: The SERVERHLADDRESS, SERVERLLADDRESS or SERVERPASSWORD has not been set for this server. These are required for the CROSSDEFINE option on the define server command.

System action: The command fails.

User response: Use the QUERY STATUS command to find what values need to be set. An authorized administrator must issue the SET SERVERHLADDRESS, SET and SERVERLLADDRESS or SET SERVERPASSWORD command to set the missing values.

ANR1708I Define server for *Server name* failed because the crossdefine failed.

Explanation: The define server command failed because the crossdefine parameter was included, and the crossdefine was not successful.

System action: The command fails.

User response: Check this server, and the server being defined for other messages indicating the reason for the failure.

ANR1709E Command.: Failure determining current usage for server or group name *Server name*.

Explanation: The specified command failed to determine the current use of the server name or server group specified.

System action: The command fails.

User response: Retry the command. If it continues to fail and the cause of the failure can not be determined, please contact your local service representative.

ANR1710E Command.: Name *Name* not valid for this command.

Explanation: The name specified for this command is not valid for this operation. The first case is that a server name was specified for a command requiring a server group name. The other case is where a server group name was specified for a command requiring a server name.

System action: The command fails.

User response: Retry the command specifying the proper name.

ANR1711E Error accessing the server or server group name *Name*.

Explanation: A server operation attempted to access the server name or server group name specified. An error occurred while trying to access the information for this server name or server group name.

System action: The server operation fails.

User response: Review the activity log to try to determine the cause of the failure. If a cause can not be determined, please contact your local service representative.

ANR1712W Command routing not allowed from server console.

Explanation: Command routing is not allowed from the server console.

System action: The command is not executed.

User response: Reissue the command from an Administrative client.

ANR1713I Command '*command*' issued against server *server name*.

Explanation: The specified command has been sent to the indicated server. The command is to terminate the specified server, no confirmation will be received.

System action: None.

User response: None.

ANR1714W The password for administrator *administartor name* has expired. The password for this administrator must be updated on the configuration manager server *server name*.

Explanation: The password for the named administrator has expired, but the administrator is a managed object on this server. The password must be updated on the named configuration manager server.

System action: The administrator is allow access to the server.

User response: Change the administrator's password on the named configuration manager server.

ANR1715E Event server cannot be deleted - it is currently active.

Explanation: The event server cannot be deleted since it is currently active for event logging.

System action: The server does not delete the event server entry.

User response: In order to delete the event server, it must not be currently active for event logging. To stop

event logging to the event server issue END EVENTLOGGING EVENTSERVER. Then reissue the DELETE EVENTSERVER command.

ANR1716I Server cannot be crossdefined to itself, crossdefine not allowed.

Explanation: An attempt was made to crossdefine the server to itself.

System action: The command fails.

User response: None.

ANR1717E Command: Command failed - Non-Compatible Filespace name types have been specified.

Explanation: A server command has been entered but cannot be processed because Non-Compatible Filespace name types have been specified.

System action: The server does not process the command.

User response: Specify compatible filespace names. Unicode to Unicode or Non-Unicode to Non-Unicode.

ANR1718E Command: Reconstruction of file aggregates is supported only for movement in which the source and target storage pools are sequential-access.

Explanation: The indicated command specifies that file aggregates be reconstructed during a move operation for which reconstruction is not supported. Aggregates are reconstructed only when both the source storage pool and the target storage pool are sequential-access.

System action: The server does not process the command.

User response: Reissue the command without specifying that aggregates should be reconstructed. Alternatively, specify a move operation involving transfer of data within a sequential-access storage pool or between two sequential-access storage pools.

ANR1719E Storage pool *storage pool name* specified on the MOVE NODEDATA command is not a valid pool name or pool type.

Explanation: If the source storage pool specified in the command is a primary storage pool, then the destination storage pool specified must also be a primary storage pool. If the source storage pool is a copy storage pool, then the specified destination storage pool must be the same storage pool as the source storage pool.

System action: The MOVE NODEDATA process fails.

ANR1720I • ANR1729E

User response: Provide a valid primary storage pool name as the destination storage pool if the source pool is a primary storage pool. If the source pool is a copy storage pool do not specify a destination pool, or, specify the same copy storage pool as the destination pool.

ANR1720I A path from *source name* to *destination name* has been defined.

Explanation: In response to the DEFINE PATH command, the path from the source name to the destination name has been defined in the server database.

System action: Server operation continues.

User response: None.

ANR1721I A path from *source name* to *destination name* has been deleted.

Explanation: In response to the DELETE PATH command or to an UPDATE DEVCLASS command with the MOUNTLIMIT parameter, the path from the source name to the destination name has been deleted in the server database.

System action: Server operation continues.

User response: None.

ANR1722I A path from *source name* to *destination name* has been updated.

Explanation: In response to the UPDATE PATH command, the path from the source name to the destination name has been updated in the server database.

System action: Server operation continues.

User response: None.

ANR1723E A path is already defined using *source name* and *destination name*.

Explanation: In response to the DEFINE PATH command, the server determines that a path with the same source name and the same destination name already exists in the server database.

System action: Server operation continues.

User response: Correct the source name or destination name and re-enter this command.

ANR1724W Command: **Server** *server name* is currently in use.

Explanation: The command shown specifies a server that is currently in use. The server is referenced in a PATH used for LANFree access to a FILE device type drive in a shared library.

System action: The server does not process the command.

User response: Reissue the command at a later time. In order to delete the server specified, it must not be currently connected to the server, it may not be referenced in a device class, it can not be defined to be the event server, and it cannot be referenced within a PATH definition as a FILE device type drive.

ANR1725E *resource name* is not defined.

Explanation: In response to the DEFINE PATH command, a resource name was provided that has not been defined.

System action: Server operation continues.

User response: Define the source name or the destination name and re-enter this command.

ANR1726E A operation using the path from *sourcename* to *destname* is currently being used.

Explanation: This path was in use when the command was entered. The attributes of a path may not be changed while it is being used.

System action: The server ignores the command.

User response: Wait until the operation using this path is complete, or cancel the operation using this path, and then reissue the command.

ANR1727E A path from *sourcename* to *destname* does not exist.

Explanation: The path being updated or deleted does not exist.

System action: The server ignores the command.

User response: Reissue the command with a different source or destination name or define a new path.

ANR1728E The library *libname* is not a SCSI library.

Explanation: A drive that is to be used by a NAS data mover must be attached to a SCSI library.

System action: The server ignores the command.

User response: Reissue the command with a different drive name.

ANR1729E A path using the data mover *source name* still exists.

Explanation: In the DELETE DATAMOVER command, the data mover name supplied is either the source or the destination in a path that still exists in the server database.

System action: Server operation continues.

User response: Delete the existing path and reissue this command.

ANR1730I Data mover *mover name* has been defined.

Explanation: The data mover has been defined in the server database.

System action: Server operation continues.

User response: None.

ANR1731I Data mover *mover name* has been deleted.

Explanation: The data mover has been deleted in the server database.

System action: Server operation continues.

User response: None.

ANR1732I Data mover *mover name* has been updated.

Explanation: The data mover has been updated in the server database.

System action: Server operation continues.

User response: None.

ANR1733E Data mover *mover name* is already defined.

Explanation: A DEFINE DATAMOVER command was entered for a data mover that already exists in the server database.

System action: Server operation continues.

User response: Use the UPDATE DATAMOVER to change the attributes in this data mover. Otherwise use a different data mover name.

ANR1734E Data mover *mover name* is not defined.

Explanation: An UPDATE DATAMOVER command was entered for a data mover that does not exist in the server database.

System action: Server operation continues.

User response: Correct the data mover name or use the DEFINE DATAMOVER command to define a new data mover.

ANR1735E Data mover *data mover* is currently being used.

Explanation: A data mover was in use when the command was entered. The attributes of a data mover may not be changed while it is being used.

System action: The server ignores the command.

User response: Wait until the operation using this data mover is complete, or cancel the operation using this data mover, and then reissue the command.

ANR1736E Command: Parameter *parameter* length is invalid.

Explanation: The specified server command has been entered with a parameter that is longer or smaller in length than the allowed length.

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR1737E Command: Device name *device* specified is invalid.

Explanation: The specified command has been entered with an invalid device name.

System action: The command failed.

User response: Reissue the command with a valid device name.

ANR1738I Unable to begin a server-free operation with data mover *data mover name*; received error *error*.

Explanation: The server attempted to begin a server-free operation with the specified data mover but was unable to do so.

System action: Server operation continues.

User response: The server-free data movement will fail and the client may retry the request using LAN or LAN-free data transfer.

ANR1739I Unable to update configuration of data mover *data mover name*; received error *error*.

Explanation: The server attempted to notify the specified data mover that a change in the SAN requires that the configuration be updated. The update failed because the data mover was busy.

System action: Server operation continues.

User response: The data mover must finish its current operation before the configuration can be updated. The server-free data movement will fail and the client will retry the request using LAN or LAN-free data transfer.

ANR1740E For the path defined from disk *node name* *disk name* received lun *actual lun* from client, expected *expected lun*.

Explanation: A client attempted to backup the disk, but the server path definition was different than that which was detected by the client.

ANR1741E • ANR1749W

System action: Server operation continues.

User response: Correct the path definition from the disk to a datamover.

ANR1741E For the path defined from disk *node name disk name* received serial number *actual serial* from client, expected *expected serial*.

Explanation: A client attempted to backup the disk, but the server path definition was different than that which was detected by the client.

System action: Server operation continues.

User response: Correct the path definition from the disk to a datamover.

ANR1742E The disk *node name disk name* is not online.

Explanation: An operation requested the specified disk. The disk cannot be used because it is not online.

System action: Server operation continues.

User response: Determine the reason for the disk being offline; if possible, update the disk status to online.

ANR1743E The path from data mover *datamover name* to disk *node name disk name* is not online.

Explanation: An operation requested the specified disk. The disk cannot be used because the path from the datamover to the disk is not online.

System action: Server operation continues.

User response: Determine the reason for the path being offline; if possible, update the path status to online.

ANR1744E The world wide name is invalid for the destination of the path being defined.

Explanation: A path was being defined from a datamover to a destination and that destination has an incorrect world wide name specified.

System action: Server operation continues.

User response: Update the destination's definition with the correct world wide name.

ANR1745I Unable to discover SAN devices. Function is busy.

Explanation: The SAN device discovery function is busy. The requested query cannot be completed at this time.

System action: Server operation continues.

User response: Reissue the request when current queries have completed.

ANR1746E The path from data mover *datamover name* to drive *library name drive name* is not online.

Explanation: A server-free operation requested the specified device. The device cannot be used because the path from the datamover to the device is not online.

System action: Server operation continues.

User response: Determine the reason for the path being offline; if possible, update the path status to online.

ANR1747W The data mover *datamover name* was not found on the SAN. The data mover definition has been marked offline.

Explanation: During device discovery on a storage area network a device was not found that has the same serial number as the data mover defined to TSM.

System action: Server operation continues.

User response: Verify that the serial number of the data mover definition is correct and that the data mover is operational.

ANR1748W The disk *node name disk name* was not found on the SAN. The path definition for this disk has been marked offline.

Explanation: During device discovery on a storage area network a device was not found that has the same serial number as the disk defined to TSM.

System action: Server operation continues.

User response: Verify that the serial number of the disk definition is correct and that the disk is operational.

ANR1749W The drive *library name drive name* was not found on the SAN. The path definition for this drive has been marked offline.

Explanation: During device discovery on a storage area network a device was not found that has the same serial number as the drive defined to TSM.

System action: Server operation continues.

User response: Verify that the serial number of the drive definition is correct and that the drive is operational.

ANR1750E The server detected an internal error, return code = *return code*.

Explanation: An unexpected error occurred during server operation.

System action: Server operation continues.

User response: Use the QUERY ACTLOG command to examine messages prior to this error to determine the cause of the data storage failure. If the failure can be found and resolved, retry the operation. If the failure cannot be found, contact your service representative for assistance in resolving the problem.

ANR1751I Disk *disk name* has been defined.

Explanation: In response to the DEFINE DISK command, the disk has been defined in the server database.

System action: Server operation continues.

User response: None.

ANR1752E Disk *disk name* is already defined.

Explanation: A DEFINE DISK command was entered for a disk that already exists in the server database.

System action: Server operation continues.

User response: Use the UPDATE DISK command to change the attributes of this disk. Otherwise, use a different disk name.

ANR1753E Disk *disk name* is currently being used.

Explanation: A disk was in use when the command was entered. The attributes of a disk may not be changed while it is being used.

System action: The server ignores the command.

User response: Wait until the operation using this disk is complete, or cancel the operation using this disk, and then reissue the command.

ANR1754E Disk *disk name* is not defined.

Explanation: An UPDATE, DELETE or client function requested the specified disk, but the disk has not been defined to the server.

System action: Server operation continues.

User response: Correct the disk name or use the DEFINE DISK command to define a new disk.

ANR1755I Disk *disk name* has been updated.

Explanation: In response to the UPDATE DISK command, the disk attributes have been updated in the server database.

System action: Server operation continues.

User response: None.

ANR1756I Disk *disk name* has been deleted.

Explanation: In response to the DELETE DISK command, the disk has been deleted in the server database.

System action: Server operation continues.

User response: None.

ANR1757E A path using the disk *disk name* still exists.

Explanation: The name supplied in a DELETE DISK command is the destination in a path that still exists in the server database.

System action: Server operation continues.

User response: Delete the existing path using the DELETE PATH command and re-enter the DELETE DISK command.

ANR1758E A path from disk *node name disk name* to a **datamover cannot be determined.**

Explanation: During a backup operation a path from the disk cannot be found.

System action: Server operation continues.

User response: Define a path from the disk to a datamover.

ANR1759E *Command:* A device with SCSI datamover capabilities was not found in the system configuration for datamover *datamover name*.

Explanation: The scsi address could not be determined for a device that is capable of performing datamover operations.

System action: The requested operation fails.

User response: Verify that the hardware that can perform SCSI datamover operations is installed and powered on.

ANR1760E *Command:* Command failed for node *node name*, *filesystem filesystem name* - destination storage pool *storage pool* was skipped.

Explanation: The indicated command failed because the destination storage pool was skipped. A storage pool may be skipped because it does not have enough available space, or because it has a MAXSIZE value that is less than the size of the object to be inserted.

System action: The operation fails.

User response: Ensure that the destination storage

pool is available, has an adequate MAXSIZE setting, and has adequate space. The MAXSIZE setting may be changed using the UPDATE STGPOOL command. Space may be added to the storage pool by checking in scratch volumes or defining new volumes in the storage pool. If volumes in the destination storage pool are offline, use the VARY ONLINE command to vary them online and make them available for use. Correct the problem and reissue the command.

ANR1761E *Command: Command failed for node node name, filespace filespace name - storage media is inaccessible.*

Explanation: The indicated command failed because required storage media is unavailable.

System action: The operation fails.

User response: Ensure that there are sufficient volumes available for storing backups and that any volumes required for restore are checked in and available. Correct the problem and try the command again.

ANR1762E *Command: Command failed for node node name, filespace filespace name - mount point unavailable.*

Explanation: The indicated command failed because sufficient mount points are not available.

System action: The operation fails.

User response: Ensure that sufficient mount points are available and working correctly. Correct the problem and try the command again.

ANR1763E *Command: Command failed - see previous error messages or view the activity log.*

Explanation: The indicated server command has failed. This message is always preceded by one or more other error messages which provide more detail about why the command failed.

System action: The operation fails.

User response: Examine the previous error messages to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages if needed. Correct the problem and try the command again.

ANR1764E *Command: Command failed - loadable module module name is not available.*

Explanation: The indicated server command has failed because it requires the availability of the specified loadable module, but the module is not loaded.

System action: The operation fails.

User response: Make sure the necessary loadable module is available for your platform. Not all modules are available on all platforms. If the module is available for your platform and is installed, contact your service representative for assistance.

ANR1765E *Command: The number of copy threads entered, copythreads, exceed the capabilities of the datamover.*

Explanation: A datamover has an upper limit of the number of copy threads that it is capable of executing. The copythreads parameter provided is greater than this limit.

System action: The command fails.

User response: Make sure the value entered for the copythreads parameter is less than the maximum for this datamover. Using the default for the number of copythreads sets the number of copythreads to the datamover's maximum value.

ANR1766I *The number of sessions currently active for datamover datamover, exceed the number of copy threads defined for this datamover.*

Explanation: The datamover definition has a parameter that is used to limit the number of operations involving that datamover. This limit was reached.

System action: The operation continues using another method.

User response: Verify that the number of copy threads in the datamover definition is sufficient enough to allow multiple server-free operations, or define another datamover to handle additional server-free operations.

ANR1767W *A datamover with a online path to both the disk, nodename diskname, and the drive, libraryname drivename cannot be found.*

Explanation: To perform server-free data movement, a path must exist from the datamover to both the disk and the drive. If either path is not defined or is offline to all datamovers defined then the data movement cannot occur via server-free.

System action: The operation continues using another method.

User response: Define the appropriate paths from a datamover to the disks and drives. If a path is defined from a datamover to a drive in a library then all drives in that library should have paths defined from that same datamover. A path may have to be updated to specify online=yes.

ANR1768E *Command:* **The device name provided conflicts with a device name that is already in use.**

Explanation: The device name provided in the command is already used by an existing path.

System action: The command is not processed.

User response: Specify a valid DEVICE parameter that is not used by any other drive or library.

ANR1769E *Command:* **Command failed - multiple actions between commit actions not allowed.**

Explanation: A server script that performs multiple actions between commit actions is not allowed. For example, deletion of multiple paths before each of the deletions is committed is not allowed.

System action: The server does not process the command.

User response: Rewrite the script or macro so that no new command is issued until the previous command is committed.

ANR1770E *Processing for session *session id* found destination *new destination*. Expected current destination.*

Explanation: While processing a remote image operation, the specified session was working with the current destination. But the server received a client request with a new destination name.

System action: Server operation continues.

User response: From the client, quit the current remote image request. Reissue the request, if desired.

ANR1771E *The path from remote server *remote server name* to destination *destination name* with the destination *device type* is not valid.*

Explanation: The library manager receives a command to update the path for the remote server. The device type field of the destination device is not valid. The destination for update path from remote server must be either drive or library.

System action: Server operation continues.

User response: Determine why the device type field of the destination device is not valid.

ANR1772E *The path from source *source name* to destination *drive name* is taken offline.*

Explanation: The path is now marked offline.

System action: The path is inaccessible.

User response: Determine the reason the path is inaccessible, such as a hardware problem. Make any needed corrections. Then, issue the the UPDATE PATH command with the ONLINE=YES option to make the path online.

ANR1773W *Unable to update the path in the database *path source name* and drive *drive name*.*

Explanation: The system is unable to update the path information in the database table.

System action: .

User response: None.

ANR1774E *The Query Status command failed, and server initialization has not completed. Allow server initialization to complete, and then try the command again.*

Explanation: The command Query Status failed because server initialization has not completed.

System action: Server operation continues.

User response: Allow server initialization to complete, and then try the command again.

ANR1775I *Data mover *mover name* has been defined, however a connection to the data mover failed. Please check the attributes of the file server specified in the definition of the data mover.*

Explanation: The data mover has been defined in the server database, however the server cannot connect to the file server associated with the data mover. The connection failed because of one of the following possible reasons:

- One of the parameters specified during datamover definition was incorrect: TCP/IP address of the file server, user id, password, TCP/IP port
- File server is not accessible
- NDMP server limits the number of opened NDMP sessions

System action: The data mover is defined to the server.

User response: Check that the file server associated with the data mover is accessible through the network; check each of the attributes specified during datamover definition; check the number of open NDMP sessions with the file server.

ANR1776I *Data mover *mover name* has been updated, however a connection to the data mover failed. Please check the attributes of the file server specified in the update command.*

Explanation: The data mover has been updated in the server database, however the server cannot connect to the file server associated with the data mover. The connection failed because of one of the following possible reasons:

- One of the parameters specified during datamover update was incorrect: TCP/IP address of the file server, user id, password, TCP/IP port
- File server is not accessible
- NDMP server limits the number of opened NDMP sessions

System action: The data mover definition is updated.

User response: Check that the file server associated with the data mover is accessible through the network; check each of the attributes specified in the datamover update command; check the number of open NDMP sessions with the file server.

ANR1777I *module(offset): Object object id hi.object id lo is object name for node node name (node id), filespace filespace name (filespace id).*

Explanation: The server reported a problem with the specified object. See accompanying messages for further information.

System action: Server operation continues.

User response: None.

ANR1778E *Command: Invalid or missing parameter.*

Explanation: The specified server command has been entered with an invalid parameter, or, is missing a required parameter.

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR1779I *backupset process name process completed: successful count backupset(s) were generated or defined out of total count backupset(s) requested by the command's specifications.*

Explanation: A GENERATE or DEFINE BACKUPSET command has finished successfully, and the backupsets described in previous messages have been created.

System action: The backupsets described have been created.

User response: None.

ANR1782W *ESTIMATE DBREORG process process number started - server performance may be degraded while this process is running.*

Explanation: The ESTIMAGE DBREORG process has

been started as the reported process number. This process estimates the amount of space that the database will reduced by if a database reorganization is performed.

System action: This process performs extensive database I/O and may impact other server operations and processes while it is running.

User response: This process may be monitored using the QUERY PROCESS command. If this process needs to be cancelled, issue the CANCEL PROCESS command.

ANR1783E *ESTIMATE DBREORG process process number failed and only evaluated pages evaluated database pages.*

Explanation: The ESTIMATE DBREORG process failed to complete successfully. It only evaluated *pages evaluated* database pages.

System action: None.

User response: If the has been cancelled, this message will be issued. If this processed failed to process but was not cancelled, it is likely that it failed because it was not able to acquire access to the necessary database pages to perform the evaluation. Retry the operation.

ANR1784I *A database reorganization would reduce the database utilization by an estimated space recovered MB.*

Explanation: The ESTIMATE DBREORGSTATS process completed and determined that the database space utilized would be reduced by *space recovered* megabytes if a database reorganization were performed.

System action: Server operations continue normally, and the ESTIMATE DBREORGSTATS process completes.

User response: This message reports the estimated database space recovered if a database reorganization were to be performed. The Tivoli Storage Manager administrator should evaluate this information relative to their current database utilization, expected database growth and changes, and determine whether or not a database reorganization is needed for this server. To reorganize the server database, refer to DSMSEV UNLOADDB, DSMSEV LOADFORMAT, and DSMSEV LOADDB in the Administrator's Reference.

ANR1785I *ESTIMATE DBREORG process is already running.*

Explanation: The ESTIMAGE DBREORG process is already running. The server does not allow more than one instance of this process to be running at a time.

System action: None.

User response: Use the QUERY PROCESS command

to monitor the existing process. If the existing process needs to be cancelled, issue the CANCEL PROCESS command.

ANR1786W HBAAPI not able to get adapter name.

Explanation: The HBAAPI function getAdapterName failed. The server will continue to access next adapter if it exists.

System action: None.

User response: The Tivoli Storage Manager SAN discovery will not work with this Host Bus Adapter. For the list of supported HBAs and required driver levels by operating system go to <http://WWW.IBM.COM/SUPPORT>.

ANR1787W Not able to open adapter *adapter name*.

Explanation: The HBAAPI function to open the host bus adapter (HBA) failed.

System action: None.

User response: The Tivoli Storage Manager SAN discovery will not work with this Host Bus Adapter. For the list of supported HBAs and required driver levels by operating system go to <http://WWW.IBM.COM/SUPPORT>.

ANR1788W Not able to get the adapter attributes for *adapter name*.

Explanation: The HBAAPI function to get the adapter's attributes failed. For UNIX systems, this error may be caused by the user not logging in as root. Please login as root and retry.

System action: None.

User response: SAN discovery will not work for this adapter. For the list of supported HBAs and required driver levels by operating system go to <http://WWW.IBM.COM/SUPPORT>.

ANR1789W Get HBA target mapping failed.

Explanation: The HBAAPI function to get the target mapping failed.

System action: None.

User response: SAN discovery will not work for this adapter. For the list of supported HBAs and required driver levels by operating system go to <http://WWW.IBM.COM/SUPPORT>.

ANR1790W SAN discovery failed.

Explanation: SAN discovery failed.

System action: None.

User response: SAN discovery failed. This may be a

problem with the HBA firmware, HBA or the HBA vendor's HBAAPI driver. For the list of supported HBAs and required driver levels by operating system go to <http://WWW.IBM.COM/SUPPORT>.

ANR1791W HBAAPI wrapper library *file name* failed to load or is missing.

Explanation: This library is provided by Tivoli Storage Manager. It is required for discovery of devices on a SAN.

- For windows, the HBAAPI wrapper library is hbaapi.dll.
- For AIX, the HBAAPI wrapper library is libHBAAPI.a.
- For Solaris, the HBAAPI wrapper library is libhbaapi32.so for 32 bit application and libhbaapi64.so for 64 bit application.
- For Linux, the HBAAPI wrapper library is libhbaapi32.so for 32 bit application and libhbaapi64.so for 64 bit application.

System action: None.

User response: Make sure the HBAAPI wrapper library for this platform is in the same directory as the IBM Tivoli Storage Manager server executable. AIX is the only exception with HBAAPI wrapper library libHBAAPI.a in /usr/lib.

ANR1792W HBAAPI vendor library failed to load or is missing.

Explanation: The HBAAPI vendor library failed to load or is missing. This HBAAPI library is provided by the Host Bus Adapter (HBA) vendor. It is required for Tivoli Storage Manager server to discover devices on the SAN.

System action: None.

User response: Ensure the HBAAPI file exists on the system. If the driver level on your system is not supported, go to the HBA vendor's website and download/install the HBA driver. For the list of supported HBAs and required driver levels by operating system go to <http://WWW.IBM.COM/SUPPORT>. The following is an example of some of the HBA vendor's HBAAPI file:

- For UNIX systems, This HBAAPI vendor library's location is indicated in /etc/hba.conf. For example:

```
qla2x00
    /usr/lib/libqlsdm.so
com.emulex.emulexapilibrary
    /usr/lib/libemulexhbaapi.so
```
- For Windows systems, verify the location of the HBAAPI vendor library by checking LibraryFile in:

```
HKEY_LOCAL_MACHINE
SOFTWARE
  SNIA
    HBA
      <HBAAPI library>
```

ANR1793W TSM SAN discovery is not supported on this platform or this version of OS.

Explanation: SAN discovery for this platform is currently not supported.

System action: None.

User response: SAN discovery will not work for this platform.

- For AIX, we only support AIX5.2F and above
- For HP, we do not support this platform yet.
- For Linux, we do not support Linux-zOS yet.
- For Windows, we do not support Windows 2003 64 bit yet.

For the list of supported HBAs and required driver levels by operating system go to <http://WWW.IBM.COM/SUPPORT>.

ANR1794W TSM SAN discovery is disabled by options.

Explanation: SAN discovery is disabled by option SANDISCOVERY OFF.

System action: None.

User response: SAN discovery is currently disabled by default or with the server option SANDISCOVERY OFF depending on the platform. For the list of supported HBAs and required driver levels by operating system go to <http://WWW.IBM.COM/SUPPORT>.

ANR1795I The device driver has been updated successfully for device *old device name*. The new device name is *new device name*.

Explanation: This message is displayed in response to the CHANGE DEVDRIVER command. The device driver for device *old device name* has been updated successfully.

System action: Server operation continues.

User response: None.

ANR1796E Invalid device name *device name*.

Explanation: The device name is not in the form of TAPE*x* or CHANGER*x*.

System action: The server fails the command.

User response: Change the device name to TAPE*x* or CHANGER*x* and retry the command.

ANR1797E Device *device name* is not supported by the IBM Tivoli Storage Manager device driver.

Explanation: Device *device name* is not supported by the IBM Tivoli Storage Manager device driver. The hardware ID was not found in the IBM Tivoli Storage Manager device driver INF file, i.e. tsmlb.inf and tsmmt.inf.

System action: The server fails the command.

User response: Access the Tivoli Storage Manager Web site at www.ibm.com/software/sysmgmt/products/support/IBMTivoliStorageManager.html and navigate to the device support information for the server's operating system. Verify if the device is supported. If the device is supported by the IBM Tivoli Storage Manager device driver, contact your service representative.

ANR1798E Device driver update failed for device *device name*.

Explanation: The CHANGE DEVDRIVER operation failed for device *device name*.

System action: The activity that generated this error fails.

User response: None.

ANR1799E The Tivoli Storage Manager device driver is not installed, or one or more device driver files are missing.

Explanation: The server command has failed because the Tivoli Storage Manager device driver is not installed, or one or more device driver files are missing.

System action: The operation fails.

User response: Make sure the Tivoli Storage Manager device driver is installed. and the following files are not missing. %WINDIR%\system32\drivers\tsmscsi.sys (or tsmscsi64.sys for 64-bit Windows), %WINDIR%\inf\tsmmt.inf, and %WINDIR%\inf\tsmlb.inf.

ANR1800E Missing or invalid EVENTLOG command parameter.

Explanation: The event logging command issued contains an invalid parameter, or is missing a required parameter.

System action: The command is ignored.

User response: Reissue the command with the proper parameters.

ANR1801E *Eventlog command: Invalid event or event class - Event or event class name.*

Explanation: An event logging command has been entered which specifies an unknown event or event class.

System action: The command is ignored for the invalid event or event class. Any valid events or classes specified are processed.

User response: Reissue the command with the correct event or event class.

ANR1802E *Device device name was not found.*

Explanation: The device was not found in the device information set. The vendor ID and/or product ID, or device name may be invalid, or the device has been removed from the system.

System action: The activity that generated this error fails.

User response: Reissue the command with the correct vendor ID and product ID, or device name.

ANR1803W *SAN discovery module module name is not installed correctly.*

Explanation: The server attempted to load the SAN discovery module, but the permissions or ownership of the file are incorrect.

System action: Server operation continues, but without SAN discovery function.

User response: Ensure that the SAN discovery module is executable, has the setuid bit turned on, and is owned by root. The SAN discovery module is called 'dsmqsan' and must reside in the server or storage agent executable directory.

ANR1804W *Command: Process process number skipping volume volume name in storage pool pool name because the volume is in use by another process.*

Explanation: The command shown specifies the volume to be processed, but that volume is currently being used by another operation.

System action: The server skips the volume and processes the next available volume.

User response: Check the activity log to determine which operation was using the volume. If the operation using the volume is complete reissue the *Command* to process the skipped volume.

ANR1805E *command: Invalid value paths for NUMDBDIRS parameter.*

Explanation: During processing of command *EXTEND DBSpace command*, an invalid value is encountered for the NUMDBDIRS parameter. The value should be from 1 to 3

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value.

ANR1806I *Table reorganizing and updating statistics performed successfully for processed table.*

Explanation: Reorganize and Runstat successfully run on that table.

System action: Server operation continues.

User response: No user action required.

ANR1807I *Table updating statistics performed successfully for processed table.*

Explanation: Runstat successfully run on that table.

System action: Server operation continues.

User response: No user action required.

ANR1808E *Unable to open event log file file spec for appending.*

Explanation: The server cannot write to a file which has been specified for event logging.

System action: No logging will be done to the file receiver.

User response: Check the file for proper access permissions, or specify a different file for logging.

ANR1809E *Insufficient memory to activate event logging.*

Explanation: A BEGIN EVENTLOGGING command has been entered, but the server has insufficient memory available to activate logging.

System action: The command is ignored.

User response: If logging is required, make more memory available to the server then restart the server.

ANR1810E *Eventlog command: Invalid receiver - receiverName.*

Explanation: An event logging command has been entered which specifies an unknown event log receiver (maybe unknown just to this platform).

System action: The command is ignored for the

invalid receiver. Any valid receivers specified are processed.

User response: Reissue the command with the correct receiver.

ANR1811W HBAAPI returned zero FC adapters from the system.

System action: None.

User response: Your version of the HBA API file might not be supported. Go to the HBA vendor's website to obtain the latest version of the HBA API. For a list of supported HBAs and required HBA API levels by operating system, go to <http://www-1.ibm.com/support/docview.wss?uid=swg21193154>.

ANR1821W Event logging is not started for the *receiverName* receiver.

Explanation: In response to a BEGIN EVENTLOGGING command, recording of event log records to the specified receiver was attempted. The event logging for the specified receiver is already started because either the receiver is currently running or the receiver was terminated previously and is still in the process of writing the messages that were queued up for processing.

System action: None.

User response: Check to see if the event log receiver is already started by issuing the QUERY STATUS command, and checking the Active Receivers field. Some event log receivers such as FILETEXT, FILETEXTEXIT, USEREXIT, and Tivoli receiver, can be started during server initialization if they are configured in the server options file.

- If the event log receiver is already started you do not take any further action.
- If the event log receiver is not currently running then wait and try to start it again after a short delay.

ANR1822I Event logging ended for the *receiverName* receiver.

Explanation: In response to an END EVENTLOGGING command or because an error occurred, event log records are no longer being output to the specified receiver.

System action: None.

User response: None.

ANR1823I Event logging ended for all receivers.

Explanation: In response to an END EVENTLOGGING command, event log records are no longer being output to any receiver.

System action: None.

User response: None.

ANR1824E Event logging is inactive for the specified receiver.

Explanation: An END EVENTLOGGING command has been entered, but logging is not active for the specified receiver.

System action: The command is ignored.

User response: If logging is desired, use the ENABLE EVENT and BEGIN EVENTLOGGING commands to activate event logging.

ANR1825I Event logging active for the *receiverName* receiver.

Explanation: In response to a BEGIN EVENTLOGGING command, event log records are now being output to the specified receiver.

System action: None.

User response: None.

ANR1826I Event logging active for all receivers.

Explanation: In response to a BEGIN EVENTLOGGING command, event log records are now being output to all receivers.

System action: None.

User response: None.

ANR1827E *Eventlog command: No valid receiver specified.*

Explanation: An event logging command has been entered, and no valid receivers were specified.

System action: The command is ignored.

User response: Reissue the command with the correct receiver.

ANR1828E *Eventlog command: No valid event specified.*

Explanation: An event logging command has been entered and no valid events or event classes were specified.

System action: The command is ignored.

User response: Reissue the command with the correct events or event classes.

ANR1829E *Eventlog command: Server events may not be disabled for the activity log receiver.*

Explanation: A DISABLE EVENT command has been entered for the activity log receiver.

System action: The command is ignored for the

activity log receiver. Any valid receivers specified are processed.

User response: Reissue the command with the correct receiver.

ANR1830E *receiverName* **receiver options not defined in the server options file.**

Explanation: A BEGIN EVENTLOGGING command has been entered for a receiver, but the required receiver options were not specified in the server options file.

System action: Logging is not started for the specified receiver.

User response: Enter the receiver options in the server options file and restart the server.

ANR1831I **Event logging of client events ended for ACTLOG receiver.**

Explanation: An END EVENTLOGGING command has been entered for the activity log receiver.

System action: The server no longer records client events in the activity log. Server events continue to be recorded in the activity log.

User response: None.

ANR1842E **An error occurred on the *receiverName* receiver.**

Explanation: An error occurred on the specified receiver.

System action: The server no longer sends events to the receiver.

User response: Issue a BEGIN EVENTLOGGING command for the receiver to attempt to start logging events to the receiver again.

ANR1843I **Event log receiver initialization in progress.**

Explanation: Initialization is starting for the eventlog receivers.

System action: None.

User response: None.

ANR1844I *Eventlog command* **command processed.**

Explanation: The specified command was processed.

System action: None.

User response: If any previous messages indicate that parts of the command failed, reissue the command for those parts only.

ANR1850E **Circular event logging detected. The event server has previously handled event *Event number* from *Source trail*. To prevent looping, events which have already been logged by the event server are not sent again. Please correct the situation causing circular logging to avoid wasting system resources.**

Explanation: The server is attempting to log an event which has previously been handled by the event server that is currently defined.

System action: The event is not sent to the event server. Other events will still be sent, and this message will be issued periodically if this situation is detected again.

User response: Determine what is wrong with the server to server event logging setup, and fix the problem.

ANR1851E **The source trail for server to server event logging has exceeded the maximum length of *Maximum sourcetrail length* bytes.**

Explanation: While attempting to log an event to the event server, the server has found that the source trail length is too long.

System action: The server continues to try to send the event to the event server, but the source trail may be truncated and appear something like:

```

name1>...>namex>namey
where,
name1      is the originator of the event.
...        is where intervening server name(s)
           have been left off the source trail.
```

User response: Most likely you are using very long server names and/or have excessive hops from server to server. Either use shorter server names or change your configuration to reduce the number of hops.

ANR1852E **Unable to send header to TEC at *TEC server rc return code***

Explanation: A network error has occurred in attempting to send the event header to the Tivoli Enterprise Console®.

System action: None.

User response: Verify network connections and contact your service representative if this error persists.

ANR1853E Unable to send data to TEC at TEC
server rc return code

Explanation: A network error has occurred in attempting to send the event data to the Tivoli Enterprise Console.

System action: None.

User response: Verify network connections and contact your service representative if this error persists.

ANR1854E Unable to flush data to TEC at TEC
server rc return code

Explanation: A network error has occurred in attempting to flush data to the Tivoli Enterprise Console .

System action: None.

User response: Verify network connections and contact your service representative if this error persists.

ANR1855E Failure validating protocol between client and server for node node on session session number

Explanation: For a node having the "VALIDATE PROTOCOL" option set to either "DATAONLY" or "ALL", a validation error occurred. The transaction is aborted and an indication is sent to the client indicating the failure.

System action: None.

User response: Verify network connections and contact your service representative if this error persists.

ANR1856W Command: No volumes selected to process.

Explanation: No volumes were eligible for processing by the AUDIT VOLUME command based upon the parameters specified.

System action: The AUDIT VOLUME process ends without processing any volumes.

User response: Review the parameters specified for the command. If there was an error specifying a parameter, re-issue the command with the parameter corrected.

ANR1857I AUDIT VOLUME will start count repair processes.

Explanation: The AUDIT VOLUME command will process a range of volumes due to one or more of the following parameters having been specified: FROMDATE, TODATE, or STGPOOL. The AUDIT VOLUME processing will start a process for each volume that qualifies and process an AUDIT VOLUME for each volume with FIX=YES specified.

System action: One or more volumes are audited and inconsistent data is discarded.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to audit the volume or 'N' to stop the process.

ANR1858I AUDIT VOLUME will start count inspect processes.

Explanation: The AUDIT VOLUME command will process a range of volumes due to one or more of the following parameters having been specified: FROMDATE, TODATE, or STGPOOL. The AUDIT VOLUME processing will start a process for each volume that qualifies and process an AUDIT VOLUME for each volume with FIX=NO specified.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to audit the volume or 'N' to stop the process.

ANR1859W Node node on session session id received CRC protocol validation information when it is not configured to do so.

Explanation: The server received protocol validation information for the session and node specified. The settings for this node are not configured to perform protocol validation and any CRC information received will be ignored.

System action: The server operation continues.

User response: The server administrator should evaluate whether or not this node should perform protocol validation. If so, issue the "UPDATE NODE" command and specify the VALIDATEPROTOCOL option with the appropriate setting to enable protocol validation.

If this is a TYPE=SERVER node for the target of a virtual volume operation and protocol validation is not desired, the server definition on the source server should be updated with VALIDATEPROTOCOL=NO set. Otherwise, if protocol validate is desired, the SERVER type node on the target server should be updated using the "UPDATE NODE" command with "VALIDATEPROTOCOL=ALL".

ANR1860E Drive with serial serial element element port port and target target lun lun does not match with the library libraryPath .

Explanation:

System action:

User response:

ANR1861E Drive with element *element* port *port* and target *target lun lun* does not match with the library *libraryPath* .

Explanation:

System action:

User response:

ANR1863E library *libraryPath* and serial *serial* does not support Read Element Status command. It is very old and should be replaced with newer model.

Explanation:

System action:

User response:

ANR1864E library *libraryPath* does not support Read Element Status command and it does not have a serial number. It is very old and should be replaced with newer model.

Explanation:

System action:

User response:

ANR1865I *export command* : **Summary for Restartable Export operation** *export identifier* :

Explanation: A summary of the total number of objects transmitted in the restartable export operation with *export identifier* is displayed following this message.

System action: Export processing for the command ends. Server operation continues.

User response: None.

ANR1866I *Export/import command*: **Processing suspended with status** *status*.

Explanation: The background process to service the command *command* was suspended with a SUSPEND command.

System action: Processing for the command *command* stops. Statistics on the number and type of objects moved, together with the total number of bytes copied, are displayed on the server console following this message.

User response: None.

ANR1867I *Export/import command*: **Processing completed with status** *status*.

Explanation: The background export or import process to service the command *export/import command* has completed with status *status*. If the status is INCOMPLETE, some files have been skipped due to errors reading or writing the file.

System action: Export or import processing for the command completes. Statistics on the number and type of objects moved, together with the total number of bytes copied, are displayed on the server console following this message. A summary of the number of files that were skipped is also displayed.

User response: None.

ANR1868I *Export/import command*: **Copied** *filesystem number file spaces archive number archive files, backup number backup files, and spacemg number space managed files*.

Explanation: The background export or import process to service the command *export/import command* copies *filesystem number* client file space definitions, *archive number* archive file copies, *backup number* backup file copies, and *spacemg number* space-managed files from either the server database to export media or from import media into the server database. Data is not actually moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR1869W *Export/import command*: **Skipped** *archive number archive files, backup number backup files, and spacemg number space managed files*.

Explanation: The background export or import process to service the command *export/import command* skipped *archive number* archive file copies, *backup number* backup file copies, and *spacemg number* space-managed files from either the server database to export media or from import media into the server database. Data is not actually moved if Preview=Yes is specified in the command *export/import command*.

System action: Export or import processing for the command completes. Server operation continues.

User response: Check previous messages for the names of the files that were not exported or imported, and problem determination information.

ANR1870I *Export/import command: Copied number bytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* bytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. Data is not moved if *Preview=Yes* is specified in the command *export/import command*. This figure can be used during export preview processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR1871I *Export/import command: Copied number kilobytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* kilobytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. This figure can be used during export preview processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR1872I *Export/import command: Copied number megabytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* megabytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. This figure can be used during export preview processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR1873I *Export/import command: Copied number gigabytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* gigabytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. This figure can be used during export preview

processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR1874I *Export/import command: Copied number terabytes of data.*

Explanation: The background export or import process to service the command *export/import command* copies *number* terabytes of data from the server database and data storage to the export media or from the export media to the server database and data storage. This figure can be used during export preview processing to estimate the number of removable media volumes needed to hold the exported information from the server.

System action: Export or import processing for the command completes. Server operation continues.

User response: None.

ANR1875I *Export/import command: Detected number errors.*

Explanation: The background export or import process to service the command *export/import command* detects *number* errors while copying information from the server database and data storage to the export media or from the export media to the server database and data storage.

System action: Export or import processing for the command completes. Server operation continues.

User response: Examine the server messages issued prior to this message to view the error. Use the *QUERY ACTLOG* command to view the activity log and search for messages.

ANR1903E *Export export name is not defined.*

Explanation: An NFS client attempted to mount the specified name as a mount point. The specified name is not currently being exported by the server.

System action: The server does not provide an export of the specified directory.

User response: Ensure that an NFS *ADDEXPORT* command was issued for the specified node.

ANR1904E *Missing or invalid value for option. A valid directory needs to be defined for this.*

Explanation: The server detects a missing or invalid value for a server option. A valid directory needs to be defined for this option.

System action: Server initialization stops.

User response: Correct the error and restart the server.

ANR1905E Path *dir name* for *parm* does not exist or is not empty.

Explanation: The directory specified does not exist or is not empty.

System action: The server stops.

User response: Reissue the command with a valid path name.

ANR1906E Server failed to extend the database space.

Explanation: A failure occurred during the extend database space. This occurred during the processing of a 'EXTEND DBSPACE' command.

System action: Server operation continues.

User response: Review error messages to determine the cause of the failure and retry the 'EXTEND DBSPACE' once the issue has been resolved. If unable to determine the cause of the failure or to resolve it, please contact your IBM service representative for further assistance.

ANR1907E The server can not resolve absolute path of directory *dir name*. That path might not exist.

Explanation: The directory specified does not exist or is not accessible.

System action: The server operation stops.

User response: Reissue the command with a valid path name.

ANR1908W Invalid value for *parameter parameter - parameter value*MB. The default value *default value*MB is used for this parameter.

Explanation: The value (*parameter value*) specified for the (*parameter*) parameter is not a valid. The server uses the default value for this parameter.

System action: Processing of the command continues by using the default value.

User response: Verify that the correct value have been used. Update the value, if necessary.

ANR1909W Invalid value for *option name option - option valuetype* . The default value *default valuetype* is used for this option.

Explanation: The value (*option value*) specified for the (*option*) option is not valid. The server uses the default value for this parameter.

System action: Server operation continues.

User response: Verify that the correct value have been used. Update the value, if necessary.

ANR1910E Directory *directory name* is already defined for other path in the command.

Explanation: While processing the command argument list, a duplicate path name has been encountered.

System action: The command terminates.

User response: Issue the command again, specifying a directory that is not in the argument list.

ANR1911W Invalid value for *option name option - option valuetype* . The default value *default valuetype* is used for this option.

Explanation: The value (*option value*) specified for the (*option*) option is not valid. The server uses the default value for this parameter.

System action: Server operation continues.

User response: Verify that the correct value have been used. Update the value, if necessary.

ANR1912I Stopping the activity log because of a server shutdown.

System action: Stopping the activity log because of a server shutdown.

User response: None.

ANR1913I *command* successfully started *number of processes* IDENTIFY processes.

System action: The server successfully started the indicated number of IDENTIFY processes.

User response: Review the status of the identify processes using the QUERY PROCESS or QUERY ACTLOG commands.

ANR1914I *command* successfully ended *number of processes* IDENTIFY processes.

System action: The server successfully ended the indicated number of IDENTIFY processes.

User response: Review the status of the identify processes using the QUERY ACTLOG command.

ANR1993I *command* has been removed.

Explanation: The specified command was a valid server command, but is no longer needed due to new capabilities in the TSM server. The command has been removed.

System action: The server ignores the command.

User response: None.

ANR1994I **Activity log pruning started: removing delete megabytes M based on current size current size megabytes M and retention setting retention size megabytes M.**

Explanation: Server activity log exceeds the retention size by the *delete megabytes* specified. The activity log pruning will delete as many records as necessary to reduce the current activity log size by the *delete megabytes* size.

System action: None.

User response: None.

ANR1995E *Command: Invalid Formatsize value - formatsize value for device class Device Class*

Explanation: A value was specified for the *Formatsize* parameter which is larger than the maximum capacity value for the device class indicated in the message. The device class is associated with the storage pool specified in the *DEFINE VOLUME* command and is a *FILE* device type. The maximum capacity value of the device class is the limit of data that the server will write to the volume.

System action: The server does not process the command.

User response: Reissue the command with a *Formatsize* value which is less than the maximum capacity value of the storage pool. The maximum capacity can be displayed with the *QUERY DEVCLASS classname F=D* command.

ANR1996E *Command: Invalid volume name prefix - volume name. Room for additional characters is required.*

Explanation: The command is being used for multiple volume names. The suffix for the names is being generated in the indicated command. When the suffix is taken into account, the specified name is too long by the indicated number of characters. Three characters must be allowed for the suffix.

System action: The server does not process the command.

User response: Reissue the command with a prefix short enough to allow for the suffix. Three extra characters are needed for the suffix.

ANR1997E *Command: The Formatsize parameter must be specified when more than 1 volume is created.*

Explanation: The command specified the creation of more than one volume with the *Numberofvolumes*

parameter. When multiple volumes are created, the *Formatsize* parameter must also be specified to provide the size of the volumes. Each volume will be created with the same size.

System action: The server does not process the command.

User response: Reissue the command with the *Formatsize* parameter or define a single volume without the *Formatsize* parameter.

ANR1998E *Command: Invalid value for parameter parameter - parameter value.*

Explanation: The value (*parameter value*) specified for the (*parameter*) parameter in command *command* is not a valid value for this parameter.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid parameter value. For information on valid values for the parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR1999I *Command completed successfully.*

Explanation: Processing for the specified command completed successfully.

System action: Server processing continues.

User response: None.

ANR2000E **Unknown command - command.**

Explanation: The specified command is not a valid server command.

System action: The server ignores the command.

User response: Reissue the correct command.

ANR2001E **Insufficient server memory to initiate command.**

Explanation: A command has been entered, but the server cannot obtain enough internal memory to process the command.

System action: The server ignores the command.

User response: Allocate additional storage to the server. For details, issue *HELP MEMORY* to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2002E **Missing closing quote character.**

Explanation: A server command that contains a quoted parameter has been entered, but a matching closing quote is missing.

System action: The server ignores the command.

User response: Reissue the command with properly matched quotes.

ANR2003E **Illegal use of keyword parameter character (=) - parameter.**

Explanation: A server command contains the parameter shown followed by an equal sign (=), but the parameter is not a keyword parameter.

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR2004E **Missing value for keyword parameter - parameter.**

Explanation: A server command containing a keyword parameter has been entered, but the value for the parameter is missing.

System action: The server ignores the command.

User response: Reissue the command and supply a value for the keyword parameter.

ANR2005E **Keyword parameter character (=) may not be surrounded by blanks.**

Explanation: A server command contains a keyword parameter followed by an equal sign (=), but the equal sign is preceded or followed by a blank, or both.

System action: The server ignores the command.

User response: Reissue the command without blanks next to the equal sign.

ANR2006E **Activity log process was not started, the default output stream cannot be opened.**

Explanation: The process that monitors the default (console) output stream and maintains the activity log cannot access that output stream.

System action: The server does not update the activity log.

User response: Contact your service representative.

ANR2007E **Activity log process was not started, due to an internal error.**

Explanation: The process that monitors the default (console) output stream and maintains the activity log cannot start due to a server internal error.

System action: The server does not update the activity log.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot

be isolated and resolved, contact your service representative.

ANR2008E **Activity log process has stopped - database transaction could not be started.**

Explanation: The process that monitors the default (console) output stream and maintains the activity log cannot continue due to a server transaction failure. This may be a memory shortage error.

System action: The server stops updating the activity log.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2009E **Activity log process has stopped - database error.**

Explanation: The process that monitors the default (console) output stream and maintains the activity log cannot continue due to a server database error.

System action: The server stops updating the activity log.

User response: Contact your service representative.

ANR2010W **Server is out of LOG space in adding entries to the Activity Log. Console messages will not be logged until LOG space is available.**

Explanation: The process that monitors the default (console) output stream and maintains the activity log cannot update the activity log due to a lack of recovery log space.

System action: The server does not update the activity log.

User response: An authorized administrator can issue the DEFINE LOGVOLUME command to add volumes for use by the log, and can issue the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR2011W **Server is out of DB space in adding entries to the Activity Log. Console messages will not be logged until DB space is available.**

Explanation: The process that monitors the default (console) output stream and maintains the activity log cannot update the activity log due to a lack of database space.

System action: The server does not update the activity log.

User response: An authorized administrator can issue the DEFINE DBVOLUME command to add volumes for use by the database, and can issue the EXTEND DB command to extend the size of the database so that the new volumes are used.

ANR2012W Activity log process has encountered unexpected table data output in the default output stream.

Explanation: The process that monitors the default (console) output stream and maintains the activity log has detected invalid data in the console stream.

System action: The server stops updating the activity log.

User response: Contact your service representative.

ANR2013E The activity log process has encountered unexpected output data in the console output stream. The process will be restarted.

Explanation: The process that monitors console output and maintains the activity log has detected invalid data (unknown data type) in the console stream.

System action: The server restarts the activity log recording process. While the process is restarting, the server may not be able to record some console messages in the activity log.

User response: The server may be low on available memory. Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see “Appendix A. Allocating Additional Server Memory”.

ANR2014E Activity log pruning process could not be started, due to an internal error.

Explanation: The process that removes expired records from the server activity log cannot begin execution due to a server internal error.

System action: The server does not prune the activity log.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR2015E Activity log failure - database transaction could not be started.

Explanation: The process that removes expired records from the server activity log has failed due to a database transaction failure, which may be a memory shortage error.

System action: The server ends activity log pruning.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see “Appendix A. Allocating Additional Server Memory”.

ANR2016E Activity log failure - database error.

Explanation: The process that removes expired records from the server activity log has failed due to a server database error.

System action: The server ends activity log pruning.

User response: Contact your service representative.

ANR2017I Administrator *Administrator Name* issued command: *Command*

Explanation: This message records the fact that the named administrator issued the command specified. The messages is issued and logged to provide an audit trail for administrative commands.

System action: Server operation continues

User response: None.

ANR2018E Administrator Command: Unicode conversion failed for argument *Command Argument*

Explanation: The specified command argument could not be converted to a Unicode string. Conversion can fail if the string includes characters that are not available in the server code page, or if the server has a problem accessing system conversion routines.

System action: Server command fails.

User response: Make sure that the server’s locale is properly configured.

ANR2019I Command: No nodes updated.

Explanation: An UPDATE NODE command has been entered, but no objects were updated.

System action: None.

User response: None.

ANR2020E Command: Invalid parameter - *parameter*.

Explanation: The specified server command has been entered with an invalid parameter.

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR2021E *Command: Missing subcommand keyword.*

Explanation: The specified server command has been entered without a valid subcommand (second parameter).

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR2022E *Command: One or more parameters are missing.*

Explanation: The specified server command has been entered without all required parameters.

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR2023E *Command: Extraneous parameter - parameter.*

Explanation: The specified server command contains more positional parameters than is allowed.

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR2024E *Command: Too many parameters specified.*

Explanation: The specified server command contains more positional parameters than is allowed.

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR2025E *Command: Command failed - server thread resource not available.*

Explanation: A server command, which has a requirement to start a server thread, has been entered but cannot be executed because no server thread is available.

System action: The command is not executed.

User response: Reissue the command. If the command fails with the same error, wait for server activity to decrease and try again.

ANR2026E *Command: Command failed - sufficient server memory is not available.*

Explanation: A server command has been entered but cannot be processed because sufficient memory is not available to the server.

System action: The server does not process the command.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2027E *Command: Command failed - sufficient server recovery log space is not available.*

Explanation: A server command has been entered but cannot be processed because sufficient recovery log space is not available.

System action: The server does not process the command.

User response: An authorized administrator can issue the DEFINE LOGVOLUME command to add volumes for use by the log, and can issue the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR2028E *Command: Command failed - sufficient server database space is not available.*

Explanation: A server command has been entered but cannot be processed because sufficient database space is not available. For certain operations, like SQL commands, this message can be issued when the database has space, but it is unusable for the current request due to the DB allocation history. In this case, the database query will show a Maximum Reduction of 0.

System action: The server does not process the command.

User response: An authorized administrator can issue the DEFINE DBVOLUME command to add volumes for use by the database, and can issue the EXTEND DB command to extend the size of the database so that the new volumes are used. If the database has space, but the Maximum Reduction is 0, then a database reorganization can also be used to solve the problem. See the IBM Tivoli Storage Manager Guide, Managing the Database and Recovery Log for information on how to reorganize the database.

ANR2029E *Command: Transaction failed; command not executed.*

Explanation: A command that is part of the current transaction has failed; therefore, any additional commands fail.

System action: The server does not process the command.

User response: Stop the administrative session, restart it, and try the command again. If this problem persists, contact your service representative.

ANR2030E Commit not accepted; transaction failed.

Explanation: A command that is part of the current transaction has failed; therefore, a COMMIT command cannot be processed.

System action: The server does not process the COMMIT command.

User response: Stop the administrative session, restart it, and try the command again. If this problem persists, contact your service representative.

ANR2031E Command: At least one attribute must be specified for update.

Explanation: The specified UPDATE command has been entered, but no attributes have been specified for updating.

System action: The server ignores the command.

User response: Reissue the UPDATE command with one or more attributes to be updated.

ANR2032E Command: Command failed - internal server error detected.

Explanation: An internal error has occurred during an attempt to process a server command. This message always accompanies another error message and provides more detail about that error.

System action: The server does not process the command.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR2033E Command: Command failed - lock conflict.

Explanation: A server command that requires the server to lock a system resource has been entered. The command cannot be executed because the resource is already in use by another command or process.

System action: The server does not process the command.

User response: Try the command again at a later time.

ANR2034E Command: No match found using this criteria.

Explanation: The specified command has been entered, but no objects that match the criteria can be found. In some cases when using the SELECT command, this message is issued when there is contention for a record.

System action: None.

User response: Verify that all the specified parameter values are correct. If a mistake is found, correct it and reissue the command. If you issued a SELECT command, in some cases issuing the command again will yield a match.

ANR2035E Command: Administrator administrator name is not authorized to issue this command.

Explanation: The specified administrator has entered the indicated command, but this administrator does not have the proper authority necessary to run the command. Note: This message can be issued as a result of the server option REQSYSAUTHOUTFILE YES being in effect.

System action: The server does not process the command.

User response: Examine previous messages for any additional information. Issue the command from a properly authorized administrator ID, or contact the system administrator to have additional authority granted to the current administrator ID.

ANR2036E Command: Process could not be started - sufficient memory is not available.

Explanation: A background process cannot be started for the indicated command because sufficient memory is not available to the server.

System action: A new process is not started to execute this command.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2037E Command: Process could not be started - lock conflict.

Explanation: A background process cannot be started for the indicated command because a required system resource is already locked by another command or process.

System action: A new process is not started to execute this command. If other processes have been started for this command, these processes may execute successfully.

User response: If necessary, try the command again at a later time.

ANR2038E *Command:* **Process could not be started - server thread resource not available.**

Explanation: A background process cannot be started for the indicated command because no server thread is available.

System action: A new process is not started to execute this command. If other processes have been started for this command, these processes may execute successfully.

User response: If necessary, reissue the command. If the command fails with the same error, wait for server activity to decrease and try again.

ANR2039E *Command:* **Process could not be started - internal server error detected.**

Explanation: A background process cannot be started for the indicated command because an internal error has occurred.

System action: A new process is not started to execute this command. If other processes have been started for this command, these processes may execute successfully.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR2040W **This command attempts to restore all files in storage pool *storage pool* which have previously been found to be damaged or which reside on a volume with access mode "destroyed"; existing references to files in storage pool *storage pool* will be deleted from the database after the files have been restored.**

Explanation: Issuing the RESTORE STGPOOL command will result in deletion of existing files in the indicated primary storage pool after these files have been restored from a copy storage pool. If a volume with access mode destroyed becomes empty because all files on the volume have been restored to another location, the destroyed volume will be deleted from the database.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to restore the storage pool, 'N' otherwise.

ANR2041W **This command attempts to restore all files in storage pool *storage pool* which reside on one of the volumes specified in the command; existing references to files on these volumes will be deleted from the database after the files have been restored.**

Explanation: Issuing the RESTORE VOLUME command causes the access mode of the specified volumes to be updated to destroyed. Existing files will be deleted from the specified volumes after these files have been restored from a copy storage pool. If a volume with access mode destroyed becomes empty because all files on the volume have been restored to another location, the destroyed volume will be deleted from the database.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to restore the volumes, 'N' otherwise.

ANR2042E *Command:* **Copied parameter not valid for pool type storage pool volume.**

Explanation: The QUERY CONTENT server command has been entered with an invalid parameter. COPIED is not a valid parameter when the volume specified belongs to a copy or active-data type storage pool.

System action: The server ignores the command.

User response: Reissue the command without the COPIED parameter.

ANR2043E *Command:* **WAIT parameter not allowed from server console.**

Explanation: The WAIT parameter is not allowed for commands issued from the server console.

System action: The command is not executed.

User response: Either reissue the command without the WAIT parameter or else reissue the command from an administrator using an Administrative Client.

ANR2044E *Command:* **Invalid option's value - Option's value.**

Explanation: The set option command has been entered with an invalid value.

System action: The server does not process the command.

User response: Reissue the command with a valid value.

ANR2045E *Command: An error (error code) occurred during a write operation.*

Explanation: The server detects an error while attempting a write operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the write operation has failed.

ANR2046I *optionset name: Optionset optionset name defined.*

Explanation: The requested option set has been added to the system in response to a DEFINE OPTIONSET command.

System action: None.

User response: None.

ANR2047E *Command: Optionset optionset name is already defined.*

Explanation: A DEFINE OPTIONSET command has been entered that specifies an optionset name already defined to the server.

System action: The server does not process the command.

User response: To define the optionset, reissue the command and specify a different optionset name.

ANR2048I *Command: Optionset optionset name deleted.*

Explanation: The requested option set has been deleted from the system in response to a DELETE OPTIONSET command.

System action: None.

User response: None.

ANR2049E *Command: Optionset optionset name is not defined.*

Explanation: The command shown specifies an optionset that is not defined in the server.

System action: The server does not process the command.

User response: None.

ANR2050I *Command: Option option name defined in optionset option set name.*

Explanation: The requested option has been added to the specified optionset in response to a DEFINE OPTIONSET command.

System action: None.

User response: None.

ANR2051E *Command: Option option name, sequence number sequence number is already defined in optionset option set name.*

Explanation: The requested option already exists in the optionset specified by the DEFINE CLIENTOPT command.

System action: The server does not process the command.

User response: None.

ANR2052E *Command: Option option name, sequence number sequence number is not defined in optionset option set name.*

Explanation: The requested option is not defined in the optionset specified by the DELETE CLIENTOPT command.

System action: The server does not process the command.

User response: None.

ANR2053I *Command: Option option name, sequence number sequence number, has been deleted from optionset option set name.*

Explanation: The requested option has been deleted from the specified optionset in response to a DELETE CLIENTOPT command.

System action: None.

User response: None.

ANR2054I *Command: Optionset optionset name updated.*

Explanation: The requested option set has been updated in the system in response to an UPDATE OPTIONSET command.

System action: None.

User response: None.

ANR2055I *Command: Optionset source optionset name copied to optionset target optionset name.*

Explanation: This message is displayed in response to the COPY OPTIONSET command. The optionset named *source optionset name* has been copied to the optionset named *target optionset name*.

System action: Server operation continues.

User response: None. The requested option set has been added to the system in response to a COPY OPTIONSET command.

ANR2056E *Command: Invalid option name - option name. Retry using the full optionname.*

Explanation: The command shown specifies an invalid option name.

System action: The server does not process the command.

User response: Reissue the command with a valid option name.

ANR2057E *Command: Invalid option value - option value.*

Explanation: The command shown specifies an invalid option value.

System action: The server does not process the command.

User response: Reissue the command with a valid option value.

ANR2058W *Command: Options file Filespec not found - user needs to update the file manually.*

Explanation: The server options file cannot be opened or found.

System action: The command is processed but the option is not updated in the options file.

User response: Use a text editor to update the server options file if the user wants to use this value when the server restarts later. If the user does not update the file, the current value in the options file will be used when the server restarts.

ANR2059W *Command: Error occurs when writing to Filespec - user needs to update the file manually.*

Explanation: An error occurs when trying to write the new value to the server options file.

System action: The command is processed but the option is not updated in the options file.

User response: Use a text editor to update the server options file if the user wants to use this value when the server restarts later. If the user does not update the file, the current value in the options file will be used when the server restarts.

ANR2060I *Node node name registered in policy domain domain name.*

Explanation: The requested backup-archive node has been added to the system in response to a REGISTER NODE command and has been assigned to the policy domain indicated.

System action: None.

User response: None.

ANR2061I *Node node name removed from policy domain domain name.*

Explanation: In response to a REMOVE NODE command, the requested backup-archive node has been removed from the system.

System action: None.

User response: None.

ANR2062I *Node node name renamed to new node name.*

Explanation: In response to a RENAME NODE command, the requested backup-archive node has been renamed to the new name shown.

System action: None.

User response: None.

ANR2063I *Node node name updated.*

Explanation: One or more attributes of a backup-archive node have been updated by an UPDATE NODE command.

System action: None.

User response: None.

ANR2064I *Node node name locked.*

Explanation: In response to a LOCK NODE command, the indicated backup-archive node has been locked.

System action: None.

User response: None.

ANR2065I *Node node name is already locked.*

Explanation: The indicated backup-archive node referenced in the LOCK NODE command is already locked.

System action: None.

User response: None.

ANR2066I *Node node name unlocked.*

Explanation: In response to an UNLOCK NODE command, the indicated backup-archive node is unlocked.

System action: None.

User response: None.

ANR2067I Node *node name* is already unlocked.

Explanation: The indicated backup-archive node referenced in the UNLOCK NODE command is not locked.

System action: None.

User response: None.

ANR2068I Administrator *administrator ID* registered.

Explanation: In response to a REGISTER ADMIN command, the requested administrator ID has been added to the system.

System action: None.

User response: None.

ANR2069I Administrator *administrator ID* removed.

Explanation: In response to a REMOVE ADMIN command, the requested administrator ID has been removed from the system.

System action: None.

User response: None.

ANR2070I Administrator *administrator ID* renamed to *new administrator ID*.

Explanation: In response to a RENAME ADMIN command, the requested administrator ID has been changed to the new name shown.

System action: None.

User response: None.

ANR2071I Administrator *administrator ID* updated.

Explanation: One or more attributes of an administrative user have been updated by an UPDATE ADMIN command.

System action: None.

User response: None.

ANR2072I Administrator *administrator ID* locked.

Explanation: In response to a LOCK ADMIN command, the indicated administrator ID has been locked.

System action: None.

User response: None.

ANR2073I Administrator *administrator ID* is already locked.

Explanation: The indicated administrator ID referenced in the LOCK ADMIN command is already locked.

System action: None.

User response: None.

ANR2074I Administrator *administrator ID* unlocked.

Explanation: In response to an UNLOCK ADMIN command, the indicated administrator ID is unlocked.

System action: None.

User response: None.

ANR2075I Administrator *administrator ID* is already unlocked.

Explanation: The indicated administrator ID referenced in the UNLOCK ADMIN command is not locked.

System action: None.

User response: None.

ANR2076I System privilege granted to administrator *administrator ID*.

Explanation: In response to a GRANT AUTHORITY command, system privilege class has been granted to the indicated administrator.

System action: None.

User response: None.

ANR2077I Unrestricted policy privilege granted to administrator *administrator ID*.

Explanation: In response to a GRANT AUTHORITY command, unrestricted policy privilege has been granted to the indicated administrator.

System action: None.

User response: None.

ANR2078I Restricted policy privilege granted to administrator *administrator ID* - policy domain *domain name*.

Explanation: In response to a GRANT AUTHORITY command, restricted policy privilege for the specified policy domain has been granted to the indicated administrator.

System action: None.

User response: None.

ANR2079I **Unrestricted storage privilege granted to administrator** *administrator ID.*

Explanation: In response to a GRANT AUTHORITY command, unrestricted storage privilege has been granted to the indicated administrator.

System action: None.

User response: None.

ANR2080I **Restricted storage privilege granted to administrator** *administrator ID - storage pool storage pool name.*

Explanation: In response to a GRANT AUTHORITY command, restricted storage privilege for the specified storage pool has been granted to the indicated administrator.

System action: None.

User response: None.

ANR2081I **Analyst privilege granted to administrator** *administrator ID.*

Explanation: In response to a GRANT AUTHORITY command, analyst privilege class has been granted to the indicated administrator.

System action: None.

User response: None.

ANR2082I **Operator privilege granted to administrator** *administrator ID.*

Explanation: In response to a GRANT AUTHORITY command, operator privilege class has been granted to the indicated administrator.

System action: None.

User response: None.

ANR2083I **System privilege revoked for administrator** *administrator ID.*

Explanation: In response to a REVOKE AUTHORITY command, system privilege class has been revoked from the indicated administrator.

System action: None.

User response: None.

ANR2084I **Policy privilege revoked for administrator** *administrator ID.*

Explanation: In response to a REVOKE AUTHORITY command, policy privilege class for all policy domains has been revoked from the indicated administrator.

System action: None.

User response: None.

ANR2085I **Restricted policy privilege revoked for administrator** *administrator ID - policy domain domain name.*

Explanation: In response to a REVOKE AUTHORITY command, restricted policy privilege for the specified policy domain has been revoked from the indicated administrator.

System action: None.

User response: None.

ANR2086I **Storage privilege revoked for administrator** *administrator ID.*

Explanation: In response to a REVOKE AUTHORITY command, storage privilege class for all storage pools has been revoked from the indicated administrator.

System action: None.

User response: None.

ANR2087I **Restricted storage privilege revoked for administrator** *administrator ID - storage pool storage pool name.*

Explanation: In response to a REVOKE AUTHORITY command, restricted storage privilege for the storage pool indicated has been revoked from the indicated administrator.

System action: None.

User response: None.

ANR2088I **Analyst privilege revoked for administrator** *administrator ID.*

Explanation: In response to a REVOKE AUTHORITY command, analyst privilege class has been revoked from the indicated administrator.

System action: None.

User response: None.

ANR2089I **Operator privilege revoked for administrator** *administrator ID.*

Explanation: In response to a REVOKE AUTHORITY command, operator privilege class has been revoked from the indicated administrator.

System action: None.

User response: None.

ANR2090I Activity log retention set to *value* for management by *management style*.

Explanation: The server activity log has been set to the value indicated with the SET ACTLOGRETENTION command for the indicated management style. If the management style is DATE, the value is the number of days that messages will be kept in the activity log before being deleted. If the management style is SIZE, the value is the size in megabytes that the activity log will be allowed to occupy in the server database.

System action: None.

User response: None.

ANR2091I Accounting parameter set to *value*.

Explanation: Accounting record generation has been turned on or off as indicated with the SET ACCOUNTING command.

System action: None.

User response: None.

ANR2092I Password expiration period set to *number of days* days.

Explanation: The number of days that a password can be used before it must be changed has been set to the value indicated with the SET PASSEXP command.

System action: None.

User response: None.

ANR2093I Registration parameter set to *registration method*.

Explanation: Backup-archive node registration has been set to the method indicated with the SET REGISTRATION command.

System action: None.

User response: None.

ANR2094I Server name set to *server name*.

Explanation: The name that the server displays and communicates to backup-archive nodes has been set to the value indicated with the SET SERVERNAME command.

System action: None.

User response: None.

ANR2095I Authentication parameter set to *value*.

Explanation: The requirement for a node or administrator to enter a password when establishing a session with the server has been turned on or off as indicated with the SET AUTHENTICATION command.

System action: None.

User response: None.

ANR2096I Server now enabled for backup/archive client access.

Explanation: The server has been made available for use by backup-archive clients with the ENABLE command.

System action: None.

User response: None.

ANR2097I Server now disabled for backup/archive client access.

Explanation: The server has been made unavailable for use by backup-archive clients with the DISABLE command.

System action: None.

User response: None.

ANR2098E *Command: Invalid URL specification - url.*

Explanation: The specified URL is too long.

System action: The server ignores the command.

User response: Reissue the command and enter a URL value that is 200 characters or less.

ANR2099I Administrative userid *administrator name* defined for OWNER access to node *node name*.

Explanation: An administrator with the specified name was created having OWNER access to the client node. This administrator is created for accessing the client node from an interactive interface.

System action: None.

User response: None.

ANR2100I Activity log process has started.

Explanation: The automatic server process that removes expired server activity log records has begun processing.

System action: None.

User response: None.

ANR2101I Activity log process stopped, activity log retention set to 0.

Explanation: A SET ACTLOGRETENTION command has set the retention period to zero days. As a result, activity logging stops.

System action: The activity log process stops recording console output in the server activity log.

User response: None.

ANR2102I Activity log pruning started: removing entries prior to *date time*.

Explanation: Server activity log records older than the date and time indicated are being removed from the activity log.

System action: None.

User response: None.

ANR2103I Activity log pruning completed: *number of records* records removed.

Explanation: All expired (older than the log archive retention value) server activity log records have been removed; the number of records deleted is shown.

System action: None.

User response: None.

ANR2104I Activity log processing is now restarted.

Explanation: The process that records data in the server activity log had suspended logging messages because of insufficient space in the server recovery log or database or because access to the database failed. The condition that caused the activity log processing to fail has been resolved and the activity log processing is able to resume.

System action: Activity log processing resumes.

User response: None.

ANR2105W Command: Node was registered in excess of license terms - node registration will fail after 120% of the licensed quantity of nodes have been registered.

Explanation: The server has detected the addition of a node in excess of the terms under which the server is licensed. The REGISTER NODE command will fail after 120% of the licensed number of nodes have been registered.

System action: Server operation continues.

User response: Use the QUERY LICENSE command to determine the license terms that are no longer in compliance. You may remove nodes to reduce the number of registered nodes or purchase additional client node connections. If additional nodes have been purchased, issue the AUDIT LICENSES command to resynchronize the server configuration with license terms.

ANR2106I Server HALT command: Quiescing database update activity.

Explanation: The server is quiescing transactions that update the database so that the database is in a consistent state when the server is halted. This action occurs when HALT QUIESCE is specified to halt the server with the database in a consistent state.

System action: When database update transaction activity has been stopped, the server program ends.

User response: None.

ANR2107I Server HALT command: Database update activity is now quiesced.

Explanation: The server has stopped all database update transaction activity. This action occurs when HALT QUIESCE is specified to halt the server with the database in a consistent state.

System action: The server program ends.

User response: None.

ANR2108I Server HALT command: Reattempting to quiesce database update activity.

Explanation: The server is quiescing transactions that update the database so that the database is in a consistent state when the server is halted. The previous attempt at quiescing database activity failed because of the current transaction load on the server. The quiesce operation is being reattempted. This action occurs when HALT QUIESCE is specified to halt the server with the database in a consistent state.

System action: When database update transaction activity has been stopped, the server program ends.

User response: None.

ANR2109I Server HALT command: Database update transaction activity could not be successfully quiesced.

Explanation: After repeated attempts, server database update transaction activity could not be quiesced. The server is not halted with the HALT QUIESCE command. Attempts to quiesce database update transaction activity can fail if heavy transaction load is on the server when a HALT QUIESCE command is entered.

System action: Server operation continues.

User response: You may disable the server, cancel all client sessions accessing the server, cancel all processes, and reenter the HALT QUIESCE command to stop server processing. The HALT command may also be used to stop server processing without quiescing database transaction update activity. Server recovery logic will be used when the server is restarted to

reconcile database transaction activity.

ANR2110I *Command started as process process ID.*

Explanation: A background process has been started to service the command *command*. The background process is defined as process *process ID*.

System action: The server processes the indicated command.

User response: To query the progress of the background process, use the QUERY PROCESS command. To cancel the background process, use the CANCEL PROCESS command. Use the *process ID* number to specify this process.

ANR2111W *Command: There is no data to process for storage pool.*

Explanation: The indicated command does not have any data to process. This can occur if the command specifies a storage pool with no volumes, or with no volumes that contain data. This can also occur if there are no volumes in the storage pool with an access state of READWRITE or READONLY.

System action: The command ends without starting a background process.

User response: Issue the QUERY VOLUME F=D command to verify that there is at least one volume in the storage pool that contains data, and that the storage pool volumes have an access state of READWRITE or READONLY.

ANR2112E *Command: Volume volume name is not in a primary storage pool.*

Explanation: The command indicated specifies the name of a volume that does not belong to a primary storage pool. The command syntax requires that a volume in a primary storage pool be specified.

System action: The server does not process the command.

User response: Reissue the command with a volume in a primary pool.

ANR2113E *Command: Volume volume name does not belong to the same storage pool (storage pool name) as previously listed volumes.*

Explanation: The indicated command accepts a list of one or more volumes which belong to the same storage pool. The named volume does not belong to the same storage pool as the previously listed volumes.

System action: The server does not process the command.

User response: Issue the command with a list of volumes that belong to the same storage pool.

ANR2114I *Command: Access mode for volume volume name updated to "destroyed".*

Explanation: A RESTORE VOLUME command has updated the access mode of the indicated volume to destroyed.

System action: Restore processing continues.

User response: None.

ANR2115E *Command: Access mode for volume volume name cannot be changed to "destroyed" - volume is still online.*

Explanation: A RESTORE VOLUME command cannot change the access mode of the indicated volume to destroyed because the volume is still online.

System action: The server does not process the command.

User response: Issue the VARY OFFLINE command, and reissue the RESTORE VOLUME command.

ANR2116E *Command: Access mode for volume volume name cannot be changed to "destroyed" - volume does not belong to a primary storage pool.*

Explanation: The access mode for the indicated volume cannot be changed to destroyed because the volume does not belong to a primary storage pool.

System action: The access mode for this volume is not changed.

User response: None.

ANR2117E *Command: Access mode for volume volume name cannot be changed to "offsite" - volume either does not belong to a copy storage pool or from a device class of DEVTYPE=SERVER.*

Explanation: The access mode for the indicated volume cannot be changed to offsite because the volume either does not belong to a copy storage pool or is of a device class with a DEVTYPE of SERVER.

System action: The access mode for this volume is not changed.

User response: None.

ANR2118E *Storage pool storage pool name specified on the MOVE DATA command is not a valid poolname and or pooltype for volume volume name.*

Explanation: If the volume belongs to a primary storage pool, then the storage pool specified must also be a primary storage pool. If the volume belongs to a copy storage pool, then the specified storage pool must

be the same storage pool as that of the volume.

System action: The MOVE DATA process fails.

User response: Provide a valid primary storage pool name if the volume belongs to a primary storage pool. If the volume belongs to a copy storage pool, remove the storage pool name from the command.

ANR2119I **The *Option* option has been changed in the options file.**

Explanation: The option is updated in the server options file.

System action: Server continues.

User response: None.

ANR2120E *Command: Invalid platform name - platform name.*

Explanation: The command shown specifies an invalid platform name.

System action: The server does not process the command.

User response: Reissue the command with a valid platform name.

ANR2121W **ATTENTION: More than *amount* changed unit megabytes, gigabytes or terabytes of the database has changed and the last database backup was more than *hours* name hours ago. Use the BACKUP DB command to provide for database recovery.**

Explanation: The server issues this warning when a significant amount of database change activity has occurred and the server database has not been backed up.

System action: Server operation continues.

User response: To provide for server database recovery should a hardware or software problem affect your database, use the BACKUP DB command to back up the database.

ANR2122E *command name: The DOMAINS parameter cannot be specified when the NODES parameter is specified.*

Explanation: Both the NODES and DOMAINS parameters were specified. The NODES parameter may be specified, or the DOMAINS parameter may be specified, but both should not be specified at the same time.

System action: The command fails.

User response: Reenter the command specifying either

the NODES parameter or the DOMAINS parameter, but not both.

ANR2123E *command name: The NODES parameter cannot be specified when the DOMAINS parameter is specified.*

Explanation: Both the NODES and DOMAINS parameters were specified. The NODES parameter may be specified, or the DOMAINS parameter may be specified, but both should not be specified at the same time.

System action: The command fails.

User response: Reenter the command specifying either the NODES parameter or the DOMAINS parameter, but not both.

ANR2124E *command name: Invalid Client authority specified: authority.*

Explanation: An invalid client authority was specified in a GRANT AUTHORITY or REVOKE AUTHORITY command when the CLASS=NODE parameter was specified.

System action: The command fails.

User response: Reenter the command specifying a valid client authority.

ANR2125I *command name: Administrator administrator name was granted OWNER authority for client client name.*

Explanation: The named administrator was granted OWNER authority over the named client node as the result of a GRANT AUTHORITY command.

System action: Processing continues.

User response: None.

ANR2126I *command name: Administrator administrator name was granted ACCESS authority for client client name.*

Explanation: The named administrator was granted ACCESS authority over the named client node as the result of a GRANT AUTHORITY command.

System action: Processing continues.

User response: None.

ANR2127I *command name: Owner authority for node client node was revoked for administrator administrator.*

Explanation: OWNER authority over the named client node was revoked from the named administrator as a result of a REVOKE AUTHORITY command.

System action: Processing continues.

ANR2128I • ANR2138I

User response: None.

ANR2128I *command name:* **Access authority for node client node was revoked for administrator administrator.**

Explanation: ACCESS authority over the named client node was revoked from the named administrator as a result of a REVOKE AUTHORITY command.

System action: Processing continues.

User response: None.

ANR2129I **Administrative userid *admininstrator name* defined ONLY for authority over node *node name* has been removed.**

Explanation: The specified administrator has been removed because the client node was removed and the administrator only had OWNER access to the specified node.

System action: None.

User response: None.

ANR2130S **Early Product Version has Expired. Server is HALTING.**

Explanation: This server is pre-release version of the server. The pre-release version's expiration date has been reached.

System action: The server halts.

User response: Install the product version of the server.

ANR2131I **Server password set.**

Explanation: The password that the server uses to allow other servers to communicate with it has been set, changed or removed with the SET SERVERPASSWORD command.

System action: None.

User response: None.

ANR2132I **Server hladdress set to *hladdress*.**

Explanation: The high level address that other servers use to communicate with this server has been set to the value indicated with the SET SERVERHLADDRESS command.

System action: None.

User response: None.

ANR2133I **Server lladdress set to *lladdress*.**

Explanation: The low level address that other servers use to communicate with this server has been set to the value indicated with the SET SERVERLLADDRESS command.

System action: None.

User response: None.

ANR2134I **Server url set to *url*.**

Explanation: The url that other servers use to communicate with this server has been set to the value indicated with the SET SERVERURL command.

System action: None.

User response: None.

ANR2135I **Crossdefine set to *state*.**

Explanation: The ability for another server to automatically define itself to this server has been turned on or off as indicated with the SET CROSSDEFINE command.

System action: None.

User response: None.

ANR2136I **Administrator *administrator name* already has POLICY access for domain *policy domain name*.**

Explanation: The named administrator already has POLICY authority over the named policy domain. An attempt to grant client authority over this domain is ignored.

System action: The policy domain is skipped.

User response: None.

ANR2137I **Administrator *administrator name* already has POLICY access for domain *policy domain name* to which node *node name* belongs.**

Explanation: The named administrator already has POLICY authority over the named policy domain. An attempt to grant client authority for a client in this domain is ignored.

System action: The client is skipped.

User response: None.

ANR2138I **Minimum password length set to *length*.**

Explanation: The minimum length of a password a node or administrator may send to the server is indicated with the SET MINPWLENGTH command.

System action: None.

User response: None.

ANR2139E *Command: The value supplied for the minimum password length is not valid - length.*

Explanation: A SET MINPWLENGTH command has been entered that specifies a value for the length is not valid. Valid values are from 0 to 64, inclusive.

System action: The server does not process the command.

User response: Reissue the command with a valid value.

ANR2140E *Command: Invalid activity log retention period - retention value.*

Explanation: A SET ACTLOGRETENTION command has been entered that specifies an invalid log retention period.

System action: The server does not process the command.

User response: Reissue the command with a valid retention period.

ANR2141E *Command: Invalid password expiration period - days value.*

Explanation: A SET PASSEXP command has been entered that specifies an invalid days value.

System action: The server does not process the command.

User response: Reissue the command with a password expiration period.

ANR2142E *Command: Invalid server name - server name.*

Explanation: A SET SERVERNAME command has been entered that specifies an invalid server name.

System action: The server does not process the command.

User response: Reissue the command with a valid server name.

ANR2143E *Command: Invalid node name - node name.*

Explanation: The command shown specifies an invalid node name.

System action: The server does not process the command.

User response: Reissue the command with a valid node name.

ANR2144E *Command: Invalid password - password.*

Explanation: The command specifies an invalid node password.

System action: The server does not process the command.

User response: Ensure that the password adheres to naming convention rules and meets the required minimum password length as set by your administrator. Ensure that the new password is different from the old password. Then, reissue the command with a valid password.

ANR2145E *Command: Contact information exceeds maximum characters characters.*

Explanation: A REGISTER NODE or REGISTER ADMIN command has been entered that specifies a contact information value that is too long. The maximum valid length is shown in the command.

System action: The server does not process the command.

User response: Reissue the command with less contact information.

ANR2146E *Command: Node node name is not registered.*

Explanation: The command shown specifies a node that is not registered with the server.

System action: The server does not process the command.

User response: None.

ANR2147E *Command: Node node name is already registered.*

Explanation: A REGISTER NODE command has been entered that specifies a node name already registered with the server.

System action: The server does not process the command.

User response: To register the node, reissue the command and specify a different node name.

ANR2148E *Command: Administrator administrator ID is not registered.*

Explanation: The command shown specifies an administrator ID that is not registered with the server.

System action: The server does not process the command.

User response: None.

ANR2149E *Command: Administrator administrator ID is already registered.*

Explanation: A REGISTER ADMIN command has been entered that specifies an administrator ID already registered with the server.

System action: The server does not process the command.

User response: To register the administrator, reissue the command and specify a different administrator ID.

ANR2150E *Command: Node node name is currently accessing the server.*

Explanation: The command shown specifies a node that has an active session with the server.

System action: The server does not process the command.

User response: Reissue the command at a later time, or if necessary, cancel the current session and reissue the command.

ANR2151E *Command: Administrator administrator ID is currently accessing the server.*

Explanation: An UPDATE ADMIN or REMOVE ADMIN command has been entered that specifies an administrator ID that is having an active session with the server.

System action: The server does not process the command.

User response: Reissue the command at a later time, or if necessary, cancel the current session and reissue the command.

ANR2152E *Command: Inventory references still exist for node node name.*

Explanation: A REMOVE NODE command has been entered for a node for which the server is still storing backup or archive data, or both.

System action: The server does not process the command.

User response: To remove the node, delete all of its file spaces and any virtual file space mapping definitions from the server and reissue the command.

ANR2153E *Command: Invalid file space name - filespace name.*

Explanation: The specified server command has been entered with a file space name that is longer than allowed.

System action: The server does not process the command.

User response: Reissue the command with a valid file space name.

ANR2154E *Command: Invalid administrator name - administrator ID.*

Explanation: The command shown specifies an invalid administrator ID.

System action: The server does not process the command.

User response: Reissue the command with a valid administrator ID.

ANR2155E *Command: Invalid privilege class - privilege class.*

Explanation: A command specifies an invalid administrative privilege class.

System action: The server does not process the command.

User response: Reissue the command with a valid privilege class.

ANR2156E *Command: Administrator administrator ID has already been granted system privilege.*

Explanation: A GRANT AUTHORITY command has been issued to grant system authority to an administrator ID that already has system authority.

System action: The server does not process the command.

User response: None.

ANR2157E *Command: Other privileges cannot be granted with system privilege.*

Explanation: A GRANT AUTHORITY command has been issued to grant system authority to an administrator ID, and at the same time to grant other privileges.

System action: The server does not process the command.

User response: Reissue the GRANT AUTHORITY command specifying only system privilege class.

ANR2158E *Command: Policy domains cannot be specified for unrestricted policy administrator administrator ID.*

Explanation: A REVOKE AUTHORITY command has been issued to revoke an administrator's policy authority over a specific policy domain, but the administrator has unrestricted policy authority.

System action: The server does not process the command.

User response: None.

ANR2159E *Command: Storage pools cannot be specified for unrestricted storage administrator administrator ID.*

Explanation: A REVOKE AUTHORITY command has been issued to revoke an administrator's storage authority over a specific storage pool, but the administrator has unrestricted storage authority.

System action: The server does not process the command.

User response: None.

ANR2160E *Command: No new privileges granted to administrator administrator ID.*

Explanation: A GRANT AUTHORITY command has been issued to grant authority to an administrator ID, but the administrator already has all privileges specified.

System action: The server does not process the command.

User response: None.

ANR2161E *Command: Only system privilege can be revoked for administrator administrator ID.*

Explanation: A REVOKE AUTHORITY command has been issued to revoke one or more of an administrator's privileges, but the administrator has system authority.

System action: The server does not process the command.

User response: None.

ANR2162E *Command: No privileges revoked for administrator administrator ID.*

Explanation: A REVOKE AUTHORITY command has been issued to revoke authority from an administrator ID, but the administrator does not have any of the privileges specified.

System action: The server does not process the command.

User response: None.

ANR2163E *Command: Command is invalid for administrator ID.*

Explanation: The command specified cannot be issued for the server console. For instance, the server console administrator ID cannot be removed.

System action: The server does not process the command.

User response: None.

ANR2164E *Command: Command rejected - administrator ID is the only system administrator.*

Explanation: A REMOVE ADMIN or REVOKE AUTHORITY command has been issued to remove or revoke the authority of the last administrator who had system authority.

System action: The server does not process the command.

User response: To remove or revoke this ID, grant system authority to another administrator ID before reissuing the command.

ANR2165E *Command: Invalid begin date - date.*

Explanation: A QUERY ACTLOG command has been entered that specifies an invalid begin date as a search criteria.

System action: The server does not process the command.

User response: Reissue the command with a valid begin date.

ANR2166E *Command: Invalid begin time - time.*

Explanation: A QUERY ACTLOG command has been entered that specifies an invalid begin time as a search criteria.

System action: The server does not process the command.

User response: Reissue the command with a valid begin time.

ANR2167E *Command: Invalid end date - date.*

Explanation: A QUERY ACTLOG command has been entered that specifies an invalid end date as a search criteria.

System action: The server does not process the command.

User response: Reissue the command with a valid end date.

ANR2168E *Command: Invalid end time - time.*

Explanation: A QUERY ACTLOG command has been entered that specifies an invalid end time as a search criteria.

System action: The server does not process the command.

User response: Reissue the command with a valid end time.

ANR2169E *Command: Invalid message number - message number.*

Explanation: A QUERY ACTLOG command has been entered that specifies an invalid message number as a search criteria.

System action: The server does not process the command.

User response: Reissue the command with a valid message number.

ANR2170E *Command: Invalid message search string argument - search string.*

Explanation: A QUERY ACTLOG command has been entered that specifies an invalid search string as a search criteria.

System action: The server does not process the command.

User response: Reissue the command with a valid search string.

ANR2171E *Command: Invalid time range - Begin: date time End: date time.*

Explanation: A QUERY ACTLOG command has been entered that specifies an invalid beginning and ending date/time range. This error can occur when the beginning date/time is not before the ending date/time.

System action: The server does not process the command.

User response: Reissue the command with a valid date/time range.

ANR2172E *Command: No matching administrators.*

Explanation: The command shown specified an administrator ID that does not match any administrator registered with the server.

System action: The command is not executed.

User response: If desired, reissue the command with a different administrator ID.

ANR2173E *Command: Location information exceeds maximum characters characters.*

Explanation: A DEFINE or UPDATE VOLUME command has been entered that specifies a location information value that is too long. The maximum valid length is shown in the command.

System action: The server does not process the command.

User response: Reissue the command with less location information.

ANR2174E *Administrator administrator ID is not registered. Schedule schedule name is not processed and is marked as failed.*

Explanation: The command shown specifies an administrator ID that is not registered with the server. The schedule and related command are not processed.

System action: The server does not process the command.

User response: Update the command schedule with a valid administrator ID which has the proper authority to execute the scheduled command.

ANR2175I *Invalid password limit set to password attempts limit attempts.*

Explanation: The maximum number of consecutive invalid passwords a node or administrator may send to the server is indicated with the SET INVALIDPWLIMIT command.

System action: None.

User response: None.

ANR2176E *Command: The value supplied for the invalid password attempts limit is not valid - password attempts limit.*

Explanation: A SET INVALIDPWLIMIT command has been entered that specifies a value for the consecutive invalid password attempts limit that is not valid. Valid values are from 0 to 9999, inclusive.

System action: The server does not process the command.

User response: Reissue the command with a valid value.

ANR2177I *node/admin name has count invalid sign-on attempts. The limit is limit.*

Explanation: The server detected an invalid password for the specified node during sign-on processing. The node currently has sent *count* consecutive invalid passwords. The maximum allowed is *limit*. The server will lock the node when *limit* is reached.

System action: The node or administrator session will be refused.

User response: Before the client node is permitted to access the server, a properly authorized administrator must unlock the node or administrator with the UNLOCK NODE or UNLOCK ADMIN command.

ANR2178E *node/admin name* **has been locked. Invalid sign-on attempt limit (*limit*) reached.**

Explanation: The specified node has been locked by the server. The limit for consecutive invalid passwords has been reached.

System action: The node or administrator session will be refused.

User response: Before the client node is permitted to access the server, a properly authorized administrator must unlock the node or administrator with the UNLOCK NODE or UNLOCK ADMIN command.

ANR2179E *Administrator administrator* **should have been locked, but was not.**

Explanation: The indicated administrator reached the limit for consecutive invalid passwords and should have been locked. If it were locked, there would be no means to execute commands requiring system authority.

System action: The administrator session will be refused.

User response: Sign-on again using the correct password.

ANR2180W *Unable to update last access date for administrator administrator ID - insufficient recovery log space.*

Explanation: While establishing an administrative session for the indicated ID, the server is unable to update the administrator's date of last access due to insufficient recovery log space.

System action: The server establishes the administrative session, but the last access date is not updated.

User response: An authorized administrator can issue the DEFINE LOGVOLUME command to add volumes for use by the log, and can issue the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR2181W *Unable to update last access date for administrator administrator ID - insufficient database space.*

Explanation: While establishing an administrative session for the indicated ID, the server cannot update the administrator's date of last access due to insufficient database space.

System action: The server establishes the administrative session, but the last access date is not updated.

User response: An authorized administrator can issue the DEFINE DBVOLUME command to add volumes

for use by the database, and can issue the EXTEND DB command to extend the size of the database so that the new volumes are used.

ANR2182W *Unable to update last access date for administrator administrator ID - internal server error.*

Explanation: While establishing an administrative session for the indicated ID, the server cannot update the administrator's date of last access due to a server internal error.

System action: The server establishes the administrative session, but the last access date is not updated.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR2183W *Diagnostic(ID): Transaction transaction ID was aborted.*

Explanation: An error was detected during transaction commit that caused this transaction to be aborted. This message may have been preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If this was encountered while the server was halting then this can be ignored. During server HALT processing, existing in-flight transactions may be aborted as a normal part of server shutdown processing. If the error cannot be isolated and resolved, contact your service representative.

ANR2184W *Diagnostic(ID): Transaction transaction ID was aborted for command command.*

Explanation: An error was detected during transaction commit for the specified server command. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR2185W Transaction was aborted for command
command.

Explanation: An error was detected during transaction commit. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR2186W Transaction was aborted for session
session number for node node name (client platform).

Explanation: An error was detected during transaction commit. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR2187W Transaction was aborted for node/admin
name.

Explanation: An error is detected during a transaction commit for the specified node or administrator name. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR2188W A Transaction was aborted. The activity
is terminating.

Explanation: An error is detected during a transaction commit. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error ends.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved,

contact your service representative.

ANR2189W Diagnostic(ID): Transaction transaction ID
was aborted for node/admin name.

Explanation: An error is detected during a transaction commit for the specified node or administrator name. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The activity that generated this error fails.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR2190E command: Device class DISK cannot be
specified for this command.

Explanation: The DEVCLASS value DISK cannot be specified for the command.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid device class. Issue the QUERY DEVCLASS command for a list of valid device classes for the server.

ANR2191E command: Volume list contains defined
and undefined volumes.

Explanation: The list of volumes specified on the SALVAGE VOLUME command must all be defined to the server, or all not defined to the server.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a valid list of volumes.

ANR2192E Command: Unable to start background
process.

Explanation: The server command processor is not able to start a background process to perform the command *command*.

System action: The command process ends and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2193E *Command: Invalid option set name - option set name.*

Explanation: The command shown specifies an invalid option set name.

System action: The server does not process the command.

User response: Reissue the command with a valid option set name.

ANR2194E *Command: Invalid option set description - too long.*

Explanation: The command shown specifies an invalid description. The description is too long.

System action: The server does not process the command.

User response: Reissue the command with a valid description.

ANR2195E *Command: Invalid option sequence number - option sequence number name.*

Explanation: The command shown specifies an invalid option sequence number.

System action: The server does not process the command.

User response: Reissue the command with a valid option sequence number.

ANR2196E *Command: Option name and/or Option value is missing for define.*

Explanation: The specified DEFINE command has been entered, but no attributes have been specified for the definition.

System action: The server does not process the command.

User response: Reissue the DEFINE command with one or more attributes to be defined

ANR2197E *Command: The value supplied for the WEB authentication time out is not valid - time-out value.*

Explanation: A SET WEBAUTHTIMEOUT command has been entered that specifies a value that is not valid. Valid values are from 0 to 9999, inclusive.

System action: The server does not process the command.

User response: Reissue the command with a valid value.

ANR2198I *Command: Web authentication time-out set to time-out value minutes.*

Explanation: The time-out value that determines how often WEB browser administrative users need to re-authenticate with the server has been set with the SET WEBAUTHTIMEOUT command to the value displayed.

System action: None.

User response: None.

ANR2199I *Password expiration period for node node name set to number of days days.*

Explanation: The number of days that the node's password can be used before it must be changed has been set to the value indicated with the SET PASSEXP command.

System action: None.

User response: None.

ANR2200I *Storage pool storage pool name defined (device class device class name).*

Explanation: A DEFINE STGPOOL command has created the storage pool indicated of the device class shown.

System action: None.

User response: None.

ANR2201I *Storage pool storage pool name deleted.*

Explanation: A DELETE STGPOOL command has deleted the storage pool indicated.

System action: None.

User response: None.

ANR2202I *Storage pool storage pool name updated.*

Explanation: An UPDATE STGPOOL command has updated the storage pool indicated.

System action: None.

User response: None.

ANR2203I *Device class device class name defined.*

Explanation: A DEFINE DEVCLASS command has created the device class indicated.

System action: None.

User response: None.

ANR2204I Device class *device class name* deleted.

Explanation: A DELETE DEVCLASS command has deleted the device class indicated.

System action: None.

User response: None.

ANR2205I Device class *device class name* updated.

Explanation: An UPDATE DEVCLASS command has updated the device class indicated.

System action: None.

User response: None.

ANR2206I Volume *volume name* defined in storage pool *storage pool name* (device class *device class name*).

Explanation: A DEFINE VOLUME command has defined the volume indicated in the storage pool shown that belongs to the device class shown.

System action: None.

User response: None.

ANR2207I Volume *volume name* updated.

Explanation: An UPDATE VOLUME command has updated the volume indicated.

System action: None.

User response: None.

ANR2208I Volume *volume name* deleted from storage pool *storage pool name*.

Explanation: The volume indicated has been deleted by one of the following:

- A DELETE VOLUME command was issued.
- The volume was empty and the volume's access mode was updated to destroyed.
- The volume was empty, scratch, and offsite, and the access mode was changed to readwrite, readonly, or unavailable.
- The volume was scratch, not offsite, and was emptied by DELETE FILESPACE, RECLAMATION, or RESTORE VOLUME/STGPOOL.
- The volume was an empty scratch WORM FILE volume and deleted by RECLAMATION since the retention of the volume has expired.

System action: None.

User response: None.

ANR2209W Volume *volume name* contains no data.

Explanation: The AUDIT VOLUME or MOVE DATA command entered specifies a volume that contains no data.

System action: The server does not process the command.

User response: None.

ANR2210I Vary online initiated for disk volume *volume name*.

Explanation: A VARY ONLINE command for the volume shown is being processed, and if no errors occur the volume will be varied online.

System action: None.

User response: None.

ANR2211I Vary offline initiated for disk volume *volume name*.

Explanation: A VARY OFFLINE command for the volume shown is being processed and, if no errors occur, the volume will be varied offline.

System action: None.

User response: None.

ANR2212I Command: No volumes updated.

Explanation: An UPDATE VOLUME command has been entered, but no objects were updated.

System action: None.

User response: None.

ANR2213I Command: Storage pool *storage pool name* renamed to *storage pool name*.

Explanation: A RENAME STGPOOL command has been entered. The rename of the storage pool was successful.

System action: None.

User response: None.

ANR2214E Command: Invalid backup set name - *backup set name*.

Explanation: The command shown specifies an invalid backup set name.

System action: The command fails.

User response: Reissue the command with a valid backup set name.

ANR2215E *Command:* **Description text is too long.**

Explanation: The specified description text is too long for a command that allows description text to be specified.

System action: The command fails

User response: Reissue the command specifying a shorter description

ANR2216E *Command:* **Device class must be a sequential device class.**

Explanation: The device class specified on the command is not a sequential device class.

System action: The command fails

User response: Reissue the command specifying the name of a sequential device class

ANR2217E *Command:* **Invalid backup set retention period - retention value.**

Explanation: Server processing for the backup set command *command* fails because the value (*retention value*) specified for the RETENTION parameter is not valid.

System action: The command fails

User response: Reissue the command specifying a valid RETENTION value.

ANR2218E *Command:* **A device class must be specified.**

Explanation: The DEVCLASS parameter is not specified in the command *command name*. A DEVCLASS value must be specified.

System action: The command fails.

User response: Reissue the command specifying a valid device class. Issue the QUERY DEVCLASS command for a list of valid device classes for the server.

ANR2219I **Discard Data process ended for volume *volume name* - volume is not deleted from storage pool *storage pool name* because the volume access is offsite.**

Explanation: The process that deleted data for the volume shown has ended, but the volume has not been deleted because the volume access is marked as offsite.

System action: None.

User response: To delete the volume, change the volume access to readwrite, readonly, or unavailable.

ANR2220W **This command will delete volume *volume name* from its storage pool after verifying that the volume contains no data.**

Explanation: A DELETE VOLUME command with the Discarddata=No option has been entered.

System action: The system asks whether you wish to continue with the command.

User response: To process the DELETE VOLUME command, enter 'Y' to continue or 'N' to stop the process.

ANR2221W **This command will result in the deletion of all inventory references to the data on volume *volume name*, thereby rendering the data unrecoverable.**

Explanation: A DELETE VOLUME command with the Discarddata=Yes option has been entered.

System action: The system asks whether you wish to continue with the command.

User response: To process the DELETE VOLUME command, enter 'Y' to continue or 'N' to stop the process.

ANR2222I **Discard Data process started for volume *volume name* (process ID *process ID*).**

Explanation: As a result of a DELETE VOLUME command with the Discarddata=Yes option, the process whose ID is displayed has begun to delete the data on the volume shown.

System action: The server deletes the data on the volume.

User response: None.

ANR2223I **Discard Data process ended for volume *volume name* - volume deleted from storage pool *storage pool name*.**

Explanation: The process that deleted data for the volume shown has ended, and the volume has been deleted.

System action: None.

User response: None.

ANR2224W **Discard Data process terminated for volume *volume name* - process canceled.**

Explanation: The process that was deleting data for the volume shown, in preparation for deleting the volume, has been canceled.

System action: The server does not delete the volume.

User response: None.

ANR2225W Discard Data process terminated for volume *volume name* - volume still contains data.

Explanation: The process that was deleting data for the volume shown, in preparation for deleting the volume, has ended. However, the volume contains data.

System action: The server does not delete the volume.

User response: Contact your service representative.

ANR2226W Discard data process terminated for volume *volume name* - sufficient recovery log space is not available.

Explanation: The process that was deleting data for the volume shown, in preparation for deleting the volume, has ended due to a shortage of recovery log space.

System action: The server does not delete the volume.

User response: An authorized administrator can issue the DEFINE LOGVOLUME command to add volumes for use by the log, and can issue the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR2227W Discard data process terminated for volume *volume name* - sufficient memory is not available.

Explanation: The process that was deleting data for the volume shown, in preparation for deleting the volume, has ended due to a shortage of memory.

System action: The server does not delete the volume.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2228W Discard data process terminated for volume *volume name* - lock conflict detected.

Explanation: The process that was deleting data for the volume shown, in preparation for deleting the volume, has ended due to a locking conflict.

System action: The server does not delete the volume.

User response: Reissue the command at a later time. If this problem persists, contact your service representative.

ANR2229W Discard data process terminated for volume *volume name* - internal server error detected.

Explanation: The process that was deleting data for the volume shown, in preparation for deleting the volume, has ended due to a server internal error.

System action: The server does not delete the volume

User response: Contact your service representative.

ANR2232W This command will move all of the data stored on volume *volume name* to other volumes within the same storage pool; the data will be inaccessible to users until the operation completes.

Explanation: A move data has been entered that will move data from the indicated volume to other volumes in the same storage pool. While the data is being moved, it will not be available to users.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to continue with the command or 'N' to end the process.

ANR2233W This command will move all of the data stored on volume *volume name* to other volumes in storage pool *storage pool name*; the data will be inaccessible to users until the operation completes.

Explanation: A move data has been entered that will move data from the indicated volume to volumes in the storage pool shown. While the data is being moved it will not be available to users.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to continue with the command or 'N' to end the process.

ANR2234W This command will halt the server; if the command is issued from a remote client, it may not be possible to restart the server from the remote location.

Explanation: A HALT command has been entered.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to halt the server or 'N' to leave the server activated.

ANR2235W This command will remove administrator *adminName*. This administrator has defined or updated schedules. Removing this authority WILL cause these schedules to fail.

Explanation: A REMOVE ADMINISTRATOR command has been entered for an administrator that owns administrative schedules. If you confirm that you want to proceed with this command, the schedules owned by this administrator will fail when executed in the future.

System action: The system asks whether you wish to continue with the command.

User response: To process the REMOVE ADMINISTRATOR command, enter 'Y' to continue or 'N' to stop the process. To deal with schedules owned by the administrator, use the QUERY SCHEDULE command OR an SQL SELECT statement on the ADMIN_SCHEDULES table to determine which schedules were last updated by the administrator. Use the UPDATE SCHEDULE command to update those schedules under an administrator that has authority to execute them, or use the DELETE SCHEDULE command to remove the schedules.

ANR2236W This command has removed administrator *adminName*. This administrator has defined or updated schedules. This WILL cause these schedules to fail in the future.

Explanation: A REMOVE ADMINISTRATOR command has been entered and the administrator removed owns administrative schedules. The schedules will fail when executed in the future because they do not belong to a valid administrator.

System action: The system removes the administrator.

User response: Use the QUERY SCHEDULE command OR an SQL SELECT statement on the ADMIN_SCHEDULES table to determine which schedules were last updated by the administrator. Use the UPDATE SCHEDULE command to update those schedules under an administrator that has authority to execute them, or use the DELETE SCHEDULE command to remove the schedules.

ANR2237W This command has revoked privileges for administrator *adminName*. This administrator has defined or updated schedules. This may cause these schedules to fail in the future.

Explanation: A REVOKE AUTHORITY command has been entered.

System action: The system removes the authority.

User response: None.

ANR2238W This command will result in the deletion of all inventory references to the data on filespaces that match the pattern *filespace name* for node *node name*, whereby rendering the data unrecoverable.

Explanation: A DELETE FILESPACE command has been entered.

System action: The system asks whether you wish to continue with the command.

User response: To process the DELETE FILESPACE command, enter 'Y'; otherwise, enter 'N'.

ANR2239W This command will revoke privileges for administrator *adminName*. This administrator has defined or updated schedules. Revoking this authority may cause schedules to fail.

Explanation: A REVOKE AUTHORITY command has been entered.

System action: The system asks whether you wish to continue with the command.

User response: To process the REVOKE AUTHORITY command, enter 'Y' to continue or 'N' to stop the process.

ANR2240I Database volume *volume name* defined.

Explanation: A DEFINE DBVOLUME command has defined the database volume indicated.

System action: None.

User response: None.

ANR2241I Database volume copy *volume name* defined.

Explanation: A DEFINE DBCOPY command has defined the database volume indicated.

System action: None.

User response: None.

ANR2242I Database volume copy *volume name* defined; synchronization process started (process ID *process ID*).

Explanation: A DEFINE DBCOPY command has added the volume shown as a database copy volume. The process whose ID is displayed will copy data to the new volume to synchronize it with existing volumes.

System action: None.

User response: None.

ANR2243I Database volume *volume name* deleted.

Explanation: A DELETE DBVOLUME command has deleted the database volume indicated.

System action: None.

User response: None.

ANR2244I Delete process initiated for database volume *volume name* (process id *process ID*).

Explanation: In response to a DELETE DBVOLUME command, the process with the process ID shown has been started to delete the volume.

System action: None.

User response: None.

ANR2245I Database volume *volume name* varied online.

Explanation: A VARY ONLINE command has put the database volume indicated into an online state.

System action: None.

User response: None.

ANR2246I Vary online process initiated for database volume *volume name* (process ID *process ID*).

Explanation: In response to a VARY ONLINE command, the process with the process ID shown has been started to vary on the database volume indicated.

System action: None.

User response: None.

ANR2247I Database volume *volume name* varied offline.

Explanation: A VARY OFFLINE command has put the indicated database volume into an offline state.

System action: None.

User response: None.

ANR2248I Database assigned capacity has been extended.

Explanation: An EXTEND DB command has increased the storage capacity of the database.

System action: None.

User response: None.

ANR2249I Database extension process initiated (process ID *process ID*).

Explanation: In response to an EXTEND DB command, the process with the process ID shown has been started to extend the database.

System action: None.

User response: None.

ANR2250I Database assigned capacity has been reduced.

Explanation: A REDUCE DB command has decreased the storage capacity of the database.

System action: None.

User response: None.

ANR2251I Database reduction process initiated (process ID *process ID*).

Explanation: In response to a REDUCE DB command, the process with the process ID shown has been started to reduce the database.

System action: None.

User response: None.

ANR2252W Database volume copy *volume name* is larger than volume *volume name* by *count* megabyte(s).

Explanation: A DEFINE DBCOPY command has defined a database copy volume whose size is larger than the volume it mirrors by the amount shown.

System action: The excess capacity is ignored.

User response: None.

ANR2253W The database volume copy to be defined (*volume name*) is larger than volume *volume name*; use of the volume will result in *count* megabyte(s) of unusable space.

Explanation: A DEFINE DBCOPY command is attempting to define a database copy volume whose size is larger than the volume it mirrors by the amount shown. The excess capacity would not be used.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to define the copy, 'N' otherwise.

ANR2254E *Command: The VOLUMENAMES parameter must be specified when SCRATCH=NO is specified.*

Explanation: The SCRATCH parameter is specified as NO for the command *Command* but the VOLUMENAMES parameter is not specified. When scratch volumes are not allowed, the VOLUMENAMES parameter must be specified to indicate the volumes that can be used for the command.

System action: The command fails.

User response: Reissue the command and specify a valid VOLUMENAMES parameter.

ANR2255E *Command: The VOLUMENAMES parameter must be specified.*

Explanation: The VOLUMENAMES parameter must be specified to indicate the volumes that can be used for the command.

System action: The command fails.

User response: Reissue the command and specify a valid VOLUMENAMES parameter.

ANR2256E *Command: The RETENTION parameter must be specified.*

Explanation: The RETENTION parameter must be specified to indicate the retention period to be used for the command.

System action: The command fails.

User response: Reissue the command and specify a valid RETENTION parameter.

ANR2257E *Command: Administrator administrator name is not authorized to issue this command for node node name.*

Explanation: The specified administrator has entered the indicated command, but this administrator does not have the proper authority necessary to run the command for the indicated node. Note: This message can be issued as a result of the server option REQSYSAUTHOUTFILE YES being in effect.

System action: The server does not process the command for the indicated node. If multiple nodes were specified on the command, the server may continue processing the command for the other nodes.

User response: Examine previous messages for any additional information. Issue the command from a properly authorized administrator ID, or contact the system administrator to have additional authority granted to the current administrator ID.

ANR2258E *Command: Invalid summary retention period - retention value.*

Explanation: A SET SUMMARYRETENTION command has been entered that specifies an invalid retention period.

System action: The server does not process the command.

User response: Reissue the command with a valid retention period.

ANR2259I *Summary retention period set to number of days days.*

Explanation: The number of days that activity summary records are kept in the server database has been set to the value indicated with the SET SUMMARYRETENTION command.

System action: None.

User response: None.

ANR2260I *Recovery log volume volume name defined.*

Explanation: A DEFINE LOGVOLUME command has defined the recovery log volume indicated.

System action: None.

User response: None.

ANR2261I *Recovery log volume copy volume name defined.*

Explanation: A DEFINE LOGCOPY command has defined the recovery log volume indicated.

System action: None.

User response: None.

ANR2262I *Recovery log volume copy volume name defined; synchronization process started (process ID process ID).*

Explanation: A DEFINE LOGCOPY command has added the volume shown as a log copy volume. The process whose ID is displayed copied data to the new volume to synchronize it with existing volumes.

System action: None.

User response: None.

ANR2263I *Recovery log volume volume name deleted.*

Explanation: A DELETE LOGVOLUME command has removed the recovery log volume indicated.

System action: None.

ANR2264I • ANR2274I

User response: None.

ANR2264I Delete process initiated for recovery log volume *volume name* (process id *process ID*).

Explanation: In response to a DELETE LOGVOLUME command, the process with process ID shown has been started to delete the volume.

System action: None.

User response: None.

ANR2265I Recovery log volume *volume name* varied online.

Explanation: A VARY ONLINE command has put the recovery log volume indicated into an online state.

System action: None.

User response: None.

ANR2266I Vary online process initiated for recovery log volume *volume name* (process ID *process ID*).

Explanation: In response to a VARY ONLINE command, the process with process ID shown has been started to vary on the recovery log volume indicated.

System action: None.

User response: None.

ANR2267I Recovery log volume *volume name* varied offline.

Explanation: A VARY OFFLINE command has put the recovery log volume indicated into an offline state.

System action: None.

User response: None.

ANR2268I Recovery log assigned capacity has been extended.

Explanation: An EXTEND LOG command has increased the storage capacity of the recovery log.

System action: None.

User response: None.

ANR2269I Recovery log extension process initiated (process ID *process ID*).

Explanation: In response to an EXTEND LOG command, the process with the process ID shown has been started to extend the recovery log.

System action: None.

User response: None.

ANR2270I Recovery log assigned capacity has been reduced.

Explanation: A REDUCE LOG command has decreased the storage capacity of the recovery log.

System action: None.

User response: None.

ANR2271I Recovery log reduction process initiated (process ID *process ID*).

Explanation: In response to a REDUCE LOG command, the process with the process ID shown has been started to reduce the recovery log.

System action: None.

User response: None.

ANR2272W Recovery log volume copy *volume name* is larger than volume *volume name* by *count* megabytes.

Explanation: A DEFINE LOGCOPY command has defined a recovery log copy volume whose size is larger than the volume it mirrors by the amount shown.

System action: The excess capacity is ignored.

User response: None.

ANR2273W The recovery log volume copy to be defined (*volume name*) is larger than volume *volume name*; use of the volume will result in *count* megabytes of unusable space.

Explanation: A DEFINE LOGCOPY command is attempting to define a recovery log copy volume whose size is larger than the volume it mirrors by the amount shown. The excess capacity would not be used.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to define the copy or 'N' to stop the process.

ANR2274I Data Base Space trigger defined and enabled.

Explanation: The database space trigger has been defined with a DEFINE SPACETRIGGER command. The percentage of utilization specified with the FULLPCT parameter is used to automatically expand the database.

System action: None.

User response: None.

ANR2275I Data Base Space trigger defined, but is disabled.

Explanation: A database space trigger has been defined, but because the space expansion percentage is currently set to 0, the space trigger is disabled.

System action: None.

User response: To activate the space trigger, use the UPDATE SPACETRIGGER command to set the space expansion percentage to a value greater than 0.

ANR2276I Data Base Space trigger updated and enabled.

Explanation: An UPDATE SPACETRIGGER command has successfully completed for the data base space trigger. The updated parameters specified on the command are used to automatically trigger space expansion for the database.

System action: None.

User response: None.

ANR2277I Database Space trigger updated, but disabled.

Explanation: An UPDATE SPACETRIGGER command has successfully completed for the data base space trigger. However, the space expansion percentage is currently set to 0, which disables the space trigger.

System action: None.

User response: To activate the space trigger, use the UPDATE SPACETRIGGER command with the SPACEexpansion parameter to set a value greater than zero.

ANR2278I Database Space trigger deleted.

Explanation: A DELETE SPACETRIGGER command has successfully completed for the database space trigger. Space expansions are no longer triggered automatically for the database.

System action: None.

User response: None.

ANR2279I Recovery Log Space trigger defined and enabled.

Explanation: The recovery log space trigger has been defined with a DEFINE SPACETRIGGER command. The percentage of utilization specified with the FULLPCT parameter is used to automatically expand the recovery log.

System action: None.

User response: None.

ANR2280I Full database backup started as process *process ID*.

Explanation: A background process was started to backup the contents of the database. The full database backup process was assigned the process ID shown.

System action: The database backup process starts and server operation continues.

User response: The administrator may query the status of the database backup process by using the QUERY PROCESS command, or cancel the process with the CANCEL PROCESS command.

ANR2281I Incremental database backup started as process *process ID*.

Explanation: A background process was started to backup the contents of the database. The incremental database backup process was assigned the process ID shown.

System action: The database backup process starts and server operation continues.

User response: The administrator may query the status of the database backup process by using the QUERY PROCESS command, or cancel the process with the CANCEL PROCESS command.

ANR2282I Database backup trigger defined and enabled.

Explanation: A database backup trigger has been defined with a DEFINE DBBACKUPTRIGGER command. The percentage of recovery log utilization specified with the LOGFULLPCT parameter is used to automatically trigger database backups.

System action: None.

User response: None.

ANR2283I Database backup trigger defined, but is disabled.

Explanation: A database backup trigger has been defined, but because the recovery log mode is currently set to NORMAL, the database backup trigger is disabled. Database backups can only be triggered when the log mode is set to ROLLFORWARD with a SET LOGMODE command.

System action: None.

User response: To activate the database backup trigger, use the SET LOGMODE ROLLFORWARD command.

ANR2284I Database backup trigger updated and enabled.

Explanation: An UPDATE DBBACKUPTRIGGER command has successfully completed. The updated parameters specified on the command are used to automatically trigger database backups.

System action: None.

User response: None.

ANR2285I Database backup trigger updated, but disabled.

Explanation: An UPDATE DBBACKUPTRIGGER command has successfully completed, but because the recovery log mode is currently set to NORMAL, the database backup trigger is disabled. Database backups can only be triggered when the log mode is set to ROLLFORWARD with a SET LOGMODE command.

System action: None.

User response: To activate the database backup trigger, use the SET LOGMODE ROLLFORWARD command.

ANR2286I Database backup trigger deleted.

Explanation: A DELETE DBBACKUPTRIGGER command has successfully completed. Database backups are no longer triggered automatically by recovery log utilization.

System action: None.

User response: None.

ANR2287I Snapshot database backup started as process *process ID*.

Explanation: A background process was started to backup the contents of the database. The snapshot database backup process was assigned the process id shown.

System action: The database backup process starts and server operation continues.

User response: The administrator may query the started process by using the QUERY PROCESS command, or may cancel the process using the CANCEL PROCESS command.

ANR2288I Subfile set to *state*.

Explanation: The SET SUBFILE command has been used to specify whether this server will allow clients to back up subfiles. If a value of CLIENT is specified, clients are given the option of backing up subfiles. If a value of NO is specified, clients are not allowed to back up subfiles.

System action: None.

User response: None.

ANR2289I Administrative userid *admininstrator name* defined for authority over node *node name* has not been removed.

Explanation: The specified administrator was not removed.

System action: None.

User response: None.

ANR2290W Changing the log mode to NORMAL will prevent roll-forward recovery.

Explanation: The system has determined that changing the recovery log mode from ROLLFORWARD to NORMAL mode will cause the log records being kept for ROLLFORWARD and single database volume restore processing to be discarded. Without these log records, only point-in-time database restores can be performed.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to change the LOGMODE, 'N' otherwise.

ANR2291W Changing the log mode to NORMAL will disable the database backup trigger.

Explanation: Changing the recovery log mode from ROLLFORWARD to NORMAL disables the setting specified in the DEFINE DBBACKUPTRIGGER command. Database backups can only be triggered when the recovery log mode is set to ROLLFORWARD with the SET LOGMODE command.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to change the log mode, 'N' otherwise. Responding 'Y' does not delete the DEFINE DBBACKUPTRIGGER settings.

ANR2292W Changing the log mode to ROLLFORWARD will enable the database backup trigger.

Explanation: Changing the recovery log mode from NORMAL to ROLLFORWARD causes a previously issued DEFINE DBBACKUPTRIGGER command to become effective, and immediately start a full database backup. Database backups can only be triggered when the recovery log mode is set to ROLLFORWARD with a SET LOGMODE command.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to change the log mode, 'N' otherwise.

ANR2293I Only point-in-time database recovery is now possible.

Explanation: An administrator has changed the recovery log mode from ROLLFORWARD to NORMAL with a SET LOGMODE command. Only point-in-time database restores can be performed. ROLLFORWARD database restores and individual database volume restores are not possible.

System action: None.

User response: None.

ANR2294I Log mode set to log mode.

Explanation: The mode for saving recovery log records has been set as indicated by the SET LOGMODE command. When set to NORMAL, only those log records needed to resume database processing if a system failure occurs are saved. When set to ROLLFORWARD, all log records created since the last database backup are saved. ROLLFORWARD mode also enables the database backup trigger to be used to automatically start database backups based on the percentage of recovery log utilization.

System action: None.

User response: None.

ANR2295I Log mode set to ROLLFORWARD; database backup trigger enabled.

Explanation: The mode for saving recovery log records has been set to ROLLFORWARD, and a previously defined database backup trigger has been enabled. All log records created since the last database backup are saved in this mode. The database backup trigger will automatically start a database backup based on the percentage of recovery log utilization.

System action: None.

User response: None.

ANR2296I Log mode set to NORMAL; database backup trigger disabled.

Explanation: The mode for saving recovery log records has been set to NORMAL mode, and the defined database backup trigger is disabled. Only those log records needed to resume database processing if a system failure occurs are saved in this mode. Database backups can only be started using the BACKUP DB command.

System action: None.

User response: None.

ANR2297I Command: **Optionset** *optionset name*, **option** *option name*, **sequence number** *old sequence number*, **has been changed to** *new sequence number*.

Explanation: The requested option sequence number has been updated in response to an UPDATE CLIENTOPT command.

System action: None.

User response: None.

ANR2298I Command: **Optionset** *optionset name*, **option** *option name*, **sequence number** *old sequence number*, **is not updated**.

Explanation: The requested option sequence number is not updated in response to an UPDATE CLIENTOPT command.

System action: None.

User response: Reissue the UPDATE CLIENTOPT command with a valid old sequence number.

ANR2299I Password expiration period for administrator *administrator name* set to *number of days* days.

Explanation: The number of days that the administrator's password can be used before it must be changed has been set to the value indicated with the SET PASSEXP command.

System action: None.

User response: None.

ANR2300E Could not open "*file spec*" the server help file.

Explanation: The named help file could not be accessed.

System action: The requested help text is not displayed.

User response: Contact the system administrator.

ANR2301E Errors were encountered while setting up the index to the help text.

Explanation: Either insufficient memory or a help file read failure has occurred during setup of the help index.

System action: The server does not display the requested help text.

User response: Contact the system administrator.

ANR2302E The argument *operand* is not valid for the HELP command.

Explanation: The argument supplied on the HELP command is not an integer or the name of a command.

System action: The server does not process the HELP command.

User response: Issue the HELP command with no operands and select from the numbered list displayed in response.

ANR2303E There is no help section numbered *section number*.

Explanation: The numeric operand supplied on the HELP command is either less than 1 or greater than the highest-numbered entry in the help index.

System action: The server does not process the HELP command.

User response: Issue the HELP command with no operands and select from the numbered list (help index) displayed in response.

ANR2304E I/O error reading "*help file name*" the file of help text.

Explanation: An error is detected when reading help text from the named file.

System action: The server ends display of the help text.

User response: Contact the system administrator.

ANR2305E No such command/subcommand: *command subcommand*.

Explanation: The operands you entered for the HELP command do not match any named entry into the file of help text.

System action: The server does not process the HELP command.

User response: Check your input for a misspelled command or subcommand name.

ANR2306E No help text could be found for this command/subcommand: *command*.

Explanation: The operands you entered for the HELP command, although valid command/subcommand names, do not match any named entry into the file of help text.

System action: The server does not process the HELP command.

User response: Contact the system administrator.

ANR2307E No help text could be found for this message: *message ID*.

Explanation: The message ID you entered for the help command does not match any message entry in the file of help text.

System action: The help command is not processed.

User response: Contact the system administrator.

ANR2308W Audit Volume marking damaged file as damaged on volume *volume name*: Node *node name*, Type *file type*, File space *filespace name*, fsId *filespace id*, File Name *file name* is number *version of total versions* **versions**.

Explanation: As the result of an AUDIT VOLUME command that specified FIX=YES for the volume shown, the file whose information is displayed is marked as damaged in the server. The file is marked as damaged because it can be recovered from a copy known to exist in a COPY storage pool. If this file belongs to an aggregate, the entire aggregate is marked damaged, and this message will be issued for every file in the aggregate. The version numbers for the file are numbered from most recent (1) to least recent (n, where n is the total number of versions).

System action: The file is marked as damaged in the server database.

User response: To recover the damaged file use the RESTORE STGPOOL or RESTORE VOLUME command.

ANR2309E The server log mode is currently set to roll-forward. You may run out of log space when auditing the server in this mode. Specify LOGMODE=NORMAL to set the log mode to NORMAL for the audit operation, or LOGMODE=ROLLFORWARD to force the audit operation with the logmode set to roll-forward.

Explanation: An AUDITDB operation was specified and the server log mode is set to roll-forward mode. When in roll-forward mode, the server may run out of log space during the AUDITDB operation, requiring an emergency extend of the recovery log to re-start the server. The recommended log mode for executing an AUDITDB operation is NORMAL.

System action: The AUDITDB operation fails

User response: To force the server log mode to NORMAL for the AUDITDB operation, specify LOGMODE=NORMAL on the AUDITDB command. Specify LOGMODE=ROLLFORWARD on the AUDITDB command to allow the audit to run with a roll-forward log mode setting.

ANR2310W This command will compare all inventory references to volume *volume name* with the actual data stored on the volume and will report any discrepancies; the data will be inaccessible to users until the operation completes.

Explanation: During the execution of an AUDIT VOLUME command, any data the volume named would be unavailable to users.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to audit the volume or 'N' to stop the process.

ANR2311W This command will discard any inventory references to volume *volume name* associated with missing or inconsistent stored data, thereby rendering the data unrecoverable; the valid data on the volume will be inaccessible to users until the operation completes.

Explanation: During the execution of an AUDIT VOLUME command, any data the volume named would be unavailable to users. After the command has ended, any inconsistent data found will be discarded.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to audit the volume or 'N' to stop the process.

ANR2312I Audit Volume (Repair) process started for volume *volume name* (process ID *process ID*).

Explanation: As the result of an AUDIT VOLUME command that specified FIX=YES for the volume shown, the process whose ID is displayed has begun auditing the volume.

System action: The volume is audited and inconsistent data is discarded.

User response: None.

ANR2313I Audit Volume (Inspect Only) process started for volume *volume name* (process ID *process ID*).

Explanation: As the result of an AUDIT VOLUME command that specified FIX=NO for the volume shown, the process whose ID is displayed has begun auditing the volume.

System action: The volume is audited and inconsistent data is displayed.

User response: None.

ANR2314I Audit volume process ended for volume *volume name*; *file count* files inspected, *file count* damaged files deleted, *file count* damaged files marked as damaged.

Explanation: The AUDIT VOLUME command specifying FIX=YES for the volume shown has ended. The number of files audited and the number of inconsistent files deleted or marked as damaged are displayed. The number of files marked as damaged includes all files belonging to aggregates that were marked damaged during the audit. Files are marked as damaged in primary storage pools and not deleted when backup copies for the files are known to exist in COPY storage pools.

System action: None.

User response: To recover files that have been marked as damaged on the volume, use the RESTORE STGPOOL or RESTORE volume command.

ANR2315I Audit volume process ended for volume *volume name*; *file count* files inspected, *file count* damaged files found and marked as damaged.

Explanation: The AUDIT VOLUME command specifying FIX=NO for the volume shown has ended. The number of files audited and the number of inconsistent files found are displayed. The number of files marked damaged includes all files belonging to aggregates that were marked damaged during the audit. Inconsistent files are marked as damaged in the database and can be recovered by using the RESTORE STGPOOL or RESTORE VOLUME command if copies of the files reside in a COPY storage pool. Another AUDIT VOLUME command may be able to access the files and reset the damaged indicator in the database if the audit volume process cannot access the files due to hardware problems (for example, dirty tape heads).

System action: None.

User response: If you suspect that files were inaccessible because of hardware problems such as dirty tape heads, correct the hardware problem and reissue the AUDIT VOLUME FIX=NO command for this volume. To remove damaged file references, issue the AUDIT VOLUME command and specify FIX=YES.

ANR2316W Audit Volume deleting damaged file on volume *volume name*: **Node** *node name*, **Type** *file type*, **File space** *filespace name*, **fsId** *filespace id*, **File Name** *file name* is **number** *version* of total versions **versions**.

Explanation: As the result of an AUDIT VOLUME command that specified FIX=YES for the volume shown, the file whose information is displayed is deleted from the server. The version numbers for the

ANR2317W • ANR2324W

file are numbered from most recent (1) to least recent (n, where n is the total number of versions).

System action: The file is deleted.

User response: None.

ANR2317W Audit Volume found damaged file on volume *volume name*: Node *node name*, Type *file type*, File space *filespace name*, fsId *filespace id*, File name *file name* is number *version* of total versions *versions*.

Explanation: As the result of an AUDIT VOLUME command that specified FIX=NO for the volume shown, the file whose information is displayed is found to be in error and not accessible. If this file belongs to an aggregate, the entire aggregate is marked damaged, and this message will be issued for every file in the aggregate. The version numbers for the file are numbered from most recent (1) to least recent (n, where n is the total number of versions).

System action: None.

User response: None.

ANR2318W Audit volume process terminated for volume *volume name* - process canceled.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, the process performing the audit was canceled.

System action: The AUDIT VOLUME command is ended.

User response: None.

ANR2319W Audit volume process terminated for volume *volume name* - error reading device.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, an unrecoverable read error occurred on the volume.

System action: The AUDIT VOLUME command is ended.

User response: Attempt to correct the cause of the read error, and reissue the command.

ANR2320W Audit volume process terminated for volume *volume name* - data transfer interrupted.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, a data transfer operation has been interrupted and cannot be continued.

System action: The AUDIT VOLUME command is ended.

User response: If possible, determine and correct the cause of the interruption, and reissue the command.

ANR2321W Audit volume process terminated for volume *volume name* - storage media inaccessible.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, a required volume cannot be mounted.

System action: The AUDIT VOLUME command is ended.

User response: None.

ANR2322W Audit volume process terminated for volume *volume name* - sufficient recovery log space is not available.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, the server does not have sufficient recovery log space to continue.

System action: The AUDIT VOLUME command is ended.

User response: If necessary, make more recovery log space available to the server.

ANR2323W Audit volume process terminated for volume *volume name* - sufficient database space is not available.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, the server does not have sufficient database space to continue.

System action: The AUDIT VOLUME command is ended.

User response: If necessary, make more database space available to the server.

ANR2324W Audit volume process terminated for volume *volume name* - thread resource not available.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, the server cannot start a thread for the audit process.

System action: The AUDIT VOLUME command is ended.

User response: Reissue the AUDIT VOLUME command. If the error persists, it may indicate a shortage of server memory.

ANR2325W Audit volume process terminated for volume *volume name* - sufficient memory is not available.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, the server does not have enough memory available to complete the command.

System action: The AUDIT VOLUME command is ended.

User response: If necessary make more memory available to the server.

ANR2326W Audit volume process terminated for volume *volume name* - lock conflict detected.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, the server cannot obtain a required lock.

System action: The AUDIT VOLUME command is ended.

User response: Reissue the command.

ANR2327W Audit volume process terminated for volume *volume name* - internal server error detected.

Explanation: During processing of an AUDIT VOLUME command for the volume shown, an internal server error occurs.

System action: The AUDIT VOLUME command is ended.

User response: Contact your service representative.

ANR2332W Object *object.ID* deleted by another process during execution of an AUDIT VOLUME command for volume *volume name*.

Explanation: During processing of an AUDIT VOLUME command, a data storage object was deleted from the volume that was being audited. The AUDIT VOLUME process was unable to locate this object on the specified volume. Normally, this action is not considered an error condition, because the object was probably deleted by a process such as a DELETE FILESPACE command.

System action: Processing of the AUDIT VOLUME command continues.

User response: Check the activity log to verify that some process (such as a DELETE FILESPACE command) was in progress during the AUDIT VOLUME command that would account for the deleted object. If no such process can be identified, contact your service representative.

ANR2333W Missing or incorrect information detected by AUDIT VOLUME for volume *volume name*.

Explanation: An AUDIT VOLUME command detects missing or incorrect information for the specified volume.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the information can be created or corrected.

ANR2334W Missing or incorrect information detected by AUDIT VOLUME for volume *volume name* - information will be created or corrected.

Explanation: An AUDIT VOLUME process detects missing or incorrect information for the specified volume. Because FIX=YES has been specified for the audit command, the information is created or corrected.

System action: Audit processing continues.

User response: None.

ANR2335W Audit Volume has encountered an I/O error for volume *volume name* while attempting to read: Node *node name*, Type *file type*, Filespace *filespace name*, fsId *filespace id*, File Name *file name*.

Explanation: The AUDIT VOLUME process encountered an I/O error for the specified volume while attempting to read the specified file. If this file belongs to an aggregate, the entire aggregate is marked damaged, and this message will be issued for every file in the aggregate.

System action: None.

User response: Identify and resolve the I/O error for the volume if possible. Verify that the volume's device is functioning properly and that the volume is usable. For example, if the volume is a tape volume, make sure the drive is clean or that the tape volume is usable by testing it by using a different drive.

ANR2336W Audit Volume terminated for volume *volume name* - insufficient number of mount points available for removable media.

Explanation: During Audit Volume for the indicated volume, the server could not allocate sufficient mount points for the volume required.

System action: Audit Volume stops.

User response: If necessary, make more mount points available.

ANR2337W Header size is reset for object *Object.ID*, verb type (*Verb Type*), from (*Header Size*) to (*Verb Length*).

Explanation: The header size for the specified object was recalculated while auditing a volume.

System action: If FIX=YES was specified, the header size for the object will be updated. Processing continues.

User response: None.

ANR2338E *Diagnostic(ID): Invalid header received for object Object.ID, length Data Length. Size (Header Size), pushed (Pushed Length), skipped (Skipped Length), status (New Retrieve). Found length (Verb Length), type (Verb Type), size (Verb Size).*

Explanation: An invalid header was detected for the specified object while auditing a volume. Diagnostic information is included in the message.

System action: If FIX=YES was specified, this object will be marked damaged. Processing continues.

User response: Restore the volume or storage pool that includes this object.

ANR2339E *Command: Object sets still exist for node node name.*

Explanation: A REMOVE NODE command has been entered for a node for which the server is still storing backup sets. To remove a node, the node must not have any files or backup sets stored on the server.

System action: The server does not process the command.

User response: To remove the node, delete all backup sets from the server and reissue the command.

ANR2340E *Command: Invalid storage pool name - storage pool name.*

Explanation: The command indicated contains an invalid storage pool name.

System action: The server does not process the command.

User response: Reissue the command with a valid storage pool name.

ANR2341E *Command: Missing next storage pool name.*

Explanation: The command indicated requires a storage pool name, but none has been entered.

System action: The server does not process the command.

User response: Reissue the command with a storage pool name.

ANR2342E *Command: Storage pool description exceeds maximum characters characters.*

Explanation: The command indicated contains a storage pool description that exceeds the maximum length allowed.

System action: The server does not process the command.

User response: Reissue the command with a valid storage pool description.

ANR2343E *Command: Invalid device class name - device class name.*

Explanation: The command indicated contains an invalid device class name.

System action: The server does not process the command.

User response: Reissue the command with a valid device class name.

ANR2344E *Command: The "option" option is not valid for device class device class name.*

Explanation: The command indicated specifies an option shown that is not valid for a storage pool that belongs to the device class shown.

System action: The server does not process the command.

User response: Reissue the command with options appropriate to the device class.

ANR2345E *Command: Invalid volume name - volume name.*

Explanation: The command indicated contains an invalid volume name.

System action: The server does not process the command.

User response: Reissue the command with a valid volume name.

ANR2346E *Command: Volume name "volume name" is not valid for device class device class name.*

Explanation: The command indicated specifies the name of a volume that cannot be used with the device class shown.

System action: The server does not process the command.

User response: Reissue the command with a valid volume name.

ANR2347E *Command: Volume name "volume name" is ambiguous; resolves to multiple defined volume names.*

Explanation: The command shown was entered with a volume name pattern that matches more than one volume. The command can only process a single volume.

System action: The command is not executed.

User response: Reissue the command with a more specific volume name.

ANR2348E *Command: The "option" option is not valid for a volume assigned to a primary storage pool.*

Explanation: The command indicated specifies an option that is not valid for a volume in a primary storage pool.

System action: The server does not process the command.

User response: Reissue the command with valid options for a volume in a primary storage pool.

ANR2349E *Command: The "option" option is not valid for a volume assigned to a copy storage pool.*

Explanation: The command indicated specifies an option that is not valid for a volume in a copy storage pool.

System action: The server does not process the command.

User response: Reissue the command with valid options for a volume in a copy storage pool.

ANR2350E *Command: Device class device class name is already defined.*

Explanation: The command indicated has attempted to define a device class that already exists.

System action: The server does not process the command.

User response: None.

ANR2351E *Command: Device class device class name is not defined.*

Explanation: The command indicated references a device class that does not exist.

System action: The server does not process the command.

User response: None.

ANR2352E *Command: Device class device class name may not be deleted.*

Explanation: A DELETE DEVCLASS command specifies the class name DISK, which is a system-defined device class and may not be deleted.

System action: The server does not process the command.

User response: None.

ANR2353E *Command: Device class device class name may not be updated.*

Explanation: An UPDATE DEVCLASS command specifies the class name DISK, which is a system-defined device class and may not be changed.

System action: The server does not process the command.

User response: None.

ANR2354E *Command: Device class device class name is still referenced by one or more storage pools, or database backup, or export volumes or backupset volumes.*

Explanation: The DELETE DEVCLASS command has attempted to delete a device class that has storage pools assigned to it, or is referenced by database backup, export volumes or backupset volumes.

System action: The server does not process the command.

User response: Issue Q DEVCLASS to view the storage pool reference count, Q STGPOOL to determine which pool references the device class, and Q VOLHIST to locate database backup or export volume or backupset volume references.

ANR2355E *Command: Required parameter is missing - missing parameter.*

Explanation: The specified server command has been entered without the required parameter. The required parameter is shown.

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR2356E *Command: Incompatible parameters specified - first parameter, second parameter.*

Explanation: The specified server command has been entered with mutually exclusive parameters. The two parameters are listed.

ANR2357E • ANR2365I

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR2357E *Command: The DISK device class is not supported for copy storage pools.*

Explanation: An attempt is made to define a copy storage pool using a device of DISK. Copy storage pools can only be assigned to a sequential device class.

System action: The server does not process the command.

User response: Reissue the command specifying a sequential device class.

ANR2358E *Command: Device class `device class name` is still referenced in the volume history file.*

Explanation: The DELETE DEVCLASS command has attempted to delete a device class that is associate with entries in the volume history file. These entries are for volumes that contain database backup or export data.

System action: The server does not process the command.

User response: Use the DELETE VOLHIST command to remove that entries before deleting the device class.

ANR2359E *Command: Volume name "`volume name`" must be specified with a DISK or FILE STGPOOL.*

Explanation: The command indicated specifies the name of a volume that must be specified with a storage pool associated with a device class of type DISK or FILE.

System action: The server does not process the command.

User response: Reissue the command with a valid volume name and storage pool.

ANR2360E *Command: Device class `device class name` may not be used for database backup.*

Explanation: The command specifies the DISK device class, which cannot be used for database backup, backup trigger, or restore operations.

System action: The server does not process the command.

User response: Reissue the command with a valid device class.

ANR2361E *Command: A full database backup is required.*

Explanation: A BACKUP DB command specified an incremental backup, but a full backup is required.

System action: The server does not process the command.

User response: Reissue the command specifying a full backup.

ANR2362E *Command: Database backup is not currently possible - compressed log records exist in the current transaction checkpoint.*

Explanation: A BACKUP DB command was issued but a database backup cannot be started. Log compression has recently taken place, and the compressed log records are still part of the current transaction checkpoint. After these log records are no longer part of the current checkpoint a backup can take place.

System action: The server does not process the command.

User response: Reissue the command at a later time.

ANR2363E *Command: One of the following parameter must be supplied but is missing - `missing parameter`, `missing parameter`, `missing parameter`, `missing parameter`.*

Explanation: The specified server command has been entered without one of the mutually exclusive required parameters. One of the parameters from the list must be specified.

System action: The server ignores the command.

User response: Reissue the command and enter the proper syntax.

ANR2364E *Command: Missing reclaim-storage pool name.*

Explanation: The command indicated requires a storage pool name, but none has been entered.

System action: The server does not process the command.

User response: Reissue the command with a storage pool name.

ANR2365I *Backupset `backup set name` for node `node name` (data type `data type`) has been deleted.*

Explanation: The backup set has been deleted.

System action: The server has deleted the backupset.

User response: None.

ANR2366I Backupset *backup set name* for node *node name* (data type *data type*) would have been deleted.

Explanation: The backup set would have been deleted as the result of a DELETE BACKUPSET command, but the PREVIEW=YES parameter was specified.

System action: None.

User response: If the backup set is to be deleted, reissue the command without specifying PREVIEW=YES.

ANR2367I Retention period for backupset *backup set name* for node *node name* (data type *data type*) has been updated.

Explanation: The backup set's retention period has been updated.

System action: The server has updated the backupset's retention period.

User response: None.

ANR2368I Retention period for backupset *backup set name* for node *node name* (data type *data type*) would have been updated.

Explanation: The backup set's retention period would have been updated as the result of an UPDATE BACKUPSET command, but the PREVIEW=YES parameter was specified.

System action: None.

User response: If the backup set is to be updated, reissue the command without specifying PREVIEW=YES.

ANR2369I Database backup volume and recovery plan file expiration starting under process *process ID*.

Explanation: The server has started expiration processing to remove expired database backup volumes and recovery plan files created on a remote server. This message is issued only if DRM is licensed on the server. The DB backup volumes expired is based on the value specified on the SET DRMDBBACKUPEXPIREDAYS. The recovery plan files expired is based on the value specified on the SET DRMRPFEXPIREDAYS. Server inventory expiration processing deletes the DB backup volumes and recovery plan files only if the volumes or plan files are created on the server to server virtual volumes.

System action: Server operation continues. The expiration process is cancellable.

User response: None.

ANR2370E Command: Database backup trigger is already defined.

Explanation: The database backup trigger cannot be defined because it is already defined.

System action: The server does not process the command.

User response: Use the UPDATE DBBACKUPTRIGGER command to modify the database backup trigger parameters.

ANR2371E Command: Database backup trigger is not defined.

Explanation: The database backup trigger cannot be updated or deleted because it is not currently defined.

System action: The server does not process the command.

User response: None.

ANR2372E Command: Database Space trigger is already defined.

Explanation: The database space trigger cannot be defined because it is already defined.

System action: The server does not process the command.

User response: Use the UPDATE SPACETRIGGER command to modify the indicated space trigger parameters.

ANR2373E Command: Database backup trigger is not defined.

Explanation: The database space trigger cannot be updated or deleted because it is not currently defined.

System action: The server does not process the command.

User response: None.

ANR2374E Command: Recovery Log Space trigger is already defined.

Explanation: The recovery log space trigger cannot be defined because it is already defined.

System action: The server does not process the command.

User response: Use the UPDATE SPACETRIGGER command to modify the indicated space trigger parameters.

ANR2375E *Command: Recovery Log trigger is not defined.*

Explanation: The recovery log space trigger cannot be updated or deleted because it is not currently defined.

System action: The server does not process the command.

User response: None.

ANR2376I **Recovery Log Space trigger defined, but is disabled.**

Explanation: A recovery log space trigger has been defined, but because the space expansion percentage is currently set to 0, the space trigger is disabled.

System action: None.

User response: To activate the space trigger, use the UPDATE SPACETRIGGER command to set the space expansion percentage to a value greater than 0.

ANR2377I **Recovery Log Space trigger updated and enabled.**

Explanation: An UPDATE SPACETRIGGER command has successfully completed for the recovery log space trigger. The updated parameters specified on the command are used to automatically trigger space expansion for the database.

System action: None.

User response: None.

ANR2378I **Recovery Log Space trigger updated, but disabled.**

Explanation: An UPDATE SPACETRIGGER command has successfully completed for the recovery log space trigger. However, the space expansion percentage is currently set to 0, which disables the space trigger.

System action: None.

User response: To activate the space trigger, use the UPDATE SPACETRIGGER command with the SPACEexpansion parameter to set a value greater than zero.

ANR2379I **Recovery Log Space trigger deleted.**

Explanation: A DELETE SPACETRIGGER command has successfully completed for the recovery log space trigger. Space expansions are no longer triggered automatically for the recovery log.

System action: None.

User response: None.

ANR2380E *Command: Storage pool storage pool name is not defined.*

Explanation: The command indicated specifies the name of a nonexistent storage pool.

System action: The server does not process the command.

User response: Reissue the command with a valid storage pool name.

ANR2381E *Command: Storage pool storage pool name is already defined.*

Explanation: A DEFINE STGPOOL command specifies the name of a storage pool that already exists.

System action: The server does not process the command.

User response: None.

ANR2382E *Command: Storage pool storage pool name still contains at least one volume.*

Explanation: A DELETE STGPOOL command specifies a storage pool that has volumes assigned to it.

System action: The server does not process the command.

User response: Delete the volume belonging to the storage pool and reissue the command.

ANR2383E *Command: Storage pool storage pool name is currently in use by clients and/or data management operations.*

Explanation: The command indicated references a storage pool that is in use.

System action: The server does not process the command.

User response: Reissue the command at a later time.

ANR2384E *Command: Next or Reclaim storage pool storage pool name introduces a cycle into the storage pool chain.*

Explanation: A DEFINE STGPOOL or UPDATE STGPOOL command specifies a next storage pool that eventually points to the pool being processed.

System action: The server does not process the command.

User response: Reissue the command with a different next pool value.

ANR2385E *Command: Storage pool storage pool name is in use as the next or reclaim pool for one or more other storage pools.*

Explanation: A DELETE STGPOOL command specifies a pool that is the next pool or the reclaim pool for other storage pools.

System action: The server does not process the command.

User response: If necessary, update other storage pools so that they do not reference the pool to be deleted, and reissue the command.

ANR2386E *Command: High migration threshold must be set greater than or equal to the low migration threshold.*

Explanation: A DEFINE or UPDATE STGPOOL command has attempted to set the storage pool low migration threshold (LOWMIG) parameter greater than the high migration threshold (HIGHMIG).

System action: The server does not process the command.

User response: Reissue the command with a low migration threshold less than or equal to the high migration threshold.

ANR2387E *Command: Storage pool storage pool name is not a primary pool.*

Explanation: The command indicated specifies the name of a storage pool which is not a primary pool. The command syntax requires that a primary storage pool name be specified.

System action: The server does not process the command.

User response: Reissue the command with a valid primary storage pool name.

ANR2388E *Command: Storage pool storage pool name is not a copy or an active-data pool type pool.*

Explanation: The command indicated specifies the name of a storage pool which is not a copy pool or an active-data pool. The command syntax requires that a copy storage pool name or an active-data pool name be specified.

System action: The server does not process the command.

User response: Reissue the command with a valid copy storage pool name or active-data pool name.

ANR2389E *Command: The "option" option is not valid for a primary storage pool.*

Explanation: The command indicated specifies an option that is not valid for a primary storage pool.

System action: The server does not process the command.

User response: Reissue the command with options appropriate for a primary storage pool.

ANR2390E *Command: The "option" option is not valid for a pool type storage pool.*

Explanation: The command indicated specifies an option that is not valid for either a copy or active-data type storage pool.

System action: The server does not process the command.

User response: Reissue the command with options appropriate for the specified storage pool type.

ANR2391E *Command: Server could not write device configuration information to file name.*

Explanation: The BACKUP DEVCONFIG command does not successfully complete because the server cannot write to the file name specified.

System action: The server does not process the command.

User response: Make sure that the server has proper authority to write to the file indicated and that sufficient space is available in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set.

ANR2392E *Command: An internal error was encountered in writing device configuration information to file name.*

Explanation: The BACKUP DEVCONFIG command does not successfully complete because the server cannot write to the file name specified.

System action: The server does not process the command.

User response: Examine error messages on the server console that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that sufficient space is available in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set.

ANR2393I *Command: Server device configuration information was written to file name.*

Explanation: This message is displayed in response to the BACKUP DEVCONFIG command and indicates that device configuration information was successfully written to the file name indicated.

System action: The server records device configuration information to the file name specified

User response: None.

ANR2394I *Command: Server device configuration information was written to all device configuration files.*

Explanation: This message is displayed in response to the BACKUP DEVCONFIG command and indicates that device configuration information was successfully written to all files that were specified in the server options file.

System action: The server records device configuration information to the device configuration files.

User response: None.

ANR2395I *Command: Device configuration files have NOT been defined for automatic recording - specify a file name for device configuration information.*

Explanation: This message is displayed in response to the BACKUP DEVCONFIG command and indicates that device configuration information cannot be written because no files were specified in the options file.

System action: The device configuration information is not written. Server operation continues.

User response: Reissue the BACKUP DEVCONFIG command and specify the name of a file to which you would like to have device configuration information recorded. If desired, you may configure files that should be automatically updated with the DEVCONFIG option and restart the server.

ANR2396E *Command: An I/O error was encountered in writing device configuration information to one or more of the defined device configuration files.*

Explanation: The BACKUP DEVCONFIG command does not complete successfully because the server cannot write to one or more of the defined device configuration files.

System action: The server does not process the command.

User response: Examine error messages on the server console that may have been displayed prior to this

message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that sufficient space is available in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set.

ANR2397E *Command: An internal server error was encountered in writing device configuration information to one or more of the defined device configuration files.*

Explanation: The BACKUP DEVCONFIG command does not complete successfully because the server cannot write to one or more of the defined device configuration files.

System action: The server does not process the command.

User response: Examine error messages on the server console that may have been displayed prior to this message and correct any problems, if possible. Contact your service representative if you are unable to resolve the problem.

ANR2398E *Command: The device configuration file contains a statement with invalid syntax.*

Explanation: While processing the device configuration information, an invalid statement has been encountered.

System action: The server ends the operation being performed.

User response: Examine error messages on the server console that may have been displayed prior to this message and correct any problems if you have constructed the device configuration file manually. Make sure the statements are in the proper order. If you let the server construct the device configuration file automatically, restart the server, refresh the device configuration file by issuing the BACKUP DEVCONFIG command, and reissue the operation. If the problem persists, contact your service representative.

ANR2399E *Command: Storage pool storage pool name is not a sequential pool.*

Explanation: The command indicated specifies the name of a storage pool which is not a sequential pool. All storage pools are either fixed disk or sequential archival. All tape devices, as well as optical and file device classes, are sequential.

System action: The server does not process the command.

User response: Reissue the command with a valid sequential storage pool name.

ANR2400E *Command:* **Volume *volume name* is already defined in a storage pool or has been used previously to store export, database dump, or database backup information.**

Explanation: The command indicated specifies the name of a storage pool volume that already exists or has been used to store server export, database dump, or database backup information as recorded in the server volume history file.

System action: The server does not process the command.

User response: Specify a volume that is not in use, is not defined in a storage pool, and which has not been previously used for an export, a database dump, or database backup operation as recorded in the server volume history information. Use the QUERY VOLUME command to display the names of volumes that are defined to server storage pools. Use the QUERY VOLHISTORY command to display the names of volumes that have been used for export, a database dump, or database backup operations.

ANR2401E *Command:* **Volume *volume name* is not defined in a storage pool.**

Explanation: The command indicated specifies the name of a storage pool volume that does not exist.

System action: The server does not process the command.

User response: None.

ANR2402E *Command:* **Volume *volume name* is already online.**

Explanation: A VARY ONLINE command specifies the name of a volume that is already online.

System action: The server does not process the command.

User response: None.

ANR2403E *Command:* **Volume *volume name* is not online.**

Explanation: The command indicated specifies the name of a volume that is not online.

System action: The server does not process the command.

User response: None.

ANR2404E *Command:* **Volume *volume name* is not available.**

Explanation: The command indicated has attempted to access a volume that cannot be found.

System action: The server does not process the command.

User response: Check the spelling of the volume name to ensure it is correct. If the volume does not exist, preallocate it with the appropriate mechanism for the operating system on which the server is running.

ANR2405E *Command:* **Volume *volume name* is currently in use by clients and/or data management operations.**

Explanation: The command indicated specifies the name of a data storage volume that is currently in use.

System action: The server does not process the command.

User response: Verify that the volume is unavailable by issuing the QUERY VOLHISTORY command. If the volume is listed in the command output, then it is being used and unavailable. Wait until the conflicting volume activity has completed, and then retry this operation. If the volume is currently mounted, but idle, dismount it using the DISMOUNT VOLUME command, and then retry the operation.

ANR2406E *Command:* **Volume *volume name* still contains data.**

Explanation: The indicated command tries to delete a data storage volume that contains data.

System action: The server does not process the command.

User response: None.

ANR2407E *Command:* **Maximum number of mirrored copies exceeded.**

Explanation: A DEFINE LOGCOPY or DEFINE DBCOPY command has attempted to add a mirror volume, but the maximum number of mirrors for the target volume already exists.

System action: The server does not process the command.

User response: None.

ANR2408E *Command:* **Capacity of volume *volume name* must be at least as large as capacity of volume *volume name*.**

Explanation: A DEFINE LOGCOPY or DEFINE DBCOPY command has attempted to add a mirror volume, but the size of the volume to be added is less than the size of the target volume.

System action: The server does not process the command.

User response: Use a larger mirror volume.

ANR2409E *Command: Capacity of volume *volume name* must be at least 5 megabytes.*

Explanation: A define command for a database or log volume or copy has specified a volume that is too small to be used by the server for a database or log volume. The minimum size for one of these volumes is 5 megabytes.

System action: The server does not process the command.

User response: Reissue the command and specify a volume that is at least 5 megabytes in size.

ANR2410E *Command: Unable to access volume *volume name* - access mode is set to "unavailable".*

Explanation: The command shown specifies the volume whose name is displayed, but the volume cannot be accessed because its status is unavailable.

System action: The server does not process the command.

User response: If necessary, reset the status of the volume and reissue the command.

ANR2411E *Command: Unable to access associated volume *volume name* - access mode is set to "unavailable".*

Explanation: The command shown would require access to the volume whose name is displayed (because data from the volume specified in the command spans into this volume); the volume shown cannot be accessed because its status is unavailable.

System action: The server does not process the command.

User response: If necessary, reset the status of the volume and reissue the command.

ANR2412E *Command: Audit operation already in progress for volume *volume name*.*

Explanation: The command specified a volume that is currently in use by an audit volume operation.

System action: If the command is a MOVE NODEDATA command the server will skip the volume and continues moving node data on other volumes. Other commands are not processed.

User response: Reissue the command after the audit volume operation ends.

ANR2413E *Command: Audit operation already in progress for associated volume *volume name*.*

Explanation: The command shown would require access to the volume whose name is displayed (because data from the volume specified in the command spans into this volume); the volume shown cannot be accessed because it is in use by an audit volume operation.

System action: The server does not process the command.

User response: Reissue the command after the audit volume operation ends.

ANR2414E *Command: Deletion operation already in progress for volume *volume name*.*

Explanation: The command specified a volume that is currently in use by a delete volume operation.

System action: If the command is a MOVE NODEDATA command the server will skip the volume and continues moving node data on other volumes. Other commands are not processed.

User response: Reissue the command after the delete volume operation ends.

ANR2415E *Command: Deletion operation already in progress for associated volume *volume name*.*

Explanation: The command shown would require access to the volume whose name is displayed (because data from the volume specified in the command spans into this volume); the volume shown cannot be accessed because it is in use by a delete volume operation.

System action: The server does not process the command.

User response: Reissue the command after the delete volume operation ends.

ANR2416E *Command: Move Data operation already in progress for volume *volume name*.*

Explanation: The command specified a volume that is currently in use by a move data operation.

System action: If the command is a MOVE NODEDATA command the server will skip the volume and continues moving node data on other volumes. Other commands are not processed.

User response: Reissue the command after the move data process ends.

ANR2417E *Command: Move Data operation already in progress for associated volume *volume name*.*

Explanation: The command shown would require access to the volume whose name is displayed (because data from the volume specified in the command spans into this volume); the volume shown cannot be accessed because it is in use by a move data operation.

System action: The server does not process the command.

User response: Reissue the command after the move data operation ends.

ANR2418E *Command: Migration operation already in progress for volume *volume name*.*

Explanation: The command specified a volume that is currently in use by a migration operation.

System action: If the command is a MOVE NODEDATA command the server will skip the volume and continues moving node data on other volumes. Other commands are not processed.

User response: Reissue the command after the migration ends.

ANR2419E *Command: Migration operation already in progress for associated volume *volume name*.*

Explanation: The command shown would require access to the volume whose name is displayed (because data from the volume specified in the command spans into this volume); the volume shown cannot be accessed because it is in use by a migration operation.

System action: The server does not process the command.

User response: Reissue the command after the migration ends.

ANR2420E *Command: Space reclamation operation already in progress for volume *volume name*.*

Explanation: The command specified a volume is currently in use by a reclamation operation.

System action: If the command is a MOVE NODEDATA command the server will skip the volume and continues moving node data on other volumes. Other commands are not processed.

User response: Reissue the command after the reclamation ends.

ANR2421E *Command: Space reclamation operation already in progress for associated volume *volume name*.*

Explanation: The command shown would require access to the volume whose name is displayed (because data from the volume specified in the command spans into this volume); the volume shown cannot be accessed because it is in use by a reclamation operation.

System action: The server does not process the command.

User response: Reissue the command after the reclamation ends.

ANR2422E *Command: Volume *volume name* is not a defined disk volume.*

Explanation: The command shown specifies a volume name that does not match any known disk volume.

System action: The server does not process the command.

User response: Reissue the command with the correct volume name.

ANR2423E *Command: Volume *volume name* is still online.*

Explanation: An UPDATE VOLUME command specifies access=unavailable for a disk volume that is still online.

System action: The server does not process the command.

User response: Issue the VARY OFFLINE command, and reissue the UPDATE VOLUME command.

ANR2424E *Command: Unable to access volume *volume name* - access mode is set to "destroyed".*

Explanation: The command shown specifies the volume whose name is displayed, but the volume cannot be accessed because its status is destroyed.

System action: The server does not process the command.

User response: If necessary, reset the status of the volume and reissue the command.

ANR2425E *Command: Unable to access volume *volume name* - access mode is set to "offsite".*

Explanation: The command shown specifies the volume whose name is displayed, but the volume cannot be accessed because its status is offsite.

System action: The server does not process the command.

ANR2426I • ANR2435E

User response: If necessary, reset the status of the volume and reissue the command.

ANR2426I Backupset *backup set name* defined for node *node name* (data type *data type*).

Explanation: The backup set has been defined for the indicated node.

System action: The server has defined the backupset.

User response: None.

ANR2427E Backupset *backup set name* for node *node name* (data type *data type*) was not deleted. Device class *device class name* was not found.

Explanation: The specified backup set was not deleted because the device class used to generate it was not found.

System action: The backup set is not deleted.

User response: If the device class was inadvertently deleted, redefine it, then delete the backup set again.

ANR2428E Backupset *backup set name* for node *node name* (data type *data type*) has not been deleted due to error *error code*.

Explanation: The backup set has not been deleted.

System action: The server has not deleted the backupset.

User response: Check related error messages.

ANR2429E Command: Maximum database capacity exceeded.

Explanation: Do not allocate any volume that would cause the database to exceed 500GB. A subsequent DEFINE DBVOLUME command for that volume would fail.

System action: The server does not process the command.

User response: None.

ANR2430E Command: Volume *volume name* is already defined as a database volume.

Explanation: A DEFINE DBVOLUME command specifies the name of a database volume that already exists.

System action: The server does not process the command.

User response: None.

ANR2431E Command: Volume *volume name* is not a defined database volume.

Explanation: A DELETE DBVOLUME command specifies the name of a database volume that does not exist.

System action: The server does not process the command.

User response: None.

ANR2432E Command: Maximum number of database volumes exceeded.

Explanation: A DEFINE DBVOLUME command has attempted to add more database volumes than the server can manage.

System action: The server does not process the command.

User response: None.

ANR2433E Command: A database define, delete, extend, reduce, or backup operation is already in progress.

Explanation: The specified command has been entered while a command that is modifying or backing up the database is already active.

System action: The server does not process the command.

User response: Wait for other activity to end, and reissue the command.

ANR2434E Command: Insufficient space on other database volumes to delete volume *volume name*.

Explanation: A DELETE DBVOLUME command has been entered, but the data on the volume to be deleted cannot be copied to other volumes due to insufficient free space.

System action: The server does not process the command.

User response: Make more database space available, and reissue the command.

ANR2435E Command: Unable to delete database volume *volume name* - mirrored copies not synchronized.

Explanation: A DELETE DBVOLUME command has been entered, but mirrors of the volume to be deleted are not up to date.

System action: The server does not process the command.

User response: Try the command at a later time (after

database volumes have been synchronized).

ANR2436E *Command: Insufficient space to extend database by requested amount.*

Explanation: An EXTEND DB command has been entered, but not enough allocated, unused space is available to the database to add the amount of space requested.

System action: The server does not process the command.

User response: Make more database space available, and reissue the command.

ANR2437E *Command: Output error encountered while attempting to extend database.*

Explanation: An EXTEND DB command has been entered, but an I/O error occurs during the command.

System action: The server does not process the command.

User response: Reissue the command. If the problem persists, identify and remove or repair the volume that caused the error.

ANR2438E *Command: Insufficient database space would be available following a reduction by the requested amount.*

Explanation: A REDUCE DB command has been entered, but the database does not have enough free space to reduce by the amount specified.

System action: The server does not process the command.

User response: None.

ANR2439E *Command: Unable to vary database volume *volume name* offline - mirrored copies not synchronized.*

Explanation: A VARY OFFLINE command has been entered, but mirrors of the volume to be varied are not up to date.

System action: The server does not process the command.

User response: Try the command at a later time (after database volumes have been synchronized).

ANR2440E *Command: Unable to vary database volume *volume name* offline - only copy.*

Explanation: A VARY OFFLINE command has been entered, but the database volume has no mirrors and therefore contains the only copy of the data on that volume.

System action: The server does not process the command.

User response: None.

ANR2441E *Command: Volume *volume name* is already defined as a recovery log volume.*

Explanation: A DEFINE LOGVOLUME command specifies the name of a recovery log volume that already exists.

System action: The server does not process the command.

User response: None.

ANR2442E *Command: Volume *volume name* is not a defined recovery log volume.*

Explanation: A DELETE LOGVOLUME command specifies the name of a recovery log volume that does not exist.

System action: The server does not process the command.

User response: None.

ANR2443E *Command: Maximum number of recovery log volumes exceeded.*

Explanation: A DEFINE LOGVOLUME command attempts to add more recovery log volumes than the server can manage.

System action: The server does not process the command.

User response: None.

ANR2444E *Command: A recovery log define, delete, extend, or reduce operation is already in progress.*

Explanation: The specified command has been entered while a command that is modifying the recovery log is already active.

System action: The server does not process the command.

User response: Wait for other activity to end, and reissue the command.

ANR2445E *Command: Insufficient space on other recovery log volumes to delete volume *volume name*.*

Explanation: A DELETE LOGVOLUME command has been entered, but the data on the volume to be deleted cannot be copied to other volumes due to insufficient free space.

ANR2446E • ANR2453E

System action: The server does not process the command.

User response: Make more recovery log space available, and reissue the command.

ANR2446E *Command: Unable to delete recovery log volume `volume name` - mirrored copies not synchronized.*

Explanation: A DELETE LOGVOLUME command has been entered, but mirrors of the volume to be deleted are not up to date.

System action: The server does not process the command.

User response: Try the command at a later time (after recovery log volumes have been synchronized).

ANR2447E *Command: Insufficient space to extend recovery log by requested amount.*

Explanation: An EXTEND LOG command has been entered, but there is not enough allocated, unused space available to the recovery log to add the amount of space requested.

System action: The server does not process the command.

User response: Make more recovery log space available, and reissue the command.

ANR2448E *Command: Output error encountered while attempting to extend recovery log.*

Explanation: An EXTEND LOG command has been entered, but an I/O error occurs during the command.

System action: The server does not process the command.

User response: Reissue the command. If the problem persists, identify and remove or repair the volume that caused the error.

ANR2449E *Command: Insufficient recovery log space would be available following a reduction by the requested amount.*

Explanation: A REDUCE LOG command has been entered, but the recovery log does not have enough free space to reduce by the amount specified.

System action: The server does not process the command.

User response: None.

ANR2450E *Command: Unable to vary recovery log volume `volume name` offline - mirrored copies not synchronized.*

Explanation: A DELETE LOGVOLUME command has been entered, but mirrors of the volume to be deleted are not up to date.

System action: The server does not process the command.

User response: Try the command at a later time (after recovery log volumes have been synchronized).

ANR2451E *Command: Unable to vary recovery log volume `volume name` offline - only copy.*

Explanation: A VARY OFFLINE command has been entered, but the recovery log volume has no mirrors and contains the only copy of the data on that volume.

System action: The server does not process the command.

User response: None.

ANR2452E *Command: Maximum recovery log capacity exceeded.*

Explanation: Do not allocate any volume that would cause the recovery log to exceed 13GB. A subsequent DEFINE LOGVOLUME command for that volume would fail.

System action: The server does not process the command.

User response: None.

ANR2453E *Command: Unable to reduce recovery log - log mode must be set to NORMAL.*

Explanation: A REDUCE LOG command has been entered, but the recovery log mode of the server is currently set to ROLLFORWARD. The recovery log can only be reduced when the log mode is set to NORMAL with a SET LOGMODE command.

System action: The server does not process the command.

User response: Set the log mode to NORMAL with the SET LOGMODE command, reissue the REDUCE LOG command, and set the log mode back to ROLLFORWARD with the SET LOGMODE command. If you change the log mode to NORMAL, you can only recover your database to the time of the last complete database backup.

ANR2454E *Command: Unable to reduce database - LOGMODE must be set to NORMAL.*

Explanation: A REDUCE DB command has been entered, but the recovery log mode of the server is currently set to ROLLFORWARD. The database can only be reduced when log mode is set to NORMAL with the SET LOGMODE command.

System action: The server does not process the command.

User response: Set the log mode to NORMAL with the SET LOGMODE command, reissue the REDUCE DB command, and reset the log mode to ROLLFORWARD with the SET LOGMODE command. If you change the log mode to NORMAL, you can only recover your database to the time of the last complete database backup.

ANR2455E *Command: Unable to access associated volume volume name - access mode is set to "destroyed".*

Explanation: The specified command would require access to the volume whose name is displayed (because data from the volume specified in the command spans into this volume); the volume shown cannot be accessed because its status is destroyed.

System action: The server does not process the command.

User response: If necessary, reset the status of the volume and reissue the command.

ANR2456E *Command: Unable to access associated volume volume name - access mode is set to "offsite".*

Explanation: The command shown would require access to the volume whose name is displayed (because data from the volume specified in the command spans into this volume); the volume shown cannot be accessed because its status is offsite.

System action: The server does not process the command.

User response: If necessary, reset the status of the volume and reissue the command.

ANR2457E *Command: Backup of primary storage pool primary pool name to copy storage pool copy pool name already in progress.*

Explanation: The command shown specifies a backup operation that is already in progress.

System action: The server does not process the command.

User response: Reissue the command after the current backup operation ends.

ANR2458E *Command: Restore of primary storage pool primary pool name (or volumes in that storage pool) already in progress.*

Explanation: The command shown cannot be processed because a restore operation involving the indicated storage pool is already in progress. Either a RESTORE STGPOOL command is in progress for the indicated storage pool or a RESTORE VOLUME command is in progress for volumes that belong to the indicated storage pool.

System action: The server does not process the command.

User response: Reissue the command after the current restore operation ends.

ANR2459E *Command: Volume volume name cannot be updated - a restore operation involving that volume is in progress.*

Explanation: The indicated volume has an access mode of destroyed. Either a RESTORE STGPOOL command or a RESTORE VOLUME command is in progress to restore the contents of the indicated volume.

System action: The server does not process the command.

User response: If necessary, cancel the restore processing and update the volume.

ANR2460E *Command: Server could not write sequential volume history information to File name.*

Explanation: The BACKUP VOLHISTORY command does not complete successfully because the server cannot write to the file name specified.

System action: The server does not process the command.

User response: Make sure that the server has proper authority to write to the file indicated and that sufficient space is available in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set.

ANR2461E *Command: An internal error was encountered in writing sequential volume history information to file name.*

Explanation: The BACKUP VOLHISTORY command does not complete successfully because the server cannot write to the file name specified.

System action: The server does not process the command.

User response: Examine error messages on the server

ANR2462I • ANR2468E

console that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that sufficient space is available in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set.

ANR2462I *Command: Server sequential volume history information was written to file name.*

Explanation: This message is displayed in response to the BACKUP VOLHISTORY command and indicates that sequential volume history information was successfully written to the file name indicated.

System action: The server records sequential volume history information to the file name specified.

User response: None.

ANR2463I *Command: Server sequential volume history information was written to all configured history files.*

Explanation: This message is displayed in response to the BACKUP VOLHISTORY command and indicates that sequential volume history information was successfully written to all files that were specified in the server options file.

System action: The server records sequential volume history information to the configured files.

User response: None.

ANR2464I *Command: Volume history files have NOT been defined for automatic history recording - specify a file name for recording history information.*

Explanation: This message is displayed in response to the BACKUP VOLHISTORY. It indicates that sequential volume history information cannot automatically be written because no files were defined in the server options file for recording this information.

System action: The sequential volume history information is not written. Server operation continues.

User response: Reissue the BACKUP VOLHISTORY command and specify the name of a file for recording sequential volume history information. If desired, you may configure files that should be automatically updated with the VOLUMEHISTORY parameter and restart the server.

ANR2465E *Command: An I/O error was encountered in writing sequential volume history information to one or more of the defined volume history files.*

Explanation: The BACKUP VOLHISTORY command does not complete successfully because the server cannot write to one or more of the defined volume history files.

System action: The server does not process the command.

User response: Examine error messages on the server console that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that sufficient space is available in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set.

ANR2466E *Command: An internal server error was encountered in writing sequential volume history information to one or more of the defined volume history files.*

Explanation: The BACKUP VOLHISTORY command does not complete successfully because the server cannot write to one or more of the defined volume history files.

System action: The server does not process the command.

User response: Examine error messages on the server console that may have been displayed prior to this message and correct any problems, if possible. Contact your service representative if you are unable to resolve the problem.

ANR2467I *Command: number of entries deleted sequential volume history entries were successfully deleted.*

Explanation: The DELETE VOLHISTORY command successfully deleted the number of entries specified.

System action: Server operation continues.

User response: None.

ANR2468E *Command: An internal server error was encountered while deleting server sequential volume history information.*

Explanation: The DELETE VOLHISTORY command fails because an internal server error has been encountered.

System action: The DELETE VOLHISTORY command fails, and server operation continues.

User response: Examine the messages in the activity log or server console that were displayed prior to the error to see if the error can be resolved. Contact your service representative if this error cannot be resolved.

ANR2469E *Command: Invalid volume history type: history type.*

Explanation: The command failed because an invalid sequential volume history type was specified for the TYPE= parameter.

System action: The command fails, and server operation continues.

User response: Refer to the *Administrator's Reference* for an explanation of the valid types for this command. Reissue the command and specify a valid type value.

ANR2470I *Message output being re-directed to file file name.*

Explanation: The message output is being redirected to the specified file instead of being displayed at the console.

System action: None.

User response: None.

ANR2471E *Message output re-direction to file file name failed - unable to open file.*

Explanation: An error occurs while trying to open the file. The message output will not be redirected to the specified file.

System action: None.

User response: Determine the cause of the file open failure and take corrective action.

ANR2472E *Command: Invalid volume specified: volume name.*

Explanation: The command failed because the sequential history volume specified is not a DB DUMP, DB BACKUP, or EXPORT volume.

System action: The command fails, and server operation continues.

User response: Reissue the command and specify a valid volume name.

ANR2473I *Command for volume volume name completed.*

Explanation: The command completed and the volume history file has been updated.

System action: The server records sequential volume history information.

User response: None.

ANR2474E *Command: Input volume names must be specified with the VOLumentnames= parameter.*

Explanation: The command failed because input volume names were not specified with the VOLumentnames parameter.

System action: The command fails.

User response: On some platforms, or with certain device classes, the server cannot prompt to mount input removable media volumes, so the names of the required volumes must be specified in the command. Reissue the command specifying the name(s) of volumes that should be mounted for input.

ANR2475E *Command: File file name could not be opened.*

Explanation: The DSMSEVER command could not be completed successfully because the file specified (to contain the list of volumes to be used) cannot be opened.

System action: The DSMSEVER command fails.

User response: Examine the file name that was specified in the DSMSEVER command. Correct the specification, if necessary, so that it specifies the name of a file that exists and is accessible by the server program. Reissue the DSMSEVER command if this can be corrected. Contact your service representative if this error cannot be resolved.

ANR2476I *License storage auditing is disabled, no output available.*

Explanation: The license storage occupancy function is currently disabled.

System action: None.

User response: To obtain storage occupancy results, remove the NOAUDITSTORAGE or AUDITSTORAGE NO option from the server options file, then restart the server and issue the AUDIT LICENSES command.

ANR2477I *License storage auditing is disabled, storage values may be outdated and should be ignored.*

Explanation: The license storage occupancy function is currently disabled.

System action: None.

User response: To obtain storage occupancy results, remove the NOAUDITSTORAGE or AUDITSTORAGE NO option from the server options file, then restart the server and issue the AUDIT LICENSES command.

ANR2478E *Command: Command cannot be executed in this session.*

Explanation: The command indicated is not supported by the session in which it was invoked. For example, a DEFINE CURSOR command can not be invoked from the server's primary console.

System action: The server does not process the command.

User response: The command must be issued from a standard administrator session.

ANR2479E *Command: Invalid SQL cursor name - SQL cursor name.*

Explanation: The command indicated contains an invalid SQL cursor name.

System action: The server does not process the command.

User response: Reissue the command with a valid SQL cursor name.

ANR2480E *Command: SQL cursor name SQL cursor name is already defined.*

Explanation: The command indicated specifies an SQL cursor name that has already been defined.

System action: The server does not process the command.

User response: Reissue the command and specify a different cursor name.

ANR2481E *Command: SQL cursor name SQL cursor name is not defined.*

Explanation: The command indicated specifies an SQL cursor name that has not been defined.

System action: The server does not process the command.

User response: Use the DEFINE CURSOR command to first define the cursor.

ANR2482E *Command: SQL cursor SQL cursor name is already open.*

Explanation: The command indicated failed because an SQL cursor is already open.

System action: The server does not process the command.

User response: Use the CLOSE CURSOR command to first close the current cursor.

ANR2483E *Command: No SQL cursor is currently open.*

Explanation: The command indicated failed because no SQL cursor is currently open.

System action: The server does not process the command.

User response: Use the OPEN CURSOR command to first open a cursor.

ANR2484E *Command: Invalid SQL date-time display format - SQL date-time display format name.*

Explanation: The command indicated contains an invalid SQL date-time display format name.

System action: The server does not process the command.

User response: Reissue the command with a valid SQL date-time format name.

ANR2485E *Command: Invalid SQL display format - SQL display format name.*

Explanation: The command indicated contains an invalid SQL display format name.

System action: The server does not process the command.

User response: Reissue the command with a valid SQL display format name.

ANR2486E *Command: Invalid SQL character arithmetic mode - SQL arithmetic mode.*

Explanation: The command indicated contains an invalid SQL arithmetic mode name.

System action: The server does not process the command.

User response: Reissue the command with a valid SQL arithmetic mode name.

ANR2487E *Command: An SQL expression is required.*

Explanation: The command indicated requires that an SQL expression be provided through the SQL keyword parameter.

System action: The server does not process the command.

User response: Reissue the command specifying an SQL expression.

ANR2488W List file *list file name* could not be opened.

Explanation: While attempting to read or write a sequential file list, the server was unable to open the file name specified.

System action: The server does not use the list file.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. For OUTFILE files, make sure that the server has proper authority to write to the file indicated and that there is sufficient space in the file system for the file. On OS/390® and z/OS®, make sure that the server has authority to write to the data set.

ANR2489W An error was encountered writing to volume list file *volume list file name*.

Explanation: While attempting to write to the sequential file for a volume list an error occurs on the file name specified. The volume list is not be complete and should not be used for input.

System action: The server stops writing to the file.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that there is sufficient space in the file system for the file. On MVS, make sure that the server has authority to write to the data set. Obtain the volume list from console messages, the QUERY VOLHISTORY command or the volume history file, if it is used.

ANR2490E Command: NODENAMES and SERVERNAMES parameters cannot both be specified in the same command.

Explanation: The command indicated failed because both the nodenames parameter and the servernames parameter were specified.

System action: None.

User response: Determine whether you want the action taken for one or more nodes or for one or more servers and reenter the command with only the correct parameter specified.

ANR2491I Volume Creation Process starting for *volume name*, Process Id *process ID*.

Explanation: As a result of a DEFINE VOLUME, DEFINE DBVOLUME, or DEFINE LOGVOLUME command with the SIZE=xxx parameter, a new volume is being created. The process whose ID is displayed has begun to create the volume shown.

System action: The server creates the volume and adds it to the server.

User response: None.

ANR2500I Schedule *schedule name* defined in policy domain *domain name*.

Explanation: This message is displayed in response to the DEFINE SCHEDULE command. The schedule named *schedule name* has been defined in the policy domain named *domain name* in the server database.

System action: Server operation continues.

User response: None.

ANR2501I Schedule *schedule name* deleted from policy domain *domain name*.

Explanation: This message is displayed in response to the DELETE SCHEDULE command. The schedule named *schedule name* has been deleted from the policy domain named *domain name* in the server database.

System action: Server operation continues.

User response: None.

ANR2502I Schedule *schedule name* updated in policy domain *domain name*.

Explanation: This message is displayed in response to the UPDATE SCHEDULE command. The schedule named *schedule name* has been updated in the policy domain named *domain name* in the server database.

System action: Server operation continues.

User response: None.

ANR2503I Schedule *schedule name* in domain *domain name* copied to schedule *new schedule name* in domain *new domain name*.

Explanation: This message is displayed in response to the COPY SCHEDULE command. The schedule named *schedule name* in policy domain *domain name* has been copied to the schedule named *new schedule name* in the policy domain named *new domain name*. Node associations have not been copied.

System action: Server operation continues.

User response: None.

ANR2504I Schedule *schedule name* deleted.

Explanation: This message is displayed in response to the DELETE SCHEDULE command. The schedule named *schedule name* has been deleted from the server database.

System action: Server operation continues.

User response: None.

ANR2505I *number of schedules* **schedules were defined for command.**

Explanation: *number of schedules* were generated and nodes successfully associated for the *command* issued.

System action: Server operation continues.

User response: If the number is less than expected, check the *nodeList* and *domainList* combination specified to the DEFINE CLIENTACTION command. Schedules are generated when at least one node in the *nodeList* exists in a domain in the *domainList*.

ANR2506I **Node** *node name* **associated with schedule** *schedule name* **in policy domain** *domain name* **processed.** *rc=return code.*

Explanation: This message is displayed in response to the DEFINE CLIENTACTION WAIT=YES command. Node *node name* is associated with the schedule named *schedule name* in policy domain *domain name* has been processed. name The result is indicated in the return code *return code*.

System action: Server operation continues.

User response: If the return code is non-zero, issue the QUERY ACTLOG command to to view the activity log and search for the error messages. After the error has been resolved, restart the scheduled operations.

ANR2507I **Schedule** *schedule name* **for domain** *domain name* **started at** *start timestamp* **for node** *node name* **completed successfully at** *timestamp*.

Explanation: The scheduled operation for the *domain name* and *schedule name* specified was processed. It was processed for node *node name* and completed successfully at the indicated time.

System action: Server operation continues.

User response: This message is intended to report the completion state of a scheduled client action. This message indicates that the scheduled action completed successfully.

ANR2508E **Trace Tsmtrcfm failed: A tracefile name is required.**

Explanation: Trace Tsmtrcfm doesn't output to console

System action: Trace won't start without a tracefile name for Trace Tsmtrcfm

User response: Issue the command with a tracefile name.

ANR2509E **Command: Invalid Virtual file space name -** *vfs name*.

Explanation: The specified server command has been entered with a virtual file space name that is longer than allowed.

System action: The server does not process the command.

User response: Reissue the command with a valid virtual file space name.

ANR2510I **Node** *node name* **associated with schedule** *schedule name* **in policy domain** *domain name*.

Explanation: This message is displayed in response to the DEFINE ASSOCIATION command. Node *node name* is associated with the schedule named *schedule name* in policy domain *domain name*. Schedule *schedule name* is now applied to node *node name*.

System action: Server operation continues.

User response: None.

ANR2511I **Node** *node name* **disassociated from schedule** *schedule name* **in policy domain** *domain name*.

Explanation: This message is displayed in response to the DELETE ASSOCIATION command. Node *node name* is no longer associated with the schedule named *schedule name* in policy domain *domain name*.

System action: Server operation continues.

User response: None.

ANR2512I **Event records deleted:** *record count*.

Explanation: This message is displayed in response to the DELETE EVENT command. A total of *record count* event records have been deleted from the database.

System action: Server operation continues.

User response: None.

ANR2513I **Schedule** *schedule name* **copied to schedule** *new schedule name*.

Explanation: This message is displayed in response to the COPY SCHEDULE command. The schedule named *schedule name* has been copied to the schedule named *new schedule name*.

System action: Server operation continues.

User response: None.

ANR2514E *Command: Virtual file space name `vfs name` conflicts with file space on the network attached storage (NAS) device.*

Explanation: The specified server command has been entered with a virtual file space that has the same name as a File space on the NAS device.

System action: The server does not process the command.

User response: Ensure that no virtual file space mappings for this NAS device have the same name as an actual file space that exists on the NAS device.

ANR2515I *Command: A virtual file space mapping named `vfs name` for node `node name` has been defined.*

Explanation: In response to the DEFINE VIRTUALFSMAPPING command, a virtual file space mapping for the specified node has been defined in the server database.

System action: Server operation continues.

User response: None.

ANR2516E *Command: The specified file space, `fs name`, does not exist on the NAS device associated with the node `node name`.*

Explanation: The specified server command has been entered with a file space that does not exist on the associate NAS device.

System action: The server ignores the command.

User response: Reissue the command with a valid file space name from the NAS device.

ANR2517E *Command: The virtual file space `vfs name` is already defined for node `node name`.*

Explanation: The specified command has been issued with a virtual file space name that has already been defined for the indicated node.

System action: Server operation continues, but the command is not processed.

User response: Issue the command using a virtual file space name that has not already been defined for this node.

ANR2518E *Command: A virtual file space mapping already exists to the specified node, file space and path.*

Explanation: The specified command has been issued with a node, file space and path for which there is already a virtual file space mapping defined.

System action: Server operation continues, but the command is not processed.

User response: Issue the command using a file space and path that does not already have a mapping defined.

ANR2519E *Command: The file space, `fs name`, does not exist on the NAS device associated with the node `node name`.*

Explanation: During a Backup of a virtual file space mapping for a NAS device, the server detected that the file space upon which the virtual file space resides does not exist on the associated NAS device.

System action: The server ignores the command.

User response: Use QUERY VIRTUALFSMAPPING to verify that the virtual file space mapping is defined correctly.

ANR2520I *Scheduled sessions set to `percent` percent.*

Explanation: This message is displayed in response to the SET MAXSCHEDESSESSIONS command. It indicates the percentage of total server sessions that can be used for the processing of scheduled work.

System action: Server operation continues.

User response: None.

ANR2521I *Event record retention period set to `days` days.*

Explanation: This message is displayed in response to the SET EVENTRETENTION command. It indicates the number of days for which event records are retained in the database.

System action: Server operation continues.

User response: None.

ANR2522I *Randomization set to `percent` percent.*

Explanation: This message is displayed in response to the SET RANDOMIZE command. It indicates the percentage of the startup window over which the start times for individual clients are distributed.

System action: Server operation continues.

User response: None.

ANR2523I *Schedule query period set to `hours` hour(s).*

Explanation: This message is displayed in response to the SET QUERYSCHEDPERIOD command. It indicates the number of hours between attempts by the client to contact the server for scheduled commands.

System action: Server operation continues.

User response: None.

ANR2524I Schedule query period reset to value determined by each client.

Explanation: This message is displayed in response to the SET QUERYSCHEPERIOD command.

System action: Server operation continues.

User response: None.

ANR2525I Maximum number of command retries set to *retries*.

Explanation: This message is displayed in response to the SET MAXCMDRETRIES command. It indicates the maximum number of times the client scheduler retries a command after a failed attempt to process a scheduled command.

System action: Server operation continues.

User response: None.

ANR2526I Maximum number of command retries reset to value determined by each client.

Explanation: This message is displayed in response to the SET MAXCMDRETRIES command.

System action: Server operation continues.

User response: None.

ANR2527I Retry period set to *minutes* minutes.

Explanation: This message is displayed in response to the SET RETRYPERIOD command. It indicates the number of minutes between attempts by the client scheduler to retry, after a failed attempt, to contact the server or to process a scheduled command.

System action: Server operation continues.

User response: None.

ANR2528I Retry period reset to value determined by each client.

Explanation: This message is displayed in response to the SET RETRYPERIOD command.

System action: Server operation continues.

User response: None.

ANR2529I Scheduling mode set to POLLING.

Explanation: This message is displayed in response to the SET SCHEDMODES command. With client-polling scheduling, a client queries the server at prescribed time intervals to obtain scheduled work or to ensure that the schedules the client is waiting to process have not changed.

System action: Server operation continues.

User response: None.

ANR2530I Scheduling mode set to PROMPTED.

Explanation: This message is displayed in response to the SET SCHEDMODES command. With server-prompted scheduling, the server contacts the client when scheduled work needs to be performed and a session is available.

System action: Server operation continues.

User response: None.

ANR2531I Scheduling mode set to ANY.

Explanation: This message is displayed in response to the SET SCHEDMODES command. The server now allows clients to run in either the client-polling or the server-prompted scheduling mode.

System action: Server operation continues.

User response: None.

ANR2532I Schedule *schedule name* updated.

Explanation: This message is displayed in response to the UPDATE SCHEDULE command. The schedule named *schedule name* has been updated in the server database.

System action: Server operation continues.

User response: None.

ANR2533I Client action schedule duration set to *days* days.

Explanation: This message is displayed in response to the Set CLIENTACTDuration command. It indicates the number of days for which schedules and associations generated by the DEFine CLIENTAction are retained in the database.

System action: Server operation continues.

User response: None.

ANR2534I Client action schedule *schedule name* was not executed by *node name* in domain *name*.

Explanation: Immediate client action *schedule name* was not executed by node *node name*, which is in domain *domain name*. The schedule is being deleted.

System action: Server operation continues.

User response: None.

ANR2535E *Command: The node `node name` cannot be removed or renamed because it has an associated data mover.*

Explanation: You attempted to remove or rename a node that has an associated data mover.

System action: The server does not remove or rename the node.

User response: To remove or rename the node, delete the associated data mover and reissue the command.

ANR2536E *Command: The "option" option is not valid with the storage pool's data format.*

Explanation: The command indicated includes an option that is not valid with the specified (or defaulted) data format for the storage pool.

System action: The server does not process the command.

User response: Reissue the command with options appropriate for the desired data format of the storage pool.

ANR2537E *Command: Device class `device class name` has a device type that is not allowed for this operation.*

Explanation: The device class in the indicated command has a device type that is not allowed for this operation.

System action: The server does not process the command.

User response: Choose a different device class and reissue the command.

ANR2538E *Command: Backup set cannot be generated for NAS node `node name`.*

Explanation: Backup sets cannot be generated for NAS nodes.

System action: The command fails.

User response: None.

ANR2539E *Command: Storage pool `Storage Pool Name` does not have a valid data format.*

Explanation: The data format of the indicated storage pool is not valid for the requested operation. The storage pool must have NATIVE or NONBLOCK data format. The server is unable to perform the requested operation.

System action: The command fails.

User response: Choose a different storage pool with the appropriate data format and reissue the command.

ANR2540E *Command: The "option" device class is not valid with the storage pool's data format.*

Explanation: The command indicated specifies a device class that is not valid with the specified (or defaulted) data format for the storage pool.

System action: The server does not process the command.

User response: Reissue the command with a data class appropriate for the desired data format of the storage pool.

ANR2541E *Command: The storage pool specified with option "option" is not compatible with the option's intended use.*

Explanation: The command specifies a storage pool whose device class is a Centera device. Such storage pools are not available for use with data movement operations such as reclaim or attributes such as copy, active-data, or reclaim storage pools.

System action: The server does not process the command.

User response: Issue the command again with a storage pool appropriate for the desired function.

ANR2542E *Command: The storage pool is not compatible with the operation's intended use.*

Explanation: The command specifies a storage pool whose device class is a Centera device. Such storage pools are not available for use with data movement operations, such as reclaim, or attributes, such as copy or reclaim storage pools.

System action: The server does not process the command.

User response: Issue the command again with a storage pool appropriate for the desired function.

ANR2543E *Command: The volume name is not compatible with the operation's intended use.*

Explanation: The command specifies a volume that resides in a storage pool whose device class is a Centera device. Such volumes are not available for use with data movement operations, such as reclaim, or attributes, such as copy or reclaim storage pools.

System action: The server does not process the command.

User response: Issue the command again with a volume appropriate for the desired function.

ANR2544E Unable to open the centera device at hla *hla*.

Explanation: The server cannot start communication with the device at the specified HLA.

System action: The transaction needing this device fails.

User response: Verify that the hla specified in the device class is correct, verify that the centera device is operational.

ANR2545E The version of the centera library, *version*, is not compatible with the server.

Explanation: The centera library must be at least version 2 to be able to be compatible with the server.

System action: The transaction fails.

User response: Contact your service representative.

ANR2546E The centera device is not capable of performing the required operation, *version*.

Explanation: The centera device must be capable of reading, writing and deleting objects. The device is not capable of performing at least one of these operations.

System action: The transaction fails.

User response: Contact your service representative.

ANR2547E A Centera device (*devclass*) reported error "*message,error*" during command *Centera* command.

Explanation: The Centera device reported an error while performing the specified command.

System action: The operation fails.

User response: Verify that the IP addresses specified in the device class associated with the storage pool are correct. Contact your service representative if the problem persists.

ANR2548I *NAS command: Renaming file space filespace name for node node name to file space new filespace name.*

Explanation: The NAS Backup process detected a name conflict between the Virtual file space *filespace name* and a file space on the NAS device associated with the node *node name*. The Virtual file space is renamed to the *new filespace name*. During a NAS backup process, if the object to be backed up is a Virtual file space, TSM will verify that this name does not also exist as a file space on the NAS device. If a name conflict exists, TSM will rename the existing

Virtual file space and the associated file space definition, if one exists.

System action: NAS Backup processing for the command continues.

User response: None; however, users should make note of the original Virtual file space *filespace name* and the new *new filespace name* so that they know where the backup data for this Virtual file space is located. Note, the RENAME FILESPACE command may be used to rename the Virtual file space to a more appropriate name.

ANR2549E *Command: Invalid virtual file space name. A virtual file space mapping name must have a forward slash as the first character.*

Explanation: The specified server command has been entered with a virtual file space name that does not have a forward slash as the first character.

System action: The server does not process the command.

User response: Reissue the command with a valid virtual file space name.

ANR2550W *command name: Administrative schedule schedule name does not have valid activation information.*

Explanation: This message is displayed during a database audit and indicates that the 'ACTIVE=YES or NO' information is not recorded correctly for an administrative schedule in the server database.

System action: Server database audit operation continues.

User response: Execute the AUDITDB operation specifying FIX=YES so that the activation information can be corrected.

ANR2551I *command name: Administrative schedule schedule name does not have valid activation information - activation information will be deleted.*

Explanation: This message is displayed during a database audit and indicates that the 'ACTIVE=YES or NO' information is not recorded correctly for an administrative schedule in the server database. The audit operation corrects this discrepancy by removing the invalid activation information.

System action: Server database audit operation continues.

User response: The named administrative schedule will now appear to be inactive in the server database (as if ACTIVE=NO was specified). If you want this schedule to be active, execute the UPDATE SCHEDULE

command with the ACTIVE=YES parameter to activate the schedule when the server is restarted.

ANR2552I Server now enabled for *session type* access.

Explanation: The server has been made available for use by the specified session types with the ENABLE command.

System action: None.

User response: None.

ANR2553I Server now disabled for *session type* access.

Explanation: The server has been made unavailable for use by the specified session types with the DISABLE command.

System action: None.

User response: None.

ANR2554I Format lfvolume process *process id* ended for storage pool *pool name*, number of volumes requested **volumes requested**, number of volumes formatted **volumes formatted**.

Explanation: The FORMAT LFVOLUME process for the storage pool shown has ended. The number of volumes requested to be formatted, and the number of volumes actually formatted are displayed.

System action: None.

User response: If the number of volumes formatted is less than the number of volumes requested to be formatted, check the activity log for messages indicating the reason for the difference. Possible reasons include the process was canceled, no more scratch volumes are allowed in the storage pool, or an error occurred processing a scratch volume.

ANR2556W The managed server *server name* is not capable of using enhanced style client schedule *schedule name* in domain *domain name*. The domain will not be propagated to this server.

Explanation: The managed server *server name* is subscribed to domain *domain name* that contains client schedule *schedule name* that uses enhanced style syntax. The managed server is not capable of using an enhanced style schedule. Only TSM servers that are at least Version 5 Release 3 are capable of using enhanced style schedules.

System action: Server operation continues. The domain will not be propagated to the managed server.

User response: Consider upgrading the managed

server to at least TSM Version 5 Release 3.

ANR2557W The managed server *server name* is not capable of using the enhanced style administrative schedule *schedule name*. The administrative schedule will not be propagated to this server.

Explanation: The managed server *server name* is subscribed to an administrative schedule that uses enhanced style syntax. The managed server is not capable of using an enhanced style schedule. Only TSM servers that are at least Version 5 Release 3 are capable of using enhanced style schedules.

System action: Server operation continues. The administrative schedule will not be propagated to the managed server.

User response: Consider upgrading the managed server to at least TSM Version 5 Release 3.

ANR2558W *command*: One or more managed servers that subscribe to domain *domain name* which contains client schedule *schedule name* are not capable of using an enhanced style schedule.

Explanation: The client schedule *schedule name* uses enhanced style schedule syntax. The schedule is in a domain which is a managed object and one or more of the managed servers that subscribe to it are not capable of using an enhanced style schedule. Only TSM servers that are at least Version 5 Release 3 are capable of using enhanced style schedules. During configuration refresh processing, the domain will not be propagated to managed servers that are not capable of using it.

System action: Server operation continues.

User response: Consider upgrading managed servers to at least TSM Version 5 Release 3.

ANR2559W *command*: One or more managed servers that subscribe to administrative schedule *schedule name* are not capable of using an enhanced style schedule.

Explanation: The administrative schedule *schedule name* uses enhanced style schedule syntax. The schedule is a managed object and one or more of the managed servers that subscribe to it are not capable of using an enhanced style schedule. Only TSM servers that are at least Version 5 Release 3 are capable of using enhanced style schedules. During configuration refresh processing, The schedule will not be propagated to managed servers that are not capable of using it.

System action: Server operation continues.

User response: Consider upgrading managed servers to at least TSM Version 5 Release 3.

ANR2560I Schedule manager started.

Explanation: The schedule manager is started when the server is initialized. The schedule manager maintains entries of scheduled operations.

System action: Server operation continues.

User response: None.

ANR2561I Schedule prompter contacting *node name* (session *session number*) to start a scheduled operation.

Explanation: The schedule prompter contacts the client scheduler for node *node name* because a scheduled operation should be started for that node.

System action: Server operation continues.

User response: None.

ANR2562I Automatic event record deletion started.

Explanation: A process has been started to delete event records for which the retention period has elapsed.

System action: Server operation continues.

User response: None.

ANR2563I Removing event records dated prior to *date time*.

Explanation: Events that were scheduled to start prior to *date time* are automatically deleted unless their startup window has not yet elapsed.

System action: Server operation continues.

User response: None.

ANR2564I Automatic event record deletion ended - *record count* records deleted.

Explanation: The event deletion process has ended. A total of *record count* event records have been deleted from the database.

System action: Server operation continues.

User response: None.

ANR2565I *schedules* schedules for immediate client actions have been deleted.

Explanation: A total of *schedules* that were generated by the DEFINE CLIENTACTION command have expired and been deleted from the database.

System action: Server operation continues.

User response: None.

ANR2566E An error occurred while deleting immediate client action schedules.

Explanation: Processing did not complete for deleting schedules that were generated by the DEFINE CLIENTACTION command.

System action: Server operation continues.

User response: Check the activity log for other messages that might relate to this failure. Correct any memory or space problems.

ANR2567W Schedule prompter skipped contact attempt with *node name* to start a scheduled operation.

Explanation: The schedule prompter skipped the contact attempt with the client scheduler for node *node name* because the start-up window has passed for that node, or the node was locked.

System action: Server operation continues.

User response: Check the length of the schedule start-up window to see if it needs to be increased. Check the activity log for ANR2716E messages. These messages are associated with failures to contact a client scheduler. If there are an excessive number of these messages the schedule window could have elapsed waiting for TCP/IP timeouts from these failed attempts. Also, check to see if the client node is locked. The contact attempt would be skipped for a locked node.

ANR2568E Request for node *node* to start schedule *schedule* at *startTime* is denied. Current time is *now*.

Explanation: The client scheduler attempted to start the specified instance of a schedule for a node. The request was denied because that instance is still in the future.

System action: Server operation continues. The node does not start the schedule.

User response: Check the client schedule and error logs for problems with the network or the preschedule command. Also, you may need to upgrade the client.

ANR2569E Request by node *node* to report results (*result*, *code code*) for schedule *schedule* at *startTime* is denied. Current time is *now*.

Explanation: The client scheduler attempted to report the results of executing the specified schedule. However, the schedule occurs in the future. The results will not be saved.

System action: Server operation continues. The results will not be saved.

User response: Check the client schedule and error

logs for problems with the network or the preschedule command. Also, you may need to upgrade the client.

**ANR2570W A scheduled session has been denied.
The schedule manager is not active.**

Explanation: The client scheduler attempts to connect with the server, but it is denied a session because the schedule manager is not active.

System action: Server operation continues, but central scheduling is not operational.

User response: Issue the QUERY OPTION command to determine if the option DISABLESCHEDULES YES has been specified in the server options file. If so, scheduling can be enabled by updating the server options file with DISABLESCHEDULES NO and restarting the server. If DISABLESCHEDULES YES was not specified in the server options file, determine the source of the error by examining the QUERY ACTLOG command to view the activity log and search for messages. After the error has been resolved, restart the server to restore central scheduler operations. If the error cannot be isolated and resolved, contact your service representative.

ANR2571W Scheduled session from node *node name* (*platform name*) has been denied, scheduled sessions are not currently available.

Explanation: The client scheduler for node *node name* attempts to connect with the server, but is denied a session. All sessions that have been allocated for scheduled operations are already in use.

System action: Server operation continues.

User response: Issue the QUERY OPTION command to determine if the option DISABLESCHEDULES YES has been specified in the server options file. If so, scheduling can be enabled by updating the server options file with DISABLESCHEDULES NO and restarting the server. If DISABLESCHEDULES YES was not specified in the server options file, change the total number of sessions by altering the MAXSESSIONS parameter in the server options file and then restarting the server. The percentage of sessions that are available for scheduled operations can be increased by using the SET MAXSCHEDULESESSIONS command.

ANR2572W Schedule prompter session to node *node name* has been denied, scheduled sessions are not currently available.

Explanation: The server attempts to prompt the client scheduler for node *node name*, but all sessions that have been allocated for scheduled operations are already in use.

System action: The server continues to attempt contact with the client scheduler until the startup

window for the scheduled event has elapsed.

User response: To change the total number of sessions, alter the MAXSESSIONS parameter in the server options file and then restart the server. The percentage of sessions that are available for scheduled operations can be increased by using the SET MAXSCHEDULESESSIONS command.

ANR2573W Sufficient memory is not available for the central scheduler - will retry in *number of seconds* seconds.

Explanation: The server suspends central scheduler processing because sufficient server memory is not available.

System action: Server operation continues; the scheduler operation will be retried after the specified delay.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see “Appendix A. Allocating Additional Server Memory”.

ANR2574W Insufficient recovery log space available for the central scheduler - will retry in *number of seconds* seconds.

Explanation: The server suspends central scheduler processing because sufficient recovery log space is not available.

System action: Server operation continues; the scheduler operation will be retried after the specified delay.

User response: To increase the amount of log space available to the server, an authorized administrator can add log volumes by using the DEFINE LOGVOLUME command, and can extend the size of the log by using the EXTEND LOG command.

ANR2575W Insufficient database space available for the central scheduler - will retry in *number of seconds* seconds.

Explanation: The server suspends central scheduler processing because sufficient database space is not available.

System action: Server operation continues; the scheduler operation will be retried after the specified delay.

User response: To increase the amount of database space available to the server, an authorized administrator can add database volumes by using the DEFINE DBVOLUME command, and can extend the size of the database by using the EXTEND DB command.

ANR2576W An attempt was made to update an event record for a scheduled operation which has already been executed - multiple client schedulers may be active for node *node name*.

Explanation: The server has attempted to update an event record for a scheduled operation for the specified client node. However, the existing event record shows that this scheduled operation has already been executed, either successfully or unsuccessfully. Two or more client schedulers may be running for this node.

System action: Server operation continues. The existing event record is not modified. No further processing is performed for this scheduled operation.

User response: Contact the user for this client node, and make sure that only one client scheduler is running.

ANR2577I Schedule *schedule name* defined.

Explanation: This message is displayed in response to the DEFINE SCHEDULE command. The schedule named *schedule name* in the server database.

System action: Server operation continues.

User response: None.

ANR2578W Schedule *schedule name* in domain *domain name* for node *node name* has missed its scheduled start up window.

Explanation: This message is displayed when the scheduled startup window for this schedule has passed and the schedule has not begun.

System action: Server operation continues. The scheduled operation is not processed by the server.

User response: Ensure that a scheduled session for node *node name* has been initiated from the client to the server. Refer to *Administrator's Guide* and *Administrator's Reference* for more information on setting up scheduling operations.

ANR2579E Schedule *schedule name* in domain *domain name* for node *node name* failed (return code *return code*).

Explanation: This message is displayed when a client reports failure in executing a scheduled action. The return code reported by the client is displayed.

System action: Server operation continues.

User response: Examine the node's schedule log to determine the cause for the failure.

ANR2580E Schedule *schedule name* in domain *domain name* for node *node name* failed.

Explanation: This message is displayed when the server finds that a scheduled start window has elapsed for a client schedule and the client is not currently running the schedule.

System action: Server operation continues.

User response: Examine the node's schedule log to determine the cause for the failure. Ensure that the client scheduler is started.

ANR2581W Schedule *schedule name* of an administrative command has missed its scheduled start up window.

Explanation: This message is displayed when the scheduled startup window for this schedule has passed and the schedule has not begun.

System action: Server operation continues. The scheduled operation is not processed by the server.

User response: Ensure that the duration and period specified in the schedule are long enough to allow the schedule to start. Refer to *Administrator's Guide* and *Administrator's Reference* for more information on setting up scheduling operations.

ANR2582E Command: Specified device class cannot be used with storage pools with different reclamation types.

Explanation: Storage pools can be defined with RECLAMATIONTYPE=THRESHOLD or RECLAMATIONTYPE=SNAPLOCK. A device class can only be used with either RECLAMATIONTYPE=THRESHOLD or RECLAMATIONTYPE=SNAPLOCK storage pools. An attempt was made to define a storage pool with one type of reclamation type with a device class that is already associated with another storage pool of the other reclamation type.

System action: The command fails.

User response: Reissue the command and specify another device class that is referenced by storage pools with the same reclamation type as your new storage pool. You may need to define another device class.

ANR2583E Command: Storage pool *storage pool name* is not a LAN-free storage pool.

Explanation: The command indicated specifies the name of a storage pool which is not a LAN-free pool. The command syntax requires that a LAN-free storage poolname be specified.

System action: The server does not process the command.

User response: Reissue the command with a valid LAN-free storage pool name.

ANR2584E *Command: An email address exceeds maximum characters characters.*

Explanation: A REGISTER NODE or REGISTER ADMIN command has been entered that specifies a list of email addresses, and one of those addresses is too long. The maximum valid length for a single email address is shown in the command.

System action: The server does not process the command.

User response: Reissue the command with a shorter email address.

ANR2585E *Command: An email address contains invalid syntax.*

Explanation: A REGISTER NODE, REGISTER ADMIN, UPDATE NODE, or UPDATE ADMIN command has been entered that specifies an invalid email addresses. Email addresses must be in the format "name@domain", where the name must be between 1 and 64 characters long, and the domain must be between 1 and 255 characters long.

System action: The server does not process the command.

User response: Reissue the command with a correct email address.

ANR2586W **This command will set the server name to *serverName*. Changing the server name could adversely affect: communication from the server to backup archive nodes, event logging, virtual volumes, library sharing, and storage agents used for LAN-free and server-to-server operations such as enterprise configuration. See the administrator's guide for more information on these areas and the impact of changing the server name.**

Explanation: The name that the server displays and communicates with has been set to the value indicated with the SET SERVERNAME command. Communication with the Tivoli Storage Manager server is based on the name assigned to the server. If this is a source server for a virtual volume operation, changing this value can impact the ability of the source server to access and manage the data it has stored on the corresponding target server. Windows clients use the server name to identify which passwords belong to which servers. Changing the server name after the clients are connected forces the clients to re-enter the passwords. On a network where clients connect to multiple servers, it is recommended that all of the servers have unique names.

System action: Tivoli Storage Manager prompts the user to continue.

User response: Enter 'Y' to change the server name. Enter 'N' if you do not want to change the server name.

ANR2587W **TSM encountered a zero verb on backupset volume *Volume* and skipped to the next volume.**

Explanation: TSM detected the problem described in APAR PK12572 . The server options file contains SKIPONZEROVERBBACKUPSET ON. TSM verified there was no further data on the volume, and skipped to the next volume.

System action: Processing continues.

User response: If the backupset volume was written before TSM 5.2.7, or 5.3.3 was put on the system and meets the PK12572 criteria, no action is required. If not, the volume has encountered a read error, and should read again on a server without the SKIPONZEROVERBBACKUPSET ON option to get the correct error messages for problem determination.

ANR2588E *Command: Storage pool "StgPool" cannot have CACHE set to YES with a non zero SHRED attribute.*

Explanation: Storage pools can be defined or updated with a non zero SHRED attribute only if the storage pool CACHE attribute is NO. Existing storage pools with CACHE attribute of YES cannot be updated with a non zero SHRED attribute. Likewise, existing storage pools with a non zero SHRED attribute cannot be updated with CACHE = YES. Existing storage pools with CACHE set to YES cannot be updated with a non zero SHRED attribute. New storage pools cannot be define nor can existing storage pools be modified with CACHE set to YES and a non zero SHRED value.

System action: The command fails.

User response: Reissue the command and specify SHRED value of zero or CACHE = NO.

ANR2589E **Backupset *backup set name* for node *node name* (data type *data type*) is in use and cannot be deleted.**

Explanation: The server attempted to delete the backup set, but the operation could not be completed, because the backup set was in use by another process.

System action: The server does not process the command.

User response: Reissue the command at a later time.

ANR2590E *Command failed - SET DBRECOVERY command has not been issued.*

Explanation: Backup DB command failed because a SET DBRECOVERY command has not been issued to define the device class used for automatic DB backup.

System action: The server does not process the command.

User response: Issue the SET DBRECOVERY command to define the device class for automatic DB backup operation.

ANR2591I *Directory *directory name* is already defined in the database space.*

Explanation: This directory is already in the database space .

System action: The command terminates.

User response: Issue the command again, specifying a directory that is not defined in the server database space.

ANR2592I *Directory(ies) *directory list* has been defined in the database space.*

Explanation: Command 'EXTEND DBSPACE' successfully added new directory(ies) *dir list* into the server database space.

System action:

User response:

ANR2593E *Command: Storage pool *storage pool name* exists but does not match the storage-pool type that the server is attempting to process with the command.*

Explanation: The storage pool specified does not match the type being processed with the command.

System action: The server does not process the command.

User response: Retry the command with a valid storage pool type specified.

ANR2594E *Command: Input volume specified has to be at least two when SCRATCH input parameter is set to NO.*

Explanation: The command failed because input volume specified is not enough since the SCRATCH is set to NO.

System action: The command fails.

User response: .

ANR2595I *Directory *directory name* is already in the list to add to database space.*

Explanation: While processing the command argument list, a duplicate path name has been encountered.

System action: The command terminates.

User response: Issue the command again, specifying a directory that is not in the argument list.

ANR2596E *There is insufficient authority to create the database files.*

Explanation: The database manager, running under the user ID for the Tivoli Storage Manager instance, does not have the authority to create files in one or more of the database directories.

System action: The server process ends.

User response: Ensure that the user ID for the Tivoli Storage Manager instance has write permission to all database directories. No matter which user ID is running the dsmserv process, the database files are written by the database manager. The permissions on these database directories must allow write access from the database manager user ID. Change the ownership of the database directories to the user ID for the Tivoli Storage Manager instance.

ANR2597W *Node *node name* in domain *domain name* began schedule *schedule name* at actual start and is *schedule state*. The period expired at *expiration time*.*

Explanation: This message is displayed when a node started a schedule, the period for the schedule expired, and the node has not reported results for the schedule. Possible causes are:

- processing for the action is taking longer than the schedule period
- a problem occurred while the node was performing the scheduled action
- the node completed the scheduled action but did not report the results to the server

System action: Server operation continues. The results of the scheduled operation are unknown.

User response: Administrators should consult the server activity log and the client scheduler log, then take corrective action if needed.

ANR2598W *Administrative command schedule *schedule name* started processing at actual start and is *schedule state*. The period expired at *expiration time*.*

Explanation: This message is displayed when an administrative command schedule has started, the period for the schedule expired, and the results for the

schedule have not been reported. Possible causes are:

- processing for the action is taking longer than the scheduled period
- a problem occurred while performing the scheduled action
- a problem occurred reporting the schedule results

System action: Server operation continues. The results of the scheduled operation are unknown.

User response: Administrators should consult the server activity log, then take corrective action if needed.

ANR2599W *The central scheduler is unable to obtain a required lock and will retry in number of seconds seconds.*

Explanation: The server temporarily suspends central scheduler processing because a required lock is not available.

System action: Server operation continues; the scheduler operation will be retried after the specified delay.

User response: The server workload is high. If this condition persists, you may need to consider adjusting the server workload.

ANR2600E *Command: Invalid schedule name - schedule name.*

Explanation: The specified command has been issued with an invalid schedule name.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid schedule name.

ANR2601E *Command: Schedule description exceeds maximum length characters.*

Explanation: The specified command has been issued with a description that exceeds the maximum length.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid description.

ANR2602E *Command: Invalid action - action.*

Explanation: The specified command has been issued with an invalid action.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid action.

ANR2603E *Command: Options string exceeds maximum length characters.*

Explanation: The specified command has been issued with an options string that exceeds the maximum length.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid options string.

ANR2604E *Command: Objects string exceeds maximum length characters.*

Explanation: The specified command has been issued with an objects string that exceeds the maximum length.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid objects string.

ANR2605E *Command: Invalid priority - priority.*

Explanation: The specified command has been issued with an invalid priority.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid priority.

ANR2606E *Command: Invalid start date - date.*

Explanation: The specified command has been issued with an invalid start date.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid start date.

ANR2607E *Command: Invalid start time - time.*

Explanation: The specified command has been issued with an invalid start time.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid start time.

ANR2608E *Command: Invalid duration - duration.*

Explanation: The specified command has been issued with an invalid duration.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid duration.

ANR2609E *Command: Invalid duration units - duration units.*

Explanation: The specified command has been issued with an invalid value for duration units.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid value for duration units.

ANR2610E *Command: Invalid period - period.*

Explanation: The specified command has been issued with an invalid period.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid period.

ANR2611E *Command: Invalid period units - period units.*

Explanation: The specified command has been issued with an invalid value for period units.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid value for period units.

ANR2612E *Command: Invalid day of week - day of week.*

Explanation: The specified command has been issued with an invalid value for day of the week.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid value for day of the week.

ANR2613E *Command: Invalid expiration - date.*

Explanation: The specified command has been issued with an invalid expiration date.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid expiration date.

ANR2614E *Command: Invalid combination of the following parameters: duration, duration units, period, period units.*

Explanation: The specified command has been issued with an invalid combination of the DURATION, DURUNITS, PERIOD, and PERUNITS parameters. This message may be displayed if the duration of the startup window for the schedule is not shorter than the period between windows. This message may also be displayed if DURUNITS=INDefinite is specified, but PERUNITS=Onetime is not specified.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid combination of parameters.

ANR2615E *Command: Expiration date date has elapsed.*

Explanation: The specified command has been issued with an elapsed expiration date *date*.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify an expiration date that has not already elapsed.

ANR2616E *Command: Start date start date must be earlier than expiration date expiration.*

Explanation: The specified command has been issued with a start date that is not earlier than the expiration date.

System action: Server operation continues, but the command is not processed.

User response: Issue the command using a schedule start date that is earlier than the expiration date.

ANR2617E *Command: Schedule schedule name is not defined in policy domain domain name.*

Explanation: The specified command has been issued with a schedule name that has not been defined in the indicated policy domain.

System action: Server operation continues, but the command is not processed.

User response: Issue the command using a schedule that has already been defined for this domain.

ANR2618E *Command: Schedule schedule name is already defined in policy domain domain name.*

Explanation: The specified command has been issued with a schedule name that has already been defined for the indicated policy domain.

System action: Server operation continues, but the command is not processed.

User response: Issue the command using a schedule that has not already been defined for this domain.

ANR2619E *Command: Currently defined period period is invalid with updated period units.*

Explanation: The specified command has been issued with a value for period units that is not allowed with the existing period.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a new period.

ANR2620E *Command: Currently defined duration duration is invalid with updated duration units.*

Explanation: The specified command has been issued with a value for duration units that is not allowed with the existing duration.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a new duration.

ANR2621E *Command: No matching schedules.*

Explanation: The specified command has been issued but no matching schedules have been found.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify different schedules.

ANR2622E *Command: No new node associations added.*

Explanation: The specified command has been issued but no new node associations are defined.

System action: Server operation continues, but the command has no effect.

User response: Issue the command and specify different nodes.

ANR2623E *Command: No node associations deleted.*

Explanation: The specified command has been issued but no node associations are deleted.

System action: Server operation continues, but the command has no effect.

User response: Issue the command and specify different nodes.

ANR2624E *Command: No matching nodes registered.*

Explanation: No matching nodes are found for the specified command.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify different nodes.

ANR2625E *Command: No matching nodes registered in policy domain domain name.*

Explanation: The specified command has been issued, but no matching nodes are registered in the indicated policy domain.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify different nodes.

ANR2626E *Command: Invalid value for replace - replace.*

Explanation: The specified command has been issued with an invalid value for replace.

System action: Server operation continues, but the command is not processed.

User response: Issue the command using a valid value for replace.

ANR2627E *Command: Invalid value for format - format.*

Explanation: The specified command has been issued with an invalid value for format.

System action: Server operation continues, but the command is not processed.

User response: Issue the command using a valid value for format.

ANR2628E *Command: Invalid date - date.*

Explanation: The specified command has been issued with an invalid date.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid date.

ANR2629E *Command: Invalid time - time.*

Explanation: The specified command has been issued with an invalid time.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid time.

ANR2630E *Command: Event deletion is already in process.*

Explanation: The specified command has been issued while event deletion is already in progress.

System action: Server operation continues, but the command is not processed.

User response: Wait for event deletion to complete before issuing the command.

ANR2631E *Command: Invalid begin date - date.*

Explanation: The specified command has been issued with an invalid begin date.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid begin date.

ANR2632E *Command: Invalid begin time - date.*

Explanation: The specified command has been issued with an invalid begin time.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid begin time.

ANR2633E *Command: Invalid end date - date.*

Explanation: The specified command has been issued with an invalid end date.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid end date.

ANR2634E *Command: Invalid end time - time.*

Explanation: The specified command has been issued with an invalid end time.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid end time.

ANR2635E *Command: Invalid time range - Begin: begin End: end.*

Explanation: The specified command has been issued with an invalid time range. This occurs if the date and time for the beginning of the time range (*begin*) do not precede the date and time for the end of the time range (*end*).

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid time range.

ANR2636E *Command: Invalid value for exceptions only - exceptions only.*

Explanation: The specified command has been issued with an invalid value for exceptions only.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value for exceptions only.

ANR2637E **There is insufficient authority to create the recovery log files.**

Explanation: The database manager, running under the user ID for the Tivoli Storage Manager instance, does not have the authority to create files in one or more of the log directories.

System action: The server process ends.

User response: Ensure that the user ID for the Tivoli Storage Manager instance has write permission to all active, mirror, archive, and failover archive log directories. No matter which user ID is running the dsmserv process, the recovery log files are written by the database manager. The permissions on these log directories must allow write access from the database manager user ID. Change the ownership of the recovery log directories to the user ID for the Tivoli Storage Manager instance.

ANR2638W **This command will delete all user data and log files, as well as any backup/restore history for the TSM server database. Are you sure you want your database and all of its references removed (y or n)?**

Explanation: A REMOVEDB command has been entered.

System action: The administrator is asked whether to continue.

User response: Enter 'y' to remove the database or 'n' to leave the server database.

ANR2639E *Command failed - no files have been defined for storing sequential volume history information.*

Explanation: Sequential volume history information is required to restore the server data base. Because no files were configured for receiving this information, the operation fails.

System action: Server operation continues.

User response: To have the server automatically record sequential volume history information to assist in server recovery, use the VOLUMEHISTORY option in the server options file to specify where history information should be written. If you update the options file, restart the server.

ANR2640E *Command: Invalid percentage of sessions for scheduled processing - value.*

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value.

ANR2641E *Command: Invalid event record retention period - value.*

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value.

ANR2642E *Command: Invalid percentage for randomization - value.*

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value.

ANR2643E *Command: Invalid schedule query period - value.*

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value.

ANR2644E *Command: Invalid maximum number of command retries - value.*

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value.

ANR2645E *Command: Invalid retry period - value.*

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value.

ANR2646E *Command: Invalid scheduling mode - value.*

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value.

ANR2647E *Command: Invalid type - type.*

Explanation: The specified command has been issued with an invalid type.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid type.

ANR2648E *Command: Type string exceeds maximum length characters.*

Explanation: The specified command has been issued with a type string that exceeds the maximum length.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid type string.

ANR2649E *Command: Schedule schedule name is not defined.*

Explanation: The specified command has been issued with a schedule name that has not been defined.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a schedule that has already been defined.

ANR2650E *Command: Schedule schedule name is already defined.*

Explanation: The specified command has been issued with a schedule name that has already been defined.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a schedule name that has not already been defined.

ANR2651E *Command: Invalid combination of one or more of the following parameters: cmd, type, action, objects, options.*

Explanation: The specified command has been issued with an invalid combination of the CMD, ACTION, OBJECTS, and OPTIONS parameters. This message is displayed when the CMD parameter is specified and TYPE=CLIENT is not specified, or when TYPE=ADMIN is specified, and one or more of the following is specified: ACTION, OBJECTS, or OPTIONS.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid combination of parameters.

ANR2652E *Command: Invalid combination of one or more of the following parameters: active, cmd, type.*

Explanation: The specified command has been issued with an invalid combination of the TYPE, CMD, or ACTIVE parameters. This message is displayed when TYPE=CLIENT is specified and one or more of the following is specified: ACTIVE, CMD.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid combination of parameters.

ANR2653W *Command: Node node name cannot be processed because it is not registered or does not belong to the specified domain.*

Explanation: This command cannot be processed for the indicated node. Either the node is not registered or it is not assigned to the required domain.

System action: The indicated node is not processed, but other nodes may be processed if specified by this command.

User response: If the node name was entered incorrectly, reissue the command with the correct node name.

ANR2654E *Command: The NODES parameter cannot be used when querying administrative schedules.*

Explanation: A QUERY SCHEDULE command has been issued with TYPE=ADMINISTRATIVE and the NODES parameter both specified. The NODES parameter cannot be specified when querying administrative schedules.

System action: Server operation continues, but the command is not processed.

User response: Issue the command without the NODES parameter.

ANR2655E *Command: Invalid client action schedule duration - days.*

Explanation: The specified command has been issued with an invalid number of days. Valid values are 1 to 9999 inclusive. *days* specifies the length of time during which a schedule defined by the DEFINE CLIENTAction command must be executed by an associated node. After that, the schedule will be deleted from the database.

System action: Server operation continues, but the command is not processed.

User response: Reissue the command with a valid number of days.

ANR2656E *Command: Invalid schedule style schedStyle.*

Explanation: The specified command has been issued with an invalid schedule style.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid schedule style.

ANR2657E *Command: Invalid month month.*

Explanation: The specified command has been issued with an invalid month.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid month.

ANR2658E *Command: Invalid day of month month.*

Explanation: The specified command has been issued with an invalid day of month.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid day of month.

ANR2659E *Command: Invalid week of month month.*

Explanation: The specified command has been issued with an invalid week of month.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid week of month.

ANR2660E *Command: Invalid combination of enhanced schedule parameters or their values: parm1 and parm2.*

Explanation: The specified command has been issued with an invalid combination of the DAYOFMONTH, WEEKOFMONTH, and DAYOFWEEK parameters. WEEKOFMONTH and DAYOFWEEK cannot be specified with DAYOFMONTH. WEEKEND or WEEKDAY must be specified with the FIRST or LAST week of month.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and specify a valid combination of parameters.

ANR2661E *Command: Invalid combination of enhanced schedule parameters or their values, parm1 and parm2, found for schedule name.*

Explanation: The specified update command has been issued with either an invalid combination of parameters or their values, or a specified parameter or value is not compatible with an option that is not being updated for the existing schedule. WEEKOFMONTH and DAYOFWEEK must not be specified with DAYOFMONTH. WEEKEND or WEEKDAY must be specified with the FIRST or LAST week of month.

System action: Server operation continues, but the command is not processed.

User response: To see the options for the existing schedule, issue: QUERY SCHEDULE FORMAT=DETAILED for the client or administrative schedule. Determine if the error was caused by one of the following:

- a conflict between parameters to the update command.
- a conflict between a parameter specified with the update command and a value that already exists for the schedule.

For the latter problem, also update the existing option that is causing the problem. Correct the update command and issue it again.

ANR2662I (*) "Query schedule format=standard" displays an asterisk in the day of week column for enhanced schedules. The period column is blank. Issue "query schedule format=detailed" to display complete information about an enhanced schedule.

Explanation: This message explains the standard display for an enhanced schedule.

System action: Server operation continues.

User response: Issue "query schedule format=detailed" to display information about an enhanced schedule.

ANR2663I *Command: resetting existing options options for schedule name to default values. .*

Explanation: The update schedule command has reset existing options for the schedule to default values. The change is required by the parameters specified with the update or audit commands.

System action: Server operation continues.

User response: None.

ANR2664E *Command: Invalid parameter parm for schedule style schedule style.*

Explanation: A specified parameter is not valid for the schedule style.

System action: Server operation continues, but the command is not processed.

User response: Issue the command and with parameters valid for the schedule style.

ANR2665W *Command: Invalid month and day, month day, detected.*

Explanation: The specified command has been issued with an invalid combination of MONTH and DAYOFMONTH. If one month and one day were specified in the command, the command will fail. If there is at least one valid month and day combination, the schedule will be defined and run on the valid dates. The schedule will skip the invalid month and day combinations.

System action: Server operation continues.

User response: Determine the correct day and month combinations. If the command failed, issue the define command again. If the schedule was defined, use the update command to change the month and day values.

ANR2666W *Command: Invalid month and day, month day, detected for schedule name.*

Explanation: The specified update command has been issued with either an invalid combination of MONTH and DAYOFMONTH, or a specified MONTH or DAYOFMONTH value is incompatible with a MONTH or DAYOFMONTH value that is not being updated for the existing schedule. If there is just one month and one day combination and that combination is invalid, the command will fail. If there is at least one valid month and day combination, the schedule will be updated and run on the valid dates. The schedule will skip the invalid month and day combinations.

System action: Server operation continues.

User response: To see the options for the existing schedule, issue "q sched f=d" for the client or administrative schedule. Determine the correct day and month combinations. If the the command failed, issue the update command again.

ANR2670E *Export command: Invalid value for SCHEDSTYLE parameter detected while exporting schedule schedule name in domain domain name - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the SCHEDSTYLE parameter for schedule *schedule name* in domain *domain name*.

System action: Export processing continues, but the exported data contains an unknown SCHEDSTYLE value for this schedule. If this data is imported, the default or existing SCHEDSTYLE value is used.

User response: Update the SCHEDSTYLE value for this schedule and restart the export command. Alternatively, use the export data with the unknown value, and check and update the SCHEDSTYLE value after import processing has been performed.

ANR2671E *Export command: Invalid value for SCHEDSTYLE parameter detected while exporting administrative schedule schedule name - default or existing value is used during import.*

Explanation: During processing of command *export command*, an invalid value is encountered for the SCHEDSTYLE parameter for administrative schedule *schedule name*.

System action: Export processing continues, but the exported data contains an unknown SCHEDSTYLE value for this schedule. If this data is imported, the server uses the default or existing SCHEDSTYLE value.

User response: Update the SCHEDSTYLE value for this schedule and restart the export command. Alternatively, the export data with the unknown value

can be used, and the SCHEDSTYLE value can be checked and updated after import processing has been performed.

ANR2672E *Import command: Invalid value for SCHEDSTYLE parameter in exported data for schedule schedule name in domain domain name.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the SCHEDSTYLE parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues. If a later command causes the data to be imported, the default or existing SCHEDSTYLE value is used.

User response: If the data is imported with a later command, verify that the correct SCHEDSTYLE value is used for this schedule.

ANR2673E *Import command: Invalid value for SCHEDSTYLE parameter in exported data - schedule schedule name in domain domain name defined with default SCHEDSTYLE value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the SCHEDSTYLE parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues, by using the default SCHEDSTYLE value for this schedule.

User response: Verify that the correct SCHEDSTYLE value has been used for this schedule. Update this value, if necessary.

ANR2674E *Import command: Invalid value for SCHEDSTYLE parameter in exported data - existing SCHEDSTYLE value for schedule schedule name in domain domain name was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the SCHEDSTYLE parameter for schedule *schedule name* in policy domain *domain name*.

System action: Processing of the command continues, by using the existing SCHEDSTYLE value for this schedule.

User response: Verify that the correct SCHEDSTYLE value has been used for this schedule. Update this value, if necessary.

ANR2675E *Import command: Invalid value for SCHEDSTYLE parameter in exported data for administrative schedule `schedule name`.*

Explanation: During preview processing of command *import command*, an invalid value is encountered for the SCHEDSTYLE parameter for administrative schedule *schedule name*.

System action: Processing of the command continues. If a later command is issued that causes the data to be imported, the default or existing SCHEDSTYLE value is used.

User response: If the data is imported with a later command, verify that the correct SCHEDSTYLE value is used for this schedule.

ANR2676E *Import command: Invalid value for SCHEDSTYLE parameter in exported data - administrative schedule `schedule name` defined with default SCHEDSTYLE value.*

Explanation: During processing of command *import command*, an invalid value is encountered for the SCHEDSTYLE parameter for administrative schedule *schedule name*.

System action: Processing of the command continues, by using the default SCHEDSTYLE value for this schedule.

User response: Verify that the correct SCHEDSTYLE value has been used for this schedule. Update this value, if necessary.

ANR2677E *Import command: Invalid value for SCHEDSTYLE parameter in exported data - existing SCHEDSTYLE value for administrative schedule `schedule name` was not updated.*

Explanation: During processing of command *import command*, an invalid value is encountered for the SCHEDSTYLE parameter for administrative schedule *schedule name*.

System action: Processing of the command continues, by using the existing SCHEDSTYLE value for this schedule.

User response: Verify that the correct SCHEDSTYLE value has been used for this schedule. Update this value, if necessary.

ANR2678E **Server database format failed.**

Explanation: A failure occurred during the format of the TSM server database. This occurred during the processing of a 'DSMSERV FORMAT' command.

System action: Server format processing terminates.

User response: Review error messages to determine the cause of the failure and retry the 'DSMSERV FORMAT' once the issue has been resolved. If unable to determine the cause of the failure or to resolve it, please contact your IBM service representative for further assistance.

ANR2679E *Command: All of the nodes provided are invalid.*

Explanation: While verifying the parameters of the specified command, no valid node was found.

System action: The server ends the command.

User response: Verify that the nodes specified are correct and all are registered. Then, reissue the command.

ANR2680E *Command: You cannot specify TOC=YES when TYPE is SNAPMIRROR.*

Explanation: A SnapMirror backup was attempted while specifying TOC=YES. Network Appliance SnapMirror backups do not support TOC creation.

System action: The server ends the command.

User response: Reissue the command without specifying TOC=YES.

ANR2681E *Command: The file server `movername` does not support SnapMirror-to-Tape operations or is not running NDMP Version 4.*

Explanation: A SnapMirror backup was specified with a NAS device that does not Network Appliance SnapMirror backup operations.

System action: The server ends the command.

User response: Reissue the command by specifying a standard NDMP full or differential backup. .

ANR2682E *Command: You cannot specify MODE=DIFF when TYPE is SNAPMIRROR.*

Explanation: A SnapMirror backup was attempted while specifying MODE=DIFF. Network Appliance SnapMirror backups may only be full image backups.

System action: The server ends the command.

User response: Reissue the command and do not specify MODE=DIFF with TYPE=SNAPMIRROR.

ANR2683I *Command: A Table of Contents will not be created for a SnapMirror backup.*

Explanation: A Netapp SnapMirror backup was requested and the TOC parameter is set to PREFERRED. The backup will continue, however no

Table of Contents will be created.

System action: The server operation continues.

User response: None.

ANR2684E *Command: SnapMirror operations are not supported on NAS virtual filesystem definitions.*

Explanation: A SnapMirror backup or restore was attempted on a NAS virtual filesystem. Network Appliance SnapMirror backups do not support directory level backup, therefore a virtual filesystem may not used with TYPE=SNAPMIRROR.

System action: The server ends the command.

User response: Reissue the command by specifying TYPE=DUMPIMAGE.

ANR2685I *SnapMirror backup of NAS node nodename, file system file system, started as process process ID by administrator administrator.*

Explanation: A SnapMirror backup is started for the indicated file system of a NAS node. The operation is initiated by the administrator shown.

System action: The indicated process is started.

User response: None.

ANR2686I *SnapMirror Restore of NAS node nodename, file system file system, started as process process ID by administrator administrator. A full image for this file system will be restored to destination destination.*

Explanation: A SnapMirror restore is started for the indicated file system of a NAS node. The operation is initiated by the administrator shown. The restore will be performed using a full image of this file system. The file system will be restored to the indicated destination.

System action: The indicated process is started.

User response: None.

ANR2687E *Command: You cannot specify a FILELIST when TYPE is SNAPMIRROR.*

Explanation: A file level restore was attempted from a SnapMirror backup. Network Appliance SnapMirror backups do not support file level restore.

System action: The server ends the command.

User response: Reissue the command without the FILELIST parameter.

ANR2688E *Command: The SnapMirror Restore of NAS node nodename, file system file system, cannot be started. The destination file system destination is not set to "Restricted" on the NAS device.*

Explanation: While verifying the parameters of the specified command, no valid node was found.

System action: The server ends the command.

User response: Verify that the nodes specified are correct and all are registered. Then, reissue the command.

ANR2689W *Command: The dataformat of the datamover data mover is incompatible with the NAS device with host identifier hostId.*

Explanation: The dataformat provided in the command is not compatible with the NAS device which is associated with the high level address. was found.

System action: The server completes the command.

User response: Determine the proper dataformat for your NAS device and reissue the command.

ANR2690E *Command: The file system file system is in restricted state and cannot be used in an NDMP backup or restore operation.*

Explanation: A NAS file system that is in the restricted state was specified for an NDMP backup or restore operation. You cannot perform an NDMP backup or restore of a file system in the restricted state.

System action: The server ends the command.

User response: Refer to your NAS device's documentation on how to unrestrict the file system. Then, reissue the command.

ANR2691E *Command: All of the nodes provided are invalid.*

Explanation: While verifying the parameters of the specified command, no valid node was found.

System action: The server ends the command.

User response: Verify that the nodes specified are correct and all are registered. Then, reissue the command.

ANR2700E *Schedule manager aborted.*

Explanation: The schedule manager has ended because of an error condition and is not able to maintain entries for scheduled operations.

System action: Server operation continues, but the central scheduler is not operational.

User response: To determine the source of the error, examine server messages issued prior to this message. Issue the QUERY ACTLOG command to view the activity log and search for messages. After the error has been resolved, restart the server to restore central scheduler operations. If the error cannot be isolated and resolved, contact your service representative.

ANR2701E The schedule manager could not be started: *diagcode*.

Explanation: The schedule manager cannot be started during initialization because sufficient memory is not available. Diagnostic code *diagcode* is issued.

System action: Initialization fails.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2702E The schedule prompter could not be started: *diagcode*.

Explanation: The schedule prompter cannot be started during initialization because sufficient memory is not available. Diagnostic code *diagcode* is issued.

System action: Initialization fails.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2703E Schedule prompter aborted.

Explanation: The schedule prompter ends because of a processing error.

System action: Server operation continues, but prompted scheduling is not operational.

User response: To determine the source of the error, examine server messages issued prior to this message. Issue the QUERY ACTLOG command to view the activity log and search for messages. After the error has been resolved, restart the server to restore central scheduler prompting operations. If the error cannot be isolated and resolved, contact your service representative.

ANR2707E Out of server log space in central scheduler.

Explanation: The server ends a database update transaction for the central scheduler because sufficient log space is not available on the server.

System action: Server operation continues, but the database update fails.

User response: An authorized administrator can use

the DEFINE LOGVOLUME command to add volumes for use by the log and can issue the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR2708E Out of server database space in central scheduler.

Explanation: The server ends a database update transaction for the central scheduler because sufficient database space is not available on the server.

System action: Server operation continues, but the database update fails.

User response: An authorized administrator can use the DEFINE DBVOLUME command to add volumes for use by the database and can use the EXTEND DB command to extend the size of the database so that the new volumes are used.

ANR2709E Schedule manager : Unable to start event record deletion.

Explanation: Event record deletion cannot be started because sufficient memory is not available.

System action: Server operation continues, but event records are not automatically deleted after their retention period has elapsed.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2712E Node *node1* requested scheduling information for node *node2* - session rejected.

Explanation: A request for pending scheduled operations has been sent from the client scheduler for node *node1*. However, the request is for scheduling information concerning another node *node2*.

System action: Server operation continues, but the client scheduler for node *node1* will not be able to process pending operations.

User response: Try restarting the client scheduler for node *node1*. If the problem persists, contact your service representative to resolve the client program error.

ANR2713E Node *node1* trying to start scheduled operation for node *node2* - session rejected.

Explanation: The client scheduler for node *node1* has attempted to execute a scheduled operation for another node, *node2*.

System action: Server operation continues, but the scheduled operation is not processed.

User response: Try restarting the client scheduler for node *node1*. If the problem persists, contact your service representative to resolve client program error.

ANR2714E Node *node1* trying to report scheduled operation results for node *node2* - session rejected.

Explanation: The client scheduler for node *node1* has attempted to report the results of a scheduled operation using another node name, *node2*.

System action: Server operation continues, but the results that were sent from node *node1* are not be stored in the server's database.

User response: Try restarting the client scheduler for node *node1*. If the problem persists, contact your service representative to resolve the client program error.

ANR2715E Client node *node id* unable to register valid address for server prompting: type *address type* (*high address low address*).

Explanation: The client scheduler for node *node id* has attempted to register an invalid address for server-prompted central scheduling. The address was type *address type* with high-level field *high address* and low-level field *low address*. The only valid address type is 1.

System action: Server operation continues, but the node *node id* will not be prompted to perform scheduled operations.

User response: Verify that the address type and address are correct for this client. The only valid address type is 1 (for TCP/IP). Make sure the client scheduler is not using an invalid address obtained from the client's options file or from the command line when the client scheduler was started.

ANR2716E Schedule prompter was not able to contact client *node name* using type *address type* (*high address low address*).

Explanation: The server has attempted to prompt the client scheduler for node *node name* because a scheduled operation should be started. The server is unable to contact the client by using address type *address type*, with high-level field *high address* and low-level field *low address*.

System action: Server operation continues, but node *node name* is not prompted to start the scheduled operation. If operations should be started for other nodes, the server will attempt to prompt the client schedulers for these nodes. This error is usually caused by network outages or the client scheduler program not being run on the client node.

User response: Verify that the address type and address are correct for this client. The only valid address type is 1 (for TCP/IP). Make sure the client

scheduler is not using an invalid address, obtained at the time the client scheduler was started, from either the client's options file or from the command line. Verify that the client scheduler for node *node name* is running and that the necessary communication links to that scheduler are operational.

ANR2717E Schedule prompter cannot contact client *node name* using address type (*address type*).

Explanation: The server attempts to prompt the client scheduler for node *node name* because scheduled work should be started. However, either the server does not support address type *address type* needed for server-prompted scheduling, or the communication method is not currently available. The only valid address type is 1 (for TCP/IP).

System action: Server operation continues, but the server does not prompt node *node name*.

User response: If the server does not support the *address type* specified, clients may only use the polling mode of scheduling. If the communication method is temporarily not available, prompted mode scheduling will resume after the communication problem is fixed and service restored. If the problem persists, contact your service representative.

ANR2718W Schedule manager disabled.

Explanation: The schedule manager has been disabled because the DISABLESCHEDULES YES option was specified in the server options file.

System action: Server operation continues, but the central scheduler is not operational.

User response: To enable the schedule manager, specify DISABLESCHEDULES NO in the server options file and restart the server.

ANR2750I Starting scheduled command *schedule name* (*scheduled command*).

Explanation: This message is displayed when the server starts the execution of a scheduled command. The name of the schedule and the actual command scheduled is displayed.

System action: Server operation continues, the scheduled command is processed.

User response: None.

ANR2751I Scheduled command *schedule name* completed successfully.

Explanation: This message is displayed when the server successfully completes processing of a scheduled command.

System action: Server operation continues.

User response: None.

ANR2752E Scheduled command *schedule name* failed.

Explanation: This message is displayed when the server encounters a failure in processing a scheduled command.

System action: Server operation continues. The scheduled command is ended.

User response: Examine messages issued prior to this message and use the UPDATE SCHEDULE command to correct the scheduled command. The QUERY EVENT command may also be used to determine the cause of the failure for this scheduled command.

ANR2753I (*Schedule name*):*command response*

Explanation: This message is used to display the server response to a scheduled command. The name of the command schedule is included at the beginning of the message in parentheses.

System action: Server operation continues. The scheduled command is ended.

User response: None.

ANR2754E DEFINE SCHEDULE or UPDATE SCHEDULE parameter CMD=*'command'* - Unknown command.

Explanation: The specified command is not a valid server command.

System action: The DEFINE SCHEDULE or UPDATE SCHEDULE command is not processed.

User response: Reissue the correct command.

ANR2755E DEFINE SCHEDULE or UPDATE SCHEDULE parameter CMD=*'command'* - not eligible for scheduling.

Explanation: The specified command is not eligible for scheduling.

System action: The DEFINE SCHEDULE or UPDATE SCHEDULE command is not processed.

User response: None.

ANR2756I Scheduled command *schedule name* started successfully.

Explanation: This message is displayed when the server successfully starts processing of a background process for a scheduled command.

System action: Server operation continues.

User response: None.

ANR2757E Command: The NODES parameter cannot be used when querying events for administrative schedules.

Explanation: A QUERY EVENT command has been issued with TYPE=ADMINISTRATIVE and the NODES parameter both specified. The NODES parameter cannot be specified when querying events for administrative schedules.

System action: Server operation continues, but the command is not processed.

User response: Issue the command without the NODES parameter.

ANR2758E Please specify a tracefile name with less than 37 characters if it is fully qualified or 26 characters if it is not fully qualified.

Explanation: The .template file adds 9 more characters to the end of the filename.

System action: Server operation continues.

User response: Reduce the filename length to a working range for s390 system

ANR2759I Command: The virtual file space definition *vfs name* for node *node name* has been deleted.

Explanation: In response to the DELETE VIRTUALFSMAPPING command, the virtual file space mapping *vfs name* for the node *node name* has been deleted in the server database.

System action: Server operation continues.

User response: None.

ANR2760E Command: Unable to delete the virtual file space definition *vfs name* for node *node name*. A file space definition exists with the same name.

Explanation: The DELETE VIRTUALFSMAPPING command has been entered, but the specified virtual file space mapping *vfs name* for the node *node name* has an associated file space definition in server database.

System action: The server does not process the command.

User response: To delete the virtual file space definition, first delete the filespace definition with the same name.

ANR2761I *Audit command: auditing inventory virtual file space mappings.*

Explanation: This message is displayed during a database audit and indicates that server information about virtual file space mappings is currently being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR2762I *Command: A virtual file space mapping named vfs name for node node name has been updated.*

Explanation: In response to the UPDATE VIRTUALFSMAPPING command, a virtual file space mapping for the specified node has been updated in the server database.

System action: Server operation continues.

User response: None.

ANR2763E *Command: The hexadecimal string entered for the path parameter is not valid.*

Explanation: The command indicated specifies an invalid Hexadecimal value for the path parameter.

System action: The server does not process the command.

User response: Check that the string representing the path contains only valid hexadecimal characters and contains an even number of characters. Reissue the command with a valid Hex string for the path parameter.

ANR2764E *command: Filespace filespace name cannot be renamed to new filespace name; a virtual file space with this name already exists for node node name.*

Explanation: The file space name specified as a target name for the command was found to already exist as a virtual file space for the node specified. The command fails.

System action: Server operation continues, the command fails.

User response: Reissue the command with a different target filespace name

ANR2765E *command: The node node name has an invalid node type for virtual file space definitions; the node type must be NAS.*

Explanation: A Define VirtualFSMapping command was entered with an invalid node type.

System action: The server does not process the command.

User response: You might want to run this command again, specifying a node of TYPE=NAS.

ANR2766W *Command: Virtual file space name vfs name conflicts with file space on the network attached storage (NAS) device.*

Explanation: The specified server command has been entered with a virtual file space that has the same name as a file space on the NAS device.

System action: The server operation continues.

User response: Ensure that no virtual file space mappings for this NAS device have the same name as an actual file space that exists on the NAS device.

ANR2767E *Command: The data format of storage pool Storage Pool Name does not match the data format of storage pool Storage Pool Name.*

Explanation: The data format of the indicated storage pools does not match. The requested operation failed.

System action: The command fails.

User response: Use QUERY STGPOOL F=D to display the data format for various pools and determine which may be eligible for the operation. Choose a storage pool that has the matching data format and re-issue the command.

ANR2768I *Process process ID will use data mover datamover name for the operation.*

Explanation: The indicated data mover is being used by the indicated process.

System action: The indicated data mover is being used by the indicated process.

User response: None.

ANR2769E *Command: Process process ID terminated - data mover inaccessible.*

Explanation: The indicated process terminated for the indicated command because none of the data movers is accessible.

System action: The indicated process terminates.

User response: Examine the previous error messages for possible reasons a remote session could not be started.

ANR2770E *Command:* **Process process ID skipped restoring data from volume *volume name* in storage pool name storage pool - drive path unavailable.**

Explanation: The indicated process skipped restoring data from the indicated volume because none of the NAS type datamovers is available.

System action: The data in the indicated volume is not restored.

User response: Use QUERY STGPOOL to obtain the device class to which the indicated source storage pool belongs. Use QUERY DEVCLASS to obtain the library containing the source storage pool. Then, use the QUERY DATAMOVER and QUERY PATH commands to verify that at least one NAS datamover has paths to the drives in the library.

ANR2771E **Move data process terminated for volume *volume name* - data mover inaccessible.**

Explanation: Move data processing terminated for the indicated volume because none of the data movers is accessible.

System action: Move data ends for the indicated volume.

User response: Examine the previous error messages for possible reasons a remote session could not be started.

ANR2772E *Command:* **Process process ID terminated - drive path or data mover unavailable.**

Explanation: The indicated process terminated for the indicated command for one of the following reasons:

- None of the data movers with paths to the drives in the library containing the source storage pool is available.
- None of the data movers with paths to the drives in the library containing the target storage pool is available.

System action: The indicated process ends.

User response: Use QUERY STGPOOL to obtain the device class to which the source or target storage pool belongs. Use QUERY DEVCLASS to obtain the library name that contains the source or target storage pool. Then, use the QUERY DATAMOVER and QUERY PATH commands to verify that at least one data mover has paths to the drives in the library.

ANR2773E **Move data process terminated for volume *volume name* - drive path or data mover unavailable.**

Explanation: MOVE DATA processing terminated for the indicated volume for one of the following reasons:

- None of the data movers with paths to the drives in the library containing the source storage pool is available.
- None of the data movers with paths to the drives in the library containing the target storage pool is available.

System action: The indicated process ends.

User response: Use QUERY STGPOOL to obtain the device class to which the source or target storage pool belong. Use QUERY DEVCLASS to obtain the library name that contains the source or target storage pool. Then, use the QUERY DATAMOVER and QUERY PATH commands to verify that at least one data mover has paths to the drives in the library.

ANR2774E *Command:* **Process process ID terminated - data format mismatch.**

Explanation: During restore processing, a data format mismatch occurred between the storage pool being restored and the copy storage pool.

System action: The indicated restore process terminates.

User response: Examine the previous error message to determine the name of the copy storage pool used for the restore. If possible, specify a copy storage pool that has the same data format as the storage pool being restored on the restore command.

ANR2775W *Command:* **Process Process id encountered an output error. File on volume *volume name* skipped - Node *node name*, type *file type*, file space *filespace name*, file name *file name*, fsId *filespace id*.**

Explanation: During copy or move operation, an output error was encountered. The indicated file was skipped.

System action: The file will not be processed.

User response: If possible, correct the error and re-run the command.

ANR2776I *Audit command:* **Inventory object (*object.ID*) is part of an incomplete group. The inventory entry will be deleted.**

Explanation: A database audit process found an inventory object that is part of an incomplete group. Because FIX=YES has been specified for the command, the inventory entry is deleted.

System action: Audit processing continues.

User response: None.

ANR2777I *Audit command: Inventory object (object.ID) is part of an incomplete group.*

Explanation: A database audit process found an inventory object that is part of an incomplete group.

System action: Audit processing continues.

User response: Run the audit command again with FIX=YES, so that the error can be corrected.

ANR2778I *Audit command: Storage entry for an inventory object (object.ID) cannot be found. The inventory entry will be deleted.*

Explanation: A database audit process cannot find the storage entry for the specified inventory object. Because FIX=YES has been specified for the command, the inventory entry is deleted.

System action: Audit processing continues.

User response: None.

ANR2779I *Audit command: Storage entry for an inventory object (object.ID) cannot be found.*

Explanation: A database audit process cannot find the storage entry for the specified inventory object.

System action: Audit processing continues.

User response: Run the audit command again with FIX=YES, so that the error can be corrected.

ANR2780W *Command: Updates for nodes previously processed during this command will be rolled back.*

Explanation: An error has occurred during an UPDATE NODE operation. If the UPDATE NODE command was processing more than one node, updates for nodes which were previously processed will be rolled back.

System action: Server operation continues.

User response: Correct the error and reissue the command.

ANR2781E *command name: keyword value longer than max length characters.*

Explanation: The directory specified for the indicated keyword is too long. Specify a directory less than or equal to the number of characters indicated. This is a limitation of the underlying database.

System action: Server database format processing terminates.

User response: Specify a valid value for the indicated keyword.

ANR2782I **SET DBRECOVERY completed successfully and device class for automatic DB backup is set to *value*.**

Explanation: The device class requirement for automatic database backup is set with the SET DBRECOVERY command.

System action: None.

User response: None.

ANR2783E **FORMAT: Required keyword *keyword* not specified.**

Explanation: A required keyword was not specified for database format processing.

System action: Server database format processing terminates.

User response: Reissue the format command with the required parameters.

ANR2784E **FORMAT: The mirror log directory must not be the same as the active log directory.**

Explanation: The server found an error when processing the format command.

System action: Server stops the format.

User response: Select a different directory for mirror log and reissue command.

ANR2785E **An error occurred when trying to access *path name*.**

Explanation: An access denied error occurred while attempting to access a directory.

System action: The command stops.

User response: Verify permission for that directory is set correctly then reissue the command.

ANR2786E **The server was unable to find *path name*.**

Explanation: The server could not find the directory specified.

System action: The command stops.

User response: Verify the existence of that directory and reissue the command.

ANR2787E The server failed with error code *last error* when attempt to access *path name*.

Explanation: The server failed to access the directory specified.

System action: The command stops.

User response: Verify the existence of that directory and reissue the command.

ANR2788E The server failed with error code *last error* when attempt to create files in *path name*. The path is not empty. It might contain data from your existing database.

Explanation: The format operation requires an empty directory to protect data from being overwritten.

System action: The format operation stops.

User response: Verify the directory that was specified. Delete any data in that directory if the data is not needed, or create a new directory. Reissue the format command.

ANR2789W Command: Node *node name* is registered, but the server cannot remove it because it is reserved.

Explanation: The command shown specifies a node that is reserved by the server.

System action: The server does not process the command.

User response: None.

ANR2790E Too many symbolic links were found while traversing file path *path name*.

System action: The server stops processing the command.

User response: Refer to your operating system's manual for the maximum number of symbolic links allowed on a path name. Reduce the number of symbolic links that lead to the file path, and then reissue the command.

ANR2791E The file or volume name *path name* is too long.

System action: The server stops processing the command.

User response: Check your operating system's limits on files and pathss length.Reissue the command with a shorter file or volume name.

ANR2792E A component of the path *path name* is not a directory.

Explanation:

System action: The server stops processing the command.

User response: Verify all directories in the path of the file or volume name. Reissue the command with a valid file or volume path. command.

ANR2797E The license value was skipped because of a bad date range.

Explanation: One or more license values were skipped due to the current system date not being valid for the license. This message occurs when reading the nodelock file. This can occur during server start-up, license audit, or REGISTER LICENSE.

System action: Server operation fails.

User response: Verify the correct system date setting. After you correct the system date, the licenses that are registered with a quantity value will need to be registered again.

ANR2798E Server operation is denied - server is not licensed for *License required*.

Explanation: The server refuses a server operation because the server is not licensed with the appropriate support.

System action: Server operation fails.

User response: Obtain and register the appropriate license.

ANR2799W Server operation is in violation of server license terms - server is not licensed for *License required*.

Explanation: The server warns about a server operation because the server is not licensed with the appropriate support.

System action: Server operation continues.

User response: Obtain and register the appropriate license.

ANR2800E The license manager cannot be started: *diagcode*.

Explanation: The license manager cannot be started during initialization because sufficient memory is not available. Diagnostic code *diagcode* is issued.

System action: Initialization fails.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating

Additional Server Memory”.

ANR2803I License manager started.

Explanation: The license manager is started when the server is initialized. The license manager monitors license compliance.

System action: Server operation continues.

User response: None.

ANR2804W Insufficient memory is available for the license manager - will retry in *number of seconds* seconds.

Explanation: The server suspends license manager processing because sufficient server memory is not available.

System action: Server operation continues; the license manager operation will be retried after the specified delay.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see “Appendix A. Allocating Additional Server Memory”.

ANR2805W Insufficient recovery log space available for the license manager - will retry in *number of seconds* seconds.

Explanation: The server suspends license manager processing because sufficient recovery log space is not available.

System action: Server operation continues; the license manager operation will be retried after the specified delay.

User response: To increase the amount of log space available to the server, an authorized administrator can add log volumes using the DEFINE LOGVOLUME command, and can extend the size of the log using the EXTEND LOG command.

ANR2806W Insufficient database space available for the license manager - will retry in *number of seconds* seconds.

Explanation: The server suspends license manager processing because sufficient database space is not available.

System action: Server operation continues; the license manager operation will be retried after the specified delay.

User response: To increase the amount of database space available to the server, an authorized administrator can add database volumes using the DEFINE DBVOLUME command, and can extend the size of the log using the EXTEND DB command.

ANR2807E Out of server log space in license manager.

Explanation: The server ends a database update transaction for the license manager because sufficient recovery log space is not available on the server.

System action: Server operation continues, but the database update fails.

User response: An authorized administrator can use the DEFINE LOGVOLUME command to add volumes for use by the log and can issue the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR2808E Out of server database space in license manager.

Explanation: The server ends a database update transaction for the license manager because sufficient database space is not available on the server.

System action: Server operation continues, but the database update fails.

User response: An authorized administrator can use the DEFINE DBVOLUME command to add volumes for use by the database and can use the EXTEND DB command to extend the size of the database so that the new volumes are used.

ANR2811I Audit License completed - Server is in compliance with license terms.

Explanation: The results from the AUDIT LICENSES command indicate the server is in compliance with the terms of the current license.

System action: Server operation continues.

User response: None.

ANR2812W License Audit completed - ATTENTION: Server is NOT in compliance with license terms.

Explanation: The results from the AUDIT LICENSES command indicate the server is not in compliance with the terms of the current license.

System action: Server operation continues, but the REGISTER NODE command or backup-archive requests, or both, will fail.

User response: Use the QUERY LICENSE command to determine the license terms that are no longer in compliance.

ANR2813I Server is licensed for a capacity of *capacity* gigabytes and *number of clients* clients.

Explanation: This message is issued during server startup.

System action: Server operation continues.

User response: None.

ANR2814I Audit command: License audit period changed to *number of days* days.

Explanation: This message is displayed in response to the SET LICENSEAUDITPERIOD command used to change the interval in days between automatic license audits.

System action: Server processing continues.

User response: None.

ANR2815E Command: Invalid value specified for interval between license audits - *value*.

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid value.

ANR2816E Command: License audit or register operation already in progress.

Explanation: The server is currently performing a register license or license audit.

System action: The server does not process the specified command.

User response: Reissue the command after the license audit process or the register license command ends. Only one REGISTER LICENSE command or AUDIT LICENSE process can be running at a time. The REGISTER LICENSE command and the AUDIT LICENSE process may not run at the same time.

ANR2817I Command: License audit started as process *process ID*.

Explanation: A background process has been started to audit the server for license compliance.

System action: The server checks the existing configuration for the server and compares it against the values for which the server is licensed.

User response: The administrator may query the status of the background process by using the QUERY PROCESS command, or cancel the process with the CANCEL PROCESS command.

ANR2818I Command: Licensed capacity is *capacity* GB with *number of clients* clients.

Explanation: This message displays the license information that existed before issuing the REGISTER LICENSE command.

System action: None.

User response: None.

ANR2819I Command: Licensed capacity changed to *capacity* GB with *number of clients* clients.

Explanation: The license information has been changed to the indicated values with the REGISTER LICENSE command.

System action: None.

User response: To implement the changed license information, issue an AUDIT LICENSES command or wait until an automatic license audit occurs.

ANR2820I Automatic license audit started as process *process ID*.

Explanation: A background process has been started to audit the server for license compliance.

System action: The server checks storage utilization and registered nodes for the server and licensed factors, comparing these against the values for which the server is licensed.

User response: The administrator may query the status of the background process using the QUERY PROCESS command.

ANR2821E Automatic license audit could not be started: *diagcode*.

Explanation: The license manager cannot start an automatic process to audit server licenses because sufficient memory is not available. Diagnostic code *diagcode* is issued.

System action: Server processing continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR2822I Cancel in progress

Explanation: The license audit operation has been cancelled and will end when resources have been freed for the background process. This message may be displayed in response to a QUERY PROCESS command for an AUDIT LICENSES operation.

System action: Server operation continues.

User response: None.

ANR2823I Have audited *number of nodes* nodes

Explanation: An AUDIT LICENSES operation is in progress. The process has audited the specified number of nodes. This message may be displayed in response to a QUERY PROCESS command for an AUDIT LICENSES operation.

System action: Server operation continues.

User response: None.

ANR2824I License audit process *process number* canceled - *number of nodes* nodes audited.

Explanation: A background server process to audit server licenses has been canceled by using the CANCEL PROCESS command. The number of nodes that have been audited before the operation ended are reported in the message.

System action: The server process is ended and server operation continues.

User response: None.

ANR2825I License audit process *process number* completed successfully - *number of nodes* nodes audited.

Explanation: A background server process to audit server licenses has completed successfully after auditing the specified number of nodes.

System action: The server process is ended and server operation continues.

User response: None.

ANR2826I License audit process *process number* terminated in error - *number of nodes* nodes audited.

Explanation: A background server process to audit server licenses encounters an error and is ended. The number of nodes that have been audited before the operation ended is reported in the message.

System action: The server process is ended and server operation continues.

User response: None.

ANR2832I *Command: The License Manager has not yet completed initialization - please retry this command later.*

Explanation: While attempting to process the specified license command, the server detects that the licensing component of the server had not completed initialization. The licensing facility used on some platforms may require some time to initialize because network calls are involved, and waits may occur.

System action: Server operation continues; the command is not processed.

User response: Reissue the command after waiting 10 minutes. If this message is displayed after a number of retry attempts, contact your service representative.

ANR2833I *Command: Auditing license definitions.*

Explanation: The server has started to audit database definitions that describe licensing information.

System action: Server database audit operation continues.

User response: None.

ANR2834W License Audit completed - WARNING: Server is NOT in compliance with license terms.

Explanation: The results from the AUDIT LICENSES command indicate that the server is not in compliance with the terms of the current license.

System action: Server operation continues, but the REGISTER NODE command fails.

User response: Use the QUERY LICENSE command to determine the license terms that are no longer in compliance. Remove nodes or purchase additional client node connections. After these actions have been taken, reissue the AUDIT LICENSES command to resynchronize the server configuration with license terms.

ANR2836I *Command: License audit started as process process ID.*

Explanation: A background process has been started to audit the server for license compliance.

System action: The server checks registered nodes for the server and compares this against the value for which the server is licensed.

User response: The administrator may query the status of the background process using the QUERY PROCESS command, or cancel the process with the CANCEL PROCESS command.

ANR2839I Automatic license audit started as process *process ID*.

Explanation: A background process has been started to audit the server for license compliance.

System action: The server checks registered nodes and compares them against the value for which the server is licensed.

User response: The administrator may query the status of the background process by using the QUERY PROCESS command.

ANR2841W Server is NOT IN COMPLIANCE with license terms.

Explanation: This message is issued periodically when the server configuration does not comply with the terms for which it is licensed.

System action: Server operation continues.

User response: Use the QUERY LICENSE command to display the current server configuration with respect to licensed terms to discover which factors of the configuration do not conform to your license. Contact your service representative to obtain more licenses, if required.

ANR2852I Current license information:

Explanation: This message is issued during a REGISTER LICENSE command to display the current licensing information for the server before the new license has been interpreted by the command. Messages appearing after this message display the factors under which the server is currently licensed.

System action: Server operation continues.

User response: None.

ANR2853I New license information:

Explanation: This message is issued during a REGISTER LICENSE command to display the updated licensing information for the server after the new license has been interpreted by the command. Messages appearing after this message display the updated factors under which the server is licensed.

System action: Server operation continues.

User response: Check to make sure that the new license information includes the updates that you intended for the REGISTER LICENSE command. If the license terms do not change, check the parameters and reissue the command, if you find that it was not entered correctly. If the REGISTER LICENSE command does not produce the desired updates in terms of licensing, contact your service representative.

ANR2855I Server is licensed to support Tivoli Space Manager clients.

Explanation: This message is issued during server startup.

System action: Server operation continues.

User response: None.

ANR2860I Server is licensed to support Tivoli Disaster Recovery Manager.

Explanation: This message is issued during server startup.

System action: Server operation continues.

User response: None.

ANR2900W The character string '*string*' was truncated during assignment.

Explanation: Truncation occurred during assignment of an SQL character string. For example, the expression CAST('Hello' AS CHAR(2)) will result in truncation because the string 'Hello' (length 5) can not fit in the target type CHAR(2) without loss of trailing characters.

System action: This warning can occur before or after SQL query processing, but does not terminate query processing.

User response: None.

ANR2901W The result of character string concatenation was truncated.

Explanation: Truncation occurred when the concatenation of character strings resulted in a length that exceeds the maximum character string length (250 for data type CHAR, and 2000 for data type VARCHAR).

System action: This warning can occur before or after SQL query processing, but does not terminate query processing.

User response: None.

ANR2902E Insufficient memory was available to process the SQL statement.

Explanation: Sufficient memory was not available to complete the processing of an SQL query.

System action: The SQL query is terminated.

User response: None.

ANR2903E An SQL parser stack overflow occurred while processing token '*token*'.

Explanation: The internal stack used by the SQL query parser has overflowed. This typically occurs when too many column names or expressions have been specified in the SELECT clause.

System action: The SQL query is terminated.

User response: None.

ANR2904E Unexpected SQL key word token - 'token'.

Explanation: A syntax error occurred because an SQL key word was found that can not legally be used at the specified position within the SQL statement. Examples of SQL key words are SELECT, FROM, and WHERE.

System action: The SQL query is terminated.

User response: None.

ANR2905E Unexpected SQL identifier token - 'token'.

Explanation: A syntax error occurred because an SQL identifier was found that can not legally be used at the specified position within the SQL statement. Examples of SQL identifiers are table names and column names.

System action: The SQL query is terminated.

User response: None.

ANR2906E Unexpected SQL literal token - 'token'.

Explanation: A syntax error occurred because an SQL literal token was found that can not legally be used at the specified position within the SQL statement. Examples of SQL literal tokens are 'abc', 1.567, and DATE '1/1/96'.

System action: The SQL query is terminated.

User response: None.

ANR2907E Unexpected SQL operator token - 'token'.

Explanation: A syntax error occurred because an SQL operator token was found that can not legally be used at the specified position within the SQL statement. Examples of SQL operator tokens are +, *, <, and =.

System action: The SQL query is terminated.

User response: None.

ANR2908E Unexpected SQL punctuation token - 'token'.

Explanation: A syntax error occurred because an SQL punctuation token was found that can not legally be used at the specified position within the SQL statement. Examples of SQL punctuation tokens are the period, the comma, and the parenthesis.

System action: The SQL query is terminated.

User response: None.

ANR2909E The SQL statement is incomplete; additional tokens are required.

Explanation: A syntax error occurred because, although the syntax of the SQL query expression was correct up to the end of the string, the parser expected additional tokens in order to form a syntactically-correct SQL statement.

System action: The SQL query is terminated.

User response: None.

ANR2910E Invalid SQL token - 'token'.

Explanation: An invalid SQL token was found. For example, the token formed by the character sequence "!!" is not a valid SQL token.

System action: The SQL query is terminated.

User response: None.

ANR2911E Invalid SQL numeric literal token - 'token'.

Explanation: An invalid SQL numeric literal token was found. For example, the floating point literal "1.456E" is not valid.

System action: The SQL query is terminated.

User response: None.

ANR2912E Invalid character string literal token - 'token'.

Explanation: An invalid SQL character string literal token was found. For example, the hexadecimal literal X'78FG' is not valid because it contains the character 'G'.

System action: The SQL query is terminated.

User response: None.

ANR2913E Invalid SQL identifier token - 'token'.

Explanation: An invalid SQL identifier token was found. For example, the character sequence "ABC.123" is not a valid identifier because the second part of the identifier, "123", does not begin with a letter.

System action: The SQL query is terminated.

User response: None.

ANR2914E SQL identifier token 'token' is too long; name or component exceeds 18 characters.

Explanation: An SQL identifier token was found that exceeds the maximum length of 18 characters per component.

System action: The SQL query is terminated.

User response: None.

ANR2915E The SQL token beginning with *'token'* is missing an ending delimiter.

Explanation: An SQL token was found that is missing its ending delimiter. For example, each of the tokens *'abc*, *"abc*, and *X'abc* is missing its ending delimiter.

System action: The SQL query is terminated.

User response: None.

ANR2916E The SQL data types *data type* and *data type* are incompatible for operator *'operator'*.

Explanation: The data types of the operands are not compatible when used with the specified operator. For example, the expression *3 + 'abc'* is not valid because the operand data types `INTEGER` and `CHAR(3)` are not compatible for the addition operator `"+"`.

System action: The SQL query is terminated.

User response: None.

ANR2917E The SQL data type of expression *'expression'* is data type; expecting an integer expression.

Explanation: An SQL expression of data type `SMALLINT`, `INTEGER`, or `DECIMAL` with scale zero is expected.

System action: The SQL query is terminated.

User response: None.

ANR2918E The SQL data type of expression *'expression'* is data type; expecting a Boolean expression.

Explanation: An SQL expression of data type `BOOLEAN` is expected.

System action: The SQL query is terminated.

User response: None.

ANR2919E The SQL data type of expression *'expression'* is data type; expecting a numeric expression.

Explanation: An SQL expression of numeric data type `SMALLINT`, `INTEGER`, `DECIMAL`, `NUMERIC`, `REAL`, `FLOAT`, or `DOUBLE_PRECISION` is expected.

System action: The SQL query is terminated.

User response: None.

ANR2920E The SQL data type of expression *'expression'* is data type; expecting a numeric or interval expression.

Explanation: An SQL expression of numeric data type (`SMALLINT`, `INTEGER`, `DECIMAL`, `NUMERIC`, `REAL`, `FLOAT`, `DOUBLE`) or of interval data type (`INTERVAL`) is expected.

System action: The SQL query is terminated.

User response: None.

ANR2921E The SQL data type of expression *'expression'* is data type; expecting a character string expression.

Explanation: An SQL expression of character string type `CHAR` or `VARCHAR` is expected.

System action: The SQL query is terminated.

User response: None.

ANR2922E The SQL data type of expression *'expression'* is data type; expecting a date, timestamp, character string date, character string timestamp, or interval expression.

Explanation: An SQL expression was expected of one of the types `DATE`, `TIMESTAMP`, `CHAR`, `VARCHAR`, or `INTERVAL` as the operand to the `EXTRACT` function. In the case of `CHAR` or `VARCHAR`, the expression must be a valid character string representation of a date or a timestamp.

System action: The SQL query is terminated.

User response: None.

ANR2923E The SQL data type of expression *'expression'* is data type; expecting a time, timestamp, character string time, character string timestamp, or interval expression.

Explanation: An SQL expression was expected of one of the types `TIME`, `TIMESTAMP`, `CHAR`, `VARCHAR`, or `INTERVAL` as the operand to the `EXTRACT` function. In the case of `CHAR` or `VARCHAR`, the expression must be a valid character string representation of a time or a timestamp.

System action: The SQL query is terminated.

User response: None.

ANR2924E The SQL data type of expression *'expression'* is data type; expecting a date or character string date expression.

Explanation: An SQL expression was expected of one of the types `DATE`, `CHAR`, or `VARCHAR`. In the case

ANR2925E • ANR2934E

of CHAR or VARCHAR, the expression must be a valid character string representation of a date.

System action: The SQL query is terminated.

User response: None.

ANR2925E The SQL data type of expression *'expression'* is data type; expecting a time or character string time expression.

Explanation: An SQL expression was expected of one of the types TIME, CHAR, or VARCHAR. In the case of CHAR or VARCHAR, the expression must be a valid character string representation of a time.

System action: The SQL query is terminated.

User response: None.

ANR2926E The SQL data type of expression *'expression'* is data type; expecting a date, timestamp, character string date, or character string timestamp expression.

Explanation: An SQL expression was expected of one of the types DATE, TIMESTAMP, CHAR, or VARCHAR. In the case of CHAR or VARCHAR, the expression must be a valid character string representation of a date or a timestamp.

System action: The SQL query is terminated.

User response: None.

ANR2927E The SQL data type of expression *'expression'* is data type; expecting an interval containing a single date-time field.

Explanation: An SQL expression was expected of data type INTERVAL YEAR, INTERVAL MONTH, INTERVAL DAY, INTERVAL HOUR, INTERVAL MINUTE, or INTERVAL SECOND, all of which contain a single date-time field. Multi-field interval types (for example, INTERVAL DAY TO SECOND) are not allowed.

System action: The SQL query is terminated.

User response: None.

ANR2928E A number can not be converted to SQL data type INTERVAL if the interval contains multiple date-time fields.

Explanation: An attempt was made to convert a number to the data type INTERVAL, but the target interval contains multiple date-time fields (for example, INTERVAL DAY TO SECOND). Only the single-field interval types INTERVAL YEAR, INTERVAL MONTH, INTERVAL DAY, INTERVAL HOUR, INTERVAL MINUTE, or INTERVAL SECOND can be specified.

System action: The SQL query is terminated.

User response: None.

ANR2929E The expression *'expression'* is not an integer constant.

Explanation: An integer constant such as 1 or -9 is expected. For example, the DECIMAL function requires that the precision and scale operands be integer constants. A decimal constant such as 1.67 is not valid.

System action: The SQL query is terminated.

User response: None.

ANR2930E A subquery used in an SQL expression must specify a single result column.

Explanation: A subquery used in an expression can not specify multiple result columns. For example, the expression X > (select A,B from T) is invalid because it specifies two result columns (A and B).

System action: The SQL query is terminated.

User response: None.

ANR2931E A subquery expression may not contain a reference to a column name that is contained in an outer query expression.

Explanation: A subquery contains a reference to a column name in an outer query expression.

System action: The SQL query is terminated.

User response: None.

ANR2932E The maximum nesting depth for subquery expressions has been exceeded.

Explanation: Too many nested subqueries were specified.

System action: The SQL query is terminated.

User response: None.

ANR2933E The WHERE clause must not contain an aggregate function.

Explanation: The use of the aggregate functions COUNT, MAX, MIN, SUM, AVG, VARIANCE, or STDDEV in the WHERE clause is not allowed.

System action: The SQL query is terminated.

User response: None.

ANR2934E The result data type of a CASE expression can not be determined; at least one non-null THEN or ELSE expression must be specified.

Explanation: The result data type of a CASE

expression can not be determined because all of the THEN expressions and the ELSE expression (if present) specifies the NULL key word.

System action: The SQL query is terminated.

User response: None.

ANR2935E The date-time field *field* is not present in the expression '*expression*' (data type *data type*).

Explanation: The specified date-time field (YEAR, MONTH, DAY, HOUR, MINUTE, or SECOND) is not contained in the data type of the expression.

System action: The SQL query is terminated.

User response: None.

ANR2936E The SQL aggregate function *function* can not be nested within another aggregate function.

Explanation: One of the aggregate functions COUNT, MAX, MIN, SUM, AVG, VARIANCE, or STDDEV was found nested within another aggregate expression.

System action: The SQL query is terminated.

User response: None.

ANR2937E An SQL subquery expression can not be nested within an aggregate function.

Explanation: An expression containing a subquery was found nested within one of the aggregate functions COUNT, MAX, MIN, SUM, AVG, VARIANCE, or STDDEV.

System action: The SQL query is terminated.

User response: None.

ANR2938E The column '*column*' is not allowed in this context; it must either be named in the GROUP BY clause or be nested within an aggregate function.

Explanation: A column reference was specified that is neither a column specified in a GROUP BY clause nor is a column nested in one of the aggregate functions COUNT, MAX, MIN, SUM, AVG, VARIANCE, or STDDEV. The use of the column reference is prohibited because either 1) the GROUP BY clause has been specified, 2) the HAVING clause has been specified, or 3) at least one aggregate function is present.

System action: The SQL query is terminated.

User response: None.

ANR2939E The reference '*reference*' is an unknown SQL table name.

Explanation: The specified table reference is not one of the base tables defined by the server's database. The rows of the table SYSCAT.TABLES can be selected to obtain a list of all of the valid base tables.

System action: The SQL query is terminated.

User response: None.

ANR2940E The command '*reference*' contains an unknown SQL column name.

Explanation: A column name in the SQL command is not one of the base table columns defined by the server's database. The rows of the table SYSCAT.COLUMNS can be selected to obtain a list of all of the valid base table columns. If a two-part (compound) column reference such as X.Y is specified, then the correlation name X must be one of the active correlation names for the query.

System action: The SQL query is terminated.

User response: None.

ANR2941E The column reference '*column reference*' matches more than one SQL column name.

Explanation: The specified column reference is ambiguous because it matches the columns associated with multiple tables.

System action: The SQL query is terminated.

User response: None.

ANR2942E The column reference '*column reference*' is not allowed in this context because it is part of an outer SQL query expression.

Explanation: The specified column reference is not allowed because it names a columns of some outer query expression. Such references are not allowed when contained within the expressions of the HAVING and SELECT clauses.

System action: The SQL query is terminated.

User response: None.

ANR2943E The column reference '*column reference*' is a duplicate of another SQL column name in the same list.

Explanation: A duplicate column reference was specified within the same GROUP BY or ORDER BY list of columns.

System action: The SQL query is terminated.

User response: None.

ANR2944E The reference '*reference*' is an unknown SQL scalar function name.

Explanation: The specified function reference is not the name of a valid scalar function.

System action: The SQL query is terminated.

User response: None.

ANR2945E Too few arguments are specified for SQL scalar function *function*.

Explanation: Too few function arguments were specified. For example, the expression LEFT(x) is invalid because the LEFT function requires at least two arguments.

System action: The SQL query is terminated.

User response: None.

ANR2946E Too many arguments are specified for SQL scalar function *function*.

Explanation: Too many function arguments were specified. For example, the expression UPPER(x,y) is invalid because the UPPER function requires exactly one argument.

System action: The SQL query is terminated.

User response: None.

ANR2947E Division by zero was detected for operator '*operator*'.

Explanation: An attempt to divide by the number zero was detected for the specified SQL operator. The most likely cause of the problem is that one of the values of a column is zero, and that column is used in the denominator of a division operation. To protect against this case the NULLIF function can be used. For example, instead of the expression 1/X, specify 1/NULLIF(X,0), which will set the expression to null whenever the value if X is zero.

System action: The SQL query is terminated.

User response: None.

ANR2948E The value '*value*' can not be assigned or converted to SQL data type *data type*.

Explanation: A value could not assigned or converted to a value in the specified SQL data type because either 1) the data type of the value can not be legally cast to the target data type (for example, data type TIME can not be converted to data type INTEGER); 2) the assignment of the value results in overflow in the target data type (for example, the decimal value 12345678.34 can not be assigned to data type DECIMAL(3,2) because the precision of the target type is exceeded); or 3) the syntax of a character string value

is not appropriate for the target data type (for example, the string 'abc' can not be converted to data type DATE).

System action: The SQL query is terminated.

User response: None.

ANR2949E Arithmetic overflow occurred for SQL operator '*operator*'.

Explanation: An arithmetic overflow occurred for the specified operator. Examples of this include: 1) the application of the unary negation operator to the smallest INTEGER value (-2147483648) causes overflow because the result can not be represented in 2's complement; 2) the sum of the set of INTEGER column values applied to the SUM aggregate function can not be represented within the precision of INTEGER type.

System action: The SQL query is terminated.

User response: None.

ANR2950E Arithmetic or date-time overflow occurred for SQL operator '*operator*' for values '*value*' (data type *data type*) and '*value*' (data type *data type*).

Explanation: An arithmetic or date-time overflow occurred for the specified operator. The values that caused the overflow (and their SQL data types) are displayed.

System action: The SQL query is terminated.

User response: None.

ANR2951E The value '*value*' (data type *data type*) is not a valid argument for operator '*operator*'.

Explanation: An invalid value was specified as an argument to an SQL operator. For example, the expression SQRT(-1) is not valid because the argument to the SQRT function is negative.

System action: The SQL query is terminated.

User response: None.

ANR2952E The value '*value*' (data type *data type*) is not a valid character string representation of an SQL date or a timestamp for operator '*operator*'.

Explanation: An invalid character string representation of a DATE or TIMESTAMP was specified. For example, the string 'abc' is neither a valid date nor a timestamp.

System action: The SQL query is terminated.

User response: None.

ANR2953E The value '*value*' (data type *data type*) is not a valid character string representation of an SQL time or a timestamp for operator '*operator*'.

Explanation: An invalid character string representation of a TIME or TIMESTAMP was specified. For example, the string 'g pm' is neither a valid time nor a timestamp.

System action: The SQL query is terminated.

User response: None.

ANR2954E An SQL subquery used in a scalar expression must yield a table that contains at most one row.

Explanation: This error results when a subquery used in a scalar expression returns multiple rows, thereby making it ambiguous as to which value should be returned.

System action: The SQL query is terminated.

User response: Respecify the subquery (for example, using the WHERE clause) so that the subquery returns at most one row.

ANR2955E The SQL character string expression '*expression*' must return a single character.

Explanation: A single-character character string was expected for the ESCAPE clause of the LIKE operator, for the trim character of the TRIM operator, or for the pad character of the LEFT or RIGHT function. For example, the string 'Hello' is invalid because it contains multiple characters.

System action: The SQL query is terminated.

User response: None.

ANR2956E Unable to access SQL base table '*table*'.

Explanation: An error occurred when attempting to read rows from one of the SQL base tables. This message is typically preceded by another error describing the condition.

System action: The SQL query is terminated.

User response: None.

ANR2957E An error occurred inserting a row in an SQL temporary table. The server database size may need to be increased

Explanation: An error occurred when attempting to insert a row into a temporary table being used for an SQL query. This message is typically preceded by another error describing the condition. In many cases this error can be resolved by increasing the size of the

server database. Free space in the database is used to store temporary tables created during the execution of an SQL SELECT query.

System action: The SQL query is terminated.

User response: None.

ANR2958E SQL temporary table storage has been exhausted.

Explanation: The result of an SQL query could not be computed because temporary table storage space was unavailable. By issuing the QUERY DB command and viewing the Maximum Reduction parameter, you can determine the amount of space that is available for temporary table storage space. If the parameter is less than 4, the storage space becomes exhausted and the SQL query can no longer run. Complex SQL queries such as the ORDER BY clause, the GROUP BY clause, and the DISTINCT operator can cause additional temporary table space to be required.

System action: The SQL query is terminated.

User response: If your database is full, increase the size of the database. If your database is fragmented (Where the Available space parameter is greater than 4, but the Maximum Reduction parameter is less than 4), you must either unload and load your database or add avolume.

ANR2959E SQL temporary table row is too wide.

Explanation: A row could not be inserted into an SQL temporary table because the row is too wide. This can occur if 1) there are too many columns in the row being inserted, or 2) the sum of the lengths of the columns in the row is too wide. Temporary tables are used when 1) the ORDER BY clause is specified; 2) the GROUP BY clause is specified; or 3) the DISTINCT operator is specified.

System action: The SQL query is terminated.

User response: Reduce the number of columns specified in the ORDER BY and/or GROUP BY clauses.

ANR2960E Unexpected SQL enumerated type name token - '*token*'.

Explanation: A syntax error occurred because an SQL enumerated type name was found that can not legally be used at the specified position within the SQL statement. A list of all of the enumerated types declared by the server can be found in the SQL catalog table SYSCAT.ENUMTYPES.

System action: The SQL query is terminated.

User response: None.

ANR2961E Invalid SQL enumerated type name - 'name'.

Explanation: A syntax error occurred because an SQL enumerated type name was expected, but the specified name is not one of the declared enumerated types. For example, the literal expression XXX::YYYY is illegal because XXX is not a valid enumerated type name. A list of all of the enumerated types declared by the server can be found in the SQL catalog table SYSCAT.ENUMTYPES.

System action: The SQL query is terminated.

User response: None.

ANR2962E Unable to resolve SQL enumerated type for value 'value'.

Explanation: A syntax error occurred because an unqualified SQL enumerated value name was specified, but, because that value name is a member of more than one enumerated type, its type could not be resolved. For example, the enumerated value name YES belongs to more than one enumerated type, and so the result type of the expression YES = YES can not be resolved. A list of all of the enumerated types declared by the server can be found in the SQL catalog table SYSCAT.ENUMTYPES.

System action: The SQL query is terminated.

User response: None.

ANR2963W This SQL query may produce a very large result table, or may require a significant amount of time to compute.

Explanation: An SQL query has been posed that could potentially cause a very large number of rows to be returned and displayed, or may involve a large amount of processing time before the first result table row can be generated.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to continue with SQL query processing or 'N' to terminate the query.

ANR2964E The reference 'reference' is not a column of the SQL result table.

Explanation: The ORDER BY clause specified a column that is not part of the result table for the SQL query. Only those columns named in the select list are part of the result table.

System action: The SQL query is terminated.

User response: None.

ANR2965E An SQL temporary table cannot be built. *required columns* columns are needed. *maximum columns* is the maximum.

Explanation: A temporary table *required columns* wide is needed to complete processing for an SQL query. The maximum degree of an SQL table is *maximum columns*. The table will not be created.

System action: The SQL query is terminated.

User response: If the ORDER BY and/or GROUP BY clauses were specified, reduce the number of columns needed for the result table.

ANR2966E *Command/process:* Database temporary table storage has been exhausted.

Explanation: The named command or operation could not be completed because insufficient temporary table storage space was available. Free space in the server database is used to store temporary tables created during the execution of the named command or process.

System action: The named command or process is terminated.

User response: Extend the server database (after adding database volumes if necessary) and rerun the command or process.

ANR2967I Differential database backup started as process *process ID*.

Explanation: A background process was started to backup the contents of the database. The differential database backup process was assigned the process ID shown.

System action: The database backup process starts and server operation continues.

User response: The administrator may query the status of the database backup process by using the QUERY PROCESS command, or cancel the process with the CANCEL PROCESS command.

ANR2968E Database backup terminated. DB2 sqlcode: *sqlcode*. DB2 sqlerrmc: *sqlerrmc*.

Explanation: DB2 detected a problem during the backup operation. Sources of the problem might include:

1. Tivoli Storage Manager API configuration errors for the DB2 instance in which the Tivoli Storage Manager server database resides.
2. An error related to the DB2 backup operation.
3. Errors related to the target backup device.

System action: The database backup is terminated.

User response: If the message indicates DB2 sqlcode

2033, then the problem is probably the Tivoli Storage Manager API configuration. The DB2 instance uses the Tivoli Storage Manager API to copy the Tivoli Storage Manager database-backup image to the Tivoli Storage Manager server-attached storage devices. Common sqlerrmc codes include:

1. 50 - To determine whether an error created the API timeout condition, look for any Tivoli Storage Manager server messages that occurred during the database-backup process and that were issued before ANR2968E. Ensure that the Tivoli Storage Manager API options file has the correct TCPSEVERADDR and TCPPOINT options specified for the Tivoli Storage Manager server being backed up. If the option settings are wrong, correct them for the DB2 instance.
2. 53 - Ensure that the NODENAME option in the Tivoli Storage Manager API options files is set to `$$_TSMDBMGR_$$`.
3. 106 - Ensure that the DB2 Instance DSMI_DIR environment variable is pointing to the location of the Tivoli Storage Manager API executables and the dsm.sys configuration file. If the DSMI_DIR setting is wrong, correct it for the DB2 instance, and then restart the DB2 instance.
4. 137 - Ensure that the DB2-instance DSMAPIPW command was run and that it specified nodename `$$_TSMDBMGR_$$` and the password TSMDBMGR.
5. 400 - Ensure that the options specified in the Tivoli Storage Manager API options file are valid.
6. 406 - Ensure that the DB2 instance owner has at least read access to the Tivoli Storage Manager API options file. Ensure that the DB2-instance DSMI_CONFIG environment variable is pointing to a valid options file for the Tivoli Storage Manager API. If the DSMI_CONFIG setting is wrong, correct it for the DB2 instance, and then restart the DB2 instance.
7. For descriptions of other sqlerrmc values, look in the dsrmc.h file that is installed with the Tivoli Storage Manager API.

If this message is issued with a DB2 sqlcode that is not 2033, then look for more information about the error by opening a DB2 command-line processor window and typing: ? SQLsqlcode. For example, db2 => ? sql2428

ANR2969E Database restore terminated. DB2 sqlcode: *sqlcode*. DB2 sqlerrmc: *sqlerrmc*.

Explanation: DB2 detected a problem during the restore operation. Sources of the problem might include:

1. Tivoli Storage Manager API configuration errors for the DB2 instance in which the Tivoli Storage Manager server database resides.
2. Errors related to the DB2 restore operation.
3. Errors related to the target backup device.

System action: The database restore operation is terminated.

User response: If the message indicates DB2 sqlcode 2033, then the problem is probably the Tivoli Storage Manager API configuration. The DB2 instance uses the Tivoli Storage Manager API to copy the Tivoli Storage Manager database restore image from the Tivoli Storage Manager server-attached storage devices to DB2. Common sqlerrmc codes include:

1. 50 - To determine whether an error created the API timeout condition, look for any TSM server messages that occurred during the backup DB process and that were issued before ANR2969E. Ensure that the Tivoli Storage Manager API options file has the correct TCPSEVERADDR and TCPPOINT options specified for the Tivoli Storage Manager server being backed up. If the option settings are wrong, correct for the DB2 instance.
2. 53 - Ensure that the NODENAME option in the Tivoli Storage Manager API options files is set to `$$_TSMDBMGR_$$`.
3. 106 - Ensure that the DB2-instance DSMI_DIR environment variable is pointing to the location of the Tivoli Storage Manager API executables and the dsm.sys configuration file. If the DSMI_DIR setting is wrong, correct it for the DB2 instance, and then restart the DB2 instance.
4. 137 - Ensure that the DB2-instance DSMAPIPW command was run and that it specified the nodename `$$_TSMDBMGR_$$` and the password TSMDBMGR.
5. 400 - Ensure that the options specified in the Tivoli Storage Manager API options file are valid.
6. 406 - Ensure that the DB2 instance owner has at least read access to the Tivoli Storage Manager API options file. Ensure that the DB2 Instance DSMI_CONFIG environment variable is pointing to a valid options file for the Tivoli Storage Manager API. If the DSMI_CONFIG setting is wrong, correct it for the DB2 instance, and then restart the DB2 instance.
7. For descriptions of other sqlerrmc values, look in the dsrmc.h file that is installed with the Tivoli Storage Manager API.

If this message is issued with a DB2 sqlcode that is not 2033, then look for more information about the error by opening a DB2 command-line processor window and typing: ? SQLsqlcode. For example, db2 => ? sql2428

ANR2970E Database rollforward terminated - DB2 sqlcode *sqlcode* sqlerrmc *sqlerrmc*

Explanation: There is a problem detected by DB2.

System action: The database rollforward is terminated.

User response: More information about the error is

ANR2971E • ANR2981E

available by opening a DB2 command-line processor window and typing: ? SQLsqlcode. For example, db2 => ? sql2428

ANR2971E Database backup/restore/rollforward terminated - DB2 sqlcode *sqlcode* error.

Explanation: There is a problem detected by DB2.

System action: The database backup/restore/rollforward is terminated.

User response: More information about the error is available by opening a DB2 command-line processor window and typing: ? SQLsqlcode. For example, db2 => ? sql2428

ANR2972E Restore DB Command: Database restore/rollforward terminated - Not able to clean up log directory *directory name*.

Explanation: TSM tried to clean up this log directory before PIT restore DB and not able to.

System action: The database restore/rollforward is terminated.

User response: Please clean up this directory manually before performing DB PIT restore.

ANR2973E Restore DB Command: Database restore/rollforward terminated - Log directory is required and does not exist *directory name*.

Explanation: The log directory is required and it does not exist. PIT restore DB is terminated.

System action: The database restore/rollforward is terminated.

User response: Create the specified directory and retry.

ANR2974I Offline DB backup for database *DB Alias* completed successfully.

Explanation: Offline DB backup completed successfully.

System action: None.

User response: None.

ANR2975E Offline DB backup for database *DB Alias* failed with sqlcode *sqlcode* and sqlerrmc *sqlerrmc*.

Explanation: The Offline Database backup failed.

System action:

User response:

ANR2976I Offline DB backup for database *DB Alias* started.

Explanation: Offline DB backup started.

System action: None.

User response: None.

ANR2977E Command: Command failed - Restore DB failed with command error in device config file.

Explanation: Restore DB failed due to error in device configuration file.

System action: None.

User response: Correct the problem in device configuration file and retry.

ANR2978E Command: Invalid directory name - *directory name*.

Explanation: Restore DB failed due to invalid target directory name in device target directory file.

System action: None.

User response: Correct the problem in target directory file and retry.

ANR2979E Internal error - Control descriptor is NULL.

Explanation: Something is wrong the control descriptor is NULL.

System action: None.

User response: None.

ANR2980E Database backup terminated TCPIP failure - DB2 sqlcode *sqlcode* sqlerrmc *sqlerrmc*.

Explanation: There is a TCPIP failure detected by DB2.

System action: The database backup is terminated.

User response: Correct the TCPIP setup problem between TSM and DB2 and retry.

ANR2981E Database backup terminated due to environment or setup issue related to file access - DB2 sqlcode *sqlcode* sqlerrmc *sqlerrmc*.

Explanation: There is a problem related to environment or setup detected by DB2.

System action: The database backup is terminated.

User response: Ensure that you specified the correct file or directory name, correct the permissions, or

specify a new location and retry.

ANR2982E Database backup terminated due to environment or setup issue related to password - DB2 sqlcode *sqlcode* sqlerrmc *sqlerrmc*.

Explanation: There is a problem related to environment or setup detected by DB2.

System action: The database backup is terminated.

User response: If the TSM parameter PASSWORDACCESS is set to GENERATE, ensure that the system administrator has used the dsmapiw utility to set the password. If PASSWORDACCESS is set to PROMPT, ensure that the TSM_NODENAME and TSM_PASSWORD database configuration parameters have been set correctly.

ANR2983E Database backup terminated due to environment or setup issue related to DSMI_DIR - DB2 sqlcode *sqlcode* sqlerrmc *sqlerrmc*.

Explanation: There is a problem related to environment or setup detected by DB2.

System action: The database backup is terminated.

User response: Ensure that DSMI_DIR points to a directory containing the correct version of db2tca, restart the instance, and execute the command again.

ANR2984E Database backup terminated due to environment or setup issue related to DSMI_CONFIG - DB2 sqlcode *sqlcode* sqlerrmc *sqlerrmc*.

Explanation: There is a problem related to environment or setup detected by DB2.

System action: The database backup is terminated.

User response: Ensure that the DSMI_CONFIG environment variable points to a valid TSM options file. Ensure that the instance owner has read access to the dsm.opt file. Ensure that the DSMI_CONFIG environment variable is set in the db2profile.

ANR2985E Database backup terminated due to I/O error related to TCPIP - DB2 sqlcode *sqlcode* sqlerrmc *sqlerrmc*.

Explanation: There is a TCPIP problem detected by DB2 and caused the database backup to fail.

System action: The database backup is terminated.

User response: The possible TCPIP problem are connection time out, connection refused, bad host name or network unreachable. Correct the TCPIP problem between TSM and DB2 and retry.

ANR2986E Database backup terminated due to I/O error - DB2 sqlcode *sqlcode* sqlerrmc *sqlerrmc*.

Explanation: There is a I/O problem detected by DB2 and caused the database backup to fail.

System action: The database backup is terminated.

User response: Correct the I/O problem between TSM and DB2 and retry.

ANR2987W Session ended because of machine GUID or local host IP address mismatch.

Explanation: Backup or Restore DB commands are only allowed when the TSM database being backed up or restored and the TSM api and the TSM server are on the same machine. Either the GUID of the TSM api client in use by the database manager does not match the GUID of the TSM server or the local host IP address indicated by the TSM client is not accepted.

System action: The database backup or restore operation is terminated.

User response: Default acceptable local host addresses are "127.0.0.1" for IPV4 and "::1" for IPV6. If you can not configure one of these local host addresses on your system then use the TSM server option "DBMTRUSTEDIPADDR ipaddr" to set a local host address that can be accepted.

ANR2988W Attempt to add the last backup db volume used entry back in to the volume history was unsuccessful.

Explanation: Restore db operation was successful however the attempt to add the last backup db volume used back in to the volume history failed.

System action: The database restore operation is successful. Entry for last backup db volume used in the operation might be missing from volume history.

User response: Keep a copy of the volume history file that was used to do the restore operation. After you have verified the restore db operation do a backup db type=full. Manually track the volume that was not added back in to the volume history.

ANR2989E Database *Database Name* backup failed - Missing volume history file.

Explanation: Backup DB failed due to volume history file is not defined in the dsmserv.opt.

System action: None.

User response: Correct the problem in dsmserv.opt file and retry.

ANR2990E Database restore is terminated due to an invalid database path *sqlerrmc* and DB2 sqlcode *sqlcode*

Explanation: DB2 detected invalid database path.

System action: The database restore is terminated.

User response: Ensure the path exists and permissions are correct and issue restore DB command again or issue restore DB command again with ON parameter to specify a new valid database storage path.

ANR2996I The server log is *log full percentage* percent full. The server is no longer delaying transactions.

Explanation: The server log utilization was dangerously high and the server was delaying transactions. The log utilization is now at a lower level and the server is no longer delaying transactions.

System action: Server processing continues.

User response: Continue to monitor server activity and log usage. If log usage is low enough, you may consider reducing the amount of space allocated to the log.

ANR2997W The server log is *log full percentage* percent full. The server will delay transactions by *delay time* milliseconds.

Explanation: The server log utilization is very high. In order to prevent the server log from becoming full, the server will begin delaying transactions by the specified amount of time.

System action: Server processing continues.

User response: Monitor server activity and log usage. If possible, delay adding new work to the server load.

ANR2998W The server log is *log full percentage* percent full. The server has cancelled the oldest transaction in the log.

Explanation: The server log utilization is dangerously high. In order to prevent the server log from becoming exhausted, the server has cancelled the oldest transaction in the log. Once the server activity associated with this transaction is able to perform cleanup processing, log space will be freed.

System action: Server processing continues.

User response: Monitor server activity and log usage. If possible, delay adding new work to the server load.

ANR3000E *Command:* Command can only be issued on a configuration manager.

Explanation: The *command* can only be issued on a server that is a configuration manager.

System action: Server operation continues. The command is not processed.

User response: Issue this command from a configuration manager.

ANR3001E *Command:* Command can only be issued on a managed server.

Explanation: The *command* can only be issued on a managed server.

System action: Server operation continues. The command is not processed.

User response: Issue this command from a managed server.

ANR3002E *Command:* Profile name exceeds *maximum length* characters.

Explanation: The profile name specified in the *command* is longer than the maximum length allowed.

System action: Server operation continues. The command is not processed.

User response: Select a profile name that does not exceed the maximum length.

ANR3003E *Command:* Profile description exceeds *maximum length* characters.

Explanation: The profile description specified in the *command* is longer than the maximum length allowed.

System action: Server operation continues. The command is not processed.

User response: Select a description that does not exceed the maximum length.

ANR3004E *Command:* The configuration manager name exceeds *maximum length* characters.

Explanation: The configuration manager name specified in the *command* is longer than the maximum length allowed.

System action: Server operation continues. The command is not processed.

User response: Select a configuration manager name that does not exceed the maximum length.

ANR3005E *Command: The server name exceeds maximum length characters.*

Explanation: The configuration manager name specified in the *command* is longer than the maximum length allowed.

System action: Server operation continues. The command is not processed.

User response: Select a configuration manager name that does not exceed the maximum length.

ANR3006E *Command: The configuration refresh interval value must be between minimum value and maximum value.*

Explanation: The specified command has been issued with an invalid refresh interval.

System action: Server operation continues. The command is not processed.

User response: Issue the command and specify a valid refresh interval value.

ANR3007E *Command: The option option must be specified.*

Explanation: When the command is issued on a server that is neither a configuration manager nor a managed server, the specified option must be supplied.

System action: Server operation continues. The command is not processed.

User response: Reissue the command with the specified option.

ANR3010W *This command will delete an object that is associated with one or more profiles on a configuration manager. Subsequent configuration refresh processing will delete the object on managed servers that subscribe to a profile with which the object is associated.*

Explanation: A command has been entered that will delete an object from a configuration manager. Since this object is associated with one or more profiles on a configuration manager, configuration refresh processing will delete this object on subscribing managed servers.

System action: The system asks whether you wish to continue with the command.

User response: To process the command, enter 'Y' to continue or 'N' to stop the process.

ANR3011E *command: Subscription for profile profile name was not deleted because one or more objects could not be discarded.*

Explanation: This message was issued because one or more objects could not be discarded by the indicated command. A previous message gives an explanation for each object that could not be discarded.

System action: The system may discard some of the managed objects that are associated with profile *profile name*. The subscription itself is not deleted.

User response: Examine previous messages to determine the action that must be taken before remaining objects can be discarded. Alternatively, you can delete the subscription without using the DISCARDOBJECTS=YES option.

ANR3012I *command: Configuration manager state set to state.*

Explanation: The command has successfully set the configuration manager state.

System action: The command succeeded.

User response: None.

ANR3013W *command: Configuration manager state already set to state.*

Explanation: The specified state is already in force on the server.

System action: Server operation continues. The command is not processed.

User response: This server is already set to the specified state. If the state should be set differently, reissue the command specifying the new state value.

ANR3014E *command: One or more subscriptions still exist.*

Explanation: A configuration manager state cannot be set to OFF if one or more subscription still exist. The server still has a record of one or more subscriptions to its profiles.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SUBSCRIBERS command to determine which subscriptions still exist. The DELETE SUBSCRIBER command can be used to remove the record of these subscriptions. You may instead want to delete the actual subscription(s) on the managed server(s). When there are no more subscriptions recorded on the configuration manager, you must then delete all the profiles. Once the profiles have been deleted, you can reissue the command.

ANR3015E *command: One or more profiles still exist.*

Explanation: A configuration manager state cannot be set to OFF if one or more profiles still exist.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY PROFILE command to determine which profiles still exist on the configuration manager then use the DELETE PROFILE command. After all the profiles have been deleted, reissue the command.

ANR3016I *command: Configuration refresh interval set to interval.*

Explanation: The command has successfully set the configuration refresh interval to the specified value. Automatic configuration refresh processing will immediately be attempted and then will again be performed after the specified number of minutes of elapsed.

System action: The command succeeded.

User response: None.

ANR3017I *command: Profile profile name defined.*

Explanation: The command has successfully define a profile.

System action: The command succeeded.

User response: None.

ANR3018E *command: Profile profile name already exists.*

Explanation: The profile specified already exists on the configuration manager.

System action: Server operation continues. The command is not processed.

User response: Decide on another profile name and reissue the command.

ANR3019I *command: Profile profile name updated.*

Explanation: The command has successfully updated a profile.

System action: The command succeeded.

User response: None.

ANR3020E *command: Profile profile name not found.*

Explanation: The profile specified could not be found.

System action: Server operation continues. The command is not processed.

User response: Check to see if the profile name was specified correctly on the command. Use the QUERY PROFILE command to check to see if the profile exists on the configuration manager. Reissue the command with the correct profile name.

ANR3021I *command: Profile profile name copied to profile profile name.*

Explanation: The command has successfully copied the first profile to the newly created second profile. All the profile associations were also copied.

System action: The command succeeded.

User response: None.

ANR3022E *command: The profile lock timeout interval value must be between minimum value and maximum value.*

Explanation: The specified command has been issued with an invalid lock timeout interval.

System action: Server operation continues. The command is not processed.

User response: Issue the command and specify a valid lock timeout interval value.

ANR3023I *command: Profile profile name locked.*

Explanation: The command has successfully locked the profile. No configuration information can be propagated to the subscribers of the profile until it is unlocked.

System action: The command succeeded.

User response: None.

ANR3024W *command: Profile profile already locked with timeout interval greater than interval.*

Explanation: An attempt was made to lock the specified profile. The profile is already locked with a timeout interval greater than the value specified.

System action: The profile remains locked with the original timeout interval.

User response: If you want to lower the timeout interval, unlock the profile and then lock the profile again specifying the lower value.

ANR3025I *command: Profile profile name unlocked.*

Explanation: The command has successfully unlocked the profile. Configuration information can now be propagated to the subscribers of the profile.

System action: The command succeeded.

User response: None.

ANR3026I *command: Profile profile name deleted.*

Explanation: The command has successfully deleted the profile from the configuration manager.

System action: The command succeeded.

User response: None.

ANR3027E *command: One or more subscriptions still exist to profile profile name.*

Explanation: An attempt was made to delete a profile that still has subscriptions defined on one or more managed servers. The configuration manager still has a record of one or more subscriptions to the profiles.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SUBSCRIBERS command to determine which subscriptions still exist. Use the DELETE SUBSCRIPTION command on the managed server(s) to delete the subscriptions, and then reissue the DELETE PROFILE command on the configuration manager. Alternatively, the FORCE=YES option can be used on the DELETE PROFILE command to delete the profile even if there are subscriptions to the profile. In this case, messages will be issued when the managed server requests updates for that profile, informing the managed server that the profile has been deleted.

ANR3028E *command: Profile profile name is locked.*

Explanation: The specified command cannot be performed on a locked profile.

System action: Server operation continues. The command is not processed.

User response: Unlock the profile using the UNLOCK PROFILE command and then reissue the command.

ANR3029E *command: Profile name not specified.*

Explanation: A profile name must be specified on this command using the PROFILE= parameter.

System action: Server operation continues. The command is not processed.

User response: Reissue the command and specify a profile name.

ANR3030I *command: Subscription defined for profile profile name.*

Explanation: The command has successfully defined a subscription to the specified profile. A refresh of the configuration information has been initiated.

System action: The command succeeded.

User response: None.

ANR3031W *command: Subscription for profile profile name already exists.*

Explanation: A subscription already exists for the specified profile.

System action: Server operation continues. The command is not processed.

User response: Check to make sure you specified the correction profile name, and reissue the command if needed.

ANR3032E *command: Server name not specified.*

Explanation: A server name must be specified on this command using the SERVER= parameter. This identifies the configuration manager.

System action: Server operation continues. The command is not processed.

User response: Reissue the command and specify a server name.

ANR3033E *command: Server server is not the managed server's configuration manager.*

Explanation: A server name was specified on the command which does not match the current configuration manager. A managed server may only have one configuration manager.

System action: Server operation continues. The command is not processed.

User response: Reissue the command and leave off the server parameter. It will default to use the current configuration manager. A QUERY SUBSCRIPTION will display the configuration manager currently in use.

ANR3034E *command: Server server cannot be used as this server's configuration manager.*

Explanation: A server name was specified on the command which cannot be used as a configuration manager.

System action: Server operation continues. The command is not processed.

User response: Find out the correct name for the configuration manager and then reissue the command.

ANR3035I *command: Subscriber subscriber name deleted.*

Explanation: The command has successfully deleted a subscriber from the record kept in the configuration manager. If the subscriber (managed server) still has a subscription to a valid profile, the record of the subscription will reappear when it performs its next configuration refresh.

System action: The command succeeded.

User response: None.

ANR3036E *command: Subscriber subscriber name not found.*

Explanation: The specified subscriber name was not found in the configuration manager's records as being a valid subscriber of any profiles.

System action: Server operation continues. The command is not processed.

User response: Check to see that the subscriber (managed server) name is correction. If you think the name is correct, perhaps the managed server has not yet successfully contacted the configuration manager to inform it that the subscription exists.

ANR3037I *command: Subscription deleted for profile profile name.*

Explanation: The command has successfully deleted a subscription for the specified profile. A refresh of the configuration information has been initiated.

System action: The command succeeded.

User response: None.

ANR3038E *command: Subscription for profile profile name not found.*

Explanation: A subscription was not found for the specified profile.

System action: Server operation continues. The command is not processed.

User response: Check to see that the profile name was specified correctly. Issue the QUERY SUBSCRIPTION command to check to see which profiles have subscriptions. Reissue the command with the correct profile name.

ANR3039E *command: No matching administrators found in configuration.*

Explanation: No administrator definitions were found on the configuration manager that match the admin(s) specified on the DEFINE PROFASSOCIATION command.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY ADMIN command to check which administrators that are defined on the server and then reissue to DEFINE PROFASSOCIATION command.

ANR3040I *command: All administrators associated with profile profilename.*

Explanation: The command has successfully associated all the administrators with the specified profile. All administrator definitions will be automatically propogated to managed servers which subscribe to the profile. If an administrator is added to the configuration manager in the future, its definition will also be automatically propogated to the managed servers.

System action: The command succeeded.

User response: None.

ANR3041I *command: Administrator admin associated with profile profilename.*

Explanation: The command has successfully associated the administrator with the specified profile. The administrator definition will be automatically propogated to managed servers which subscribe to the profile.

System action: The command succeeded.

User response: None.

ANR3042W *command: No additional administrators associated with profile profilename.*

Explanation: No additional administrator were associated with the profile. The administrator(s) specified are already associated with the profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY ADMIN command to check which administrators are defined on the server and then reissue to DEFINE PROFASSOCIATION command. The QUERY PROFASSOCIATION FORMAT=DETAILED can be used to see which administrators are already associated with the profile.

ANR3043E *command: No matching domains found in configuration.*

Explanation: No domain definitions were found on the configuration manager that match the domain(s) specified on the DEFINE PROFASSOCIATION command.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY DOMAIN command to check which domains that are defined on the server and then reissue to DEFINE PROFASSOCIATION command.

ANR3044I *command: All domains associated with profile `profilename`.*

Explanation: The command has successfully associated all the domains with the specified profile. All domain definitions will be automatically propagated to managed servers which subscribe to the profile. If a domain is added to the configuration manager in the future, its definition will also be automatically propagated to the managed servers.

System action: The command succeeded.

User response: None.

ANR3045I *command: Domain `domain` associated with profile `profilename`.*

Explanation: The command has successfully associated the domain with the specified profile. The domain definition will be automatically propagated to managed servers which subscribe to the profile.

System action: The command succeeded.

User response: None.

ANR3046W *command: No additional domains associated with profile `profilename`.*

Explanation: No additional domains were associated with the profile. The domain(s) specified are already associated with the profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY DOMAIN command to check which domains are defined on the server and then reissue to DEFINE PROFASSOCIATION command. The QUERY PROFASSOCIATION FORMAT=DETAILED can be used to see which domains are already associated with the profile.

ANR3047E *command: No matching admin schedules found in configuration.*

Explanation: No admin schedule definitions were found on the configuration manager that match the admin schedule(s) specified on the DEFINE PROFASSOCIATION command.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SCHEDULE TYPE=ADMIN command to check which admin schedules are defined on the server and then reissue to DEFINE PROFASSOCIATION command.

ANR3048I *command: All admin schedules associated with profile `profilename`.*

Explanation: The command has successfully associated all the admin schedules with the specified profile. All admin schedule definitions will be automatically propagated to managed servers which subscribe to the profile. If an admin schedule is added to the configuration manager in the future, its definition will also be automatically propagated to the managed servers.

System action: The command succeeded.

User response: None.

ANR3049I *command: Admin Schedule `admin schedule` associated with profile `profilename`.*

Explanation: The command has successfully associated the admin schedule with the specified profile. The admin schedule definition will be automatically propagated to managed servers which subscribe to the profile.

System action: The command succeeded.

User response: None.

ANR3050W *command: No additional admin schedules associated with profile `profilename`.*

Explanation: No additional admin schedules were associated with the profile. The admin schedule(s) specified are already associated with the profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SCHEDULE TYPE=ADMIN command to check which admin schedules are defined on the server and then reissue to DEFINE PROFASSOCIATION command. The QUERY PROFASSOCIATION FORMAT=DETAILED can be used to see which admin schedules are already associated with the profile.

ANR3051E *command: No matching scripts found in configuration.*

Explanation: No script definitions were found on the configuration manager that match the script(s) specified on the DEFINE PROFASSOCIATION command.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SCRIPT command to check which scripts that are defined on the server and then reissue to DEFINE PROFASSOCIATION command.

ANR3052I *command: All scripts associated with profile `profilename`.*

Explanation: The command has successfully associated all the scripts with the specified profile. All script definitions will be automatically propagated to managed servers which subscribe to the profile. If a script is added to the configuration manager in the future, its definition will also be automatically propagated to the managed servers.

System action: The command succeeded.

User response: None.

ANR3053I *command: Script `script` associated with profile `profilename`.*

Explanation: The command has successfully associated the script with the specified profile. The script definition will be automatically propagated to managed servers which subscribe to the profile.

System action: The command succeeded.

User response: None.

ANR3054W *command: No additional scripts associated with profile `profilename`.*

Explanation: No additional scripts were associated with the profile. The script(s) specified are already associated with the profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SCRIPT command to check which scripts are defined on the server and then reissue to DEFINE PROFASSOCIATION command. The QUERY PROFASSOCIATION FORMAT=DETAILED can be used to see which scripts are already associated with the profile.

ANR3055E *command: No matching client option sets found in configuration.*

Explanation: No client option set definitions were found on the configuration manager that match the client option set(s) specified on the DEFINE PROFASSOCIATION command.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY CLOPTSET command to check which client option sets that are defined on the server and then reissue to DEFINE PROFASSOCIATION command.

ANR3056I *command: All client option sets associated with profile `profilename`.*

Explanation: The command has successfully associated all the client option sets with the specified profile. All client option set definitions will be automatically propagated to managed servers which subscribe to the profile. If a client option set is added to the configuration manager in the future, its definition will also be automatically propagated to the managed servers.

System action: The command succeeded.

User response: None.

ANR3057I *command: Client option set `client option set` associated with profile `profilename`.*

Explanation: The command has successfully associated the client option set with the specified profile. The client option set definition will be automatically propagated to managed servers which subscribe to the profile.

System action: The command succeeded.

User response: None.

ANR3058W *command: No additional client option sets associated with profile `profilename`.*

Explanation: No additional client option sets were associated with the profile. The client option set(s) specified are already associated with the profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY CLOPTSET command to check which client option sets are defined on the server and then reissue to DEFINE PROFASSOCIATION command. The QUERY PROFASSOCIATION FORMAT=DETAILED can be used to see which client option sets are already associated with the profile.

ANR3059E *command: No matching servers found in configuration.*

Explanation: No server definitions were found on the configuration manager that match the server(s) specified on the DEFINE PROFASSOCIATION command.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SERVER command to check which servers that are defined on the server and then reissue to DEFINE PROFASSOCIATION command.

ANR3060I *command: All servers associated with profile `profilename`.*

Explanation: The command has successfully associated all the servers with the specified profile. All server definitions will be automatically propagated to managed servers which subscribe to the profile. If a server is added to the configuration manager in the future, its definition will also be automatically propagated to the managed servers.

System action: The command succeeded.

User response: None.

ANR3061I *command: Server `server` associated with profile `profilename`.*

Explanation: The command has successfully associated the server with the specified profile. The server definition will be automatically propagated to managed servers which subscribe to the profile.

System action: The command succeeded.

User response: None.

ANR3062W *command: No additional servers associated with profile `profilename`.*

Explanation: No additional servers were associated with the profile. The server(s) specified are already associated with the profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SERVER command to check which servers are defined on the server and then reissue to DEFINE PROFASSOCIATION command. The QUERY PROFASSOCIATION FORMAT=DETAILED can be used to see which servers are already associated with the profile.

ANR3063E *command: No matching server groups found in configuration.*

Explanation: No server group definitions were found on the configuration manager that match the server group(s) specified on the DEFINE PROFASSOCIATION command.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SERVERGROUP command to check which server groups that are defined on the server and then reissue to DEFINE PROFASSOCIATION command.

ANR3064I *command: All server groups associated with profile `profilename`.*

Explanation: The command has successfully associated all the server groups with the specified profile. All server group definitions will be automatically propagated to managed servers which subscribe to the profile. If a server group is added to the configuration manager in the future, its definition will also be automatically propagated to the managed servers.

System action: The command succeeded.

User response: None.

ANR3065I *command: Server group `server group` associated with profile `profilename`.*

Explanation: The command has successfully associated the server group with the specified profile. The server group definition will be automatically propagated to managed servers which subscribe to the profile.

System action: The command succeeded.

User response: None.

ANR3066W *command: No additional server groups associated with profile `profilename`.*

Explanation: No additional server groups were associated with the profile. The server group(s) specified are already associated with the profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY SERVERGROUP command to check which server groups are defined on the server and then reissue to DEFINE PROFASSOCIATION command. The QUERY PROFASSOCIATION FORMAT=DETAILED can be used to see which server groups are already associated with the profile.

ANR3067E *command: No matching administrators associated with profile `profile`.*

Explanation: No matching administrator definitions are associated with the specified profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY PROFASSOCIATION command to check which administrators are associated with the profile and then reissue to DELETE PROFASSOCIATION command.

ANR3068I *command: All administrator associations deleted from profile `profilename`.*

Explanation: The command has successfully deleted all administrators associations from the specified profile. This will automatically delete these administrators from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3069I *command: Administrator association admin deleted from profile `profilename`.*

Explanation: The command has successfully deleted an administrator association from the specified profile. This will automatically delete this administrator from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3070E *command: No matching domains associated with profile `profile`.*

Explanation: No matching domain definitions are associated with the specified specified profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY PROFASSOCIATION command to check which domains are associated with the profile and then reissue to DELETE PROFASSOCIATION command.

ANR3071I *command: All domain associations deleted from profile `profilename`.*

Explanation: The command has successfully deleted all domains associations from the specified profile. This will automatically delete these domains from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3072I *command: Domain association `domain` deleted from profile `profilename`.*

Explanation: The command has successfully deleted a domain association from the specified profile. This will automatically delete this domain from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3073E *command: No matching admin schedules associated with profile `profile`.*

Explanation: No matching admin schedule definitions are associated with the specified specified profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY PROFASSOCIATION command to check which admin schedules are associated with the profile and then reissue to DELETE PROFASSOCIATION command.

ANR3074I *command: All admin schedule associations deleted from profile `profilename`.*

Explanation: The command has successfully deleted all admin schedules associations from the specified profile. This will automatically delete these admin schedules from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3075I *command: Admin schedule association admin schedule deleted from profile `profilename`.*

Explanation: The command has successfully deleted an admin schedule association from the specified profile. This will automatically delete this admin schedule from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3076E *command: No matching scripts associated with profile `profile`.*

Explanation: No matching script definitions are associated with the specified specified profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY PROFASSOCIATION command to check which scripts are associated with the profile and then reissue to DELETE PROFASSOCIATION command.

ANR3077I *command: All script associations deleted from profile `profilename`.*

Explanation: The command has successfully deleted all scripts associations from the specified profile. This will automatically delete these scripts from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3078I *command: Script association script deleted from profile `profilename`.*

Explanation: The command has successfully deleted a script association from the specified profile. This will automatically delete this script from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3079E *command: No matching client option sets associated with profile `profile`.*

Explanation: No matching client option set definitions are associated with the specified profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY PROFASSOCIATION command to check which client option sets are associated with the profile and then reissue to DELETE PROFASSOCIATION command.

ANR3080I *command: All client option set associations deleted from profile `profilename`.*

Explanation: The command has successfully deleted all client option sets associations from the specified profile. This will automatically delete these client option sets from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3081I *command: Client option set association client option set deleted from profile `profilename`.*

Explanation: The command has successfully deleted a client option set association from the specified profile. This will automatically delete this client option set from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3082E *command: No matching servers associated with profile `profile`.*

Explanation: No matching server definitions are associated with the specified profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY PROFASSOCIATION

command to check which servers are associated with the profile and then reissue to DELETE PROFASSOCIATION command.

ANR3083I *command: All server associations deleted from profile `profilename`.*

Explanation: The command has successfully deleted all servers associations from the specified profile. This will automatically delete these servers from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3084I *command: Server association server deleted from profile `profilename`.*

Explanation: The command has successfully deleted a server association from the specified profile. This will automatically delete this server definition from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3085E *command: No matching server groups associated with profile `profile`.*

Explanation: No matching server group definitions are associated with the specified profile.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY PROFASSOCIATION command to check which server groups are associated with the profile and then reissue to DELETE PROFASSOCIATION command.

ANR3086I *command: All server group associations deleted from profile `profilename`.*

Explanation: The command has successfully deleted all server groups associations from the specified profile. This will automatically delete these server groups from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3087I *command: Server group association server group deleted from profile `profilename`.*

Explanation: The command has successfully deleted a server group association from the specified profile. This will automatically delete this server group from the managed servers that are subscribed to this profile.

System action: The command succeeded.

User response: None.

ANR3088W This command will cause the deletion of objects on any managed server subscribed to profile *profile name*.

Explanation: A DELETE PROFASSOCIATION command option has been entered. This action will not only delete the association from the profile, but it will also result in the deletion of managed object(s) on any managed server subscribing to this profile. The deletion of these objects will occur during the next configuration refresh for that managed server.

System action: The system asks whether you wish to continue with the command.

User response: To process the DELETE PROFASSOCIATION command, enter 'Y' to continue or 'N' to stop the command.

ANR3089E *command: Command failed - Server-to-server communication error with server server name.*

Explanation: The specified command failed while attempting to communicate with the indicated server.

System action: Server operation continues. The command is not processed.

User response: Verify that the indicated server name is correctly defined. Try reissuing the command. Use the server PING command to see if the other server is up. If the problem persists, consult with your network administrator.

ANR3090E *command: Server server name is not a configuration manager.*

Explanation: The specified command failed because it tried to contact the specified server, and discovered that the server is not a configuration manager.

System action: Server operation continues. The command is not processed.

User response: Reissue the command and specify a correct configuration manager name.

ANR3091E *command: Profile list not specified.*

Explanation: The specified command failed because you did not specify a profile list on the command.

System action: Server operation continues. The command is not processed.

User response: Reissue the command specifying a profile list.

ANR3092I *command: Subscriber notification processing has begun.*

Explanation: A NOTIFY SUBSCRIBER process has begun. The managed server(s) are being contacted, asking them to immediately perform a configuration refresh.

System action: Server operation continues. The command succeeded.

User response: None.

ANR3093I *command: No matching profiles or subscriptions were found.*

Explanation: No subscriptions were found for the profiles specified. Either the profiles do not exist, or there are no subscriptions to the profiles.

System action: Server operation continues. The command is not processed.

User response: Use the QUERY PROFILE and QUERY SUBSCRIBER command to determine which profiles exist and which profiles have subscribers. Reissue the command specifying the correct profile name(s).

ANR3150E *Configuration refresh failed with configuration manager server name. Will retry in minutes minutes.*

Explanation: While receiving configuration information from the specified configuration manager, processing failed because of a communications error.

System action: Server operation continues. The configuration refresh process was stopped and will be automatically retried.

User response: Perhaps the configuration manager is not active. If the problem continues, contact the administrator for the configuration manager, or contact a network administrator. The refresh will automatically retry several times and then give up until the configuration refresh interval is reached again.

ANR3151E *Configuration refresh failed with configuration manager server name.*

Explanation: While receiving configuration information from the specified configuration manager, processing failed.

System action: Server operation continues. The configuration refresh process was stopped.

User response: Examine the activity log for other messages that may explain why the configuration refresh failed. The refresh will be attempted again when the configuration refresh interval is reached.

ANR3152I Configuration refresh started with configuration manager *server name*.

Explanation: Configuration refresh processing has started. A server-to-server session was opened to receive configuration information from the configuration manager. Updates will be sent for objects associated with any subscribed-to profiles.

System action: Refresh processing continues.

User response: None.

ANR3153I Configuration refresh ended successfully with configuration manager *server name*.

Explanation: Configuration refresh processing ended successfully. All updates have been made to managed objects associated with any subscribed-to profiles.

System action: Server processing continues. The next automatic refresh will start when the configuration refresh interval is reached.

User response: None.

ANR3154E Communication error on notify to managed server *server name*. Will retry in *minutes* minutes.

Explanation: While attempting a notify subscriber request to the specified managed server, a communications error was detected.

System action: Server operation continues. The notify subscriber request was stopped and will be automatically retried.

User response: Perhaps the managed server is not active. If the problem continues, contact the administrator for the managed server, or contact a network administrator. The notify subscriber request will automatically retry several times and then give up.

ANR3155E Error attempting notify subscribers request to managed server *server*.

System action: Server operation continues. The notify subscriber request failed.

User response: Examine the activity log for other messages that may explain why the notify subscriber request failed.

ANR3156E Configuration refresh failed for managed server *server name*.

Explanation: While sending configuration information to the specified managed server, processing failed.

System action: Server operation continues. The configuration refresh process ended.

User response: Examine the activity log of both the

managed server and the configuration manager for other messages that may explain why the configuration refresh failed. The refresh will be attempted again by the managed server when its configuration refresh interval is reached.

ANR3157I Configuration refresh started for managed server *server name*.

Explanation: Configuration refresh processing has started. A server to server session was opened by the managed server to receive configuration information from the configuration manager. Updates will be sent for objects associated with any subscribed-to profiles.

System action: Refresh processing continues.

User response: None.

ANR3158I Configuration refresh ended successfully for managed server *server name*.

Explanation: Configuration refresh processing ended successfully. All updates have been made to managed objects associated with any subscribed-to profiles on the managed server.

System action: Server processing continues.

User response: None.

ANR3159E Managed server *server name* **has newer version for profile** *profile name*.

Explanation: While sending configuration information to the specified managed server, it has been detected that the managed server has a newer version of configuration information for the specified profile than does the configuration manager. This condition can happen if the configuration manager's database has been restored to an earlier point in time. Another possibility is that the profile was deleted on the configuration manager and a new profile by the same name was created.

System action: Server operation continues. No configuration information for this profile will be sent to the managed server until this condition is corrected.

User response: Before correcting the situation, you may want to use QUERY PROFILE to examine the profile associations defined on both the configuration manager and the managed server. To correct the situation, on the managed server delete the subscription to the profile and define the subscription again. This will cause the managed server to be refreshed at the configuration manager's current level.

ANR3160E Unable to receive confirmation of refresh from managed server *server name*.

Explanation: While sending configuration information to the specified managed server, a communication error occurred when trying to receive confirmation from the managed server that information was processed successfully.

System action: Server operation continues. Configuration refresh processing ended.

User response: Determine if communication can be established with the managed server by using the server PING command. Use the NOTIFY SUBSCRIBERS command to force the configuration refresh to retry.

ANR3161E Premature end of configuration refresh for managed server *server name*.

Explanation: While sending configuration information to the specified managed server, processing ended prematurely because of an error.

System action: Server operation continues. Configuration refresh processing ended.

User response: Examine the activity log on the managed server for any error messages that might explain why the refresh failed. Use the NOTIFY SUBSCRIBERS command on the configuration manager to force the configuration refresh to retry.

ANR3162E Managed server *server name* aborted configuration refresh processing due to a low memory condition.

Explanation: While sending configuration information to the specified managed server, processing ended prematurely because of a low memory condition on the managed server.

System action: Server operation continues. Configuration refresh processing ended.

User response: Make more memory available to the managed server.

ANR3163E Managed server *server name* aborted configuration refresh processing due to an internal error.

Explanation: While sending configuration information to the specified managed server, processing ended prematurely because of an internal error on the managed server.

System action: Server operation continues. Configuration refresh processing ended.

User response: Examine the activity log of the managed server for messages that explain the cause of the internal error.

ANR3164E Managed server *server name* aborted configuration refresh processing due to a lock conflict.

Explanation: While sending configuration information to the specified managed server, processing ended prematurely because of a lock conflict on the managed server.

System action: Server operation continues. Configuration refresh processing ended.

User response: Use the NOTIFY SUBSCRIBERS command to retry the configuration refresh. If this problem persists, contact your service representative.

ANR3165E Managed server *server name* aborted configuration refresh processing due to a protocol error.

Explanation: While sending configuration information to the specified managed server, processing ended prematurely because of a protocol error detected on the managed server.

System action: Server operation continues. Configuration refresh processing ended.

User response: Use the NOTIFY SUBSCRIBERS command to retry the configuration refresh. If this problem persists, contact your service representative.

ANR3166E Unable to receive configuration refresh information from server *server name*.

Explanation: While receiving configuration information from the specified configuration manager, processing ended prematurely because of a communications error.

System action: Server operation continues. Configuration refresh processing ended.

User response: Use the server PING command to see if the configuration manager can be reached. If the problem persists, contact your network administrator.

ANR3167E Configuration manager *server name* aborted configuration refresh processing due to a low memory condition.

Explanation: While receiving configuration information from the specified configuration manager, processing ended prematurely because of a low memory condition on the configuration manager.

System action: Server operation continues. Configuration refresh processing ended.

User response: Notify the administrator of the configuration manager.

ANR3168E Configuration manager *server name* aborted configuration refresh processing due to an internal error.

Explanation: While receiving configuration information from the specified configuration manager, processing ended prematurely because of an internal error on the configuration manager.

System action: Server operation continues. Configuration refresh processing ended.

User response: Examine the activity log of the configuration manager for messages that explain the cause of the internal error.

ANR3169E Configuration manager *server name* aborted configuration refresh processing due to a lock conflict.

Explanation: While receiving configuration information from the specified managed server, processing ended prematurely because of a lock conflict on the configuration manager.

System action: Server operation continues. Configuration refresh processing ended.

User response: Retry the configuration refresh by issuing the SET CONFIGREFRESH command (using the current refresh interval value). If this problem persists, contact your service representative.

ANR3170E Configuration manager *server name* aborted configuration refresh processing due to a protocol error.

Explanation: While receiving configuration information from the specified configuration manager, processing ended prematurely because of a protocol error detected on the configuration manager.

System action: Server operation continues. Configuration refresh processing ended.

User response: Retry the configuration refresh by issuing the SET CONFIGREFRESH command (using the current refresh interval value). If this problem persists, contact your service representative.

ANR3171E Configuration refresh with configuration manager *server name* had to skip processing for one or more objects.

Explanation: While receiving configuration information from the specified configuration manager, it became necessary to skip the creation or deletion of one or more objects.

System action: Server operation continues. Configuration refresh processing ended.

User response: Examine the managed server's activity

log for earlier messages that identify the object, and take the actions identified in those messages. Configuration refresh processing will not complete successfully until the problem is clear up.

ANR3172W Subscription exists for deleted profile *profile name*.

Explanation: While receiving configuration information from the configuration manager, it has been detected that the managed server has a subscription to a profile that no longer exists on the configuration manager. This condition can exist because the profile was deleted with FORCE=YES on the configuration manager. This out-of-synch condition can also occur because one of the server's database was regressed because of a restore db.

System action: Server operation continues.

User response: The DELETE SUBSCRIPTION command is used to correct this situation. You need to decide if you want the managed objects to remain on the server. If you want them to be deleted, specify DISCARD=YES. If you want the objects to remain on the managed server as local objects, specify DISCARD=NO.

ANR3173E Server has newer version for profile *profile name* than the configuration manager *server name*.

Explanation: While receiving configuration information from the configuration manager, it has been detected that the managed server has a newer version of configuration information for the specified profile than does the configuration manager. This condition can happen if the configuration manager's database has been restored to an earlier point in time. Another possibility is that the profile was deleted on the configuration manager with FORCE=YES and a new profile by the same name was created.

System action: Server operation continues. No configuration information for this profile will be sent to the managed server until this condition is corrected.

User response: Before correcting the situation, you may want to use QUERY PROFILE to examine the profile associations defined on both the configuration manager and the managed server. To correct the situation, on the managed server delete the subscription to the profile and define the subscription again. This will cause the managed server to be refreshed at the configuration manager's current level.

ANR3174E Communication error with managed server *server name*.

Explanation: While receiving or sending information to the specified managed server, a communications error was experienced.

System action: Server operation continues. The operation in progress fails.

User response: If this error happens often, consult with your network administrator. Also check to see that the managed server is up.

ANR3175W Profile *profile name* is locked and could not be refreshed from configuration manager *server name*.

Explanation: While receiving configuration refresh information from the specified managed server, it was detected that a subscribed-to profile is locked.

System action: Server operation continues. Refresh processings skips over this profile.

User response: Normally, the profile will later be unlocked automatically, or by an administrator. If you think that it should not be locked, have ask the configuration manager admin to unlock it using the UNLOCK PROFILE command.

ANR3176W Profile *profile name* is locked and could not be refreshed for managed server *server name*.

Explanation: While sending configuration refresh information to the specified managed server, it was detected that a subscribed-to profile is locked.

System action: Server operation continues. Refresh processings skips over this profile.

User response: If the profile should no longer be locked, use the UNLOCK PROFILE command to unlock it.

ANR3177W Server level does not support object in profile *profile name*.

Explanation: While receiving configuration refresh information from the configuration manager, an object was received that is not supported on this managed server.

System action: Server operation continues. Refresh processings skips over this object. The refresh for the profile fails.

User response: The configuration manager is at a higher release level than the managed server. The managed server subscribed to a profile that contains an unsupported object. Delete the subscription to this profile until service can be applied to the server to bring it to a higher release level.

ANR3200E *command*: Command cannot be executed - domain *domain name* is a managed object.

Explanation: The specified command cannot be executed because it would alter the contents of the

indicated managed domain. With the exception of policy set activation, a managed domain can only be modified using configuration information propagated from the configuration manager.

System action: The command fails and server operation continues.

User response: None.

ANR3201E *command*: Domain *domain name* is a managed object and cannot be deleted.

Explanation: The indicated domain is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3202E *command*: Domain *domain name* is a managed object and cannot be updated.

Explanation: The indicated domain is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3203E *command*: Policy set *set name* in domain *domain name* is a managed object and cannot be deleted.

Explanation: The indicated policy set is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3204E *command*: Policy set *set name* in domain *domain name* is a managed object and cannot be updated.

Explanation: The indicated policy set is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3205E *command: Management class class name in domain domain name, policy set set name is a managed object and cannot be deleted.*

Explanation: The indicated management class is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3206E *command: Management class class name in domain domain name, policy set set name is a managed object and cannot be updated.*

Explanation: The indicated management class is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3207E *command: Backup copy group group name in domain domain name, policy set set name, management class class name is a managed object and cannot be deleted.*

Explanation: The indicated backup copy group is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3208E *command: Archive copy group group name in domain domain name, policy set set name, management class class name is a managed object and cannot be deleted.*

Explanation: The indicated archive copy group is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3209E *command: Backup copy group group name in domain domain name, policy set set name, management class class name is a managed object and cannot be updated.*

Explanation: The indicated backup copy group is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3210E *command: Archive copy group group name in domain domain name, policy set set name, management class class name is a managed object and cannot be updated.*

Explanation: The indicated archive copy group is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3211E *command: Client schedule schedule name in domain domain name is a managed object and cannot be deleted.*

Explanation: The indicated client schedule is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3212E *command: Client schedule schedule name in domain domain name is a managed object and cannot be updated.*

Explanation: The indicated client schedule is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this object, you can delete the subscription to the configuration profiles with which domain *domain name* is associated.

ANR3213E *command: Administrative schedule*
schedule name is a managed object and cannot be deleted.

Explanation: The indicated administrative schedule is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this object, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3214E *command: Administrative schedule*
schedule name is a managed object and cannot be updated, except to activate or deactivate the schedule.

Explanation: The indicated administrative schedule is a managed object and cannot be updated on the managed server, except to change the active state of the schedule.

System action: The command fails and server operation continues.

User response: To update this object, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3215W *Managed domain* *domain name* **contains at least one node and cannot be discarded.**

Explanation: This message is issued while processing a DELETE SUBSCRIPTION command with DISCARDOBJECTS=YES. The indicated domain cannot be discarded on the managed server because it still contains one or more nodes.

System action: Domain *domain name* is not deleted. Policy sets, management classes, copy groups, and client schedules belonging to this domain are also not deleted.

User response: Before this domain can be deleted, nodes in the domain must be removed or assigned another domain.

ANR3216W *Managed administrative schedule*
schedule name is active and cannot be discarded.

Explanation: This message is issued while processing a DELETE SUBSCRIPTION command with DISCARDOBJECTS=YES. The indicated administrative schedule cannot be discarded on the managed server because it is in the active state.

System action: Administrative schedule *schedule name* is not deleted.

User response: Before this administrative schedule can be deleted, it must be deactivated using the Update Schedule command.

ANR3217E *command: Administrator* *administrator*
name is a managed object and cannot be removed.

Explanation: The indicated administrator is a managed object and cannot be removed on the managed server.

System action: The command fails and server operation continues.

User response: To remove this administrator, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3218E *command: Administrator* *administrator*
name is a managed object and cannot be updated.

Explanation: The indicated administrator is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this administrator, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3219E *command: Administrator* *administrator*
name is a managed object and cannot be renamed.

Explanation: The indicated administrator is a managed object and cannot be renamed on the managed server.

System action: The command fails and server operation continues.

User response: To rename this administrator, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3220E *command: Administrator* *administrator*
name is a managed object - authority cannot be granted.

Explanation: The indicated administrator is a managed object. Authority cannot be granted to this administrator on the managed server.

System action: The command fails and server operation continues.

User response: To grant authority to this administrator, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3221E *command: Administrator administrator name is a managed object - authority cannot be revoked.*

Explanation: The indicated administrator is a managed object. Authority of this administrator cannot be revoked on the managed server.

System action: The command fails and server operation continues.

User response: To revoke authority of this administrator, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3222W *Managed administrator administrator name is the only system administrator and cannot be discarded.*

Explanation: This message is issued while processing a DELETE SUBSCRIPTION command with DISCARDOBJECTS=YES. The indicated administrator cannot be discarded on the managed server because it is the only system administrator.

System action: Administrator *administrator name* is not deleted.

User response: Before this administrator can be deleted, another administrator must be given system authority.

ANR3223W *Managed administrator administrator name is currently accessing the server and cannot be discarded.*

Explanation: This message is issued while processing a DELETE SUBSCRIPTION command with DISCARDOBJECTS=YES. The indicated administrator cannot be discarded on the managed server because it has an active session with the server.

System action: Administrator *administrator name* is not deleted.

User response: Quit or cancel all sessions for this administrator before discarding the administrator definition.

ANR3224E *command: Command script command script name is a managed object and cannot be deleted.*

Explanation: The indicated command script is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this script, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3225E *command: Command script command script name is a managed object and cannot be updated.*

Explanation: The indicated command script is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this script, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3226E *command: Command script command script name is a managed object and cannot be renamed.*

Explanation: The indicated command script is a managed object and cannot be renamed on the managed server.

System action: The command fails and server operation continues.

User response: To rename this script, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3227E *command: Option set optionset name is a managed object and cannot be deleted.*

Explanation: The indicated option set is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this option set, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3228E *command: Option set optionset name is a managed object and cannot be updated.*

Explanation: The indicated option set is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this option set, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3229E *command: Command cannot be executed - option set optionset name is a managed object.*

Explanation: The specified command cannot be executed because it would alter the contents of the indicated managed option set.

ANR3230E • ANR3237W

System action: The command fails and server operation continues.

User response: None.

ANR3230E *command:* **Server group *group name* is a managed object and cannot be deleted.**

Explanation: The indicated server group is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this server group, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3231E *command:* **Server group *group name* is a managed object and cannot be updated.**

Explanation: The indicated server group is a managed object and cannot be updated on the managed server.

System action: The command fails and server operation continues.

User response: To update this server group, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3232E *command:* **Server group *group name* is a managed object and cannot be renamed.**

Explanation: The indicated server group is a managed object and cannot be renamed on the managed server.

System action: The command fails and server operation continues.

User response: To rename this server group, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3233E *command:* **Command cannot be executed - server group *group name* is a managed object.**

Explanation: The specified command cannot be executed because it would alter the membership of the indicated managed server group.

System action: The command fails and server operation continues.

User response: None.

ANR3234E *command:* **Server *server name* is a managed object and cannot be deleted.**

Explanation: The indicated server is a managed object and cannot be deleted on the managed server.

System action: The command fails and server operation continues.

User response: To delete this object, you can delete the subscription to the configuration profiles with which the object is associated.

ANR3235E *command:* **Server *server name* is a managed object - one or more specified attributes cannot be updated.**

Explanation: Because the indicated server is a managed object, certain attributes cannot be updated on the managed server. These attributes are: SERVERPASSWORD, HLADDRESS, LLADDRESS, COMMMETHOD, DESCRIPTION, URL, and ALLOWREPLACE.

System action: The command fails and server operation continues.

User response: You can restrict the update to attributes that can be updated on the managed server. For example, the PASSWORD, NODENAME, FORCESYNC, and DELGRACEPERIOD attributes can be updated, even if the server is a managed object. Alternatively, you can delete the subscription to the configuration profiles with which the object is associated, so that the server is no longer a managed object.

ANR3236W **Server *server name* is currently in use and cannot be discarded.**

Explanation: This message is issued while processing a DELETE SUBSCRIPTION command with DISCARDOBJECTS=YES. The indicated server cannot be discarded on the managed server because *server name* is in use. This could occur if the managed server has an active connection to *server name* or if the managed server has a device class with DEVTYPE=SERVER that refers to *server name*.

System action: Server *server name* is not deleted.

User response: Before *server name* can be deleted, the managed server must not have a connection to that server and the managed server cannot have any device-class references to that server.

ANR3237W **Server *server name* is the event server and cannot be discarded.**

Explanation: This message is issued while processing a DELETE SUBSCRIPTION command with DISCARDOBJECTS=YES. The indicated server cannot be discarded because it is the event server for the managed server.

System action: Server *server name* is not deleted.

User response: Before *server name* can be deleted, the DELETE EVENTSERVER command must be used to remove the event server reference to *server name*.

ANR3238E *command*: This object cannot be renamed because it is associated with one or more configuration profiles.

Explanation: This message is issued on a configuration manager when an attempt is made to rename an object that is associated with one or more configuration profiles. Associated objects cannot be renamed because the enterprise configuration facility does not support renaming of objects.

System action: The command fails and server operation continues.

User response: If you must change the object name you can delete the object, define it with a new name, and then define a profile association to the new object (unless a wildcard profile association already exists). This will cause the object to be deleted and re-defined on managed servers with subscriptions to the profiles with which this object is associated.

ANR3239E *Error rc* while creating device class *device class*.

Explanation: This message is issued when a device class could not be created, because there was an error while processing the device configuration file.

System action: The command fails.

User response: Look in the device configuration file for errors, and look at the activity log for any previous error messages that might help determine the location of these errors in the device configuration file.

ANR3350W *Locally defined domain domain name* contains at least one node and cannot be replaced with a definition from the configuration manager.

Explanation: During configuration refresh processing the indicated locally defined domain could not be replaced with a definition from the configuration manager. The domain definition was not replaced because the domain still contains one or more assigned nodes.

System action: Refresh processing continues, but this domain is not replaced. The system will attempt to replace the local domain during later configuration refresh operations.

User response: If you want existing nodes to be assigned to the domain from the configuration manager, you can temporarily assign them to another domain. After the domain definition has successfully been propagated from the configuration manager, reassign the nodes to the new domain. Alternatively, if you want to prevent further attempts to replace the local domain definition during configuration refresh processing, delete the subscription to the profiles with which domain *domain name* is associated.

ANR3351W *Managed domain domain name* contains at least one node and cannot be deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the enterprise configuration facility attempted to remove the indicated domain because it has been deleted from the configuration manager or because the profile association no longer exists. The domain could not be deleted on the managed server because it still contains one or more nodes.

System action: Refresh processing continues, but this domain is not deleted. The system will attempt to delete the domain during later configuration refresh operations.

User response: Assign nodes in this domain to another domain. Alternatively, you can delete the subscription to the profiles with which domain *domain name* is associated.

ANR3352I *Locally defined domain domain name* replaced during configuration refresh processing.

Explanation: During configuration refresh processing, a local domain definition was replaced with a definition from the configuration manager. The system also deleted all policy sets, management classes, copy groups, and client schedules belonging to the locally defined domain and added definitions from the configuration manager.

System action: None.

User response: None.

ANR3353I *Managed domain domain name* deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the indicated managed domain was removed from the managed server. This occurred either because the domain has been deleted from the configuration manager or because the profile association no longer exists. The system also deleted all policy sets, management classes, copy groups, and client schedules belonging to the managed domain.

System action: None.

User response: None.

ANR3354W *Locally defined administrative schedule schedule name* is active and cannot be replaced with a definition from the configuration manager.

Explanation: During configuration refresh processing the indicated locally defined administrative schedule could not be replaced with a definition from the configuration manager. The schedule definition was not replaced because the schedule is in the active state.

System action: Refresh processing continues, but this administrative schedule is not replaced. The system will attempt to replace the local administrative schedule during later configuration refresh operations.

User response: If you want this administrative schedule to be replaced with the schedule definition from the configuration manager, deactivate the local schedule using the Update Schedule command. After the administrative schedule definition has successfully been propagated from the configuration manager, you can activate the new schedule. Alternatively, if you want to prevent further attempts to replace the local schedule definition during configuration refresh processing, delete the subscription to the profiles with which the schedule name is associated.

ANR3355W **Managed administrative schedule**
schedule name is active and cannot be deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the enterprise configuration facility attempted to remove the indicated administrative schedule because it has been deleted from the configuration manager or because the profile association no longer exists. The schedule could not be deleted on the managed server because the schedule is in the active state.

System action: Refresh processing continues, but this schedule is not deleted. The system will attempt to delete the administrative schedule during later configuration refresh operations.

User response: If you want this administrative schedule to be deleted in accordance with changes that have been made on the configuration manager, deactivate the managed schedule using the Update Schedule command. Alternatively, if you want to prevent further attempts to delete the managed schedule definition during configuration refresh processing, delete the subscription to the profiles with which the schedule name is associated.

ANR3356I **Locally defined administrative schedule**
schedule name replaced during configuration refresh processing.

Explanation: During configuration refresh processing, a local administrative schedule definition was replaced with a definition from the configuration manager.

System action: None.

User response: None.

ANR3357I **Managed administrative schedule**
schedule name deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the indicated managed administrative schedule was

removed from the managed server. This occurred either because the schedule has been deleted from the configuration manager or because the profile association no longer exists.

System action: None.

User response: None.

ANR3358W **Locally defined administrator**
administrator name is the only system administrator and cannot be replaced with a definition from the configuration manager.

Explanation: During configuration refresh processing the indicated locally defined administrator could not be replaced with a definition from the configuration manager. The administrator definition was not replaced because it is the only system administrator and the definition from the configuration manager does not include system authority.

System action: Refresh processing continues, but this administrator definition is not replaced. The system will attempt to replace the local administrator definition during later configuration refresh operations.

User response: If you want this administrator definition to be replaced with a definition from the configuration manager, you can grant system authority to another administrator. Alternatively, if you want to prevent further attempts to replace the local administrator definition during configuration refresh processing, delete the subscription to the profiles with which administrator *administrator name* is associated.

ANR3359W **Managed system administrator**
administrator name is the only system administrator and cannot be deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the enterprise configuration facility attempted to remove the indicated administrator because it has been deleted from the configuration manager or because the profile association no longer exists. The administrator could not be deleted on the managed server because it is the only system administrator.

System action: Refresh processing continues, but this administrator is not deleted. The system will attempt to delete the administrator during later configuration refresh operations.

User response: Grant system authority to another administrator. Alternatively, you can delete the subscription to the profiles with which administrator *administrator name* is associated.

ANR3360W Managed system administrator *administrator name* is the only system administrator - authority cannot be revoked during configuration refresh processing.

Explanation: During configuration refresh processing, the enterprise configuration facility attempted to revoke authority for the indicated administrator because authority has been revoked on the configuration manager. The authority of the administrator could not be revoked on the managed server because this is the only system administrator.

System action: Refresh processing continues, but authority is not revoked for this administrator. The system will attempt to revoke administrator during later configuration refresh operations.

User response: Grant system authority to another administrator. Alternatively, you can delete the subscription to the profiles with which administrator *administrator name* is associated.

ANR3361I Locally defined administrator *administrator name* replaced during configuration refresh processing.

Explanation: During configuration refresh processing, a local administrator definition was replaced with a definition from the configuration manager.

System action: None.

User response: None.

ANR3362I Managed administrator *administrator name* deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the indicated managed administrator was removed from the managed server. This occurred either because the administrator has been deleted from the configuration manager or because the profile association no longer exists.

System action: None.

User response: None.

ANR3363W Managed administrator *administrator name* is currently accessing the server and cannot be deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the enterprise configuration facility attempted to remove the indicated administrator because it has been deleted from the configuration manager or because the profile association no longer exists. The administrator could not be deleted on the managed server because it currently has an active session with the server.

System action: Refresh processing continues, but this administrator is not deleted. The system will attempt to delete the administrator during later configuration refresh operations.

User response: Quit or cancel all sessions for the indicated administrator. Alternatively, you can delete the subscription to the profiles with which administrator *administrator name* is associated.

ANR3364W Administrator *administrator name* has been removed. This administrator has defined or updated administrative schedules that will fail when executed.

Explanation: This message is issued during configuration refresh processing or as a result of a DELETE SUBSCRIPTION command with the DISCARDOBJECTS=YES option. The indicated managed administrator was removed from the server, but this administrator owns one or more administrative schedules. These schedules will fail when executed in the future because they do not belong to a valid administrator.

System action: The indicated administrator was removed.

User response: Use the QUERY SCHEDULE command OR an SQL SELECT statement on the ADMIN_SCHEDULES table to determine which schedules were last updated by the administrator. Use the UPDATE SCHEDULE command to update those schedules under an administrator that has authority to execute them, or use the DELETE SCHEDULE command to remove the schedules.

ANR3365I Locally defined command script *command script name* replaced during configuration refresh processing.

Explanation: During configuration refresh processing, a local command script definition was replaced with a definition from the configuration manager.

System action: None.

User response: None.

ANR3366I Managed command script *command script name* deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the indicated managed command script was removed from the managed server. This occurred either because the script has been deleted from the configuration manager or because the profile association no longer exists.

System action: None.

User response: None.

ANR3367I Locally defined option set *option set name* replaced during configuration refresh processing.

Explanation: During configuration refresh processing, a local option set definition was replaced with a definition from the configuration manager.

System action: None.

User response: None.

ANR3368I Managed option set *option set name* deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the indicated managed option set was removed from the managed server. This occurred either because the option set has been deleted from the configuration manager or because the profile association no longer exists.

System action: None.

User response: None.

ANR3369I Locally defined server group *group name* replaced during configuration refresh processing.

Explanation: During configuration refresh processing, a local server group definition was replaced with a definition from the configuration manager.

System action: None.

User response: None.

ANR3370I Managed server group *group name* deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the indicated managed server group was removed from the managed server. This occurred either because the server group has been deleted from the configuration manager or because the profile association no longer exists.

System action: None.

User response: None.

ANR3371W Server group *group name* cannot be defined during configuration refresh processing because a server already exists with this name.

Explanation: During configuration refresh processing, the enterprise configuration facility attempted to define the indicated server group on a managed server. The server group could not be defined because a server

definition with the same name already exists on the managed server.

System action: Refresh processing continues, but this server group is not defined. The system will attempt to define the server group during later configuration refresh operations.

User response: You can delete the subscription to the profile with which the indicated server group is associated or delete the conflicting server definition on the managed server. Alternatively, you can rename the server group on the configuration manager, after first deleting the profile association for that server group.

ANR3372I Locally defined server *server name* replaced during configuration refresh processing.

Explanation: During configuration refresh processing, a local server definition was replaced with a definition from the configuration manager.

System action: None.

User response: None.

ANR3373I Server *server name* deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the definition for managed object *server name* was removed from the managed server. This occurred either because *server name* has been deleted from the configuration manager or because the profile association no longer exists.

System action: None.

User response: None.

ANR3374I Server group *group name* replaced with server *server name* during configuration refresh processing.

Explanation: During configuration refresh processing, a server group definition was replaced with a server definition from the configuration manager. The server has the same name as the deleted server group.

System action: None.

User response: None.

ANR3375W Server *server name* is currently in use cannot be deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the enterprise configuration facility attempted to remove the indicated server definition because it has been deleted from the configuration manager or because the profile association no longer exists. The indicated server could not be deleted on the managed

server because *server name* is in use. This could occur if the managed server has an active connection to *server name* or if the managed server has a device class with DEVTYPE=SERVER that refers to *server name*.

System action: Refresh processing continues, but this server definition is not deleted. The system will attempt to delete the server during later configuration refresh operations.

User response: Before *server name* can be deleted, the managed server must not have a connection to that server and the managed server cannot have any device-class references to that server.

ANR3376W Server *server name* is the event server and cannot be deleted during configuration refresh processing.

Explanation: During configuration refresh processing, the enterprise configuration facility attempted to remove the indicated server definition because it has been deleted from the configuration manager or because the profile association no longer exists. The indicated server could not be deleted on the managed server because it is the event server for the managed server.

System action: Refresh processing continues, but this server definition is not deleted. The system will attempt to delete the server during later configuration refresh operations.

User response: Before *server name* can be deleted, the DELETE EVENTSERVER command must be used to remove the event server reference to *server name*.

ANR3377W Replacement of local server *server name* with a definition from the configuration manager is not allowed.

Explanation: During configuration refresh processing, the enterprise configuration facility attempted to replace the indicated server definition with a definition from the configuration manager. This operation could not be performed because ALLOWREPLACE=NO for the indicated server.

System action: Refresh processing continues, but this server definition is not replaced. The system will attempt to replace the server definition during later configuration refresh operations.

User response: Before the local server definition for *server name* can be replaced with a definition from the configuration manager, the UPDATE SERVER command must be used to set the ALLOWREPLACE attribute to ON.

ANR3470I Command: Auditing enterprise configuration definitions.

Explanation: The server has started to audit database definitions used by the enterprise configuration facility.

System action: Server database audit operation continues.

User response: None.

ANR3471E Audit command: Enterprise configuration global attributes are missing.

Explanation: A database audit process finds that the global attributes used by the enterprise configuration facility are missing.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES specified so that the enterprise configuration global attributes can be recreated.

ANR3472I Audit command: Enterprise configuration global attributes are missing - attributes will be recreated using available database information or default values.

Explanation: A database audit process finds that the global attributes used by the enterprise configuration facility are missing. Because FIX=YES has been specified on the AUDIT command, these attributes will be recreated using available information from the database or default values.

System action: Audit processing continues.

User response: When the audit completes, you can use the QUERY STATUS command to examine the values set for the enterprise configuration global attributes. Then use the appropriate SET command to change the attributes, if desired.

ANR3473E Audit command: Enterprise configuration global attribute(s) are incorrect.

Explanation: A database audit process finds that global attributes used by the enterprise configuration facility are incorrect.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES specified so that the enterprise configuration global attributes can be corrected.

ANR3474I Audit command: Enterprise configuration global attribute(s) are incorrect - attributes will be corrected using available database information or default values.

Explanation: A database audit process finds that

global attributes used by the enterprise configuration facility are incorrect. Because FIX=YES has been specified on the AUDIT command, these attributes will be corrected using available information from the database or default values.

System action: Audit processing continues.

User response: When the audit completes, you can use the QUERY STATUS command to examine the values set for the enterprise configuration global attributes. Then use the appropriate SET command to change the attributes, if desired.

ANR3475E *Audit command: Extraneous profile information found.*

Explanation: A database audit process finds extraneous configuration profile information.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the information is deleted.

ANR3476E *Audit command: Extraneous profile information found - information will be deleted.*

Explanation: A database audit process finds extraneous configuration profile information. Because FIX=YES has been specified for the audit command, the extraneous information will be deleted.

System action: Audit processing continues.

User response: None.

ANR3477E *Audit command: Profile information is inconsistent.*

Explanation: A database audit process detects inconsistent configuration profile information. This information can be corrected.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the information can be corrected.

ANR3478E *Audit command: Profile information is inconsistent - it will be corrected.*

Explanation: A database audit process detects inconsistent configuration profile information. Because FIX=YES has been specified for the audit command, the information will be corrected.

System action: Audit processing continues.

User response: None.

ANR3479E *Audit command: Profile association information is missing.*

Explanation: A database audit process detects missing profile association information. This information can be recreated.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the information can be recreated.

ANR3480E *Audit command: Profile association information is missing - it will be recreated.*

Explanation: A database audit process detects missing profile association information. Because FIX=YES has been specified for the audit command, the information will be recreated.

System action: Audit processing continues.

User response: None.

ANR3481E *Audit command: Extraneous profile association information found.*

Explanation: A database audit process finds extraneous profile association information.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the information is deleted.

ANR3482E *Audit command: Extraneous profile association information found - information will be deleted.*

Explanation: A database audit process finds extraneous profile association information. Because FIX=YES has been specified for the audit command, the extraneous information will be deleted.

System action: Audit processing continues.

User response: None.

ANR3483E *Audit command: Subscription information is inconsistent.*

Explanation: A database audit process detects inconsistent profile subscription information. This information can be corrected.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the information can be corrected.

ANR3484E *Audit command: Profile subscription information is inconsistent - it will be corrected.*

Explanation: A database audit process detects inconsistent profile subscription information. Because FIX=YES has been specified for the audit command, the information will be corrected.

System action: Audit processing continues.

User response: None.

ANR3485E *Audit command: Profile subscriptions were found to more than one configuration manager.*

Explanation: A database audit process determines that a managed server has subscriptions to more than one configuration manager. This may cause the enterprise configuration facility to behave in an unpredictable manner.

System action: Audit processing continues.

User response: Delete subscriptions for all but one configuration manager. To do this, it may be necessary to delete subscriptions to all configuration managers and then define the desired subscriptions.

ANR3500I *Backup set for node *node name* as set name (data type data type) being generated.*

Explanation: The named object set is being created for the specified node.

System action: The server generates a backup set.

User response: None.

ANR3501I *Backup set for *node name* as set name (data type data type) completed successfully - processed *files* files.*

Explanation: The named object set was successfully created for the specified node. The number of files processed is specified.

System action: None.

User response: None.

ANR3502W *Backup set for *node name* as set name (data type data type) completed with file processing errors - processed *files* files with error files files skipped.*

Explanation: The named object set was successfully created for the specified node. However, during processing errors were encountered accessing some files - these files were skipped.

System action: None.

User response: Evaluate other server messages for an indication of why the files were skipped. Files can be skipped because of failures locking those files, having no files to process, or for other more serious problems. First, retry the command and see if it completes without any skipped files. If you are unable to generate the backup set without skipping files, please contact your local service representative for assistance.

ANR3503E *Generation of backup set for *node name* as set name (data type data type) failed.*

Explanation: The named object for the specified node was not created. An error was encountered causing the creation of this object set not to complete successfully.

System action: Server operation continues.

User response: Evaluate other messages that were issued and try to determine the cause of the failure. After determining the cause of the failure, retry the command. If the cause can not be determined, please contact your local service representative.

If ANR3504W was received, then an error occurred while logging the volumes used to the server volume history. It is possible to issue a DEFINE BACKUPSET listing these volumes. That would cause the server to create the necessary entries for this backup set on this server.

ANR3504W *Backup set for *node name* as set name was not able to log the volumes used for this operation to the server volume history.*

Explanation: The named object for the specified node was created. However, when the process attempted to add the volumes, used for this operation to the volume history for the server, an error occurred and this could not be completed.

System action: Server operation continues.

User response: Review other messages issued to determine which volumes were used for to generate this backup set. The volumes can be inserted into the server volume history for use by issuing a DEFINE BACKUPSET and listing these volumes. This will also allow this backup set to be queried from a client as well since there is not a server entry for this backup set. Only issue the DEFINE BACKUPSET if this generate backup set operation completed successfully.

ANR3505I *Backup set for *node name* as set name used volume *volume name*.*

Explanation: The named object for the specified node used the specified volume.

System action: Server operation continues.

User response: None.

ANR3507I Cancel in progress

Explanation: This message is displayed in response to a QUERY PROCESS command, and indicates that a generate backupset process has been canceled. The process will end shortly.

System action: The process terminates and server operation continues.

User response: None.

ANR3508W Generation of backup set for *node name* as *set name (data type data type)* failed - no filespaces to process.

Explanation: The named object for the specified node was not created. No filespaces were available to process.

System action: Server operation continues.

User response: Reissue the command against a node that has filespaces associated with it. If no filespaces exist for a given node, then there is no file data to write to the backupset.

ANR3509E *Command: Error encountered in accessing data storage - device class *device class name* is not defined.*

Explanation: During command *command* processing, an error occurred because the specified device class is not defined.

System action: The command *command* is ended and server operation continues.

User response: Make sure the specified device class is defined.

ANR3510E *Command: Error encountered in accessing data storage - disk volume specified.*

Explanation: During command *command* processing, an error occurred because a specified volume is a disk volume rather than a tape volume.

System action: The command *command* is ended and server operation continues.

User response: Make sure that all volumes specified for the command *command* are tape volumes.

ANR3511E *Command: Error encountered in accessing data storage - invalid volume name specified.*

Explanation: The server encounters an error in accessing data storage while processing command *command*. The error occurred because an attempt has been made to access a volume with an invalid name.

System action: The command *command* operation is ended and server operation continues.

User response: Issue the command with a valid volume name.

ANR3512E *Command: Error encountered in accessing data storage - insufficient number of mount points available for removable media.*

Explanation: During command *command* processing, the server cannot allocate sufficient mount points.

System action: The command *command* operation is ended and server operation continues.

User response: If necessary, make more mount points available.

ANR3513E *Command: Output error encountered in accessing data storage.*

Explanation: The command *command* operation ends because an error has been encountered by the server in writing to a device. Possible reasons include:

- I/O error writing to a device
- No storage space.

System action: The command *command* operation ends and server operation continues.

User response: Query the activity log to find messages preceding this one to determine the cause of the error. After the problem is corrected, the command can be retried.

ANR3514E *Command: Data transfer was interrupted in accessing data storage.*

Explanation: The database transaction associated with command *command* operation failed because data transfer to or from data storage was interrupted by an external event.

System action: The command *command* operation is ended and server operation continues.

User response: Examine the messages issued prior to this message to determine why the data transfer was interrupted. Reissue the command *command* after the problem is resolved.

ANR3515E *Command: Error encountered in accessing data storage - volume already in use.*

Explanation: During command *command* processing, a volume cannot be used because it is already defined in a storage pool, or has been previously used by an export, database dump, or database backup operation (as recorded in the volume history) or is in use by another process.

System action: The command *command* operation is ended and server operation continues.

User response: Specify a volume that is not in use or

defined in a storage pool, and that has not been previously used for an export, database dump, or database backup operation as recorded in the server volume history information. Use the QUERY VOLUME command to display the names of volumes that are defined to server storage pools. Use the QUERY VOLHISTORY command to display the names of volumes that have been used for export, database dump, or database backup operations.

ANR3516E *Command: Out of space on sequential media, scratch media could not be mounted.*

Explanation: During command *command* processing, the process encounters an out-of-space condition writing to the sequential media. Command *command* ends when there is no more space on the sequential media for storing data and SCRATCH=NO has been specified on command *command*.

System action: Command *command* processing ends. Server processing continues.

User response: Reissue the command and specify SCRATCH=YES or specify additional volume names on the command.

ANR3517E *Command: Error encountered in accessing data storage - required volume was not mounted.*

Explanation: During command *command* processing, a required volume cannot be mounted. The mount request may have been canceled.

System action: The command *command* operation is ended and server operation continues.

User response: Issue the command again and make sure the necessary volumes are accessible.

ANR3518I *Command: Processing canceled before completion.*

Explanation: The background process to service the command *command* has been canceled with the CANCEL PROCESS command.

System action: Processing for the command *command* ends. Statistics on the number and type of objects moved, together with the total number of bytes copied, are displayed on the server console following this message.

User response: None.

ANR3519E *Command: Insufficient memory available in accessing data storage.*

Explanation: The server encounters a memory shortage in accessing data storage during command *command* operation.

System action: The command *command* operation ends and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see “Appendix A. Allocating Additional Server Memory”.

ANR3520E *Command: Internal error encountered in accessing data storage.*

Explanation: The server encounters an internal error in accessing data storage while processing command *command* operation.

System action: The command *command* operation is ended and server operation continues.

User response: Use the QUERY ACTLOG command to examine messages prior to this error to determine the cause of the data storage failure. If the failure can be found and resolved, reissue the command *command* operation. If the failure cannot be found, contact your service representative for assistance in resolving the problem.

ANR3521W *BackupSet command: Data storage retrieve or restore failed - error detected.*

Explanation: The server ends an backup set operation because an error has been encountered on the server. Some common reasons for the error are:

- The input volume is unavailable
- The storage pool is unavailable
- Data is corrupted on the input volume
- Hardware or media failure has occurred
- Database corruption

System action: The server ends the backup set operation and continues operation.

User response: Examine any prior error messages to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages if needed. Correct the problem and try the restore or retrieve again. You can also refer to the *Problem Determination Guide* for problem determination hints and information. If retry of the operation continues to fail contact your service representative.

ANR3522W *Command: Retrieve or restore failed - file was deleted from data storage during retrieval.*

Explanation: The server ends a file retrieval operation for the specified command because the file has been deleted from data storage by another process before retrieval is complete.

System action: The server ends the command and continues operation.

User response: Contact your administrator to find out

if DELETE FILESPACE, DELETE VOLUME, or inventory expiration processes are running; these processes can delete data storage files during retrieval. Reissue the command after these processes have been completed or canceled.

ANR3523W *Backup set command: Retrieve failed - error on input storage device.*

Explanation: The server ends a backup set operation for the specified session because an I/O error has been encountered by the server in reading from a device. The object for which the I/O was issued is reported in a later message.

System action: Backup set processing skips this file, and continues operation.

User response: Query the activity log to find messages preceding this one that specify the device that is failing. Storage pool volumes can be varied offline (by using the VARY OFFLINE command), or the server may need to be shut down with the HALT command to correct the hardware problem.

ANR3524W *Backup set command: Transaction failed - data transfer interrupted.*

Explanation: The database transaction associated with a backup set operation failed because data transfer to or from data storage was interrupted by an external event.

System action: The backup set operation is ended and server operation continues.

User response: Examine the messages issued prior to this message to determine why the data transfer was interrupted. Attempt the backup set operation again after problem is resolved.

ANR3525W *Backup set command: Transaction failed - storage media inaccessible.*

Explanation: The server ends a transaction for an backup set operation because storage volumes are not available in the storage pools in which the client files are to be stored.

System action: The server ends the backup set operation and server operation continues.

User response: An authorized administrator can issue the DEFINE VOLUME command to add storage to one or more storage pools in the storage hierarchy. The VARY ONLINE command can be used to vary offline storage volumes online in the storage hierarchy to make them available for file storage.

ANR3526E *Backup set command: Error encountered in accessing data storage - volume cannot be used.*

Explanation: During backup set processing, a volume has been mounted but cannot be used.

System action: The backup set operation is ended and server operation continues.

User response: Query the activity log for messages preceding this one that give additional information. Make sure a usable volume is specified and mounted.

ANR3527E *Backup set command operation terminated - it is acting on an empty volume or volume content is not as expected.*

Explanation: The volume content this command is acting upon is not as expected, the volume is empty, or the volume cannot be found.

System action: The command operation is ended.

User response: Issue the command again and make sure the expected content is in the volumes or the volume is not empty and exists.

ANR3528E *Backup set command: Media not accessible in accessing data storage.*

Explanation: The server ends a transaction for a backup set operation because storage volumes are not available in the storage pools in which the client files are to be stored.

System action: The server ends the backup set operation and server operation continues.

User response: An authorized administrator can issue the DEFINE VOLUME command to add storage to one or more storage pools in the storage hierarchy. The VARY ONLINE command can be used to vary offline storage volumes online in the storage hierarchy to make them available for file storage.

ANR3529W *Generate backupset skipping damaged file on volume* *volume name: Node node name, Type file type, File space filespace name, fsId filespace id, File name file name.*

Explanation: The backup set generation process encountered a file that was previously found to be damaged. The process encountered the file during a sequential scan of all files on the storage pool volume; the indicated file may or may not have been a candidate for inclusion in the backup set.

If this file is part of an aggregate, it may have been previously marked as damaged because an integrity error was detected in some other file within the same aggregate. AUDIT VOLUME can determine if this is the case, and if so, will reset the damaged state for the file.

System action: The damaged file is not added to the backupset.

User response: Audit the indicated volume with FIX=NO to determine if the file is actually damaged. The audit will reset the file's damaged state if the file is not damaged. (If the file is part of an aggregate, and none of the files within the aggregate are damaged, the audit will also reset the entire aggregate's damaged state.)

If the file remains in the damaged state after the audit completes, attempt to restore the damaged file by using the RESTORE STGPOOL command. Note, however, that this is only an option if the damaged file is in a primary storage pool that had been previously backed up to a copy storage pool.

If the audit resets the file's damaged state, or the damaged file was successfully restored using RESTORE STGPOOL, and it is important for this file be included in the backup set, then rerun the GENERATE BACKUPSET command to generate a new backup set containing the file.

ANR3530E *Audit command: A missing, incorrect, or invalid collocation group has been detected.*

Explanation: A database audit process found a missing, incorrect, or invalid collocation group.

System action: Audit processing continues.

User response: Issue the audit command again, and specify FIX=YES so that the error can be corrected.

ANR3531E *Audit command: A missing or incorrect collocation group has been detected; it will be corrected.*

Explanation: A database audit process found a missing, incorrect, or invalid collocation group. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR3532E *Audit command: Missing or incorrect collocation group identifier for collocation group collocation group name has been detected.*

Explanation: A database audit process detects an invalid, missing, or incorrect collocation group identifier.

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES so that the error can be corrected.

ANR3533E *Audit command: Missing or incorrect collocation group id detected for collocation group name - it will be corrected.*

Explanation: A database audit process detects missing or incorrect information for a collocation group. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR3534E *Audit command: Missing or incorrect collocation group name for collocation group id collocation group id has been detected.*

Explanation: A database audit process finds a missing or incorrect collocation group name.

System action: Audit processing continues.

User response: Issue the audit command again, and specify FIX=YES so that the error can be corrected.

ANR3535E *Audit command: Missing or incorrect collocation group name has been detected for collocation group id collocation group id - it will be corrected.*

Explanation: A database audit process detects missing or incorrect information for a collocation group. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR3536E *Audit command: Inconsistent information detected in collocation group (Aggregate.ID).*

Explanation: A database audit process finds inconsistent information for a collocation group. This problem cannot be corrected by the audit process.

System action: Audit processing continues.

User response: Contact your service representative.

ANR3537E *Audit command: A missing or incorrect collocation group member has been detected for collocation group ID collocation group ID.*

Explanation: A database audit process detects a missing or incorrect member for a collocation group.

System action: Audit processing continues.

User response: Issue the audit command again, and specify FIX=YES so that the error can be corrected.

ANR3538E *Audit command: A missing or incorrect collocation group member has been detected for collocation group id collocation group id - it will be corrected.*

Explanation: A database audit process detects a missing or incorrect member for a collocation group. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR3539E *Generation of backup set for node name as set name (data type data type) skipped shreddable data object.*

Explanation: The named object for the specified node was included.

Data retrieved from a shreddable storage pool was skipped because the ALLOWSHREDDABLE=YES parameter was not specified.

System action: Server operation is terminated.

User response: Check with your Storage Administrator to ensure data retrieved from a shreddable storage pool is a candidate for storing on a backupset. Data on backupsets cannot be shredded. Only data that resides in a shreddable storage pool can be shredded. Check whether your Storage Administrator allows shreddable data to be stored on backupsets. Restart the operation and specify the ALLOWSHREDDABLE=YES parameter.

A shreddable storage pool is a storage pool that has been defined with a non zero SHRED attribute. Alternatively, the storage pool from which the backupset data is retrieved can be updated as a non shreddable storage pool. This requires the storage pool SHRED attribute to have a value of zero. Backupsets generated from data retrieved from non shreddable storage pools do not require the ALLOWSHREDDABLE=YES parameter.

ANR3540E *Object set set node:set name:data type was not found for session session number, node.*

Explanation: The indicated session id requested to restore the object set. The object set was not found on the server.

System action: The error is returned to the client.

User response: None.

ANR3541E *Error error code occurred opening object set set node:set name:data type for session session number, node.*

Explanation: An error occurred while opening the indicated object set.

System action: An error is returned to the client.

User response: Correct the problem reported by previous messages, if possible.

ANR3542E *Error error code occurred reading object set set node:set name:data type for session session number, node.*

Explanation: An error occurred while reading the indicated object set.

System action: An error is returned to the client.

User response: Correct the problem reported by previous messages, if possible.

ANR3543E *Error error code occurred while sending entries from object set set node:set name:data type for session session number, node.*

Explanation: An error occurred while sending entries for the indicated object set.

System action: An error is returned to the client.

User response: Correct the problem reported by other prior or subsequent messages related to this session, and try the operation again.

ANR3544E *Generation of backup set for node name as set name (data type data type) skipped shreddable data object in file space filespace name (fsId filespace id), file name file name, type file type.*

Explanation: The named data object for the specified node was skipped while generating a backupset.

The data object resides in a shreddable storage pool and will not be included in the backupset because the ALLOWSHREDDABLE=YES parameter was not specified.

System action: Backupset generation continues.

User response: Check with your Storage Administrator to ensure data residing in a shreddable storage pool is allowed to be stored on a backupset. Data stored on backupsets cannot be shredded. Only data that resides in a shreddable storage pool can be shredded. If your Storage Administrator allows shreddable data to be stored on backupsets, then restart the operation and specify the ALLOWSHREDDABLE=YES parameter.

ANR3547I Backup set *set name* used volume *volume name*.

Explanation: The named object used the specified volume.

System action: Server operation continues.

User response: None.

ANR3550E Definition of backup set *set name* for *node name* failed because it has an unknown format.

Explanation: The named object for the specified node was not defined. It was generated on a server that is at a higher level than this server and contains data that cannot be properly interpreted by this server.

System action: Server operation continues.

User response: Define the object on a server that is compatible with the server that generated the object, or upgrade this server to be compatible with the server that generated the object.

ANR3601W Policy Domain release failed for domain *domain id* due to communications failure.

Explanation: The storage agent was attempting to inform the database server that it was finished with the domain indicated by the *domain id*, but was unable to communicate with the database server. The cached policy information will be cleaned up when the storage server terminates or re-starts or when the database server re-starts.

System action: The storage agent continues operation. The policy information is deleted from the storage agent policy cache.

User response: Policy caches are cleaned up on the storage agent or server re-start. Network communication between the storage agent and database server should be checked.

ANR3602E Unable to communicate with database server.

Explanation: The storage agent was attempting to communicate with the database server but was unable to do so.

System action: The storage agent operation fails.

User response: Check the configuration of the storage agent and server to ensure that communication parameters are correct. Ensure that the database server is running and is accepting messages.

ANR3603E Storage Agent *Storage Agent name* was unable to load policy information due to a protocol error.

Explanation: While receiving policy information from a database server, processing ended prematurely because of a protocol error.

System action: Server operation continues. Policy is loaded from the database server database.

User response: If this problem persists, contact your service representative.

ANR3604E This command is not supported in the current operating environment.

Explanation: A command was issued that is valid under most circumstances, but not in the current server environment.

System action: Server operation continues.

User response: Issue commands which are allowed in the current environment.

ANR3605E Unable to communicate with storage agent.

Explanation: The database server was attempting to communicate with the storage agent but was unable to do so.

System action: The database server operation fails.

User response: Check the configuration of the storage agent and server to ensure that communication parameters are correct.

ANR3606E The storage agent was communicating with the database server on a restore request with verb *verb name* and received return code *return code*.

Explanation: The storage agent and database server were coordinating a restore request. While communicating using the indicated verb (an internal request mechanism between the storage agent and database server), an unexpected return code was received. The verb name and return code are provided for Tivoli support personnel.

System action: Database server and storage agent continue. The restore request fails, but may be retried by the client.

User response: Check the configuration of the storage agent and server to ensure that communication parameters are correct. If this problem persists, contact your service representative.

ANR3607E The storage agent was communicating with the client on a restore request with verb *verb name* and received return code *return code*.

Explanation: The storage agent was communicating with a client for a restore request. While communicating using the indicated verb (an internal request mechanism between the storage agent and client), an unexpected return code was received. The verb name and return code are provided for Tivoli support personnel.

System action: Database server and storage agent continue. The restore request fails, but may be retried by the client.

User response: Check the configuration of the storage agent and client to ensure that communication parameters are correct. If this problem persists, contact your service representative.

ANR3608E The storage agent was communicating with the database server on a restore request. An unexpected request (id *verb*) was received from the database server.

Explanation: The storage agent and database server were coordinating a restore request. While communicating, the indicated verb (an internal request mechanism between the storage agent and database server), was unexpected. The verb number is provided for Tivoli support personnel.

System action: Database server and storage agent continue. The restore request may fail, but may be retried by the client.

User response: If this problem persists, contact your service representative.

ANR3609E The storage agent was handling a restore request. A failure occurred in starting a new thread. The return code *return code* from the failing routine may be useful to Tivoli service.

Explanation: The storage agent was handling a restore request. A new thread could not be started. Without the new thread the request could not be handled.

System action: Database server and storage agent continue. The restore request has failed.

User response: Ensure that there is sufficient system memory for the storage agent to operate properly. Insufficient memory or paging/swap space can cause problems in starting threads. If this problem persists, contact your service representative.

ANR3610I Domain Identifier *domain identifier* was not found.

Explanation: The server was cleaning up cached policy information after a restore request. A domain with the indicated identifier was not found in an internal list.

System action: Database server and storage agent continue.

User response: No response is required if the message is the result of starting a storage agent. The storage agent requests that the server purge cached information that it was using previously. It is possible that information tracking policy caching has become stale. In this case, no response is required. If the message occurs without a storage agent connecting to the server, contact your service representative.

ANR3611E Storage Agent unable to contact server.

Explanation: The storage agent was attempting to contact the server to start a session or run a command. The storage agent was unable to contact the server to start a transaction.

System action: The storage agent continues processing. The server may be down or there may be a communications problem.

User response: No response is required if the message is the result of stopping a server. Ensure that the server with which the storage agent communicates is running and that there is connectivity between the systems. The server must be restarted before you can start a new administrator session with the storage agent.

ANR3612E This command is not supported in the Express environment.

Explanation: A command was issued that is valid under most circumstances, but not in the current server environment.

System action: Server operation continues.

User response: Issue commands which are allowed in the current environment.

ANR3999E Failure validating database load: expected *numRecs* records and *numBV* bit vectors - loaded *actNumRecs* records and *actNumBV* bit vectors.

Explanation: The database load process has ended and the number of records, the number of bit vectors, or both the number of records or number of bit vectors loaded, failed to validate.

System action: The LOAD DB process completes with a failure. The server database is not in a usable state.

User response: A number of possible causes exist. To

recover from this situation, first retry the database load process. If the error reoccurs, check the activity log or other system logs to determine if there is a hardware or media error. If a hardware or media error exists, correct the error and retry the load process. If a hardware or media error does not exist, it is likely the dump or unload of the server database has encountered an error resulting in the dump/unload server database image as being unusable or that there is an error in the logic for load db processing. Contact your service representative for assistance.

ANR4000I *Dump command: Database dump process started.*

Explanation: The database dump process has started.

System action: The server dumps the contents of the database to a file or removable media.

User response: None.

ANR4001I *Dump command: Database dump process completed.*

Explanation: The database dump process has ended.

System action: The server completes processing.

User response: None.

ANR4002I *Dump command: Database dump process terminated due to error (error indicator).*

Explanation: The database dump process has ended prematurely due to an error.

System action: The server ends dump processing.

User response: Examine previously issued messages to determine if an error can be corrected, such as an output error. If you cannot resolve the error, contact your service representative.

ANR4003I *Load command: Database load process started.*

Explanation: The database load process has started.

System action: The server loads the contents of the database from a file or removable media.

User response: None.

ANR4004I *Load command: Database load process completed.*

Explanation: The database load process has ended.

System action: The server completes processing.

User response: None.

ANR4005E *Load command: Database load process terminated due to error (error indicator).*

Explanation: The database load process has ended prematurely due to an error.

System action: The server ends load processing.

User response: Examine previously issued messages to determine if an error can be corrected, such as a syntax error. If you cannot resolve the error, contact your service representative.

ANR4006I *Command: Volume volume number written by process is volume name.*

Explanation: A sequential data process wrote to the volume named in the series of one or more volumes that were used to store output. The volume's position in the series is indicated by the volume number reported.

System action: The server ends processing.

User response: None.

ANR4007E *Command: A transaction error was encountered in recording volume usage history.*

Explanation: The command process encounters a database transaction error in recording the names of the volumes used for the process in the server database.

System action: The server ends processing.

User response: Examine previously issued messages to determine if there is an error that can be corrected, such as a syntax error. If you cannot resolve the error, contact your service representative. The volumes used by the process are valid for the corresponding input process, but are not recorded in sequential volume history lists generated by the server.

ANR4008W *Load command: Database object object name does not exist.*

Explanation: The database load process attempts to delete a database object, but the object does not exist.

System action: Database processing continues.

User response: None.

ANR4009E *Load command: Database object object name cannot be deleted because it is in use by another process.*

Explanation: The database load process attempts to delete a database object, but the object is currently being used by another process.

System action: Database processing ends.

User response: Reissue the command. If it fails,

contact your service representative.

ANR4010E *Dump/load command: Database dump/load processing failed - insufficient memory.*

Explanation: The database dump/load process fails due to insufficient memory.

System action: Database processing ends.

User response: Allocate additional storage to the server. There are two ways to do this:

- Increase the size of the server's virtual machine (for VM), or region size (for MVS). For AIX, ensure that there is sufficient paging space. You may also use SMIT to determine if the number of applications is causing a memory shortage. For OS/2, ensure that there is sufficient space for the OS/2 SWAPPER.DAT file. Check your CONFIG.SYS for the SWAPPATH statement to determine where your SWAPPER.DAT file is located and then determine how much space is left on the drive.
- Decrease the amount of space allocated to the server's database or log buffer pool. To do this, update the value of the BUFPOOLSIZE or LOGPOOLSIZE parameters in the server options file and restart the server. Note that each page causes an additional 4K page to be allocated for the specified buffer pool. Reducing the pool sizes requires more I/O to service the same amount of data; some performance degradation may result.

ANR4011W *Dump command: Database page page number is invalid - it will be skipped.*

Explanation: The specified page is invalid, and it will not be used during dump processing.

System action: Processing continues.

User response: None.

ANR4012W *Dump command: Database page page number is damaged.*

Explanation: The specified database page is damaged; it will not be dumped.

System action: Processing continues.

User response: None.

ANR4013I *Dump command: Dumped number of entries database entries (cumulative).*

Explanation: This message indicates the number of database entries that have been dumped so far during database dump processing.

System action: Server processing continues.

User response: None.

ANR4014E *Load command: The specified input volume does not contain a server database dump.*

Explanation: The specified volume does not contain a dump created from the database dump command.

System action: Processing ends.

User response: None.

ANR4015E *Load command: Invalid record format (format code) detected.*

Explanation: During processing of command *load command*, an invalid record type is detected when reading the dumped information from the dump media.

System action: Processing of the command ends.

User response: Examine the server messages issued prior to this message to determine the source of the error. On MVS or VM, the LOADDB command syntax may be specified by using a ddname or by specifying a device class name. You must use the same method that was used when the database was originally dumped. If you did not, this error message will be displayed. Try loading the database by using the other method of syntax (devclass). If the error cannot be isolated and resolved, contact your service representative.

ANR4016E *Load command: Invalid header sequence number detected in database dump. Expected expected sequence number; Actual actual sequence number.*

Explanation: During processing of command *load command*, an invalid sequence number is detected when reading the dumped information from the dump media.

System action: Processing of the command ends.

User response: Examine previously issued server messages to determine the source of the error. If the error cannot be isolated and resolved, contact your service representative.

ANR4017E *Load command: Invalid record type record type read from database dump data.*

Explanation: The server database load process encounters an invalid record in reading data from the dump media.

System action: The database load process ends.

User response: Examine previously issued server messages to determine the source of the error. If the error cannot be isolated and resolved, contact your service representative.

ANR4018E *Load command:* **Load processing failed - insufficient recovery log space.**

Explanation: The load process fails due to insufficient recovery log space.

System action: Database load processing ends.

User response: Reinstall the server and specify a larger recovery log and reissue the database load command.

ANR4019E *Load command:* **Load processing failed - insufficient database space.**

Explanation: The load process fails due to insufficient database space.

System action: Load processing ends.

User response: Reinstall the server and specify a larger database and reissue the database load command.

ANR4020E *Load command:* **Batch database insert failed.**

Explanation: The database load process fails when it attempts to insert a batch of rows into the database.

System action: Database load processing ends.

User response: Examine the messages issued prior to this one to determine if an error can be corrected. You may wish to reinstall the server with a new recovery log and database and reissue the load command. If the problem persists, contact your service representative.

ANR4021E *Dump/load command:* **Error (error code) occurred during an open operation.**

Explanation: An error occurs while attempting an open operation on the dump media for a database dump/load operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the operation failed; correct the problem and restart the process.

ANR4022E *Dump command:* **Error (error code) occurred during a write operation.**

Explanation: The server database dump process encounters an error while writing to the dump media.

System action: Server processing continues, the dump processing ends.

User response: Refer to the other displayed messages to determine why the operation failed; correct the problem and restart the process.

ANR4023E *Load command:* **Error (error code) occurred during a read operation.**

Explanation: The server database load process encounters an error reading from the dump media.

System action: The database load operation ends.

User response: Refer to the other displayed messages to determine why the operation failed; correct the problem and restart the process.

ANR4025I *Dumped number of pages database pages, number of bit vectors bit vectors, and number of database entries database entries; number of bad pages bad database pages have been encountered; number of bytes copied.*

Explanation: This message is displayed in response to a QUERY PROCESS command executed against an online database dump process. The message displays information about the progress of the dump.

System action: Database dump processing continues.

User response: None. You may cancel the dump process with the CANCEL PROCESS command.

ANR4026I *Dump command:* **Process process number, database dump has completed.**

Explanation: The online server database dump process started as process *process number* has completed.

System action: Database dump processing ends.

User response: None.

ANR4027I *Dump command:* **Process process number, database dump was canceled.**

Explanation: The online server database dump process started as process *process number* has been canceled with the CANCEL PROCESS command.

System action: Database dump processing ends.

User response: None.

ANR4028I *Dump command:* **Process process number, Database dump terminated due to an error (error code).**

Explanation: The online database dump process has ended prematurely due to an error.

System action: The server ends dump processing.

User response: Examine the messages issued prior to this message to see if an error can be corrected, such as output error. If you cannot resolve the error, contact your service representative.

ANR4029I *Dump command:* **Database checkpoint started.**

Explanation: The database dump process is flushing updated database pages from the database buffer pool to stable storage so that they can be dumped.

System action: Database dump processing continues.

User response: None.

ANR4030I *Dump command:* **Database checkpoint completed.**

Explanation: The database dump process has flushed all updated pages from the database buffer pool to stable storage.

System action: Database load processing continues.

User response: None.

ANR4031I *Dump/load command:* **Copied number of pages database pages.**

Explanation: This message is displayed at the end of a server database dump or load command to indicate the number of database pages copied.

System action: Database dump or load processing ends.

User response: None.

ANR4032I *Dump/load command:* **Copied number of records database records.**

Explanation: This message is displayed at the end of a server database dump or load command to indicate the number of database records copied.

System action: Database dump or load processing ends.

User response: None.

ANR4033I *Dump/load command:* **Copied number of bit vectors bit vectors.**

Explanation: This message is displayed at the end of a server database dump or load command to indicate the number of database bit vectors copied.

System action: Database dump or load processing ends.

User response: None.

ANR4034I *Dump/load command:* **Encountered number of bad database pages bad database pages.**

Explanation: This message is displayed at the end of a server database dump or load command to indicate the number of invalid database pages that have been encountered.

System action: Database dump or load processing ends.

User response: None.

ANR4035I *Dump/load command:* **Encountered number of bad database records bad database records.**

Explanation: This message is displayed at the end of a server database dump or load command to indicate the number of invalid database records that have been encountered.

System action: Database dump or load processing ends.

User response: None.

ANR4036I *Dump/load command:* **Copied number of database entries database entries.**

Explanation: This message is displayed at the end of a server database dump or load command to indicate the number of database entries that have been copied.

System action: Database dump or load processing ends.

User response: None.

ANR4037I *Dump/load command:* **number of bytes copied.**

Explanation: This message is displayed at the end of a server database dump or load command to indicate the number of bytes that have been copied.

System action: Database dump or load processing ends.

User response: None.

ANR4038I *Load command:* **Loading database information dumped on dump date at dump time.**

Explanation: At the beginning of a server database load process, this message indicates the date and time that the dump took place for the database information that is loaded into the server.

System action: Database load processing continues.

User response: None.

ANR4039I *Load command:* **Loaded number of entries database entries (cumulative).**

Explanation: This message indicates the number of database entries that have been loaded so far during database load processing.

System action: Database load processing continues.

User response: None.

ANR4040I *Audit command: Auditing client node and administrator definitions.*

Explanation: This message is displayed during a database audit and indicates that the client node and administrator definitions are being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4041I *Audit command: Node node name is assigned to Domain domain name, but not verified by server database policy entries.*

Explanation: A database audit process finds a node assigned to a policy domain that is not recorded properly in policy database entries.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, you may want to run this command again, and specify FIX=YES so that the audit process can correct the policy domain assignment for the node.

ANR4042I *Audit command: Node node name is assigned to Domain domain name, but not found in server database policy entries - attempting to assign the node to domain domain name.*

Explanation: A database audit process finds a node assigned to a policy domain that cannot be referenced in database policy entries. Because FIX=YES has been specified for the audit command, the audit function will attempt to correct the policy domain assignment for the node.

System action: Audit processing continues.

User response: When the audit command completes, you may want to check the domain assignment for this node, and reassign the node to a different policy domain, if desired.

ANR4043I *Audit command: Node node name assignment failed - will attempt to assign the node to domain domain name.*

Explanation: A database audit process finds a node assigned to a policy domain that cannot be located in database policy entries. Because FIX=YES has been specified for the audit command, the audit function is attempting to assign the node to an existing policy domain. The function attempts to assign the node to the domain name specified.

System action: Audit processing continues.

User response: When the audit command completes,

you may want to check the domain assignment for this node, and reassign the node to a different policy domain, if desired.

ANR4044I *Audit command: Could not assign Node node name to a policy domain; use the UPDATE NODE command to assign a policy domain for this node.*

Explanation: A database audit process cannot find an appropriate policy domain for assigning the specified node.

System action: Audit processing continues.

User response: When the audit command completes, use the UPDATE NODE command to assign the specified node to an appropriate policy domain.

ANR4045I *Audit command: Invalid compression value encountered for node node name.*

Explanation: A database audit process encounters an invalid node compression value for the node indicated.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, you may want to run this command again, and specify FIX=YES so that the audit process can correct the problem.

ANR4046I *Audit command: Invalid compression value encountered for node node name the default value will be set.*

Explanation: A database audit process encounters an invalid node compression value for the node indicated. Because FIX=YES has been specified, the audit function sets the node's compression value to the default value.

System action: Audit processing continues.

User response: If you want the compression value for the specified node to be set to a value other than the default, use the UPDATE NODE command to change the value after the audit command has completed.

ANR4047I *Audit command: Invalid archive delete value encountered for node node name.*

Explanation: A database audit process encounters an invalid archive delete permission value for the node indicated.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, you may want to run this command again, and specify FIX=YES so that the audit process can correct the problem.

ANR4048I *Audit command: Invalid archive delete value encountered for node `node name` the default value will be set.*

Explanation: A database audit process encounters an invalid archive delete permission value for the node indicated. Because FIX=YES has been specified, the audit function sets the node's archive delete permission value to the default value.

System action: Audit processing continues.

User response: If you want the archive delete value for the specified node to be set to a value other than the default, use the UPDATE NODE command to change the value after the audit command has completed.

ANR4049I *Audit command: Invalid backup delete value encountered for node `node name`.*

Explanation: A database audit process encounters an invalid backup delete permission value for the node indicated.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, you may want to run this command again, and specify FIX=YES so that the audit process can correct the problem.

ANR4050I *Audit command: Invalid backup delete value encountered for node `node name` the default value will be set.*

Explanation: A database audit process encounters an invalid backup delete permission value for the node indicated. Because FIX=YES has been specified, the audit function sets the node's backup delete permission value to the default value.

System action: Audit processing continues.

User response: If you want the backup delete value for the specified node to be set to a value other than the default, use the UPDATE NODE command to change the value after the audit command has completed.

ANR4051I *Audit command: Invalid lock state encountered for node `node name`.*

Explanation: A database audit process encounters an invalid lock state value for the node indicated.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, you may want to run this command again, and specify FIX=YES so that the audit process can correct the problem.

ANR4052I *Audit command: Invalid lock state encountered for node `node name` the node will be unlocked.*

Explanation: A database audit process encounters an invalid lock state value for the node indicated. Because FIX=YES has been specified, the audit function sets the node's lock state to unlocked.

System action: Audit processing continues.

User response: If you want the lock state for the specified node to be set to a value other than unlocked, use the LOCK NODE command to change the value after the audit command has completed.

ANR4053I *Audit command: Invalid Node conversion state encountered for node `node name`.*

Explanation: A database audit process encounters an invalid Node conversion state value for the node indicated.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, you may want to run this command again, and specify FIX=YES so that the audit process can correct the problem. However, next time this node logs onto the server, the node conversion state will be reset.

ANR4054I *Audit command: Invalid conversion state encountered for node `node name` the node will be reset.*

Explanation: A database audit process encounters an invalid conversion state value for the node indicated. Because FIX=YES has been specified, the audit function resets the conversion state.

System action: Audit processing continues.

User response: None.

ANR4055I *Audit command: Invalid lock state encountered for administrator `administrator name`.*

Explanation: A database audit process encounters an invalid lock state value for the administrator indicated.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, you may want to run this command again, and specify FIX=YES so that the audit process can correct the problem.

ANR4056I *Audit command: Invalid lock state encountered for administrator administrator name the administrator will be unlocked.*

Explanation: A database audit process encounters an invalid lock state value for the administrator indicated. Because FIX=YES has been specified, the audit function sets the administrator's lock state to unlocked.

System action: Audit processing continues.

User response: If you want the lock state for the specified administrator to be set to a value other than unlocked, use the LOCK ADMIN command to change the value after the audit command has completed.

ANR4057E *Audit command: Administrative global attributes are missing.*

Explanation: A database audit process finds that the global attributes used for server administrative activities are missing.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES specified so that the administrative global attributes can be recreated.

ANR4058I *Audit command: Administrative global attributes are missing - default values will be used to recreate the attributes.*

Explanation: A database audit process finds that the global attributes used for server administrative activities are missing. Because FIX=YES has been specified on the AUDIT command, default attribute values will be used to recreate the administrative global attributes.

System action: Audit processing continues.

User response: When the audit completes, you can use the QUERY STATUS command to examine the values set for the administrative global attributes, and use the appropriate SET command to change the attributes, if desired.

ANR4059E *Audit command: Administrative ID assignments are incorrect.*

Explanation: A database audit process finds that the global attributes used for server administrative activities are incorrect.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES specified so that the administrative global attributes can be corrected.

ANR4060I *Audit command: Administrative ID assignments are incorrect - value(s) will be corrected.*

Explanation: A database audit process finds that the global attributes used for server administrative activities are incorrect. Because FIX=YES has been specified on the AUDIT command, the attribute value will be corrected in the server database.

System action: Audit processing continues.

User response: None.

ANR4061E *Audit command: Administrative global attribute(s) are incorrect.*

Explanation: A database audit process finds that the global attributes used for server administrative activities are incorrect.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES specified so that the administrative global attributes can be corrected.

ANR4062I *Audit command: Administrative global attribute(s) are incorrect - default values will be set.*

Explanation: A database audit process finds that the global attributes used for server administrative activities are incorrect. Because FIX=YES has been specified on the AUDIT command, default attribute values will be used to correct the administrative global attributes.

System action: Audit processing continues.

User response: When the audit completes, you can use the QUERY STATUS command to examine the values set for the administrative global attributes, and use the appropriate SET command to change the attributes, if desired.

ANR4063E *Audit command: Client node node number not found in the server database.*

Explanation: A database audit process finds a client node reference that is not defined correctly in the server database.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4064I *Audit command: Client node node number created as node node name assigned to policy domain domain name in the server database.*

Explanation: A database audit process finds a client node reference that is not defined correctly in the server database. Because FIX=YES has been specified for the audit command, the audit function creates a new node definition for the node with the name specified.

System action: Audit processing continues.

User response: After the AUDIT command completes, use the QUERY NODE command to examine the node that was added. Use the RENAME NODE command to rename the corrected node and the UPDATE NODE command to set attributes for the corrected node, such as its password. You can issue the QUERY FILESPACE command for the node, to determine which node and platform type was originally represented by the corrected node.

ANR4065E *Audit command: Administrator administrator number not found in the server database.*

Explanation: A database audit process finds an administrator reference that is not defined correctly in the server database.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4066I *Audit command: Administrator administrator number not found in the server database - reference will be removed.*

Explanation: A database audit process finds an administrator reference that is not defined correctly in the server database. The invalid reference will be removed from the database.

System action: Audit processing continues.

User response: After the audit command completes, review your administrator definitions with the QUERY ADMIN command. You can then use the REGISTER ADMIN and UPDATE ADMIN commands to change any definitions desired.

ANR4067E *Audit command: Domain domain name referenced by an administrator authority does not exist.*

Explanation: A database audit process finds a policy administrator reference to a policy domain that does not exist.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4068I *Audit command: Policy domain domain name referenced by an administrator authority does not exist - the authority will be removed.*

Explanation: A database audit process finds a policy administrator reference to a policy domain that does not exist. Because FIX=YES has been specified, the authority will be removed.

System action: Audit processing continues.

User response: After the audit command completes, review your administrator definitions with the QUERY ADMIN command. You can then use the REGISTER ADMIN, UPDATE ADMIN, and GRANT AUTHORITY commands to change any definitions.

ANR4069E *Audit command: Storage pool storage pool name referenced by an administrator authority does not exist.*

Explanation: A database audit process finds a storage administrator reference to a storage pool that does not exist.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4070I *Audit command: Storage pool storage pool name referenced by an administrator authority does not exist - the authority will be removed.*

Explanation: A database audit process finds a policy administrator reference to a storage pool that does not exist. Because FIX=YES has been specified, the authority will be removed.

System action: Audit processing continues.

User response: After the audit command completes, review your administrator definitions with the QUERY ADMIN command. You can then use the REGISTER ADMIN, UPDATE ADMIN, and GRANT AUTHORITY commands to change any definitions.

ANR4071I *Audit command: Invalid sign-on attempts is not valid for node/administrator name.*

Explanation: A database audit process encounters an invalid sign-on attempts value that is not valid for the node or administrator indicated.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, you may want to run this command again, and specify FIX=YES so that the audit

process can correct the problem.

ANR4072I *Audit command: Invalid file aggregation information encountered for node `node name`.*

Explanation: A database audit process encounters invalid information used for controlling aggregation of files for the node indicated.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, you may want to run this command again, and specify FIX=YES so that the audit process can correct the problem.

ANR4073I *Audit command: Invalid file aggregation information encountered for node `node name` - information will be corrected.*

Explanation: A database audit process encounters invalid information used for controlling aggregation of files for the node specified. Because FIX=YES has been specified, the audit function corrects the information.

System action: Audit processing continues.

User response: None.

ANR4074I *Dump/load command: Encountered number of entries bad database entries.*

Explanation: This message is displayed at the end of a server database dump or load command to indicate the number of invalid database entries that have been encountered.

System action: Database dump or load processing ends.

User response: None.

ANR4075I *Audit command: Auditing policy definitions.*

Explanation: This message is displayed during a database audit and indicates that the server policy information (domain, policy set, management classes, and copy groups) are being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4076E *Audit command: Invalid client node count detected for policy domain `domain name`.*

Explanation: A database audit process finds that the count of nodes recorded for the specified policy domain do not match the actual number of nodes assigned to the domain.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4077I *Audit command: Invalid client node count detected for policy domain `domain name` count will be corrected.*

Explanation: A database audit process finds that the count of nodes recorded for the specified policy domain do not match the actual number of nodes assigned to the domain. Because FIX=YES has been specified for the command, the node count will automatically be corrected.

System action: Audit processing continues.

User response: None.

ANR4078E *Audit command: Invalid activation indicators encountered for policy domain `domain name`.*

Explanation: A database audit process finds incorrect policy set activation entries for the specified policy domain.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4079I *Audit command: Invalid activation indicators encountered for policy domain `domain name` - entry will be corrected.*

Explanation: A database audit process finds incorrect policy set activation entries for the specified policy domain. Because FIX=YES has been specified for the audit command, the entry will be corrected.

System action: Audit processing continues.

User response: None.

ANR4080E *Audit command: Invalid grace period backup retention value encountered for policy domain `domain name`.*

Explanation: A database audit process finds an incorrect grace period retention value for the specified policy domain.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4081I *Audit command: Invalid grace period backup retention value encountered for policy domain `domain name` - default value will be set.*

Explanation: A database audit process finds an

incorrect grace period retention value for the specified policy domain. Because FIX=YES has been specified for the audit command, the default value will be set.

System action: Audit processing continues.

User response: None.

ANR4082E *Audit command: Invalid grace period archive retention value encountered for policy domain *domain name*.*

Explanation: A database audit process finds an incorrect grace period retention value for the specified policy domain.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4083I *Audit command: Invalid grace period archive retention value encountered for policy domain *domain name* - default value will be set.*

Explanation: A database audit process finds an incorrect grace period retention value for the specified policy domain. Because FIX=YES has been specified for the audit command, the default value will be set.

System action: Audit processing continues.

User response: None.

ANR4084E *Audit command: Invalid administrator update information encountered for policy domain *domain name*.*

Explanation: A database audit process finds incorrect last updated information for the specified policy domain.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4085I *Audit command: Invalid administrator update information encountered for policy domain *domain name* - information will be corrected.*

Explanation: A database audit process finds incorrect last updated information for the specified policy domain. Because FIX=YES has been specified for the command, the information is corrected.

System action: Audit processing continues.

User response: None.

ANR4086E *Audit command: Invalid node *node number* found assigned to domain *domain name*.*

Explanation: A database audit process finds a node number assigned to a policy domain that does not reference a valid client node definition.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4087I *Audit command: Invalid node *node number* found assigned to domain *domain name* reference will be deleted.*

Explanation: A database audit process finds a node number assigned to a policy domain that does not reference a valid client node definition. Because FIX=YES has been specified for the audit command, the reference will be deleted.

System action: Audit processing continues.

User response: None.

ANR4088E *Audit command: Default management class *management class name* specified for policy set *policy set name* in domain *domain name* does not exist.*

Explanation: A database audit process finds a policy set with a default management class specified that does not exist.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4089I *Audit command: Default management class *management class name* specified for policy set *policy set name* in domain *domain name* does not exist - the reference will be removed.*

Explanation: A database audit process finds a policy set with a default management class specified that does not exist. Because FIX=YES has been specified for the audit command, the reference will be removed from the policy set.

System action: Audit processing continues.

User response: When the audit command completes, examine the policy set specified, and set a new default management class for the set. If the policy set is the ACTIVE policy set, you must activate a new policy set for the domain with a valid default management class.

ANR4090E *Audit command: Active Policy set for domain **domain name** does not contain a valid default management class - policy will fail for this domain. Please correct the ACTIVE policy set.*

Explanation: A database audit process finds an active policy set for the specified policy domain that does not have a valid active management class specified.

System action: Audit processing continues.

User response: When the audit command completes, you must activate a new policy set for the domain with a valid default management class.

ANR4091E *Audit command: Invalid administrator update information encountered for policy set **set name** in policy domain **domain name**.*

Explanation: A database audit process finds incorrect last updated information for the specified policy set.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4092I *Audit command: Invalid administrator update information encountered for policy set **set name** in policy domain **domain name** - information will be corrected.*

Explanation: A database audit process finds incorrect last updated information for the specified policy set. Because FIX=YES has been specified for the command, the information is corrected.

System action: Audit processing continues.

User response: None.

ANR4093E *Audit command: A management class identifier is not defined for management class **management class name** in policy set **set name**, domain **domain name**.*

Explanation: A database audit process finds incorrect information for the specified management class.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4094E *Audit command: A management class identifier is not defined for management class **management class name** in policy set **set name**, domain **domain name** - an identifier will be generated for this management class.*

Explanation: A database audit process finds incorrect information for the specified management class. The audit process generates an identifier, because FIX=YES has been specified for the audit command.

System action: Audit processing continues.

User response: None.

ANR4095E *Audit command: An invalid management class identifier (**actual identifier**) was encountered for management class **management class name** in policy set **set name**, domain **domain name** (**expected expected identifier**).*

Explanation: A database audit process finds incorrect information for the specified management class.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4096E *Audit command: An invalid management class identifier (**actual identifier**) was encountered for management class **management class name** in policy set **set name**, domain **domain name** (**expected expected identifier**) - the correct identifier will be stored.*

Explanation: A database audit process finds incorrect information for the specified management class. The audit process corrects the identifier, because FIX=YES has been specified for the audit command.

System action: Audit processing continues.

User response: None.

ANR4097E *Audit command: Invalid administrator update information encountered for management class **management class name** in policy set **set name** in policy domain **domain name**.*

Explanation: A database audit process finds incorrect last updated information for the specified management class.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4098I *Audit command: Invalid administrator update information encountered for management class **management class name** in policy set **set name** in policy domain **domain name** - information will be corrected.*

Explanation: A database audit process finds incorrect

ANR4099E • ANR4106E

last updated information for the specified management class. Because FIX=YES has been specified for the command, the information is corrected.

System action: Audit processing continues.

User response: None.

ANR4099E *Audit command: Copy group copy group name in management class management class name, policy set set name, domain domain name has an invalid name or type.*

Explanation: A database audit process encounters a copy group that has an invalid name or copy group type.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, reissue the command specifying FIX=YES so that the error can be corrected.

ANR4100I *Audit command: Attempting to reinsert the copy group as a BACKUP copy group.*

Explanation: A database audit process encounters a copy group that has an invalid name or copy group type. The process attempts to reinsert the definition as a backup copy group.

System action: Audit processing continues.

User response: None.

ANR4101I *Audit command: A backup copy group already exists - the invalid copy group will be deleted.*

Explanation: A database audit process encounters a copy group that has an invalid name or copy group type. While attempting to reinsert the copy group as a backup copy group, the process discovers that a backup copy group already exists for the management class. The copy group is deleted.

System action: Audit processing continues.

User response: After the audit command completes, you may examine the server copy groups using the QUERY COPYGROUP command, and correct them with the DEFINE COPYGROUP and UPDATE COPYGROUP commands if desired.

ANR4102I *Audit command: Attempting to reinsert the copy group as an ARCHIVE copy group.*

Explanation: A database audit process encounters a copy group that has an invalid name or copy group type. The process attempts to reinsert the definition as an archive copy group.

System action: Audit processing continues.

User response: None.

ANR4103I *Audit command: An archive copy group already exists - the invalid copy group will be deleted.*

Explanation: A database audit process encounters a copy group that has an invalid name or copy group type. While attempting to reinsert the copy group as an archive copy group, the process discovers that a backup copy group already exists for the management class. The copy group is deleted.

System action: Audit processing continues.

User response: After the audit command completes, you may examine the server copy groups using the QUERY COPYGROUP command, and correct them with the DEFINE COPYGROUP and UPDATE COPYGROUP commands, if desired.

ANR4104E *Audit command: An invalid management class identifier (actual identifier) was encountered for a copy group in management class management class name, policy set set name, domain domain name (expected expected identifier).*

Explanation: A database audit process finds incorrect information for the specified copy group.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4105E *Audit command: An invalid management class identifier (actual identifier) was encountered for a copy group in management class management class name, policy set set name, domain domain name (expected expected identifier) - the correct identifier will be stored.*

Explanation: A database audit process finds incorrect information for the specified copy group. The audit process corrects the identifier, since FIX=YES has been specified for the audit command.

System action: Audit processing continues.

User response: None.

ANR4106E *Audit command: An invalid copy group identifier (actual identifier) was encountered for a copy group in management class management class name, policy set set name, domain domain name (expected expected identifier).*

Explanation: A database audit process finds incorrect information for the specified copy group.

System action: Audit processing continues.

User response: For programming support, contact your service representative.

ANR4107E *Audit command: An invalid copy group identifier (actual identifier) was encountered for copy group name copy group name (expected expected identifier).*

Explanation: A database audit process finds incorrect information for the specified copy group name.

System action: Audit processing continues.

User response: For programming support, contact your service representative.

ANR4108E *Audit command: Invalid backup copy group attributes encountered for copy group copy group name in management class management class name, policy set set name, domain domain name.*

Explanation: A database audit process encounters invalid backup copy group attributes for the specified copy group.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, reissue the command specifying FIX=YES so that the inconsistency can be corrected.

ANR4109I *Audit command: Invalid backup copy group attributes encountered for copy group copy group name in management class management class name, policy set set name, domain domain name - the copy group will be corrected using default attributes.*

Explanation: A database audit process encounters invalid backup copy group attributes for the specified copy group. Because FIX=YES has been specified for the command, the copy group will be corrected using default values for the attributes found in error.

System action: Audit processing continues.

User response: After the audit command completes, examine the copy group by using the QUERY COPYGROUP command, and correct attributes with the UPDATE COPYGROUP command, if desired.

ANR4110E *Audit command: Invalid archive copy group attributes encountered for copy group copy group name in management class management class name, policy set set name, domain domain name.*

Explanation: A database audit process encounters invalid archive copy group attributes for the specified copy group.

System action: Audit processing continues.

User response: If FIX=YES has not been specified for the audit command, reissue the command and specify FIX=YES so that the inconsistency can be corrected.

ANR4111I *Audit command: Invalid archive copy group attributes encountered for copy group copy group name in management class management class name, policy set set name, domain domain name - the copy group will be corrected using default attributes.*

Explanation: A database audit process encounters invalid archive copy group attributes for the specified copy group. Because FIX=YES has been specified for the command, the copy group will be corrected using default values for the attributes found in error.

System action: Audit processing continues.

User response: After the audit command completes, examine the copy group by using the QUERY COPYGROUP command, and correct the attributes with the UPDATE COPYGROUP command, if desired.

ANR4112W *Audit command: Storage pool storage pool name, specified as a destination for copy group copy group name in management class management class name, policy set set name, domain domain name, does not exist.*

Explanation: A database audit process encounters a storage pool specified for the destination of the specified copy group that is not defined in the server database. If this copy group is used in an active policy set, then backup or archive operations will fail when attempting to put client data in the destination.

System action: Audit processing continues.

User response: After the audit command completes, use the DEFINE STGPOOL command to define the missing storage pool or the UPDATE COPYGROUP command to update the copy group to refer to an existing storage pool.

ANR4113E *Audit command: Invalid administrator update information encountered for copy group copy group name in management class management class name, policy set set name, policy domain domain name.*

Explanation: A database audit process finds incorrect last updated information for the specified copy group.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4114I *Audit command: Invalid administrator update information encountered for copy group `copy group name` in management class `management class name`, policy set `set name`, policy domain `domain name` - information will be corrected.*

Explanation: A database audit process finds incorrect last updated information for the specified copy group. Because FIX=YES has been specified for the command, the information is corrected.

System action: Audit processing continues.

User response: None.

ANR4115E *Audit command: Policy domain `domain name` is referenced, but not formally defined.*

Explanation: A database audit process finds a reference to the specified policy domain, but the domain is not formally defined in the server database.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4116I *Audit command: Policy domain `domain name` is referenced, but not formally defined - a policy domain with default attributes will be defined with this name.*

Explanation: A database audit process finds a reference to the specified policy domain, but the domain is not formally defined in the server database. Because FIX=YES has been specified, a new policy domain with this name will be defined by the audit processor.

System action: Audit processing continues.

User response: After the audit command has completed, you can view the attributes for this policy domain using the QUERY DOMAIN command, and update attributes with the UPDATE DOMAIN command, if desired.

ANR4117E *Audit command: Policy set `set name` in domain `domain name` is referenced, but not formally defined.*

Explanation: A database audit process finds a reference to the specified policy set, but the set is not formally defined in the server database.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4118I *Audit command: Policy set `set name` in domain `domain name` is referenced, but not formally defined - a policy set with this name will be created.*

Explanation: A database audit process finds a reference to the specified policy set, but the set is not formally defined in the server database. Because FIX=YES has been specified, the audit process will create a new policy set with this name.

System action: Audit processing continues.

User response: After the audit command has completed, you can view the attributes for this policy set by using the QUERY POLICYSET command, and update attributes with the UPDATE POLICYSET command, if desired.

ANR4119E *Audit command: Management class `class name` in policy set `set name`, domain `domain name` is referenced, but not formally defined.*

Explanation: A database audit process finds a reference to the specified management class, but the class is not formally defined in the server database.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4120I *Audit command: Management class `class name` in policy set `set name`, domain `domain name` is referenced, but not formally defined - the management class will be created.*

Explanation: A database audit process finds a reference to the specified management class, but the class is not formally defined in the server database. Because FIX=YES has been specified for the audit command, the audit process defines a management class in the server with this name.

System action: Audit processing continues.

User response: After the audit command has completed, you can view the attributes for this management class by using the QUERY MGMTCLASS command, and update attributes with the UPDATE MGMTCLASS command, if desired.

ANR4122E *Audit command: The instance count for management class `class name` does not agree with the actual management class data (`number of instances instances`).*

Explanation: A database audit process finds a reference count for the specified management class that did not match the actual number of instances for this class.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4123I *Audit command: The instance count for management class `class name` does not agree with the actual management class data (number of instances instances) - the number will be corrected.*

Explanation: A database audit process finds a reference count for the specified management class that does not match the actual number of instances for this class. The audit process corrects the count because FIX=YES has been specified for the audit command.

System action: Audit processing continues.

User response: None.

ANR4124E *Audit command: The instance count for copy group `copy group name` does not agree with the actual copy group data (number of instances instances).*

Explanation: A database audit process finds a reference count for the specified copy group that does not match the actual number of instances for this copy group.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4125I *Audit command: The instance count for copy group `copy group name` does not agree with the actual copy group data (number of instances instances) - the number will be corrected.*

Explanation: A database audit process finds a reference count for the specified copy group that does not match the actual number of instances for this copy group. The audit process corrects the count because FIX=YES has been specified for the audit command.

System action: Audit processing continues.

User response: None.

ANR4126E *Audit command: Policy global attributes cannot be found.*

Explanation: A database audit process is not able to locate the global attributes for policy information in the server database.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4127I *Audit command: Policy global attributes cannot be found - attributes will be recreated.*

Explanation: A database audit process is not able to locate the global attributes for policy information in the server database. Because FIX=YES has been specified for the audit command, the attributes will be regenerated.

System action: Audit processing continues.

User response: None.

ANR4128E *Audit command: Policy global high-water marks do not match the identifiers in use.*

Explanation: A database audit process finds the attributes used to track policy identifiers are incorrect.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4129E *Audit command: Policy global high-water marks do not match the identifiers in use - they will be corrected.*

Explanation: A database audit process finds the attributes used to track policy identifiers are incorrect. Because FIX=YES has been specified for the audit command, the attributes will be corrected.

System action: Audit processing continues.

User response: None.

ANR4130W *Audit Volume updating object information for volume `volume name`: Node `node name`, Type `file type`, File space `filespace name`, fsId `filespace id`, File Name `file name`.*

Explanation: As the result of an AUDIT VOLUME command that specified FIX=YES for the volume shown, object information for the specified file will be updated.

System action: The object information is updated.

User response: None.

ANR4131W *Audit Volume found incorrect object information for volume `volume name`: Node `node name`, Type `file type`, File space `filespace name`, fsId `filespace id`, File name `file name`.*

Explanation: As the result of an AUDIT VOLUME command that specified FIX=NO for the volume shown, object information for the specified file is found to be in error.

ANR4132I • ANR4137I

System action: None.

User response: None.

ANR4132I **Audit volume process ended for volume** *volume name; file count* **files inspected, file count** **damaged files deleted, file count** **damaged files marked as damaged, file count** **files previously marked as damaged reset to undamaged, file count** **objects updated.**

Explanation: The AUDIT VOLUME command specifying FIX=YES for the volume shown has ended.

The following information is displayed:

- The number of files audited
- The number of inconsistent files deleted
- The number of inconsistent files marked as damaged
- The number of files previously marked as damaged that were reset to undamaged
- The number of updated objects

The number of files marked as damaged includes all files belonging to aggregates that were marked damaged during the audit. Files are marked as damaged in primary storage pools and not deleted when backup copies for the files are known to exist in COPY storage pools.

System action: None.

User response: To recover files that have been marked as damaged on the volume, use the RESTORE STGPOOL or RESTORE volume command.

ANR4133I **Audit volume process ended for volume** *volume name; file count* **files inspected, file count** **damaged files found and marked as damaged, file count** **files previously marked as damaged reset to undamaged, file count** **objects need updating.**

Explanation: The AUDIT VOLUME command specifying FIX=NO for the volume shown has ended.

The following information is displayed:

- The number of files audited
- The number of inconsistent files marked as damaged
- The number of files previously marked as damaged that were reset to undamaged
- The number of objects need updating

The number of files marked damaged includes all files belonging to aggregates that were marked damaged during the audit. Inconsistent files are marked as damaged in the database and can be recovered by using the RESTORE STGPOOL or RESTORE VOLUME command if copies of the files reside in a COPY storage pool. Another AUDIT VOLUME command may be able to access the files and reset the damaged indicator in

the database if the audit volume process cannot access the files due to hardware problems (for example, dirty tape heads).

System action: None.

User response: If you suspect that files were inaccessible because of hardware problems such as dirty tape heads, correct the hardware problem and reissue the AUDIT VOLUME FIX=NO command for this volume. To remove damaged file references and update the object information, issue the AUDIT VOLUME command and specify FIX=YES.

ANR4134I **AUDITDB: Processed** *number of entries* **entries in database tables and** *number of blocks* **blocks in bit vectors. Elapsed time** *is elapsed time.*

Explanation: This message reports the progress of a database audit operation. While auditing database tables, the number of entries processed will increase, but the number of blocks processed in bit vectors will not increase. While auditing bit vectors, the number of blocks processed will increase, but the number of entries processed will not increase. The number of entries processed and the number of blocks are cumulative for the entire audit operation. The elapsed time of the audit operation is reported in hours, minutes, and seconds.

System action: Database audit processing continues.

User response: None.

ANR4135I *Audit command:* **Auditing central scheduler definitions.**

Explanation: This message is displayed during a database audit and indicates that the server scheduling information is examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4136I *Audit command:* **Auditing server inventory.**

Explanation: This message is displayed during a database audit and indicates that server information about client file spaces is currently being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4137I *Audit command:* **Auditing inventory file spaces.**

Explanation: This message is displayed during a database audit and indicates that server information about client file spaces is currently being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4138I *Audit command: Auditing inventory backup objects.*

Explanation: This message is displayed during a database audit and indicates that server information about client backup objects is currently being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4139I *Audit command: Auditing inventory archive objects.*

Explanation: This message is displayed during a database audit and indicates that server information about client archive objects is currently being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4140I *Audit command: Database audit process started.*

Explanation: This message is displayed during a database audit and indicates that the audit process has started.

System action: Audit processing continues.

User response: None.

ANR4141I *Audit command: Database audit process completed.*

Explanation: This message is displayed during a database audit and indicates that the database audit has successfully completed.

System action: Audit processing ends.

User response: None.

ANR4142I *Audit command: Database audit process terminated in error.*

Explanation: This message is displayed during a database audit and indicates that the audit process ended prematurely due to an internal server database error.

System action: Audit processing ends.

User response: Examine the messages issued prior to this one to see if the error can be corrected. If the situation cannot be resolved, contact your service representative.

ANR4143E *Audit command: Central scheduler global attributes cannot be found.*

Explanation: A database audit process cannot locate the global attributes for scheduling information in the server database.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4144I *Audit command: Central scheduler global attributes cannot be found - attributes will be recreated.*

Explanation: A database audit process cannot locate the global attributes for scheduler information in the server database. Because FIX=YES has been specified for the audit command, the attributes will be regenerated.

System action: Audit processing continues.

User response: None.

ANR4145E *Audit command: One or more central scheduler attributes are incorrect.*

Explanation: A database audit process finds that the global attributes used for server scheduling activities are incorrect.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the administrative global attributes can be corrected.

ANR4146I *Audit command: One or more central scheduler global attribute(s) are incorrect - default values will be set.*

Explanation: A database audit process finds that the global attributes used for server scheduling activities are incorrect. Because FIX=YES has been specified on the AUDIT command, default attribute values will be used to correct the scheduling global attributes.

System action: Audit processing continues.

User response: When the audit completes, you can use the QUERY STATUS command to examine the values set for the administrative global attributes, and use the appropriate SET command to change the attributes, if desired.

ANR4147E *Audit command: Policy domain domain name referenced by schedule schedule name does not exist.*

Explanation: A database audit process finds a schedule that references a policy domain that is not defined in the server database.

ANR4148I • ANR4156I

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the administrative global attributes can be corrected.

ANR4148I *Audit command: Policy domain domain name referenced by schedule schedule name does not exist - the schedule will be deleted.*

Explanation: A database audit process finds a schedule that references a policy domain that is not defined in the server database. Because FIX=YES has been specified for the audit command, the specified schedule will be deleted from the server database.

System action: Audit processing continues.

User response: None.

ANR4149E *Audit command: One or more attributes for schedule schedule name in policy domain domain name are incorrect.*

Explanation: A database audit process finds one or more invalid attributes for the specified schedule.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the administrative global attributes can be corrected.

ANR4150I *Audit command: One or more attributes for schedule schedule name in policy domain domain name are incorrect - default values will be set.*

Explanation: A database audit process finds one or more invalid attributes for the specified schedule. Because FIX=YES has been specified for the audit command the invalid attributes will be set to default values.

System action: Audit processing continues.

User response: When the audit completes, you can use the QUERY SCHEDULE command to examine the values set for the schedule, and use the UPDATE SCHEDULE command to change any attributes desired.

ANR4151E *Audit command: Schedule schedule name in policy domain domain name not found, but is referenced by a client node.*

Explanation: A database audit process finds a schedule reference from a client node for a schedule that is not defined in the server database.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the administrative global attributes can be corrected.

ANR4152I *Audit command: Schedule schedule name in policy domain domain name not found, but is referenced by a client node - the schedule association will be deleted.*

Explanation: A database audit process finds a schedule reference from a client node for a schedule that is not defined in the server database. Because FIX=YES has been specified for the audit command, the schedule association will be deleted from the server database.

System action: Audit processing continues.

User response: None.

ANR4153E *Audit command: Schedule schedule name in policy domain domain name references a client node that does not exist.*

Explanation: A database audit process finds a schedule that references a client node that is not defined in the server database.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the administrative global attributes can be corrected.

ANR4154I *Audit command: Schedule schedule name in policy domain domain name references a client node that does not exist - the node reference will be deleted.*

Explanation: A database audit process finds a schedule that references a client node that is not defined in the server database. Because FIX=YES has been specified for the audit command, the reference will be removed from the server database.

System action: Audit processing continues.

User response: None.

ANR4155E *Audit command: Invalid administrator update information encountered for a schedule assignment.*

Explanation: A database audit process finds incorrect last updated information for a schedule-node assignment.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4156I *Audit command: Invalid administrator update information encountered for a schedule assignment - information will be corrected.*

Explanation: A database audit process finds incorrect

last updated information for a schedule-node assignment. Because FIX=YES has been specified for the command, the information is corrected.

System action: Audit processing continues.

User response: None.

ANR4157E *Audit command: Scheduling callback address is registered for a client node that does not exist.*

Explanation: A database audit process finds a server-prompted-scheduling callback address for a node that does not exist.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4158I *Audit command: Scheduling callback address is registered for a client node that does not exist - callback information will be deleted.*

Explanation: A database audit process finds a server-prompted-scheduling callback address for a node that does not exist. Because FIX=YES has been specified for the command, the callback information will be deleted from the server database.

System action: Audit processing continues.

User response: None.

ANR4159I *Audit command: An inventory authorization rule specifies an invalid node (node ID) or file space (filespace ID) - the rule will be deleted.*

Explanation: A database audit process finds that either a node ID or file space ID is invalid for an authorization rule. Since FIX=YES has been specified, the invalid authorization rule will be deleted.

System action: Audit processing continues.

User response: None.

ANR4160I *Audit command: An inventory authorization rule specifies an invalid node (node ID) or file space (filespace ID).*

Explanation: A database audit process finds that either a node ID or file space ID is invalid for an authorization rule.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4161I *Audit command: Inventory global attributes could not be found - they will be created.*

Explanation: A database audit process cannot find the inventory global attributes. Because FIX=YES has been specified for the command, the information is corrected by the creation of the global attributes.

System action: Audit processing continues.

User response: None.

ANR4162I *Audit command: Inventory global attributes could not be found.*

Explanation: A database audit process cannot find the inventory global attributes.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4163I *Audit command: Invalid object ID high-water mark encountered for inventory global attributes - the value will be corrected.*

Explanation: A database audit process finds that the object ID high-water mark for the inventory global attributes is invalid. Because FIX=YES has been specified for the command, the object ID high-water mark is determined by the current inventory and set accordingly.

System action: Audit processing continues.

User response: None.

ANR4164I *Audit command: Invalid object ID high-water mark encountered for inventory global attributes.*

Explanation: A database audit process finds that the object ID high-water mark for the inventory global attributes is invalid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4165I *Audit command: An inventory node assignment entry was not found for node node ID - an entry will be created.*

Explanation: A database audit process cannot find the node assignment entry corresponding to the specified node. Since FIX=YES has been specified for the command, the required inventory entry will be created using default values.

System action: Audit processing continues.

User response: None.

ANR4166I *Audit command: An inventory node assignment entry was not found for node node ID.*

Explanation: A database audit process cannot find the node assignment entry corresponding to the specified node.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4167I *Audit command: The file space high-water mark for node node ID is incorrect - the value will be corrected.*

Explanation: A database audit process finds that a file space high-water mark is incorrect for the specified node ID. Since FIX=YES has been specified for the command, the information is corrected.

System action: Audit processing continues.

User response: None.

ANR4168I *Audit command: The file space high-water mark for node node ID is incorrect.*

Explanation: A database audit process finds that a file space high-water mark is incorrect for the specified node ID.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4169I *Audit command: The file space high-water mark for node node ID is incorrect - the value will be corrected.*

Explanation: A database audit process finds that an authorization rule high-water mark is incorrect for the specified node ID. Since FIX=YES has been specified for the command, the information is corrected.

System action: Audit processing continues.

User response: None.

ANR4170I *Audit command: The authorization rule high-water mark for node node ID is incorrect.*

Explanation: A database audit process finds that an authorization rule high-water mark is incorrect for the specified node ID.

System action: Audit processing continues.

User response: Reissue the audit command and

specify FIX=YES so that the error can be corrected.

ANR4171I *Audit command: Primary backup entry for an expiring object (object.ID) cannot be found - the expiring object entry will be deleted.*

Explanation: A database audit process cannot find the primary backup entry for the specified expiring object. Because FIX=YES has been specified for the command, the information is corrected by deleting the expiring object entry.

System action: Audit processing continues.

User response: None.

ANR4172I *Audit command: Primary backup entry for an expiring object (object.ID) cannot be found.*

Explanation: A database audit process cannot find the primary backup entry for the specified expiring object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4173I *Audit command: Primary archive entry for an expiring object (object.ID) cannot be found - the expiring object entry will be deleted.*

Explanation: A database audit process cannot find the primary archive entry for the specified expiring object. Because FIX=YES has been specified for the command, the information is corrected by deleting the expiring object entry.

System action: Audit processing continues.

User response: None.

ANR4174I *Audit command: Primary archive entry for an expiring object (object.ID) cannot be found.*

Explanation: A database audit process cannot find the primary archive entry for the specified expiring object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4175I *Audit command: Invalid copy type encountered for an expiring objects entry (object.ID) - the expiring object entry will be deleted.*

Explanation: A database audit process finds that the copy type for the specified expiring object is invalid. Because FIX=YES has been specified for the command,

the information is corrected by deleting the expiring object entry. The entry will be recreated later if it is necessary.

System action: Audit processing continues.

User response: None.

ANR4176I *Audit command: Invalid copy type encountered for an expiring objects entry (object.ID).*

Explanation: A database audit process finds that the copy type for the specified expiring object is invalid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4177I *Audit command: Primary backup entry for an object (object.ID) cannot be found - entry will be deleted.*

Explanation: A database audit process cannot find the specified primary backup object. Because FIX=YES has been specified for the command, the entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4178I *Audit command: Primary backup entry for an object (object.ID) cannot be found.*

Explanation: A database audit process cannot find the specified primary backup object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4179I *Audit command: Primary archive entry for an object (object.ID) cannot be found - entry will be deleted.*

Explanation: A database audit process cannot find the specified primary archive object. Because FIX=YES has been specified for the command, the entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4180I *Audit command: Primary archive entry for an object (object.ID) cannot be found.*

Explanation: A database audit process cannot find the specified primary archive object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4181I *Audit command: Invalid copy type encountered for object object.ID - object found as a backup object - correcting the invalid copy type*

Explanation: A database audit process encounters an invalid copy type for the specified object ID but finds a corresponding backup object for the entry. Because FIX=YES has been specified for the command, the invalid copy type is corrected.

System action: Audit processing continues.

User response: None.

ANR4182I *Audit command: Invalid copy type encountered for object object.ID - object found as an archive object - correcting the invalid copy type*

Explanation: A database audit process encounters an invalid copy type for the specified object ID but finds a corresponding archive object for the entry. Because FIX=YES has been specified for the command, the invalid copy type is corrected.

System action: Audit processing continues.

User response: None.

ANR4183I *Audit command: Invalid copy type encountered for object object.ID - primary archive entry created for object using default values.*

Explanation: A database audit process encounters an invalid copy type for the specified object ID and is unable to find corresponding primary backup or primary archive objects. Because FIX=YES has been specified for the command, a primary archive entry is created using default values.

System action: Audit processing continues.

User response: None.

ANR4184I *Audit command: Invalid copy type encountered for object object.ID.*

Explanation: A database audit process encounters an invalid copy type for the specified object ID and is unable to find corresponding primary backup or primary archive objects.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4185I *Audit command: Object entry for backup object object.ID not found - entry will be created.*

Explanation: A database audit process cannot find an object entry for the specified backup object. Because FIX=YES has been specified for the command, an object entry is created using default values.

System action: Audit processing continues.

User response: None.

ANR4186I *Audit command: Object entry for backup object object.ID not found.*

Explanation: A database audit process cannot find an object entry for the specified backup object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4187I *Audit command: Inventory object fields for object object.ID do not match the primary backup entry - the object will be updated.*

Explanation: A database audit process determines that the object fields for the specified object ID do not match the fields for the corresponding primary backup object. Because FIX=YES has specified for the command, the incorrect object fields will be corrected.

System action: Audit processing continues.

User response: None.

ANR4188I *Audit command: Inventory object fields for object object.ID do not match the primary backup entry.*

Explanation: A database audit process determines that the object fields for the specified object ID do not match the fields for the corresponding primary backup object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4189I *Audit command: Expiring entry for inactive backup object object.ID not found - the entry will be created.*

Explanation: A database audit process cannot find an expiring entry for the specified inactive backup entry. Because FIX=YES has been specified for the command, an expiring entry will be created.

System action: Audit processing continues.

User response: None.

ANR4190I *Audit command: Expiring entry for inactive backup object object.ID not found.*

Explanation: A database audit process cannot find an expiring entry for the specified inactive backup entry.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4191I *Audit command: Object entry for archive object object.ID not found - entry will be created.*

Explanation: A database audit process cannot find an object entry for the specified archive object. Because FIX=YES has been specified for the command, the information is corrected by creating an object entry.

System action: Audit processing continues.

User response: None.

ANR4192I *Audit command: Object entry for archive object object.ID not found.*

Explanation: A database audit process cannot find an object entry for the specified archive object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4193I *Audit command: Inventory object fields for object object.ID do not match the primary archive entry - the object will be updated.*

Explanation: A database audit process determines that the object fields for the specified object ID do not match the fields for the corresponding primary archive object. Because FIX=YES has been specified for the command, the incorrect object fields will be corrected.

System action: Audit processing continues.

User response: None.

ANR4194I *Audit command: Inventory object fields for object object.ID do not match the primary archive entry.*

Explanation: A database audit process determines that the object fields for the specified object ID do not match the fields for the corresponding primary archive object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4195I *Audit command: Expiring entry for archive object `object.ID` not found - the entry will be created.*

Explanation: A database audit process cannot find an expiring entry for the specified archive object. Because FIX=YES has been specified for the command, an expiring entry will be created.

System action: Audit processing continues.

User response: None.

ANR4196I *Audit command: Expiring entry for archive object `object.ID` not found.*

Explanation: A database audit process cannot find an expiring entry for the specified archive object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4197I *Audit command: File space entry `filespace ID` not found for node `node ID`.*

Explanation: A database audit process cannot find a file space entry for the specified node.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4198I *Audit command: File space entry `filespace ID` not found for node `node name` - an entry will be created.*

Explanation: A database audit process cannot find a file space entry for the specified node. Because FIX=YES has been specified for the command, a file space entry has been created.

System action: Audit processing continues.

User response: None.

ANR4199I *Audit command: File space entry `filespace ID` not found for node `node ID` - unable to create an entry.*

Explanation: A database audit process cannot find a file space entry for the specified node ID. Because FIX=YES has been specified for the command, the audit process has attempted to create a file space entry but is not successful.

System action: Audit processing continues.

User response: Contact your system administrator.

ANR4200I *Audit command: Expiring entry `node ID` and file space `filespace ID` does not match the object entry for object ID `object.ID` - the entry will be deleted.*

Explanation: A database audit process determines that the specified expiring object entry does not match the corresponding object entry for the specified object ID. Because FIX=YES has been specified for the command, the expiring object entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4201I *Audit command: Expiring entry `node ID` and file space `filespace ID` does not match the object entry for object ID `object.ID`.*

Explanation: A database audit process determines that the specified expiring object entry does not match the corresponding object entry for the specified object ID.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4202I *Audit command: The base date for expiration processing of entry `object.ID` is not valid - the entry will be deleted.*

Explanation: A database audit process determines that the specified expiring object has a date that is not valid. Because FIX=YES has been specified for the command, the expiring object entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4203I *Audit command: The base date for expiration processing of object `object.ID` is not valid.*

Explanation: A database audit process determines that the specified expiring object has a date value that is not valid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4204I *Audit command: One or more date values for a backup entry `object.ID` is not valid.*

Explanation: A database audit process determines that one or more of the date values is improperly formatted or contains incorrect information for the specified backup object.

System action: Audit processing continues.

User response: Contact your system administrator.

ANR4205I *Audit command: The insertion date value for archive entry `object.ID` is not valid.*

Explanation: A database audit process determines that the insertion date for the specified archive object is improperly formatted or contains incorrect information.

System action: Audit processing continues.

User response: Contact your system administrator.

ANR4206I *Audit command: Object entry for expiring object `object.ID` not found - expiring object entry will be deleted.*

Explanation: A database audit process cannot find an object entry corresponding to the specified expiring object. Because FIX=YES has been specified for the command, the expiring object entry for the specified object ID is deleted.

System action: Audit processing continues.

User response: None.

ANR4207I *Audit command: Object entry for expiring object `object.ID` not found.*

Explanation: A database audit process cannot find an object entry corresponding to the specified expiring object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4208I *Audit command: An inventory node assignment entry is not valid for node `node ID` - the entry will be deleted.*

Explanation: A database audit process finds that a node assignment entry for the specified node ID is not valid. Since FIX=YES has been specified for the command, the required inventory entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4209I *Audit command: An inventory node assignment entry was not found for node `node ID`.*

Explanation: A database audit process finds that a node assignment entry for the specified node ID is not valid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4210I *Audit command: Auditing physical volume repository definitions.*

Explanation: This message is displayed during a database audit and indicates that the physical volume repository definitions are being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4211I *Audit command: Drive entry `library name` for library `drive name` in the physical volume repository is invalid.*

Explanation: A database audit process finds that a drive entry is missing a corresponding library entry.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4212I *Audit command: An object entry for library `library name` and drive `drive name` in the physical volume repository is invalid - the entry will be deleted.*

Explanation: A database audit process finds that a drive entry is missing a corresponding library entry. Because FIX=YES has been specified for the command, the invalid drive entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4213I *Audit command: A device type for library `library name` and drive `drive name` in the physical volume repository is invalid.*

Explanation: A database audit process finds that a device type for the specified library and drive is invalid.

System action: Audit processing continues.

User response: Contact the system administrator so that appropriate action may be taken.

ANR4214I *Audit command: A drive model for library `library name` and drive `drive name` in the physical volume repository is invalid.*

Explanation: A database audit process finds that the drive model for the specified library and drive is invalid.

System action: Audit processing continues.

User response: Contact the system administrator so that appropriate action may be taken.

ANR4215I *Audit command: An object entry for library library name and volume volume name in the physical volume repository is invalid.*

Explanation: A database audit process finds that a library inventory entry is missing a corresponding library entry.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4216I *Audit command: An object entry for library library name and volume volume name in the physical volume repository is invalid - the entry will be deleted.*

Explanation: A database audit process finds that a library inventory entry is missing a corresponding library entry. Because FIX=YES has been specified for the command, the invalid library inventory entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4217I *Audit command: The volume status for library library name and volume volume name in the physical volume repository is invalid.*

Explanation: A database audit process finds that the volume status for the specified library and volume is set to scratch. This is incorrect because storage agent has a volume name for the library and volume indicating that it should have a volume status of private.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4218I *Audit command: The volume status for library library name and volume volume name in the physical volume repository is invalid - the volume status will be changed to private.*

Explanation: A database audit process finds that the volume status for the specified library and volume is set to scratch. This is incorrect because storage agents has a volume name for the library and volume which indicates that it should have a volume status of private. Because FIX=YES has been specified for the command, the incorrect volume status is set to private.

System action: Audit processing continues.

User response: None.

ANR4219I *Audit command: A library type specified for library library name in the physical volume repository is invalid.*

Explanation: A database audit process finds that the library type for the specified library is invalid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4220I *Audit command: A library type specified for library library name in the physical volume repository is invalid - the library type has been changed to the default of library type default.*

Explanation: A database audit process finds that the library type for the specified library is invalid. Because FIX=YES has been specified for the command, the information is corrected by changing the library type to the default type.

System action: Audit processing continues.

User response: None.

ANR4221I *Audit command: An error (error code) was found with archive description for node (node identifier), description (description), objects (old object count,new object count), count (old directory count,new directory count) - entry will be deleted or updated.*

Explanation: A database audit process has found an error with the specified archive description. Because FIX=YES has been specified for the command, the entry is deleted or updated.

System action: Audit processing continues.

User response: None.

ANR4222I *Audit command: An error (error code) was found with archive description for node (node identifier), description (description), objects (old object count,new object count), count (old directory count,new directory count).*

Explanation: A database audit process has found an error with the specified archive description.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4223I *Audit command: An error (error code) was found with converted archive object for node (node identifier), description (description identifier), object (object.ID), filespace (filespace identifier) - entry will be deleted.*

Explanation: A database audit process has found an error with the specified converted archive object. Because FIX=YES has been specified for the command, the entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4224I *Audit command: An error (error code) was found with converted archive object for node (node identifier), description (description identifier), object (object.ID), filespace (filespace identifier).*

Explanation: A database audit process has found an error with the specified converted archive object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4225I *Audit command: table entry for archive object (object.ID), node (node identifier), description (description), filespace (filespace identifier) not found - the entry will be created.*

Explanation: A database audit process cannot find a converted *table* table entry for the specified archive object. Because FIX=YES has been specified for the command, an entry will be created.

System action: Audit processing continues.

User response: None.

ANR4226I *Audit command: table entry for archive object (object.ID), node (node identifier), description (description), filespace (filespace identifier) not found.*

Explanation: A database audit process cannot find a converted *table* table entry for the specified archive object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4227E *Audit command: Inconsistent information detected for file aggregate (Aggregate.ID).*

Explanation: A database audit process finds inconsistent information for a file aggregate. This problem cannot be corrected by the audit process, but the file data is not deleted.

System action: Audit processing continues.

User response: Contact your service representative.

ANR4228E *Audit command: Missing or incorrect information detected for file aggregate (Aggregate.ID).*

Explanation: A database audit process detects missing or incorrect information for a file aggregate. This information can be corrected.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4229E *Audit command: Missing or incorrect information detected for file aggregate (Aggregate.ID) - It will be corrected.*

Explanation: A database audit process detects missing or incorrect information for a file aggregate. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR4230I *Audit command: Auditing data storage definitions.*

Explanation: This message is displayed during a database audit and indicates that the data storage definitions are being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4231E *Audit command: Invalid device class strategy strategy for device class device class name.*

Explanation: A database audit process finds a device class with an invalid access strategy.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the access strategy can be corrected.

ANR4232E *Audit command: Invalid device class strategy strategy for device class device class name - information will be corrected.*

Explanation: A database audit process finds a device class with an invalid access strategy. Because FIX=YES has been specified for the audit command, the access strategy will be corrected for this device class.

System action: Audit processing continues.

User response: None.

ANR4233E *Audit command: Pool ID information is missing or incorrect for storage pool storage pool name.*

Explanation: A database audit process finds a storage pool whose pool ID information is missing or incorrect.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the access strategy can be corrected.

ANR4234E *Audit command: Pool ID information is missing or incorrect for storage pool storage pool name - information will be created or corrected.*

Explanation: A database audit process finds a storage pool whose pool ID information is missing or incorrect. Because FIX=YES has been specified for the audit command, the pool ID information will be created or corrected for this storage pool.

System action: Audit processing continues.

User response: None.

ANR4235E *Audit command: Device class ID referenced by storage pool storage pool name is not defined - data in this pool may not be available.*

Explanation: A database audit process finds a storage pool which references a device class ID which is not defined.

System action: Audit processing continues.

User response: Contact your service representative.

ANR4236E *Audit command: An invalid access strategy was encountered for storage pool storage pool name.*

Explanation: A database audit process encounters an invalid device access strategy for the specified storage pool.

System action: Audit processing continues.

User response: Reissue the audit command with

FIX=YES so that the attribute can be corrected.

ANR4237E *Audit command: An invalid access strategy was encountered for storage pool storage pool name - the strategy will be corrected.*

Explanation: A database audit process encounters an invalid device access strategy for the specified storage pool. Because FIX=YES has been specified for the command, the storage pool access strategy will be corrected.

System action: Audit processing continues.

User response: After the audit command completes, examine the storage pool using the QUERY STGPOOL command, and verify that the correct information is displayed for this storage pool.

ANR4238E *Audit command: Storage pool storage pool name specifies an undefined pool ID for its next storage pool.*

Explanation: The specified storage pool references an invalid pool ID as its next storage pool.

System action: Audit processing continues.

User response: Use the UPDATE STGPOOL command to update the next pool. Alternatively, if the audit command is reissued with FIX=YES, the reference to the next pool will be deleted.

ANR4239E *Audit command: Storage pool storage pool name specifies an undefined pool ID for its next storage pool - reference will be deleted.*

Explanation: The specified storage pool references an invalid pool ID as its next storage pool. Because FIX=YES has been specified for the command, the reference is deleted. The specified storage pool will not have a next pool.

System action: Audit processing continues.

User response: After the audit command completes, use the UPDATE STGPOOL command to assign a next storage pool, if desired.

ANR4240E *Audit command: An invalid attribute was encountered for storage pool storage pool name.*

Explanation: A database audit process encounters an invalid attribute for the specified storage pool.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the attribute can be corrected.

ANR4241E *Audit command: An invalid attribute was encountered for storage pool *storage pool name* - the attribute will be assigned its default value.*

Explanation: A database audit process encounters an invalid attribute for the specified storage pool. Because FIX=YES has been specified for the command, the storage pool will be corrected using the default value for the attribute.

System action: Audit processing continues.

User response: After the audit command completes, examine the storage pool using the QUERY STGPOOL command, and correct attributes with the UPDATE STGPOOL command, if desired.

ANR4242E *Audit command: Invalid administrator update information encountered for storage pool *storage pool name*.*

Explanation: A database audit process finds incorrect information pertaining to the last update for the specified storage pool.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4243E *Audit command: Invalid administrator update information encountered for storage pool *storage pool name* - information will be corrected.*

Explanation: A database audit process finds incorrect information pertaining to the last update for the specified storage pool. Because FIX=YES has been specified for the command, the information is corrected.

System action: Audit processing continues.

User response: None.

ANR4244E *Audit command: Storage pool ID referenced by volume *volume name* is not defined - data on this volume may not be available.*

Explanation: A database audit process finds a data storage volume which references a storage pool ID that is not defined.

System action: Audit processing continues.

User response: You can attempt to move data on the specified volume to other volumes using the MOVE DATA command; then delete the specified volume and redefine it. If this does not work, contact your service representative.

ANR4245E *Audit command: An invalid access strategy was encountered for volume *volume name*.*

Explanation: A database audit process encounters an invalid device access strategy for the specified volume.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the strategy can be corrected.

ANR4246E *Audit command: An invalid access strategy was encountered for volume *volume name* - the strategy will be corrected.*

Explanation: A database audit process encounters an invalid device access strategy for the specified volume. Because FIX=YES has been specified for the command, the access strategy will be corrected for this volume.

System action: Audit processing continues.

User response: None.

ANR4247E *Audit command: Missing information for volume *volume name* cannot be created. Delete the volume after optionally moving any files from the volume.*

Explanation: A database audit process encounters missing database information for the specified volume. Since FIX=YES has been specified for the audit command, an attempt is made to create the missing information where possible. However, some of the information cannot be created, and the volume must be deleted.

System action: The access mode for the volume is set to UNAVAILABLE to prevent further attempts to write to this volume. Audit processing continues.

User response: After audit processing completes, an administrator should take the following actions to eliminate the volume

- (Optional) Use the UPDATE VOLUME command to set the access mode for the volume to READWRITE. It may then be possible to use the MOVE DATA command to move files from the volume so that these files can be accessed by the server.
- (Required) Use the DELETE VOLUME command to delete the volume from the database.

ANR4248E *Audit command: Missing or incorrect information for storage volume *volume name*.*

Explanation: A database audit process finds a data storage volume for which information is missing or incorrect.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the information can be created or corrected.

ANR4249E *Audit command: Missing or incorrect information for storage volume `volume name` - information will be created or corrected.*

Explanation: A database audit process finds a data storage volume for which information is missing or incorrect. Since FIX=YES has been specified for the audit command, the information will be created or corrected.

System action: Audit processing continues.

User response: None.

ANR4250E *Audit command: Extraneous reference found.*

Explanation: A database audit process finds a reference to a nonexistent entity such as a storage pool or volume.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the non-existent entity is recreated, if possible. If recreation is not possible, the extraneous reference is deleted.

ANR4251E *Audit command: Extraneous reference found - information will be recreated or deleted.*

Explanation: A database audit process finds a reference to a nonexistent entity such as a storage pool or volume. Since FIX=YES has been specified for the audit command, the nonexistent entity will be recreated, if possible. If recreation is not possible, the extraneous information will be deleted.

System action: Audit processing continues.

User response: None.

ANR4252E *Audit command: Data storage global attributes cannot be found.*

Explanation: A database audit process is not able to locate the global attributes for data storage in the server database.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4253E *Audit command: Data storage global attributes cannot be found - attributes will be recreated.*

Explanation: A database audit process is not able to locate the global attributes for data storage in the server database. Because FIX=YES has been specified for the audit command, the attributes will be regenerated.

System action: Audit processing continues.

User response: None.

ANR4254E *Audit command: Data storage high-water marks do not match the identifiers in use.*

Explanation: A database audit process finds that the information used to track data storage identifiers is incorrect.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4255E *Audit command: Data storage high-water marks do not match the identifiers in use - they will be corrected.*

Explanation: A database audit process finds that the information used to track data storage identifiers is incorrect. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR4256I *Audit command: Auditing data storage definitions for disk volumes.*

Explanation: This message is displayed during a database audit and indicates that the database information relating to data storage disk volumes is being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4257E *Audit command: A correctable data-integrity error was detected on volume `volume name`.*

Explanation: A database audit process finds a data-integrity error for a file stored on the specified volume. This error is correctable.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4258E *Audit command: A data-integrity error was detected on volume *volume name* - the error will be corrected.*

Explanation: A database audit process finds a correctable data-integrity error for a file stored on the specified volume. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR4259E *Audit command: Invalid data encountered for a file in data storage - data can be corrected.*

Explanation: A database audit process finds invalid data for a file in data storage. The error should be correctable.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4260E *Audit command: Invalid data encountered for a file in data storage - the error will be corrected.*

Explanation: A database audit process finds invalid data for a file in data storage. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR4261E *Audit command: Invalid access information was encountered for volume *volume name*.*

Explanation: A database audit process encounters invalid access information for the specified volume.

System action: Audit processing continues.

User response: After audit processing has completed, use the UPDATE VOLUME command to set the access information for this volume. Or reissue the audit command with FIX=YES, which sets access to the default value.

ANR4262E *Audit command: Invalid access information was encountered for volume *volume name* - the information will be corrected.*

Explanation: A database audit process encounters invalid access information for the specified volume. Because FIX=YES has been specified for the command, the information will be corrected by setting the default value.

System action: Audit processing continues.

User response: After audit processing has completed, use the UPDATE VOLUME command to set the access information for this volume, if desired.

ANR4263I *Audit command: Auditing data storage definitions for sequential volumes.*

Explanation: This message is displayed during a database audit and indicates that the database information relating to data storage sequential volumes is being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4264I *Audit command: Auditing file information.*

Explanation: This message is displayed during a database audit and indicates that information on stored files is being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4265I *Audit command: Auditing disk file information.*

Explanation: This message is displayed during a database audit and indicates that information on files stored on disk media is being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4266I *Audit command: Auditing sequential file information.*

Explanation: This message is displayed during a database audit and indicates that information on files stored on sequential media is being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4267E *Audit command: A storage pool containing file data cannot be located - file data may not be accessible.*

Explanation: This message is displayed during a database audit and indicates that the storage pool containing a file's data cannot be located or is not defined. This problem cannot be corrected by the audit process, but the file data is not deleted.

System action: Audit processing continues.

User response: Contact your service representative.

ANR4268E *Audit command: A storage volume containing file data cannot be located - file data may not be accessible.*

Explanation: This message is displayed during a database audit and indicates that the storage volume containing a file's data cannot be located or is not defined. This problem cannot be corrected by the audit process, and the file data is deleted.

System action: Audit processing continues.

User response: Contact your service representative.

ANR4269E *Audit command: Extraneous file data reference found.*

Explanation: A database audit process finds a reference to a file that no longer exists.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the information can be deleted.

ANR4270E *Audit command: Extraneous file data reference found - information will be deleted.*

Explanation: A database audit process finds a reference to a file that no longer exists. Because FIX=YES has been specified for the audit command, the information will be deleted.

System action: Audit processing continues.

User response: None.

ANR4271E *Audit command: Missing or incorrect occupancy information detected.*

Explanation: A database audit process detects missing or incorrect occupancy information for a data storage pool or a data storage volume.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the information can be created or corrected.

ANR4272E *Audit command: Missing or incorrect occupancy information detected - information will be created or corrected.*

Explanation: A database audit process detects missing or incorrect occupancy information for a data storage pool or a data storage volume. Because FIX=YES has been specified for the audit command, the information will be created or corrected.

System action: Audit processing continues.

User response: None.

ANR4273E *Audit command: A data-integrity error was detected on volume *volume name* - Issue the AUDIT VOLUME command to correct the error.*

Explanation: A database audit process finds a data-integrity error for a file stored on the specified volume.

System action: Audit processing continues.

User response: Issue the AUDIT VOLUME command on the specified volume to correct the data-integrity error.

ANR4274E *Audit command: A correctable data-integrity error was detected.*

Explanation: A database audit process finds a data-integrity error for a stored file. This error can be corrected.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4275E *Audit command: A data-integrity error was detected - it will be corrected.*

Explanation: A database audit process finds a data-integrity error for a stored file. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR4276E *Audit command: Invalid file storage information detected - file data is not accessible.*

Explanation: A database audit process finds invalid file storage information for a stored file, and it cannot be corrected.

System action: Audit processing continues.

User response: Issue the AUDIT VOLUME command on all your volumes to correct the data-integrity error.

ANR4277E *Audit command: Invalid file storage information detected.*

Explanation: A database audit process finds invalid file storage information for a stored file. This information can be corrected.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4278E *Audit command: Invalid file storage information detected - It will be corrected.*

Explanation: A database audit process finds invalid file storage information for a stored file. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR4279E *Audit command: Administrator administrator number assigned to more than just system authority class.*

Explanation: A database audit process finds that an administrator is assigned to other authority classes. Being assigned with 'SYSTEM' authority supersedes all other classes and the other privilege class entries should be deleted.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4280I *Audit command: Administrator administrator number assigned to more than just system authority class - the other class entries will be deleted.*

Explanation: A database audit process finds that an administrator is assigned to other authority classes. Being assigned with 'SYSTEM' authority supersedes all other classes and the other privilege class entries should be deleted. Because FIX=YES has been specified for the command, any authority class other than system will be deleted.

System action: Audit processing continues.

User response: None.

ANR4281E *Audit command: Administrator administrator number assigned as an unrestricted policy administrator is also assigned as a restricted administrator for domain domain name.*

Explanation: A database audit process finds the specified administrator is assigned as an unrestricted policy administrator. The specified administrator is also assigned as the restricted administrator for the specified policy domain. The unrestricted policy administration class supersedes any restricted policy class definitions for an administrator. The administrator's authority needs to be corrected.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4282I *Audit command: Administrator administrator number assigned as an unrestricted policy administrator is also assigned as administrator for domain domain name - restricted class entry will be deleted.*

Explanation: A database audit process finds the specified administrator is assigned as an unrestricted policy administrator. The specified administrator is also assigned as the restricted administrator for the specified policy domain. The unrestricted policy administration class supersedes any restricted policy class definitions for an administrator. Because FIX=YES has been specified for the command, the restricted administrator policy class will be deleted.

System action: Audit processing continues.

User response: None.

ANR4283E *Audit command: Administrator administrator number assigned as an unrestricted storage administrator is also assigned as a restricted administrator for storage pool storage pool name.*

Explanation: A database audit process finds the specified administrator is assigned as an unrestricted storage administrator. The specified administrator is also assigned as the restricted administrator for the specified storage pool. The unrestricted storage administration class supersedes any restricted storage class definitions for an administrator. The administrator's authority needs to be corrected.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4284I *Audit command: Administrator administrator number assigned as an unrestricted storage administrator is also assigned as a restricted administrator for storage pool storage pool name - restricted class entry will be deleted.*

Explanation: A database audit process finds the specified administrator is assigned as an unrestricted storage administrator. The specified administrator is also assigned as the restricted administrator for the specified storage pool. The unrestricted storage administration class supersedes any restricted storage class definitions for an administrator. Because FIX=YES has been specified for the command, the restricted administrator storage class will be deleted.

System action: Audit processing continues.

User response: None.

ANR4285E *Audit command: A data-integrity error was detected on a storage volume for object (Object.ID).*

Explanation: A database audit process found a data-integrity error for a file stored on a storage volume, but the specific volume name is not known. If fix=yes was specified, the audit process will attempt to correct the data-integrity error.

System action: Audit processing continues.

User response: None.

ANR4286E *Audit command: A correctable storage allocation error detected for volume volume name.*

Explanation: A database audit process finds incorrect block allocation information for the specified storage volume; the error can be corrected.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4287E *Audit command: Storage allocation error detected for volume volume name - It will be corrected.*

Explanation: A database audit process finds incorrect block allocation information for the specified storage volume; the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR4288E *Audit command: Multiple files allocated the same disk storage block on volume volume name.*

Explanation: A database audit process finds multiple files allocated the same disk storage block on the specified volume; this error cannot be corrected by the audit process.

System action: Audit processing continues.

User response: Contact your service representative.

ANR4289E *Audit command: Multiple files allocated the same disk storage block on volume volume name.*

Explanation: A database audit process finds multiple files allocated the same disk storage block on the specified volume; this error cannot be corrected by the audit process.

System action: Audit processing continues.

User response: Contact your service representative.

ANR4290I *Audit command: License global attributes could not be found - they will be created.*

Explanation: A database audit process cannot find the license global attributes. Because FIX=YES has been specified for the command, the information is corrected by the creation of the global attributes.

System action: Audit processing continues.

User response: None.

ANR4291I *Audit command: License global attributes could not be found.*

Explanation: A database audit process cannot find the license global attributes.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4292I *Audit command: Invalid table active column encountered for license global attribute - the value will be corrected.*

Explanation: A database audit process finds that the active column license global attribute is invalid. Because FIX=YES has been specified for the command, the active column is reset to a proper value.

System action: Audit processing continues.

User response: None.

ANR4293I *Audit command: Invalid table active column encountered for license global attributes.*

Explanation: A database audit process finds that the active column license global attribute is invalid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4294I *Audit command: A license node assignment entry was not found for node node ID - an entry will be created.*

Explanation: A database audit process cannot find the node assignment entry corresponding to the specified node. Since FIX=YES has been specified for the command, the required license entry will be created using default values.

System action: Audit processing continues.

User response: None.

ANR4295I *Audit command: A license node assignment entry was not found for node `node ID`.*

Explanation: A database audit process cannot find the node assignment entry corresponding to the specified node.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4296I *Audit command: An invalid license node assignment entry was found for node `node ID` - the entry will be deleted.*

Explanation: A database audit process finds that the license node assignment entry is invalid. Because FIX=YES has been specified for the command, the node entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4297I *Audit command: An invalid license node assignment entry was found for node `node ID`.*

Explanation: A database audit process finds that the license node assignment entry is invalid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4298I **Expiration thread already processing - unable to begin another expiration process.**

Explanation: The expiration thread is already processing. The processing expiration thread is either an EXPIRE INVENTORY command or is the automatic background expiration process. In either case, another expiration process cannot be started until the current expiration process completes or is canceled.

System action: Current expiration process continues.

User response: Use the QUERY PROCESS command to determine the status of the current expiration process.

ANR4299I *Audit command: Invalid audit interval encountered for license global attribute - the value will be set to the default.*

Explanation: A database audit process finds that the audit interval license global attribute is invalid. Because FIX=YES has been specified for the command, the audit interval is reset to the default value.

System action: Audit processing continues.

User response: None.

ANR4300I *Audit command: Invalid audit interval encountered for license global attributes.*

Explanation: A database audit process finds that the audit interval license global attribute is invalid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4301I *Audit command: Invalid last audit date encountered for license global attribute - the value will be set to 0.*

Explanation: A database audit process finds that the last audit date license global attribute is invalid. Because FIX=YES has been specified for the command, the last audit date is set to 0. The next execution of AUDIT LICENSES will set a new last audit date.

System action: Audit processing continues.

User response: None.

ANR4302I *Audit command: Invalid last audit date encountered for license global attribute.*

Explanation: A database audit process finds that the last audit date license global attribute is invalid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4303E *Audit command: Inventory references for object(`Object.ID`) deleted.*

Explanation: A database audit process deleted all inventory references for the specified object ID. This process corrects a data-integrity error if FIX=YES was specified.

System action: Audit processing continues.

User response: None.

ANR4304E *Audit command: object name missing entry for cluster `cluster ID` - cluster entries deleted.*

Explanation: A database audit process is missing a corresponding entry for the specified comparison object and cluster ID. This process indicates a data-integrity error for the database cluster information. If FIX=YES was specified, the invalid cluster information will be deleted.

System action: Audit processing continues.

User response: None.

ANR4305E *Audit command: object name missing entry for cluster cluster ID.*

Explanation: A database audit process is missing a corresponding entry for the specified comparison object and cluster ID. This indicates a data-integrity error for the database cluster information.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4306I *AUDITDB: Processed number of entries database entries (cumulative).*

Explanation: This message indicates the number of database entries that have been processed during database audit processing.

System action: Database audit processing continues.

User response: None.

ANR4307I *Audit command: Auditing inventory external space-managed objects.*

Explanation: This message is displayed during a database audit and indicates that server information about external space-managed client objects is currently being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4308I *Audit command: External space-managed entry for node node ID and file space filespace ID is missing a corresponding space-managed object entry - the external space-managed entry will be deleted.*

Explanation: A database audit process finds that an external space-managed entry is missing a corresponding space-managed entry. Because FIX=YES has been specified, the orphaned external space-managed entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4309I *Audit command: External space-managed entry for node node ID and file space filespace ID is missing a corresponding space-managed object entry.*

Explanation: A database audit process finds that an external space-managed entry is missing a corresponding space-managed entry.

System action: Audit processing continues.

User response: Reissue the audit command and

specify FIX=YES so that the error can be corrected.

ANR4310I *Audit command: Auditing inventory space-managed objects.*

Explanation: This message is displayed during a database audit and indicates that server information about space-managed client objects is currently being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4311I *Audit command: Object entry for space-managed object object.ID not found - entry will be created.*

Explanation: A database audit process cannot find an object entry for the specified space-managed object. Because FIX=YES has been specified for the command, an object entry is created by using default values.

System action: Audit processing continues.

User response: None.

ANR4312I *Audit command: Object entry for space-managed object object.ID not found.*

Explanation: A database audit process cannot find an object entry for the specified backup object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4313I *Audit command: Space-managed object (object ID) for node node ID and file space filespace ID has one or more incorrect fields - the values will be corrected.*

Explanation: A database audit process determined that one or more field values for the specified space-managed object is not valid. Because FIX=YES was specified the values are corrected.

System action: Audit processing continues.

User response: None.

ANR4314I *Audit command: Space-managed object (object ID) for node node ID and file space filespace ID has one or more incorrect fields.*

Explanation: A database audit process determined that one or more field values for the specified space-managed object is not valid.

System action: Audit processing continues.

ANR4315I • ANR4323E

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4315I *Audit command: Space-managed object (object ID) for node node ID and file space filespace ID is missing the corresponding external space managed entry - the entry will be created.*

Explanation: A database audit process determines that the space-managed object entry is missing a corresponding external space managed entry. Because FIX=YES was specified, the missing entry will be created.

System action: Audit processing continues.

User response: None.

ANR4316I *Audit command: Space-managed object (object ID) for node node ID and file space filespace ID is missing the corresponding external space managed entry.*

Explanation: A database audit process determines that the space-managed object entry is missing a corresponding external space-managed entry.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4317I *Audit command: External space-managed object (object ID) for node node ID and file space filespace ID has one or more incorrect fields - the values will be corrected.*

Explanation: A database audit process determined that one or more field values for the specified external space-managed object is not valid. Because FIX=YES was specified, the values will be corrected.

System action: Audit processing continues.

User response: None.

ANR4318I *Audit command: External space-managed object (object ID) for node node ID and file space filespace ID has one or more incorrect fields.*

Explanation: A database audit process determined that one or more field values for the specified external space-managed object is not valid.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4319I *Audit command: Space-managed object not found for object object.ID - object entry will be deleted.*

Explanation: A database audit process cannot find a space-managed object entry for the specified object. Because FIX=YES was specified the object entry will be deleted.

System action: Audit processing continues.

User response: None.

ANR4320I *Audit command: Space-managed object not found for object object.ID.*

Explanation: A database audit process cannot find a space-managed object entry for the specified object.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4321I *Audit command: Invalid copy type encountered for object object.ID - object found as an space-managed object - correcting the invalid copy type*

Explanation: A database audit process encounters an invalid copy type for the specified object ID, but finds a corresponding space-managed object for the entry. Because FIX=YES has been specified for the command, the invalid copy type is corrected.

System action: Audit processing continues.

User response: None.

ANR4322E *Audit command: Management class class name in policy set set name, domain domain name does not have a valid space management technique defined.*

Explanation: A database audit process finds a management class that does not have a valid value specified.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4323E *Audit command: Management class class name in policy set set name, domain domain name does not have a valid space management technique defined - the default value will be set.*

Explanation: A database audit process finds a management class that does not have a valid value specified. Because FIX=YES was specified for the AUDITDB operation, the default space management

technique value will be set for the management class specified.

System action: Audit processing continues.

User response: Refer to the DEFINE MGMTCLASS command in the *Administrator's Reference* for valid values.

ANR4324E *Audit command: Management class class name in policy set set name, domain domain name does not have a valid AUTOMIGNONUSE value specified.*

Explanation: A database audit process finds a management class that does not have a valid value specified.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4325E *Audit command: Management class class name in policy set set name, domain domain name does not have a valid AUTOMIGNONUSE value defined - the default value will be set.*

Explanation: A database audit process finds a management class that does not have a valid value specified. Because FIX=YES was specified for the AUDITDB operation, the default AUTOMIGNONUSE value will be set for the management class specified.

System action: Audit processing continues.

User response: Refer to the DEFINE MGMTCLASS command in the *Administrator's Reference* for valid values.

ANR4326E *Audit command: Management class class name in policy set set name, domain domain name does not have a valid MIGREQUIRESBKUP value specified.*

Explanation: A database audit process finds a management class that does not have a valid value specified.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4327E *Audit command: Management class class name in policy set set name, domain domain name does not have a valid MIGREQUIRESBKUP value defined - the default value will be set.*

Explanation: A database audit process finds a management class that does not have a valid value specified. Because FIX=YES was specified for the

AUDITDB operation, the default MIGREQUIRESBKUP value will be set for the management class specified.

System action: Audit processing continues.

User response: Refer to the DEFINE MGMTCLASS command in the *Administrator's Reference* for valid values.

ANR4328W *Audit command: Storage pool storage pool name, specified as a space management destination for management class management class name, policy set set name, domain domain name, does not exist.*

Explanation: A database audit process encounters a storage pool specified for the space management destination of the specified management class that is not defined in the server database. If this management class is used in an active policy set, then migration operations will fail when attempting to put client data in the destination.

System action: Audit processing continues.

User response: After the audit command completes, use the DEFINE STGPOOL command to define the missing storage pool or the UPDATE MGMTCLASS command to update the management class to refer to an existing storage pool.

ANR4329I *Audit command: Inactive reference found for active backup entry (Object.ID) - the inactive reference will be deleted.*

Explanation: A database audit process found that an active backup entry for the specified object has a corresponding inactive backup entry. Since FIX=YES was specified for the command, the information is corrected by deleting the inactive backup object entry.

System action: Audit processing continues.

User response: None.

ANR4330I *Audit command: Inactive reference found for active backup entry (Object.ID).*

Explanation: A database audit process found that an active backup entry for the specified object has a corresponding inactive backup entry.

System action: Audit processing continues.

User response: None.

ANR4331E *command process terminated, no matching device classes.*

Explanation: The server did not find any device class names matching the specifications entered in the RECONCILE VOLUMES command.

System action: Server operation continues.

ANR4332W • ANR4340W

User response: Use the QUERY DEVCLASS command to determine which device classes are defined on the server and reissue the RECONCILE VOLUMES command.

ANR4332W This command will compare all volumes used by the specified device class(es) with the actual data stored on the associated server for those volumes and will report any discrepancies; the data will be inaccessible to users until the operation completes.

Explanation: During the execution of a RECONCILE VOLUMES command, any data a volume named would be unavailable to users.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to reconcile the volumes or 'N' to stop the process.

ANR4333W This command will discard any references to volumes used by the specified device class(es) that are missing from the associated server, thereby rendering the data unrecoverable; the valid volumes will be inaccessible to users until the operation completes.

Explanation: During the execution of a RECONCILE VOLUMES command, any data on a volume being reconciled would be unavailable to users. After the command has ended, any inconsistent volumes found will be discarded.

System action: The administrator is asked whether to continue.

User response: Enter 'Y' to reconcile the volumes or 'N' to stop the process.

ANR4334I *command (Repair) process started, process ID process ID.*

Explanation: As the result of a RECONCILE VOLUMES command that specified FIX=YES, the process whose ID is displayed has begun reconciling the volumes associated with the given device class.

System action: The volumes are reconciled and invalid volumes are displayed.

User response: None.

ANR4335I *command (Inspect Only) process started, process ID process ID.*

Explanation: As the result of a RECONCILE VOLUMES command that specified FIX=NO, the process whose ID is displayed has begun reconciling

the volumes associated with the given device class.

System action: The volumes are reconciled and inconsistent volumes are displayed.

User response: None.

ANR4336W *command process ended, process ID process ID.*

Explanation: The RECONCILE VOLUMES command for the specified device class has ended.

System action: None.

User response: For complete details on the results of the RECONCILE VOLUMES command, examine the previous messages.

ANR4337W *command process terminated - process canceled.*

Explanation: During processing of a RECONCILE VOLUMES command, the process performing the reconcile was canceled.

System action: The RECONCILE VOLUMES command is ended.

User response: None.

ANR4338W *command process terminated - sufficient recovery log space is not available.*

Explanation: During processing of a RECONCILE VOLUMES command, the source server does not have sufficient recovery log space to continue.

System action: The RECONCILE VOLUMES command is ended.

User response: If necessary, make more recovery log space available to the source server.

ANR4339W *command process terminated - sufficient database space is not available.*

Explanation: During processing of a RECONCILE VOLUMES command, the source server does not have sufficient database space to continue.

System action: The RECONCILE VOLUMES command is ended.

User response: If necessary, make more database space available to the source server.

ANR4340W *command process terminated - thread resource not available.*

Explanation: During processing of a RECONCILE VOLUMES command, the source server cannot start a thread for the reconcile process.

System action: The RECONCILE VOLUMES command is ended.

User response: Reissue the RECONCILE VOLUMES command. If the error persists, it may indicate a shortage of source server memory.

ANR4341W *command process terminated - sufficient memory is not available.*

Explanation: During processing of a RECONCILE VOLUMES command, the source server does not have enough memory available to complete the command.

System action: The RECONCILE VOLUMES command is ended.

User response: If necessary make more memory available to the source server.

ANR4342W *command process terminated - lock conflict detected.*

Explanation: During processing of a RECONCILE VOLUMES command, the source server cannot obtain a required lock.

System action: The RECONCILE VOLUMES command is ended.

User response: Reissue the RECONCILE VOLUMES command.

ANR4343W *command process terminated - internal server error detected.*

Explanation: During processing of a RECONCILE VOLUMES command, an internal server error occurs on the source server.

System action: The RECONCILE VOLUMES command is ended.

User response: Contact your service representative.

ANR4344I *command started for device class device class (process ID process ID).*

Explanation: The RECONCILE VOLUMES process whose ID is displayed has started reconciling volumes associated with the given device class.

System action: The volumes are reconciled and inconsistent volumes are displayed.

User response: None.

ANR4345I *command completed for device class device class; (process ID process ID); volume count volumes inspected, volume count invalid volumes found, volume count volumes deleted.*

Explanation: The RECONCILE VOLUMES process whose ID is displayed has finished reconciling volumes associated with the given device class. The number of volumes reconciled and the number of invalid volumes

found or deleted are displayed.

System action: None.

User response: For complete details on the results of the RECONCILE VOLUMES command for the shown device class, examine the previous messages.

ANR4346I *command completed for device class device class; (process ID process ID); volume count volumes inspected, volume count invalid volumes found.*

Explanation: The RECONCILE VOLUMES process whose ID is displayed has finished reconciling volumes associated with the given device class. The number of volumes reconciled and the number of invalid volumes found are displayed.

System action: None.

User response: For complete details on the results of the RECONCILE VOLUMES command for the shown device class, examine the previous messages. If you suspect that volumes were inaccessible because of communications problems, correct the problems and retry the RECONCILE VOLUMES command. If the errors are valid, reissue the reconcile volumes command with FIX=YES so that the source server can attempt to correct the information.

ANR4352I **Contacting Server** *server name*

Explanation: This message is displayed in response to a QUERY PROCESS command, and indicates that a reconciliation process is attempting to obtain volume information from the shown server.

System action: The reconciliation process continues.

User response: None.

ANR4353I **Cancel in progress**

Explanation: This message is displayed in response to a QUERY PROCESS command, and indicates that a reconciliation process has been canceled. The process will end shortly.

System action: The reconciliation process terminates and server operation continues.

User response: None.

ANR4354W *command: Source server not authorized to reconcile target server server name.*

Explanation: During processing of a RECONCILE VOLUMES command, the source server was not permitted to reconcile volume on the shown target server.

System action: The reconciliation process continues.

User response: If the source server should have

ANR4355W • ANR4358W

permission to reconcile volumes on the shown target server, issue the UPDATE SERVER command with FORCESYNC=YES to cause the target server to accept reconcile operations for the source server. Reissue the RECONCILE VOLUMES command.

ANR4355W *command: Volume volume name not valid, source server missing corresponding entry for target server.*

Explanation: As the result of a RECONCILE VOLUMES command, the volume shown was reported by the target server and it has no matching volume on the source server.

System action: The reconciliation process continues.

User response: The database on either the source or target server has been regressed by either a RESTORE DATABASE operation or some system facility external to the server. Investigate the action that caused one or both of the databases to be regressed to their current condition. If a newer database images exist for that server, consider restoring the server to that point in time. If the condition of the database on each server is acceptable and the RECONCILE VOLUMES command was issued with FIX=NO, reissue the RECONCILE VOLUMES command with FIX=Yes to have the volume deleted from the target server.

ANR4356W *command: Volume volume name not valid, target server missing corresponding entry for source server.*

Explanation: As the result of a RECONCILE VOLUMES command, the volume shown was found on the source server and it has no matching volume on the target server.

System action: The reconciliation process continues.

User response: The database on either the source or target server has been regressed by either a RESTORE DATABASE operation or some system facility external to the server. Investigate the action that caused one or both of the databases to be regressed to their current condition. If a newer database images exist for that server, consider restoring the server to that point in time. If the RECONCILE VOLUMES command was issued with FIX=Yes and the volume is defined in a storage pool, the access mode of the volume will be changed to unavailable to prevent attempted mounts on the source server. If the condition of the database on each server is acceptable, issue the DELETE VOLUME or DELETE VOLHISTORY command on the source server to remove the volume from the database.

ANR4357W *command: Volume volume name not valid, target server volume refers to device class device class that does not exist on the source server.*

Explanation: As the result of a RECONCILE

VOLUMES command, the volume shown was found on the target server and it is associated with the device class shown. The source server has NO corresponding device class.

System action: The reconciliation process continues.

User response: The database on either the source or target server has been regressed by either a RESTORE DATABASE operation or some system facility external to the server. Investigate the action that caused one or both of the databases to be regressed to their current condition. If a newer database image exist for that server, consider restoring the server to that point in time. In the case of a volume in the VOLHISTORY, the device class may have been deleted from the source server. If possible, issue the DEFINE DEVCLASS command to correct the situation. If the condition of the database on each server is acceptable and the RECONCILE VOLUMES command was issued with FIX=NO, reissue the RECONCILE VOLUMES command with FIX=Yes to have the volume deleted from the target server.

ANR4358W *command: Volume volume name not valid, the attributes of the volume on target server do not match the attributes on the source server.*

Explanation: As the result of a RECONCILE VOLUMES command, the volume shown was found on both the source and target server, but the attributes describing the volume does not match.

System action: The reconciliation process continues.

User response: The database on either the source or target server has been regressed by either a RESTORE DATABASE operation or some system facility external to the server. Investigate the action that caused one or both of the databases to be regressed to their current condition. If a newer database image exist for that server, consider restoring the server to that point in time. If the condition of the database on each server is acceptable, additional actions will have to be taken because RECONCILE VOLUMES FIX=YES is unable to correct this situation. In the case of a volume in the VOLHISTORY, an IMPORT PREVIEW=YES or a RESTORE DATABASE PREVIEW=YES will determine the integrity of the volume. If the volume is in error, a DELETE VOLHISTORY will remove the volume from both the source and target servers. In the case of a volume in a storage pool, an AUDIT VOLUME FIX=NO will determine the integrity of the volume. If errors are found, an AUDIT VOLUME FIX=YES may make some data on the volume accessible. Otherwise, issue the DELETE VOLUME command on the source server to remove the volume from both the source and target servers.

ANR4359W *command: Volume *volume name* not valid, the size of the volume on target server does not match the size on the source server.*

Explanation: As the result of a RECONCILE VOLUMES command, the volume shown was found on both the source and target server, but the size of the volume does not match.

System action: The reconciliation process continues.

User response: The database on either the source or target server has been regressed by either an RESTORE DATABASE operation or some system facility external to the server. Investigate the action that caused one or both of the databases to be regressed to there current condition. If a newer database image exist for that server, consider restoring the server to that point in time. If the condition of the database on each server is acceptable, additional actions will have to be taken because RECONCILE VOLUMES FIX=YES is unable to correct this situation. In the case of a volume in the VOLHISTORY, an IMPORT PREVIEW=YES or a RESTORE DATABASE PREVIEW=YES will determine the integrity of the volume. If the volume is in error, a DELETE VOLHISTORY will remove the volume from both the source and target servers. In the case of a volume in a storage pool, an AUDIT VOLUME FIX=NO will determine the integrity of the volume. If errors are found, an AUDIT VOLUME FIX=YES may make some data on the volume accessible. Otherwise, issue the DELETE VOLUME command on the source server to remove the volume from both the source and target servers.

ANR4360W *command: Volume *volume name* not valid, the type of the volume on target server does not match the type on the source server.*

Explanation: As the result of a RECONCILE VOLUMES command, the volume shown was found on both the source and target server, but the type of the volume does not match. For example, the volume on the target server is defined in a storage pool, but the target server indicates that volume was used for a DATABASE BACKUP.

System action: The reconciliation process continues.

User response: The database on either the source or target server has been regressed by either an RESTORE DATABASE operation or some system facility external to the server. Investigate the action that caused one or both of the databases to be regressed to there current condition. If a newer database image exists for that server, consider restoring the server to that point in time. If the condition of the database on each server is acceptable, additional actions will have to be taken because RECONCILE VOLUMES FIX=YES is unable to correct this situation. These actions may have to be performed on one or both servers. Use the QUERY

VOLHISTORY and QUERY VOLUME commands on both servers to determine the volume type on each server. In the case of a volume in the VOLHISTORY, a DELETE VOLHISTORY on the appropriate server that will remove the volume on that server. In the case of a volume in a storage pool, the DELETE VOLUME command on the appropriate server will remove the volume on that server.

ANR4361W *command: Volume *volume name* not valid, the target server has reported damage to all or part of the volume.*

Explanation: As the result of a RECONCILE VOLUMES command, the volume shown was found on both the source and target server, but the target server has reported damage to all or part of the volume.

System action: The reconciliation process continues.

User response: On the target server, an audit with FIX=NO of the volumes in the storage pool used by the source server will indicate what which volume on the target server is damaged. This AUDIT VOLUME command may be able to reset the damaged indicator in the database if the damage was temporary due to hardware problems (for example, dirty tape heads). If the volume on the target server is in a primary storage pool that has previously been backed up to a copy storage pool, attempt to correct the damage by using the RESTORE STGPOOL command. If attempts to correct the damage on the target server fail, an AUDIT VOLUME command FIX=YES from the source server will mark as damaged in the source server database each file that is inaccessible and those files will not be accessed for future operations. If the files are part of an aggregate, the entire aggregate will be marked damaged. If a usable copy of the file exists in another storage pool, that copy may be accessed for future operations involving the file.

ANR4362W *command: Invalid volume *volume name* deleted from server *server name* for device class *device class*.*

Explanation: As the result of a RECONCILE VOLUMES command that specified FIX=YES, the volume shown whose information is displayed is deleted from the target server.

System action: The volume is deleted.

User response: None.

ANR4363W *command: Volume *volume name* access changed to *access mode*.*

Explanation: As the result of a RECONCILE VOLUMES command that specified FIX=YES, the access mode of the source volume has been changed to the value shown.

System action: The volume's access mode is changed.

ANR4364W • ANR4371E

User response: Review any additional messages issued by the RECONCILE VOLUMES command and correct the errors that set the volume to unavailable, or use the DELETE VOLUME command to remove it from the system.

ANR4364W *command:* **Unable to connect to target server** *server name.*

Explanation: During processing of indicated command, the source server was unable to maintain communications with the shown target server.

System action: The command process continues.

User response: Check both the source server and the target server for any additional messages that might further describe the communications problem.

ANR4365W *command:* **Prefix for volume** *volume name* **does not match the device class prefix.**

Explanation: As the result of a RECONCILE VOLUMES command, the volume shown was found on both the source and target server, but the beginning portion of the high-level archive file name (the prefix) on the target server does not match the prefix in the device class on the source server.

System action: The reconciliation process continues.

User response: Verify that the prefix in the device class on the source server is correct and update it if necessary. Use the RECONCILE VOLUMES FIX=YES command on the source server to rename the target archive objects to match the device class on the source server.

ANR4366I *command:* **Prefix for volume** *volume name* **was changed to match the device class prefix.**

Explanation: As the result of a RECONCILE VOLUMES FIX=YES command, the beginning portion of the high-level archive file name (the prefix) on the target server was changed to match the prefix in the device class on the source server.

System action: The prefix is corrected.

User response: None.

ANR4367E *Audit command:* **A storage volume containing file data cannot be located - file data may not be accessible.**

Explanation: This message is displayed during a database audit and indicates that the storage volume containing a file's data cannot be located or is not defined.

System action: Audit processing continues.

User response: Reissue the audit command with

FIX=YES and the server will attempt to recreate the missing volume definition. If the server cannot recreate the missing volume information, the server will delete the inaccessible file data.

ANR4368I *Audit command:* **Attributes for group** *group.ID* **and member** *member.ID* **are not correct - the attributes are corrected.**

Explanation: A database audit process determines that attributes for the specified group ID and member ID do not match attributes for the corresponding primary backup object. Because FIX=YES was specified for the command, the incorrect attributes are corrected.

System action: Audit processing continues.

User response: None.

ANR4369I *Audit command:* **Attributes for group** *group.ID* **and member** *member.ID* **are not correct.**

Explanation: A database audit process determines that attributes for the specified group ID and member ID do not match attributes for the corresponding primary backup object.

System action: Audit processing continues.

User response: The AUDITDB process should be re-issued with FIX=YES specified.

ANR4370E **The source server is not authorized to create volumes on target server** *server name.*

Explanation: The source server has attempted to create a volume on the shown target server, but the operation failed because the source server does not have the authority to create volumes.

System action: The operation fails.

User response: If the source server should have permission to create volumes on the shown target server, issue the UPDATE SERVER command with FORCESYNC=YES to cause the target server to accept volume create operations for the source server. Retry the failing operation.

ANR4371E **Information on the source server does not match information on target server** *server name.*

Explanation: The source server has determined that information contained on the shown target server no longer matches information contained on the source server.

System action: The operation fails.

User response: Issue the RECONCILE VOLUMES command to determine the problem. If possible, correct

the problem and retry the failing operation.

ANR4372E The password on the source server does not match the password on target server *server name*.

Explanation: The source server has attempted to update both the source password and the target password. An error occurred that prevented the source server from updating the target server. The passwords no longer match.

System action: The operation fails.

User response: On the target server, issue the UPDATE NODE command to change the password. On the source server, issue the UPDATE SERVER command to change the password to match the new password on the target server. Retry the failing operation.

ANR4373E Session rejected by target server *server name*, reason: *rejection reason*.

Explanation: The source server has attempted to open a session with the shown target server. The session was rejected for the indicated reason.

System action: The operation fails.

User response: Check both the source server and the target server for any additional messages that might further describe the reason the session was rejected. For a reason of AUTHENTICATION FAILURE, ensure that both the source and target servers are using the same password. For a reason of NO RESOURCE, ensure that the target server is enabled, has sufficient DB, LOG, and memory resource to support the source server session and that the node name of the source server is not locked or in use. If this is a routed command, check to make sure that the administrator id being used to route the command is not locked or in use. For a reason of LICENSE FAILURE, ensure that the target server is properly licensed to support the source server session. For a reason of DOWN LEVEL, ensure that the target server program is a level new enough to support the source server session. For a reason of NODE TYPE, the source server is not allowed to establish a session with the given target server. The NODETYPE on the target server is CLIENT. The NODENAME parameter of the server definition on the source server is incorrect. The NODETYPE parameter of the registered node on the target server is incorrect and should be NODETYPE=SERVER. For a reason of INTERNAL ERROR, use the messages on the target server to determine the problem and contact your service representative. Retry the failing operation.

ANR4374E Session failure, source server detected an internal error.

Explanation: The source server ends the session because an internal logic error is detected.

System action: The source server ends the session and continues operation.

User response: To determine the source of the error, the administrator can examine server messages issued prior to this message. The QUERY ACTLOG command can be used to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR4375E Session failure, source server has insufficient memory.

Explanation: The source server ends the session because sufficient memory (virtual memory) is not available.

System action: The source server ends the session and continues operation.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR4376E Session failure, target server *server name* is locked on the source server.

Explanation: The source server ends the session because shown target server is locked from source server access.

System action: The source server ends the session and continues operation.

User response: Before the source server is permitted to access the target server, a properly authorized administrator must unlock the target server.

ANR4377E Session failure, target server *server name* is not defined on the source server.

Explanation: The source server ends the session because shown target server is not defined on the source server.

System action: The source server ends the session and continues operation.

User response: Before the source server is permitted to access the target server, the target server must be properly defined.

ANR4378E For device class *device class*, the retry of a session with target server *server name* has timed out.

Explanation: The source server has attempted to re-establish a session with the shown target server, but the RETRYPERIOD from the given device class has been exceeded.

System action: The source server ends the operation.

User response: Determine if the target server is having a problem or considering increasing the RETRYPERIOD value.

ANR4379E The source server was unable to update the password on target server *server name*.

Explanation: The source server has attempted to update the target password. An error occurred that prevented the source server from updating the target server.

System action: The operation fails.

User response: On the target server, determine the cause of the problem and correct it. It may be necessary for an administrator to correct the passwords with the following actions. On the target server, issue the UPDATE NODE command to change the password. On the source server, issue the UPDATE SERVER command to change the password to match the new password on the target server. Retry the failing operation.

ANR4380E The source server was unable to update the server validation key on target server *server name*.

Explanation: The source server has attempted to update its server validation key on the target server. An error occurred that prevented the source server from updating the target server.

System action: The operation fails.

User response: On the target server, determine the cause of the problem and correct it. It may be necessary for an administrator to correct the keys with the following actions. On the source server, issue the UPDATE SERVER command with FORCESYNC=YES to cause an attempt to synchronize the keys on both the source and target servers. Retry the failing operation.

ANR4381E The source server was unable to register with target server *server name*.

Explanation: The source server has attempted to register with the shown target server. An error occurred that prevented the source server from registering with the target server.

System action: The operation fails.

User response: Ask an authorized administrator to submit the request on the use of the target server using REGISTER NODE command. Retry the failing operation.

ANR4382E Session failure, policy information from target server *server name* is incomplete, missing policy object.

Explanation: The source server ends the session because the shown target server has provided policy information which is incomplete. The missing policy object is shown.

System action: The source server ends the session and continues operation.

User response: Use the appropriate commands on the target server to complete the policy definitions being used by the source server. Retry the failing operation.

ANR4383E Session failure, target server *server name* has aborted current transaction; reason: *abort reason*.

Explanation: The source server ends the session because the shown target server has aborted the current transaction for the given reason.

System action: The source server ends the session and continues operation.

User response: Check both the source server and the target server for any additional messages that might further describe the reason the transaction was aborted. Retry the failing operation.

ANR4384E Node *node name* is not allowed to establish a session as a target server.

Explanation: The node specified has attempted to establish a session with this system and this is not permitted due to the NODETYPE for this node.

System action: The operation fails.

User response: To allow the specified node to establish a session as a target server, the node must be registered with a NODETYPE of SERVER. Or else change the node name on the target server to a node name that is allowed to establish a session using a node name that was registered with the NODETYPE=SERVER parameter specified.

ANR4385I Session retry in progress with target server *server name*.

Explanation: The source server is attempting to re-establish a session with the shown target server. Session retry processing occurs when the source server has lost the connection with a target server and a RETRYPERIOD value is specified,

System action: The source server attempts to contact the target server.

User response: Determine if the target server is having a problem and considering canceling the operation on the source server or correcting the problem with the target server.

ANR4386I Session retry was successful for target server *server name*.

Explanation: The source server has re-establish a session with the shown target server.

System action: Source server processing continues.

User response: None.

ANR4387E Session *session number* for node *node name (client platform)* refused - node name not registered as TYPE=CLIENT.

Explanation: The server refuses a request to start a client session because the client node name is not registered as a node of TYPE=CLIENT. This node name is already in use either as a server definition as defined by a DEFINE SERVER command or else as a node of TYPE=SERVER using the REGISTER NODE command.

System action: Server operation continues.

User response: Issue a QUERY NODE TYPE=SERVER or a QUERY SERVER to determine which server definition already is using this node name. This client should be registered using the REGISTER NODE TYPE=CLIENT command and specify a name that is not in use by any other nodes or server defined to this server.

ANR4388W No expiration process to cancel.

Explanation: The CANCEL EXPIRATION command was issued but there were no expiration processes currently running.

System action: Server operation continues.

User response: None.

ANR4389I Expiration process cancelled.

Explanation: The CANCEL EXPIRATION command was issued and successfully cancelled the current process.

System action: Server operation continues.

User response: None.

ANR4390E CANCEL EXPIRATION failed - unable to cancel expiration process.

Explanation: The CANCEL EXPIRATION command was issued but encountered an error. Due to this error, the command was unable to cancel the process.

System action: Server operation continues.

User response: Issue the command QUERY PROCESS to determine the process number for the expiration process and then issue the command CANCEL PROCESS for that process number. This will cancel the current expiration process.

ANR4391I Expiration processing node *node name*, *filesystem filesystem name*, *fsId filesystem id*, *domain domain name*, and *management class management class name* - for type *type* files.

Explanation: Expiration processing is currently evaluating information for the node, filesystem, domain name, and management class specified for the file type indicated.

System action: Server operation continues.

User response: None.

ANR4395I Audit command: Invalid node type encountered for node *node name*.

Explanation: A database audit process encounters an invalid node type for the node indicated, and FIX=YES was not specified.

System action: Audit processing continues.

User response: You may want to run this command again, specifying FIX=YES so that the audit process can correct the problem.

ANR4396I Audit command: Invalid node type encountered for node *node name*. The default type will be set.

Explanation: A database audit process encounters an invalid node type for the node indicated. Because FIX=YES has been specified, the audit function sets the node's type to the default value.

System action: Audit processing continues.

User response: If you want the node type for the specified node to be other than the default, you must remove and re-register the node with the correct type after the audit command has completed.

ANR4397E Audit command: An invalid data format was encountered for storage pool *storage pool name*.

Explanation: A database audit process encounters an invalid data format for the specified storage pool.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the attribute can be corrected.

ANR4398E *Audit command: An invalid data format was encountered for storage pool *storage pool name* - the data format will be assigned its default value.*

Explanation: A database audit process encounters an invalid data format for the specified storage pool.

System action: Because FIX=YES has been specified for the command, the audit process assigns the default value to the data format. Audit processing continues.

User response: If you want the data format for the specified storage pool to be other than the default, you must delete and re-define the storage pool with the desired type after the audit command has completed.

ANR4402I *Database Dump command: Database update activity resumed*

Explanation: Database update activities that were suspended by the database dump process are restarted.

System action: Server operation continues.

User response: None.

ANR4403I *Database Load command: Database dump image is consistent - a database audit (AUDITDB) will NOT be required if this load completes successfully.*

Explanation: The database dump that is currently being loaded by the LOADDDB process is a consistent database image. This process implies that a database audit (AUDITDB) will not be required if the load completes successfully.

System action: Server database load processing continues.

User response: None

ANR4404I *Database Load command: Loaded a consistent dump image - a database audit (AUDITDB) is NOT required.*

Explanation: The database dump image loaded by the LOAD command was consistent. A database audit (AUDITDB) is not required. The server may be started normally.

System action: Server database load processing completes.

User response: None.

ANR4405I *Database Load command: Loaded an inconsistent dump image - a database audit (AUDITDB) IS REQUIRED with FIX=YES.*

Explanation: The database dump image loaded by the LOAD command was not consistent. A database audit

(AUDITDB) with FIX=YES is required to return the database to a consistent state.

System action: Server database load processing completes.

User response: To check the database for inconsistencies and correct any inconsistencies, use the database audit (AUDITDB) utility as described in the *Administrator's Reference*.

ANR4406I *Audit command: Client option *Client option name* sequence number *option sequence number* is not a member of an optionset. The option will be deleted.*

Explanation: A database audit process found that the specified client option does not have a corresponding optionset. The option is deleted.

System action: Audit processing continues.

User response: None.

ANR4407I *Audit command: Client option *Client option name* sequence number *option sequence number* is not a member of an optionset.*

Explanation: A database audit process found that the specified client option does not have a corresponding optionset. The option is deleted.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4408I *Audit command: Client option *Client option name* sequence number *option sequence number* in optionset *optionset name* is not a valid option. The option will be deleted.*

Explanation: A database audit process found that the specified client option is not a valid option. The option is deleted.

System action: Audit processing continues.

User response: None.

ANR4409I *Audit command: Client option *Client option name* sequence number *option sequence number* in optionset *option set* is not a valid option.*

Explanation: A database audit process found that the specified client option is not a valid option.

System action: Audit processing continues.

User response: Reissue the audit command and specify FIX=YES so that the error can be corrected.

ANR4410I Triggered space expansion will be retried in *number of seconds* seconds.

Explanation: Because of a problem encountered during a triggered space expansion for the database and/or recovery log, the current expansion stops but will be retried after the time period shown.

System action: The system waits for the specified period and then retries to expand the database and/or recovery log.

User response: If possible, correct the condition that stopped the expansion. If the problem persists, contact your service representative.

ANR4411I Triggered space expansion retry delay ended; checking space trigger criteria.

Explanation: Because a triggered space expansion had been stopped due to a problem, the system waited before retrying. The retry wait period has ended, and the system can now retry to expand space for the database and/or recovery log.

System action: Space expansion begins.

User response: None.

ANR4412I Data Base and Recovery Log Space expansion triggered.

Explanation: A triggered space expansion had started.

System action: Space expansion begins.

User response: None.

ANR4413I Recovery Log Space expansion Is Needed, *megabytes needed* Megabytes needed.

Explanation: The recovery log is above the utilization percentage defined in a DEFINE SPACETRIGGER LOG command. An expansion of the indicated number of megabytes are needed to be above the space trigger utilization value.

System action: Space expansion begins if supported on this platform.

User response: None.

ANR4414I Data Base Space expansion Is Needed, *megabytes needed* Megabytes needed.

Explanation: The database is above the utilization percentage defined in a DEFINE SPACETRIGGER DB command. An expansion of the indicated number of megabytes are needed to be above the space trigger utilization value.

System action: Space expansion begins if supported on this platform.

User response: None.

ANR4415I Data Base and Recovery Log Space Expansion Completed.

Explanation: A triggered space expansion had completed.

System action: Normal operations resume.

User response: None.

ANR4416W Unable to Determine Maximum Number of Data Base Volume Copies, *rc=return code*.

Explanation: The Data Base Space Trigger was in the processing of expanding the data base by creating new database volumes. In doing so, the maximum number of copy volumes for any database volume is determined. The process of determining this value failed.

System action: Server operation continues. No additional database copy volumes are created during this database space expansion.

User response: Use the Query DBVOL command to determine if your database volume configuration is satisfactory. You may use the DEFINE DBCOPY command to define additional database volume copies, if necessary.

ANR4417W Unable to Create Data Base Copy Volume *Data Base Copy Volume for volume Data Base Volume*.

Explanation: The Data Base Space Trigger was in the processing of expanding the data base by creating new database volumes. In doing so, database copy volumes are created for mirroring. The indicated database copy volume could not be created for the primary database volume named.

System action: Server operation continues. A database copy volume is not created for the indicated primary volume.

User response: Use the Query DBVOL command to determine if your database volume configuration is satisfactory. You may use the DEFINE DBCOPY command to define additional database volume copies, if necessary.

ANR4418W Unable to Define Data Base Copy Volume *Data Base Copy Volume for volume Data Base Volume*.

Explanation: The Data Base Space Trigger was in the processing of expanding the data base by creating new database volumes. In doing so, database copy volumes are created for mirroring. The indicated database copy volume was created for the primary database volume

named, but could be registered with the server.

System action: Server operation continues. A database copy volumes is not registered for the indicated primary volume. The database copy volume still exists on the system.

User response: Use the Query DBVOL command to determine if your database volume configuration is satisfactory. You may use the DEFINE DBCOPY command to retry the definition of the database volume copy, if necessary.

ANR4419W Unable to Determine Maximum Number of Recovery Log Volume Copies, rc=return code.

Explanation: The Recovery Log Space Trigger was in the processing of expanding the recovery log by creating new recovery log volumes. In doing so, the maximum number of copy volumes for any recovery log volume is determined. The process of determining this value failed.

System action: Server operation continues. No additional recovery log copy volumes are created during this recovery log space expansion.

User response: Use the QUERY LOGVOL command to determine if your recovery log volume configuration is satisfactory. You may use the DEFINE LOGCOPY command to define additional recovery log volume copies, if necessary.

ANR4420W Unable to Create Recovery Log Copy Volume *Recovery Log Copy Volume for volume Recovery Log Volume.*

Explanation: The Recovery Log Space Trigger was in the processing of expanding the recovery log by creating new database volumes. In doing so, recovery log copy volumes are created for mirroring. The indicated recovery log copy volume could not be created for the primary recovery log volume named.

System action: Server operation continues. A recovery log copy volume is not created for the indicated primary volume.

User response: Use the QUERY LOGVOL command to determine if your recovery log volume configuration is satisfactory. You may use the DEFINE LOGCOPY command to define additional recovery log volume copies, if necessary.

ANR4421W Unable to Define Recovery Log Copy Volume *Recovery Log Copy Volume for volume Recovery Log Volume.*

Explanation: The Recovery Log Space Trigger was in the processing of expanding the recovery log by creating new recovery log volumes. In doing so, recovery log copy volumes are created for mirroring. The indicated recovery log copy volume was created

for the primary recovery log volume named, but could be registered with the server.

System action: Server operation continues. A recovery log copy volume is not registered for the indicated primary volume. The recovery log copy volume still exists on the system.

User response: Use the QUERY LOGVOL command to determine if your recovery log volume configuration is satisfactory. You may use the DEFINE LOGCOPY command to retry the definition of the recovery log volume copy, if necessary.

ANR4422I AUDITDB: Insufficient database space to optimize audit processing.

Explanation: A database audit process found that insufficient database space is available to optimize audit processing. If the audit can process, it will take much longer to complete than if the space was available.

System action: Audit processing continues of possible, but may terminate if very little space is available.

User response: Use the dsmserv extend db command to increase the size of the server database and restart the database audit function.

ANR4423I AUDITDB: Insufficient database space to continue audit processing.

Explanation: A database audit process found that insufficient database space is available to continue audit processing.

System action: Audit processing terminates.

User response: Use the dsmserv extend db command to increase the size of the server database and restart the database audit function.

ANR4424W Database has reached Maximum Size in Space Trigger.

Explanation: The Data Base Space Trigger was specified with a maximum size for the data base. That value has been reached for the size of the database.

System action: Server operation continues. No additional database space expansion will occur as a result of the database space trigger.

User response: None. You may review the space trigger settings and use the UPDATE SPACETRIGGER DB command to adjust space trigger values.

ANR4425W Recovery Log has reached Maximum Size in Space Trigger.

Explanation: The Recovery Log Space Trigger was specified with a maximum size for the recovery log.

That value has been reached for the size of the recovery log.

System action: Server operation continues. No additional recovery log expansion will occur as a result of the recovery log space trigger.

User response: None. You may review the space trigger settings and use the UPDATE SPACETRIGGER LOG command to adjust space trigger values.

ANR4426W Recovery Log can no longer be Expanded by the Space Trigger.

Explanation: The Recovery Log Space Trigger was going to automatically expand the recovery log. Expanding the recovery log would cause the recovery log's size to exceed 13GB, which is beyond the server maximum limit for the recovery log.

System action: Server operation continues, but the recovery log is not automatically expanded. No additional recovery log expansion will occur as a result of the recovery log space trigger.

User response: None. You may review the space trigger settings and use the UPDATE SPACETRIGGER LOG command to adjust space trigger values. You may also backup the data base and/or setup a database backup trigger to cause the database to be backed up more often. Backing up the database will decrease the recovery log utilization and you then use the REDUCE LOG and DELETE LOGVOLUME command to decrease the size of the recovery log.

ANR4427W One or more Recovery Log Volumes differ in number of copy volumes.

Explanation: The Recovery Log Space Trigger was in the processing of expanding the recovery log by creating new volumes. In doing so, copy volumes are created for mirroring, and existing volumes are examined for mirroring. One or more recovery log volumes was found to have a different number of copy volumes than other volumes of the same type. It is recommended that the same number of copy volumes be created for each volume of the same type (database or log).

System action: Server operation continues.

User response: Use the QUERY LOGVOL command to determine if your volume configuration is satisfactory. You may use the DEFINE LOGCOPY command to define additional copy volumes, if necessary. You may use the DELETE LOGCOPY command to delete unnecessary copy volumes.

ANR4428W One or more Data Base Volumes differs in number of copy volumes.

Explanation: The Data Base Space Trigger was in the processing of expanding the data base by creating new volumes. In doing so, copy volumes are created for

mirroring, and existing volumes are examined for mirroring. One or more data base volumes was found to have a different number of copy volumes than other volumes of the same type. It is recommended that the same number of copy volumes be created for each volume of the same type (database or log).

System action: Server operation continues.

User response: Use the Query DBVOL command to determine if your volume configuration is satisfactory. You may use the DEFINE DBCOPY command to define additional copy volumes, if necessary. You may use the DELETE DBCOPY command to delete unnecessary copy volumes.

ANR4429W Unable to Define Recovery Log Volume
Recovery Log Volume.

Explanation: The Recovery Log Space Trigger was in the processing of expanding the recovery log by creating new recovery log volumes. The indicated recovery log volume was created, but could not be registered with the server.

System action: Server operation continues. A recovery log volume is not registered with the server. The recovery log copy volume still exists on the system.

User response: Use the Query LOGVOL command to determine if your recovery log volume configuration is satisfactory. You may use the DEFINE LOGCOPY command to retry the definition of the recovery log volume copy, if necessary. There will be an additional message in the activity log prior to this message indicating the reason for the failure.

ANR4430W Unable to Define Data Base Volume
Data Base Volume.

Explanation: The Data Base Space Trigger was in the processing of expanding the data base by creating new database volumes. The indicated database volume was created, but could not be registered with the server.

System action: Server operation continues. A database volume is not registered with the server. The database volume still exists on the system.

User response: Use the Query DBVOL command to determine if your database volume configuration is satisfactory. You may use the DEFINE DBVOLUME command for the database volume named, to retry the definition of the database volume copy, if necessary. There will be an additional message in the activity log prior to this message indicating the reason for the failure.

ANR4431I Recovery Log now Eligible for Expansion.

Explanation: The Recovery Log Space Trigger has previously hit a point where expanding the recovery log would have caused the recovery log's size to

exceed 13GB, which is beyond the server maximum limit for the recovery log. This caused automatic recovery log expansion to be halted. The recovery log size has shrunk but once again needs expansion and is now eligible for expansion.

System action: Server operation continues, and the automatic recovery log expansion will proceed.

User response: None. None.

ANR4432W Data Base can no longer be Expanded by the Space Trigger.

Explanation: The Data Base Space Trigger was going to automatically expand the data base. Expanding the database would cause the size of the database to exceed 500GB, which is beyond the server maximum limit for the database.

System action: Server operation continues, but the database is not automatically expanded. No additional database expansion will occur as a result of the recovery log space trigger until the database size is less than the maximum size and the trigger attributes allow it to be expanded to a size less than the maximum.

User response: None. You may review the space trigger settings and use the UPDATE SPACETRIGGER DB command to adjust space trigger values. You may also reduce the database size, if possible.

ANR4433I Data Base now Eligible for Expansion.

Explanation: The Data Base Space Trigger has previously hit a point where expanding the database would have caused the size of the database to exceed 500GB, which is beyond the server maximum limit for the database. This caused automatic database expansion to be halted. The database size has shrunk or the space trigger values have been adjusted to allow expansion.

System action: Server operation continues, and automatic database expansion may proceed.

User response: None.

ANR4434E Audit command: Password expiration found for unknown client node *node name*.

Explanation: A database audit process finds a password expiration period for a client node, but the client node is not defined correctly in the server database.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4435I Audit command: Password expiration period deleted for unknown client node *node name*.

Explanation: A database audit process finds a password expiration period for a client node, but the client node is not defined correctly in the server database. Because FIX=YES has been specified for the audit command, the audit function deletes the password expiration period.

System action: Audit processing continues.

User response: None.

ANR4436E Audit command: Invalid password expiration *password expiration period* for client node *node name*.

Explanation: A database audit process finds an invalid password expiration period for a client node.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4437I Audit command: Invalid password expiration period *password expiration period* deleted for client node *node name*.

Explanation: A database audit process finds an invalid password expiration period for a client node. Because FIX=YES has been specified for the audit command, the audit function deletes the password expiration period, causing the default, global password expiration period to take effect for the client node.

System action: Audit processing continues.

User response: After the AUDIT command completes, use the QUERY NODE command to examine the node that was updated. Use the UPDATE NODE command to set the correct password expiration period for the node.

ANR4438E Audit command: Password expiration found for unknown administrator *administrator name*.

Explanation: A database audit process finds a password expiration period for an administrator, but the administrator is not defined correctly in the server database.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4439I *Audit command: Password expiration period deleted for unknown administrator administrator name.*

Explanation: A database audit process finds a password expiration period for an administrator, but the administrator is not defined correctly in the server database. Because FIX=YES has been specified for the audit command, the audit function deletes the password expiration period.

System action: Audit processing continues.

User response: None.

ANR4440E *Audit command: Invalid password expiration password expiration period for administrator administrator name.*

Explanation: A database audit process finds an invalid password expiration period for an administrator.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4441I *Audit command: Invalid password expiration period password expiration period deleted for administrator administrator name.*

Explanation: A database audit process finds an invalid password expiration period for an administrator. Because FIX=YES has been specified for the audit command, the audit function deletes the password expiration period, causing the default, global password expiration period to take effect for the administrator.

System action: Audit processing continues.

User response: After the AUDIT command completes, use the QUERY ADMIN command to examine the administrator that was updated. Use the UPDATE ADMIN command to set the correct password expiration period for the administrator.

ANR4442E *Audit command: Extended attribute extended attribute type is not a valid attribute type.*

Explanation: A database audit process finds an extended attribute type that is not supported.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4443I *Audit command: Invalid extended attribute extended attribute type has been deleted.*

Explanation: A database audit process finds an extended attribute type that is not supported. Because FIX=YES has been specified for the audit command, the audit function deletes extended attribute.

System action: Audit processing continues.

User response: None.

ANR4444W *Command: Input volume volume name cannot be processed.*

Explanation: During a DSMSERV DISPLAY DBBACKUPVOLUME command, the server cannot display the necessary information about the specified backup volume.

System action: The volume is not processed. Processing continues for all the volumes in the given volume list.

User response: Examine previous error messages for the cause of failure.

ANR4445I *Context parameter set to value.*

Explanation: Determines if context reporting will be generated when an ANR9999D error occurs. This is turned on or off with the SET CONTEXT messaging command.

System action: None.

User response: None.

ANR4446I *Audit command: Auditing address definitions.*

Explanation: This message is displayed during a database audit and indicates that the name address definitions are being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4447E *Audit command: An invalid data mover type was encountered for data mover name.*

Explanation: A database audit process encounters an invalid data mover type for the specified data mover.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the attribute can be corrected.

ANR4448E *Audit command: An invalid data mover type was encountered for data mover `datamover name` - the data mover entry will be removed.*

Explanation: A database audit process encounters an invalid data mover type for the specified data mover.

System action: Because FIX=YES has been specified for the command, the data mover entry will be removed. Audit processing continues.

User response: If you want the data mover entry to be defined you must redefine this data mover after the audit command has completed.

ANR4449E *Audit command: An invalid data mover attribute was encountered for `data mover name`.*

Explanation: A database audit process encountered an invalid data mover attribute for the specified data mover.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the attribute can be corrected.

ANR4450E *Audit command: An invalid data mover attribute was encountered for data mover `data mover name` - the data mover entry will be removed.*

Explanation: A database audit process encounters an invalid data mover attribute for the specified data mover.

System action: Because FIX=YES has been specified for the command, the data mover entry will be removed. Audit processing continues.

User response: If you want the data mover entry to be defined you must redefine this data mover after the audit command has completed.

ANR4451E *Audit command: An invalid disk attribute was encountered for `disk name`.*

Explanation: A database audit process encountered an invalid disk attribute for the specified disk.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the attribute can be corrected.

ANR4452E *Audit command: An invalid disk attribute was encountered for `disk name` - the disk entry will be removed.*

Explanation: A database audit process encounters an invalid disk attribute for the specified disk. Because

FIX=YES has been specified for the command, the disk entry will be removed.

System action: Audit processing continues.

User response: If you want the disk entry to be defined you must redefine this disk after the audit command has completed.

ANR4453E *Audit command: An invalid source attribute was encountered for `source name` and `destination destination name`*

Explanation: A database audit process encountered an invalid source attribute in a path definition with the specified source name and destination name.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the attribute can be corrected.

ANR4454E *Audit command: An invalid source attribute was encountered for `source name` and `destination destination name` - the path entry will be removed.*

Explanation: A database audit process encounters an invalid source attribute in a path definition with the specified source name and destination name. Because FIX=YES has been specified for the command, the path entry will be removed.

System action: Audit processing continues.

User response: If you want the TSM server to use this path you must redefine the source name, verify the destination name exists, and then redefine the path after the audit command has completed.

ANR4455E *Audit command: An invalid destination attribute was encountered for `source name` and `destination destination name`*

Explanation: A database audit process encountered an invalid destination attribute in a path definition with the specified source name and destination name.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES so that the attribute can be corrected.

ANR4456E *Audit command: An invalid destination attribute was encountered for `source name` and `destination destination name` - the path entry will be removed.*

Explanation: A database audit process encounters an invalid destination attribute in a path definition with the specified source name and destination name. Because FIX=YES has been specified for the command, the path entry will be removed.

System action: Audit processing continues.

User response: If you want the TSM server to use this path you must redefine the source name, verify the destination name exists, and then redefine the path after the audit command has completed.

ANR4457E *Audit command: KEEPMP found for unknown client node node name.*

Explanation: A database audit process found a KEEPMP setting for a client node, but the client node is not defined correctly in the server database.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4458I *Audit command: KEEPMP setting deleted for unknown client node node name.*

Explanation: A database audit process found a KEEPMP setting for a client node, but the client node is not defined correctly in the server database. Because FIX=YES has been specified for the audit command, the audit function has deleted the KEEPMP setting.

System action: Audit processing continues.

User response: None.

ANR4459E *Audit command: Invalid KEEPMP setting KEEPMP setting for client node node name.*

Explanation: A database audit process found an invalid KEEPMP setting for a client node.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4460I *Audit command: Invalid KEEPMP setting KEEPMP setting deleted for client node node name.*

Explanation: A database audit process found an invalid KEEPMP setting for a client node. Because FIX=YES has been specified for the audit command, the audit function has deleted the KEEPMP setting, causing the default, KEEPMP setting to take effect for the client node.

System action: Audit processing continues.

User response: After the AUDIT command completes, use the QUERY NODE command to examine the node that was updated. Use the UPDATE NODE command to set the correct KEEPMP setting for the node.

ANR4461E *Audit command: TCP name, address and GUID found for unknown client node node name.*

Explanation: A database audit process found a TCP name, address and globally unique identifier for a client node, but the client node is not defined correctly in the server database.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4462I *Audit command: TCP name, address and GUID deleted for unknown client node node name.*

Explanation: A database audit process found a TCP name, address and globally unique identifier for a client node, but the client node is not defined correctly in the server database. Because FIX=YES has been specified for the audit command, the audit function deletes the TCP name, address and GUID.

System action: Audit processing continues.

User response: None.

ANR4463E *Audit command: Invalid TCP name, address or GUID length invalid length for client node node name.*

Explanation: A database audit process found an invalid TCP name, address or globally unique identifier length for a client node.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4464I *Audit command: Invalid TCP name, address or GUID length invalid length deleted for client node node name.*

Explanation: A database audit process found an invalid TCP name, address or globally unique identifier length for a client node. Because FIX=YES has been specified for the audit command, the audit function sets the TCP name, address and GUID to blank. The values will be reset when the client signs on to the server.

System action: Audit processing continues.

User response: After the AUDIT command completes, use the QUERY NODE command to examine the node that was updated. The values should be blank.

ANR4465I *Audit command: An incorrect transaction group size was found for node `node name`.*

Explanation: A database audit process encounters invalid information used for controlling the transaction group size for the node indicated.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4466I *Audit command: An incorrect transaction group was found for node `node name`. This information will be corrected.*

Explanation: A database audit process encounters invalid information used for controlling the transaction group size for the node specified. Because FIX=YES has been specified, the audit function corrects the information.

System action: Audit processing continues.

User response: None.

ANR4467E *Audit command: Data Path Type Path was found for unknown client node `node name`.*

Explanation: A database audit process found a Data Path setting for a client node, but the client node is not defined correctly in the server database.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4468I *Audit command: The Data Path Type Path setting was deleted for unknown client node `node name`.*

Explanation: A database audit process found a Data Path setting for a client node, but the client node is not defined correctly in the server database. Because FIX=YES has been specified for the audit command, the audit function has deleted the KEEPMP setting.

System action: Audit processing continues.

User response: None.

ANR4471E *Audit command: Invalid TCP address (server-prompted scheduling) or length `invalid length` for client node `node name`.*

Explanation: A database audit process found an invalid TCP address or length for a client node's

server-prompted scheduling..

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4472I *Audit command: Invalid TCP name or length for server-prompted scheduling. `invalid length` deleted for client node `node name`.*

Explanation: A database audit process found an invalid TCP name or length for a client node's server-prompted scheduling attributes. Because FIX=YES has been specified for the audit command, the audit function sets the TCP information to blank. The values must be reset with the UPDATE NODE command.

System action: Audit processing continues.

User response: After the AUDIT command completes, use the QUERY NODE command to examine the node that was updated. The values should be blank.

ANR4473E *Audit command: Node missing from session initiation attribute for client node `node name`.*

Explanation: A database audit process found a session initiation value for a client node's server-prompted scheduling but the node definition was missing.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4474I *Audit command: Node missing from session initiation value for server-prompted scheduling. Attribute deleted for client node `node name`.*

Explanation: A database audit process found a value for a client node's server-prompted session initiating attributes, but the node definition was missing. Because FIX=YES has been specified for the audit command, the audit function sets the value to the default. The attribute must be redefined with the REGISTER or UPDATE NODE commands.

System action: Audit processing continues.

User response: After the AUDIT command completes, use the QUERY NODE command to examine the node that was updated.

ANR4475E *Audit command: Node missing from client address attribute for client node node name.*

Explanation: A database audit process found client node addressing information for a client node's server-prompted scheduling but the node definition was missing.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function specifying FIX=YES so that the error can be corrected.

ANR4476I *Audit command: Node missing from session initiation value for server-prompted scheduling. Attribute deleted for client node node name.*

Explanation: A database audit process found client node addressing information for a client node's server-prompted scheduling but the node definition was missing.

Because FIX=YES has been specified for the audit command, the audit function deletes the value. The information must be redefined with the REGISTER or UPDATE NODE commands.

System action: Audit processing continues.

User response: After the AUDIT command completes, use the QUERY NODE command to examine the node that was updated.

ANR4477E *Audit command: An invalid data path type path setting was found for client node node name.*

Explanation: A database audit process found an incorrect data path setting for a client node.

System action: Audit processing continues.

User response: If the audit command has not been issued with FIX=YES specified, reissue the audit function, specifying FIX=YES so that the error can be corrected.

ANR4478I *Audit command: An incorrect data path type path setting was deleted for client node node name.*

Explanation: A database audit process found an invalid data path setting for a client node. Because FIX=YES has been specified for the audit command, the audit function has deleted the Data Path setting, causing the default Data Path setting to take effect for the client node.

System action: Audit processing continues.

User response: After the AUDIT command completes,

use the QUERY NODE command to examine the node that was updated. Use the UPDATE NODE command to set the correct data path setting for the node.

ANR4479I **Extraneous or incorrect entry found for a backup group member.**

Explanation: An extraneous or incorrect entry was found for a member of a backup group.

System action: Audit processing continues.

User response: Issue the AUDITDB command again, using the FIX=YES parameter.

ANR4480I **Extraneous or incorrect entry fixed for a backup group member.**

Explanation: An extraneous or incorrect entry was found for a member of a backup group. If this was an incorrect entry, it was fixed. If this was an extraneous entry, it was deleted.

System action: Audit processing continues.

User response: None, because the AUDITDB processing performed the necessary corrective action.

ANR4481I *Command: Extraneous or incorrect entry found for a proxy association. Target: node_id_1 Agent: node_id_2*

Explanation: An extraneous or incorrect entry was found for a proxy association.

System action: Audit processing continues.

User response: Issue the AUDITDB command again, using the FIX=YES parameter.

ANR4482I *Command: Extraneous or incorrect entry found for a proxy association. Target: node_id_1 Agent: node_id_2*

Explanation: An extraneous or incorrect entry was found for a proxy association. The entry will be removed.

System action: Audit processing continues.

User response: None, because the AUDITDB processing performed the necessary corrective action.

ANR4483I *Node node name issued command: Set Access copy type file space namehigh-level addresslow-level address authorized node name ,authorized owner name.*

Explanation: The SET ACCESS command completed.

System action: Processing continues.

User response: None.

ANR4484I Node *node name* issued command: Delete Access *copy type file space name* high-level address *slow-level address* authorized node name *, authorized owner name*.

Explanation: The DELETE ACCESS command completed.

System action: Processing continues.

User response: None.

ANR4485I A storage pool space trigger has been defined and enabled for storage pool *storage pool name*.

Explanation: A storage pool space trigger has been defined with a DEFINE SPACETRIGGER command for the specified storage pool.

System action: None.

User response: None.

ANR4486I A default storage pool space trigger has been defined and enabled.

Explanation: A default storage pool space trigger has been defined and enabled. It will be effective for any storage pools associated with a devtype=DISK device class or a devtype=FILE device class.

System action: None.

User response: None.

ANR4487I The storage pool space trigger is defined for storage pool *storage pool name*, but is disabled.

Explanation: A storage pool space trigger has been defined for the indicated storage pool, but because the space expansion percentage is currently set to 0, the space trigger is disabled.

System action: None.

User response: To activate the space trigger, use the UPDATE SPACETRIGGER command to set the space expansion percentage to a value greater than 0.

ANR4488I The default storage pool space trigger is defined, but it is disabled.

Explanation: A default storage pool space trigger has been defined for storage pools associated with a devtype=DISK or devtype=FILE device class. But it has been defined without a space trigger; because the space expansion percentage is currently set to 0, the space trigger is disabled.

System action: None.

User response: To activate the space trigger, use the UPDATE SPACETRIGGER command to set the space

expansion percentage to a value greater than 0.

ANR4489I The storage pool space trigger has been deleted for storage pool *storage pool name*.

Explanation: A DELETE SPACETRIGGER command has successfully completed for the indicated storage pool space trigger. Space expansions are no longer triggered automatically for the specified storage pool. If a default storage pool space trigger exists, it will apply to the specified storage pool.

System action: None.

User response: None.

ANR4490I The default storage pool space trigger has been deleted.

Explanation: A DELETE SPACETRIGGER command has successfully completed for the default storage pool space trigger. Space expansions are no longer triggered automatically for storage pool without a specific space trigger.

System action: None.

User response: None.

ANR4491I The storage pool space trigger is updated and enabled for storage pool *storage pool name*.

Explanation: An UPDATE SPACETRIGGER command has successfully completed for the specified storage pool space trigger. The updated parameters specified on the command are used to automatically trigger space expansion for the storage pool.

System action: None.

User response: None.

ANR4492I The default storage pool space trigger is updated and enabled.

Explanation: An UPDATE SPACETRIGGER command has successfully completed for the default storage pool space trigger. The updated parameters specified on the command are used to automatically trigger space expansion for storage pools without a specific storage pool space trigger and which are associated with a devtype=FILE or devtype=DISK device class.

System action: None.

User response: None.

ANR4493I The storage pool space trigger is updated, but disabled for storage pool storage pool name.

Explanation: An UPDATE SPACETRIGGER command has successfully completed for the specified storage pool space trigger. However, the space expansion percentage is currently set to 0, which disables the space trigger.

System action: None.

User response: To activate the space trigger, use the UPDATE SPACETRIGGER command with the SPACEexpansion parameter to set a value greater than zero.

ANR4494I The default storage pool space trigger is updated, but disabled.

Explanation: An UPDATE SPACETRIGGER command has successfully completed for the default storage pool space trigger. However, the space expansion percentage is currently set to 0, which disables the space trigger.

System action: None.

User response: To activate the space trigger, use the UPDATE SPACETRIGGER command with the SPACEexpansion parameter to set a value greater than zero.

ANR4495E Command: Storage pool space trigger is not defined.

Explanation: The storage pool space trigger cannot be updated or deleted because it is not currently defined. If a storage pool was not specified, an attempt was made to delete the default storage pool space trigger, but no default storage pool space trigger is defined.

System action: The server does not process the command.

User response: None.

ANR4496E Command: Storage pool space trigger is already defined.

Explanation: The storage pool space trigger cannot be defined because it is already defined for the storage pool. If a default storage pool trigger is being defined, a default storage pool trigger already exists.

System action: The server does not process the command.

User response: Use the UPDATE SPACETRIGGER command to modify the indicated space trigger parameters.

ANR4497E Command: EXPansionprefix not valid for storage pool space trigger with storage pool Storage Pool.

Explanation: The storage pool space trigger cannot be defined with an EXPansionprefix parameter because the specified storage pool is not associated with a DISK-type device class. Sequential access storage pools use their associated directories for creating space when a space trigger is activated.

System action: The server does not process the command.

User response: Use the UPDATE SPACETRIGGER command to create a space trigger without using the EXPansionprefix parameter.

ANR4498E Command: STGPOOL Storage Pool is not eligible for a storage pool space trigger.

Explanation: The indicated storage pool cannot have a space trigger defined, because it is not associated with a DISK-type or a FILE-type device class, or it is a RECLAMATIONTYPE=SNAPLOCK storage pool.

System action: The server does not process the command.

User response: Use the DEFINE SPACETRIGGER command to create a space trigger with a storage pool whose device class is of type DISK or FILE, or is not a RECLAMATIONTYPE=SNAPLOCK storage pool.

ANR4499E Command: Base backup set name Backup Set Name could not be found.

Explanation: No full backup sets whose name begins with the specified backup set name prefix could be found.

System action: The server does not process the command.

User response: Use the QUERY BACKUPSET command to list available full backup sets and reissue the command with the backup set name prefix of an existing full backup set. If no full backup set exists, then do not specify the BASE parameter until after a full backup set has been generated.

ANR4500I Writing sequential volume history information to defined files.

Explanation: The server is updating all sequential volume history files defined in the server options file with information on sequential volume usage information. The files updated are those specified with the VOLUMEHISTORY option in the server options file.

System action: Server operation continues.

User response: None.

ANR4501I Sequential volume history information successfully written to *file name*.

Explanation: The server is updating all sequential volume history files defined in the server options file with information on sequential volume usage information. Volume history information was successfully written to the file specified.

System action: Server operation continues.

User response: None.

ANR4502W No files have been defined for automatically storing sequential volume history information.

Explanation: The server is attempting to update all sequential volume history files defined in the server options file with information on sequential volume usage information. Because no files were configured for receiving this information, the automatic operation fails.

System action: Server operation continues.

User response: To have the server automatically record sequential volume history information to assist in server recovery, use the VOLUMEHISTORY option in the server options file to specify where history information should be written. If you update the options file, restart the server.

ANR4503W The server current date *current date* is earlier than the date in a server record *server date*.

Explanation: The server has detected that the current system date is an earlier date than the date in a server record that is being processed. Possible causes for this problem are the current system date is invalid, the server was previously run with a future date, or there is an error in the server record. If the server was run with a future date, this message will continue to appear until that date has passed, or all records with the future date have been deleted from the server.

System action: Processing continues. The processing for the current object may not occur as expected.

User response: On the machine on which the server is running, verify that the system date is correct.

ANR4504E *Command:* The specified point in time is earlier than the point in time of the base backup set.

Explanation: The point in time specified for the differential backup set is earlier than the point in time of its base backup set.

System action: The server does not process the command.

User response: Reissue the command, specifying a later point in time.

ANR4505E Required table of contents could not be created for backup set for *node name* as *set name* (*data type data type*).

Explanation: A table of contents could not be created for the named object set, but a table of contents was required (TOC=YES was specified or implied).

System action: The backup set is deleted.

User response: Correct the problem that prevented the table of contents from being created and generate the backup set again.

ANR4506W Backup set for *node name* as *set name* (*data type data type*) requires a table of contents.

Explanation: The specified backup set requires a table of contents, but TOC=YES was not specified.

System action: The server will attempt to create a table of contents for the backup set. If the table of contents creation fails, the backup set will be deleted.

User response: None.

ANR4510E Server could not write sequential volume history information to *volume history file name*.

Explanation: While attempting to write sequential volume history information to defined history files, the server could not write to the file name specified.

System action: The server does not write volume history information to the file specified

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that there is sufficient space in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set. After the problem has been corrected, use the BACKUP VOLHISTORY command to write sequential volume history information to the file.

ANR4511E Volume history file *volume history file name* could not be opened.

Explanation: While attempting to write sequential volume history information to or read information from defined history files, the server cannot open the file name specified.

System action: The server does not write volume history information to or read volume history information from the file specified

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that there is sufficient space in the file system for the file. On MVS, make sure that the data set has been allocated and that the server has authority to write to the data set.

ANR4512E A database transaction failure was encountered in processing sequential volume history information.

Explanation: While attempting to process sequential volume history information, the server encountered a database transaction error.

System action: The operation fails. Usage for a sequential volume was not properly recorded for later reference.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. If this does not resolve the problem, contact your support representative.

ANR4513E A database lock conflict was encountered in processing sequential volume history information.

Explanation: While attempting to process sequential volume history information, the server encountered a database locking conflict.

System action: The operation fails. This usually means that usage for a sequential volume was not properly recorded for later reference.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. If this does not resolve the problem, contact your support representative.

ANR4514E Sufficient database space is not available for the server while processing sequential volume history information.

Explanation: While attempting to process sequential volume history information, the server found that sufficient database space was not available for updates.

System action: The operation fails. Usage for a sequential volume was not properly recorded for later reference.

User response: To increase the amount of database space available to the server, an authorized administrator can add database volumes by using the DEFINE DBVOLUME command, and extend the size of the database by using the EXTEND DB command.

ANR4515E Sufficient recovery log space is not available for the server while processing sequential volume history information.

Explanation: While attempting to process sequential volume history information, the server finds that sufficient recovery log space is not available for updates.

System action: The operation fails. Usage for a sequential volume was not properly recorded for later reference.

User response: To increase the amount of database space available to the server, an authorized administrator can add database volumes by using the DEFINE LOGVOLUME command, and extend the size of the database by using the EXTEND LOG command.

ANR4516E Server could not read sequential volume history information from any defined files.

Explanation: While attempting to read sequential volume history information from defined history files, the server finds that it cannot open any of the files defined in the server options file.

System action: The server does not read volume history information. If the current server task requires this information, the task ends.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to read from the defined volume history files. If you are doing a database restore, issue RESTORE DB DEVCLASS=VOL.

ANR4517E No files have been defined for storing sequential volume history information - information cannot be read.

Explanation: The server is attempting to read from at least one of the volume history files defined in the server options file. Since no files were defined for this information the read operation fails.

System action: Server operation ends.

User response: You can restore the database specifying the volume names for each restore operation (in order) up to the desired point-in-time. If a volume history file is available, specify its name in the server options file and retry the operation.

ANR4518E Volume history file *file name* line *line number* does not have the proper format - read operation fails.

Explanation: The server is attempting to read from a volume history file and encounters a record that does not have the proper format.

System action: Server operation terminates.

User response: Examine the file specified to determine if the invalid record can be located and corrected. If the file is corrupted or does not contain valid volume history entries, it cannot be used for the desired operation.

ANR4519W Volume History File does not reflect latest Storage Agent Updates

Explanation: The storage agent failed to have the volume history file on the server updated with the latest changes from the storage agent.

System action: The storage agent continues processing.

User response: To bypass the problem, a BACKUP VOLHIST command can be issued from an admin client connected to the server. The problem may be due to a temporary loss of communication with the server.

ANR4520I Storage Pool *storage pool name* is being skipped during a space allocation. A request for *request amount* megabytes was made but only *available amount* megabytes were available.

Explanation: A request for storage was made in the indicated storage pool. The storage pool has a capacity of the number of megabytes shown. The requested amount can not be satisfied in the storage pool being skipped. The next storage pool, if any, will be tried in an attempt to satisfy the request.

System action: The storage server skips the indicated storage pool and tries to allocate storage in a "next" pool.

User response: More space can be created in the storage pool by increasing the number of scratch volumes allowed (use the UPDATE STGPOOL poolname MAXSCRATCH=xx command), by creating private volumes in the storage pool (use the DEFINE VOLUME poolname volname command), or by creating a storage pool space trigger to monitor storage in the storage pool. The storage pool space trigger can also automatically create new FILE volumes when space triggers are exceeded (use the DEFINE SPACETRIGGER STG STGPOOL=poolname command).

ANR4521E The number of volumes specified in the BACK DB command is not sufficient Backup failed.

Explanation: The backup volume provided in the input parameter for BACKUP DB command is not sufficient.

System action: BACKUP DB terminates.

User response: Provide more input volumes.

ANR4522E RESTORE DB failed with LOG file error.

Explanation: The LOG file is not associated with the current log sequence.

System action: RESTORE DB terminates.

User response: Issue REMOVE DB first and retry the RESTORE DB.

ANR4523I Storage Pool Space expansion triggered. Storage Pool *storage pool name* with capacity of *capacity* megabytes requires *percentage percent* expansion for *expansion amount* bytes of additional space.

Explanation: A triggered space expansion has started for the indicated storage pool. The storage pool has a capacity of the number of megabytes shown. It is being expanded by the indicated percentage as directed by the storage pool space trigger for this storage pool, or by the default storage space trigger if this storage pool has no dedicated trigger of its own. The percentage is represented by the additional amount of space indicated.

System action: Space expansion begins.

User response: None.

ANR4524I Volume *volume name* defined in Storage Pool *storage pool name* as a result of storage pool triggered space expansion.

Explanation: A triggered space expansion has caused the indicated volume to be created in the storage shown in the message. The volume definition is the result of a storage pool space trigger definition which allocates new space when the space trigger space threshold is met.

System action: Processing continues.

User response: None.

ANR4525E Failure to define volume *volume name* in Storage Pool *storage pool name*. Return *codereturn code*.

Explanation: A triggered space expansion has caused an attempt to create the indicated in the storage pool shown in the message. The volume creation failed with the indicated return code. The volume was not added to the storage pool. Additional messages with specific information on the failure are displayed from the volume creation process.

System action: Processing continues.

User response: It might be necessary to take action based on the failure message from the volume creation process. Such actions might include changing the

storage space trigger definition, ensuring that hardware is function properly, or ensuring that the server is set up with sufficient permissions to access and create files on the file system to which Tivoli Storage Manager is writing.

ANR4526E **Storage Pool Space trigger for *storage pool name* is ended; the thread resource not available.**

Explanation: The server cannot start a thread to handle storage pool expansion for the indicated storage pool.

System action: Server processing continues but the storage pool is not expanded.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix B. Allocating Additional Server Memory".

ANR4527W **Storage Pool Space trigger for *storage pool name* is disabled after *volume definition failures* expansion failures. Insufficient space for pool expansion.**

Explanation: The server failed to complete a storage pool expansion for the indicated storage pool. The number of failures in pool expansion is also displayed.

System action: Server processing continues but the storage pool is not expanded. The storage pool space trigger for the indicated storage pool is disabled.

User response: Allocate additional storage space to the server. For storage pools of device type FILE, additional directories may be added to the list of directories that the associated device class uses for storage. If this action is taken, the corresponding storage agent directories should be added via the UPDATE PATH command. The storage pool space trigger may be re-enabled with the UPDATE SPACETRIGGER STG STPOOL=xx command, where xx is the storage pool for which expansion has failed (no space trigger parameters need be updated).

ANR4528W **Storage Pool Space Expansion for *storage pool name* is disabled due to previous expansion failures. After addressing space requirements, an UPDATE SPACETRIGGER STG command must be issued to allow automatic stgpool expansion.**

Explanation: The server failed to complete a storage pool expansion for the indicated storage pool. The storage pool space trigger is disabled due to previous expansion failures. The storage pool space trigger may be re-enabled with the UPDATE SPACETRIGGER STG STPOOL=xx command, where xx is the storage pool for which expansion has failed (no space trigger parameters need be updated).

System action: Server processing continues but the storage pool is not expanded. The storage pool space trigger for the indicated storage pool remains disabled. This message is re-issued periodically when expansion is required but the storage pool space trigger remains disabled.

User response: Allocate additional storage space to the server. For storage pools of device type FILE, additional directories may be added to the list of directories that the associated device class uses for storage. If this action is taken, the corresponding storage agent directories should be added via the UPDATE PATH command. The storage pool space trigger may be re-enabled with the UPDATE SPACETRIGGER STG STPOOL=xx command, where xx is the storage pool for which expansion has failed (no space trigger parameters need be updated).

ANR4529I **An automatic full or incremental database backup will be started. The active log space used is *log space used* megabytes, and the active log space available is *log space available* megabytes. The ratio, *active log used ratio*, exceeds the threshold *log utilization threshold*.**

Explanation: When the active log space used exceeds the log utilization threshold, a database backup is started. If there has been at least one full database backup, the backup is an incremental database backup. Otherwise, a full database backup is started.

System action:

User response:

ANR4530I **An automatic full database backup will be started. The total space used in log file system is *log space used* megabytes, and the total space available in the log file system is *log space available* megabytes. The ratio is *log file system used ratio* and is greater than the threshold *log file system utilization threshold*.**

Explanation: When the space used in the log file system exceeds the threshold for log file system utilization, a full database backup is started.

System action:

User response:

ANR4531I **An automatic full database backup will be started. The last log number used is *last log used* and the first log number used is *first log used*. The log file size is *log file size* megabytes. The maximum log file size is *maximum log file size* megabytes.**

Explanation: When the log space used since the last database backup exceeds the maximum log file size, a full database backup is started.

System action:

User response:

ANR4532W The total DB used in DB space is *log space used* megabytes, and the total space available in the DB space is *log space available* megabytes. The ratio is *log file system used ratio*.

Explanation: The DB space used exceeds the threshold for DB space utilization, please define more DB space using EXTend DBSpace command.

System action:

User response:

ANR4539E There is a mismatch in directory count between Device Class *device class name* and Path Definition for Server *server name*. The device class has *directory count* directories while the path definition has *path directory count* directories.

Explanation: The server was assigning a shared FILE library volume to a server or storage agent. Share FILE libraries require a matching number of directories in the PATH definition for the server or storage agent's access to FILE drives and the server's device class definition. For example, if the server has the following device class definition: DEFINE DEVCLASS SFILE DEVTYPE=FILE MOUNTL=10 SHARED=YES DIR=D:\DIR1,E:\DIR2,F:\DIR3 a FILE library name SFILE will be created along with 10 drives named SFILE1 to SFILE10 in shared library SFILE. Each of these drives might have scratch volumes created in directories D:\DIR1, E:\DIR2 or F:\DIR3. (For UNIX Platforms, substitute UNIX style names in the example).

For library clients and storage agents, the appropriate directory paths from those systems must be defined using the DEFINE PATH command. An example, in this case, might be DEFINE PATH STA1 SFILE1 SRCTYPE=SERVER DESTTYPE=DRIVE DIR=V:\DIR1,W:\DIR2,X:\DIR3 LIBRARY=SFILE which means that server (or storage agent) STA1 accesses directory D:\DIR1 using V:\DIR1 from the STA1 system, E:\DIR2 on the server is accessed using W:\DIR2 on STA1, and that F:\DIR3 is accessed using X:\DIR3 on STA1. If the number of directories between the PATH and DEVCLASS do not match, there could be problem in accessing the resulting file in the future.

System action: Processing continues. Another directory path is chosen. This might result in a subsequent access failure by the storage agent.

User response: Use the QUERY DEVCLASS classname

F=D and the QUERY PATH pathname F=D commands to compare the directory lists for the device class and the path and ensure that they are synchronized.

ANR4540E Audit command: Invalid device class *device class id* found in DevClass.Dirs table.

Explanation: A database audit process finds a non-existent device class or a device class with an invalid access strategy for a record in the Devclasses.Dirs table.

System action: Audit processing continues.

User response: If the FIX=YES parameter was specified, the data base record with the incorrect entry will be deleted. Otherwise, reissue the audit command with FIX=YES, so that the incorrect record can be deleted. After records with incorrect entries have been removed, review directories associated with Device classes and Paths with the following commands: QUERY DEVCLASS F=D QUERY PATH F=D

ANR4541E Audit command: Invalid directory for device class *device class id* in DevClass.Dirs table.

Explanation: A database audit process finds a directory entry whose length is longer than allowed for the indicated device class id in the DevClass.Dirs table, which relates directories to device classes and paths.

System action: Audit processing continues.

User response: If the FIX=YES parameter was specified, the data base record with the incorrect entry will be deleted. Otherwise, reissue the audit command with FIX=YES so that the incorrect record can be deleted. After records with incorrect entries have been removed, review directories associated with device classes and paths with the following commands: QUERY DEVCLASS F=D QUERY PATH F=D

ANR4542E Audit command: Invalid server for device class *device class id* in DevClass.Dirs table. The server name in the table is *server name*.

Explanation: A database audit process finds a directory entry with a server which is either not defined or has an invalid length in the DevClass.Dirs table. This table relates directories to device classes and paths. The class ID of the table entry is shown, along with the server name. However, if the server name has an invalid length, only blanks are shown.

System action: Audit processing continues.

User response: If the FIX=YES parameter was specified, the data base record with the incorrect entry will be deleted. Otherwise, reissue the audit command with FIX=YES, so that the incorrect record can be deleted. After records with incorrect entries have been

removed, review directories associated with device classes and paths with the following commands:
 QUERY DEVCLASS F=D QUERY PATH F=D

ANR4543E *Audit command: Mismatched server for device class `device class id` in DevClass.Dirs table. Server ID in table is `server id`. Server ID in data base is `found server id`.*

Explanation: A database audit process finds a directory entry with a server which does not match the path source name in the DevClass.Dirs table. This table relates directories to device classes and paths. The class ID of the table entry is shown, along with the server ID in the table and the ID that was found when searching using the source name.

System action: Audit processing continues.

User response: If the FIX=YES parameter was specified, the data base record with the incorrect entry will be deleted. Otherwise, reissue the audit command with FIX=YES, so that the incorrect record can be deleted. After records with incorrect entries have been removed, review directories associated with device classes and paths with the following commands:
 QUERY DEVCLASS F=D QUERY PATH F=D

ANR4544E *Audit command: Invalid library for device class `device class id` in the DevClass.Dirs table.*

Explanation: A database audit process finds a directory entry with a DEST name where the associated library can not be found. This record is in the DevClass.Dirs table. This table relates directories to device classes and paths. The class ID of the table entry is shown.

System action: Audit processing continues.

User response: If the FIX=YES parameter was specified, the database record with the incorrect entry will be deleted. Otherwise, reissue the audit command with FIX=YES, so that the incorrect record can be deleted. After records with incorrect entries have been removed, review directories associated with device classes and paths with the following commands:
 QUERY DEVCLASS F=D QUERY PATH F=D

ANR4545E *Audit command: Invalid drive for device class `device class id` in the DevClass.Dirs table.*

Explanation: A database audit process finds a directory entry with a DEST name where the associated drive (DESTNAME) can not be found. This record is in the DevClass.Dirs table. This table relates directories to device classes and paths. The class ID of the table entry is shown.

System action: Audit processing continues.

User response: If the FIX=YES parameter was specified, the database record with the incorrect entry will be deleted. Otherwise, reissue the audit command with FIX=YES, so that the incorrect record can be deleted. After records with incorrect entries have been removed, review directories associated with device classes and paths with the following commands:
 QUERY DEVCLASS F=D QUERY PATH F=D

ANR4549I *Database dump command: A database dump is already in progress.*

Explanation: This message is issued in response to a database dump command and indicates that a database dump cannot be started because a dump is already in progress.

System action: Server operation continues. The requested database dump is not started.

User response: Only one database dump can be started at one time. Use the QUERY PROCESS command to monitor the dump that is in progress. When completed, issue the database dump command to start another database dump if required.

ANR4550I *Full database backup (process `process ID`) completed.*

Explanation: A full database backup process has completed. The output volumes used in this backup may be used during a database restore operation.

System action: None.

User response: None.

ANR4551I *Incremental database backup (process `process ID`) completed.*

Explanation: An incremental database backup process has completed. The output volumes used in this backup may be used in conjunction with any preceding volumes in the backup series during a database restore operation.

System action: None.

User response: None.

ANR4552I *Full database backup triggered; started as process `process ID`.*

Explanation: A background process, triggered by the LOGFULLPCT parameter on a DEFINE DBBACKUPTRIGGER command, was started to back up the full contents of the database. The full database backup process is assigned the process ID shown.

System action: The database backup process starts and server operation continues.

User response: The administrator may query the status of the database backup process by using the

ANR4553I • ANR4561I

QUERY PROCESS command, or cancel the process by using the CANCEL PROCESS command.

ANR4553I Incremental database backup triggered; started as process *process ID*.

Explanation: A background process, triggered by the LOGFULLPCT parameter on a DEFINE DBBACKUPTRIGGER command, was started to incrementally back up the contents of the database. The incremental database backup process was assigned the process ID shown.

System action: The database backup process starts and server operation continues.

User response: The administrator may query the status of the database backup process by using the QUERY PROCESS command, or cancel the process by using the CANCEL PROCESS command.

ANR4554I Backed up *number of pages backed up of number of pages to back up in current operation* database pages.

Explanation: Periodically, during a database backup, the server displays the number of pages backed up.

System action: None.

User response: None.

ANR4555I Database backup process *process ID* canceled.

Explanation: The database backup process was canceled by an administrator with the CANCEL PROCESS command.

System action: The database backup process is ended.

User response: None.

ANR4556W Attention: the database backup operation did not free sufficient recovery log space to lower utilization below the database backup trigger. The recovery log size may need to be increased or the database backup trigger parameters may need to be adjusted.

Explanation: A database backup process has completed. The server is running in roll-forward mode and the recovery log utilization remains above that specified in the database backup trigger.

System action: A database backup operation will be triggered. Unless this situation is corrected, database backups will be triggered rapidly, one after the other.

User response: If a database backup operation does not free up enough recovery log space to reset utilization below the database backup trigger, the recovery log needs to be extended or the database

backup trigger updated to a higher log full percentage or a higher log free percentage or a higher minimum interval.

ANR4557I Differential database backup (process *process ID*) completed.

Explanation: A snapshot database backup process has completed.

System action: None.

User response: None.

ANR4558I Snapshot database backup (process *process ID*) completed.

Explanation: A differential database backup process has completed. The output volumes used in this backup may be used in conjunction with preceding volumes in the full backup during a database restore operation.

System action: None.

User response: None.

ANR4559I Backup DB is in progress.

Explanation: The database backup in process.

System action: None.

User response: None.

ANR4560I Triggered database backup will be retried in *number of seconds* seconds.

Explanation: Because of a problem encountered during a triggered database backup, the current backup stops but will be retried after the time period shown.

System action: The system waits for the specified period and then retries a database backup.

User response: If possible, correct the condition that stopped the database backup. If the problem persists, contact your service representative.

ANR4561I Triggered database backup retry delay ended; checking database backup trigger criteria.

Explanation: Because a triggered database backup had been stopped due to a problem, the system waited before retrying. The retry wait period has ended, and the system can now retry the database backup.

System action: Database backup begins.

User response: None.

ANR4562I Database backup criteria is no longer met; triggered database backup canceled.

Explanation: Because a triggered database backup had been stopped due to a problem, the system waited before retrying. The retry wait period has ended, and the system determined that the criteria for triggering a database backup was no longer met.

System action: The system waits until the database backup trigger criteria is met before triggering another database backup.

User response: None.

ANR4563I Unable to trigger database backup - a database define, delete, extend, reduce, or backup operation is already in progress.

Explanation: A database backup was triggered, but a command that is modifying or backing up the database is already active.

System action: The backup stops and the server waits for the retry period to expire and then tries the database backup again.

User response: None.

ANR4564I Unable to trigger database backup - sufficient memory is not available.

Explanation: A database backup was triggered, but there is not enough server memory available.

System action: The backup stops and the server waits for the retry period to expire and then tries the database backup again.

User response: If necessary, make more memory available to the server.

ANR4565E Unable to trigger database backup - thread resource not available.

Explanation: A database backup was triggered, but the server cannot start a thread for the backup process.

System action: The backup stops and the server waits for the retry period to expire and then tries the database backup again.

User response: If the error persists, it may indicate a shortage of server memory. Allocate additional server memory.

ANR4570E Database backup/restore terminated - device class *device class name* not defined.

Explanation: During database backup or restore processing, an error occurred because the specified device class is not defined.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again. A database restore is terminated.

User response: For database backup, make sure the specified device class is defined. For database restore processing, make sure the device class has a definition in a device configuration file that is pointed to in the server options file.

ANR4571E Database backup/restore terminated - insufficient number of mount points available for removable media.

Explanation: During database backup or restore, the server cannot allocate sufficient mount points for the volumes required.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again. A database restore is ended.

User response: For database backup, make more mount points available if necessary. For database restore processing, make sure the device class has sufficient mount points defined in the device configuration information file that is pointed to in the server options file.

ANR4572E Database restore terminated - excessive read errors encountered.

Explanation: During database restore, read errors occur that prevent the restore from continuing.

System action: Database restore processing stops.

User response: Use a different device for the restore operation. If the problem persists, contact your service representative.

ANR4573E Database backup terminated - excessive write errors encountered.

Explanation: During database backup, write errors occur that prevent the backup from continuing.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again.

User response: If possible, determine and correct the cause of the write errors. If the problem cannot be

corrected, contact your service representative.

ANR4574E Database backup/restore terminated - data transfer interrupted.

Explanation: During a database backup or restore operation, a data transfer operation has been interrupted and cannot be continued.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again. A database restore is ended.

User response: If possible, determine and correct the cause of the interruption. If the problem cannot be corrected, contact your service representative.

ANR4575E Database backup/restore terminated - sufficient recovery log space is not available.

Explanation: During a database backup or restore operation, the server runs out of recovery log space.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again. A database restore is terminated.

User response: For database backup, make more server recovery log space available, if necessary. For database restore, contact your service representative.

ANR4576E Database backup/restore terminated - sufficient database space is not available.

Explanation: During a database backup or restore operation, the server runs out of database space.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again. The database restore process attempts to set the database capacity to the required capacity to hold the database being restored. If this fails, the restore operation is ended.

User response: For database backup, make more server database space available, if necessary. For database restore, make sure that the size of the online database is at least the same capacity as the database being restored.

ANR4577E Database backup terminated - volume already in use.

Explanation: During a database backup operation, a volume cannot be used because it is already defined in a storage pool, or has been previously used by an export, a database dump, or a database backup operation (as recorded in the volume history) or is in use by another process.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again.

User response: Specify a volume that is not in use or defined in a storage pool, and that has not been previously used for an export, a database dump, or a database backup operation as recorded in the server volume history information. The QUERY VOLUME command may be used to display the names of volumes that are defined to server storage pools. The QUERY VOLHISTORY command may be used to display the names of volumes that have been used for export, database dump, or database backup operations.

ANR4578E Database backup/restore terminated - required volume was not mounted.

Explanation: During a database backup or restore operation, a required volume cannot be mounted, because the mount request was canceled.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again. A database restore is terminated.

User response: Issue the command again or wait for the server to retry the backup and make sure the necessary volumes are accessible. If you are restoring a database to a given date or doing a roll-forward restore, restart the entire restore operation. If you are restoring a single database backup with COMMIT=NO, reissue the restore command. If you are restoring a database backup with COMMIT=YES, restore the complete backup series from the beginning.

ANR4579E Database backup/restore terminated - thread resource not available.

Explanation: During a database backup or restore operation, the server cannot start a thread for the backup process.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database

backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again. A database restore is terminated.

User response: Retry the command or wait for the server to retry the backup if it was started by the backup trigger. If the error persists, it may indicate a shortage of server memory.

ANR4580E Database backup/restore terminated - insufficient memory available.

Explanation: During a database backup or restore operation, there was not enough server memory available.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again. A database restore is terminated.

User response: If necessary, make more memory available to the server.

ANR4581W Database backup/restore terminated - internal server error detected.

Explanation: During a database backup or restore operation, the server encounters an internal error.

System action: If the database backup was started with the BACKUP DB command, the database backup is ended and server operation continues. If the database backup was triggered automatically, the backup stops and the server waits for the retry period to expire and then tries the database backup again. A database restore is terminated.

User response: Contact your service representative.

ANR4582E Database restore terminated - volume cannot be used.

Explanation: During a database restore operation, a volume has been mounted but cannot be used.

System action: The restore operation is terminated.

User response: If a volume list was specified on the command, make sure the correct volume is being specified and mounted. If no volume list was specified, contact your service representative.

ANR4583E Database backup terminated - output media full and scratch media could not be mounted.

Explanation: During a database backup operation, an out-of-space condition occurred writing to the

sequential media, and a scratch volume cannot be mounted.

System action: The database backup is ended and server operation continues.

User response: Reissue the command and specify additional volume names on the command, or specify SCRATCH=YES.

ANR4584E Database restore terminated - incomplete input volume list.

Explanation: The list of volumes needed for the restore operation was incomplete. At least one volume needed for the restore operation is missing from the end of the list.

System action: The database restore is terminated.

User response: If you are using a DSMSEV RESTORE DB command with the VOLUMENAMES parameter specified, verify that all the volumes within a database backup operation are included in the list. Ensure that all the volume names are specified in the correct sequential order. For a restore with COMMIT=NO, reissue the last restore command. For a restore with COMMIT=YES, restart the restore from the beginning of the full backup. If you are using a DSMSEV RESTORE DB command with the TODATE parameter specified, the server created a list of volumes needed for the restore operation. Examine the volume history files to try to determine the error or use a different volume history file if available. You can also restore the database by specifying the volume names for each restore operation up to the desired point in time.

ANR4585W Volume History File does not exist - Backup/Restore DB operation requires volume history file.

Explanation: Volume history file is needed for the backup/restore DB operation. .

System action: .

User response: Please specify volume history file in the dsmserv.opt.

ANR4586E Not able to get a DB2 connection. Backup DB operation will be terminated.

Explanation: DB2 connection is needed for the backup DB operation. .

System action: Backup DB operation is terminated.

User response: Verify database manager resources. Submit command again.

ANR4590I *Backup type* **backup series** *backup series number* **operation** *backup operation in series stream* *backup stream within operation (always 1)* **sequence** *backup volume sequence number in operation* **taken on date at time.**

Explanation: During a DSMSERV DISPLAY DBBACKUPVOL command, the server displays the necessary information about a backup volume.

System action: Processing continues for all volumes in the given volume list.

User response: You can use this information to create a list of volumes for a database restore when a volume history backup file is not available.

ANR4600I **Processing volume history file** *file name.*

Explanation: During a DSMSERV RESTORE DB command with the TODATE parameter specified, the server is processing the listed file in order to build a list of volumes needed for the restore operation.

System action: None.

User response: None.

ANR4601E **Incomplete volume list found for TODATE** *date time - retrying.*

Explanation: During a DSMSERV RESTORE DB command with the TODATE parameter specified, the server created a list of volumes needed for the restore operation, but the list was incomplete.

System action: The server tries to build the list again using a different volume history file specified in the server options file. If no other volume history files are available, the server stops processing.

User response: If the problem persists, examine the volume history files to try and determine the error. You can also restore the database by specifying the volume names for each restore operation up to the desired point in time.

ANR4602E **No volumes found for TODATE** *date time.*

Explanation: No volumes were found in the volume history files that meet the date and time parameters specified.

System action: The server does not process the command.

User response: Reissue the command with a valid date and time.

ANR4610E **Database volume** *DB volume name* **not found in current configuration.**

Explanation: The command specified the name of a nonexistent database volume.

System action: The server does not process the command.

User response: Reissue the command with a valid database volume name.

ANR4611E **Unable to restore database and roll forward updates - log mode was not previously set to ROLLFORWARD.**

Explanation: The command specified that the database be restored and all updates rolled forward to the most current state. This process cannot be accomplished because the server recovery log mode was not set to ROLLFORWARD; therefore, no update information exists.

System action: The server does not process the command.

User response: Reissue the command and specify a point in time (TODATE/TOTIME) for restore.

ANR4612E **Unable to restore database and roll forward updates.**

Explanation: The command specified that the database be restored and all updates rolled forward to the most current state. This process cannot be accomplished because the internal list of volumes for the most recent full/incremental backup series is not available. Possible reasons include:

- No full backup was taken after setting the recovery log mode to ROLLFORWARD with a SET LOGMODE command.
- Only snapshot database backups were created.

System action: The server does not process the command.

User response: Reissue the command and specify a point in time (TODATE/TOTIME) for restore.

ANR4619I **Snapshot database backup series** *snapshot database backup series using device class* *device class.*

Explanation: The device class used for the snapshot database backup is shown.

System action: None.

User response: None.

ANR4620I Database backup series *Backup series operation backup operation device class device class.*

Explanation: The device class used for the backup is shown.

System action: None.

User response: None.

ANR4621I Database backup device class *device class.*

Explanation: The device class for the backup is shown.

System action: None.

User response: None.

ANR4622I Volume *volume sequence number in backup operation: volume name.*

Explanation: The volume sequence and name for a full or an incremental database backup are shown.

System action: None.

User response: None.

ANR4623I Stream *stream number in backup operation volume volume sequence number in backup stream: Volume name.*

Explanation: The stream number, volume sequence and name for a full or an incremental database backup are shown.

System action: None.

User response: None.

ANR4630I Starting point-in-time database restore (commit).

Explanation: A point-in-time database restore with a specified list of volumes has started. When this restore is complete, the database will be committed to the point in time of this backup.

System action: None.

User response: If you inadvertently specified COMMIT=YES, restart the restore process from the beginning, starting with restoring the full backup (backup operation 0).

ANR4631I Point-in-time database restore (commit) complete, restore date *date time.*

Explanation: A point-in-time database restore with a specified list of volumes is complete. The date shown is the date to which the database has been restored.

System action: None.

User response: None.

ANR4632I Starting point-in-time database restore (no commit).

Explanation: A point-in-time database restore with a specified list of volumes has started. When this restore is complete, the database will not yet be usable.

System action: None.

User response: To complete a database restore where a volume list is specified, specify COMMIT=YES on the command when restoring the last set of backup volumes. If you forgot to specify COMMIT=YES on the command, issue the last restore command again with COMMIT=YES.

ANR4633I Point-in-time database restore (no commit) complete.

Explanation: A point-in-time database restore with a specified list of volumes is complete. The database is not yet usable.

System action: None.

User response: To complete a database restore where a volume list is specified, specify COMMIT=YES on the command when restoring the last set of backup volumes. If you forgot to specify COMMIT=YES on the command, issue the last restore command again with COMMIT=YES.

ANR4634I Starting point-in-time database restore to date *date time.*

Explanation: A point-in-time database restore with the TODATE parameter specified has begun. When this restore is complete, the database will be committed to the point in time of this backup.

System action: None.

User response: None.

ANR4635I Point-in-time database restore complete, restore date *date time.*

Explanation: A point-in-time database restore with the TODATE parameter specified has completed. The database is committed to the point in time of this backup, which may be different than the TODATE specified. If this is the case, an additional message will be displayed.

System action: None.

User response: None.

ANR4636I Starting roll-forward database restore.

Explanation: A roll-forward database restore has begun. When this restore is complete, the database will be returned to its most recent state.

System action: None.

User response: None.

ANR4637I Roll-forward database restore complete.

Explanation: A roll-forward database restore has ended. All database backups in the most current backup series have been restored, and all updates to the database since the most recent backup have been rolled forward. The database has been returned to its most recent state.

System action: None.

User response: None.

ANR4638I Restore of backup series *backup series number* operation *backup operation in series* in progress.

Explanation: During a DSMSEV RESTORE DB, the server displays the backup series and operation currently being restored.

System action: None.

User response: None.

ANR4639I Restored *number of pages restored of number of pages to restore from current backup operation* database pages.

Explanation: Periodically, during a DSMSEV RESTORE DB, the server displays the number of pages restored from the current backup being restored.

System action: None.

User response: None.

ANR4640I Restored *number of database pages* pages from backup series *backup series number* operation *backup operation in series*.

Explanation: At the end of each restored backup, the server displays the number of database pages restored.

System action: None.

User response: None.

ANR4641I Sequential media log redo pass in progress.

Explanation: During a DSMSEV RESTORE DB, the process of committing incomplete database updates has begun.

System action: None.

User response: None.

ANR4642I Sequential media log undo pass in progress.

Explanation: During a DSMSEV RESTORE DB, the process of rolling back incomplete transactions has begun.

System action: None.

User response: None.

ANR4643I Processed *number of log records* log records.

Explanation: Periodically, during the commit of a point-in-time restore or while rolling forward updates during a roll forward restore, the server displays the number of log records processed.

System action: None.

User response: None.

ANR4644I A full backup will be required for the next database backup operation.

Explanation: During a point-in-time restore of a database, this message is displayed to notify the administrator that the next database backup taken during normal operation must be a full backup. This process is normal for point-in-time database restores.

System action: None.

User response: At the next server restart, do a full database backup. A full database backup is started automatically if a DBBACKUPTRIGGER is defined.

ANR4645I The restore date reflects the most recent backup available up to the specified TODATE.

Explanation: During a DSMSEV RESTORE DB with the TODATE parameter, the date of the restored backup was not identical to the date specified on the command. The backup series that was restored is the most recent backup series up to and including the specified date.

System action: None.

User response: Make sure the date of the restored database is satisfactory. If it is not, restore the database again by specifying a different TODATE or by restoring individual database backups.

ANR4646I Database capacity required for restore is *number of megabytes* megabytes.

Explanation: During a point-in-time restore of a database, the size of the database being restored is displayed. The available capacity of the online database

volumes must be at least this size.

System action: None.

User response: None.

ANR4647I Database available capacity is *number of megabytes* **megabytes.**

Explanation: During a point-in-time restore of a database, the available capacity of the online database volumes is displayed. This capacity must be as large as the size of the database being restored.

System action: If the available capacity of the online database volumes is not at least this size, the restore cannot continue.

User response: If the available capacity of the online database is not sufficient, reinstall the server with the required database size, and try the restore operation again.

ANR4648I Extending database assigned capacity to *number of megabytes* **megabytes.**

Explanation: During a point-in-time restore of a database, the assigned capacity of the online database is smaller than that of the database being restored. However, the available capacity of the online database volumes is sufficient for restore.

System action: The assigned capacity of the online database is extended to the size required for restore.

User response: None.

ANR4649I Reducing database assigned capacity to *number of megabytes* **megabytes.**

Explanation: During a point-in-time restore of a database, the assigned capacity of the online database is larger than that of the database being restored.

System action: The assigned capacity of the online database is reduced to the size required for restore.

User response: None.

ANR4650E Restore of backup series *current series operation* **current operation is not in sequence; last restored backup was series** *previous series* **operation** *previous operation.*

Explanation: During a DSMSEV RESTORE DB, a backup volume was mounted that is not in the correct sequence.

System action: The database restore is terminated.

User response: Ensure volume names are specified in the correct sequential order. For a restore with COMMIT=NO, reissue the last restore command. For a restore with COMMIT=YES, restart the restore from the

beginning of the full backup.

ANR4651E Restore of backup series *current series operation* **current operation is not in sequence; backup is part of another log epoch.**

Explanation: During a DSMSEV RESTORE DB, a backup volume was mounted that is not in the correct sequence. The current backup operation cannot be restored in this series because it belongs to the same backup series from another point in time.

System action: The database restore is terminated.

User response: Restart the database restore from the beginning of the full backup. Omit all backups from the offending backup and later from the restore.

ANR4652E No system message queues available for communications.

Explanation: While Tivoli Storage Manager was trying to establish a communications session, an attempt to acquire a system message queue failed. This usually means that the system-imposed limit on message queues has been reached.

System action: The communications session is not initialized due to lack of system resources.

User response: Increase the maximum number of message queues on the system and try the operation again. This is normally accomplished by increasing the value in the kernel's msgmni file.

ANR4653E Incremental backup DB failed. Can not perform incremental DB backup without a FULL DB backup performed first.

Explanation: A FULL DB backup has to be performed at least once before any Incremental DB backup can be performed.

System action: The incremental DB backup is terminated.

User response: Reissue the backup db command with type=FULL.

ANR4654I The restore db to most current time can not be done since contents of the active or archive log directories have been changed. The DB will be restored to the last full or full plus incremental state.

Explanation: The restore DB can only restore to the last FULL backup.

System action:

User response: Do not modify contents of active or archive log directories before attempting a dsmserv roll forward restore command.

ANR4655W The restore db completed and archive log directory have been changed from original active log directory to new active log directory

Explanation: The active log directory has been changed by DB2.

System action:

User response: the user can do the following: :

- Start DB2: db2start
- Connect to TSMDB1: db2 connect to TSMDB1
- Update the DB config: db2 update db cfg using NEWLOGPATH (log path from server options, e.g. /ALOG/tsminst1)
- Terminate connection to TSMDB1: db2 terminate
- Recycle DB2: db2stop/db2start
- Verify new log path takes effect: db2 connect to TSMDB1; db2 get db cfg | grep "Path to log files"

ANR4657E SNMP: Failed to connect to server at address *address*, port *port*.

Explanation: The SNMP client was attempting to run a session with the server at the indicated address and port number in response to an SNMP Get Request, which causes a Server Script to be run. The subagent failed to connect to the server.

System action: The SNMP subagent ends this attempt to run the script and continues operation.

User response: Ensure that the indicated server is up and able to initiate admin clients using the TCP/IP protocol.

ANR4659E SNMP: Communications failure: bad verb received (*verb type*).

Explanation: The SNMP client encountered an invalid communications verb during a session with the server and is not able to continue processing the session.

System action: The SNMP session ends and subagent operation continues.

User response: Contact your service representative.

ANR4660I Connected to SNMP subagent at *SNMP subagent address* on port *port number*.

Explanation: The server has successfully connected to the SNMP subagent at the indicated address and port.

System action: The server will now register with the subagent.

User response: None.

ANR4661E SNMP communication with the subagent failed because a thread resource was not available.

Explanation: The server could not continue with SNMP communication to the SNMP subagent because sufficient memory is not available for starting additional processes on the server.

System action: The server discontinues SNMP processing and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see the appendix "Allocating Additional Server Memory".

ANR4662W Failure sending message to SNMP subagent.

Explanation: The server experienced an error return code from TCP/IP while sending to the SNMP subagent. This message is also issued when the SNMP subagent has an error sending a verb to the server when acting as an SNMP client. This may be a normal event if either side of the connection is abruptly ended, as in the case of terminating the subagent program. The error is reflected in another message for TCP/IP which further describes the error.

System action: The session is ended. Server operation continues. If a message is being forwarded to an SNMP managing node, the message is not sent. If a heartbeat message was being sent to the subagent, this heartbeat message is lost and the server attempts to re-start its session with the SNMP subagent.

User response: If the session is ended as a result of intentionally stopping either the subagent, no response is required. Otherwise, ensure that the TCP/IP protocol stack is functioning by using the tools that come with the particular TCP/IP suite on the platform in use.

ANR4663W Failure receiving message from SNMP subagent.

Explanation: The server experienced an error return code from TCP/IP while receiving data from the SNMP subagent. This may be a normal event if either side of the connection is abruptly ended, as in the case of terminating the subagent program. The error is reflected in another message for TCP/IP which further describes the error.

System action: The session is ended. Server operation continues. If a heartbeat message was being sent to the subagent, this heartbeat message is lost and the server attempts to re-start its session with the SNMP subagent. If the server was attempting to register to the SNMP subagent, heartbeat messaging will be disabled until the server is re-started.

User response: If the session is ended as a result of intentionally stopping either the subagent, no response

is required. Otherwise, ensure that the TCP/IP protocol stack is functioning by using the tools that come with the particular TCP/IP suite on the platform in use.

ANR4664W Failure in registering with SNMP subagent.

Explanation: The server experienced a problem while attempting to register with the SNMP subagent. This may be due to problems with communication or the SNMP subagent being unavailable.

System action: Heartbeat messaging will be disabled until the server is re-started.

User response: Ensure that the subagent is running and that the TCP/IP protocol stack is functioning by using the tools that come with the particular TCP/IP suite on the platform in use.

ANR4665W Failure retrying registration with SNMP subagent.

Explanation: The server experienced a problem while attempting to re-register with the SNMP subagent after losing contact. This may be due to problems with communication or the SNMP subagent being unavailable.

System action: Registration is re-tried for a number of attempts before giving up.

User response: Ensure that the subagent is running and that the TCP/IP protocol stack is functioning by using the tools that come with the particular TCP/IP suite on the platform in use.

ANR4666W Failure sending heartbeat message to SNMP subagent.

Explanation: The server experienced a problem while attempting to send a heartbeat message to the SNMP subagent. This may be due to problems with communication or the SNMP subagent being unavailable.

System action: The server will attempt to contact the SNMP subagent again and re-synchronize.

User response: Ensure that the subagent is running and that the TCP/IP protocol stack is functioning by using the tools that come with the particular TCP/IP suite on the platform in use.

ANR4667W Failure retrying heartbeat message to SNMP subagent.

Explanation: The server experienced a problem while attempting to send a heartbeat message to the SNMP subagent. This may be due to problems with communication or the SNMP subagent being unavailable.

System action: The server attempted to contact the

SNMP subagent again and re-synchronize, but this too failed. Heartbeat functions are disabled until the server is re-started.

User response: Ensure that the subagent is running and that the TCP/IP protocol stack is functioning by using the tools that come with the particular TCP/IP suite on the platform in use. Re-start the server if the heartbeat function is required.

ANR4668I Connection successfully re-established with SNMP subagent.

Explanation: The server experienced a problem while attempting to send a heartbeat message to the SNMP subagent.

System action: The server was able to successfully resynchronize with the SNMP subagent.

User response: None.

ANR4669W Heartbeat message was not accepted by SNMP subagent.

Explanation: The server experienced a problem while attempting to send a heartbeat message to the SNMP subagent. The SNMP subagent was unable to accept the heartbeat message. If the subagent was stopped and re-started, this is a normal message.

System action: The server will attempt to contact the SNMP subagent again and re-synchronize.

User response: Ensure that the subagent is running and that the TCP/IP protocol stack is functioning by using the tools that come with the particular TCP/IP suite on the platform in use.

ANR4670W Failure in opening session with SNMP subagent.

Explanation: The server experienced a problem while attempting to open a session with the SNMP subagent.

System action: Processing continues. Heartbeat and message forwarding function will not be available.

User response: Ensure that the subagent is running and that the TCP/IP protocol stack is functioning by using the tools that come with the particular TCP/IP suite on the platform in use. If heartbeat and message forwarding functions are required, re-start the server.

ANR4671W SNMP subagent did not accept registration of this server.

Explanation: The server experienced a problem while attempting to open a session with the SNMP subagent. The subagent is available but disallowed registration by this server.

System action: Processing continues. Heartbeat and message forwarding function will not be available.

User response: It may be necessary to stop the subagent and re-start it. Then stop the server and re-start it if heartbeat and message forwarding functions are required.

ANR4672W SNMP message forwarding to the SNMP subagent was not started because a thread resource was not available.

Explanation: The server could not continue with SNMP communication to the SNMP subagent for message forwarding because sufficient memory is not available for starting additional processes on the server.

System action: The server discontinues SNMP message processing and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see the appendix "Allocating Additional Server Memory".

ANR4673E Insufficient memory for subagent initialization (*the portion of initialization where the allocation of memory failed*).

Explanation: The SNMP subagent could not initialize due to the inability to obtain the required memory.

System action: Initialization of the subagent fails.

User response: Allocate additional storage to the subagent.

ANR4674E Error starting DPI thread - Return code: *Return code received from called routine.*

Explanation: The SNMP subagent could not start the DPI® thread.

System action: Initialization of the subagent fails.

User response: Contact your service representative.

ANR4675E Server/subagent protocol violation - invalid (*where the protocol breakdown occurred*).

Explanation: The SNMP subagent received an unexpected request from the server.

System action: The subagent will stop processing requests from the server sending the invalid requests.

User response: Contact your service representative.

ANR4676E Unable to register another server.

Explanation: The SNMP subagent received a request to register a new server and was unable to allocate the memory necessary to register the new server.

System action: The subagent will not register the new server.

User response: Contact your service representative.

ANR4677I Session established with server name: *The name of the registered server..*

Explanation: The SNMP subagent completed the registration of the identified server.

System action: The subagent will wait for additional requests from the server.

User response: None.

ANR4678I Session closed with server name: *The name of the deregistered server..*

Explanation: The SNMP subagent completed the deregistration of the identified server.

System action: None.

User response: None.

ANR4679W Messages are no longer being forwarded to the SNMP subagent.

Explanation: The server has encountered multiple errors in forwarding messages to the SNMP subagent. Messages are no longer being forwarded.

System action: The server continues operating, but messages are no longer being forwarded.

User response: Message forwarding can be re-initialized by either stopping the server and re-starting it. Message forwarding will also be re-started if the heartbeat function is in use and the server re-synchronizes with the subagent. This re-synchronization occurs if the subagent, dsmsnmp, is stopped for longer than a single heartbeat interval (the heartbeat interval is a server option and appears in the output of the QUERY OPT command) and then restarted.

ANR4680I DPI subagent (*The subagent name.*): *"Connected" or "reconnected", ready to receive requests.*

Explanation: The subagent has successfully connected or reconnected to the SNMP agent.

System action: The subagent is ready to receive requests from servers.

User response: None.

ANR4681W Connect to SNMP agent failed, will keep trying.

Explanation: The subagent has failed in an attempt to connect to the SNMP agent.

System action: The subagent keeps retrying the connection.

User response: Make sure that the SNMP daemon is up, running and correctly configured.

ANR4682W A SNMP agent connection error occurred. Attempting to re-establish connection.

Explanation: An error has occurred in the communication between the subagent and the SNMP agent.

System action: The subagent will attempt to reconnect.

User response: Make sure that the SNMP daemon is up, running and correctly configured.

ANR4683E Unable to open trace file '*file name*'.

Explanation: An error occurred while opening the file for writing trace data.

System action: The subagent continues operation without tracing.

User response: Ensure there is adequate space on the drive from which you are running the subagent and retry the program.

ANR4684E Trap request failed - RC: Return code from the trap request. **Server index:** Server index number..

Explanation: An error occurred while attempting to process a trap request from a server. data.

System action: The subagent processing continues.

User response: Make sure that the SNMP daemon is up, running and correctly configured.

ANR4685E Insufficient memory for subagent initialization.

Explanation: The SNMP subagent could not initialize due to the inability to obtain the required memory.

System action: Initialization of the subagent fails.

User response: Allocate additional memory to the subagent.

ANR4686E Insufficient memory for subagent trace initialization.

Explanation: The SNMP subagent trace could not initialize due to the inability to obtain the required memory.

System action: Initialization of the subagent fails.

User response: Allocate additional memory to the subagent.

ANR4687E Server/subagent protocol violation - expecting registration request. **Received request:** *The value of the request that was received.*

Explanation: The SNMP subagent was expecting a registration request. It actually received something other than a registration request.

System action: The subagent will stop processing requests from the server sending the invalid requests.

User response: Contact your service representative.

ANR4688E Server/subagent protocol violation - incorrect request header version.

Explanation: The SNMP subagent received a request from a server that was not at the same maintenance level as the subagent.

System action: The subagent will stop processing requests from the server sending the invalid requests.

User response: Ensure the server and subagent are at the same maintenance level. If they are, contact your service representative.

ANR4689E Invalid request type received (*The value of the request that was received.*).

Explanation: The SNMP subagent received an unexpected request from the server.

System action: The subagent will stop processing requests from the server sending the invalid requests.

User response: Contact your service representative.

ANR4690E Unexpected request type (*The value of the request that was received.*) in trap data header.

Explanation: The SNMP subagent received an invalid trap request from a server.

System action: The subagent will stop processing requests from the server sending the invalid requests.

User response: Contact your service representative.

ANR4691I DPI subagent (*The subagent name.*): connected, ready to receive requests.

Explanation: The subagent has successfully connected to the SNMP agent.

System action: The subagent is ready to receive request from servers.

User response: None.

ANR4692I **DPI subagent** (*The subagent name.*):
reconnected, ready to receive requests.

Explanation: The subagent has successfully reconnected to the SNMP agent.

System action: The subagent is ready to receive request from servers.

User response: None.

ANR4693I **Interface Driver information will be loaded in quiet mode: Only warning and error messages will be displayed.**

Explanation: The server is loading information needed for the Administrative WEB Interface. To minimize message traffic, only error and warning messages will be displayed.

System action: When the command completes, WEB administrative information will be loaded into the server.

User response: None.

ANR4694E **SNMP Subagent Port Confirmation Has Failed.**

Explanation: The server was communicating configuration data to the SNMP subagent. An error occurred in the exchange. The server could not communicate interface information to the subagent.

System action: The server continues operation. The SNMP administrative interface is inoperative.

User response: The most likely cause of this problem is a temporary network failure. The server should be re-started to retry the connection to the SNMP subagent. If this problem occurs repeatedly, please contact you service representative.

ANR4695E **SNMP: Communications Failure in Receiving "verb type" verb.**

Explanation: The SNMP client encountered a communications error in using the *verb type* verb to transfer information to or from the server and an SNMP client.

System action: The SNMP session ends and server operation continues.

User response: This may not be a problem if the SNMP subagent was terminated while the session was in progress. Otherwise, ensure that TCP/IP communications is running normally.

ANR4697E **SNMP: Failed to authenticate to server at address *address*, port *port*.**

Explanation: The SNMP client was attempting to run a session with the server at the indicated address and port number in response to an SNMP Get Request, which causes a Server Script to be run. The subagent connected to the indicated server, but failed in authentication.

System action: The SNMP subagent ends this attempt to run the script and continues operation.

User response: Ensure that the indicated server has an administrative id of SNMPADMIN and that this administrative id has sufficient authority to run the script and commands it contains.

ANR4698E **SNMP: Communications Failure in Sending "verb type" verb (command).**

Explanation: The SNMP client encountered a communications error in using the *verb type* verb to issue command *command*.

System action: The SNMP client session ends and subagent operation continues.

User response: Contact your service representative.

ANR4699E **SNMP: Receive Buffer overflow.**

Explanation: The SNMP client encountered an overflow error in transferring information to or from the server.

System action: The SNMP client session ends and subagent operation continues.

User response: Contact your service representative.

ANR4700I **The server move batch size has been set to *new batch size*. Move operations that start after this point will use the new value.**

Explanation: A SETOPT commmand was used to set the value for the move batch size value. This setting determines the maximum number of files that are moved on the server in one database transaction, dependent also on the setting for the move size thrshold. The setting influences file movement for server migration, reclamation, storage pool backup, and move data operations.

System action: The server uses this new setting for move operations that are started after this message is issued.

User response: Contact your service representative.

ANR4701I The server move size threshold has been set to *new threshold*. Move operations that start after this point will use the new value.

Explanation: A SETOPT command was used to set the value for the move size threshold value. This setting determines the maximum number of megabytes that are moved on the server in one database transaction, dependent also on the setting for the move batch size. The setting influences file movement for server migration, reclamation, storage pool backup, and move data operations.

System action: The server uses this new setting for move operations that are started after this message is issued.

User response: Contact your service representative.

ANR4702I The server transaction group maximum has been set to *new value*. Client sessions that are started after this point will use the new value.

Explanation: A SETOPT command was used to set the value for the maximum number of files that can be sent from the client in a single database transaction.

System action: The server uses this new setting for client sessions that are started after this message is issued.

User response: Contact your service representative.

ANR4703E Invalid key ring filename *Key Ring Filename*

Explanation: The key ring filename specified did not contain the .kyr extension.

System action: None.

User response: Rename your key ring filename to contain the .kyr extension. Reexecute the command with the new filename.

ANR4704I Key ring filename and password have been set. Restart the server to use the new settings

Explanation: The key ring filename have been set to the new value specified in the DEFINE KEYPING command.

System action: None.

User response: Restart the server to use the new key ring information.

ANR4705I The server IDL definitions have not been installed. These definitions will need to be installed for the Web Administrator interface to work.

Explanation: The server attempted to query the server IDL interface and found no definitions defined. Because of this error the HTTP engine returns a 404 not found message.

System action: None.

User response: If you would like to use the server web administrator interface you will need to:

1. Halt the server.
 2. Issue the command DSMSERV RUNFILE dsmserv.idl. For AS/400® command see next step.
 3. For AS/400, issue the command STRSVRADSM SVRMODE(*PRPWEB).
 4. Restart the server.
-

ANR4706W Unable to open file *Filename* to satisfy web session *Session ID*.

Explanation: A web browser requested a file and the server could not find the file on the local file system. Special note, some files requested from the server are not valid and are caused by a browser error. For example, a request for CommandLineBeanInfo.class is not a valid file request. However, a request of a GIF image or HTML page should not produce this error.

System action: None.

User response: Verify that permission for the file are set correctly and file exists.

ANR4707E *Import/Loaddb command* operation terminated - incomplete input volume list.

Explanation: The list of volumes needed to process the command was incomplete. At least one volume needed for the operation is missing from the end of the list.

System action: The command operation is ended.

User response: Issue the command again and make sure the necessary volumes are included in the volume list.

ANR4708I Native SSL support has been disabled, please use the web proxy.

Explanation: Starting in this version of this product native Secure Socket Layer support has been removed. This feature has been replace with the web proxy. Support for non-secure http request (COMMMETHOD HTTP) has not been disabled.

System action: None.

User response:

1. Remove COMMMETHOD HTTPS from your option file.
2. Install and configure the web proxy. See Quick Start Appendices for more information on how to install and configure the web proxy.

ANR4709W Intervention required to mount volume
Volume Name on Library Manager Server
Server Name.

Explanation: A volume mount is awaiting operator intervention on the specified library manager server.

System action: The volume mount operation waits for operator intervention.

User response: Refer to the server consol and/ir activity log on the named library manaer server to determine the action that needs to be performed to complete the mount operation.

ANR4710W Library manager *Server Name* **could not be contacted to control library** *Library Name.*

Explanation: The specified library manager server could not be contacted for control of the named library.

System action: The server will continue to contact the named library manager server. Volume mounts in the library will fail until communication is successful.

User response: Determine why the named server is not running or why the network prevents communication with te named server.

ANR4712E Command: The DEVCLASS parameter is only valid for volume history types
DBBACKUP or DBSNAPSHOT.

Explanation: The command failed because an invalid volume history type was specified for the TYPE= parameter.

System action: The command fails, and server operation continues.

User response: Re-issue the command and specify a valid type value.

ANR4713E Command: The "option" string is not valid for the Hex Filespace Field.

Explanation: The command indicated specifies a value that is not valid for the Hex Filespace parameter.

System action: The server does not process the command.

User response: Reissue the command with a valid entry for the Hex Filespace parameter.

ANR4714I Command filename for filespace *filespace name* **of node** *node name* **started as process** *process ID.*

Explanation: A file deletion process has started to delete one or more files from the given filespace for the for given node. The process is assigned the ID specified in the message.

System action: The server starts a background process to perform the operation in response to the DELETE FILE command entered by an administrator.

User response: To obtain status on the file deletion process, issue the QUERY PROCESS command. The process may be canceled with the CANCEL PROCESS command.

ANR4715I DELETE FILE *file name (backup/archive data)* **for filespace** *filespace name* **of node** *node name* **started.**

Explanation: A background server process has started (on the server) to delete files from the given filespace for the given node.

System action: The background process deletes backup and archive objects that match the given file name while server operation continues.

User response: To obtain status on the file deletion process, issue the QUERY PROCESS command. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR4716I DELETE FILE *file name (backup data)* **for filespace** *filespace name* **of node** *node name* **started.**

Explanation: A background server process has started (on the server) to delete files from the given filespace for the given node.

System action: The background process deletes backup objects that match the given file name while server operation continues.

User response: To obtain status on the file deletion process, issue the QUERY PROCESS command. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR4717I DELETE FILE *file name (archive data)* **for filespace** *filespace name* **of node** *node name* **started.**

Explanation: A background server process has started (on the server) to delete files from the given filespace for the given node.

System action: The background process deletes archive objects that match the given file name while server operation continues.

User response: To obtain status on the file deletion process, issue the QUERY PROCESS command. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR4718I **DELETE FILE** *file name* **canceled for filespace** *filespace name* **of node** *node name* **: number of objects** **objects deleted.**

Explanation: A background server process that has been deleting files for the given filespace of the given node is canceled by the CANCEL PROCESS command. The number of objects deleted before the cancel ended the operation are reported in the message.

System action: The server process is ended and server operation continues.

User response: No action is required. An authorized administrator can issue the DELETE FILE command to delete the remaining files desired.

ANR4719I **DELETE FILE** *file name* **complete for filespace** *filespace name* **of node** *node name* **: number of objects** **objects deleted.**

Explanation: A server process deleting file space data for the node specified has completed. The total number of objects deleted is reported in the message.

System action: The server process is ended and server operation continues.

User response: None.

ANR4723E **Session rejected for down level storage agent** *storage agent name.*

Explanation: A down level storage agent attempted to connect to this server. The server can not support all previous versions of the storage agent.

System action: The server will not support connections by storage agents at a specific lower versions of the product. Review the README for an explanation of supported storage agent levels for this server. The storage agent will not startup and will report ANR0454W indicating that it is down level.

User response: None.

ANR4724E **During the backup of node** *node (Node id)* **filespace** *filespace name (filespace id)* **a deletion activity occurred.**

Explanation: During full or incremental backup processing, files were deleted from the file space. The files were not deleted by expiration, but by some other process. DELETE FILESPACE, DELETE VOLUME, AUDIT VOLUME, or some other administrator command can cause files to be deleted. The file space image on the server will not be consistent with the

client until an incremental backup is completed for the node.

System action: The server will continue processing.

User response: Perform an incremental backup for the client node.

ANR4725E *Source file(line number):* **Server lock** *Locktype,* **mode** *Lockmode* **failed.**

Explanation: An internal error occurred in an attempt to obtain a lock during processing.

System action: The activity that generated this error fails.

User response: Retry the process. If the process fails contact your service representative.

ANR4726I **The support module has been loaded.**

Explanation: The module indicated has been successfully loaded. Operations involving this module may be performed by the server.

System action: Functions which depend on this module may now be performed on the server.

User response: None.

ANR4727E **Server** *Server name* **is incompatible with this server. Please update the server to the same level as this storage agent.**

Explanation: The storage agent attempted to connect to a downlevel server. The server version, release, and fix level must exactly match, otherwise data corruption may occur. For example, a version 4.2.0.0 storage agent cannot connect to a version 4.1.0.0 server.

System action: Upgrade the TSM server to the same level as the storage agent.

User response: None.

ANR4728E **Server connection to file server** *File server name* **failed. Please check the attributes of the file server specified during definition of the datamover.**

Explanation: The server attempted to connect to a file server. The connection failed because of one of the following possible reasons:

- One of the parameters specified during datamover definition was incorrect: TCP/IP address of the file server, user id, password, TCP/IP port
- File server does not support requested NDMP version
- File server is not accessible
- NDMP server limits the number of opened NDMP sessions

- An unsupported model of the filer server was detected
- If the message specifies address 127.0.0.1 or the address of the server system, the NDMPCONTROLPORT and/or NDMPPORTRANGE options may be set to port numbers or ranges which are already in use.

System action: TSM server backup/restore of the file server fails.

User response: Check if file server is accessible through the network; check each of the attributes specified during datamover definition; check NDMP versions supported by the file server; check the number of open NDMP sessions with the file server, verify that file server model is supported by TSM server. If the server's address is in the message ensure that the ports specified or defaulted for options NDMPCONTROLPORT and/or NDMPPORTRANGE are available for use. Depending on the operating system, the netstat operating system command may be used to determine in-use port numbers.

ANR4729E *Server connection to file server **File server name** failed. The level of the file server operating system is unsupported by TSM server. Please upgrade the file server to the level of the operating system supported by the server.*

Explanation: The TSM server was trying to connect to a file server with an unsupported level of the operating system. The server can establish NDMP connection only to a file server with supported level of the operating system. Please check the following site for supported levels of file server operating systems: <http://www.tivoli.com/storage>

System action: The TSM server backup/restore of the file server fails.

User response: Upgrade the file server to a supported level of the operating system.

ANR4730E *Command: The number of pool type storage pool names specified with the parameter name **parameter exceeds the maximum number allowed for simultaneous write.***

Explanation: The number of copy storage pools combined with the number of active-data pools for a given primary storage pool is limited to three. Earlier versions allowed up to ten copy storage pools in the copy storage pool list.

System action: The command fails.

User response: Reissue the command specifying a total of three or fewer copy storage pool names and active-data storage pool names.

ANR4731E *Command: The pool type storage pool storage pool name is not defined.*

Explanation: A DEFINE STGPOOL or UPDATE STGPOOL command contained a storage pool that is not defined as either a copy storage pool or an active-data storage pool.

System action: The command fails.

User response: Verify that the copy or active-data storage pool name stated in the error message is correct. If using the COPYSTGPOOLS parameter, correct the problem by using a copy storage pool that already exists or define the copy storage pool. If using the ACTIVEDATAPOOLS parameter, correct the problem by using an active-data storage pool that already exists or define the active-data storage pool. Retry the command.

ANR4732E *Command: The storage pool storage pool name is not a pool type storage pool.*

Explanation: A DEFINE STGPOOL or UPDATE STGPOOL command contained a storage pool name that is not a copy or active-data type storage pool.

System action: None.

User response: Verify that the copy or active-data storage pool name stated in the error message is correct or remove the storage pool name from the list. If using the COPYSTGPOOLS parameter, correct the problem by using a copy storage pool that already exists or define the copy storage pool. If using the ACTIVEDATAPOOLS parameter, correct the problem by using an active-data storage pool that already exists or define the active-data storage pool. Retry the command.

ANR4733E *Command: The pool type storage pool contains a pool type storage pool name that introduces a cycle into the storage pool chain.*

Explanation: A DEFINE STGPOOL or UPDATE STGPOOL command contained a copy or active-data storage pool that eventually points to the storage pool being processed.

System action: None.

User response: Remove the storage pool name from the copy or active-data storage pool list and retry the command.

ANR4734W *The pool type storage pool pool name was removed from the storage pool list because of a failure for session **Session Id.***

Explanation: The named storage pool was removed from the storage pool list for the current session backup/archive/space management operation because

of an error. This removal is only for the session indicated in the message and does not effect other session operation.

System action: None.

User response: The error that occurred could be one of many failure. Look for the following items in the active log or on the server console. 1. Is the named storage pool currently unavailable? 2. Have any I/O error occurred on the destination devices (disk or tape drives)? 3. Is the mount limit on the device class correctly set? 4. Is the node's MAXNUMMP value sufficient to satisfy the request?

ANR4735W Server-free processing is not available. Initialization failed.

Explanation: An error occurred while initializing server-free processing. Server-free data transfer is not available to backup and restore images.

System action: Client backup and restore image requests will use lan-based data transfer.

User response: Check for messages during server initialization and correct the error.

ANR4736E Set serverfree is not allowed when server-free is not available.

Explanation: Server-free processing did not initialize. Changing the status is not allowed.

System action: Server processing continues.

User response: Server-free status may be changed when the status is ON or OFF.

ANR4737E Transaction failed for session *session number* for node *node name (client platform)* - the copy continue attribute for storage pool *storage pool name* prevented further retries.

Explanation: During a backup session one or more copy storage pools associated with the indicated storage pool had a failure. The operation was halted because the copy continue option for the indicated storage pool caused the process to stop.

System action: None.

User response: Verify the following: 1. Does the device class(es) have enough mount points to satisfy the request? 2. Was the node's MAXNUMMP value sufficient to satisfy the request? 3. Were there any errors reported during the transaction regarding I/O or related issues?

ANR4738E Command: Storage pool *storage pool name* is in use as a copy or active-data storage pool by one or more other storage pools.

Explanation: A DELETE STGPOOL command specifies a pool that is a copy storage pool and listed as one of the copy storage pools of other storage pool via the DEFINE STGPOOL or UPDATE STGPOOL's COPYSTGPOOL parameter, or, a DELETE STGPOOL command specifies a pool that is an active-data storage pool and listed as one of the active-data storage pools of other storage pools via the DEFINE STGPOOL or UPDATE STGPOOL's ACTIVEDATAPOLS parameter.

System action: The server does not process the command.

User response: If necessary, issue the UPDATE STGPOOL command to update other storage pools so that they do not reference the pool to be deleted, and reissue the command.

ANR4739E Either the high-level address (*hladdress*), low-level address (*lladdress*), or both were entered in error.

Explanation: The high-level or low-level addresses supplied are incorrect.

System action: The server does not process the command.

User response: Both the high-level address and low-level address are required for an address to be valid. For an update, both high-level address and low-level address are required for the update to succeed. For a new definition, both high-level address and low-level address are required when SESSIONINIT=SERVERONLY. Either the high-level address or low-level address is missing from this command. Issue the command again and supply the missing address represented by a "?" in this message.

ANR4740W Either the high level address, low level address, or both were never entered for the specified node(*nodename*) and the session initiation status is being changed.

Explanation: When the session initiation status of a node is changed by using the SESSIONINIT parameter on the UPDATE NODE command, the scheduling table is updated to reflect the address specified with HLA and LLA keywords of the UPDATE NODE command. If one or both of these keywords have never been used to provide addressing information for the node, server-initiated scheduling will not be able to contact this node.

System action: The server does not update the scheduling table. Subsequent server initiated sessions with the node are likely to fail, unless an additional UPDATE NODE command provides both the

HLADDRESS and LLA parameters with correct address information.

User response: Both the high level address and low level address are required for an address to be valid. Issue the UPDATE NODE command for this node with complete addressing information through the HLADDRESS parameter for the node address, and the LLADDRESS parameter for the node listen port information.

ANR4741W This command will rename administrator *adminName*. This administrator has defined or updated schedules. Renaming this administrator will cause these schedules to fail.

Explanation: A RENAME ADMINISTRATOR command has been entered for an administrator that owns administrative schedules. If you confirm that you want to proceed with this command, the schedules owned by this administrator will fail when executed in the future.

System action: The system asks whether you wish to continue with the command.

User response: To process the RENAME ADMINISTRATOR command, enter 'Y' to continue or 'N' to stop the process. To deal with schedules owned by the administrator, use the QUERY SCHEDULE command, or an SQL SELECT statement on the ADMIN_SCHEDULES table to determine which schedules were last updated by the administrator. Use the UPDATE SCHEDULE command to update those schedules controlled by an administrator that has authority to execute them, or use the DELETE SCHEDULE command to remove the schedules.

ANR4742W This command has renamed administrator *adminName* to *newAdminName*. This administrator has defined or updated schedules. This will cause these schedules to fail in the future.

Explanation: A RENAME ADMINISTRATOR command has been entered and the administrator renamed owns the administrative schedules. The schedules will fail when executed in the future because they do not belong to the administrator's new name.

System action: The system renames the administrator.

User response: Use the QUERY SCHEDULE command or an SQL SELECT statement on the ADMIN_SCHEDULES table to determine which schedules were last updated by the administrator. Use the UPDATE SCHEDULE command to update those schedules controlled by an administrator that has authority to execute them, or use the DELETE SCHEDULE command to remove the schedules.

ANR4743W An insufficient number of mount points are available in device class *device class name*.

Explanation: During simultaneous write processing, the server cannot allocate sufficient mount points for the specified device class. Possible reasons include:

- The mount limit specified for the device class does not provide a sufficient number of mount points to support the simultaneous write operation.
- The drives that service the device class are inaccessible.

System action: None.

User response: Ensure that:

- The mount limit specified for the device class provides a sufficient number of mount points to support the simultaneous write operation.
- Enough drives are defined and on-line for the library that services the device class.

ANR4744W The server cannot acquire a sufficient number of mount points.

Explanation: During simultaneous write processing, the server cannot acquire a sufficient number of mount points to satisfy the request.

System action: None.

User response: Examine error messages that might have been displayed prior to, and after this message. Correct any problems, if possible.

ANR4745E Server *server name* (*version.release.modification level.fix level*) is not compatible with storage agent *storage agent name* (*version.release.modification level.fix level*).

Explanation: The server and storage agent are not compatible. The storage agent must be at the same version and release as the server. It must also be at the same modification level, or the same modification level minus one. For example, a server at version 5.2.1 would allow connections from a storage agent at version 5.2.1 or version 5.2.0.

System action: If the storage agent and server are not at the same version and release, update the storage agent to the same version and release as the server. Once the storage agent is at the same version and release as the server, upgrade it to either the same modification level or the same modification level minus one.

User response: None.

ANR4746E Session rejected for up level storage agent *storage agent name*.

Explanation: An up level storage agent attempted to connect to this server. The storage agent can not be at higher level than the server.

System action: The server will not support connections by storage agents at a higher version, at the same version with a higher release, or at the same version and release with a higher modification level. The storage agent will not startup and will report ANR0454W indicating that no resources are available.

User response: None.

ANR4747W The web administrative interface is no longer supported. Begin using the Integrated Solutions Console instead.

Explanation: The web administrative interface is no longer supported. It has been replaced by an administrative interface based on the Integrated Solutions Console.

System action: The web administrative interface's web page is not displayed.

User response: Install the IBM Tivoli Storage Manager support for the Integrated Solutions Console and begin using it to manage your servers.

ANR4748E A NAS operation requiring NDMP Version 4 was attempted for file server *File server name*, however the current NDMP session uses NDMP Version 3. Please verify that file server supports NDMP version 4.

Explanation: A NAS operation which requires NDMP Version 4 was attempted for a file server that is currently configured to run NDMP Version 3.

System action: The TSM server backup/restore or other operation on the file server fails.

User response: Verify that the file server supports NDMP Version 4. Verify that the file server is configured to accept connections using NDMP Version 4.

ANR4749I Key ring filename and password have been deleted from the server database.

Explanation: The key ring filename and password have been deleted. Upon restart the server will attempt to generate a new password and new keyring file if options SSLTCPPOINT or SSLTCPADMINPORT are set and the keyring files cert.kdb,cert.crl,cert.rdb do not exist.

System action: None.

User response: Before restarting the server you should

delete the corresponding cert.kdb,cert.crl,cert.rdb and cert.arm files from the server execution directory if they exist. Restart the server to generate and use the new key ring information.

ANR4752I REPAIR STGVOL process *process number* started for number of volumes *volumes*.

Explanation: The REPAIR STGVOL process has been started as the reported process number. This will evaluate and if needed repair the indicated number of volumes.

System action: None.

User response: This process may be monitored using the QUERY PROCESS command. If this process needs to be cancelled, issue the CANCEL PROCESS command.

ANR4753E REPAIR STGVOL process *process number* ended, processed *volumes processed of total volumes total volumes with repaired volumes repaired and failed volumes failures*.

Explanation: The REPAIR STGVOL process has ended. It processed *volumes processed* out of *total volumes* total volumes to be processed. The *repaired volumes* indicates the number of volumes that needed database repairs and were repaired. The *failed volumes* are volumes that either failed during evaluation or during database repair if it was needed.

System action: None.

User response: If there were *failed volumes*, review the activity log for more information about the failure.

ANR4754I REPAIR STGVOL process *process number* ended, processed *volumes processed of total volumes total volumes with repaired volumes repaired*.

Explanation: The REPAIR STGVOL process has ended. It processed *volumes processed* out of *total volumes* total volumes to be processed. The *repaired volumes* indicates the number of volumes that needed database repairs and were repaired.

System action: None.

User response: None.

ANR4755W REPAIR STGVOL process *process number* ended, processed *volumes processed of total volumes total volumes with repaired volumes repaired*.

Explanation: The REPAIR STGVOL process has ended. It processed *volumes processed* out of *total volumes* total volumes to be processed. The *repaired volumes* indicates

ANR4756I • ANR4764E

the number of volumes that needed database repairs and were repaired.

System action: None.

User response: If the *volumes processed* is less than the *total volumes*, this may be because the process was cancelled before it could process all the needed volumes. Review the activity log to determine if this is the case and re-issue the command to complete this processing. Or if volumes were reclaimed or deleted while this process was running, there may have been fewer actual volumes to process than what was calculated when the process started. If this is the case no further action is necessary.

ANR4756I REPAIR STGVOL selected volume
volume name.

Explanation: The REPAIR STGVOL selected *volume name* volume to process. This volume will be evaluated for database reference errors and if any are encountered, they will be corrected.

System action: None.

User response: None.

ANR4757I REPAIR STGVOL finished evaluating
volume *volume name*, no repair was
needed.

Explanation: The REPAIR STGVOL finished evaluating *volume name* volume. No repair actions were taken for the database because there were no errors detected.

System action: None.

User response: None.

ANR4758W REPAIR STGVOL repaired volume
***volume name*, database reference errors**
were found and corrected.

Explanation: The REPAIR STGVOL evaluated *volume name* volume and determined that repair actions were needed. The necessary repairs were done successfully.

System action: None.

User response: None.

ANR4759E REPAIR STGVOL failed to process
***volume name*.**

Explanation: The REPAIR STGVOL failed for *volume name* volume. This process either failed while evaluating this volume or it had determined that repair actions were needed and it failed performing those actions.

System action: None.

User response: Review the activity log for an

indication of why processing for this volume failed. Try issuing "REPAIR STGVOL VOLNAME=*volume name*" to process this volume again. If this volume was deleted from the server, this message can be ignored.

ANR4760I REPAIR STGVOL reset processing
history.

Explanation: The REPAIR STGVOL command was issued with RESET=YES. This resets the processing history. Resetting the processing allows the command to be rerun and causes previously evaluated volumes to be re-evaluated.

System action: None.

User response: An administrator may want to periodically reset the processing history and re-evaluate all volume in the server as a means of validating the server database.

ANR4761E REPAIR STGVOL reset processing
history failed.

Explanation: The REPAIR STGVOL command was issued with RESET=YES. This resets the processing history. However, the reset of the processing history failed.

System action: None.

User response: The server is likely out of memory or resources. This command should be re-issued after either halting and restarting the server or after halting the server, rebooting the server machine, and than restarting the server. If the reset still fails after these steps, contact your IBM service representative.

ANR4762E Command: The SPACEMANAGED or
ARCHIVE type parameters are not valid
for active data storage pool volumes.

Explanation: The QUERY CONTENT server command has been entered with an invalid type parameter. The SPACEMANAGED or ARCHIVE parameters are not valid when the volume specified belongs to an active-data type storage pool.

System action: The server ignores the command.

User response: Reissue the command with correct TYPE parameter for active data storage pool.

ANR4764E Command: Invalid length for parameter
parameter - *parameter value*.

Explanation: The length for (*parameter value*) specified for the (*parameter*) parameter in command *command* exceeds the maximum allowed length.

System action: The command fails and server operation continues.

User response: Reissue the command and specify a

valid length for the parameter. For information on valid values for the parameter for the command, refer to the *Administrator's Reference* for your particular platform.

ANR4780I Node group *node group name* defined.

Explanation: A DEFINE NODEGROUP command has created the node group indicated.

System action: None.

User response: None.

ANR4781E Command: Invalid node group name - *node group name*.

Explanation: Server processing for the command *command* fails because the node group name *node group name* specified does not contain valid characters or contains too many characters.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Issue the command again and specify a node group name that conforms to the name requirements. For information on the character and length specifications for valid node group names, refer to the *Administrator's Reference*.

ANR4782E Command: Description exceeds maximum length of *length limit* characters.

Explanation: Server processing for the command *command* fails because the description specified is longer than the *length limit* number of characters allowed.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Issue the command again and specify a shorter description.

ANR4783E Command: Node group *node group name* is not defined.

Explanation: Server processing for the command *command* fails because the node group name *node group name* specified does not refer to a defined node group in the server database.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Issue the command again, specifying a node group name that is defined in the server database. For a list of the names of defined node groups in the

server database, issue the QUERY NODEGROUP command.

ANR4784I Node group *node group name* updated.

Explanation: In response to the UPDATE NODEGROUP command, the node group *node group name* has been updated in the server database.

System action: Server operation continues.

User response: None.

ANR4785I Node group *node group name* deleted.

Explanation: In response to the DELETE NODEGROUP command, the node group *node group name* has been deleted from the server database.

System action: Server operation continues.

User response: None.

ANR4786E Command: Node group *node group name* still contains at least one node.

Explanation: Server processing for the delete command *command* fails because the node group *node group name* specified refers to a node group that still contains at least one node. A node group cannot be deleted if one or more client nodes are still assigned to the node group.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: To remove remaining nodes from the node group, issue the DELETE NODEGROUPMEMBER command. After all nodes are removed, issue the delete command again.

ANR4787I Command: number of nodes members defined in the node group *node group name*.

Explanation: A DEFINE NODEGROUPMEMBER command has created the specified number of members in the indicated node group.

System action: None.

User response: None.

ANR4788I Command: number of nodes members deleted from node group *node group name*.

Explanation: A DELETE NODEGROUPMEMBER command has deleted the specified number of members from the indicated node group.

System action: None.

User response: None.

ANR4789I Node *node name* associated to node group *node group name*.

Explanation: This message is displayed in response to the DEFINE NODEGROUPMEMBER command. Node *node name* is associated with the node group name *node group name*.

System action: Server operation continues.

User response: None.

ANR4790I Node *node name* disassociated from node group *node group name*.

Explanation: This message is displayed in response to the DELETE NODEGROUPMEMBER command. Node *node name* is no longer associated with the node group name *node group name*.

System action: Server operation continues.

User response: None.

ANR4791E Command: Node group *node group name* is already defined.

Explanation: Server processing for the command *command* fails because the node group name *node group name* specified refers to a node group that is already defined in the server database.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Issue the command again, specifying a node group name that is not defined in the server database. For a list of the names of defined node groups in the server database, issue the QUERY NODEGROUP command.

ANR4792E MDMP Tape server unable to initialize due to error in LISTENing on port *Port*

Explanation: The server failed in attempting to listen for session requests on the server's internal tape server.

System action: Server operation continues, but NDMP operations may fail.

User response: Ensure that the NDMPCONTROLPORT option defaults to or is set to a port number which is available in the system. The QUERY OPTION command can be used to determine the port number associated with the NDMPCONTROLPORT option. If this value requires change, the server will have to be restarted after setting the option in the server options file.

ANR4793E MDMP Tape server is terminating due to an error in accepting a new session on Port *Port*

Explanation: The server failed in attempting to accept a new session on the server's internal tape server.

System action: Server operation continues, but NDMP operations may fail.

User response: Ensure that the NDMPCONTROLPORT option defaults to or is set to a port number which is available in the system. The QUERY OPTION command can be used to determine the port number associated with the NDMPCONTROLPORT option. If this value requires change, the server will have to be restarted after setting the option in the server options file.

ANR4794E The NAS file server *File server name* failed to open an NDMP data connection to the TSM tape server. Please verify that the file server is capable of outbound data connections.

Explanation: During a NAS filer-to-server backup operation the data connection from the file server to the TSM server failed. This may occur because a firewall exists between the file server and the TSM server and is preventing outbound network connections on the file server. This may also occur if the network configuration of the system running the TSM server is reporting an invalid TCP/IP host address, for example "127.0.0.1".

System action: The TSM server backup operation on the file server fails.

User response: Verify that the NAS file server is capable of starting outbound network connections to the TSM server. Verify that the file server supports NDMP 3-way operations. Verify that the network configuration of the system running the TSM server is reporting a valid TCP/IP host address. .

ANR4795E The TSM tape server failed to open an NDMP data connection to the NAS file server *File server name* .

Explanation: During a NAS filer-to-server restore operation the data connection from the TSM server to the NAS file server failed. This may occur if the NAS file server is not properly configured to support NDMP 3-way restore operations.

System action: The TSM server restore operation on the file server fails.

User response: Verify that the file server supports NDMP 3-way restore operations. .

ANR4796E The TSM tape server failed to open a listening socket for accepting an NDMP data connection from a NAS file server using the network interface *network host name* .

Explanation: During a NAS filer-to-server backup operation the TSM tape server failed to open a TCP/IP socket in order to listen for NDMP data connections from a NAS file server. This may occur if the network interface chosen for NDMP data connections is not running or does not support IP Version 4.

System action: The TSM server backup operation of the file server fails.

User response: Verify that the network interface specified in the NDMPREFDATAINTERFACE server option is properly configured and running. .

ANR4797E Drive *driveName* is missing path information. Please check that all related paths are defined properly.

Explanation: A drive does not have sufficient path information for the operation to complete. This is typically due to a path not being defined.

System action: The server fails the storage operation.

User response: Verify that all applicable paths are defined for the drive. Also verify that the information contained in the paths is correct.

ANR4798E Server-free operation type operation had a target failure. Please refer to accompanying messages and Message Reference Manual for further information.

Explanation: The server-free operation encountered a target failure. This is typically due to one of three conditions: 1. A SCSI error was encountered in either the source, target or datamover. 2. There was a problem with the HBA issuing the SCSI command 3. An I-O error caused the operation to time out.

System action: The server does not complete the server-free operation and attempts to trigger a failover operation by the client.

User response: If a SCSI error was encountered, please refer to the sense information and correct for the indicated problem. If the HBA had an error while issuing command, please refer to the accompanying message for appropriate action. If the operation timed out, please verify the datamover operation and SAN connections.

ANR4799E The server-free operation type from device *source name* through data mover *data mover name* to device *target name* failed after issue.

Explanation: The server-free operation failed after issuing the SCSI command. This might be because the value for the HBA (host bus adapter) scatter-gather list is not large enough.

System action: The server does not perform the server-free operation. The server will attempt either a LAN-free or classic LAN operation.

User response: Perform either, or both, of the following steps to allow server-free operations:

- Change the serverfree batchsize to a lower value.
- Change the MAXIMUMSGLIST value for the HBA within the Windows registry, or run the DSMMAXSG utility to change the MaximumSGList value to 0x41(65) for all HBAs.

ANR4800E The server-free operation from device *source name* through data mover *data mover name* to device *target name* encountered an I/O error. The following information was returned from sense device name: KEY=*Key value* ASC=*Asc value* ASCQ=*Ascq value* SENSE=*Sense info*

Explanation: The server-free process did not complete due to an I/O error.

System action: The server will attempt to recover from the error and if possible retry the server-free data transfer.

User response: The device reference manual provided with the device usually contains tables that explain the values of the KEY, ASC, and ASCQ fields. If the problem persists, contact your device service representative and provide the internal code values and sense data from this message.

ANR4801E The server-free operation from device *source name* through data mover *data mover name* to device *target name* encountered an error. This sense information is typically generated by configuration issues, please verify the device definitions.

Explanation: The server-free process did not complete due to the target being unreachable.

System action: The server will fail the transfer.

User response: For the devices involved in this operation, please verify that the device and path definitions are correct. If this message has been issued after the definitions have been verified, please verify that the hardware is operating correctly and that the data mover can see both target devices.

ANR4802I Password expiration period for node *node name* has been reset.

Explanation: The node's password expiration period has been reset to the common password expiration period.

System action: None.

User response: None.

ANR4803I Password expiration period for administrator *administrator name* has been reset.

Explanation: The administrator's password expiration period has been reset to the common password expiration period.

System action: None.

User response: None.

ANR4804I Node *node name* already uses the common password expiration period.

Explanation: The node's password expiration period is currently set to the common password expiration period.

System action: None.

User response: None.

ANR4805I Administrator *administrator name* already uses the common password expiration period.

Explanation: The administrator's password expiration period is currently set to the common password expiration period.

System action: None.

User response: None.

ANR4806W The password expiration period for node *node name* cannot be reset to the common password expiration period.

Explanation: The node's password expiration period could not be reset to the common password expiration period at this time.

System action: None.

User response: Attempt to reset the node's password expiration period at a later time.

ANR4807W The server is unable to reset *administrator name* password expiration period to the common password expiration period.

Explanation: The administrator's password expiration

period could not be reset to the common password expiration period at this time.

System action: None.

User response: Attempt to reset the node's password expiration period at a later time.

ANR4808W The password expiration period for all administrators and nodes has been reset to the common password expiration period.

Explanation: All administrators not managed by a profile and nodes on this server have had their password expiration period reset to the common password expiration period.

System action: None.

User response: None.

ANR4809I Audit command: Node group *node group name* has the same name as a node. The node group entry must be corrected.

Explanation: During Audit processing, a node group was found with the same name as an existing node. Because FIX=NO has been specified for the command, the node group entry is not corrected.

System action: Audit processing continues.

User response: None.

ANR4810I Audit command: Nodeid *nodeid* found for missing node group *node group name*. The node group entry must be corrected.

Explanation: During Audit processing, a node was found for a node group that does not exist. Because FIX=NO has been specified for the command, the node group entry is not corrected.

System action: Audit processing continues.

User response: None.

ANR4811I Audit command: Nodeid *Node Id* in node group *node group name* does not exist. The node group entry must be corrected.

Explanation: During Audit processing, a node was found in a node group, but the node does not exist. Because FIX=NO has been specified for the command, the node group entry is not corrected.

System action: Audit processing continues.

User response: None.

ANR4812I *Audit command: Nodeid nodeid found in inconsistent node group node group name. The node group entry must be corrected.*

Explanation: During Audit processing, a node was found in a node group that is inconsistent. Because FIX=NO has been specified for the command, the node group entry is not corrected.

System action: Audit processing continues.

User response: None.

ANR4813I *Audit command: Node group node group name has the same name as a node. The node group entry will be corrected.*

Explanation: During Audit processing, a node group was found with the same name as an existing node. Because FIX=YES has been specified for the command, the node group entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4814I *Audit command: Nodeid nodeid found in missing node group node group name. The node group entry will be corrected.*

Explanation: During Audit processing, a node was found for a node group that does not exist. Because FIX=YES has been specified for the command, the node group entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4815I *Audit command: Nodeid Node Id in node group node group name does not exist. The node group entry will be corrected.*

Explanation: During Audit processing, a node was found in a node group, but the node does not exist. Because FIX=YES has been specified for the command, the node group entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4816I *Audit command: Nodeid nodeid found in inconsistent node group node group name. The node group entry will be corrected.*

Explanation: During Audit processing, a node was found in a node group that is inconsistent. Because FIX=YES has been specified for the command, the node group entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4817E *Command Command: Administrator admin is not allowed to issue this command while the system date is suspect. Correct the system date or use the ACCEPT DATE command to establish the current date as valid.*

Explanation: The server has noted that the current system date is suspect. An admin client session may issue the ACCEPT DATE command to establish the current date as valid. No other commands are allowed until the system date is corrected or the current date is established as valid.

System action: The server will fail the command.

User response: If the current system date is not valid, reset the date. Otherwise, use the ACCEPT DATE command to establish the current date as valid on the server. Reissue the command.

Accepting an invalid date can cause any of the following problems:

- Premature deletion of data
 - Excessive retention of data
 - Scheduling problems
 - Event record problems
 - Password expiration problems
-

ANR4818E *The text cannot be formatted and written to the server console. The text is text. Try setting a wider screen width.*

Explanation: For the server command issued, the server is unable to format and write output in table format to the server console. The line width of some text of the output exceeds the size of the window.

System action: The server will not write the output to the console. The server continues operation.

User response: Increase the width of your window and try the command again.

ANR4819E *Session session number for node node name is not authorized to a table of contents session.*

Explanation: A client attempted to work with a table of contents (TOC) session, but the node lacks proper authorization. The server will not perform the request.

System action: The server will not perform the request.

User response: Complete the work using a node with proper authorization.

ANR4820E *Command* **The creation date and creation time are both required to be specified.**

Explanation: The server-free process did not complete due to the target being unreachable.

System action: The server will fail the command.

User response: Reissue the command, specifying both creation date and creation time, or neither of them.

ANR4821E *Command:* **The creation date - date. is not valid**

Explanation: The specified command has been issued with an invalid creation date.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid creation date.

ANR4822E *Command:* **The creation time date is not valid.**

Explanation: The specified command has been issued with an invalid creation time.

System action: Server operation continues, but the command is not processed.

User response: Issue the command with a valid creation time.

ANR4823E **The loading or reading of a table of contents for node *node name*, file space *file space name* failed because sufficient memory is not available.**

Explanation: The server ends a table of contents (TOC) loading or reading for the specified node and file space because sufficient memory is not available on the server.

System action: The TOC loading or reading is ended and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix. Allocating Additional Server Memory".

ANR4824E **The loading or reading of a table of contents for node *node name*, file space *file space name* failed because of a lock conflict.**

Explanation: The server ends a table of contents (TOC) loading or reading for the specified node and file space because the requested resource is already in use by another process.

System action: The TOC loading or reading is ended and server operation continues.

User response: Try the operation again at a later time.

ANR4825E **More than one table of contents is requested but they are not for the same node *node name* and same file space *file space name*.**

Explanation: The server ends a table of contents (TOC) loading for the requested TOCs. The requested TOCs have to be for the same file space in the same node name.

System action: The TOC loading or reading is ended and server operation continues.

User response: Try the TOC loading specifying the TOCs in the same node for the same file space.

ANR4826E **The object for the table of contents is not found in the server for node *node name*, file space *file space name*.**

Explanation: The server ends a table of contents (TOC) loading or reading for the object in the specified node and file space, because the server cannot find the object for the TOC.

System action: The TOC loading or reading is ended and server operation continues. The TOC object could be deleted from the server during server expiration or volume deletion operation.

User response: Make sure a correct TOC object is specified.

ANR4827E **The loading of a table of contents for node *node name*, file space *file space name* failed because a thread resource not available.**

Explanation: The server ends a table of contents (TOC) loading for the specified node and file space because sufficient memory is not available for starting additional processes on the server.

System action: The TOC loading is ended and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix. Allocating Additional Server Memory".

ANR4828E **The loading or reading of a table of contents for node *node name*, file space *file space name* failed because an internal server error was detected.**

Explanation: The server ends a table of contents (TOC) loading or reading for the specified node and file space because an internal logic error is detected.

System action: The TOC loading or reading is ended and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR4829E The loading or reading of a table of contents for node *node name*, file space *file space name* failed. The transaction is stopped.

Explanation: An error was detected during transaction commit. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The table of contents (TOC) loading or reading is ended and server operation continues.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR4830E The loading or reading of a table of contents for node *node name*, file space *file space name* failed. Insufficient mount points are available to satisfy the request.

Explanation: The server was unable to allocate sufficient mount points to read the table of contents (TOC).

System action: The TOC loading or reading is ended and server operation continues.

User response: If necessary, make more mount points available.

ANR4831E The loading or reading of a Table of Contents for node *node name*, file space *file space name* failed. The input volume is already in use.

Explanation: During the TOC loading or reading operation, the requested input volume is already in use by another process.

System action: The TOC loading or reading is ended and server operation continues.

User response: Try the operation again at a later time.

ANR4832E The loading or reading of a table of contents for node *node name*, file space *file space name* failed. The required volume was not mounted.

Explanation: During the table of contents (TOC) loading or reading operation, a required volume cannot

be mounted. The mount request may have been canceled.

System action: The TOC loading or reading is ended and server operation continues.

User response: Try the TOC loading or reading again and make sure the necessary volumes are accessible.

ANR4833W The loading or reading of a table of contents for node *node name*, file space *file space name* failed. The file was deleted from server storage.

Explanation: During the table of contents (TOC) loading or reading operation the file has been deleted from server storage by another process before the loading or reading is complete.

System action: The TOC loading or reading is ended and server operation continues.

User response: Contact your administrator to find out if DELETE FILESPACE, DELETE VOLUME, or inventory expiration processes are running; these processes can delete files in server storage during TOC loading or reading.

ANR4834E The loading or reading of a table of contents for node *node name*, file space *file space name* failed. The data transfer is interrupted.

Explanation: The server ends a table of contents (TOC) loading or reading for the specified node and file space because data transfer to or from data storage was interrupted by an external event.

System action: The TOC reading is ended and server operation continues.

User response: Examine the messages issued prior to this message to determine why the data transfer was interrupted. Attempt the operation again if the problem can be resolved.

ANR4835E The reading of a table of contents for node *node name*, file space *file space name* failed. A data integrity error was detected.

Explanation: The server stops reading a table of contents (TOC) for the specified node and file space because a data integrity has been encountered on the server.

System action: The TOC reading is ended and server operation continues.

User response: Examine the messages issued prior to this message and contact your service representative.

ANR4836E The reading of a table of contents for node *node name*, file space *file space name* failed. There was an error in reading from a device.

Explanation: The server ends a table of contents (TOC) reading for the specified node and file space because an I/O error has been encountered by the server in reading from a device.

System action: The TOC reading is ended and server operation continues.

User response: Examine the messages issued prior to this message that specify the device that is failing. The server may need to be shut down with a HALT command to correct the hardware problem.

ANR4837I The loading for the table of contents for node *node name*, file space *file space name* started.

Explanation: The loading for the table of contents (TOC) in the specified node and file space has been started.

System action: The server operation continues.

User response: None.

ANR4838I The loading for the table of contents for node *node name*, file space *file space name* was successful: total entries loaded *number of entries*.

Explanation: The loading for the table of contents (TOC) in the specified node and file space has been successfully finished.

System action: The server operation continues.

User response: None.

ANR4839E The loading for the table of contents for node *node name*, file space *file space name* failed. See previous messages.

Explanation: The loading for the table of contents (TOC) in the specified node and file space has failed.

System action: The TOC loading is ended and the server operation continues.

User response: Examine the messages issued prior to this message to determine the source of the problem.

ANR4840I The loading for the table of contents for node *node name*, file space *file space name* was cancelled.

Explanation: The loading for the table of contents (TOC) in the specified node and file space has been cancelled by the user.

System action: The TOC loading is ended and the server operation continues.

User response: None.

ANR4841E The loading for the table of contents for node *node name*, file space *file space name* failed. An invalid object type detected.

Explanation: The loading for the table of contents (TOC) in the specified node and file space failed because the object type given is different than the one in the server database.

System action: The TOC loading is ended and the server operation continues.

User response: Re-try the Table of Contents loading, specifying a valid object type.

ANR4842E The loading of a table of contents for node *node name* failed. The file space name was not found.

Explanation: The server ends a table of contents (TOC) loading for the specified node because the server could not find the file space name for the TOC object to be loaded.

System action: The TOC loading is ended and server operation continues.

User response: The file space could be deleted during the TOC loading operation. Issue QUERY FILESPACE command to verify if the file space is deleted. Make sure the correct file space name is specified. You can issue a QUERY FILESPACE to ensure that the file space exists. Re-issue the request with the correct file space name.

ANR4843I Command: **Displayed** *number of objects* objects, *number of errors* errors were encountered.

Explanation: QUERY TOC has completed. The number of objects displayed and the error count are displayed.

System action: The QUERY TOC command ends and server operation continues.

User response: If the error count is not equal to 0, examine the object name displayed. The error count represents the number of objects that have their names displayed as '...'. This is because the conversion from a UTF-8 to a local code page for the file name failed. If this is the case, re-issue the QUERY TOC command with FORMAT=DETAILED. The object name will be displayed in a hexadecimal format when the FORMAT=DETAILED is specified. The file may contain an invalid character and may need to be renamed. A new backup copy has to be made for the renamed file so that the file can be displayed correctly and restored later.

ANR4844I *Command:* **The specified table of contents for node *node name*, file space *file space name* contains no entries.**

Explanation: The specified table of contents (TOC) exists, but it is empty. No entries are displayed.

System action: Server operation continues.

User response: None.

ANR4845E **The writing of the of the table of contents for node *node name*, file space *file space name* failed: a directory path exceeds *max characters* bytes in length. File: *lowLevel name*, NDMP Node ID: *node id hi .node id lo*, NDMP Parent Node ID:*Parent id hi. Parent id lo*.**

Explanation: During a backup of a NAS filesystem, the server received a file history record from the NAS device with a directory path length which exceeded the maximum length supported by ITSM. The server is unable to create a TOC for a NAS filesystem which contains directory that is longer than 1024 bytes. If the TOC parameter on the BACKUP NODE command is PREFERRED, the backup continues. If the TOC parameter was YES, the backup fails.

System action: The TOC creation is ended and server operation continues.

User response: If TOC=YES was specified on the BACKUP NODE command, retry the command with TOC=NO.

ANR4846E *Operation process process ID terminated -* **The server is unable to create a table of contents for node *node name*, file space *file space*.**

Explanation: While attempting to create a table of contents (TOC) for the specified node and file space in the indicated TOC destination pool, a failure occurred.

System action: The operation fails because TOC creation is set to YES.

User response: Look for previous messages giving a specific reason for the failure. Take corrective action as appropriate.

ANR4847I *Audit command:* **Invalid nodeid *nodeid* found during email address audit. The email entry must be corrected.**

Explanation: During Audit processing, a non-existent nodeid was found associated with an email address. Because FIX=NO has been specified for the command, the email address entry is not corrected.

System action: Audit processing continues.

User response: None.

ANR4848I *Audit command:* **An email address associated with node *node name* is invalid. The email entry must be corrected.**

Explanation: During Audit processing, an invalid email address was found for the specified node. Because FIX=NO has been specified for the command, the email address entry is not corrected.

System action: Audit processing continues.

User response: None.

ANR4849I *Audit command:* **Invalid nodeid *nodeid* found during email address audit. The email entry will be corrected.**

Explanation: During Audit processing, a non-existent nodeid was found associated with an email address. Because FIX=YES has been specified for the command, the email address entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4850I *Audit command:* **An email address associated with node *node name* is invalid. The email entry will be corrected.**

Explanation: During Audit processing, an invalid email address was found for the specified node. Because FIX=YES has been specified for the command, the email address entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4851I *Audit command:* **Invalid adminid *admin id* found during email address audit. The email entry must be corrected.**

Explanation: During Audit processing, a non-existent adminid was found associated with an email address. Because FIX=NO has been specified for the command, the email address entry is not corrected.

System action: Audit processing continues.

User response: None.

ANR4852I *Audit command:* **An email address associated with administrator *administrator* is invalid. The email entry must be corrected.**

Explanation: During Audit processing, an invalid email address was found for the specified administrator. Because FIX=NO has been specified for the command, the email address entry is not corrected.

System action: Audit processing continues.

User response: None.

ANR4853I *Audit command: Invalid adminid adminid found during email address audit. The email entry will be corrected.*

Explanation: During Audit processing, a non-existent adminid was found associated with an email address. Because FIX=YES has been specified for the command, the email address entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4854I *Audit command: An email address associated with administrator administrator is invalid. The email entry will be corrected.*

Explanation: During Audit processing, an invalid email address was found for the specified administrator. Because FIX=YES has been specified for the command, the email address entry is deleted.

System action: Audit processing continues.

User response: None.

ANR4855I *Command command subcommand is no longer supported and there is no direct replacement for this capability.*

Explanation: The functions that were provided by this command are no longer necessary.

System action: System operation continues.

User response: Review information about product changes in the IBM Tivoli Storage Manager Information Center.

ANR4856I *Command command subcommand is no longer supported. The following commands provide similar functions: newcommand. See the Tivoli Storage Manager Information Center for details on commands, or issue HELP command for the replacement commands.*

Explanation: The functions formerly provided by this command are now provided by one or more new commands

System action: System operation continues.

User response: Review information about product changes in the IBM Tivoli Storage Manager Information Center.

ANR4857I *Command command subcommand is no longer supported. The following options provide similar functions: newoptions. See the Tivoli Storage Manager Information Center for details on the options or issue the HELP command for the replacement options.*

Explanation: The functions formerly provided by this command are now provided by one or more new options

System action: System operation continues.

User response: Review information about product changes in the IBM Tivoli Storage Manager Information Center.

ANR4858I *Option option name is no longer supported and there is no direct replacement for this capability.*

Explanation: The functions formerly provided by this option are no longer necessary

System action: System operation continues.

User response: Review information about product changes in the IBM Tivoli Storage Manager Information Center.

ANR4859I *Parameter parameter name on the command command name is no longer supported.*

Explanation: The function that was provided by this parameter is no longer necessary

System action: System operation continues.

User response: Review information about product changes in the IBM Tivoli Storage Manager Information Center.

ANR4860W *The correct value of ARCHRETENTION for domain domain name will not be sent to the managed servers. Please upgrade the managed servers to be at least the same level as that of the configuration manager.*

Explanation: The configuration manager has an ARCHRETENTION value that is greater than the managed server can manage. This is because the managed server is at a lower level than the configuration manager. The value of the ARCHRETENTION for the indicated domain is set to the maximum value that the managed server can process.

System action: The server operation continues.

User response: To correctly send the value of the ARCHRETENTION to the managed servers, please

upgrade the managed servers to at least the same level as that of the configuration manager.

ANR4861W The correct value of RETVER for the archive copy group *domain name policy set name mgmt class name cg name* will not be sent to the managed servers. Upgrade the managed servers to at least the same level as that of the configuration manager.

Explanation: The configuration manager has a RETVER value that is greater than what the managed server can process. This is because the managed server is at a lower level than the configuration manager. The value of the RETVER for the indicated copy group is set to NOLIMIT in the managed server.

System action: The server operation continues.

User response: To correctly send the value of RETVER for the copy group to the managed servers, please upgrade the managed servers to at least the same level as that of the configuration manager.

ANR4862W The value of the ACTIVEDESTINATION parameter for domain *domain name* will not be sent to the managed server *server name* because the release level of the managed server is earlier than the release level of the configuration manager.

Explanation: The configuration manager has a value for the ACTIVEDESTINATION parameter that contains active-data storage pool names that cannot be managed by the managed server. The problem is that the release level of the managed server is earlier than release level of the configuration manager.

System action: The server operation continues.

User response: Upgrade the managed server to the same release level or later than that of the configuration manager.

ANR4863W The value of the ACTIVEDESTINATION parameter for domain *domain name* that was received from the configuration manager will not be used on the managed server.

Explanation: The received value of the ACTIVEDESTINATION parameter contains active-data storage pool IDs that cannot be managed by the managed server. The problem is that the release level of the configuration manager is earlier than the release level of the managed server.

System action: The server operation continues.

User response: Upgrade the configuration manager to the same release level or later than that of the managed server.

ANR4864E The *module name* support module was not loaded.

Explanation: The indicated support module was not loaded.

System action: The server cannot perform functions that require this module.

User response: Restart the Tivoli Storage Manager server and retry the operation. If the support module does not load, contact your service representative.

ANR4870W Audit command: Storage pool *storage pool name*, specified as a Table of Contents (TOC) destination for copy group *copy group name* in management class *management class name*, policy set *set name*, domain *domain name*, does not exist.

Explanation: A database audit process finds a storage pool specified for the Table of Contents (TOC) destination of the specified copy group that is not defined in the server database. If this copy group is used in an active policy set, then the NDMP backup with a TOC creation operation may fail when attempting to put TOC entries in the destination.

System action: Audit processing continues.

User response: After the audit command completes, use the DEFINE STGPOOL command to define the missing storage pool, or the UPDATE COPYGROUP command to update the copy group to refer to an existing storage pool.

ANR4871I Collocation group *collocation group name* defined.

Explanation: A DEFINE COLLOGROUP command has created the collocation group indicated.

System action: None.

User response: None.

ANR4872E Command: Invalid collocation group name - *collocation group name*.

Explanation: Server processing for the command *command* fails because the collocation group name *collocation group name* specified does not contain valid characters or contains too many characters.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Issue the command again and specify a collocation group name that conforms to the name requirements. For information on the character and length specifications for valid collocation group names,

refer to the *Administrator's Reference*.

ANR4873E *Command: Collocation group description exceeds maximum length of length limit characters.*

Explanation: Server processing for the command *command* fails because the collocation group description specified is longer than the *length limit* number of characters allowed.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Issue the command again and specify a shorter collocation group description.

ANR4874I *Collocation group collocation group name updated.*

Explanation: In response to the UPDATE COLLOCGROUP command, the collocation group *collocation group name* has been updated in the server database.

System action: Server operation continues.

User response: None.

ANR4875I *Collocation group collocation group name deleted.*

Explanation: In response to the DELETE COLLOCGROUP command, the collocation group *collocation group name* has been deleted from the server database.

System action: Server operation continues.

User response: None.

ANR4876W *Command: Node node name cannot be processed because it is not registered.*

Explanation: This command cannot be processed for the indicated node. The node is not registered. The other nodes can be processed if specified by the command.

System action: The indicated node is not processed, but other nodes can be processed if specified by this command.

User response: If the node name was entered incorrectly, issue the command again with the correct node name.

ANR4877E *Command: Collocation group collocation group name is not defined.*

Explanation: Server processing for the command *command* fails because the collocation group name *collocation group name* specified does not refer to a defined collocation group in the server database.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: Issue the command again, specifying a collocation group name that is defined in the server database. For a list of the names of defined collocation groups in the server database, issue the QUERY COLLOCGROUP command.

ANR4878I *Command: number of nodes members defined in the collocation group collocation group name.*

Explanation: A DEFINE COLLOCMEMBER command has created the specified number of members in the indicated collocation group.

System action: None.

User response: None.

ANR4879I *Command: number of nodes members deleted from collocation group collocation group name.*

Explanation: A DELETE COLLOCMEMBER command has deleted the specified number of members from the indicated collocation group.

System action: None.

User response: None.

ANR4880I *Node node name disassociated from collocation group collocation group name.*

Explanation: This message is displayed in response to the DELETE COLLOCMEMBER command. Node *node name* is no longer associated with the collocation group name *collocation group name*.

System action: Server operation continues.

User response: None.

ANR4881E *Command: Collocation group collocation group name is already defined.*

Explanation: Server processing for the command *command* fails because the collocation group name *collocation group name* specified refers to a collocation group that is already defined in the server database.

System action: Database changes for the command are rolled back and server operation continues. The

command is not successful in changing the server database.

User response: Issue the command again, specifying a collocation group name that is not defined in the server database. For a list of the names of defined collocation groups in the server database, issue the QUERY COLLOCGROUP command.

ANR4882E *Command: Collocation group collocation group name still contains at least one node.*

Explanation: Server processing for the delete command *command* fails because the collocation group *collocation group name* specified refers to a collocation group that still contains at least one node. A collocation group cannot be deleted if one or more client nodes are still assigned to the collocation group.

System action: Database changes for the command are rolled back and server operation continues. The command is not successful in changing the server database.

User response: To remove remaining nodes from the collocation group, issue the DELETE COLLOCMEMBER command. After all nodes are removed, issue the delete command again.

ANR4883I *Node node name associated to collocation group collocation group name.*

Explanation: This message is displayed in response to the DEFINE COLLOCMEMBER command. Node *node name* is associated with the collocation group name *collocation group name*.

System action: Server operation continues.

User response: None.

ANR4884W *Node node name already associated to collocation group collocation group name.*

Explanation: This message is displayed in response to the DEFINE COLLOCMEMBER command. Node *node name* is already associated with the collocation group name *collocation group name*. The indicated node is not processed. The other nodes can be processed if specified by the command.

System action: Server operation continues.

User response: If the node name was entered incorrectly, issue the command again with the correct node name.

ANR4885E *Command: Either node name or collocation group name must be specified.*

Explanation: The indicated command failed because neither node name nor collocation group name is

specified or the node name and the collocation group name both are specified.

System action: The indicated command fails. The server operation continues.

User response: Issue the command again, by specifying either the node name or the collocation group name.

ANR4886E *Audit command: A missing or incorrect collocation group id has been detected for node node id.*

Explanation: A database audit process detects missing or incorrect collocation group identifier for the specified node member.

System action: Audit processing continues.

User response: Issue the audit command again, and specify FIX=YES so that the error can be corrected.

ANR4887E *Audit command: A missing or incorrect collocation group id has been detected for node node id - it will be corrected.*

Explanation: A database audit process detects missing or incorrect collocation group identifier for the specified node member. Because FIX=YES has been specified for the audit command, the error will be corrected.

System action: Audit processing continues.

User response: None.

ANR4888E *Audit command: Collocation group global high-water mark does not match the identifier in use.*

Explanation: A database audit process finds the attribute used to track collocation group identifiers are incorrect.

System action: Audit processing continues.

User response: Issue the audit command again, and specify FIX=YES so that the error can be corrected.

ANR4889E *Audit command: Collocation group global high-water mark does not match the identifiers in use; it will be corrected.*

Explanation: A database audit process finds the attributes used to track collocation group identifiers are incorrect. Because FIX=YES has been specified for the audit command, the attributes will be corrected.

System action: Audit processing continues.

User response: None.

ANR4890I *Audit command: Inventory name object (name.ID) belonging to node NodeId and filesystem FilespaceId has a missing database element. It will be corrected if FIX=YES was specified for the DSMSERV AUDITDB command.*

Explanation: A database audit process found an inventory name object that is incomplete. If FIX=YES has been specified for the command, the inventory entry will be corrected.

System action: Audit processing continues.

User response: None.

ANR4891I *Audit command: Inventory name reverse lookup object (name.ID) belonging to node NodeId and filesystem FilespaceId has a missing database element. It will be corrected if FIX=YES was specified for the DSMSERV AUDITDB command.*

Explanation: A database audit process found an inventory name object that is incomplete. If FIX=YES has been specified for the command, the inventory entry will be corrected.

System action: Audit processing continues.

User response: None.

ANR4892I *Audit command: Inventory name object (name.ID) belonging to node NodeId and filesystem FilespaceId has a missing parent element. If FIX=YES was specified for the DSMSERV AUDITDB command, the name entry will be related to the root directory for the file space.*

Explanation: A database audit process found an inventory name object that has no parent entry. To ensure that the object is restorable, the entry will be linked to the root directory for the file space if FIX=YES was specified for the DSMSERV AUDITDB command. The user should query the server to determine which objects have been moved to the root directory. The next backup operation from the client will create objects with the correct path name.

System action: Audit processing continues.

User response: None.

ANR4893I *Audit command: An inventory backup object corresponding to name ID nameId belonging to node NodeId and filesystem FilespaceId has a missing name. If FIX=YES was specified for the DSMSERV AUDITDB command, the name entry will be related to the root directory as object name for the file space.*

Explanation: A database audit process found an inventory backup object that has no name entry. To ensure that the object is restorable, the entry will be linked to the root directory for the file space if FIX=YES was specified for the DSMSERV AUDITDB command. The user should query the server to determine which objects have been moved to the root directory. The next backup operation from the client will create objects with the correct path name.

System action: Audit processing continues.

User response: None.

ANR4894I *Audit command: Auditing inventory names.*

Explanation: This message is displayed during a database audit and indicates that server information about client backup object names is currently being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR4895E *Deduplicated bitfile bitfile id on volume volname has invalid links.*

Explanation: While reading a deduplicated bitfile, the server detected invalid deduplication information.

System action: If the operation is a server data movement, the inconsistent bitfile is marked invalid and skipped, but the operation continues. If, however, the operation is a client restore or retrieve, the bitfile is marked as damaged.

User response: If the volume is in a primary storage pool, run a RESTORE VOLUME command to fix the invalid bitfile. If the volume is in a copy storage pool, run a DELETE VOLUME DISCARDATA=YES command to delete the volume, then backup the primary storage pool again.

To see what files may have been marked as damaged, use the QUERY CONTENT DAMAGED=YES command.

ANR4896I *Inventory client file expiration is restarting process process num from startdate.*

Explanation: The server is in the process of restarting a previously cancelled expiration process.

System action: The server will continue expiring eligible objects.

User response: None.

ANR4912I Database restore type byte count.

Explanation: A database restore is in progress.

System action: None.

User response: None.

ANR4913I Database restore completed for restore to date *date time*. No backup volume found.

Explanation: A point-in-time database restore has been completed without finding any backup volumes.

System action: None.

User response: None.

ANR4914I Point-in-time database restore completed, no backup volume found for restore date *date time*.

Explanation: A point-in-time database restore with the TODATE parameter specified has completed without finding any backup volumes.

System action: None.

User response: None.

ANR4915I Point-in-time database restore with snapshot completed, no snapshot volume found for restore date *date time*.

Explanation: A snapshot database restore with the TODATE parameter specified has completed without finding any snapshot volumes.

System action: None.

User response: None.

ANR4916I Starting point-in-time database restore snapshot to date *date time*.

Explanation: A point-in-time database restore with the TODATE parameter and source snapshot specified has begun. When this restore is complete, the database will be committed to the point in time of this backup.

System action: None.

User response: None.

ANR4917I Point-in-time database restore with snapshot complete, restore date *date time*.

Explanation: A point-in-time database restore with the TODATE parameter specified has completed. The database is committed to the point in time of this backup, which may be different than the TODATE specified. If this is the case, an additional message will be displayed.

System action: None.

User response: None.

ANR4918W The filespace *filespace name (filespace id)* for node *node name* will not be included in the backupset *backupset name (data type data type)* because it was not created by the backup/archive client and cannot be restored from the backupset.

Explanation: Data from the filespace will not be included in the backupset because the filespace was not created by the backup/archive client and it cannot be restored from the backupset.

System action: The filespace is skipped.

User response: None.

ANR4919W The filespace *filespace name (filespace id)* for node *node name* will not be included in the backupset *backupset name (data type data type)* because it is not a supported application type.

Explanation: Data from the filespace will not be included in the backupset because the filespace does not belong to a supported application type.

System action: The filespace is skipped.

User response: None.

ANR4920E Command: Administrator *administrator name* is not authorized to issue this command for storage pool *pool name*.

Explanation: The specified administrator has entered the indicated command, but this administrator does not have the proper authority necessary to run the command for the indicated pool. The indicated pool could be the storage pool being migrated or being reclaimed, or the storage pool to which files are migrated or reclaimed.

System action: The server does not process the command.

User response: Issue the command from a properly authorized administrator ID, or contact the system administrator to have additional authority granted to the current administrator ID.

ANR4921E Command: Primary storage pool *pool name* does not have a target pool.

Explanation: The specified primary storage pool does not have a target storage pool for the specified operation.

System action: The server does not process the command.

User response: Define a target storage pool for the

pool specified on the command and re-issue the command.

ANR4922E *Command: Migration is currently running for the storage pool *pool name*.*

Explanation: The migration operation is already running for the specified storage pool.

System action: The server does not process the command.

User response: Re-issue the command when migration is not running.

ANR4923E *Command: Reclamation is currently running for the storage pool *pool name*.*

Explanation: The reclamation operation is already running for the specified storage pool.

System action: The server does not process the command.

User response: Re-issue the command when reclamation is not running.

ANR4924I *Command: Migration is not needed for the storage pool *pool name*.*

Explanation: Either the current percentage utilization of the specified storage pool is less than the low migration threshold or the number of volumes containing data has not reached the low migration threshold.

System action: The server does not process the command.

User response: Re-issue the command when migration is needed for the pool.

ANR4925W *Migration process *process ID* terminated for storage pool *storage pool name* - duration exceeded.*

Explanation: During migration for the indicated storage pool, a process performing the migration has been terminated because the migration duration has exceeded.

System action: The migration process is terminated.

User response: None.

ANR4926W *Migration terminated for volume *volume name* - duration exceeded.*

Explanation: During migration for the indicated volume, the duration for the migration has been exceeded.

System action: The volume migration is terminated.

User response: None.

ANR4927W *Reclamation terminated for volume *volume name* - duration exceeded.*

Explanation: During reclamation for the indicated volume, the duration for the reclamation has been exceeded.

System action: The volume reclamation is terminated.

User response: None.

ANR4928E *Command: Reclamation is not allowed for the storage pool *pool name*.*

Explanation: The high reclamation threshold (percentage) is set to 100 to prevent reclamation for the specified storage pool.

System action: The server does not process the command.

User response: Re-issue the command when migration is needed for the pool.

ANR4929E *Command: The storage pool *pool name* is not a sequential-access pool.*

Explanation: The specified storage pool is not a sequential-access storage media for the specified operation. The specified operation only applies to a sequential-access storage media.

System action: The server does not process the command.

User response: Re-issue the command for a sequential-access storage media.

ANR4930I *Reclamation process *process ID* started for primary storage pool *storage pool name* automatically or manually, threshold=*threshold value*, duration=*duration*.*

Explanation: Because the high reclamation threshold for the storage pool shown has been exceeded, a process has been started to reclaim files from the storage pool. Note: a duration value of None means that the duration is not specified and hence the reclamation runs without duration.

System action: Data is moved from this storage pool to the same pool or to the reclaim storage pool.

User response: None.

ANR4931I *Reclamation process *process ID* started for copy storage pool *storage pool name* automatically or manually, threshold=*threshold value*, offsiteRclmLimit=*limit value*, duration=*duration*.*

Explanation: Because the high reclamation threshold

for the storage pool shown has been exceeded, a process has been started to reclaim files from the storage pool. Note: a duration value of None means that the duration is not specified and hence the reclamation runs without duration.

System action: Data is moved from this storage pool to the same pool or to the reclaim storage pool.

User response: None.

ANR4932I Reclamation process *process ID* ended for storage pool *storage pool name*.

Explanation: A reclamation process for the named storage pool ends. This action can occur because the threshold for the storage pool has been reached or because the duration has been exceeded.

System action: None.

User response: None.

ANR4933I Space reclamation ended for offsite volume *volume name*.

Explanation: Space reclamation for the named offsite volume is complete.

System action: None.

User response: None.

ANR4934I Offsite reclamation ended for storage pool *pool name*, Number Processes *number of processes*, Number Volumes Reclaimed *number of volume reclaimed*, Elapsed Time *seconds seconds*.

Explanation: Offsite reclamation ended successfully.

System action: None.

User response: None.

ANR4935I Migration of primary storage pool *primary pool name* has ended. Files migrated: *number of files*, Bytes migrated: *number of bytes*, Unreadable Files: *number of unreadable files*.

Explanation: Migration processing for the specified storage pool has ended with the results shown.

System action: None.

User response: Examine previous messages to determine whether all migration processes ended successfully.

ANR4936I Reclamation of storage pool *pool name* has ended. Files reclaimed: *number of files*, Bytes reclaimed: *number of bytes*, Files reconstructed: *number of reconstructed files*, Unreadable files: *number of unreadable files*.

Explanation: Reclamation processing for the specified storage pool has ended with the results shown.

System action: None.

User response: Examine previous messages to determine whether all reclamation processes ended successfully.

ANR4937E Command: Reclamation will not run - delete filesystem is currently running.

Explanation: A delete filesystem operation is running. To Avoid the resource contention, reclamation will not run when delete filesystem is running.

System action: The server does not process the command.

User response: Re-issue the command when delete filesystem is not running.

ANR4938E Command: Administrator *administrator name* is not authorized to issue this command for target storage pool *pool name*.

Explanation: The specified administrator has entered the indicated command, but this administrator does not have the proper authority necessary to run the command for the indicated pool. The indicated pool is the pool that to which files are migrated or reclaimed.

System action: The server does not process the command.

User response: Issue the command from a properly authorized administrator ID, or contact the system administrator to have additional authority granted to the current administrator ID.

ANR4939E Command: The "*option*" option is not valid for a DISK storage pool.

Explanation: The command indicated specifies an option that is not valid for a DISK storage pool.

System action: The server does not process the command.

User response: Reissue the command with options appropriate for a DISK storage pool.

ANR4940E Reclamation is ended for storage pool *storage pool name*. There is an insufficient number of mount points available for removable media.

Explanation: During reclamation for the indicated storage pool the server could not allocate sufficient mount points in the storage pool.

System action: Reclamation stops.

User response: If necessary, make more mount points available.

ANR4941E The server is unable to translate the Unicode name while building table of contents for node *node name*, file space *file space name*, Unicode name *unicode name* node identifier *node id*, parent node identifier *parent node id*. Table of contents creation fails.

Explanation: While creating a table of contents (TOC) for a Network Appliance file server, the TSM server attempted to translate the Unicode name in the file history message from UCS-2 to UTF-8. The translation failed.

System action: The TOC creation fails.

User response: Verify that the required support for translations between UCS-2 and UTF-8 is properly installed and configured on the system where the Tivoli Storage Manager is running.

Verify that the reported Unicode name is valid. Note that the Unicode name is encoded in little-endian UCS-2 and is reported in hexadecimal notation. If the Unicode name is not valid, the problem may usually be corrected by deleting or renaming the corresponding file or directory on the Network Appliance file server. The node identifier and parent node identifier are provided by the Network Appliance NDMP server. Their values are NDMP-server implementation dependent but will typically be the inode number of the file or directory. For more information about the Unicode name or the node identifiers, including using them to locate and correct the invalid file or directory, contact Network Appliance for support.

If possible, configure the Network Appliance file server to always encode file and directory names as UTF-8. For additional information about using international characters with Network Appliance file servers, see the :cit.ADSM Administrator's Guide:ecit. for your particular platform.

Once the problem has been corrected, try the operation again.

ANR4942E *Command: Volume Volume Name is not defined. The file name doesn't exist or has no space.*

Explanation: A define volume command was issued for the indicated volume name. The volume name was specified without the FORMATSIZ parameter, but was found to either not exist, or to exist but as a file of size 0.

System action: Volume definition fails.

User response: Either use the FORMATSIZ parameter to have the server pre-allocate space for the new volume, or use the dsmfmt utility prior to specifying the DEFINE VOLUME command so that the volume has space pre-allocated.

ANR4943E *Command: Volumes cannot be deleted from RECLAMATIONTYPE=SNAPLOCK storage pools.*

Explanation: Deleting volumes from RECLAMATIONTYPE=SNAPLOCK storage pools is not allowed. Rather, deletion of empty volumes occurs automatically during reclamation processing.

System action: The operation fails.

User response: Allow deletion of empty volumes to be done automatically during reclamation processing.

ANR4944E *Command: Volumes cannot be defined in RECLAMATIONTYPE=SNAPLOCK storage pools.*

Explanation: Defining volumes on RECLAMATIONTYPE=SNAPLOCK storage pools is not allowed. Rather, the MAXSCRATCH parameter on the DEFINE and UPDATE STGPOOL commands is used to make storage pool space available for these storage pools.

System action: The operation fails.

User response: Use the MAXSCRATCH parameter on the DEFINE and UPDATE STGPOOL commands to create space in the storage pool.

ANR4945E *Command: The volume named volume name is larger than is allowed for a volume on your system.*

Explanation: While attempting to define a volume on volume name the server detected that the volume size exceeds the maximum allowed.

System action: The operation fails.

User response: Consider defining 2 smaller volumes.

ANR4946W The character encoding of NDMP file history messages for node *node name*, file system *file system name* is unknown. The Tivoli Storage Manager server will use the UTF-8 encoding to build a table of contents.

Explanation: While initializing a backup with a table of contents (TOC) for the specified node and file system, the TSM server determines that the character encoding of file history information from the NAS file server is unknown. The Tivoli Storage Manager server will assume file history information is encoded as UTF-8 in order to build a TOC.

If the character encoding is not UTF-8 and non-English characters are present, the names will be improperly displayed and probably unreadable, making recovery difficult.

System action: The operation continues.

User response: Verify that the encoding of file history information is UTF-8. For Network Appliance NAS file servers, verify that the volume language for the specified node and file space is UTF-8, or a subset of UTF-8 (for example 7-bit ASCII).

ANR4947E The server is unable to translate the Unicode path name while building table of contents for node *node name*, file space *file space name*. Table of contents creation fails.

Explanation: While creating a table of contents (TOC), the server attempted to translate the Unicode path name in the file history message from UCS-2 to UTF-8. The translation failed.

System action: The TOC creation fails.

User response: Verify that the required support for translations between UCS-2 and UTF-8 is properly installed and configured on the system where the Tivoli Storage Manager is running. Try the operation again.

ANR4948E The list file named *list file name* contains more than *max entry count* entries.

Explanation: While reading a list file, the server detects that the number of entries exceeds the maximum allowed.

System action: The operation fails.

User response: Consider breaking up the operation into multiple commands, each handling a subset of the required entries.

ANR4949E The server is unable to write to table *table name* because there is not enough temporary space in the database. Table of contents operation for node *node name*, file space *file space name* fails.

Explanation: While operating on a table of contents (TOC), the server attempted to insert data into the specified temporary database table, but there is not enough temporary space in the server's database.

System action: The TOC operation fails.

User response: Ensure that sufficient temporary space is available in the server's database. To increase the amount of database space available to the server, an authorized administrator can add database volumes by using the DEFINE DBVOLUME command, and extend the size of the database by using the EXTEND DB command.

ANR4950E The server is unable to retrieve NDMP file history information while building table of contents for node *node name*, file space *file space name*. NDMP node ID is *NDMP node ID*. Table of contents creation fails.

Explanation: While creating a table of contents (TOC), the server attempted to retrieve information contained in a previous NDMP file history message. The information was not found. This could be caused by a problem with the NAS file server that is sending file history messages. The NDMP node ID reported in the message is the node ID referenced in the current NDMP file history message.

System action: The TOC creation fails.

User response: Verify that the NDMP server is properly sending file history information. Otherwise, contact your service representative.

ANR4951E The writing of a table of contents for node *node name*, file space *file space name* failed. The object is excluded from storage pool *pool name* and all successor pools because of its size.

Explanation: The server ends a table of contents (TOC) creation for the specified node. The size of the TOC is larger than that allowed in the storage pool specified by the TOC destination attribute of the assigned management class backup copy group. No successor storage pools to the one specified on the copy group can accept the large TOC.

System action: The TOC creation is ended and server operation continues.

User response: Increase the maximum file size for one or more of the storage pools in the storage hierarchy to accommodate the TOC. An authorized administrator can increase the MAXSIZE parameter by issuing the

UPDATE STGPOOL command.

ANR4952E The writing of a table of contents for node *node name*, file space *file space name* failed. No space is available in storage pool *pool name* and all successor pools.

Explanation: The server ends a table of contents (TOC) creation for the specified node. The storage pool specified by the TOC destination attribute of the backup copy group in the assigned management class does not contain enough free space to hold the TOC. No successor storage pools to the one specified on the copy group contain enough free space.

System action: The TOC creation is ended and server operation continues.

User response: An authorized administrator can issue the DEFINE VOLUME command to add storage to one or more storage pools in the storage hierarchy. This action may also involve creating storage space by using an operating system-specific utility.

ANR4953E The writing of a table of contents for node *node name*, file space *file space name* failed. The server encountered an error when writing to the storage device.

Explanation: The server ends a table of contents (TOC) creation for the specified node because an I/O error has been encountered by the server in writing to a device.

System action: The TOC creation is ended and server operation continues.

User response: Query the activity log to find messages preceding this one that specify the failing device. Storage pool volumes can be varied offline (by using the VARY command), or the server may need to be halted to correct the hardware problem. After the problem is corrected, try the operation again.

ANR4954E The writing of a table of contents for node *node name*, file space *file space name* failed. The data transfer was interrupted.

Explanation: The server ends a table of contents (TOC) creation for the specified node because data transfer to or from data storage was interrupted by an external event.

System action: The TOC creation is ended and server operation continues.

User response: Examine the messages issued prior to this message to determine why the data transfer was interrupted. Attempt the operation again if the problem can be resolved.

ANR4955E The writing of a table of contents for node *node name*, file space *file space name* failed. The storage media is not available.

Explanation: The server ends a table of contents (TOC) creation for the specified node because storage volumes are not available in the storage pools in which the TOC is to be stored.

System action: The TOC creation is ended and server operation continues.

User response: An authorized administrator can issue the DEFINE VOLUME command to add storage to one or more storage pools in the storage hierarchy. The VARY ONLINE command can be used to vary offline storage volumes online in the storage hierarchy to make them available for TOC storage.

ANR4956E The writing of a table of contents for node *node name*, file space *file space name* failed. The server does not have sufficient recovery log space.

Explanation: The server ends a table of contents (TOC) creation for the specified node because sufficient log space is not available on the server.

System action: The TOC creation is ended and server operation continues.

User response: An authorized administrator can issue the DEFINE LOGVOLUME command to add volumes for use by the log, and can issue the EXTEND LOG command to extend the size of the log so that the new volumes are used.

ANR4957E The writing of a table of contents for node *node name*, file space *file space name* failed. The server does not have sufficient database space.

Explanation: The server ends a table of contents (TOC) creation for the specified node because sufficient database space is not available on the server.

System action: The TOC creation is ended and server operation continues.

User response: An authorized administrator can issue the DEFINE DBVOLUME command to add volumes for use by the database. Also, an administrator can issue the EXTEND DB command to extend the size of the database so that the new volumes are used.

ANR4958E The writing of a table of contents for node *node name*, file space *file space name* failed. The server is unable to start a new thread.

Explanation: The server ends a table of contents (TOC) creation for the specified node because sufficient

memory is not available for starting additional processes on the server.

System action: The TOC creation is ended and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online, or see “Appendix. Allocating Additional Server Memory”.

ANR4959E The writing of a table of contents for node *node name*, file space *file space name* failed. The server does not have sufficient memory.

Explanation: The server ends a table of contents (TOC) creation for the specified node because sufficient memory is not available on the server.

System action: The TOC creation is ended and server operation continues.

User response: Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online, or see “Appendix. Allocating Additional Server Memory”.

ANR4960E The writing of a table of contents for node *node name*, file space *file space name* failed. The server detected an internal error.

Explanation: The server ends a table of contents (TOC) creation for the specified node because an internal logic error is detected.

System action: The TOC creation is ended and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR4961E The writing of a table of contents for node *node name*, file space *file space name* failed. The server could not commit the transaction.

Explanation: An error was detected during transaction commit. This message should be preceded by other messages that give additional information about the failed transaction.

System action: The table of contents (TOC) creation is ended and server operation continues.

User response: Check for additional messages and eliminate the condition that caused the failed transaction. If the error cannot be isolated and resolved, contact your service representative.

ANR4962E The writing of a table of contents for node *node name*, file space *file space name* failed. The server does not have sufficient mount points available to satisfy the request.

Explanation: The server was unable to allocate sufficient mount points to write the table of contents (TOC).

System action: The TOC creation is ended and server operation continues.

User response: If necessary, make more mount points available.

ANR4963E The writing of a table of contents for node *node name*, file space *file space name* failed. See previous messages.

Explanation: The server ends a table of contents (TOC) creation for the specified node because a previous error has occurred.

System action: The TOC creation is ended and server operation continues.

User response: Examine the server messages issued prior to this message to determine the source of the error. Issue the QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR4964I Space reclamation deleted *number of volumes* WORM FILE volumes for storage pool *storage pool name*.

Explanation: During reclamation for the indicated storage pool, the server deleted the indicated number of empty WORM FILE volumes that have exceeded their retention date.

System action: Reclamation and server operations continue.

User response: None.

ANR4965E operation is ended for storage pool *storage pool name*. Sufficient database space is not available.

Explanation: Insufficient server database space has been encountered during the indicated operation for the indicated storage pool.

System action: Either the Migration or Reclamation stops, or the operation specified in the message stops.

User response: To increase the amount of database space available to the server, an authorized administrator can add database volumes using the DEFINE DBVOLUME command and can extend the size of the database using the EXTEND DB command.

ANR4966E *operation is ended for storage pool storage pool name; sufficient recovery log space is not available.*

Explanation: Insufficient server recovery log space has been encountered during the indicated operation for the indicated storage pool.

System action: Either the Migration or Reclamation stops, or the operation specified in the message stops.

User response: To increase the amount of recovery log space available to the server, an authorized administrator can add log volumes using the DEFINE LOGVOLUME command and can extend the size of the log volumes using the EXTEND LOG command.

ANR4967W *Expired WORM FILE volume volume name still contains valid data; data will not be protected.*

Explanation: During space reclamation, the server detected the retention of the indicated WORM FILE volume has expired but the volume still contains valid data. The data on the volume will not be protected.

System action: Reclamation continues.

User response: Examine the server activity logs to find out why the reclamation does not move the valid data to another WORM FILE volume for protection.

ANR4968W *Reclamation failed on WORM FILE volume volume name.*

Explanation: During space reclamation, server failed to move the files from the indicated WORM FILE volume. The files on the volume might not be protected if the reclamation period is exceeded.

System action: Reclamation continues on other volumes.

User response: Examine the server activity logs to find out why the reclamation does not move the valid data to another WORM FILE volume for protection. To determine when the reclamation period is expired, issue a QUERY VOLUME command for the indicated volume.

ANR4969W *Conversion from the server code page to UTF-8 fails. Verify the installation of the UTF-8 code page and tools for your operating system.*

Explanation: Converting the command results from the server's code page to UTF-8 fails. Problems with operating system conversion tool or missing code page conversion tool might cause this problem. The server will attempt to recover from the situation. However, the recovery might result in unreadable characters or no output to appear on the web interface or interfaces that use the administrative API. Consult the language support information of the operating system for

information on how to install UTF-8 code page, conversion tool support, and ICONV support.

System action: The server operation continues without converting the command output from the server's code page to UTF-8.

User response: Install the UTF-8 code page support on the operating system. This is normally available by installing the UTF-8 locale for your language.

ANR4970E *Audit command: Missing or incorrect reclamation retention date for WORM FILE volume volume name; run AUDIT VOLUME FIX=YES for correction.*

Explanation: The indicated audit process finds a WORM FILE storage volume for which the reclamation retention date is missing or incorrect. To fix the missing or incorrect date, issue the AUDIT VOLUME with FIX=YES command for the indicated volume. During AUDIT VOLUME processing, the server will indeed have interface to the Network Appliance filer to obtain the retention date of the SnapLock Log Volume for correction of the missing or incorrect date.

System action: Audit processing continues.

User response: Issue the AUDIT VOLUME command with FIX=YES, so that the reclamation retention date can be created or corrected.

ANR4971E *Audit command: Missing or incorrect reclamation retention date for WORM FILE volume volume name. The reclamation retention date will be created or corrected.*

Explanation: The indicated audit process finds a WORM FILE storage volume for which the reclamation retention date is missing or incorrect. Since FIX=YES has been specified for the audit command, the date will be created or corrected.

System action: Audit processing continues.

User response: None.

ANR4972I *Command: Migration is not needed for the storage pool pool name.*

Explanation: Migration is not needed for the specified storage pool because of one of the following reasons:

- The high migration threshold (percentage) is set to 100 to prevent migration.
- If the specified storage pool uses random-access disk or sequential-access disk, the data capacity utilization is less than the low migration threshold.
- If the specified storage pool uses tape or optical media, the ratio of volumes that contain data to the total number of volumes in the storage pool is less than the low migration threshold.

System action: The server does not process the command.

User response: Re-issue the command when migration is needed for the pool.

ANR4973I *Command: Reclamation is not allowed for the storage pool `pool name`.*

Explanation: The high reclamation threshold (percentage) is set to 100 to prevent reclamation for the specified storage pool.

System action: The server does not process the command.

User response: Re-issue the command when migration is needed for the pool.

ANR4974W *The writing of a table of contents for node `node name`, file space `file space name` was cancelled.*

Explanation: The server ends a table of contents (TOC) creation for the specified node because the process was cancelled.

System action: The TOC creation is ended and server operation continues.

User response: None.

ANR4975E *No Tcp port available for backup from NAS node to server.*

Explanation: The server was unable to set up a TCP/IP port for use in backing up or restoring from or to NAS nodes and the server. The server uses a range of ports as defined by the NDMPPORTRANGE option. If none of these ports can be set up for use, backups or restores from or to NAS nodes and server native storage pools will fail. If the NDMPPORTRANGE option is not specified, the server uses ephemeral ports (ports that the operating system assigns from a dynamic pool). If the system runs out of usable ports, operations to or from NAS nodes and server native storage pools will fail.

System action: The specific operation is ended and server operation continues.

User response: Operating specific utilities, e.g. netstat, may be used to examine ports which are in use. It may be necessary to specify the NDMPPORTRANGE option (which requires a server restart), to provide a sufficient number of ports.

ANR4976W *The device class `DevClassName` is not the same as device class `DevClassName` defined for the serverbackup node `$$_TSMDBMGR_$$`.*

Explanation: The device class in this command is not

the same as the device class defined in the server backup node.

System action: The server will still process the command.

User response:

ANR4977W *The filespace `filespace name (filespace id)` for node `node name` will not be included in the backupset because it was not created by the backup/archive client and cannot be restored from the backupset.*

Explanation: Data from the filespace will not be included in the backupset because the filespace was not created by the backup/archive client and it cannot be restored from the backupset.

System action: The filespace is skipped.

User response: None.

ANR4978W *The filespace `filespace name (filespace id)` for node `node name` will not be included in the backupset because it is not a supported application type.*

Explanation: Data from the filespace will not be included in the backupset because the filespace does not belong to a supported application type.

System action: The filespace is skipped.

User response: None.

ANR4979W *Use of environment variable `DSMSERV_DIR` is no longer supported.*

Explanation: The DSMSERV_DIR environment variable was required in prior versions of TSM to find loadable modules and language files. Now, however, the directory is determined automatically and this variable is ignored.

System action: Server operation continues, using the directory containing the server executable as the base server directory.

User response: None.

ANR4980I *Auditing Interface Driver definitions.*

Explanation: The server is beginning an audit of the definitions for Web interface.

System action: The server will audit all definitions for the Web interface and report any problems.

User response: None.

ANR4981E Interface Driver audit completed - Inconsistencies were found.

Explanation: The server found errors during the audit of the definitions for Web interface.

System action: The Web Interface is not correctly installed. The Web Admin will not work correctly, but the server may be run without any problems.

User response: Ensure you are using the correct IDL file for the server level you are running. Examine error messages that may have been displayed before and/or after this message and correct any problems, if possible. If the cause of this can not be determined or resolved, contact your support representative.

ANR4982I Interface Driver audit completed - definitions are consistent.

Explanation: The server successfully completed the installation of the definitions for the Web interface.

System action: The Web Interface is now installed. The server may be run without any problems.

User response: None.

ANR4983I Auditing Interface Driver Groups.

Explanation: The server is auditing the driver groups.

System action: The server will audit the driver groups and proceed to the next step.

User response: None.

ANR4984E Error description

Explanation: The server found errors during the audit of the definitions for Web interface.

System action: The audit will fail.

User response: Ensure you are using the correct IDL file for the server level you are running. Examine error messages that may have been displayed before this message and correct any problems, if possible. If the cause of this can not be determined or resolved, contact your support representative. If you contact your support representative, the entire text of this message should be reported.

ANR4985I Auditing Interface Driver Group Members.

Explanation: The server is auditing the driver group members.

System action: The server will audit the driver group members and proceed to the next step.

User response: None.

ANR4986I Auditing Interface Driver Classes.

Explanation: The server is auditing the driver classes.

System action: The server will audit the driver classes and proceed to the next step.

User response: None.

ANR4987E Audit processing failed: sufficient memory is not available for processing.

Explanation: At RUNFILE time, the server is unable to process the IDL data due to insufficient memory.

System action: Server runfile stops.

User response: Restart the server runfile process with more memory available.

ANR4988I Auditing Interface Driver Complex Class containers.

Explanation: The server is auditing the driver class containers.

System action: The server will audit the driver class containers and proceed to the next step.

User response: None.

ANR4989I Auditing Interface Driver Operations.

Explanation: The server is auditing the driver operations.

System action: The server will audit the driver operations and proceed to the next step.

User response: None.

ANR4990I Auditing Interface Driver Operation Parameters.

Explanation: The server is auditing the driver operation parameters.

System action: The server will audit the driver operation parameters and proceed to the next step.

User response: None.

ANR4991I Auditing Interface Driver Tasks.

Explanation: The server is auditing the driver tasks.

System action: The server will audit the driver tasks and proceed to the next step.

User response: None.

ANR4992I Auditing Interface Driver Task Members.

Explanation: The server is auditing the driver task members.

System action: The server will audit the driver task members and proceed to the next step.

User response: None.

ANR4993E The client platform *platform name* is currently not supported by the TSM Storage Agent.

Explanation: At this point in time the storage agent does not accept the incoming client platform.

System action: None.

User response: None.

ANR4994E Query whether the volume *volume name* is in the library *library name* failed.

Explanation: An attempt to query if the indicated volume is in the specified library failed. It could be the library is offline or the library manager is down in a library sharing environment.

System action: The requested operation failed.

User response: Re-attempt the request when the library is brought up or when the library manager is up and running in a library sharing environment.

ANR6200I Command name: Level *compression audit level* compression audit started as process *process ID*.

Explanation: A compression audit at the specified level has been started as a background server process with the process identifier reported.

System action: Server operation continues. The background audit attempts to identify client files that may be affected by the client compression problem.

User response: None.

ANR6201I Command name: Level *compression audit level* compression audit starting as background process *process ID*.

Explanation: A compression audit at the specified level was started as a background server process having the process identifier reported.

System action: Server operation continues. The background audit attempts to identify client files that may be affected by the client compression problem.

User response: None.

ANR6202I Command name: Verifying candidates from last audit.

Explanation: A compression audit has started to verify the client file candidates that were identified in a previous compression audit execution. The verification process eliminates compression candidates that are now found to be expired by policy on the server.

System action: The audit operation continues.

User response: None.

ANR6203I Command name: Starting level *audit level* compression audit from qualifying entries in the candidates list.

Explanation: A compression audit is starting to check qualifying candidates from the candidates list for the audit level specified. Client files that were identified as compression candidates at a lower level will be tested, subject to the qualifications that were specified for the command.

System action: The audit operation continues.

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command. The QUERY PROCESS command can be used to monitor the progress of the audit operation.

ANR6204I Command name: Process *process ID*, level *audit level* audit, ended successfully - compression suspects = *total number of compression suspects*.

Explanation: A compression audit ended and is reporting the total number of suspect client files that have been found.

System action: The audit operation completes.

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command.

ANR6205I Command name: Process *process ID*, continuing Level 1 compression audit with object *object ID high order number.object ID low order number*.

Explanation: A level 1 compression audit is starting to evaluate client files for signs that they may be affected by the client compression problem. Since a previous level 1 audit has been executed, this audit will continue where the last audit stopped starting with the object whose identifier is specified.

System action: The audit operation continues.

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command. The QUERY PROCESS command can be used to monitor the progress of the audit operation.

ANR6206I *Command name: Process process ID, starting base level 1 compression audit.*

Explanation: A level 1 compression audit is starting to evaluate client files for signs that they may be affected by the client compression problem. The audit starts with the first client file found on the server, even if previous level 1 audits have been executed.

System action: The audit operation continues

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command. The QUERY PROCESS command can be used to monitor the progress of the audit operation.

ANR6207I *Command name: Process process ID, level audit level analysis detected candidate file high-level object name low-level object name in file space client filespace name for node client node name.*

Explanation: A compression audit has found a candidate file at the audit level specified. The name of the client node, file space, and file are displayed. This message is issued whenever a candidate file is detected during a compression audit that was started with the VERBOSE=YES parameter specified.

System action: The audit operation continues.

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command. The QUERY PROCESS command can be used to monitor the progress of the audit operation.

ANR6208I *Command name: Process process ID, was cancelled - number of candidate files candidate files were found in number of files examined files examined prior to cancellation.*

Explanation: A compression audit operation was canceled with the CANCEL PROCESS command before completion. The number of candidate files that were found prior to the cancellation are displayed.

System action: The audit operation ends.

User response: The compression audit may be restarted with the AUDIT COMPRESSION command. The compression candidate list can be displayed with the QUERY COMPRESSION command.

ANR6209I *Command name: Process process ID, level audit level audit completed successfully - number of candidate files candidate files were found in number of files examined files examined.*

Explanation: A compression audit operation completed successfully. The number of candidate files that were found are displayed.

System action: The audit operation ends.

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command.

ANR6210I *Command name: Process process ID, level audit level audit completed successfully - number of candidate files candidate files were found.*

Explanation: A compression audit operation completed successfully. The number of candidate files that have been found are displayed.

System action: The audit operation ends.

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command.

ANR6211I *Command name: Process process ID, level audit level analysis detected candidate file object name in file space client filespace name for node client node name.*

Explanation: A compression audit has found a candidate file at the audit level specified. The name of the client node, file space, and file are displayed. This message is issued whenever a candidate file is detected during a compression audit that was started with the VERBOSE=YES parameter specified.

System action: The audit operation continues.

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command. The QUERY PROCESS command can be used to monitor the progress of the audit operation.

ANR6212I *Command name: Process process ID, level audit level analysis eliminated level candidate level candidate file object name in filespace client filespace name for node client node name from candidate status.*

Explanation: A compression audit at the level specified has eliminated a candidate file through further analysis. The name of the client node, file space, and file are displayed. This message is issued whenever a candidate file is eliminated from consideration during a compression audit that was started with the VERBOSE=YES parameter specified.

System action: The audit operation continues.

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command. The QUERY PROCESS command can be used to monitor the progress of the audit operation.

ANR6213I *Command name: Process process ID, was cancelled - number of files promoted candidate files were promoted as candidates at level audit level, number of files eliminated files were eliminated as candidates, and number of files expired candidates were eliminated because they were found to be expired on the server.*

Explanation: A compression audit operation was cancelled with the CANCEL PROCESS command before completion. The number of candidate files that were promoted as candidates at this level of audit, eliminated as candidates at this level of audit, and found to be expired before the cancellation are reported.

System action: The audit operation ends.

User response: The compression audit can be restarted with the AUDIT COMPRESSION command. The compression candidate list can be displayed with the QUERY COMPRESSION command.

ANR6214I *Command name: Process process ID, completed successfully - number of files promoted candidate files were promoted as candidates at level audit level, number of files eliminated files were eliminated as candidates, and number of files expired candidates were eliminated because they were found to be expired on the server.*

Explanation: A compression audit operation completed successfully. The number of candidate files that were promoted as candidates at this level of audit, eliminated as candidates at this level of audit, and found to be expired are reported.

System action: The audit operation ends.

User response: The compression candidate list can be displayed with the QUERY COMPRESSION command.

ANR6215I *Command name: Backup for file high-level object name low-level object name in filespace client filespace name for node client node name could not be forced.*

Explanation: It is not possible to force a backup for the specified file using the FORCE BACKUP command. This file was either backed up using an API client or by an ADSM version 2 client or higher.

System action: The force backup operation continues, the state of the compression record for this file is updated.

User response: If the file was backed up using a Version 2 client, or higher, you may remove this entry as a candidate, using the REMOVE COMPRESSION command. If the file was backed up using an API client, notify the client owner to again back this file up.

Do not remove this entry until it becomes an "inactive" entry.

ANR6220I *Delete compression operation started as process process ID.*

Explanation: A compression deletion operation was started as a background server process with the indicated identifier.

System action: Server operation continues.

User response: None.

ANR6221I *Force backup operation started as process process ID.*

Explanation: A force backup operation was started as a background server process with the indicated identifier.

System action: Server operation continues.

User response: None.

ANR6222I *Command name: Process process ID was cancelled - number of files files were processed prior to cancellation.*

Explanation: The indicated process was cancelled prior to completion. This message displays the indicated number of files that were processed before the operation was cancelled.

System action: The process ends.

User response: The operation may be restarted by reissuing the indicated command.

ANR6223I *Delete compression process process ID has completed - number of files files were deleted.*

Explanation: The indicated process has completed processing. All database references have been deleted for the indicated number of files.

System action: The process ends.

User response: None.

ANR6224I *Force backup process process ID has completed - number of files files were marked for forced backup.*

Explanation: The indicated process has completed processing. The indicated number of files have been marked for forced backup. These files will be backed up during the next incremental backup.

System action: The process ends.

User response: None.

ANR6225I File *identifier* removed as a suspect for compression errors.

Explanation: The file with the specified identifier has been removed from the database information concerning files with possible compression errors. Other database information concerning the file is not affected.

System action: Server operation continues.

User response: None.

ANR6226I Command name: **Started as background process** *process ID*.

Explanation: A compression cleanup operation has been started to remove compression candidate information and temporary database entries from the server database. Client files are not affected by this operation.

System action: Server operation continues.

User response: The CANCEL PROCESS command can be used to cancel the compression cleanup operation. The QUERY PROCESS command may be used to query the status of the operation.

ANR6227I *cleanup process name* operation starting as process *process ID*.

Explanation: A compression cleanup operation has been started to remove compression candidate information and temporary database entries from the server database. Client files are not affected by this operation.

System action: Server operation continues.

User response: The CANCEL PROCESS command can be used to cancel the compression cleanup operation. The QUERY PROCESS command may be used to query the status of the operation.

ANR6228W *Cleanup process name*: **Process** *process ID* has been cancelled - cleanup processing is incomplete.

Explanation: A compression cleanup operation has been cancelled prior to successful completion.

System action: Server operation continues.

User response: The CLEANUP COMPRESSION command can be used to restart the cleanup operation.

ANR6229I *Cleanup process name*: **Process** *process ID* completed successfully.

Explanation: A compression cleanup operation has successfully completed.

System action: The cleanup process ends.

User response: None.

ANR6300E Command name: **Insufficient server memory available for the operation.**

Explanation: A compression testing routine cannot continue because sufficient memory is not available on the server.

System action: The operation fails.

User response: Increase the memory available to the server by increasing the server region size, virtual machine size, paging space available on the system, or relocating the memory swap file, depending upon the platform on which the server is executing. Additional memory may also be made available by limiting server activity (sessions, migration, and other activities) while this operation is processing.

ANR6301E Command name: **Invalid LEVEL specified. This command only supports a value of 1 or 2 for the LEVEL parameter.**

Explanation: An invalid LEVEL= parameter has been specified for the command.

System action: The command fails.

User response: Reissue the command specifying a value of 1 or 2 for the LEVEL parameter.

ANR6302E Command name: **Process** *process ID*, failed - number of candidate files **candidate files were found in** *number of files examined* **files examined prior to failure.**

Explanation: A compression audit operation failed before completion. The number of candidate files that were found prior to the failure are displayed.

System action: The audit operation ends.

User response: Examine message that appear before this message on the server console or in the activity log to determine the source of the failure. If the error can be corrected, re-execute the compression audit. If the failure cannot be determined or corrected, contact your service representative. The compression candidate list can be displayed with the QUERY COMPRESSION command.

ANR6303E Command name: **Process** *process ID*, failed - number of files promoted **candidate files were promoted as candidates at level** *audit level*, **number of files eliminated** *files were eliminated as candidates*, and **number of files expired** *candidates were eliminated because they were found to be expired on the server.*

Explanation: A compression audit operation failed before completion. The number of candidate files that

were promoted as candidates at this level of audit, eliminated as candidates at this level of audit, and found to be expired before the audit failure are reported.

System action: The audit operation ends.

User response: Examine message that appear before this message on the server console or in the activity log to determine the source of the failure. If the error can be corrected, re-execute the compression audit. If the failure cannot be determined or corrected, contact your service representative. The compression candidate list can be displayed with the QUERY COMPRESSION command.

ANR6304E *Command name:* **Command cannot be processed until compression audit is performed.**

Explanation: The indicated command cannot be processed until a compression audit is performed using the AUDIT COMPRESSION command.

System action: The command fails.

User response: Issue the AUDIT COMPRESSION command and then repeat the attempted operation.

ANR6305E *Command name:* **File identifier is not a suspect for compression errors.**

Explanation: The file with the specified identifier is not listed in the database as a suspect for compression errors. The file cannot be removed from the suspect list.

System action: Server operation continues.

User response: Use the QUERY COMPRESSION command to obtain the correct identifier for the file to be removed.

ANR6306E *Cleanup process name:* **Process process ID failed due to server error - cleanup processing is incomplete.**

Explanation: A compression cleanup operation has failed before successful completion.

System action: The cleanup process ends.

User response: Examine messages that appear on the server console or in the server activity log prior to this message to determine the cause of the error. If the error can be identified and corrected, restart the cleanup operation with the CLEANUP COMPRESSION command. If the error cannot be corrected, contact your service representative.

ANR6600E *Command:* **Invalid machine name - machine name.**

Explanation: The machine name specified in the command is invalid.

System action: The server does not process the command.

User response: Issue the command again and specify a valid machine name.

ANR6601E *Command:* **Description information exceeds maximum length characters.**

Explanation: The description specified in the command exceeds the maximum length of allowable characters.

System action: The server does not process the command.

User response: Issue the command again and specify a valid description.

ANR6602E *Command:* **Recovery instructions file name exceeds maximum length characters.**

Explanation: The recovery instructions file name specified in the command exceeds the maximum length of allowable characters.

System action: The server does not process the command.

User response: Issue the command again and specify a valid recovery instructions file name.

ANR6603E *Command:* **Characteristics file name exceeds maximum length characters.**

Explanation: The characteristics file name specified in the command exceeds the maximum length of allowable characters.

System action: The server does not process the command.

User response: Issue the command again and specify a valid characteristics file name.

ANR6604E *Command:* **Invalid building identifier - building.**

Explanation: The building identifier specified in the command is invalid.

System action: The server does not process the command.

User response: Issue the command again and specify a valid building identifier.

ANR6605E *Command: Invalid floor identifier - floor.*

Explanation: The floor identifier specified in the command is invalid.

System action: The server does not process the command.

User response: Issue the command again and specify a valid floor identifier.

ANR6606E *Command: Invalid room identifier - room.*

Explanation: The room identifier specified in the command is invalid.

System action: The server does not process the command.

User response: Issue the command again and specify a valid room identifier.

ANR6607E *Command: Machine machine name is already defined.*

Explanation: The machine specified in the command is already defined to the server.

System action: The server does not process the command.

User response: Issue the command again and specify another machine.

ANR6608E *Command: A machine containing a server is already defined.*

Explanation: The ADSMSERVER=YES parameter specified in the command is invalid because another machine has already been defined with this parameter. Only one machine can be defined to the server as containing a server.

System action: The server does not process the command.

User response: Issue the command again and do not specify ADSMSERVER=YES as a parameter.

ANR6609I *Machine machine name defined.*

Explanation: A DEFINE MACHINE command has added the requested machine to the server.

System action: None.

User response: None.

ANR6610E *Command: Invalid recovery media name - recovery media name.*

Explanation: The recovery media name specified in the command is invalid.

System action: The server does not process the command.

User response: Issue the command again and specify a valid recovery media name.

ANR6611E *Command: Location information exceeds maximum length characters.*

Explanation: The location specified in the command exceeds the maximum length of allowable characters.

System action: The server does not process the command.

User response: Issue the command again and specify a valid location.

ANR6612I *Machine machine name updated.*

Explanation: An UPDATE MACHINE command has updated one or more attributes of a machine.

System action: None.

User response: None.

ANR6613I *Machine machine name deleted.*

Explanation: A DELETE MACHINE command has deleted the requested machine from the server.

System action: None.

User response: None.

ANR6614E *Command: Machine machine name is not defined.*

Explanation: The machine specified in the command is not defined to the server.

System action: The server does not process the command.

User response: Issue the command again and specify a valid machine.

ANR6615E *Command: Failed to open input file - file name.*

Explanation: The input file specified in the command cannot be opened by the server.

System action: The server does not process the command.

User response: Issue the command again and specify an input file that is in a file system accessible by the server.

ANR6616E *Command: Invalid sequence number - sequence number.*

Explanation: The sequence number specified in the command is invalid.

System action: The server does not process the command.

User response: Issue the command again and specify a valid sequence number.

ANR6617W *Command: Node `node name` cannot be processed because it is not registered.*

Explanation: The node indicated in the message cannot be processed because it is not registered.

System action: The indicated node is not processed, but another node can be processed if specified by this command.

User response: Issue the command again and specify a valid registered node.

ANR6618E *Command: No matching node registered.*

Explanation: The node specified in the command does not match any node registered to the server.

System action: The server does not process the command.

User response: Issue the command again and specify a valid node.

ANR6619I *Node `node name` associated with machine `machine name`.*

Explanation: A DEFINE MACHNODEASSOCIATION command has associated the specified node with the specified machine. The node `node name` is associated with the machine `machine name`.

System action: None.

User response: None.

ANR6620E *Command: Machine and node association is already defined.*

Explanation: The machine and node association specified in the command is already defined to the server.

System action: The server operation continues, but the command has no effect.

User response: Issue the command again and specify a valid node.

ANR6621I *Node `node name` disassociated from machine `machine name`.*

Explanation: A DELETE MACHNODEASSOCIATION command has deleted the requested association from the server. The node `node name` is not associated with the machine `machine name`.

System action: None.

User response: None.

ANR6622E *Command: Recovery media `recovery media name` is not defined.*

Explanation: The recovery media specified in the command is not defined to the server.

System action: The server does not process the command.

User response: Issue the command again and specify a valid recovery media.

ANR6623W *Command: Machine `machine name` cannot be processed because it is not defined.*

Explanation: The machine indicated in the message is not defined to the server.

System action: The indicated machine is not processed, but another machine can be processed if specified by this command.

User response: Issue the command again and specify a valid machine.

ANR6624E *Command: No matching machine defined.*

Explanation: The machine specified in the command does not match any machine defined to the server.

System action: The server does not process the command.

User response: Issue the command again and specify a valid machine.

ANR6625I *Machine `machine name` associated with recovery media `recovery media name`.*

Explanation: A DEFINE RECOVERYMEDIAMACHASSOCIATION command has associated the specified machine with the specified recovery media. The machine `machine name` is associated with the recovery media `recovery media name`.

System action: None.

User response: None.

ANR6626E *Command: Recovery media/machine association is already defined.*

Explanation: The recovery media/machine association specified in the command is already defined to the server.

System action: The server operation continues, but the command has no effect.

User response: Issue the command again and specify a valid machine.

ANR6627I Machine *machine name* **disassociated from recovery media** *recovery media name*.

Explanation: A DELETE RECOVERYMEDIAMACHASSOCIATION command has deleted the requested association from the server. Machine *machine name* is not associated with the recovery media *recovery media name*.

System action: None.

User response: None.

ANR6628E Command: **Volume list exceeds maximum length characters.**

Explanation: The volume list specified in the command exceeds the maximum length of allowable characters.

System action: The server does not process the command.

User response: Issue the command again and specify a valid volume list.

ANR6629E Command: **Product name exceeds maximum length characters.**

Explanation: The product name specified in the command exceeds the maximum length of allowable characters.

System action: The server does not process the command.

User response: Issue the command again and specify a valid product name.

ANR6630E Command: **Product information exceeds maximum length characters.**

Explanation: The product information specified in the command exceeds the maximum length of allowable characters.

System action: The server does not process the command.

User response: Issue the command again and specify valid product information.

ANR6631E Command: **Missing volume list for boot recovery media.**

Explanation: Boot recovery media cannot be defined to the server without specifying a volume list.

System action: The server does not process the command.

User response: Issue the command again and specify the volume list for the boot recovery media.

ANR6632I Recovery media *recovery media name* **defined.**

Explanation: A DEFINE RECOVERYMEDIA command has defined the recovery media to the server.

System action: None.

User response: None.

ANR6633I Recovery media *recovery media name* **updated.**

Explanation: An UPDATE RECOVERYMEDIA command has updated one or more attributes of the recovery media.

System action: None.

User response: None.

ANR6634I Recovery media *recovery media name* **deleted.**

Explanation: A DELETE RECOVERYMEDIA command has deleted the requested recovery media from the server.

System action: None.

User response: None.

ANR6635E Command: **Recovery media** *recovery media name* **is already defined.**

Explanation: The recovery media specified in the command is already defined to the server.

System action: The server does not process the command.

User response: Issue the command again and specify a different recovery media.

ANR6636E Command: **The characteristics specified for machine** *machine name* **exceeds maximum length characters.**

Explanation: The characteristics specified in the command exceeds the maximum length of allowable characters.

System action: The server does not process the command.

User response: Issue the command again and specify valid characteristics.

ANR6637E Command: **The recovery instructions specified for machine** *machine name* **exceeds maximum length characters.**

Explanation: The recovery instructions specified in the command exceeds the maximum length of allowable characters.

System action: The server does not process the command.

User response: Issue the command again and specify valid recovery instructions.

ANR6638E *Command: The characteristics for machine *machine name* are already defined.*

Explanation: The characteristics for the machine specified in the command are already defined to the server.

System action: The server does not process the command.

User response: If the specified machine is defined to the server, issue an UPDATE MACHINE command to update the existing characteristics. If the machine is not defined to the server, run AUDIT DRM FIX to delete the characteristics.

ANR6639E *Command: The recovery instructions for machine *machine name* are already defined.*

Explanation: The recovery instructions for the machine specified in the command are already defined to the server.

System action: The server does not process the command.

User response: If the specified machine is defined to the server, issue an UPDATE MACHINE command to update the existing recovery instructions. If the machine is not defined to the server, run AUDIT DRM FIX to delete the recovery instructions.

ANR6640E *Command: Cannot delete volume list for boot recovery media.*

Explanation: A volume list cannot be deleted for boot recovery media. A volume list must exist for each boot recovery media defined to the server.

System action: The server does not process the command.

User response: To delete the volume list, issue an UPDATE RECOVERYMEDIA command and specify a recovery media type of OTHER and VOLUMES="". To change the recovery media type to BOOT, issue an UPDATE RECOVERYMEDIA command and specify the volume list containing the boot recovery media and TYPE=BOOT.

ANR6641E *Command: No association found for machine and node pair specified.*

Explanation: No association found for the machine and node pair specified in the command.

System action: Server operation continues, but the command has no effect.

User response: Issue the command again and specify a valid machine and node pair.

ANR6642E *Command: No association found for recovery media and machine pair specified.*

Explanation: No association found for the recovery media and machine pair specified in the command.

System action: Server operation continues, but the command has no effect.

User response: Issue the command again and specify a valid recovery media and machine pair.

ANR6643E *Command: Invalid parameter value - parameter value.*

Explanation: The parameter issued in the command is invalid.

System action: The server does not process the command.

User response: Issue the command again and specify a valid parameter.

ANR6644E *Command: A character string must be specified.*

Explanation: The INSERT command is invalid. A character string must be specified.

System action: The server does not process the command.

User response: Issue the command again and specify a valid character string.

ANR6645W *Node *node name* has already been associated with machine *machine name*.*

Explanation: The node specified in the DEFINE MACHNODEASSOCIATION command is invalid. The node is already associated with another machine shown in the message. A node can only be associated with one machine.

System action: The indicated node is not processed, but another node can be processed if specified by the command.

User response: Issue the command again and specify a valid node name.

ANR6646I *Audit command: Auditing disaster recovery manager definitions.*

Explanation: This message is displayed during a database audit and indicates that the disaster recovery

manager definitions are being examined by the database audit process.

System action: Audit processing continues.

User response: None.

ANR6647E *Audit command: DRM global attributes are missing.*

Explanation: A database audit process finds that the global attributes used for server DRM activities are missing.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to recreate the DRM global attributes.

ANR6648I *Audit command: DRM global attributes are missing - default values will be used to recreate the attributes.*

Explanation: A database audit process finds that the global attributes used for server DRM activities are missing. Because FIX=YES has been specified on the AUDIT command, default attribute values will be used to recreate the administrative global attributes.

System action: Audit processing continues.

User response: None.

ANR6649E *Audit command: DRM machine ID assignments are incorrect.*

Explanation: A database audit process finds that the global attributes machine ID used for server DRM activities are incorrect.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES specified so that the DRM global attributes can be corrected.

ANR6650I *Audit command: DRM machine ID Assignments are incorrect - values will be corrected.*

Explanation: A database audit process finds that the global attributes machine ID used for server DRM activities are incorrect. Since FIX=YES has been specified on the AUDIT command, the attribute value will be corrected in the server database.

System action: Audit processing continues.

User response: None

ANR6651I *Audit command: Invalid priority value encountered for machine machine name.*

Explanation: A database audit process encounters an invalid priority value for the machine indicated.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the priority. Or, issue an UPDATE MACHINE command and specify a new priority value.

ANR6652I *Audit command: Invalid priority value encountered for machine machine name - the default value will be set.*

Explanation: A database audit process encounters an invalid machine priority value for the machine indicated. Because FIX=YES has been specified, the audit function sets the machine priority value to the default value.

System action: Audit processing continues.

User response: To override the default value, issue an UPDATE MACHINE command to change the value after the audit command has completed.

ANR6653I *Audit command: Invalid building value encountered for machine machine name.*

Explanation: A database audit process encounters an invalid building value for the machine indicated.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the building value. Or, issue an UPDATE MACHINE command and specify a new building value.

ANR6654I *Audit command: Invalid building value encountered for machine machine name - the building value will be removed.*

Explanation: A database audit process encounters an invalid building value for the machine indicated. Because FIX=YES has been specified, the audit function removes the machine building value.

System action: Audit processing continues.

User response: To set the building value to another value, issue an UPDATE MACHINE command after the audit command has completed.

ANR6655I *Audit command: Invalid floor value encountered for machine machine name.*

Explanation: A database audit process encounters an invalid floor value for the machine indicated.

System action: Audit processing continues.

User response: Issue the command again and specify

FIX=YES to correct the floor value. Or, issue an UPDATE MACHINE command and specify a new floor value.

ANR6656I *Audit command: Invalid floor value encountered for machine *machine name* - the floor value will be removed.*

Explanation: A database audit process encounters an invalid floor value for the machine indicated. Because FIX=YES has been specified, the audit function removes the machine floor value.

System action: Audit processing continues.

User response: To set the floor value to another value, issue an UPDATE MACHINE command after the audit command has completed.

ANR6657I *Audit command: Invalid room value encountered for machine *machine name*.*

Explanation: A database audit process encounters an invalid room value for the machine indicated.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the room value. Or, issue an UPDATE MACHINE command and specify a new room value.

ANR6658I *Audit command: Invalid room value encountered for machine *machine name* - the room value will be removed.*

Explanation: A database audit process encounters an invalid room value for the machine indicated. Because FIX=YES has been specified, the audit function removes the machine room value.

System action: Audit processing continues.

User response: To set the room value for the specified machine to another value, use the UPDATE MACHINE command after the audit command has completed.

ANR6659I *Audit command: Invalid server value encountered for machine *machine name*.*

Explanation: A database audit process encounters an invalid server value for the machine indicated.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the server value. Or, issue an UPDATE MACHINE command and specify a new server value.

ANR6660I *Audit command: Invalid server value encountered for machine *machine name* - the default value will be set.*

Explanation: A database audit process encounters an invalid server value for the machine indicated. Because FIX=YES has been specified, the audit function sets the machine server value to the default value.

System action: Audit processing continues.

User response: To override the default value, issue an UPDATE MACHINE command to change the value after the audit command has completed.

ANR6661I *Audit command: Multiple machines are indicated as servers. Only one machine should have the server indicator set to YES.*

Explanation: A database audit process encounters more than one machine with the server indicator set to YES.

System action: Audit processing continues.

User response: For a list of machines with the server indicator set to YES, issue a QUERY MACHINE ADSMSERVER=YES command. Issue an UPDATE MACHINE command for each machine that is not a server.

ANR6662I *Audit command: Characteristics for machine *machine name* not found.*

Explanation: A database audit process finds a characteristics reference from a machine for characteristics that are not in the server database.

System action: Audit processing continues.

User response: Issue an UPDATE MACHINE command to load the characteristics into the database after the audit command has completed.

ANR6663I *Audit command: Recovery instructions for machine *machine name* not found.*

Explanation: A database audit process finds a recovery instructions reference from a machine for recovery instructions that are not in the server database.

System action: Audit processing continues.

User response: Issue an UPDATE MACHINE command to load the recovery instructions into the database after the audit command has completed.

ANR6664I *Audit command: Invalid access value encountered for recovery media *recovery media name*.*

Explanation: A database audit process encounters an invalid access value for the recovery media indicated.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the access value. Or, issue an UPDATE RECOVERYMEDIA command and specify a new access value.

ANR6665I *Audit command: Invalid access value encountered for recovery media *recovery media name* - the default value will be set.*

Explanation: A database audit process encounters an invalid access value for the recovery media indicated. Because FIX=YES has been specified, the audit function sets the recovery media access value to the default value.

System action: Audit processing continues.

User response: To override the default value, issue an UPDATE RECOVERYMEDIA command to change the value after the audit command has completed.

ANR6666I *Audit command: Invalid type value encountered for recovery media *recovery media name*.*

Explanation: A database audit process encounters an invalid type value for the recovery media indicated.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the type value. Or, issue an UPDATE RECOVERYMEDIA command and specify a new type value.

ANR6667I *Audit command: Invalid type value encountered for recovery media *recovery media name* - the default value will be set.*

Explanation: A database audit process encounters an invalid type value for the recovery media indicated. Because FIX=YES has been specified, the audit function sets the recovery media type value to the default value.

System action: Audit processing continues.

User response: To override the default value, issue an UPDATE RECOVERYMEDIA command to change the value after the audit command has completed.

ANR6668E *Audit command: Machine is not found for internal machine ID *machine ID*, which is referenced by recovery media.*

Explanation: A database audit process finds recovery media that references a machine that is not defined in the server database.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct recovery media attributes.

ANR6669I *Audit command: Machine is not found for internal machine ID *machine ID*, which is referenced by recovery media - the machine reference will be deleted.*

Explanation: A database audit process finds recovery media that references a machine that is not defined in the server database. Because FIX=YES has been specified for the audit command, the reference will be removed from the server database.

System action: Audit processing continues.

User response: None.

ANR6670E *Audit command: Recovery media not found for internal recovery media ID *recovery media ID*, which is referenced by a machine.*

Explanation: A database audit process finds a machine that references recovery media that is not defined in the server database.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the recovery media attributes.

ANR6671I *Audit command: Recovery media not found for internal recovery media ID *recovery media ID*, which is referenced by a machine - the recovery media reference will be deleted.*

Explanation: A database audit process finds a machine that references recovery media that is not defined in the server database. Because FIX=YES has been specified for the audit command, the reference will be deleted from the server database.

System action: Audit processing continues.

User response: None.

ANR6672E *Audit command: Client node not found for internal node ID *node ID*, which is referenced by a machine.*

Explanation: A database audit process finds a machine

that references a client node that is not defined in the server database.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the machine attributes.

ANR6673I *Audit command: Client node not found for internal node ID `node ID`, which is referenced by a machine - the client node reference will be deleted.*

Explanation: A database audit process finds a machine that references a client node that is not defined in the server database. Because FIX=YES has been specified for the audit command, the reference will be removed from the server database.

System action: Audit processing continues.

User response: None.

ANR6674E *Audit command: Machine not found for internal machine ID `machine ID`, which is referenced by a client node.*

Explanation: A database audit process finds a client node that references a machine that is not defined in the server database.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the machine attributes.

ANR6675I *Audit command: Machine not found for internal machine ID `machine ID`, which is referenced by a client node - the machine reference will be deleted.*

Explanation: A database audit process finds a client node that references a machine that is not defined in the server database. Because FIX=YES has been specified for the audit command, the reference will be removed from the server database.

System action: Audit processing continues.

User response: None.

ANR6676E *Audit command: Machine not found for internal machine ID `machine ID`, which is referenced by characteristics.*

Explanation: A database audit process finds characteristics that reference a machine that is not defined in the server database.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the machine attributes.

ANR6677I *Audit command: Machine not found for internal machine ID `machine ID`, which is referenced by characteristics - the machine reference will be deleted.*

Explanation: A database audit process finds characteristics that reference a machine that is not defined in the server database. Because FIX=YES has been specified for the audit command, the reference will be removed from the server database.

System action: Audit processing continues.

User response: None.

ANR6678E *Audit command: Machine not found for internal machine ID `machine ID`, which is referenced by recovery instructions.*

Explanation: A database audit process finds recovery instructions that reference a machine that is not defined in the server database.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the machine attributes.

ANR6679I *Audit command: Machine not found for internal machine ID `machine ID`, which is referenced by recovery instructions - the machine reference will be deleted.*

Explanation: A database audit process finds recovery instructions that reference a machine that is not defined in the server database. Because FIX=YES has been specified for the audit command, the reference will be removed from the server database.

System action: Audit processing continues.

User response: None.

ANR6680E *Audit command: Missing or invalid internal database attribute encountered for machine `machine name`.*

Explanation: A database audit process finds an invalid attribute for the specified machine.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the machine attributes.

ANR6681I *Audit command: Missing or invalid internal database attribute encountered for machine `machine name` - the attribute will be corrected.*

Explanation: A database audit process finds an invalid attribute for the specified machine. Because FIX=YES has been specified for the audit command the invalid attribute will be corrected.

System action: Audit processing continues.

User response: None.

ANR6682I *Command* **command ended: number of volumes volumes processed.**

Explanation: The indicated command ended. The total number of volumes successfully processed is shown in the message.

System action: The indicated command ends.

User response: None.

ANR6683I *Command: Volume volume name was* **moved from from state state to to state.**

Explanation: Volume *volume name* is successfully moved from *state1* to *state2* by the indicated command.

System action: The indicated volume is moved to the destination state.

User response: None.

ANR6684I *Command: Volume volume name was* **deleted.**

Explanation: The MOVE DRMEDIA * WHERESTATE=COURIERRETRIEVE command displays the message. Volume *volume name* is deleted from the server database. For database backup volume, after its expiration days have elapsed, the volume history record is deleted when it is returned onsite. For an empty scratch copy storage pool volume, or active-data storage pool volume, the volume record is deleted when it is returned onsite.

System action: The volume record is deleted from the server database.

User response: Issue the CHECKIN LIBVOLUME command for each volume returned onsite if the volume is reused by the server.

ANR6685E *Command: Volume volume name not* **defined.**

Explanation: Volume *volume name* is not defined to the server.

System action: The indicated command is not processed if the volume name is explicitly specified on the command. If a volume pattern is specified on the command, the volume shown is not processed, but the other volumes are processed.

User response: Reissue the command specifying a valid volume name.

ANR6686E *Command: Volume volume name in use.*

Explanation: The MOVE DRMEDIA * WHERESTATE=MOUNTABLE command displays the message. Volume *volume name* is used for another operation.

System action: The command is not processed if the volume is explicitly specified on the command. If a volume pattern is specified on the command, the indicated volume is not processed, but the other volumes are processed.

User response: Wait until the conflicting volume activity has completed, and then reissue the command. If the volume is currently mounted, but idle, dismount the volume by using a DISMOUNT VOLUME command and then retry this operation.

ANR6687E *Command: Executable command string* **exceeds maximum length characters.**

Explanation: The length of the executable command string specified with the CMD parameter exceeds the maximum length of allowable characters (255).

System action: The server stops processing the command.

User response: Issue the command again and specify a valid executable command with the CMD parameter.

ANR6688E *command: The specified command failed* **because the entry/exit port of library library name is full. Please remove the volume(s) from the entry/exit port and re-issue the command name command.**

Explanation: The indicated operation has failed because the entry/exit port of the specified library is full.

System action: The command fails.

User response: Remove the volume(s) from the entry/exit port and re-issue the command to process any remaining eligible volumes.

ANR6690E *Command: Copy storage pool cstgp name* **not defined for Offsite Recovery Media.**

Explanation: The MOVE DRMEDIA or QUERY DRMEDIA command displays the message. The indicated command was issued with a copy storage pool name specified, but the specified pool name is not defined to DRM for Offsite Recovery Media.

System action: The indicated command is not processed.

User response: Reissue the command, after defining the specified copy storage pool to DRM for Offsite Recovery Media.

ANR6691E *Command: No match is found for this move.*

Explanation: The indicated command was issued, but no matching volumes are defined to the server or the volume specified is not managed by the command.

System action: The command is not processed.

User response: Reissue the command specifying the valid volume.

ANR6694E *Command: The ORM state state is invalid for a volume with access mode access mode.*

Explanation: The indicated command specifies an Offsite Recovery Media state that is invalid for a volume with the access mode shown. Specify COURIER or COURIERRETRIEVE for a volume that has access mode of OFFSITE.

System action: The server does not process the command.

User response: Reissue the command specifying COURIER or COURIERRETRIEVE as the state for a volume that has access mode of OFFSITE.

ANR6695E *Command: Device class device class name not defined for volume volume name.*

Explanation: The MOVE DRMEDIA or QUERY DRMEDIA command displays the message. The volume being processed has associated with the device class name shown that is not defined to the server.

System action: The command is not processed if the volume is explicitly specified on the command. If a volume pattern is specified on the command, the indicated volume is not processed, but the other volumes not associated with the indicated class are processed.

User response: Reissue the command after the indicated device class is defined to the server.

ANR6696I *command: operation for volume volume name in library library name starting.*

Explanation: The indicated operation is being started for the volume shown in the given library.

System action: The server starts the operation in response to the indicated command entered by an administrator.

User response: For SCSI library users, remove the volume from the slot and issue a REPLY command, along with the request ID, to tell the server the volume was removed from the library.

ANR6697I *command: operation for volume volume name in library library name completed successfully.*

Explanation: The indicated operation has completed successfully for the volume shown in the given library.

System action: The volume is either deleted from the library inventory (if its status is something other than DATA) or marked not present (if its status is DATA).

User response: None.

ANR6698E *command: operation for volume volume name in library library name failed.*

Explanation: The indicated operation has failed for the volume shown in the given library. This message should be preceded by another error message which provides more detail about the error.

System action: The volume is not processed.

User response: Check for additional message and eliminate the condition that caused the failure, then retry the command.

ANR6699I **Cancel in progress.**

Explanation: The MOVE DRMEDIA command has been canceled and will end when resources have been freed for the background process. This message may be displayed in response to a QUERY PROCESS command for a MOVE DRMEDIA command.

System action: Server operation continues.

User response: None.

ANR6700I *Command command completed successfully.*

Explanation: The indicated command completed successfully.

System action: None.

User response: None.

ANR6701E *Command: Invalid courier name - courier name.*

Explanation: The indicated command has been entered with an invalid courier name.

System action: The server does not process the command.

User response: Reissue the command with a valid courier name.

ANR6702E *Command: Invalid expiration days value - days value.*

Explanation: The indicated command has been entered that specifies an invalid expiration days value.

System action: The server does not process the command.

User response: Reissue the command with a valid expiration days value.

ANR6703E *Command: Invalid recovery plan prefix - prefix.*

Explanation: The indicated command has been entered with an invalid recovery plan prefix.

System action: The server does not process the command.

User response: Reissue the command with a valid recovery plan prefix.

ANR6704E *Command: Invalid plan instructions prefix - prefix.*

Explanation: The indicated command has been entered with an invalid plan instructions prefix.

System action: The server does not process the command.

User response: Reissue the command with a valid plan instructions prefix.

ANR6705E *Command: Invalid character for volume postfix - postfix character.*

Explanation: The indicated command has been entered with an invalid character that is to be added to the volumes names in the recovery plan file.

System action: The server does not process the command.

User response: Reissue the command with a valid character.

ANR6706E *Command: Invalid vault name - vault name.*

Explanation: The indicated command has been entered with an invalid vault name.

System action: The server does not process the command.

User response: Reissue the command with a valid vault name.

ANR6707W *Command: The state, access and location attributes of the copy storage pool volume volume name were not updated.*

Explanation: The MOVE DRMEDIA command could not update the state, access and location of volume *volume name* because it was in use by another server operation.

System action: If the volume was in an automated library, the MOVE DRMEDIA command may have checked the volume out of the library.

If a volume pattern is specified on the command, the server continues processing the other volumes.

User response: Wait until the conflicting volume activity has completed, and then reissue the MOVE DRMEDIA command.

ANR6708W *Command: Copy pool volume volume name was not processed. The volume was in use.*

Explanation: The MOVE DRMEDIA command did not process volume *volume name* because it was in use by another server operation.

System action: The indicated command ends, if the volume was explicitly specified in the command. If a volume pattern was specified in the command, the server continues processing other volumes that match the pattern.

User response: Wait until the conflicting volume activity has completed, and then reissue the MOVE DRMEDIA command.

ANR6709W *Command: Active-data pool volume volume name was not processed. The volume was in use.*

Explanation: The MOVE DRMEDIA command did not process volume *volume name* because it was in use by another server operation.

System action: The indicated command ends, if the volume was explicitly specified in the command. If a volume pattern was specified in the command, the server continues processing other volumes that match the pattern.

User response: Wait until the conflicting volume activity has completed, and then reissue the MOVE DRMEDIA command.

ANR6710W *Command: The state, access and location attributes of the active-data storage pool volume volume name were not updated.*

Explanation: The MOVE DRMEDIA command could not update the state, access and location of volume *volume name* because it was in use by another server operation.

System action: If the volume was in an automated library, the MOVE DRMEDIA command may have checked the volume out of the library.

If a volume pattern is specified on the command, the server continues processing the other volumes.

User response: Wait until the conflicting volume activity has completed, and then reissue the MOVE DRMEDIA command.

ANR6711E *Audit command: An invalid database backup series expiration days encountered.*

Explanation: A database audit process encounters an invalid value for database backup series expiration days.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the expiration days. Or, issue an SET DRMDBBACKUPEXPIREDAYS command and specify a new expiration days value.

ANR6712I *Audit command: An invalid database backup series expiration days encountered - the default value will be set.*

Explanation: A database audit process encounters an invalid value for database backup series expiration days. Because FIX=YES has been specified, the audit function sets the expiration days value to the default value.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMDBBACKUPEXPIREDAYS command to change the value after the audit command has completed.

ANR6713E *Audit command: An invalid check label value encountered.*

Explanation: A database audit process encounters an invalid check label value.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the check label value. Or, issue a SET DRMCHECKLABEL command and specify a new check label value.

ANR6714I *Audit command: An invalid check label value encountered - the default value will be set.*

Explanation: A database audit process encounters an invalid check label value. Because FIX=YES has been

specified, the audit function sets the check label value to the default value.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMCHECKLABEL command to change the value after the audit command has completed.

ANR6715E *Audit command: An invalid file process value encountered.*

Explanation: A database audit process encounters an invalid file process value.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the file process value. Or, issue a SET DRMFILEPROCESS command and specify a new file process value.

ANR6716I *Audit command: An invalid file process value encountered - the default value will be set.*

Explanation: A database audit process encounters an invalid file process value. Because FIX=YES has been specified, the audit function sets the file process value to the default value.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMFILEPROCESS command to change the value after the audit command has completed.

ANR6717E *Audit command: Extraneous DRM global attribute encountered.*

Explanation: A database audit process finds a nonexistent DRM global attribute.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to delete the extraneous attribute.

ANR6718I *Audit command: Extraneous DRM global attribute encountered - the attribute will be deleted.*

Explanation: A database audit process finds a nonexistent DRM global attribute. Since FIX=YES has been specified, the extraneous attribute will be deleted.

System action: Audit processing continues.

User response: None.

ANR6719E *Audit command: DRM machine ID assignments not found.*

Explanation: A database audit process finds no entries in server database for DRM internal machine ID assignments.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the error.

ANR6720I *Audit command: DRM machine ID assignments not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for DRM internal machine ID assignments. Because FIX=YES has been specified for the audit command, the audit function creates an entry in the server database for the machine ID assignments.

System action: Audit processing continues.

User response: None.

ANR6721E *Audit command: DRM recovery media ID assignments not found.*

Explanation: A database audit process finds no entries in server database for DRM internal recovery media ID assignments.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the error.

ANR6722I *Audit command: DRM recovery media ID assignments not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for DRM internal recovery media ID assignments. Because FIX=YES has been specified for the audit command, the audit function creates an entry in the server database for the recovery media ID assignments.

System action: Audit processing continues.

User response: None.

ANR6723E *Audit command: Prefix for DRM recovery plan not found.*

Explanation: A database audit process finds no entries in server database for DRM recovery plan prefix definitions.

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6724I *Audit command: Prefix for DRM recovery plan not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for DRM recovery plan prefix definitions. Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the recovery plan file prefix.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMPPLANFILEPREFIX command to change the value after the audit command has completed.

ANR6725E *Audit command: Prefix for DRM recovery plan instructions not found.*

Explanation: A database audit process finds no entries in server database for DRM recovery plan instructions prefix definitions.

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6726I *Audit command: Prefix for DRM recovery plan instructions not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for DRM recovery plan instructions prefix definitions. Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the recovery plan instructions file prefix.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMPPLANINSTRPREFIX command to change the value after the audit command has completed.

ANR6727E *Audit command: Postfix for DRM replacement volumes names not found.*

Explanation: A database audit process finds no entries in server database for DRM postfix definitions for replacement volumes names.

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6728I *Audit command: Postfix for DRM replacement volumes names not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for DRM postfix definitions for replacement volumes names. Because FIX=YES has

been specified for the audit command, the audit function creates an entry using the default value in the server database for the replacement volumes postfix.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMPLANVPOSTFIX command to change the value after the audit command has completed.

ANR6729E *Audit command: Primary storage pools to be restored by DRM not found.*

Explanation: A database audit process finds no entries in server database for primary storage pools to be restored by DRM.

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6730I *Audit command: Primary storage pools to be restored by DRM not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for primary storage pools to be restored by DRM. Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the primary storage pools to be restored by DRM.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMPRIMSTGPOOL command to change the value after the audit command has completed.

ANR6731E *Audit command: Copy storage pools to be managed by DRM not found.*

Explanation: A database audit process finds no entries in server database for copy storage pools to be managed by DRM.

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6732I *Audit command: Copy storage pools to be managed by DRM not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for copy storage pools to be managed by DRM. Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the copy storage pools to be managed by DRM.

System action: Audit processing continues.

User response: To override the default value, issue a

SET DRMCOPYSTGPOOL command to change the value after the audit command has completed.

ANR6733E *Command: Cannot complete initialization for process name process.*

Explanation: The indicated process fails during process initialization.

System action: The indicated command is ended and server processing continues.

User response: This usually indicates that sufficient server memory is not available on the server. Allocate additional storage to the server. For details, issue HELP MEMORY to display the information online or see "Appendix A. Allocating Additional Server Memory".

ANR6734E *Command: Volume volume name not processed: library library name not defined.*

Explanation: The indicated volume is not processed since the designated library has not been defined or has been deleted.

System action: The volume is not processed.

User response: Reissue the command using a different library name, or define the library before retrying the command.

ANR6735E *Audit command: Courier information for ORM not found.*

Explanation: A database audit process finds no entries in server database for courier name definitions used by DRM Offsite Recovery Media (ORM).

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6736I *Audit command: Courier information for ORM not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for courier name definitions used by DRM Offsite Recovery Media (ORM). Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the courier name definitions.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMCOURIERNAME command to change the value after the audit command has completed.

ANR6737E *Audit command: Vault name for ORM not found.*

Explanation: A database audit process finds no entries in server database for vault name definitions used by DRM Offsite Recovery Media (ORM).

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6738I *Audit command: Vault name for ORM not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for vault name definitions used by DRM Offsite Recovery Media (ORM). Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the vault name definitions.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMVaultNAME command to change the value after the audit command has completed.

ANR6739E *Audit command: Database backup series expiration days for ORM not found.*

Explanation: A database audit process finds no entries in server database for database backup series expiration days definitions used by DRM Offsite Recovery Media (ORM).

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6740I *Audit command: Database backup series expiration days for ORM not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for database backup series expiration days definitions used by DRM Offsite Recovery Media (ORM). Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the database backup series expiration days definitions.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMDBBACKUPEXPIREDDAYS command to change the value after the audit command has completed.

ANR6741E *Audit command: Check label indicator for ORM not found.*

Explanation: A database audit process finds no entries in server database for check label definitions used by DRM Offsite Recovery Media (ORM).

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6742I *Audit command: Check label indicator for ORM not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for check label definitions used by DRM Offsite Recovery Media (ORM). Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the check label definitions.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMCHECKLABEL command to change the value after the audit command has completed.

ANR6743E *Audit command: File process indicator for ORM not found.*

Explanation: A database audit process finds no entries in server database for file process definitions used by DRM Offsite Recovery Media (ORM).

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6744I *Audit command: File process indicator for ORM not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for file process definitions used by DRM Offsite Recovery Media (ORM). Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the file process definitions.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMFILEPROCESS command to change the value after the audit command has completed.

ANR6745E *Audit command: DRM recovery media ID assignments are incorrect.*

Explanation: A database audit process finds that the global attributes recovery media id used for server DRM activities are incorrect.

System action: Audit processing continues.

User response: Reissue the audit command with FIX=YES specified so that the DRM global attributes can be corrected.

ANR6746I *Audit command: DRM recovery media ID assignments are incorrect - values will be corrected.*

Explanation: A database audit process finds that the global attributes recovery media ID used for server DRM activities are incorrect. Since FIX=YES has been specified on the AUDIT command, the attribute value will be corrected in the server database.

System action: Audit processing continues.

User response: None.

ANR6747I *Number of volumes processed: number*

Explanation: The MOVE DRMEDIA command has processed the number of volumes displayed. This message may be displayed in response to a QUERY PROCESS command for a MOVE DRMEDIA command.

System action: Server operation continues.

User response: None.

ANR6748I *Number of volumes processed: number. Checking out volume volume name from library library name.*

Explanation: The MOVE DRMEDIA command displays the number of volumes already processed and the name of the volume currently being checked out from the indicated library. This message may be displayed in response to a QUERY PROCESS command for a MOVE DRMEDIA command.

System action: Server operation continues.

User response: None.

ANR6749I *Command: process process ID terminated before completion - process canceled.*

Explanation: The indicated background process performing the command shown has been canceled.

System action: If other processes are executing, these processes continue.

User response: None.

ANR6750E *Disaster recovery manager operation command being processed is denied - server is not in compliance with license terms.*

Explanation: The server refuses a disaster recovery manager operation because the current server configuration is not in compliance with the license terms.

System action: Server operation continues. Disaster

recovery operations cannot be performed until the server is licensed for the Tivoli Disaster Recovery Manager product.

User response: Issue a QUERY LICENSE command to determine which license terms are not in compliance.

ANR6751E *Disaster recovery manager operation command being processed is denied - server is not licensed for disaster recovery manager support.*

Explanation: The server refuses a disaster recovery manager operation because the server is not licensed to support the disaster recovery manager.

System action: Server operation continues.

User response: Obtain the license to support the disaster recovery manager from your service provider or reseller. Issue the REGISTER LICENSE command with this license to enable the disaster recovery manager support.

ANR6752W *Disaster recovery manager operation Command being processed is in violation of server license terms - server is not licensed for disaster recovery manager support.*

Explanation: The server warns about a disaster recovery manager operation because the server is not licensed to support disaster recovery manager.

System action: Server operation continues.

User response: Obtain the license to support disaster recovery manager from your service provider or reseller. Issue the REGISTER LICENSE command with this license to enable disaster recovery manager support.

ANR6753E *command being processed encountered an internal server error while checking license compliance.*

Explanation: The server encountered an internal error in determining whether the server is in compliance with license terms.

System action: Server operation continues.

User response: Issue the QUERY LICENSE and QUERY STATUS commands to determine if the server is in compliance with license terms. Start an AUDIT LICENSES process to adjust server license information. When this process completes, start the session again. If the problem persists, contact your service representative.

ANR6754I Machine *machine name* characteristics deleted.

Explanation: A DELETE MACHINE command has deleted the requested characteristics from the server.

System action: None.

User response: None.

ANR6755I Machine *machine name* recovery instructions deleted.

Explanation: A DELETE MACHINE command has deleted the requested recovery instructions from the server.

System action: None.

User response: None.

ANR6756E Machine *machine name* characteristics not defined to the server.

Explanation: A DELETE MACHINE command cannot delete the requested characteristics from the server. The characteristics for the specified machine are not defined to the server.

System action: The server operation continues, but the command has no effect.

User response: Issue the command again and specify a machine that has characteristics defined to the server.

ANR6757E Machine *machine name* recovery instructions not defined to the server.

Explanation: A DELETE MACHINE command cannot delete the requested recovery instructions from the server. The recovery instructions for the specified machine are not defined to the server.

System action: The server operation continues, but the command has no effect.

User response: Issue the command again and specify a machine that has recovery instructions defined to the server.

ANR6758E *Command:* Only one character string can be specified.

Explanation: The INSERT command is invalid. Either a characteristics string can be specified or a recovery instructions string can be specified on the command. Both types of strings cannot be specified on the command at the same time.

System action: The server does not process the command.

User response: Issue the command again and specify one valid character string.

ANR6759E Disaster recovery manager operation *command being processed* is denied - disaster recovery manager support is not available for server platform *platform*.

Explanation: The server refuses a disaster recovery manager operation because disaster recovery manager support is not available for the indicated server platform.

System action: Server operation continues.

User response: None.

ANR6760E *Command:* Executable command line exceeds maximum length characters for volume *volume name*.

Explanation: While writing to a command file, one of the following conditions occurred:

- The length of the command line written to the command file exceeds the LRECL specified for MVS or exceeds the default length for the command line written (255).
- The length of the command created after replacing the substitution variables &VOL, &VOLDSN, &NL, and &LOC exceeds the server allowable command line length (1500).

System action: The server stops processing the command.

User response: Issue the command again and specify a valid executable command with the CMD parameter.

In the case where volumes are being ejected from the library, it is possible the server database does not reflect the true state of the volume. For MOVE DRMEDIA, rerun the command after determining the cause of the error. For MOVE MEDIA, an update volume command should be issued setting the access of the volume to read only.

If this message is issued by a MOVE or QUERY DRMEDIA command and the volume record has been deleted from the server database, you can not use the MOVE or QUERY DRMEDIA commands to create the command file entry for this volume. In this case, you must manually issue the proper command.

ANR6761E *Command:* WHERESTATE parameter is required.

Explanation: The indicated command specifies a volume name containing a pattern matching character and the TOSTATE parameter. The WHERESTATE parameter is not specified. The specification is invalid. Pattern-matching for volume names is only allowed when the WHERESTATE parameter is specified.

System action: The server does not process the command.

User response: Reissue the command specifying a

specific volume name or by specifying the WHERESTATE parameter along with the TOSTATE parameter.

ANR6762E *Command: The specified destination state tostate is invalid for volume volume name in current state state.*

Explanation: The indicated command specifies a destination state that is invalid for the volume name shown in the indicated current state.

System action: The server does not process the volume.

User response: Issue the command again and specify a valid destination state for the volume name shown.

ANR6763I *Command: The specified command has been written to file 'file name'.*

Explanation: The command string specified with the CMD parameter on the command shown is written to the indicated file for each volume successfully processed.

System action: None.

User response: Execute the commands written to the file.

ANR6764E *command: Command file name exceeds maximum characters characters.*

Explanation: The file name specified for containing the executable commands generated by DRM exceeds the maximum valid length shown.

System action: The server does not process the command.

User response: Reissue the command specifying a valid file name.

ANR6765E *Command: Invalid not mountable location name - not mountable name.*

Explanation: The indicated command has been entered with an invalid not mountable location name.

System action: The server does not process the command.

User response: Reissue the command with a valid not mountable location name.

ANR6766E *Command: No command string is specified for FORMAT=CMD.*

Explanation: The indicated command has been entered with a FORMAT=CMD to write a command string to a file, but no command string is specified.

System action: The server does not process the command.

User response: Reissue the command specifying a command string to be written to a file.

ANR6767E *Command: Invalid command file name - command file name.*

Explanation: The indicated command has been entered with an invalid command file name.

System action: The server does not process the command.

User response: Reissue the command with a valid command file name.

ANR6768E *command: Prefix exceeds maximum characters characters.*

Explanation: The prefix specified for recovery plan files or for plan instructions files exceeds the maximum valid length. The maximum valid length is shown in the message.

System action: The server does not process the command.

User response: Reissue the command specifying a valid prefix.

ANR6769E *Audit command: Not mountable name information for ORM not found.*

Explanation: A database audit process finds no entries in server database for not mountable location name definitions used by DRM Offsite Recovery Media (ORM).

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6770I *Audit command: Not mountable name information for ORM not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for not mountable location name definitions used by DRM Offsite Recovery Media (ORM). Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the courier name definitions.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMNOTMOUNTABLENAME command to change the value after the audit command has completed.

ANR6771E *Audit command: Command file name information for ORM not found.*

Explanation: A database audit process finds no entries in server database for command file name definitions used by DRM Offsite Recovery Media (ORM).

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6772I *Audit command: Command file name information for ORM not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for command file name definitions used by DRM Offsite Recovery Media (ORM). Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the command file name definitions.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMCMDFILENAME command to change the value after the audit command has completed.

ANR6773E *Command: Unable to open file 'command file name' for output.*

Explanation: An error occurred while opening the command file name shown. The file name shown in the message is specified with the indicated command, the SET command, or the default name generated by the indicated command.

System action: The server does not process the indicated command.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated. In AIX, make sure that the file name specified in the command or in the SET command is a full path file name, not a directory path name. In MVS, make sure that the file name specified in the command or in the SET command is a valid MVS file name. Reissue the command after determining the cause of the error.

ANR6774E *Command: Invalid volume transition states - from 'specified WHERESTATE' state to 'specified TOSTATE' state.*

Explanation: The TOSTATE specified is an invalid destination state for the WHERESTATE specified.

System action: The server does not process the command.

User response: Issue the command again and specify a valid destination state.

ANR6775E *Command: Error writing to file 'file name' for volume volume name.*

Explanation: An error occurred while writing to the file name shown for the indicated volume.

System action: The server stops processing the command.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated. Reissue the command after determining the cause of the error.

In the case where volumes are being ejected from the library, it is possible the server database does not reflect the true state of the volume. For MOVE DRMEDIA, rerun the command after determining the cause of the error. For MOVE MEDIA, an update volume command should be issued setting the access of the volume to read only.

If this message is issued by a MOVE or QUERY DRMEDIA command and the volume record has been deleted from the server database, you can not use the MOVE or QUERY DRMEDIA commands to create the command file entry for this volume. In this case, you must manually issue the proper command.

ANR6776E *Command: Could not delete file: file name*

Explanation: The indicated command failed but the file created could not be deleted.

System action: None.

User response: Delete the file shown.

ANR6777E *Command: Command file 'file name' already in use.*

Explanation: The command indicated references a command file name that is in use. The command file name shown is selected for use by the server in the following order:

- The file name specified on the indicated command.
- The file name specified on the SET command.
- The file name generated by the server (AIX only).

System action: The server does not process the command.

User response: Reissue the command at a later time or reissue the command specifying a different command file name.

ANR6778E *Command: Volume volume name not processed: device type device type not supported.*

Explanation: The indicated volume is not processed because the device type shown is not supported by the function.

System action: The indicated volume is not processed.

User response: None.

ANR6779E *Disaster recovery manager operation command being processed is denied - disaster recovery manager support is not available for server platform.*

Explanation: The server refuses a disaster recovery manager operation because disaster recovery manager support is not available for the server platform.

System action: Server operation continues.

User response: None.

ANR6780E *Audit command: An invalid recovery plan file expiration days encountered.*

Explanation: A database audit process encounters an invalid value for recovery plan file expiration days.

System action: Audit processing continues.

User response: Issue the command again and specify FIX=YES to correct the expiration days. Or, issue an SET DRMRPFEXPIREDDAYS command and specify a new expiration days value.

ANR6781I *Audit command: An invalid recovery plan file expiration days encountered - the default value will be set.*

Explanation: A database audit process encounters an invalid value for recovery plan file expiration days. Because FIX=YES has been specified, the audit function sets the expiration days value to the default value.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMRPFEXPIREDDAYS command to change the value after the audit command has completed.

ANR6782E *Audit command: Recovery plan file expiration days not found.*

Explanation: A database audit process finds no entries in server database for recovery plan file expiration days definitions.

System action: Audit processing continues.

User response: Issue the audit command again and specify FIX=YES to correct the error.

ANR6783I *Audit command: Recovery plan file expiration days not found - entry will be created.*

Explanation: A database audit process finds no entries in server database for recovery plan file expiration days definitions. Because FIX=YES has been specified for the audit command, the audit function creates an entry using the default value in the server database for the recovery plan file expiration days definitions.

System action: Audit processing continues.

User response: To override the default value, issue a SET DRMRPFEXPIREDDAYS command to change the value after the audit command has completed.

ANR6784I *Number of volumes processed: number volumes processed. Volumes sent to library library name for checkout: number volumes sent.*

Explanation: The MOVE DRMEDIA command has processed the number of volumes shown. Currently, the MOVE DRMEDIA command has sent for processing the number of volumes shown to the library shown. This message may be displayed in response to a QUERY PROCESS command for a MOVE DRMEDIA command.

System action: Server operation continues.

User response: None.

ANR6785W *Warning: The ADSM V3 Disaster Recovery Manager Disk Image Dump function is not supported in the Tivoli Disaster Recovery Manager. The ADSM V3 DRM Disk Image Restore function has been stabilized with no new maintenance or hardware support planned.*

Explanation: None.

System action: DRM Disk Image Dump and Restore function continues.

User response: None.

ANR6900I *Command: The recovery plan file file name was created.*

Explanation: The recovery plan file was created.

System action: None.

User response: None.

ANR6901I **Number of plan stanzas processed:**
number.

Explanation: The PREPARE command has processed the number of stanzas displayed. This message may be displayed in response to a QUERY PROCESS command for a PREPARE command.

System action: Server operation continues.

User response: None.

ANR6902I **Number of plan stanzas processed:**
number. Currently processing stanza:
recovery plan stanza name.

Explanation: The PREPARE command displays the number of stanzas already processed and the name of the stanza currently being processed. This message may be displayed in response to a QUERY PROCESS command for a PREPARE command.

System action: Server operation continues.

User response: None.

ANR6903I **Cancel in progress.**

Explanation: The PREPARE command has been canceled and will end when resources have been freed for the background process. This message may be displayed in response to a QUERY PROCESS command for a PREPARE command.

System action: Server operation continues.

User response: None.

ANR6904I **Sending recovery plan file to target server.**

Explanation: The PREPARE command is sending the recovery plan file to the target server. This message may be displayed in response to a QUERY PROCESS command for a PREPARE command.

System action: Server operation continues.

User response: None.

ANR6905I *Command: Recovery plan file RPF volume name was created. Specified device class device class name.*

Explanation: The recovery plan file was created on the target server.

System action: Server operation continues.

User response: None.

ANR6912W *Command: The database was not backed up.*

Explanation: No backups have been made of the server data base.

System action: Stanzas in the recovery plan do not include database recovery information.

User response: Backup the server data base by issuing the BACKUP DB command.

ANR6913W *Command: No volumes with backup data exist in copy storage pool storage pool name.*

Explanation: A copy storage pool does not contain any volumes with usable data.

System action: Stanzas in the recovery plan do not include recovery information for any volumes in the storage pool.

User response: Determine why this storage pool has no volumes with usable data.

ANR6914W *Command: No volumes with active data exist in the active-data storage pool storage pool name.*

Explanation: An active-data storage pool does not contain any volumes with usable data.

System action: Stanzas in the recovery plan do not include recovery information for any volumes in the storage pool.

User response: Determine why this storage pool has no volumes with usable data.

ANR6915W *Command: Storage pool storage pool name storage pool type is not defined to the server.*

Explanation: A storage pool that is not defined to the server was specified by SET DRMPRIMSTGPOOL, SET DRMCOPYSTGPOOL, or on the PREPARE command line.

System action: Stanzas in the recovery plan do not include recovery information for the storage pool.

User response: Correct the storage pool specification or define the storage pool to the server.

ANR6916W *Command: No copy storage pools are defined.*

Explanation: The server has no copy storage pools defined.

System action: Recovery plan file will not contain copy storage pool information.

User response: Define copy storage pools in the server.

ANR6918W *Command: Recovery instructions file file name not found.*

Explanation: A source file for recovery instructions was not found.

System action: The recovery plan will not contain recovery instructions.

User response: To get recovery instructions in the recovery plan, ensure the corresponding instructions source file exists. If it does, check authorizations to the file.

ANR6920W *Command: S volume name is not valid for server device type device type. Original volume name: volume name. Stanza is stanza name.*

Explanation: Appending the replacement volume name postfix (as defined with SET DRMPPLANVPOSTFIX) to the original volume name has created a name that is not valid for the server device type shown.

System action: Replacement volume name is used in the recovery plan stanza.

User response: Devise a naming convention that allows the use of the replacement volume name postfix or at restore time manually update the generated recovery plan with a legal replacement name. For additional information and related commands, refer to the Administrator's Reference for your particular platform.

ANR6921W *Command: Cannot locate server options file 'file name'.*

Explanation: The Prepare command cannot open the specified server options file.

System action: VOLHISTORY and DEVCONFIG options are added to the recovery plan file stanza DSMSERV.OPT.FILE.

User response: None.

ANR6922W *Command: No machine information was defined for the machine that contains server server name.*

Explanation: The machine information has not been saved in the server data base.

System action: The recovery plan file does not contain the machine and recovery media information stanzas.

User response: If you want to include the machine information in the recovery plan file, issue the DEFINE MACHINE command to save the machine information

in the server data base and reissue the PREPARE command.

ANR6923W *Command: No recovery media defined for machine machine name.*

Explanation: No recovery media has been defined to the server for the specified machine.

System action: The recovery plan file does not contain the machine recovery media stanza.

User response: If you want to include the machine recovery media information in the recovery plan file, issue the DEFINE RECOVERYMEDIA command. Reissue the PREPARE command after the appropriate commands have been issued to define the recovery media. For additional information and related commands, refer to the Administrator's Reference for your particular platform.

ANR6924W *Command: No recovery instructions defined for machine machine name.*

Explanation: No recovery instructions have been defined to the server for the specified machine.

System action: The recovery plan file does not contain the machine recovery instructions stanza.

User response: If you want to include the machine recovery instructions in the recovery plan file, issue the INSERT command. Reissue the PREPARE command after the appropriate commands have been issued to define the recovery media. For additional information and related commands, refer to the Administrator's Reference for your particular platform.

ANR6925W *Command: No machine characteristics defined for machine machine name.*

Explanation: No characteristics have been defined to the server for the specified machine.

System action: The recovery plan file does not contain the machine characteristics stanza.

User response: If you want to include the machine recovery instructions in the recovery plan file, issue the INSERT command. Reissue the PREPARE command after the appropriate commands have been issued to define the recovery media. For additional information and related commands, refer to the Administrator's Reference for your particular platform.

ANR6926W *Command: There is at least one invalid generated volume name associated with storage pool storage pool server device type device type in stanza stanza name.*

Explanation: Appending the replacement volume name postfix (as defined with SET DRMPPLANVPOSTFIX) to the original volume name

has created a name that is not valid for the server device type shown.

System action: Replacement volume name is used in the recovery plan stanza.

User response: Devise a naming convention that allows the use of the replacement volume name postfix or at restore time manually update the generated recovery plan with a legal replacement name. For additional information and related commands, refer to the Administrator's Reference for your particular platform.

ANR6927W *Command: Primary storage pool storage pool name, storage pool data format, is not managed by DRM.*

Explanation: A SET DRMPRIMSTGPOOL or the PREPARE command specified a primary storage pool that is used for backing up NAS file servers, using NDMP. DRM does not manage a storage pool with this data format.

System action: Stanzas in the recovery plan do not include recovery information for the storage pool.

User response: Correct the storage pool specification.

ANR6928W *Command: No eligible primary storage pools match the specified storage pool name storage pool name .*

Explanation: The storage pool specified by the SET DRMPRIMSTGPOOL or on PREPARE command does not match any eligible primary storage pool. Possible reasons include:

- Primary storage pools were not defined.
- Primary storage pools were defined, but their data formats are for NAS file servers, or their device classes use the CENTERA device type.
- The name specified does not match eligible primary storage pool names.

System action: Stanzas in the recovery plan do not include recovery information for the storage pools.

User response: Correct the storage pool specification or define eligible storage pools to the server.

ANR6929W *Command: No eligible primary storage pools are defined to the server.*

Explanation: The server has no eligible primary storage pools defined.

System action: Recovery plan file will not contain primary storage pool information.

User response: Define eligible primary storage pools to the server.

ANR6930W *Command: Primary storage pool storage pool name, whose device class uses the CENTERA device type, is not managed by DRM.*

Explanation: The SET DRMPRIMSTGPOOL or the PREPARE command specified a primary storage pool whose device class uses the CENTERA device type. DRM does not manage storage pools that use the CENTERA device type.

System action: Stanzas in the recovery plan do not include recovery information for the storage pool.

User response: Correct the storage pool specification.

ANR6937E *command: parameter name parameter not allowed from the command line.*

Explanation: The parameter shown is not allowed from the command line interface.

System action: The server does not process the command.

User response: Reissue the command with the parameter from the web.

ANR6938I *No information found for stanza stanza name.*

Explanation: No information found for recovery plan file stanza shown.

System action: The server does not display the information for the stanza.

User response: None

ANR6939E *Command: Invalid recovery plan file stanza name - stanza name.*

Explanation: The specified recovery plan file stanza name is invalid.

System action: The server does not process the command.

User response: Issue the command again and specify a valid recovery plan file stanza name.

ANR6940E *command command not allowed from server console.*

Explanation: The indicated command is not allowed to be issued from the server console.

System action: The command is not executed.

User response: Reissue the command from an administrator using an Administrative Client.

ANR6941E Query recovery plan file content is waiting for mount point in device class *device class name*.

Explanation: Query recovery plan file content has begun to wait for a mount point that can be used for a volume in the device class shown.

System action: The function waits for the mount point.

User response: Respond to any mount requests.

ANR6942E Query recovery plan file content is waiting for access to input volume *volume name*.

Explanation: Query recovery plan file content has begun to wait for availability of the input volume shown.

System action: The function waits for the volume to become available.

User response: None.

ANR6943E Query recovery plan file content is waiting for mount of input volume *volume name*.

Explanation: Query recovery plan file content has begun to wait for the mount of the input volume shown.

System action: The function waits for mount.

User response: Respond to any mount requests.

ANR6944E *Command: Invalid recovery plan file name - recovery plan file name.*

Explanation: The recovery plan file name specified in the command is invalid.

System action: The server does not process the command.

User response: Issue the command again and specify a valid recovery plan file name.

ANR6945E *Command: Cannot find filespace filespace name for recovery plan file recovery plan file name.*

Explanation: The server cannot find the filespace (ADSM.SERVER) for recovery plan file specified in the server.

System action: The retrieve operation ends, and the server operation continues.

User response: Issue QUERY FILESPACE command on the target server to see if there is any filespace created for the recovery plan file. The filespace name for the recovery plan file is ADSM.SERVER.

ANR6946E *Command: Retrieve failed for recovery plan file name - error on input storage device.*

Explanation: The server ends an retrieve operation because an I/O error has been encountered by the server in reading from a device.

System action: The retrieve operation ends, and the server operation continues.

User response: Query the activity log to find messages preceding this one that specify the device that is failing. The server may need to be shut down with the HALT command to correct the hardware problem.

ANR6947E *Command: Data storage retrieve failed for recovery plan file name - error detected.*

Explanation: The server ends the retrieve operation because an error has been encountered on the server. Some common reasons for the error are:

- Data is corrupted on the input volume
- Hardware or media failure has occurred
- Database corruption

System action: The retrieve operation ends, and the server operation continues.

User response: Examine any prior error messages to determine the source of the error. Use the QUERY ACTLOG command to view the activity log and search for messages if needed. Correct the problem and try the restore or retrieve again. You can also refer to the *Problem Determination Guide* for problem determination hints and information. If retry of the operation continues to fail contact your service representative.

ANR6948E *Command: Cannot find the recovery plan file for Recovery plan file name.*

Explanation: The server cannot find the specified recovery plan file.

System action: The server does not process the command.

User response: Issue the command again and specify a valid recovery plan file name. Use the QUERY RPFIL command to view the name of the recovery plan file that you are interested in displaying its content.

ANR6949E *Command: No matching device class defined.*

Explanation: The device class specified in the command does not match any device class defined to the server.

System action: The server does not process the command.

ANR6950E • ANR6964E

User response: Issue the command again and specify a valid device class.

ANR6950E *Command: The recovery plan file was not created.*

Explanation: Due to a processing error, a recovery plan file was not created.

System action: Recovery plan file not created.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Reissue the command, after determining the cause of the error.

ANR6951E *Command: Recovery plan file file name was not created.*

Explanation: Due to a processing error, a recovery plan file was not created.

System action: Recovery plan file not created.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated and that there is sufficient space in the file system for the file. Reissue the command, after determining the cause of the error.

ANR6952E *Command: File name file name already exists.*

Explanation: File already exists.

System action: None.

User response: Determine why file already exists. If possible, delete it. Reissue the command, after determining the cause of the error.

ANR6953E *Command: File write error.*

Explanation: An error occurred while writing to the recovery plan file.

System action: The recovery plan file was not created.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Make sure that there is sufficient space in the file system for the file. Reissue the command after determining the cause of the error.

ANR6954E *Command: Unable to open file 'file name' for output.*

Explanation: An error occurred while opening the recovery plan file for output.

System action: The recovery plan file was not created.

User response: Examine error messages that may have

been displayed prior to this message and correct any problems, if possible. Make sure that the server has proper authority to write to the file indicated. Reissue the command after determining the cause of the error.

ANR6959E *Command: Plan instructions prefix 'instructions prefix' is not valid.*

Explanation: The prefix specified for recovery instructions is not valid.

System action: The recovery plan file was not created.

User response: Reissue the command specifying a valid prefix.

ANR6960E *Command: Recovery plan prefix 'plan prefix' is not valid.*

Explanation: The prefix specified for the recovery plan file is too long.

System action: The recovery plan file was not created.

User response: Reissue the command specifying a valid prefix.

ANR6962E *Command: Query database failed.*

Explanation: A server database query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6963E *Command: Query log failed.*

Explanation: A server database query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6964E *Command: Query storage pool failed.*

Explanation: A server database query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6965E *Command: Query volume failed.*

Explanation: An server database query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6966E *Command: Query database volume failed.*

Explanation: A server database query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6967E *Command: Query log volume failed.*

Explanation: A server database query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6968E *Command: Query volume history failed.*

Explanation: An server database query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6969E *Command: Query device class failed.*

Explanation: An server database query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6970E *Command: A recovery plan file is already being created.*

Explanation: The server command processor will not start a background process to execute another PREPARE command.

System action: The command process ends and server operation continues.

User response: Reissue the command after the first PREPARE command has completed.

ANR6971E *Command: Could not delete plan file *plan file name*.*

Explanation: Prepare command failed but the plan file created could not be deleted.

System action: None.

User response: Delete the plan file.

ANR6972E *Command: Query machine failed.*

Explanation: A server machine query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6973E *Command: Query recovery media failed.*

Explanation: A server recovery media query error occurred. This message always accompanies another error message and provides more detail about that error.

System action: The recovery plan file was not created.

User response: Issue a QUERY ACTLOG command to view the activity log and search for messages. If the error cannot be isolated and resolved, contact your service representative.

ANR6974E *Command: Unable to open file *file name*.*

Explanation: An error occurred while PREPARE was attempting to open the local recovery plan file copy in order to send it to the target server.

System action: The recovery plan file is not stored on the target server.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Reissue the command after determining the cause of the error.

ANR6975E *Command: Unable to read file file name.*

Explanation: An error occurred while PREPARE was attempting to read the local recovery plan file copy in order to send it to the target server.

System action: The recovery plan file is not stored on the target server.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Reissue the command after determining the cause of the error.

ANR6976E *Command: The recovery plan file was not stored on another server and the local copy file name cannot be deleted.*

Explanation: Due to a processing error, a recovery plan file was not stored on target server and the local copy of the plan file cannot be deleted.

System action: PREPARE processing ends.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. After determining the cause of the error, re-issue the PREPARE command and delete the local recovery plan file.

ANR6977E *Command: Device class name device class name exceeds maximum characters characters.*

Explanation: The command shown has been entered and specifies a device class name that is too long. The maximum valid length for a device class name is shown in the message.

System action: The server does not process the command.

User response: Reissue the command specifying a valid device class name.

ANR6978E *Command: Invalid device class device class name.*

Explanation: The specified device class cannot be used by the command shown. Possible reasons include:

- The device class is not defined.
- The device class is defined but not of type SERVER.
- The name specified is an invalid device class name.

System action: The server does not process the command.

User response: Reissue the command with a valid device class.

ANR6979E *Command: Recovery plan file was not created. Specified device class device class name.*

Explanation: A recovery plan file cannot be not created using the specified device class.

System action: Recovery plan file not created.

User response: Examine error messages that may have been displayed prior to this message and correct any problems, if possible. Reissue the command, after determining the cause of the error.

ANR6980E *Command: Prefix prefix exceeds maximum characters characters.*

Explanation: The command shown has been entered and specifies a plan or instructions prefix that is too long. The maximum valid length is shown in the message.

System action: The server does not process the command.

User response: Reissue the command specifying a shorter prefix.

ANR6984E *Command: Out of space on sequential media, scratch media could not be mounted. Specified device class device class name; maximum capacity: number of bytes bytes.*

Explanation: During command PREPARE processing, the process encounters an out-of-space condition writing to the sequential media. Command PREPARE ends when there is no more space on the sequential media for storing data.

System action: Command PREPARE processing ends. Server processing continues.

User response: Increase the device class maximum capacity and reissue the PREPARE command. If an object was created on the target server, issue the RECONCILE VOLUMES FIX=YES to delete the object from the target server.

ANR6985E *Command: Error encountered in accessing data storage - volume already in use.*

Explanation: During command *command* processing, a volume cannot be used because it is already defined in a storage pool, or has been previously used by an export, database dump, database backup, or DRM prepare operation or is in use by another process.

System action: The command *command* operation is ended and server operation continues.

User response: Re-issue the PREPARE command.

ANR6986E *Command: The DELETELATEST parameter is only valid for volume history types RPFIL or RPFNAPSHOT.*

Explanation: The command failed because an invalid volume history type was specified for the TYPE= parameter.

System action: The command fails, and server operation continues.

User response: Re-issue the command and specify a valid type value.

ANR7800I (AIX) DSMSEV generated at time on date.

Explanation: The server module was generated at the indicated date and time.

System action: Server operation continues.

User response: None.

ANR7800I (HP-UX) DSMSEV generated at time on date.

Explanation: The server module was generated at the indicated date and time.

System action: Server operation continues.

User response: None.

ANR7800I (Linux) DSMSEV generated at time on date.

Explanation: The server module was generated at the indicated date and time.

System action: Server operation continues.

User response: None.

ANR7800I (Solaris) DSMSEV generated at time on date.

Explanation: The server module was generated at the indicated date and time.

System action: Server operation continues.

User response: None.

ANR7800I (Windows) DSMSEV generated at time on date.

Explanation: The server module was generated at the indicated date and time.

System action: Server operation continues.

User response: None.

ANR7801I (AIX) Subsystem process ID is process identifier.

Explanation: The server process has the indicated process identifier.

System action: Server operation continues.

User response: None.

ANR7801I (HP-UX) Subsystem (master) process ID is process identifier.

Explanation: The server's master HP-UX process has the indicated process identifier.

System action: Server operation continues.

User response: None.

ANR7801I (Linux) Subsystem process ID is process identifier.

Explanation: The server process has the indicated process identifier.

System action: Server operation continues.

User response: None.

ANR7801I (Solaris) Subsystem process ID is process identifier.

Explanation: The server process has the indicated process identifier.

System action: Server operation continues.

User response: None.

ANR7802E (AIX) Shared memory segments for a server running in the current directory already exist. The -F parameter can be used to overwrite.

Explanation: Shared memory segments are created for each instance of the server based on the current directory. This message indicates that the shared memory segments already exist. A server is presently running from the current directory or a server running from the current directory ended abnormally.

System action: The server terminates.

User response: If the server running in the current directory terminated abnormally, start dsmserv with the -F parameter to force the existing shared memory segments to be overwritten. If you want to run multiple instances of the server, each instance must be run from a separate directory with a separate dsmserv.dsk file and have separate log, database, and storage volumes.

ANR7803E (AIX) Attempt to overwrite a shared memory segment, as directed with the -F parameter, FAILED.

Explanation: The server has been started with the -F parameter and unsuccessfully attempted to overwrite existing shared memory segments. This error occurs when the user that starts the server with -F parameter is not the owner of the shared memory segments and lacks the required authority.

System action: Server terminates.

User response: Resolve the authorization problem and restart the server.

ANR7804I (AIX) An server is already running from this directory.

Explanation: The server has attempted to open the admserv.lock file in the current directory but failed to do so because an existing server already has the file open.

System action: Server terminates.

User response: Examine the contents of the admserv.lock file. The process ID for the server that is running is recorded in this file. Two servers cannot be started from the same directory. You may remove the admserv.lock file and attempt to start the server ONLY if the recorded process ID is NOT currently running dsmserv. The 'ps -e' AIX command can be used to display processes that are currently running.

ANR7804I (HP-UX) A server is already running from this directory.

Explanation: The server has attempted to open the admserv.lock file in the current directory but failed to do so because an existing server already has the file open.

System action: Server terminates.

User response: Examine the contents of the admserv.lock file. The process ID for the server that is running is recorded in this file. Two servers cannot be started from the same directory. You may remove the admserv.lock file and attempt to start the server ONLY if the recorded process ID is NOT currently running dsmserv. The 'ps -e' command can be used to display processes that are currently running.

ANR7805E (AIX) Volume *volume name* is in use by another server.

Explanation: The server has attempted to open a disk volume but has discovered that the volume is in use by another server.

System action: The open operation fails for the volume.

User response: To prevent concurrent RAW volume access by more than one server, files are created in the /tmp directory to 'lock' these volumes. The names of these temporary files are /tmp/adsm.disk.dev.<volumename> where <volumename> is the name of the RAW volume defined in the /dev directory. Please note that the name for the logical volume as defined in SMIT is represented in the /dev directory with a leading 'r' character (for example, a raw volume defined in SMIT as dsmstg1 will be represented in the /dev directory as the file /dev/rdsmstg1).

You may use the AIX 'ps -e' command to determine if other dsmserv processes are running. You may remove the temporary lock files and attempt to re-start the server ONLY if there are no other dsmserv processes running

ANR7805E (Linux) Volume *volume name* is in use by another server.

Explanation: The server has attempted to open a disk volume but has discovered that the volume is in use by another server.

System action: The open operation fails for the volume.

User response: To prevent concurrent RAW volume access by more than one server, files are created in the /tmp directory to 'lock' these volumes. The names of these temporary files are /tmp/adsm.disk.dev.<volumename> where <volumename> is the name of the RAW volume defined in the /dev directory. Please note that the name for a RAW logical volume as defined in Solaris is in the /dev directory with a leading 'r' character (for example, a raw volume defined in Solaris on a regular SCSI drive as dsk/c0t0d0s0 will be represented in the /dev directory as the file /dev/rdisk/c0t0d0s0). For a REGULAR DISK volume, the server automatically locks/unlocks a volume. Different linked file names pointing to the same volume will cause this message since the server locks the linked volume, not the link name itself.

You may use the Solaris 'ps -ef | grep dsmserv' command to determine if other dsmserv processes are running. You may remove the temporary lock files for RAW volumes and attempt to re-start the server ONLY if there are no other dsmserv processes are running.

ANR7805E (Solaris) Volume *volume name* is in use by another server.

Explanation: The server has attempted to open a disk volume but has discovered that the volume is in use by another server.

System action: The open operation fails for the volume.

User response: To prevent concurrent RAW volume access by more than one server, files are created in the

/tmp directory to 'lock' these volumes. The names of these temporary files are /tmp/adsm.disk.dev.<volumename> where <volumename> is the name of the RAW volume defined in the /dev directory. Please note that the name for a RAW logical volume as defined in Solaris is in the /dev directory with a leading 'r' character (for example, a raw volume defined in Solaris on a regular SCSI drive as dsk/c0t0d0s0 will be represented in the /dev directory as the file /dev/rdsk/c0t0d0s0). For a REGULAR DISK volume, the server automatically locks/unlocks a volume. Different linked file names pointing to the same volume will cause this message since the server locks the linked volume, not the link name itself.

You may use the Solaris 'ps -ef | grep dsmserv' command to determine if other dsmserv processes are running. You may remove the temporary lock files for RAW volumes and attempt to re-start the server ONLY if there are no other dsmserv processes are running.

ANR7806W (AIX) Unable to open file *file*.

Explanation: The server was unable to open the indicated file.

System action: The operation that was to use the indicated file fails. A subsequent unnumbered message had details from the system.

User response: Determine the reason for being unable to open the file and re-attempt the operation. Common reasons for being unable to open the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner.

ANR7806W (HP-UX) Unable to open file *file*.

Explanation: The server was unable to open the indicated file.

System action: The operation that was to use the indicated file fails. A subsequent unnumbered message had details from the system.

User response: Determine the reason for being unable to open the file and re-attempt the operation. Common reasons for being unable to open the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner.

ANR7806W (Linux) Unable to open file *file*.

Explanation: The server was unable to open the indicated file.

System action: The operation that was to use the indicated file fails. A subsequent unnumbered message had details from the system.

User response: Determine the reason for being unable to open the file and re-attempt the operation. Common

reasons for being unable to open the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner.

ANR7806W (Solaris) Unable to open file *file*.

Explanation: The server was unable to open the indicated file.

System action: The operation that was to use the indicated file fails. A subsequent unnumbered message had details from the system.

User response: Determine the reason for being unable to open the file and re-attempt the operation. Common reasons for being unable to open the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner.

ANR7806W (Windows) Unable to open file *file*.

Explanation: The server was unable to open the indicated file.

System action: The operation that was to use the indicated file fails. A subsequent unnumbered message had details from the system.

User response: Determine the reason for being unable to open the file and re-attempt the operation. Common reasons for being unable to open the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner. The file may be already opened by the server or another program.

ANR7807W (AIX) Unable to get information for file *file*.

Explanation: The server was unable to get information about the indicated file.

System action: The operation that was to use the indicated file fails. A subsequent, unnumbered message has details from the system.

User response: Determine the reason for being unable to access the file and re-attempt the operation. Common reasons for being unable to access the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner.

ANR7807W (HP-UX) Unable to get information for file *file*.

Explanation: The server was unable to get information about the indicated file.

System action: The operation that was to use the indicated file fails. A subsequent, unnumbered message has details from the system.

ANR7807W (Linux) • ANR7810E (HP-UX)

User response: Determine the reason for being unable to access the file and re-attempt the operation.

Common reasons for being unable to access the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner.

ANR7807W (Linux) Unable to get information for file *file*.

Explanation: The server was unable to get information about the indicated file.

System action: The operation that was to use the indicated file fails. A subsequent, unnumbered message has details from the system.

User response: Determine the reason for being unable to access the file and re-attempt the operation.

Common reasons for being unable to access the file include providing the wrong name, having insufficient authorization to open the file, not being the file's owner, or too many soft links to the file. If trying to access a RAW partition, the server must be started with superuser privileges.

ANR7807W (Solaris) Unable to get information for file *file*.

Explanation: The server was unable to get information about the indicated file.

System action: The operation that was to use the indicated file fails. A subsequent, unnumbered message has details from the system.

User response: Determine the reason for being unable to access the file and re-attempt the operation.

Common reasons for being unable to access the file include providing the wrong name, having insufficient authorization to open the file, not being the file's owner, or too many soft links to the file. If trying to access a RAW partition, the server must be started with superuser privileges.

ANR7807I (Windows) Sun Microsystems Library Attach module *module name* has been loaded.

Explanation: The module indicated has been successfully loaded. Operations involving this module may now be performed by the server.

System action: The server now supports ACSLS functions that depend on this module.

User response: None.

ANR7808W (AIX) root user authority required for non-default scheduling policy.

Explanation: The server was unable to use the scheduling policy specified in the options file. The

server must be running with root authority to use any scheduling policy other than the default.

System action: Operation continues but with the default scheduling policy.

User response: Run the server with root authority or don't specify a scheduling policy in the options file.

ANR7808W (Windows) Sun Microsystems Library Attach module *module name* is not available from the system.

Explanation: The server attempted to load the Library Attach module. However, this module is not installed to the system.

System action: Server operation continues, but without ACSLS function.

User response: Ensure that the Library Attach module is installed to the system.

ANR7809I (AIX) Using scheduling policy *policy*.

Explanation: All threads in the server will use the specified scheduling policy.

System action: Operations continue.

User response: None

ANR7810W (AIX) Unable to create a new child process.

Explanation: The server cannot create a new child thread.

System action: Server processing continues. Other error messages from the server component are displayed.

User response: Ensure that sufficient paging space is available for AIX. If the server has been started from a non-root user ID, ensure that the AIX process limit per user is sufficient for the server. The server requires approximately 24 processes, in addition to one process per client session, and one process for each background operation. Each thread started by the server is an AIX process. To change the number of processes per user, use the SMIT menus for System Environment, and choose Change / Show Characteristics of Operating System. You may also use SMIT to determine if the number of applications is causing a memory shortage. It may be necessary to decrease the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7810E (HP-UX) Error creating console input thread.

Explanation: Unable to start console input thread.

System action: Server operation stops.

User response: See other issued messages.

ANR7810E (Linux) Error creating console input thread.

Explanation: Unable to start console input thread.

System action: Server operation stops.

User response: See other issued messages.

ANR7810E (Solaris) Error creating console input thread.

Explanation: Unable to start console input thread.

System action: Server operation stops.

User response: See other issued messages.

ANR7811I (AIX) Using instance directory *instance directory*.

Explanation: The server is operating out of the indicated directory.

System action: Server processing continues.

User response: None.

ANR7811E (HP-UX) Insufficient memory for console initialization.

Explanation: The server is unable to allocate enough memory for console initialization.

System action: Server operation stops.

User response: Ensure that there is sufficient paging space for HP-UX. It may be necessary to reduce the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7811E (Linux) Insufficient memory for console initialization.

Explanation: The server is unable to allocate enough memory for console initialization.

System action: Server operation stops.

User response: Ensure that there is sufficient paging space. It may be necessary to reduce the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7811E (Solaris) Insufficient memory for console initialization.

Explanation: The server is unable to allocate enough memory for console initialization.

System action: Server operation stops.

User response: Ensure that there is sufficient paging space for Sun Solaris. It may be necessary to reduce the

maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7812E (HP-UX) Insufficient memory to buffer console input. The following input line was discarded: *discarded console input*.

Explanation: An error occurs during an attempt to allocate a buffer to hold the specified console input.

System action: The console input is discarded.

User response: Ensure that there is sufficient paging space for HP-UX. It may be necessary to reduce the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7812E (Linux) Insufficient memory to buffer console input. The following input line was discarded: *discarded console input*.

Explanation: An error occurs during an attempt to allocate a buffer to hold the specified console input.

System action: The console input is discarded.

User response: Ensure that there is sufficient paging space. It may be necessary to reduce the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7812E (Solaris) Insufficient memory to buffer console input. The following input line was discarded: *discarded console input*.

Explanation: An error occurs during an attempt to allocate a buffer to hold the specified console input.

System action: The console input is discarded.

User response: Ensure that there is sufficient paging space for Sun Solaris. It may be necessary to reduce the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7813W (AIX) The *server mode-bit server* is not supported on a *kernel mode-bit kernel*.

Explanation: The 32-bit server is supported only when running with the 32-bit kernel, and the 64-bit server is supported only when running the 64-bit kernel.

System action: Server processing continues.

User response: You must match the server mode with the kernel mode by either switching the kernel mode or installing the correct server fileset.

ANR7813W (Linux) Unable to create a new child thread.

Explanation: The server cannot create a new child thread.

System action: Server processing continues. Other

ANR7813W (Solaris) • ANR7820S (Linux)

error messages from the server component are displayed.

User response: Ensure that sufficient swap space is available for Solaris. The amount of swap available can be obtained by executing 'swap -l'. If the number of free blocks is low, you can add swap files while the system is running by executing 'mkfile' and then 'swap -a'. See the Solaris man pages on 'mkfile' and 'swap' for more details.

If the server has been started from a non-root user ID, ensure that the process limit per user is sufficient to accommodate the server. You can tune the 'maxusers=##' parameter in the /etc/system file to increase the number of number of users that can be on the system at one time. This will also force the kernel to allocate more memory/swap for user-processes.

A system reboot with the 'reconfigure' option is required for the new user settings to take effect. It may be necessary to decrease the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7813W (Solaris) Unable to create a new child thread.

Explanation: The server cannot create a new child thread.

System action: Server processing continues. Other error messages from the server component are displayed.

User response: Ensure that sufficient swap space is available for Solaris. The amount of swap available can be obtained by executing 'swap -l'. If the number of free blocks is low, you can add swap files while the system is running by executing 'mkfile' and then 'swap -a'. See the Solaris man pages on 'mkfile' and 'swap' for more details. If the server has been started from a non-root user ID, ensure that the Solaris process limit per user is sufficient for the server. You can tune the 'maxusers=##' parameter in the /etc/system file to increase the number of number of users that can be on the system at one time. This will also force the kernel to allocate more memory/swap for user-processes. A system reboot with the 'reconfigure' option is required for the new user settings to take effect. It may be necessary to decrease the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7814I (HP-UX) Using instance directory *instance directory*.

Explanation: The server is operating out of the indicated directory.

System action: Server processing continues.

User response: None.

ANR7814I (Linux) Using instance directory *instance directory*.

Explanation: The server is operating out of the indicated directory.

System action: Server processing continues.

User response: None.

ANR7814I (Solaris) Using instance directory *instance directory*.

Explanation: The server is operating out of the indicated directory.

System action: Server processing continues.

User response: None.

ANR7820E (AIX) Insufficient memory to buffer console input; the following input line was discarded: *discarded console input*.

Explanation: An error occurs during an attempt to allocate a buffer large enough to read console input.

System action: The console input is discarded.

User response: Ensure that sufficient paging space is available for AIX. You may also use SMIT to determine if the number of applications is causing a memory shortage. It may be necessary to decrease the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7820S (HP-UX) Server thread *thread ID* terminated in response to program abort.

Explanation: The thread has ended due to a program abort.

System action: The server completes termination processing.

User response: Note the associated messages and contact your service representative.

ANR7820S (Linux) Thread *thread ID* terminated in response to program abort.

Explanation: The thread has ended due to a program abort.

System action: The server completes termination processing.

User response: Note the associated messages and call your service representative.

ANR7820S (Solaris) Server thread *thread ID* terminated in response to program abort.

Explanation: The thread has ended due to a program abort.

System action: The server completes termination processing.

User response: Note the associated messages and call your service representative.

ANR7820W (Windows) Insufficient Space Available for file *file name*.

Explanation: The server was attempting to create a file with the indicated name. There was insufficient space for the file on the disk.

System action: Server processing continues. The file creation request fails.

User response: Free additional space on the drive to accommodate the file, specify a file name on a drive with sufficient space, or change the space request to a value consistent with the drive. Retry the operation.

ANR7821I (HP-UX) Server thread *thread ID* terminated in response to external signal.

Explanation: The thread has ended due to an external signal.

System action: The server completes termination processing.

User response: None.

ANR7821I (Linux) Thread *thread ID* terminated in response to external signal.

Explanation: The thread has ended due to an external signal.

System action: The server completes termination processing.

User response: None.

ANR7821I (Solaris) Server thread *thread ID* terminated in response to external signal.

Explanation: The thread has ended due to an external signal.

System action: The server completes termination processing.

User response: None.

ANR7821W (Windows) Unable to create directory when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. A new directory was being created as well, but its creation failed.

System action: Server processing continues. The file creation request fails.

User response: Specify a file name in an existing directory or change the name request to specify a different directory name.

ANR7822E (AIX) Error creating console input thread.

Explanation: Unable to start console input thread.

System action: Server operation stops.

User response: See other issued messages.

ANR7822I (HP-UX) Server thread *thread ID* terminated in response to server shutdown.

Explanation: The thread has ended due to a server shutdown.

System action: The server completes termination processing.

User response: None.

ANR7822I (Linux) Thread *thread ID* terminated in response to server shutdown.

Explanation: The thread has ended due to a server shutdown.

System action: The server completes termination processing.

User response: None.

ANR7822I (Solaris) Server thread *thread ID* terminated in response to server shutdown.

Explanation: The thread has ended due to a server shutdown.

System action: The server completes termination processing.

User response: None.

ANR7822W (Windows) File Already exists when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The file already exists.

System action: Server processing continues. The file creation request fails.

ANR7823E (AIX) • ANR7825E (Solaris)

User response: Specify a new file name. The server will not use an existing file name when creating a file.

ANR7823E (AIX) Insufficient memory for console initialization.

Explanation: Unable to allocate enough memory for console initialization.

System action: Server operation stops.

User response: Ensure that sufficient paging space is available for AIX. You may also use SMIT to determine if the number of applications is causing a memory shortage. It may be necessary to decrease the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR7823S (Linux) Internal error *internal error* detected.

Explanation: An internal error is detected during server initialization or operation.

System action: Server operation stops.

User response: Contact your service representative.

ANR7823W (Windows) Unable to create file *file name*.

Explanation: The server was attempting to create a file with the indicated name. The system reported an error in creating the file.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name.

ANR7824E (AIX) Error loading Async I/O support module.

Explanation: The server attempted to load the Async I/O support module, but the load failed. Refer to accompanying error message for details on the load failure.

System action: Server operation continues, but without Async I/O support.

User response: Ensure that the correct support module exists in the server bin directory and that the aio subsystem has been configured on AIX, and that AIX was rebooted after the configuration.

ANR7824S (HP-UX) Server operation terminated.

Explanation: An error occurs that causes server operation to stop.

System action: Server operation stops.

User response: Contact your service representative.

ANR7824S (Linux) Server operation terminated.

Explanation: An error occurs that causes server operation to stop.

System action: Server operation stops.

User response: Contact your service representative.

ANR7824S (Solaris) Server operation terminated.

Explanation: An error occurs that causes server operation to stop.

System action: Server operation stops.

User response: Contact your service representative.

ANR7824W (Windows) Unable to write volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The server was able to partially write to the file before running out of space.

System action: The server continues processing. The file creation request fails. The file is still present on the system.

User response: Specify a new file name where there is sufficient space.

ANR7825E (Linux) Server unable to allocate a shared memory segment of size *Client requested shared memory size*.

Explanation: A shared memory client has requested a shared memory segment size that Solaris is unable to fulfill.

System action: Client is not allowed to logon

User response: See the shared memory tuning guide for Solaris (a Sun document). You may need to increase the number/size of shared memory segments and/or message queues.

ANR7825E (Solaris) Server unable to allocate a shared memory segment of size *Client requested shared memory size*.

Explanation: A shared memory client has requested a shared memory segment size that Solaris is unable to fulfill.

System action: Client is not allowed to logon

User response: See the shared memory tuning guide for Solaris (a Sun document). You may need to increase the number/size of shared memory segments and/or message queues.

ANR7825W (Windows) Unable to create volume *file name*. Return code= *return code*.

Explanation: The server was attempting to create a file with the indicated name. The attempt failed with the indicated return code. The return code is an internal code from the server.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name. The return code may also be provided to your service representative for interpretation.

ANR7826W (Windows) Creation of Volume *file name* failed. Process was cancelled.

Explanation: The server was attempting to create a file with the indicated name. The attempt was cancelled by a cancel process command.

System action: The server continues processing. The file creation request fails.

User response: The DEFINE command may be re-entered.

ANR7830E (Linux) Invalid RAW Partition Name: A valid raw partition name is in the form of /dev/.../rdsk/.../* , where ... means 0 or more directories.

Explanation: Use the proper format for specifying a Raw partition. The ... means zero or more directories.

System action: Inform the user to use the right RAW partition specification.

User response: Have user reenter the RAW partition with the proper partition name.

ANR7830E (Solaris) Invalid RAW Partition Name: A valid raw partition name is in the form of /dev/.../rdsk/.../* , where ... means 0 or more directories.

Explanation: Use the proper format for specifying a Raw partition. The ... means zero or more directories.

System action: Inform the user to use the right RAW partition specification.

User response: Have user reenter the RAW partition with the proper partition name.

ANR7831E (Linux) *raw partition name* has an existing filesystem.

Explanation: The RAW partition specified has an existing Solaris file system on it. Writing to this Partition may/and most likely will destroy this filesystem.

System action: Warn the user that an existing

filesystem for the raw partition specified may be destroyed if written to.

User response: Determine if user still wants the valid filesystem data. If not, user needs to destroy the filesystem by either formatting the partition, create a program to destroy the filesystem header information so that the server will not be able to detect the filesystem header information, or rearrange the starting and ending blocks of a partition by using the Solaris format() command. The user can read the format() function in the Sun manuals for further details on filesystems.

ANR7831E (Solaris) *raw partition name* has an existing filesystem.

Explanation: The RAW partition specified has an existing Solaris file system on it. Writing to this partition will most likely destroy this filesystem.

System action: Warn the user that an existing filesystem for the raw partition specified may be destroyed if written to.

User response: Determine if user still wants the valid filesystem data. If not, user needs to destroy the filesystem by either formatting the partition, create a program to destroy the filesystem header information so that the server will not be able to detect the filesystem header information, or rearrange the starting and ending blocks of a partition by using the Solaris format() command. The user can read the format() function in the Sun manuals for further details on filesystems.

ANR7832I (AIX) The thread *process ID* terminated with exit code *program exit code*.

Explanation: The process has ended with the indicated exit code. This error is due to the problem caused and indicated by a preceding message.

System action: The server completes termination processing.

User response: None.

ANR7832E (Linux) *raw partition name* corresponds to a protected filesystem, such as / or /usr.

Explanation: The RAW partition specified has an existing file system on it. This filesystem is the / or /usr partition. If the SERVER writes to it, it will most likely crash the whole operating system.

System action: Disallow access to this raw partition.

User response: Have user specify another RAW partition that is not the / or /usr. It may be possible that this is not the actual / or /usr partition of the boot disk. Check, using the Solaris format() command, if your partition name tag is labeled incorrectly as / or /usr.

ANR7832E (Solaris) *raw partition name corresponds to a protected filesystem, such as / or /usr.*

Explanation: The RAW partition specified has an existing file system on it. This filesystem is the / or /usr partition. If the SERVER writes to it, it will most likely crash the whole operating system.

System action: Disallow access to this raw partition.

User response: Have user specify another RAW partition that is not the / or /usr. It may be possible that this is not the actual / or /usr partition of the boot disk. Check, using the Solaris format() command, if your partition name tag is labeled incorrectly as / or /usr.

ANR7833S (AIX) *The process thread ID terminated in response to program abort.*

Explanation: The thread has ended due to a program abort.

System action: The server completes termination processing.

User response: None.

ANR7833E (Linux) *symbolic links has too many symbolic links - the maximum allowable is 10.*

Explanation: The file specified has too many symbolic links. The server will follow at most 10 links before ending this symbolic link name resolution.

System action: Disallow access to this file.

User response: Have the user specify the actual file, where the file is not a symbolic link. Using ls -l, one can see if the file is a symbolic link.

ANR7833E (Solaris) *symbolic links has too many symbolic links - the server only supports a maximum of 10.*

Explanation: The file specified has too many symbolic links. The server will follow at most 10 links before ending this symbolic link name resolution.

System action: Disallow access to this file

User response: Have the user specify the actual file, where the file is not a symbolic link. Using ls -l, one can see if the file is a symbolic link.

ANR7834I (AIX) *The thread thread ID terminated in response to external signal.*

Explanation: The thread has ended due to an external signal.

System action: The server completes termination processing.

User response: None.

ANR7834E (Linux) *Specified raw partition name raw partition cannot contain the 0th disk cylinder.*

Explanation: The raw partition specified has the 0th disk cylinder. The server should not be allowed to write into the 0th cylinder. If allowed, the disk label would be corrupted.

System action: Disallow access to this raw partition.

User response: Have the system administrator change the starting cylinder of this partition to a number greater than 0.

ANR7834E (Solaris) *Specified raw partition name raw partition cannot contain the 0th disk cylinder.*

Explanation: The raw partition specified has the 0th disk cylinder. The server should not be allowed to write into the 0th cylinder. It allowed, the disk label would be corrupted.

System action: Disallow access to this raw partition

User response: Have the system administrator change the starting cylinder of this partition to a number greater than 0.

ANR7834I (Windows) *The server thread thread ID (tid Windows NT thread ID) terminated in response to external signal.*

Explanation: The thread has terminated due to an external signal.

System action: The server completes termination processing.

User response: None.

ANR7835I (AIX) *The server thread thread ID terminated in response to server shutdown.*

Explanation: The thread has ended due to a server shutdown.

System action: The server completes termination processing.

User response: None.

ANR7835E (Linux) *Specified raw partition name raw partition is too big for this operating system to handle.*

Explanation: The raw partition specified has greater than 2GB and the operating system is running below Solaris 2.6. Operating system below Solaris 2.6 cannot handle files natively more than 2GB. For operating

system that is at Solaris 2.6 or above, the limit is 1TB.

System action: Disallow access to this raw partition.

User response: Have the system administrator change the RAW partition size to be less than 2GB (4194303 512-byte disk blocks) for Solaris 2.5.1 or below, less than 1TB (2147483647 512-byte disk blocks) for Solaris 2.6 and above.

ANR7835E (Solaris) Specified raw partition name raw partition is too big for this operating system to handle.

Explanation: The raw partition specified has greater than 2GB and the operating system is running below Solaris 2.6. Operating system below Solaris 2.6 cannot handle files natively more than 2GB. For operating system that is at Solaris 2.6 or above, the limit is 1TB.

System action: Disallow access to this raw partition

User response: Have the system administrator change the RAW partition size to be less than 2GB (4194303 512-byte disk blocks) for Solaris 2.5.1 or below, less than 1TB (2147483647 512-byte disk blocks) for Solaris 2.6 and above.

ANR7835I (Windows) The server thread *thread ID* (tid *Windows NT thread ID*) terminated in response to server shutdown.

Explanation: The thread has terminated due to a server shutdown.

System action: The server completes termination processing.

User response: None.

ANR7836S (AIX) Server initialization terminated.

Explanation: An error occurs that causes server initialization to end.

System action: Server operation stops.

User response: Contact your service representative.

ANR7837S (AIX) Internal error *internal error* detected.

Explanation: An internal error is detected during server initialization or operation.

System action: Server operation stops.

User response: Contact your service representative. The user needs to extend the log file with dsmserv extend log logname size when he gets ANR7837S, LOGSEG871 errors.

ANR7837S (Windows) Internal error *The internal error that was detected.* detected.

Explanation: An internal error was detected during server initialization or operation.

System action: Server operation will halt.

User response: Contact your service representative. The user needs to extend the log file with dsmserv extend log logname size when he gets ANR7837S, LOGSEG871 errors.

ANR7838S (AIX) Server operation terminated.

Explanation: An error occurs that causes server operation to stop.

System action: Server operation stops.

User response: Contact your service representative.

ANR7841S (AIX) Insufficient kernel memory available.

Explanation: An error occurs due to insufficient kernel memory.

System action: Server operation stops.

User response: Contact your service representative.

ANR7842S (AIX) Monitor kernel extension not initialized.

Explanation: The monitor kernel extension is not initialized.

System action: Server operation stops.

User response: Contact your service representative.

ANR7843W (AIX) Unable to determine real memory size.

Explanation: The server checks the amount of real memory in the system to optimize use of storage in the database buffer pool. The server uses Object Data Manager (ODM) to determine how much real memory is installed on the system. The routines used to call ODM failed or were unable to return the real memory size.

System action: Server operation continues. The server allows the data base buffer pool size to grow without taking into account real memory.

User response: The server may need to run as a root user to obtain this information.

ANR7843W (HP-UX) • ANR7854W (Windows)

ANR7843W (HP-UX) Unable to determine real memory size.

Explanation: The server checks the amount of real memory in the system to optimize use of storage in the database buffer pool. The routines used to obtain this information returned a failing return code or were unable to return the real memory size.

System action: Server operation continues. The server allows the data base buffer pool size to grow without taking into account real memory.

User response: The server may need to run as a root user to obtain this information.

ANR7843W (Linux) Unable to determine real memory size.

Explanation: The server checks the amount of real memory in the system to optimize use of storage in the database buffer pool. The server uses Object Data Manager (ODM) to determine how much real memory is installed on the system. The routines used to call ODM failed or were unable to return the real memory size.

System action: Server operation continues. The server allows the data base buffer pool size to grow without taking into account real memory.

User response: The server may need to run as a root user to obtain this information.

ANR7843W (Solaris) Unable to determine real memory size.

Explanation: The server checks the amount of real memory in the system to optimize use of storage in the database buffer pool. The routines used to obtain this information returned a failing return code or were unable to return the real memory size.

System action: Server operation continues. The server allows the data base buffer pool size to grow without taking into account real memory.

User response: The server may need to run as a root user to obtain this information.

ANR7843W (Windows) Unable to determine real memory size.

Explanation: The server checks the amount of real memory in the system to optimize use of storage in the database buffer pool. The routines used to obtain this information returned a failing return code or were unable to return the real memory size.

System action: Server operation continues. The server allows the data base buffer pool size to grow without taking into account real memory.

User response: The server may need to run as a root

user to obtain this information.

ANR7849I (AIX) Server operation terminated - kernel extension has been reset.

Explanation: The kernel extension has been reinitialized by the server in response to a previous condition for which a message has been issued.

System action: Server operation stops.

User response: None.

ANR7850I (AIX) The process *process ID* has terminated on signal *signal number (signal name)*.

Explanation: The specified process has ended due to the specified signal.

System action: Server operation stops.

User response: Contact your service representative.

ANR7851S (AIX) Error resetting handler for signal *signal number (signal name)*.

Explanation: An error occurs resetting the specified signal handler.

System action: Server operation stops.

User response: Contact your service representative.

ANR7852I (Windows) The current process affinity mask is: 0x*The process affinity mask*.

Explanation: The server is running on the processors indicated by the mask.

System action: Server operation continues.

User response: None.

ANR7853W (Windows) Could not obtain the current process affinity mask. Reason: *NT return code*.

Explanation: A problem was encountered while obtaining the current process affinity.

System action: Server operation continues.

User response: None.

ANR7854W (Windows) The process affinity mask (*0xAffinity mask*.) specified in *dsmserv.opt* is out of range.

Explanation: The affinity mask value was out of range.

System action: Server operation continues.

User response: None.

ANR7855W (Windows) Could not set new process affinity mask. Reason: *NT return code.*

Explanation: A problem was encountered in setting a new process affinity mask.

System action: Server operation continues.

User response: None.

ANR7856W (Windows) The affinity mask (0xNT return code.) was set to a value other than what was requested

Explanation: A new affinity mask was set but on verification it was found not to match what was requested.

System action: Server operation continues.

User response: None.

ANR7859W (AIX) Error reading from standard input.

Explanation: An error occurs during an attempt to read from standard input.

System action: The console input thread is terminated.

User response: This is normal if the server is running as part of the installation, in a cron job, or is started in the background. This can occur if the server is started in a telnet or ssh session and that session is killed effectively creating a background process. If this is unintended, stop the server and restart in the foreground.

ANR7859W (HP-UX) Error reading from standard input.

Explanation: An error occurs during an attempt to read from standard input.

System action: The console input thread is terminated.

User response: This is normal if the server is running as part of the installation, in a cron job, or is started in the background. This can occur if the server is started in a telnet or ssh session and that session is killed effectively creating a background process. If this is unintended, stop the server and restart in the foreground.

ANR7859W (Linux) Error reading from standard input.

Explanation: An error occurs during an attempt to read from standard input.

System action: The console input thread is terminated.

User response: This is normal if the server is running as part of the installation, in a cron job, or is started in the background. This can occur if the server is started in a telnet or ssh session and that session is killed

effectively creating a background process. If this is unintended, stop the server and restart in the foreground.

ANR7859W (Solaris) Error reading from standard input.

Explanation: An error occurs during an attempt to read from standard input.

System action: The console input thread is terminated.

User response: This is normal if the server is running as part of the installation, in a cron job, or is started in the background. This can occur if the server is started in a telnet or ssh session and that session is killed effectively creating a background process. If this is unintended, stop the server and restart in the foreground.

ANR7860W (AIX) Insufficient Space Available for file file name.

Explanation: The server was attempting to create a file with the indicated name. There was insufficient space for the file in the filesystem.

System action: The server continues processing. The file creation request fails.

User response: Free additional space on the drive to accommodate the file, specify a file name on a drive with sufficient space, or change the space request to a value consistent with the drive. Retry the operation.

ANR7860W (HP-UX) Insufficient Space Available for file file name.

Explanation: The server was attempting to create a file with the indicated name. There was insufficient space for the file in the filesystem.

System action: The server continues processing. The file creation request fails.

User response: Free additional space on the drive to accommodate the file, specify a file name on a drive with sufficient space, or change the space request to a value consistent with the drive. Retry the operation.

ANR7860W (Linux) Insufficient Space Available for file file name.

Explanation: The server was attempting to create a file with the indicated name. There was insufficient space for the file in the filesystem.

System action: The server continues processing. The file creation request fails.

User response: Free additional space on the drive to accommodate the file, specify a file name on a drive with sufficient space, or change the space request to a value consistent with the drive. Retry the operation.

ANR7860W (Solaris) • ANR7863W (AIX)

ANR7860W (Solaris) Insufficient Space Available for file *file name*.

Explanation: The server was attempting to create a file with the indicated name. There was insufficient space for the file in the filesystem.

System action: The server continues processing. The file creation request fails.

User response: Free additional space on the drive to accommodate the file, specify a file name on a drive with sufficient space, or change the space request to a value consistent with the drive. Retry the operation.

ANR7861W (AIX) Unable to create directory when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. A new directory was being created as well, but its creation failed.

System action: The server continues processing. The file creation request fails.

User response: Specify a file name in an existing directory or or change the name request to specify a different directory name.

ANR7861W (HP-UX) Unable to create directory when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. A new directory was being created as well, but its creation failed.

System action: The server continues processing. The file creation request fails.

User response: Specify a file name in an existing directory or or change the name request to specify a different directory name.

ANR7861W (Linux) Unable to create directory when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. A new directory was being created as well, but its creation failed.

System action: The server continues processing. The file creation request fails.

User response: Specify a file name in an existing directory or or change the name request to specify a different directory name.

ANR7861W (Solaris) Unable to create directory when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. A new directory was being created as well, but its creation failed.

System action: The server continues processing. The file creation request fails.

User response: Specify a file name in an existing directory or or change the name request to specify a different directory name.

ANR7862W (AIX) File Already exists when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The file already exists.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name. The server will not use an existing file name when creating a file.

ANR7862W (HP-UX) File Already exists when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The file already exists.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name. The server will not use an existing file name when creating a file.

ANR7862W (Linux) File Already exists when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The file already exists.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name. The server will not use an existing file name when creating a file.

ANR7862W (Solaris) File Already exists when creating volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The file already exists.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name. The server will not use an existing file name when creating a file.

ANR7863W (AIX) Unable to create file *file name*.

Explanation: The server was attempting to create a file with the indicated name. The system reported an error in creating the file.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name.

ANR7863W (HP-UX) Unable to create file *file name*.

Explanation: The server was attempting to create a file with the indicated name. The system reported an error in creating the file.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name.

ANR7863W (Linux) Unable to create file *file name*.

Explanation: The server was attempting to create a file with the indicated name. The system reported an error in creating the file.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name.

ANR7863W (Solaris) Unable to create file *file name*.

Explanation: The server was attempting to create a file with the indicated name. The system reported an error in creating the file.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name.

ANR7864W (AIX) Unable to write volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The server was able to partially write to the file before running out of space.

System action: The server continues processing. The file creation request fails. The file is still present on the system.

User response: Specify a new file name where there is sufficient space.

ANR7864W (HP-UX) Unable to write volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The server was able to partially write to the file before running out of space.

System action: The server continues processing. The file creation request fails. The file is still present on the system.

User response: Specify a new file name where there is sufficient space.

ANR7864W (Linux) Unable to write volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The server was able to partially write to the file before running out of space.

System action: The server continues processing. The file creation request fails. The file is still present on the system.

User response: Specify a new file name where there is sufficient space.

ANR7864W (Solaris) Unable to write volume *file name*.

Explanation: The server was attempting to create a file with the indicated name. The server was able to partially write to the file before running out of space.

System action: The server continues processing. The file creation request fails. The file is still present on the system.

User response: Specify a new file name where there is sufficient space.

**ANR7865W (AIX) Unable to create volume *file name*.
Return code=*return code*.**

Explanation: The server was attempting to create a file with the indicated name. The attempt failed with the indicated return code. The return code is an the server internal code.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name. The return code may also be provided to your service representative for interpretation.

ANR7865W (HP-UX) Unable to create volume *file name*. Return code=*return code*.

Explanation: The server was attempting to create a file with the indicated name. The attempt failed with the indicated return code. The return code is a server internal code.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name. The return code may also be provided to your service representative for interpretation.

ANR7865W (Linux) Unable to create volume *file name*. Return code=*return code*.

Explanation: The server was attempting to create a file with the indicated name. The attempt failed with the indicated return code. The return code is an internal code from the server.

ANR7865W (Solaris) • ANR7867I (Linux)

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name. The return code may also be provided to your service representative for interpretation.

ANR7865W (Solaris) Unable to create volume file name. Return code=return code.

Explanation: The server was attempting to create a file with the indicated name. The attempt failed with the indicated return code. The return code is a server internal code.

System action: The server continues processing. The file creation request fails.

User response: Specify a new file name. The return code may also be provided to your service representative for interpretation.

ANR7866W (AIX) Creation of Volume file name failed. Process was cancelled.

Explanation: The server was attempting to create a file with the indicated name. The attempt was cancelled by a cancel process command.

System action: The server continues processing. The file creation request fails.

User response: The DEFINE command may be re-entered.

ANR7866W (HP-UX) Creation of Volume file name failed. Process was cancelled.

Explanation: The server was attempting to create a file with the indicated name. The attempt was cancelled by a cancel process command.

System action: The server continues processing. The file creation request fails.

User response: The DEFINE command may be re-entered.

ANR7866W (Linux) Creation of Volume file name failed. Process was cancelled.

Explanation: The server was attempting to create a file with the indicated name. The attempt was cancelled by a cancel process command.

System action: The server continues processing. The file creation request fails.

User response: The DEFINE command may be re-entered.

ANR7866W (Solaris) Creation of Volume file name failed. Process was cancelled.

Explanation: The server was attempting to create a file with the indicated name. The attempt was cancelled by a cancel process command.

System action: The server continues processing. The file creation request fails.

User response: The DEFINE command may be re-entered.

ANR7867I (AIX) file name is not a multiple of disk block size block size. File size is file size, but usable space is rounded down to usable file size.

Explanation: The server was attempting to open a random access file with the indicated name. The usable space was rounded down to the indicated value so that the amount of space is an even multiple of the disk block size. This facilitates improved performance in reading and writing the file.

System action: The server continues processing. Some space in the file will go unused.

User response: No action is required. To use all space in the file, server utilities can be used to offload existing data to other volumes. The volume can then be deleted and re-created using a multiple of the disk's block size.

ANR7867I (HP-UX) file name is not a multiple of disk block size block size. File size is file size, but usable space is rounded down to usable file size.

Explanation: The server was attempting to open a random access file with the indicated name. The usable space was rounded down to the indicated value so that the amount of space is an even multiple of the disk block size. This facilitates improved performance in reading and writing the file.

System action: The server continues processing. Some space in the file will go unused.

User response: No action is required. To use all space in the file, server utilities can be used to offload existing data to other volumes. The volume can then be deleted and re-created using a multiple of the disk's block size.

ANR7867I (Linux) file name is not a multiple of disk block size block size. File size is file size, but usable space is rounded down to usable file size.

Explanation: The server was attempting to open a random access file with the indicated name. The usable space was rounded down to the indicated value so that the amount of space is an even multiple of the disk

block size. This facilitates improved performance in reading and writing the file.

System action: The server continues processing. Some space in the file will go unused.

User response: No action is required. To use all space in the file, server utilities can be used to offload existing data to other volumes. The volume can then be deleted and re-created using a multiple of the disk's block size.

ANR7867I (Solaris) *file name is not a multiple of disk block size block size. File size is file size, but usable space is rounded down to usable file size.*

Explanation: The server was attempting to open a random access file with the indicated name. The usable space was rounded down to the indicated value so that the amount of space is an even multiple of the disk block size. This facilitates improved performance in reading and writing the file.

System action: The server continues processing. Some space in the file will go unused.

User response: No action is required. To use all space in the file, server utilities can be used to offload existing data to other volumes. The volume can then be deleted and re-created using a multiple of the disk's block size.

ANR7870W (AIX) **Unable to initialize odm query.**
Error message from odm is odm message.

Explanation: The server uses the AIX Object Data Manager (ODM) to check information about AIX. For example, the server uses ODM to determine how much real memory is installed on the system. The routine used to initialize an ODM query failed. ODM returned an error message as indicated.

System action: Server operation continues. The server makes assumptions concerning information it could not obtain.

User response: The server may need to run as a root user to obtain this information.

ANR7871W (AIX) **Unable to complete odm query.**
Error message from odm is odm message.

Explanation: The server uses the AIX Object Data Manager (ODM) to check information about AIX. For example, the server uses ODM to determine how much real memory is installed on the system. The routine used to perform an ODM query failed. ODM returned an error message as indicated.

System action: Server operation continues. The server makes assumptions concerning information it could not obtain.

User response: The server may need to run as a root user to obtain this information.

ANR8195I (AIX) **The SSL TCP/IP Version 4 driver is ready for connection with clients on port *port number*.**

Explanation: The server can now accept sessions with clients using the SSL TCP/IP protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8195I (Windows) **The SSL TCP/IP Version 4 driver is ready for connection with clients on port *port number*.**

Explanation: The server can now accept sessions with clients using the SSL TCP/IP protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8196I (AIX) **The SSL TCP/IP administrative driver is ready for connection with clients on port *port number*.**

Explanation: The server can now accept sessions with administrative clients using the SSL TCP/IP protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8196I (Windows) **The SSL TCP/IP administrative driver is ready for connection with clients on port *port number*.**

Explanation: The server can now accept sessions with administrative clients using the SSL TCP/IP protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8198E (AIX) **The SSL environment has not been established. The GSK module *gsk module return code* is *gsk return code*.**

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports are not possible.

System action: Server operation continues.

User response: Stop and restart the server.

ANR8198E (Windows) The SSL environment has not been established. The GSK module *gsk* module return code is *gsk return code*.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports are not possible.

System action: Server operation continues.

User response: Stop and restart the server.

ANR8199I (AIX) The SSL TCP/IP driver could not be initialized on port *port number*.

Explanation: A problem with the SSL environment prevents Tivoli Storage Manager from establishing the SSL protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8199I (Windows) The SSL TCP/IP driver could not be initialized on port *port number*.

Explanation: A problem with the SSL environment prevents Tivoli Storage Manager from establishing the SSL protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8200I (AIX) TCP/IP Version 4 driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8200I (HP-UX) TCP/IP Version 4 driver ready for connection with clients on port *port number*.

Explanation: The server is now able to accept sessions with clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8200I (Linux) TCP/IP Version 4 driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8200I (Solaris) TCP/IP Version 4 driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8200I (Windows) TCP/IP Version 4 driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8201W (AIX) Unable to initialize TCP/IP driver - insufficient memory.

Explanation: Because the operating system rejects a memory allocation request, the server cannot start communications through TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that sufficient paging space is available for AIX. You may also use SMIT to determine if the number of applications is causing a memory shortage. It may be necessary to decrease the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR8201E (HP-UX) Unable to initialize TCP/IP driver - socket creation failed; error *error code*.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket creation error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8201E (Linux) Unable to initialize TCP/IP driver - socket creation failed; error *error code*.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket creation error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8201E (Solaris) Unable to initialize TCP/IP driver - socket creation failed; error *error code*.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket creation error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8201W (Windows) Unable to initialize TCP/IP driver - insufficient memory.

Explanation: The server is unable to communicate by way of TCP/IP. A memory allocation request has been rejected by the operating system.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory.

ANR8202W (AIX) Unable to initialize TCP/IP driver - error creating acceptor socket. Reason code *reason code*.

Explanation: Because TCP/IP rejects a request for a socket on which to listen, the server cannot start communications through TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not started,

use the HALT command from a server prompt to stop the server and restart it.

ANR8202E (HP-UX) Unable to initialize TCP/IP driver - socket bind operation for port *TCP port number* failed; error *error code*.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket binding error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server. This message may also result from more than one server running on the same machine with the same TCP/IP port number. Make sure that the `dsmserv.opt` file `TCPPort` option is different for each server.

ANR8202E (Linux) TCP/IP driver unable to initialize due to error in using port *TCP port number*; error *error code*.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket binding error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server. This message may also result from more than one server running on the same machine with the same TCP/IP port number. Make sure that the `dsmserv.opt` file `TCPPort` option is different for each server. Make sure `TCPPORT` and `TCPADMINPORT` do not specify or default to the same values.

ANR8202E (Solaris) Unable to initialize TCP/IP driver - socket bind operation for port *TCP port number* failed; error *error code*.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket binding error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server. This message may also result from more than one server running on the same machine with the same TCP/IP port number. Make sure that the `dsmserv.opt` file `TCPPort` option is different for each server.

ANR8202W (Windows) Unable to initialize TCP/IP driver - error creating acceptor socket.
Reason code *reason code.*

Explanation: The server is unable to communicate by way of TCP/IP. TCP/IP has rejected a request for a socket on which the server listens.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not started, issue the HALT command to stop the server, and then restart the server.

ANR8203W (AIX) Unable to establish TCP connection - accept error.

Explanation: The server cannot accept a client session due to a failure in TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not started, use the HALT command from a server prompt to terminate the server and restart it.

ANR8203E (HP-UX) Unable to initialize TCP/IP driver - listen operation failed; error error code.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket listen error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8203E (Linux) Unable to initialize TCP/IP driver - listen operation failed; error error code.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket listen error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8203E (Solaris) Unable to initialize TCP/IP driver - listen operation failed; error error code.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket listen error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8203W (Windows) Unable to establish TCP connection - accept error.

Explanation: The server cannot accept a client session due to failure in TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not started, issue the HALT command to stop the server, and then restart the server.

ANR8204W (AIX) Unable to establish TCP connection - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues, but the session request for this session fails.

User response: Ensure that sufficient paging space is available for AIX. You may also use SMIT to determine if the number of applications is causing a memory shortage. You may also decrease the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8204E (HP-UX) Unable to initialize TCP/IP driver - thread creation failed.

Explanation: The server is unable to initialize the TCP/IP driver due to an error creating a server thread.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: This error often results from a lack of memory. Ensure that your system has sufficient paging space to support the current activities.

ANR8204E (Linux) Unable to initialize TCP/IP driver - thread creation failed.

Explanation: The server is unable to initialize the TCP/IP driver due to an error creating a server thread.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: This error often results from a lack of memory. Ensure that your system has sufficient paging space to support the current activities.

ANR8204E (Solaris) Unable to initialize TCP/IP driver - thread creation failed.

Explanation: The server is unable to initialize the TCP/IP driver due to an error creating a server thread.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: This error often results from a lack of memory. Ensure that your system has sufficient paging space to support the current activities.

ANR8204W (Windows) Unable to establish TCP connection - insufficient memory.

Explanation: The server is unable to accept a client session due to a memory allocation request failure.

System action: Server operation continues, but the session request for this session fails.

User response: Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8205W (AIX) Unable to establish TCP connection - server HALT in progress.

Explanation: The server cannot accept a client session due to server HALT processing that is in progress.

System action: Server operation continues, but the session request for this session fails.

User response: None.

ANR8205E (HP-UX) Terminating TCP/IP driver - accept operation failed; error error code.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket accept error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8205E (Linux) Terminating TCP/IP driver - socket accept operation failed; error error code.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket accept error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8205E (Solaris) Terminating TCP/IP driver - socket accept operation failed; error error code.

Explanation: The server is unable to initialize the TCP/IP driver due to a socket accept error.

System action: Server operation continues, but TCP/IP support is inoperative.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8205W (Windows) Unable to establish TCP connection - server HALT in progress.

Explanation: The server is unable to accept a client session due to server HALT processing that is in progress.

System action: Server operation continues, but the session request for this session fails.

User response: None.

ANR8206W (AIX) Socket socket (session session number) closed abruptly.

Explanation: The server detects that the indicated session on the specified TCP/IP socket is closed outside of the server.

System action: Server operation continues, but the session is ended.

User response: None.

ANR8206E (HP-UX) Unable to establish TCP/IP session - invalid host address *IP host address* (port *port number*).

Explanation: The server is unable to establish a session because the designated address or port number is not valid.

System action: Server operation continues.

User response: Ensure that the specified host name is valid and is accessible over the network. If the TCPCLIENTPort option is specified for the remote system, ensure it does not conflict with another application.

ANR8206E (Linux) Unable to establish TCP/IP session - invalid host address *IP host address* (port *port number*).

Explanation: The server is unable to establish a session because the designated address or port number is not valid.

System action: Server operation continues.

User response: Ensure that the specified host name is valid and is accessible over the network. If the TCPCLIENTPort option is specified for the remote system, ensure it does not conflict with another application.

ANR8206E (Solaris) Unable to establish TCP/IP session - invalid host address *IP host address* (port *port number*).

Explanation: The server is unable to establish a session because the designated address or port number is not valid.

System action: Server operation continues.

User response: Ensure that the specified host name is valid and is accessible over the network. If the TCPCLIENTPort option is specified for the remote system, ensure it does not conflict with another application.

ANR8206I (Windows) TCP/IP Version 4 administrative driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8207W (AIX) TCP/IP driver unable to initialize due to socket initialization error. Reason code *reason code*.

Explanation: While initializing TCP/IP communications, the server fails to set up an interface with TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP has been started and is active on your system. You may issue the TCP/IP ping command to your own address to verify that TCP/IP is both started and active.

ANR8207E (HP-UX) Unable to establish TCP/IP session with *IP host address* due to memory shortage.

Explanation: The server is unable to establish a session because of a memory shortage condition.

System action: Server operation continues.

User response: Ensure that your system has sufficient paging space to support the current level of system activities.

ANR8207E (Linux) Unable to establish TCP/IP session with *IP host address* due to memory shortage.

Explanation: The server is unable to establish a session because of a memory shortage condition.

System action: Server operation continues.

User response: Ensure that your system has sufficient paging space to support the current level of system activities.

ANR8207E (Solaris) Unable to establish TCP/IP session with *IP host address* due to memory shortage.

Explanation: The server is unable to establish a session because of a memory shortage condition.

System action: Server operation continues.

User response: Ensure that your system has sufficient paging space to support the current level of system activities.

ANR8207W (Windows) TCP/IP driver unable to initialize due to socket initialization error. Reason code *reason code*.

Explanation: While initializing TCP/IP communications, the server has failed to set up an interface with TCP/IP for Windows.

System action: Server operation continues, but the

server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP is properly installed on your system. Ensure that TCP/IP has been started on your system. Issue the TCP/IP ping command to your own address to verify that TCP/IP is both installed and active.

ANR8208W (AIX) TCP/IP driver unable to initialize due to error in using port *port*, reason code *reason code*.

Explanation: While initializing TCP/IP communications, the server fails to connect to a master socket on which to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that no other application is using the port number specified in the server options file with the TCPPOPT option by issuing the TCP/IP netstat command. If the server was brought down and client sessions were active, it may be necessary to terminate the client sessions on the client systems before the port can be freed.

ANR8208E (HP-UX) Unable to establish TCP/IP session with IP host address - socket creation failed; error *error code*.

Explanation: The server is unable to establish a session because of a socket creation error.

System action: Server operation continues.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8208E (Linux) Unable to establish TCP/IP session with IP host address - socket creation failed; error *error code*.

Explanation: The server is unable to establish a session because of a socket creation error.

System action: Server operation continues.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8208E (Solaris) Unable to establish TCP/IP session with IP host address - socket creation failed; error *error code*.

Explanation: The server is unable to establish a session because of a socket creation error.

System action: Server operation continues.

User response: Ensure that TCP/IP is operational on your system by using the ping command with your TCP/IP address as a target. If TCP/IP is not active on your system, you must activate it; then halt and restart the server.

ANR8208W (Windows) TCP/IP driver unable to initialize due to error in using Port *port*, reason code *reason code*.

Explanation: While initializing TCP/IP communications, the server has failed to connect to a master socket on which to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that no other application is using the port number specified in the server options file with the TCPPOPT option. If the server is brought down and then started immediately, you may be within the TCP/IP one minute timeout period for port reuse. Bring down the server, wait one minute, and then restart the server. If that does not work, it may be necessary to restart Windows.

ANR8209W (AIX) TCP/IP driver unable to initialize due to error in LISTENing on the specified Port, reason code *reason code*.

Explanation: While attempting to listen for session requests from clients using TCP/IP, TCP/IP returns an error. The reason code is the return code from the TCP/IP listen API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP is running properly by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8209E (HP-UX) Unable to establish TCP/IP session with IP host address - connection refused.

Explanation: The server is unable to establish a session because the remote system refused the connection request.

ANR8209E (Linux) • ANR8210E (Linux)

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP. Ensure that the client options file specifies the correct TCPServeraddress and TCPPort of the server you are attempting to contact.

ANR8209E (Linux) Unable to establish TCP/IP session with IP host address - connection refused.

Explanation: The server is unable to establish a session because the remote system refused the connection request.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP. Ensure that the client options file specifies the correct TCPServeraddress and TCPPort of the server you are attempting to contact.

ANR8209E (Solaris) Unable to establish TCP/IP session with IP host address - connection refused.

Explanation: The server is unable to establish a session because the remote system refused the connection request.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP. Ensure that the client options file specifies the correct TCPServeraddress and TCPPort of the server you are attempting to contact.

ANR8209W (Windows) TCP/IP driver unable to initialize due to error in LISTENing on the specified Port, reason code *reason code*.

Explanation: While attempting to listen for session requests from clients using TCP/IP, TCP/IP returns an error. The reason code is the return code from the TCP/IP listen API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP is running properly. This may be done by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to correct this condition by restarting the server.

ANR8210W (AIX) TCP/IP driver is terminating due to error in accepting a new session, reason code *reason code*.

Explanation: While attempting to accept a session request from a client using TCP/IP, TCP/IP returns an error. The reason code is the return code from the TCP/IP accept API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP is running properly. This may be done by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8210E (HP-UX) Unable to establish TCP/IP session with IP host address - connection request timed out.

Explanation: The server is unable to establish a session because the remote system did not respond to the connection request.

System action: Server operation continues.

User response: Ensure the following:

- The specified remote system is operational and is properly configured to run TCP/IP.
- The client options file specifies the correct TCPServeraddress and TCPPort of the server you are attempting to contact.
- Necessary gateways and routers are functioning properly.

ANR8210E (Linux) Unable to establish TCP/IP session with IP host address - connection request timed out.

Explanation: The server is unable to establish a session because the remote system did not respond to the connection request.

System action: Server operation continues.

User response: Ensure the following:

- The specified remote system is operational and is properly configured to run TCP/IP.
- The client options file specifies the correct TCPServeraddress and TCPPort of the server you are attempting to contact.
- Necessary gateways and routers are functioning properly.

ANR8210E (Solaris) Unable to establish TCP/IP session with *IP host address* - connection request timed out.

Explanation: The server is unable to establish a session because the remote system did not respond to the connection request.

System action: Server operation continues.

User response: Ensure the following:

- The specified remote system is operational and is properly configured to run TCP/IP.
- The client options file specifies the correct TCPServeraddress and TCPPort of the server you are attempting to contact.
- Necessary gateways and routers are functioning properly.

ANR8210W (Windows) TCP/IP driver is terminating due to error in accepting a new session, reason code *reason code*.

Explanation: While attempting to accept a session request from a client using TCP/IP, TCP/IP returns an error. The reason code is the return code from the TCP/IP accept API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the TCP/IP protocol.

User response: Ensure that TCP/IP is running properly. This may be done by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8211W (AIX) TCP/IP driver is terminating due to error in creating a new thread.

Explanation: The server cannot initialize due to the inability to create a new thread of execution.

System action: Server operation continues, but TCP/IP communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that sufficient paging space is available for AIX. You may also use SMIT to determine if the number of applications is causing a memory shortage. You may also decrease the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8211E (HP-UX) Unable to establish TCP/IP session with *IP host address* - system/network unreachable.

Explanation: The server is unable to establish a session because the remote system or network is unreachable.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP. Also, ensure that necessary gateways and routers are functioning properly.

ANR8211E (Linux) Unable to establish TCP/IP session with *IP host address* - system/network unreachable.

Explanation: The server is unable to establish a session because the remote system or network is unreachable.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP. Also, ensure that necessary gateways and routers are functioning properly.

ANR8211E (Solaris) Unable to establish TCP/IP session with *IP host address* - system/network unreachable.

Explanation: The server is unable to establish a session because the remote system or network is unreachable.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP. Also, ensure that necessary gateways and routers are functioning properly.

ANR8211W (Windows) TCP/IP driver is terminating due to error in creating a new thread.

Explanation: The server cannot initialize due its inability to create a new thread of execution.

System action: Server operation continues, but TCP/IP communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT[®] control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8212W (AIX) Unable to resolve address for *node name*.

Explanation: The server attempts to obtain a TCP/IP address for the indicated node name. The attempt is unsuccessful.

ANR8212E (HP-UX) • ANR8213W (Windows)

System action: The attempt to communicate with the indicated node fails. Server operation continues.

User response: Ensure that the node name is properly specified and that it is accessible over the network. Use the TCP/IP ping command for this purpose.

ANR8212E (HP-UX) Unable to establish TCP/IP session with IP host address - connect failed; error error code.

Explanation: The server is unable to establish a session because of a connection error.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP.

ANR8212E (Linux) Unable to establish TCP/IP session with IP host address - connect failed; error error code.

Explanation: The server is unable to establish a session because of a connection error.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP.

ANR8212E (Solaris) Unable to establish TCP/IP session with IP host address - connect failed; error error code.

Explanation: The server is unable to establish a session because of a connection error.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP.

ANR8212W (Windows) Unable to resolve address for node name.

Explanation: The server attempts to obtain a TCP/IP address for the indicated node name. The attempt is unsuccessful.

System action: The attempt to communicate with the indicated node fails. Server operation continues.

User response: Ensure that the node name is properly specified and that it is accessible over the network. Use the TCP/IP ping command for this purpose.

ANR8213W (AIX) Session open with node name timed out.

Explanation: The server attempts to contact the indicated node name. The attempt is unsuccessful.

System action: The attempt to communicate with the indicated node fails.

User response: Ensure that the node name is properly specified and that it is accessible over the network. Use the TCP/IP ping command for this purpose.

ANR8213E (HP-UX) Session Session identifier aborted due to send error; error error code.

Explanation: The session between the server and the specified client system experienced a disruptive error sending data.

System action: The session with the remote system is ended.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP.

ANR8213E (Linux) Socket Socket identifier aborted due to send error; error error code.

Explanation: The session between the server and the specified client system experienced a fatal error sending data.

System action: The session with the remote system is ended.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP.

ANR8213E (Solaris) Socket Socket identifier aborted due to send error; error error code.

Explanation: The session between the server and the specified client system experienced a fatal error sending data.

System action: The session with the remote system is ended.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP.

ANR8213W (Windows) Session open with node name timed out.

Explanation: The server attempts to contact the indicated node name. The attempt is unsuccessful.

System action: The attempt to communicate with the indicated node fails.

User response: Ensure that the node name is properly

specified and that it is accessible over the network. Use the TCP/IP ping command for this purpose.

ANR8214E (AIX) Session open with *IP host address* failed due to connection refusal.

Explanation: The server is unable to establish a session because the remote system refused the connection request.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP. Ensure that the client options file specifies the correct TCPServeraddress and TCPPort of the server you are attempting to contact.

ANR8214E (HP-UX) The session stopped when no data was read on socket *socket number*.

Explanation: The server is unable to read data on the indicated socket. This might be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required. Otherwise, ensure that the client and server can communicate through such means as Telnet or FTP applications, which are part of the TCP/IP suite.

ANR8214E (Linux) Session terminated when no data was read on socket *socket number*.

Explanation: The server is unable to read data on the indicated socket. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required. Otherwise, ensure that the client and server can communicate through such means as Telnet or FTP applications, which are part of the TCP/IP suite.

ANR8214E (Solaris) Session terminated when no data was read on socket *socket number*.

Explanation: The server is unable to read data on the indicated socket. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no

response is required. Otherwise, ensure that the client and server can communicate through such means as Telnet or FTP applications, which are part of the TCP/IP suite.

ANR8214E (Windows) Session open with *IP host address* failed due to connection refusal.

Explanation: The server is unable to establish a session because the remote system refused the connection request.

System action: Server operation continues.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP. Ensure that the client options file specifies the correct TCPServeraddress and TCPPort of the server you are attempting to contact.

ANR8215W (AIX) Session open with *IP host address* failed as unreachable.

Explanation: The server is unable to establish a session because the remote system is unreachable.

System action: Server operation continues.

User response: Ensure that the IP host address is properly specified and that it is accessible over the network. Use the TCP/IP ping command for this purpose.

ANR8215E (HP-UX) Session *Session identifier* aborted due to receive error; error *error code*.

Explanation: The session between the server and the specified client system experienced a disruptive error receiving data.

System action: The session with the remote system is ended.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP.

ANR8215E (Linux) Session *Session identifier* aborted due to receive error; error *error code*.

Explanation: The session between the server and the specified client system experienced a fatal error receiving data.

System action: The session with the remote system is ended.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP.

ANR8215E (Solaris) Session *Session identifier* aborted due to receive error; error *error code*.

Explanation: The session between the server and the specified client system experienced a fatal error receiving data.

System action: The session with the remote system is ended.

User response: Ensure that the specified remote system is operational and is properly configured to run TCP/IP.

ANR8215W (Windows) Session open with *IP host address* failed as unreachable.

Explanation: The server is unable to establish a session because the remote system is unreachable.

System action: Server operation continues.

User response: Ensure that the IP host address is properly specified and that it is accessible over the network. Use the TCP/IP ping command for this purpose.

ANR8216W (AIX) Error sending data on socket *socket number*. Reason *return code*.

Explanation: The server experiences an error return code from TCP/IP while sending data over the indicated socket. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required. Otherwise, ensure that the client and server can communicate through such means as Telnet or FTP applications, which are part of the TCP/IP suite.

ANR8216E (HP-UX) Unable to establish TCP/IP session with *IP host address* due to thread creation error.

Explanation: The server is unable to establish a session because of an error creating a thread.

System action: Server operation continues.

User response: Ensure that your system has sufficient paging space to support the current level of system activities.

ANR8216E (Linux) Unable to establish TCP/IP session with *IP host address* due to thread creation error.

Explanation: The server is unable to establish a session because of an error creating a thread.

System action: Server operation continues.

User response: Ensure that your system has sufficient paging space to support the current level of system activities.

ANR8216E (Solaris) Unable to establish TCP/IP session with *IP host address* due to thread creation error.

Explanation: The server is unable to establish a session because of an error creating a thread.

System action: Server operation continues.

User response: Ensure that your system has sufficient paging space to support the current level of system activities.

ANR8216W (Windows) Error sending data on socket *socket number*. Reason *return code*.

Explanation: The server experiences an error return code from TCP/IP while sending data over the indicated socket. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required. Otherwise, ensure that the client and server can communicate through such means as Telnet or FTP applications, which are part of the TCP/IP suite.

ANR8217W (AIX) Error receiving data on socket *socket number*. Reason *return code*.

Explanation: The server experiences an error return code from TCP/IP while receiving data on the indicated socket. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required. Otherwise, ensure that the client and server can communicate through such means as Telnet or FTP applications, which are part of the TCP/IP suite.

ANR8217W (HP-UX) TCP/IP driver is unable to set the window size to *TCPWindowsize* for client *client*. The default value will be used.

Explanation: The server cannot set the window size for the indicated client to the requested size shown. The server uses the default window size for the

indicated session. There may be a lack of memory for TCP/IP buffers.

System action: Server operation continues and the session continues with the default window size.

User response: Retry the session with a smaller window size in the options file. Issue the QUERY OPTION command to determine the setting of the server TCPWindowsize.

ANR8217W (Linux) Unable to initialize TCP/IP driver - insufficient memory.

Explanation: Because the operating system rejects a memory allocation request, the server cannot start communications through TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that sufficient paging space is available for Solaris. You may also use `ps -ef` to determine if the number of applications is causing a memory shortage. It may be necessary to decrease the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR8217W (Solaris) Unable to initialize TCP/IP driver - insufficient memory.

Explanation: Because the operating system rejects a memory allocation request, the server cannot start communications through TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that sufficient paging space is available for Solaris. You may also use `ps -ef` to determine if the number of applications is causing a memory shortage. It may be necessary to decrease the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR8217W (Windows) Error receiving data on socket *socket number*. Reason *return code*.

Explanation: The server experiences an error return code from TCP/IP while receiving data on the indicated socket. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required. Otherwise, ensure that the client and server can communicate through such means as Telnet or FTP applications, which are part of the TCP/IP suite.

ANR8218W (AIX) Session terminated when no data was read on socket *socket number*.

Explanation: The server is unable to read data on the indicated socket. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required. Otherwise, ensure that the client and server can communicate through such means as Telnet or FTP applications, which are part of the TCP/IP suite.

ANR8218W (HP-UX) TCP/IP driver is unable to use the TCP/IP NODELAY option for client *client*.

Explanation: The server cannot set TCP/IP NODELAY for the indicated client. The session proceeds with TCP/IP Delay processing in effect. This causes TCP/IP to buffer data prior to sending it to clients.

System action: Server operation continues and the session continues with the delay processing on.

User response: Further details for use in contacting your service representative can be obtained by issuing the following trace commands from an administrative session or from the server console (proper administrative authority is required): TRACE ENABLE TCPINFO TRACE BEGIN *tcptrace.out*. After a session starts and displays message ANR8218W, issue the following commands: TRACE FLUSH TRACE END. This will create trace data in file *tcptrace.out* and will terminate the trace. This file should be supplied to your server representative on request.

ANR8218W (Linux) Unable to resolve address for *node name*.

Explanation: The server attempts to obtain a TCP/IP address for the indicated node name. The attempt is unsuccessful.

System action: The attempt to communicate with the indicated node fails. Server operation continues.

User response: Ensure that the node name is properly specified and that it is accessible over the network. Use the TCP/IP ping command for this purpose.

ANR8218W (Solaris) Unable to resolve address for *node name*.

Explanation: The server attempts to obtain a TCP/IP address for the indicated node name. The attempt is unsuccessful.

System action: The attempt to communicate with the indicated node fails. Server operation continues.

ANR8218W (Windows) • ANR8220W (AIX)

User response: Ensure that the node name is properly specified and that it is accessible over the network. Use the TCP/IP ping command for this purpose.

ANR8218W (Windows) Session terminated when no data read on socket *socket number*.

Explanation: The server cannot read on the indicated socket. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required. Otherwise, ensure that the client and server can communicate through such means as Telnet or FTP applications, which are part of the TCP/IP suite.

ANR8219W (AIX) TCP/IP driver is unable to accept a new session with client at address *TCP/IP address* due to an error in creating a new thread.

Explanation: The server cannot accept a client session with the client at the indicated address due to an inability to create a new thread.

System action: Server operation continues, the session request fails.

User response: The most likely cause is lack of memory. Ensure that sufficient paging space is available for AIX. You may also use SMIT to determine if the number of applications is causing a memory shortage. You may also decrease the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8219W (HP-UX) Unable to initialize TCP/IP driver - insufficient memory.

Explanation: Because the operating system rejects a memory allocation request, the server cannot start communications through TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the TCP/IP protocol.

User response: Ensure that sufficient paging space is available for HP-UX. You may also use SMIT to determine if the number of applications is causing a memory shortage. It may be necessary to decrease the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR8219W (Linux) Unable to establish TCP connection - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues, but the session request for this session fails.

User response: Ensure that sufficient paging space is available for Solaris. You may also use 'swap -l' to determine the amount of swap available. You may also decrease the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8219W (Solaris) Unable to establish TCP connection - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues, but the session request for this session fails.

User response: Ensure that sufficient paging space is available for Solaris. You may also use 'swap -l' to determine the amount of swap available. You may also decrease the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8219W (Windows) TCP/IP driver is unable to accept a new session due to error in creating a new thread.

Explanation: The server cannot accept a client session due to the inability to create a new thread.

System action: Server operation continues, the session request fails.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8220W (AIX) TCP/IP driver is unable to set the window size to *TCPWindowsize* for client *client*. The default value will be used.

Explanation: The server cannot set the window size for the indicated client to the requested size shown. The server uses the default window size for the indicated session. There may be a lack of memory for TCP/IP buffers.

System action: Server operation continues and the

session continues with the default window size.

User response: Retry the session with a smaller window size in the options file. Issue the QUERY OPTION command to determine the setting of the server TCPWindowSize.

ANR8220W (HP-UX) Unable to establish TCP connection - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues, but the session request for this session fails.

User response: Ensure that sufficient paging space is available for HP-UX. You may also use SMIT to determine if the number of applications is causing a memory shortage. You may also decrease the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8220W (Linux) TCP/IP driver is unable to set the window size to TCPWindowSize for client client. The default value will be used.

Explanation: The server cannot set the window size for the indicated client to the requested size shown. The server uses the default window size for the indicated session. There may be a lack of memory for TCP/IP buffers.

System action: Server operation continues and the session continues with the default window size.

User response: Retry the session with a smaller window size in the options file. Issue the QUERY OPTION command to determine the setting of the server TCPWindowSize.

ANR8220W (Solaris) TCP/IP driver is unable to set the window size to TCPWindowSize for client client. The default value will be used.

Explanation: The server cannot set the window size for the indicated client to the requested size shown. The server uses the default window size for the indicated session. There may be a lack of memory for TCP/IP buffers.

System action: Server operation continues and the session continues with the default window size.

User response: Retry the session with a smaller window size in the options file. Issue the QUERY OPTION command to determine the setting of the server TCPWindowSize.

ANR8220W (Windows) TCP/IP driver is unable to contact node name due to an output socket initialization error. Reason code reason code

Explanation: The server attempts to contact the indicated node name. The attempt is unsuccessful due to the inability to initialize a local socket.

System action: The attempt to communicate with the indicated node fails.

User response: Ensure that TCP/IP is operating properly on this node and that it can communicate remotely. Use the TCP/IP ping command for this purpose.

ANR8221W (AIX) TCP/IP driver is unable to use the TCP/IP NODELAY option for client client.

Explanation: The server cannot set TCP/IP NODELAY for the indicated client. The session proceeds with TCP/IP Delay processing in effect. This causes TCP/IP to buffer data prior to sending it to clients.

System action: Server operation continues and the session continues with the delay processing on.

User response: Further details for use in contacting your service representative can be obtained by issuing the following trace commands from an administrative session or from the server console (proper administrative authority is required): TRACE ENABLE TCPINFO TRACE BEGIN. After a session starts and displays message ANR8221W, issue the commands TRACE FLUSH TRACE END. This will create trace data in file tcptrace.out and will terminate the trace. This file should be supplied to your service representative on request.

ANR8221I (HP-UX) TCP/IP Version 4 administrative driver ready for connection with clients on port port number.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8221W (Linux) TCP/IP driver is unable to use the TCP/IP NODELAY option for client client.

Explanation: The server cannot set TCP/IP NODELAY for the indicated client. The session proceeds with TCP/IP delay processing in effect. This causes TCP/IP to buffer data prior to sending it to clients.

System action: Server operation continues and the session continues with delay processing on.

ANR8221W (Solaris) • ANR8222W (Windows)

User response: Further details for use when contacting your service representative can be obtained by issuing the following trace commands from an administrative session or from the console (proper administrative authority is required): TRACE ENABLE TCPINFO TRACE BEGIN tcptrace.out. After a session starts and displays message ANR8221W, issue the following commands: TRACE FLUSH TRACE END. This will create trace data in file tcptrace.out and will terminate the trace. This file should be supplied to your service representative on request.

ANR8221W (Solaris) TCP/IP driver is unable to use the TCP/IP NODELAY option for client *client*.

Explanation: The server cannot set TCP/IP NODELAY for the indicated client. The session proceeds with TCP/IP Delay processing in effect. This causes TCP/IP to buffer data prior to sending it to clients.

System action: Server operation continues and the session continues with the delay processing on.

User response: Further details for use in contacting your service representative can be obtained by issuing the following trace commands from an administrative session or from the server console (proper administrative authority is required): TRACE ENABLE TCPINFO TRACE BEGIN tcptrace.out After a session starts and displays message ANR8221W, issue the following commands: TRACE FLUSH TRACE END This will create trace data in file tcptrace.out and will terminate the trace. This file should be supplied to your service representative on request.

ANR8221W (Windows) TCP/IP driver is unable to set the window size to *TCPWindowsize* for session *session*, client *client*. The default value will be used.

Explanation: The server cannot set the window size for the indicated session/client to the requested size shown. The server will use the default window size for the indicated session.

System action: Server operation continues and the session continues with the default window size.

User response: The most likely cause is lack of memory for TCP/IP buffers. You may retry with a smaller TCP window size in the options file. You can issue the QUERY OPTION command to display the current setting of the TCP window size.

ANR8222W (AIX) TCP/IP driver is unable to set the window size to *TCPWindowsize* for the server master socket. The default value will be used.

Explanation: The server cannot set the window size for the socket on which the server listens to the requested size shown. The server uses the default

window size for listening for sessions. There may be a lack of memory for TCP/IP buffers.

System action: Server operation continues with the default window size.

User response: Restart the server with a smaller window size in the options file if necessary. Issue the QUERY OPTION command to determine the setting of the server TCPWindowsize.

ANR8222W (HP-UX) The TCP/IP administrative driver was unable to initialize due to error using Port *port*, reason code *reason code*.

Explanation: While initializing TCP/IP communications for administrative sessions, the server failed to connect to a master socket to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept administrative sessions from clients using the TCP/IP protocol. This also includes server-server sessions, storage agent to server sessions, and library client to server sessions.

User response: Ensure that no other application is using the port number specified in the server options file with the TCPADMINPORT option. If the server was brought down and client sessions were active, it can be necessary to end the client sessions on the client systems before the port can be freed.

ANR8222W (Linux) Unable to establish TCP connection - server HALT in progress.

Explanation: The server cannot accept a client session due to server HALT processing that is in progress.

System action: Server operation continues, but the session request for this session fails.

User response: None.

ANR8222W (Solaris) Unable to establish TCP connection - server HALT in progress.

Explanation: The server cannot accept a client session due to server HALT processing that is in progress.

System action: Server operation continues, but the session request for this session fails.

User response: None.

ANR8222W (Windows) TCP/IP driver is unable to use the TCP/IP NODELAY option for client *client*.

Explanation: The server cannot set TCP/IP NODELAY for the indicated client. The session proceeds with TCP/IP Delay processing in effect. This causes TCP/IP

to buffer data prior to sending it to clients.

System action: Server operation continues and the session continues with the delay processing on.

User response: Further details for use in contacting your service representative can be obtained by issuing the following trace commands from an administrative session or from the server console (proper administrative authority is required): TRACE ENABLE TCPINFO TRACE BEGIN tcptrace.out After a session starts and displays message ANR8222W, issue the following commands: TRACE FLUSH TRACE END This will create trace data in file tcptrace.out and will terminate the trace. This file should be supplied to your service representative on request.

ANR8223W (AIX) Unable to connect to remote system *RemoteSystem* due to unexpected return code *ReturnCode*

Explanation: The server was unable to connect to a remote system due to an unexpected return code from the connect Application Programming Interface. Common return code are handled with specific messages. This return code was unexpected.

System action: Server operation continues but the connection to the remote system fails.

User response: TCP/IP return code are listed in file /usr/include/sys/errno.h and may provide a pointer to the underlying problem. /usr/include/sys/errno.h is part of fileset bos.adt.include.

ANR8223W (HP-UX) The TCP/IP driver is unable to accept a new session with the client at address *TCP/IP address*, due to an error in creating a new thread.

Explanation: The server cannot accept a client session with the client at the indicated address due to an inability to create a new thread.

System action: Server operation continues, but the session request fails.

User response: The cause is probably lack of memory. Ensure that sufficient paging space is available for AIX. You might also use SMIT to determine if the number of applications is causing a memory shortage. You might also decrease the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8223W (Linux) TCP/IP driver is unable to accept a new session with client at address *TCP/IP address* due to an error in creating a new thread.

Explanation: The server cannot accept a client session with the client at the indicated address due to an inability to create a new thread.

System action: Server operation continues, the session request fails.

User response: The most likely cause is lack of memory. Ensure that sufficient paging space is available for Solaris. You may also use ps -ef to determine if the number of applications is causing a memory shortage. You may also decrease the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8223W (Solaris) TCP/IP driver is unable to accept a new session with client at address *TCP/IP address* due to an error in creating a new thread.

Explanation: The server cannot accept a client session with the client at the indicated address due to an inability to create a new thread.

System action: Server operation continues, the session request fails.

User response: The most likely cause is lack of memory. Ensure that sufficient paging space is available for Solaris. You may also use ps -ef to determine if the number of applications is causing a memory shortage. You may also decrease the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8223W (Windows) Failed to connect to system at address *address port port*.

Explanation: The server attempted to contact the indicated node name at the specified port. The attempt is unsuccessful. The target port is not valid at the target node.

System action: The attempt to communicate with the indicated node fails. Server operation continues.

User response: Ensure that the node name still has TCP/IP running and that the client is active in SCHEDULE mode. If the server is attempting contact with the SNMP subagent, ensure that the hostname and port number for the subagent is correct in the server options file.

ANR8224W (AIX) TCP/IP Administrative driver was unable to initialize due to error in using port *port*, reason code *reason code*.

Explanation: While initializing TCP/IP communications for administrative sessions, the server has failed to connect to a master socket on which to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept administrative sessions from clients using the TCP/IP protocol. This also includes server to server sessions, storage agent to server sessions, and library client to server sessions.

ANR8224E (HP-UX) • ANR8225W (Linux)

User response: Ensure that no other application is using the port number specified in the server options file with the TCPADMINPORT or TCPPOINT options. If the server was brought down and client sessions were active, it may be necessary to terminate the client sessions on the client systems before the port can be freed.

ANR8224E (HP-UX) The server is unable to open the file due to the system limit .

Explanation: An error occurs when the server attempts to open a file.

System action: Server operation continues, but files cannot be opened until the problem is fixed.

User response: Use the System Administrator Manager (SAM) program to increase the value of the maxfiles parameter. This value determines the maximum number of files a process is allowed to open at one time. For proper server operation, increase the maxfiles value to at least 512.

ANR8224W (Linux) TCP/IP driver is unable to set the window size to TCPWindowSize for the server master socket. The default value will be used.

Explanation: The server cannot set the window size for the socket on which the server listens to the requested size shown. The server uses the default window size for listening for sessions. There may be a lack of memory for TCP/IP buffers.

System action: Server operation continues with the default window size.

User response: Restart the server with a smaller window size in the options file if necessary. Issue the QUERY OPTION command to determine the setting of the server TCPWindowSize.

ANR8224W (Solaris) TCP/IP driver is unable to set the window size to TCPWindowSize for the server master socket. The default value will be used.

Explanation: The server cannot set the window size for the socket on which the server listens to the requested size shown. The server uses the default window size for listening for sessions. There may be a lack of memory for TCP/IP buffers.

System action: Server operation continues with the default window size.

User response: Restart the server with a smaller window size in the options file if necessary. Issue the QUERY OPTION command to determine the setting of the server TCPWindowSize.

ANR8224W (Windows) TCP/IP Administrative driver was unable to initialize due to error in using Port port, reason code reason code.

Explanation: While initializing TCP/IP communications for administrative sessions, the server has failed to connect to a master socket on which to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept administrative sessions from clients using the TCP/IP protocol. This also includes server to server sessions, storage agent to server sessions, and library client to server sessions.

User response: Ensure that no other application is using the port number specified in the server options file with the TCPADMINPORT option. If the server is brought down and then started immediately, you can be within the TCP/IP one minute timeout period for port reuse. Bring down the server, wait one minute, and then restart the server. If that does not work, it may be necessary to restart Windows.

ANR8225I (AIX) TCP/IP Version 4 administrative driver ready for connection with clients on port port number.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8225W (Linux) TCP/IP Administrative driver was unable to initialize due to error in using port port, reason code reason code.

Explanation: While initializing TCP/IP communications for administrative sessions, the server has failed to connect to a master socket on which to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept administrative sessions from clients using the TCP/IP protocol. This also includes server to server sessions, storage agent to server sessions, and library client to server sessions.

User response: Ensure that no other application is using the port number specified in the server options file with the TCPADMINPORT or TCPPOINT options. If the server was brought down and client sessions were active, it may be necessary to terminate the client sessions on the client systems before the port can be freed.

ANR8225I (Solaris) TCP/IP Version 4 administrative driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8225I (Windows) TCP/IP Version 6 driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8226E (AIX) Error *errno* detecting version of HBA-API library.

Explanation: The server attempted to determine the level of the devices.common.IBM.fc.hba-api fileset and encountered an error.

System action: Server operation continues, but without accurate SAN device mapping.

User response: None.

ANR8226I (Linux) TCP/IP Version 4 administrative driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 4 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8226W (Solaris) TCP/IP Administrative driver was unable to initialize due to error in using port *port*, reason code *reason code*.

Explanation: The TCP/IP administrative driver was unable to initialize due to an error in running the BIND API to port *port*, reason code *reason code*.

System action: Server operation continues, but the server cannot accept administrative sessions from clients using the TCP/IP protocol. This also includes server to server sessions, storage agent to server sessions, and library client to server sessions.

System action: Server operation continues, but the server cannot accept administrative sessions from clients using the TCP/IP protocol. This also includes

server-server sessions, storage agent to server sessions, and library client-server sessions.

User response: Ensure that no other application is using the port number specified in the server options file with the TCPADMINPORT or TCPPOINT options. If the server was brought down and client sessions were active, it can be necessary to terminate the client sessions on the client systems before the port can be freed.

ANR8226W (Windows) Unable to initialize NETBIOS driver on adapter *network adapter number*.

Explanation: The server cannot obtain sufficient NETBIOS resources to initialize communications on the indicated network adapter.

System action: Server operation continues, but the server will not accept sessions from clients that use the NETBIOS protocol.

User response: Ensure that NETBIOS is configured on the system. Ensure that all NETBIOS resources are not already in use. If the LAN Server or LAN Requester application is running, you have NETBIOS configured. In that case, starting the server prior to starting LAN Server or LAN Requester may allow the server to obtain the necessary NETBIOS resources.

ANR8227E (AIX) Fileset devices.common.IBM.fc.hba-api is not at the required level.

Explanation: The specified fileset is at a level that is incompatible with TSM operations. Install the latest maintenance for this fileset if you use SAN devices.

System action: Server operation continues, but without accurate SAN device mapping.

User response: None.

ANR8227W (Linux) Unable to connect to remote system *RemoteSystem* due to unexpected return code *ReturnCode*

Explanation: The server was unable to connect to a remote system due to an unexpected return code from the connect Application Programming Interface. Common return code are handled with specific messages. This return code was unexpected.

System action: Server operation continues but the connection to the remote system fails.

User response: TCP/IP return code are listed in file /usr/include/asm/errno.h and may provide a pointer to the underlying problem.

ANR8227W (Solaris) Unable to connect to remote system *RemoteSystem* **due to unexpected return code** *ReturnCode*

Explanation: The server was unable to connect to a remote system due to an unexpected return code from the connect Application Programming Interface. Common return code are handled with specific messages. This return code was unexpected.

System action: Server operation continues but the connection to the remote system fails.

User response: TCP/IP return code are listed in file /usr/include/sys/errno.h and may provide a pointer to the underlying problem.

ANR8227W (Windows) NETBIOS connection terminated - insufficient memory, network adapter *network adapter number*.

Explanation: The server cannot listen for client sessions on the specified network adapter due to a memory allocation request failure.

System action: Server operation continues, but the sessions will not be accepted on the specified adapter. Other network adapters remain unaffected.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory.

ANR8228W (Windows) NETBIOS connection terminated - server HALT in progress.

Explanation: The server cannot accept a client session due to server HALT processing that is in progress.

System action: Server operation continues, but the session request for this session fails.

User response: None.

ANR8229W (Windows) Unable to add server name *server name* **to adapter** *network adapter number*.

Explanation: The server cannot initialize communications processing using the NETBIOS protocol on the indicated network adapter because the server name cannot be added as a NETBIOS name on the adapter.

System action: Server operation continues, but client sessions from clients using the NETBIOS protocol will not be accepted on this adapter. Other adapters are not affected.

User response: The most likely cause for this message

is the presence of another system on the network that is using the same name for NETBIOS communications. This may be another server or client or a LAN Requester node. Changing or adding the NETBIOSNAME option for this adapter in your server options file and restarting the server may allow this adapter to be used with NETBIOS communications.

ANR8230I (AIX) TCP/IP Version 6 driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8230I (HP-UX) The TCP/IP Version 6 driver is ready for connection with clients on port *port number*.

Explanation: The server is now able to accept sessions with clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8230I (Linux) TCP/IP Version 6 driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8230I (Solaris) TCP/IP Version 6 driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8230W (Windows) Insufficient memory to start NETBIOS session on adapter *network adapter number*.

Explanation: The server cannot accept a client session due to a memory allocation request failure on the specified adapter.

System action: Server operation continues, but the session request fails.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS or the NETBIOSESSIONS option, or both, in the server options file.

ANR8231W (Windows) Unable to create thread to accept NETBIOS sessions.

Explanation: The server cannot initialize due to the inability to create a new thread of execution.

System action: Server operation continues, but NETBIOS communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS or the NETBIOSESSIONS option, or both, in the server options file.

ANR8232W (Windows) Unable to create thread to listen for NETBIOS sessions on adapter network adapter number.

Explanation: The server cannot initialize due to the inability to create a new thread of execution to monitor the indicated network adapter.

System action: Server operation continues, but NETBIOS communications is inoperative on the indicated adapter. Other adapters remain unaffected.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS or the NETBIOSESSIONS option, or both, in the server options file.

ANR8233E (AIX) Unable to acquire local port information. getaddrinfo return code return code.

Explanation: The server or storage agent used the system getaddrinfo API to determine which TCP/IP protocols could be used. A failure occurred, as indicated by the system error code that is shown. The server was initializing TCP/IP communications.

System action: TCP/IP communications is inoperative.

User response: System information concerning return codes from the getaddrinfo system API should be consulted. Ensure that TCP/IP networking for either TCP/IP version 4 or version 6 is operating correctly.

ANR8233E (HP-UX) Unable to acquire local port information. getaddrinfo return code return code.

Explanation: The server or storage agent used the system getaddrinfo API to determine which TCP/IP protocols could be used. A failure occurred, as indicated by the system error code that is shown. The server was initializing TCP/IP communications.

System action: TCP/IP communications is inoperative.

User response: System information concerning return codes from the getaddrinfo system API should be consulted. Ensure that TCP/IP networking for either TCP/IP version 4 or version 6 is operating correctly.

ANR8233E (Linux) Unable to acquire local port information. getaddrinfo return code return code.

Explanation: The server or storage agent used the system getaddrinfo API to determine which TCP/IP protocols could be used. A failure occurred, as indicated by the system error code that is shown. The server was initializing TCP/IP communications.

System action: TCP/IP communications is inoperative.

User response: System information concerning return codes from the getaddrinfo system API should be consulted. Ensure that TCP/IP networking for either TCP/IP version 4 or version 6 is operating correctly.

ANR8233E (Solaris) Unable to acquire local port information. getaddrinfo return code return code.

Explanation: The server or storage agent used the system getaddrinfo API to determine which TCP/IP protocols could be used. A failure occurred, as indicated by the system error code that is shown. The server was initializing TCP/IP communications.

System action: TCP/IP communications is inoperative.

User response: System information concerning return

ANR8233W (Windows) • ANR8236W (Windows)

codes from the getaddrinfo system API should be consulted. Ensure that TCP/IP networking for either TCP/IP version 4 or version 6 is operating correctly.

ANR8233W (Windows) Unable to create thread to handle NETBIOS session *session number* on adapter *network adapter number*.

Explanation: The server cannot start a new client session on the indicated adapter due to an inability to start a separate thread of execution for the indicated session.

System action: Server operation continues, but this session request fails.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS or the NETBIOSESSIONS option, or both, in the server options file.

ANR8234I (AIX) TCP/IP Version 6 administrative driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8234I (HP-UX) The TCP/IP Version 6 administrative driver is ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8234I (Linux) TCP/IP Version 6 administrative driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8234I (Solaris) TCP/IP Version 6 administrative driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8234I (Windows) TCP/IP Version 6 administrative driver ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the TCP/IP Version 6 protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8235W (Windows) Requested number of NETBIOS sessions are not available on adapter *network adapter number*, proceeding with available sessions.

Explanation: The server cannot acquire the requested number of NETBIOS sessions for the indicated adapter. The server attempts to acquire the number of NETBIOS sessions as indicated by the NETBIOSESSIONS parameter of the server options file or, if this option is not specified, by the MAXSESSIONS option.

System action: Server operation continues, but the maximum number of NETBIOS sessions is limited to the number of sessions that are acquired.

User response: Ensure that the required number of NETBIOS resources are not already in use. If the LAN Server or LAN Requester application is running, you have NETBIOS configured. In that case, starting the server prior to starting LAN Server or LAN Requester may allow the server to obtain the requested NETBIOS resources.

ANR8236W (Windows) Failure while listening for NETBIOS sessions on adapter *network adapter number*, NETBIOS listen return code=*listen return code*.

Explanation: The server cannot listen for NETBIOS sessions on the indicated adapter. The indicated listen return code was received from the NETBIOS listen API. If the return code is 24, (hex 18), the listen is retried.

System action: Server operation continues. If the return code is 24 (hex 18), a new listen is setup because return code 24 indicates a temporary failure. Otherwise, no additional NETBIOS sessions will start using the

indicated adapter until the problem is corrected and the server is restarted.

User response: A NETBIOS listen failure is an indication of a network problem, an adapter problem, or a NETBIOS configuration problem. The following system configuration and system environment listen return codes (in hex) and resolution actions for a listen failure are found in the *IBM Local Area Network Technical Reference*:

Return Code	Description
11	The local session table is full. The maximum number of sessions are in use. Change NETBIOS configuration to increase the maximum number of sessions.
19	Name conflict. Ensure that the Server NETBIOS name is not in use elsewhere on the network.
22	There are too many commands pending. The maximum number of sessions are in use. Change NETBIOS configuration to increase the maximum number of sessions.
35	The operating system resources are exhausted. A reboot is probably required.

ANR8237E (Windows) Unable to acquire local port information. getaddrinfo return code return code.

Explanation: The server or storage agent used the system getaddrinfo API to determine which TCP/IP protocols could be used. A failure occurred, as indicated by the system error code that is shown. The server was initialize TCP/IP communications.

System action: TCP/IP communications is inoperative.

User response: System information concerning return codes from the getaddrinfo system API should be consulted. Ensure that TCP/IP networking for either TCP/IP version 4 or version 6 is operating correctly.

ANR8260I (Windows) Named Pipes driver ready for connection with clients.

Explanation: The server is now able to accept sessions with clients using the Named Pipes protocol.

System action: Server operation continues.

User response: None.

ANR8261W (Windows) Named Pipes connection terminated - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues. Named Pipes communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8262W (Windows) Named Pipes driver is terminating due to error in creating a new thread.

Explanation: The server cannot initialize due to the inability to create a new thread of execution.

System action: Server operation continues, but Named Pipes communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8263W (Windows) Error sending data on Named Pipes, session *session number*. WriteFile Return code is *return code*.

Explanation: The server experiences an error return code from the WriteFile Windows NT API while writing data to Named Pipes over the indicated session. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8264W (Windows) Error reading data on Named Pipes, session *session number*. ReadFile return code is *return code*.

Explanation: The server experiences an error return code from the ReadFile Windows API while reading data from Named Pipes in the indicated session. This may be a normal event if either side of the connection is ended abruptly.

System action: The session is ended. Server operation continues.

ANR8265W (Windows) • ANR8274W (Windows)

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8265W (Windows) Error open Named Pipes
Named Pipes name, CreateNamedPipe
return code *return code.*

Explanation: The server experiences an error return code when trying to open the indicated Named Pipes name for Named Pipes communication with a client. The return code shown is returned by the Windows CreateNamedPipe API.

System action: The session is ended. Server operation continues. Named Pipes communications is inoperative.

User response: The server may have run out of file handles. Stop and restart the server to reenale Named Pipes communications. It is not normal to run out of file handles. A system or logic error may be the underlying cause.

ANR8266W (Windows) Error accepting connection on Named Pipes *Named Pipes name, ConnectNamedPipe* **return code** *return code.*

Explanation: The server experiences an error return code when trying to complete a connection on the indicated Named Pipes name for Named Pipes communication with a client. The return code shown is returned by the Windows ConnectNamedPipe API.

System action: The session is ended. Server operation continues. Named Pipes communications is inoperative.

User response: A system problem may be preventing use of Named Pipes. Stop and restart the server to reenale Named Pipes communications.

ANR8267W (Windows) Error initializing a security descriptor for Named Pipes *Named Pipes name, reason: System message.*

Explanation: The server experiences an error return code when trying to initialize the indicated Named Pipe for Named Pipes communication with a client. The reason shown is returned by the Windows FormatMessage API.

System action: The session is ended. Server operation continues. Named Pipes communications is inoperative.

User response: Administrator Privileges are required. Login using an account with Administrator privileges and restart the server to reenale Named Pipes communications.

ANR8268W (Windows) Named Pipe communications were not enabled due to an error looking up the following Windows group name: *Windows group name.* Use the Windows User manager to add the specified group. Members of the group will then use Windows unified logon to access the server over Named pipes.

Explanation: The server experiences an error return code when trying to initialize the indicated Named Pipe for Named Pipes communication with a client. The system could not find the Windows Account name specified in the server options file.

System action: The session is ended. Server operation continues. Named Pipes communications is inoperative.

User response: To use Windows unified logon specify the name of a valid Windows account or group name. Restart the server to reenale Named Pipes communications.

ANR8269W (Windows) Error opening Named Pipe *Named Pipes name, reason: System message.*

Explanation: The server experiences an error return code when trying to open the indicated Named Pipe name for Named Pipes communication with a client. The reason shown is returned by the Windows FormatMessage API.

System action: The session is ended. Server operation continues. Named Pipes communications is inoperative.

User response: Consider the reason text and take appropriate action. Stop and restart the server to reenale Named Pipes communications.

ANR8273I (Windows) Shared memory driver ready for connection with clients on port *port number.*

Explanation: The server is now able to accept sessions with clients using the shared memory protocol on the indicated port.

System action: Server operation continues.

User response: None.

ANR8274W (Windows) Shared memory communications driver is terminating due to error in creating a new thread.

Explanation: The server cannot initialize due to the inability to create a new thread of execution.

System action: Server operation continues, but shared memory communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the

Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory.

ANR8275W (Windows) Shared memory connection terminated - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues. Shared memory communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8276W (Windows) Shared memory connection terminated - unable to initialize. Key channel key, Reason: reason code.

Explanation: The server cannot accept a client session due being unable to initialize shared memory.

System action: Server operation continues. Shared memory communications are inoperative.

User response: Try a different shared memory session.

ANR8277E (Windows) Shared memory unable to initialize - Port: shm port number, Reason: reason code.

Explanation: The server cannot accept a client session because it could not initialize a communication channel. Make sure no other server or storage agent running on the same machine is using the same shm port number.

System action: Server operation continues. Shared memory communications are inoperative.

User response: Try a different shared memory session.

ANR8282I (HP-UX) SNMP driver ready for connection with subagent on port port number.

Explanation: The server can now accept sessions with SNMP subagents on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8282I (Linux) SNMP driver ready for connection with subagent on port port number.

Explanation: The server can now accept sessions with SNMP subagents on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8282I (Solaris) SNMP driver ready for connection with subagent on port port number.

Explanation: The server can now accept sessions with SNMP subagents on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8283W (HP-UX) SNMP driver unable to initialize due to error in using Port port, reason code reason code.

Explanation: While initializing TCP/IP communications, the server has failed to connect to a master TCP/IP socket on which to listen to SNMP subagents. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from SNMP subagents to run macro commands.

User response: Ensure that no other application is using the port number specified in the server options file with the SNMPSUBAGENT PORT option. If TCP/IP is also in use for client sessions, ensure that the same port number is not specified for TCP/IP communications and SNMP communications. This may be done by issuing the TCP/IP netstat command.

ANR8283W (Linux) SNMP driver unable to initialize due to error in BINDING to Port port, reason code reason code.

Explanation: While initializing TCP/IP communications, the server has failed to connect to a master TCP/IP socket on which to listen to SNMP subagents. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from SNMP subagents to run macro commands.

User response: Ensure that no other application is using the port number specified in the server options file with the PORT option. If TCP/IP is also in use for client sessions, ensure that the same port number is not specified for TCP/IP and SNMP communications.

ANR8283W (Solaris) SNMP driver unable to initialize due to error in BINDing to Port *port*, reason code *reason code*.

Explanation: While initializing TCP/IP communications, the server has failed to connect to a master TCP/IP socket on which to listen to SNMP subagents. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from SNMP subagents to run macro commands.

User response: Ensure that no other application is using the port number specified in the server options file with the PORT option. If TCP/IP is also in use for client sessions, ensure that the same port number is not specified for TCP/IP communications and SNMP communications.

ANR8284E (AIX) The Shared Memory Communications Protocol could not initialize.

Explanation: The server was unable to initialize the Shared Memory Communications Protocol due to an error.

System action: Server operation continues without Shared Memory Communications.

User response: Examine previous error messages for the cause of the failure.

ANR8284E (HP-UX) The Shared Memory Communications Protocol could not initialize.

Explanation: The server was unable to initialize the Shared Memory Communications Protocol due to an error.

System action: Server operation continues without Shared Memory Communications.

User response: Examine previous error messages for the cause of the failure.

ANR8284E (Linux) The Shared Memory Communications Protocol could not initialize.

Explanation: The server was unable to initialize the Shared Memory Communications Protocol due to an error.

System action: Server operation continues without Shared Memory Communications.

User response: Examine previous error messages for the cause of the failure.

ANR8284E (Solaris) The Shared Memory Communications Protocol could not initialize.

Explanation: The server was unable to initialize the Shared Memory Communications Protocol due to an error.

System action: Server operation continues without Shared Memory Communications.

User response: Examine previous error messages for the cause of the failure.

ANR8285I (AIX) Shared Memory driver ready for connection with clients on port *port*

Explanation: The server is now able to accept sessions with clients using the Shared Memory protocol.

System action: Server operation continues.

User response: None.

ANR8285I (HP-UX) Shared Memory driver ready for connection with clients on port *port*

Explanation: The server is now able to accept sessions with clients using the Shared Memory protocol.

System action: Server operation continues.

User response: None.

ANR8285I (Linux) Shared Memory driver ready for connection with clients on port *port*

Explanation: The server is now able to accept sessions with clients using the Shared Memory protocol.

System action: Server operation continues.

User response: None.

ANR8285I (Solaris) Shared Memory driver ready for connection with clients on port *port*

Explanation: The server is now able to accept sessions with clients using the Shared Memory protocol.

System action: Server operation continues.

User response: None.

ANR8285I (Windows) SNMP driver ready for connection with subagent on port *port number*.

Explanation: The server can now accept sessions with SNMP subagents on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8286W (AIX) Unable to initialize Shared Memory driver - insufficient memory.

Explanation: Because the operating system rejected a memory allocation request, the server cannot start communications through the Shared Memory protocol.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that there is sufficient paging space for AIX. You may also use SMIT to determine if the number of applications is causing a memory shortage. It may be necessary to cut down on the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR8286W (HP-UX) Unable to initialize Shared Memory driver - insufficient memory.

Explanation: Because the operating system rejected a memory allocation request, the server cannot start communications through the Shared Memory protocol.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that there is sufficient paging space for HP-UX. You may also use SAM to determine if the number of applications is causing a memory shortage. It may be necessary to cut down on the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR8286W (Linux) Unable to initialize Shared Memory driver - insufficient memory.

Explanation: Because the operating system rejected a memory allocation request, the server cannot start communications through the Shared Memory protocol.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that there is sufficient swap space for Solaris. It may be necessary to cut down on the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR8286W (Solaris) Unable to initialize Shared Memory driver - insufficient memory.

Explanation: Because the operating system rejected a memory allocation request, the server cannot start communications through the Shared Memory protocol.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that there is sufficient swap

space for Solaris. It may be necessary to cut down on the maximum number of client sessions by changing the MAXSESSIONS option in the server options file.

ANR8286W (Windows) SNMP driver unable to initialize due to error in BINDing to Port *port*, reason code *reason code*.

Explanation: While initializing TCP/IP communications, the server has failed to connect to a master TCP/IP socket on which to listen to SNMP subagents. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from SNMP subagents to run macro commands.

User response: Ensure that no other application is using the port number specified in the server options file with the PORT option. If TCP/IP is also in use for client sessions, ensure that the same port number is not specified for TCP/IP communications and SNMP communications. This may be done by issuing the TCP/IP netstat -s command. If the server is brought down and then started immediately, you may be within the TCP/IP one minute timeout period for port reuse. Bring down the sever, wait one minute, and then restart the server. If that does not work, it may be necessary to restart Windows.

ANR8287W (AIX) Unable to initialize Shared Memory driver - error creating acceptor socket. Reason code *reason code*.

Explanation: Because TCP/IP rejected a request for a socket on which to listen, the server cannot start communications through Shared Memory.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: If TCP/IP is not started, use the HALT command from any server prompt to stop the server, and restart it.

ANR8287W (HP-UX) Unable to initialize Shared Memory driver - error creating acceptor socket. Reason code *reason code*.

Explanation: Because TCP/IP rejected a request for a socket on which to listen, the server cannot start communications through Shared Memory.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: If TCP/IP is not started, use the HALT command from any server prompt to stop the server, and restart it.

ANR8287W (Linux) Unable to initialize Shared Memory driver - error creating acceptor socket. Reason code *reason code*.

Explanation: Because TCP/IP rejected a request for a socket on which to listen, the server cannot start communications through Shared Memory.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: If TCP/IP is not started, use the HALT command from any prompt to stop the server, and restart it.

ANR8287W (Solaris) Unable to initialize Shared Memory driver - error creating acceptor socket. Reason code *reason code*.

Explanation: Because TCP/IP rejected a request for a socket on which to listen, the server cannot start communications through Shared Memory.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: If TCP/IP is not started, use the HALT command from any server prompt to stop the server, and restart it.

ANR8288W (AIX) Unable to establish Shared Memory connection - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues, but the session request for this session fails.

User response: Ensure that there is sufficient paging space for AIX. You may also use SMIT to determine if the number of applications is causing a memory shortage. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8288W (HP-UX) Unable to establish Shared Memory connection - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues, but the session request for this session fails.

User response: Ensure that there is sufficient paging space for HP-UX. You may also use SAM to determine if the number of applications is causing a memory shortage. You may also wish to cut down on the

maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8288W (Linux) Unable to establish Shared Memory connection - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues, but the session request for this session fails.

User response: Ensure that there is sufficient swap space for Solaris. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8288W (Solaris) Unable to establish Shared Memory connection - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues, but the session request for this session fails.

User response: Ensure that there is sufficient swap space for Solaris. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8289W (AIX) Shared Memory driver is terminating due to error in creating a new thread.

Explanation: The server cannot initialize due to the inability to create a new thread of execution.

System action: Server operation continues, but Shared Memory communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient paging space for AIX. You may also use SMIT to determine if the number of applications is causing a memory shortage. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8289W (HP-UX) Shared Memory driver is terminating due to error in creating a new thread.

Explanation: The server cannot initialize due to the inability to create a new thread of execution.

System action: Server operation continues, but Shared Memory communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient paging space for HP-UX. You may also use SAM to determine if the number of applications is causing a memory shortage. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8289W (Linux) Shared Memory driver is terminating due to error in creating a new thread.

Explanation: The server cannot initialize due to the inability to create a new thread of execution.

System action: Server operation continues, but Shared Memory communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient swap space for Solaris. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8289W (Solaris) Shared Memory driver is terminating due to error in creating a new thread.

Explanation: The server cannot initialize due to the inability to create a new thread of execution.

System action: Server operation continues, but Shared Memory communications is inoperative.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient swap space for Solaris. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8290W (AIX) Error sending data through Shared Memory. Reason *return code*.

Explanation: The server experienced an error return code while sending data through shared memory. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8290W (HP-UX) Error sending data through Shared Memory. Reason *return code*.

Explanation: The server experienced an error return code while sending data through shared memory. This

may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8290W (Linux) Error sending data through Shared Memory. Reason *return code*.

Explanation: The server experienced an error return code while sending data through shared memory. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8290W (Solaris) Error sending data through Shared Memory. Reason *return code*.

Explanation: The server experienced an error return code while sending data through shared memory. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8290I (Windows) IPX/SPX driver ready for connection with clients on socket *IPX socket number*.

Explanation: The server is now able to accept sessions with clients using the IPX/SPX protocol on the indicated socket number.

System action: Server operation continues.

User response: None.

ANR8291W (AIX) Error receiving data through Shared Memory. Reason *return code*.

Explanation: The server experienced an error return code while receiving data through the Shared Memory protocol. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of

ANR8291W (HP-UX) • ANR8292W (Solaris)

intentionally stopping either the client or server, no response is required.

ANR8291W (HP-UX) Error receiving data through Shared Memory. Reason *return code*.

Explanation: The server experienced an error return code while receiving data through the Shared Memory protocol. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8291W (Linux) Error receiving data through Shared Memory. Reason *return code*.

Explanation: The server experienced an error return code while receiving data through the Shared Memory protocol. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8291W (Solaris) Error receiving data through Shared Memory. Reason *return code*.

Explanation: The server experienced an error return code while receiving data through the Shared Memory protocol. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8291W (Windows) Unable to bind to IPX/SPX master socket. Return code = *return code*.

Explanation: The server cannot initiate communications on the socket number designated for its use.

System action: Server operation continues, but communications using the IPX/SPX protocol is inoperative.

User response: Ensure that SPX has been configured to run on this system through the requester configuration program. Ensure that there is no other instance of the server running on the same system that is using the same socket number. This is likely to be the

case if the return code is zero. Also ensure that the number of SPX sessions (as specified in your NET.CFG file) has not been exceeded through other applications using the IPX/SPX protocol.

ANR8292W (AIX) Session terminated when no data was read through Shared Memory.

Explanation: The server is unable to read data from Shared Memory. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8292W (HP-UX) Session terminated when no data was read through Shared Memory.

Explanation: The server is unable to read data from Shared Memory. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8292W (Linux) Session terminated when no data was read through Shared Memory.

Explanation: The server is unable to read data from Shared Memory. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8292W (Solaris) Session terminated when no data was read through Shared Memory.

Explanation: The server is unable to read data from Shared Memory. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required.

ANR8292W (Windows) IPX/SPX connection terminated - insufficient memory.

Explanation: The server cannot accept a client session due to a memory allocation request failure.

System action: Server operation continues.

User response: The most likely cause is a lack of memory. Ensure that there is sufficient space for the Windows paging file. Click on the system icon in the Windows NT control panel and then click on the virtual memory button. Refer to the online help for instructions on how to increase the amount of virtual memory. You may also wish to cut down on the maximum number of sessions that the server can accept with the MAXSESSIONS option in the server options file.

ANR8293W (AIX) Shared Memory driver unable to initialize due to socket initialization error.

Explanation: While initializing Shared Memory communications, the server failed to set up an interface with TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP has been started and is active on your system. You may issue the TCP/IP ping command to your own address to verify that TCP/IP is both started and active.

ANR8293W (HP-UX) Shared Memory driver unable to initialize due to socket initialization error.

Explanation: While initializing Shared Memory communications, the server failed to set up an interface with TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP has been started and is active on your system. You may issue the TCP/IP ping command to your own address to verify that TCP/IP is both started and active.

ANR8293W (Linux) Shared Memory driver unable to initialize due to socket initialization error.

Explanation: While initializing Shared Memory communications, the server failed to set up an interface with TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP has been started and is active on your system. You may issue the TCP/IP ping command to your own address to verify that TCP/IP is both started and active.

ANR8293W (Solaris) Shared Memory driver unable to initialize due to socket initialization error.

Explanation: While initializing Shared Memory communications, the server failed to set up an interface with TCP/IP.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP has been started and is active on your system. You may issue the TCP/IP ping command to your own address to verify that TCP/IP is both started and active.

ANR8293W (Windows) IPX/SPX driver unable to initialize due to error in LISTENing on the master socket, return code = *return code*.

Explanation: While attempting to listen for session requests from clients using IPX/SPX, the server encountered an error.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the IPX/SPX protocol.

User response: Ensure that IPX/SPX is still running properly and that it has not been intentionally or unintentionally stopped. This may be done by using the getipxad command to determine if an endpoint can still be opened and bound; also determine if you can still connect to a NetWare server.

ANR8294W (AIX) Shared Memory session unable to initialize.

Explanation: While initializing a Shared Memory communications session, an error occurred during initial setup.

System action: Server operation continues, but the session is terminated.

User response: Contact your service representative for assistance in resolving the error.

ANR8294W (HP-UX) Shared Memory session unable to initialize.

Explanation: While initializing a Shared Memory communications session, an error occurred during initial setup.

System action: Server operation continues, but the session is terminated.

ANR8294W (Linux) • ANR8295W (Solaris)

User response: Contact your service representative for assistance in resolving the error.

ANR8294W (Linux) Shared Memory session unable to initialize.

Explanation: While initializing a Shared Memory communications session, an error occurred during initial setup.

System action: Server operation continues, but the session is terminated.

User response: Contact your service representative for assistance in resolving the error.

ANR8294W (Solaris) Shared Memory session unable to initialize.

Explanation: While initializing a Shared Memory communications session, an error occurred during initial setup.

System action: Server operation continues, but the session is terminated.

User response: Contact your service representative for assistance in resolving the error.

ANR8294W (Windows) Unable to establish IPX/SPX connection - accept error. Return code = *tli error*.

Explanation: The server cannot accept a client session due to a failure in accepting the connection from IPX/SPX.

System action: Server operation continues, but this session request fails.

User response: Ensure that SPX has been configured to run on this system through the requester configuration program. Ensure that there is no other instance of the server running on the same system that is using the same socket number. Also ensure that the number of SPX sessions has not been exceeded through other applications using the IPX/SPX protocol, such as NetWare applications.

ANR8295W (AIX) Shared Memory driver unable to initialize due to error in BINDing to Port *port*, reason code *reason code*.

Explanation: While initializing Shared Memory communications, the server failed to connect to a master socket on which to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that no application is using the port number specified in the server options file with

the SHMPORT option by issuing the TCP/IP netstat command. If the server was brought down and client sessions were active, it may be necessary to terminate the client sessions on the client systems before the port can be freed.

ANR8295W (HP-UX) Shared Memory driver unable to initialize due to error in using Port *port*, reason code *reason code*.

Explanation: While initializing Shared Memory communications, the server failed to connect to a master socket on which to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that no application is using the port number specified in the server options file with the SHMPORT option by issuing the TCP/IP netstat command. If the server was brought down and client sessions were active, it may be necessary to terminate the client sessions on the client systems before the port can be freed.

ANR8295W (Linux) Shared Memory driver unable to initialize due to error in BINDing to Port *port*, reason code *reason code*.

Explanation: While initializing Shared Memory communications, the server failed to connect to a master socket on which to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that no application is using the port number specified in the server options file with the SHMPORT option by issuing the TCP/IP netstat command. If the server was brought down and client sessions were active, it may be necessary to terminate the client sessions on the client systems before the port can be freed.

ANR8295W (Solaris) Shared Memory driver unable to initialize due to error in BINDing to Port *port*, reason code *reason code*.

Explanation: While initializing Shared Memory communications, the server failed to connect to a master socket on which to listen for clients. The reason code is the return code from the TCP/IP bind API.

System action: Server operation continues, but the server cannot accept sessions from clients using the Shared Memory protocol.

User response: Ensure that no application is using the port number specified in the server options file with the SHMPORT option by issuing the TCP/IP netstat

command. If the server was brought down and client sessions were active, it may be necessary to terminate the client sessions on the client systems before the port can be freed.

ANR8295W (Windows) Error sending data on session *session number*. Reason *return code*.

Explanation: The server experiences an error return code from IPX/SPX while sending data on the indicated session. This may be a normal event if either side of the connection is abruptly ended.

System action: The session is ended. Server operation continues.

User response: If the session is ended as a result of intentionally stopping either the client or server, no response is required. Otherwise, ensure that IPX/SPX is still active.

ANR8296W (AIX) Shared Memory driver unable to initialize due to error in LISTENing on the specified Port, reason code *reason code*.

Explanation: While attempting to listen for session requests from clients using TCP/IP, TCP/IP returns an error. The reason code is the return code from the TCP/IP listen API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP is running properly by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8296W (HP-UX) Shared Memory driver unable to initialize due to error in LISTENing on the specified Port, reason code *reason code*.

Explanation: While attempting to listen for session requests from clients using TCP/IP, TCP/IP returns an error. The reason code is the return code from the TCP/IP listen API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP is running properly by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8296W (Linux) Shared Memory driver unable to initialize due to error in LISTENing on the specified Port, reason code *reason code*.

Explanation: While attempting to listen for session requests from clients using TCP/IP, TCP/IP returns an error. The reason code is the return code from the TCP/IP listen API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP is running properly by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8296W (Solaris) Shared Memory driver unable to initialize due to error in LISTENing on the specified Port, reason code *reason code*.

Explanation: While attempting to listen for session requests from clients using TCP/IP, TCP/IP returns an error. The reason code is the return code from the TCP/IP listen API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP is running properly by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8297W (AIX) Shared Memory driver is terminating due to error in accepting a new session, reason code *reason code*.

Explanation: While attempting to accept a session request from a client using the Shared Memory protocol, TCP/IP returns an error. The reason code is the return code from the TCP/IP accept API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP is running properly. This may be done by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8297W (HP-UX) Shared Memory driver is terminating due to error in accepting a new session, reason code *reason code*.

Explanation: While attempting to accept a session request from a client using the Shared Memory protocol, TCP/IP returns an error. The reason code is the return code from the TCP/IP accept API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP is running properly. This may be done by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8297W (Linux) Shared Memory driver is terminating due to error in accepting a new session, reason code *reason code*.

Explanation: While attempting to accept a session request from a client using the Shared Memory protocol, TCP/IP returns an error. The reason code is the return code from the TCP/IP accept API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP is running properly. This may be done by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8297W (Solaris) Shared Memory driver is terminating due to error in accepting a new session, reason code *reason code*.

Explanation: While attempting to accept a session request from a client using the Shared Memory protocol, TCP/IP returns an error. The reason code is the return code from the TCP/IP accept API.

System action: Server operation continues, but the server cannot accept additional sessions from clients using the Shared Memory protocol.

User response: Ensure that TCP/IP is running properly. This may be done by issuing the TCP/IP netstat -s and ping commands to other nodes on your network. It may be possible to bring the server down and restart it to allow additional client sessions to start.

ANR8300E I/O error on library *library name* (OP=*internal code*, CC=*internal code*, KEY=*internal code*, ASC=*internal code*, ASCQ=*internal code*, SENSE=*sense data*, Description=*error description*). Refer to Appendix C in the 'Messages' manual

for recommended action.

Explanation: An I/O error has occurred while operating on the specified library.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the library was identified correctly in the DEFINE PATH command and that the library is currently powered on and ready. If the library has an access door, make sure it is closed. The library reference manual usually contains tables that explain the values of the KEY, ASC, and ASCQ fields.

ANR8301E I/O error on library *library name* (OP=*internal code*, SENSE=*internal code*).

Explanation: An I/O error has occurred while operating on the specified library.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the library was identified correctly in the DEFINE PATH command and that the library is currently powered on and ready. If the library has an access door, make sure it is closed.

ANR8302E I/O error on drive *drive name* with volume *volume name* (OP=*internal code*, Error Number=*internal code*, CC=*internal code*, rc = *return code*, KEY=*internal code*, ASC=*internal code*, ASCQ=*internal code*, SENSE=*sense data*, Description=*error description*). Refer to Appendix C in the 'Messages' manual for recommended action.

Explanation: An I/O error has occurred while operating on the specified drive.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the drive was identified correctly in the DEFINE PATH command and that the drive is currently powered on and ready. The drive reference manual usually contains tables that explain the values of the KEY, ASC, and ASCQ fields.

ANR8303E I/O error on drive *drive name* (OP=*internal code*, SENSE=*internal code*).

Explanation: An I/O error has occurred while operating on the specified drive.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the drive was identified correctly in the DEFINE PATH command and that the drive is currently powered on and ready.

ANR8304E Time out error on drive *drive name* in library *library name*.

Explanation: A time out condition occurred while waiting for the given drive to become ready so that automated library operations could be performed.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the drive was identified correctly in the DEFINE PATH command, and that the device is currently powered on and ready.

ANR8305E Library *library name* is not ready or not operational.

Explanation: The specified automated library device is either not ready or not in an operational state.

System action: Initialization of the library device fails.

User response: Ensure that the library is powered on and ready for automated operations. Further initialization attempts for the given library will usually be postponed until the next attempt is made to access the library for an automated operation. During server startup, however, initialization may be retried after a short waiting period.

ANR8306I Request number: Insert device type *volume name mount mode* into the slot with element number *slot element of library library name* within time limit minutes; issue 'REPLY' along with the request ID when ready.

Explanation: A CHECKIN LIBVOLUME or a LABEL LIBVOLUME command is in progress, and the specified volume is needed. The server expects the volume to be inserted into the slot with the specified element number of the given library within the time limit specified in the message. For the slot and element number diagram of your library, refer to the documentation provided with the current ptf level or refer to the *Administrator's Guide* for your release and platform.

System action: The server waits until a REPLY command is issued, or until the time limit expires.

User response: Insert the volume into the slot and issue a REPLY command, along with the request ID, to tell the server that the volume has been inserted.

ANR8307I Request number: Remove device type *volume volume name* from slot with element number *slot name of library library name*; issue 'REPLY' along with the request ID when ready.

Explanation: A CHECKOUT LIBVOLUME command has completed. You can remove the volume from the slot with the specified element number and store it

outside the library. For the slot and element number diagram of your library, refer to the documentation provided with the current ptf level or refer to the *Administrator's Guide* manual for your release and platform.

System action: The server waits until a REPLY command is issued.

User response: Remove the volume from the slot and store it in a safe place. Issue a REPLY command, along with the request ID, to tell the server that the volume has been removed. The volume can be returned to the library with the CHECKIN LIBVOLUME command.

ANR8308I Request number: device type *volume volume name* is required for use in library *library name*; CHECKIN LIBVOLUME required within time limit minutes.

Explanation: A mount request has been made for a volume that is defined in a storage pool, but which is currently checked out of the given library.

System action: The server waits until it detects that the volume has been checked into the library, or the time limit expires.

User response: Obtain the required volume, and insert it into the library by issuing a CHECKIN LIBVOLUME command. Use the SWAP=YES option of the CHECKIN LIBVOLUME command if the library is currently full; this process allows the server to select an appropriate volume to be swapped out in order to make room for the required volume.

ANR8309E Mount attempt failed - library *library name* is not defined.

Explanation: An attempt has been made to mount a volume, but the attempt fails because the specified library is not defined.

System action: The operation fails.

User response: Ensure that the LIBRARY attribute of the device class associated with the mount operation identifies a defined library. If not, correct the value of the LIBRARY attribute, or define the specified library and retry the operation.

ANR8310E An I/O error occurred while accessing library *library name*.

Explanation: An I/O error occurs while accessing the designated library.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the library is identified correctly in the DEFINE PATH command, and that the library is currently powered on and ready. If the library has an access door, make sure it is closed. After checking and

correcting these potential problems, retry the operation.

ANR8311E An I/O error occurred while accessing drive *drive name* for low-level operation, **errno** = *drive errno*, **rc** = *return code*.

Explanation: An I/O error occurs while performing the operation on the specified drive.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the drive is identified correctly in the DEFINE PATH command, and that the drive is currently powered on and ready. After checking and correcting these potential problems, retry the operation.

ANR8312E Volume *volume name* could not be located in library *library name*.

Explanation: The designated volume cannot be found at its expected location in the given library.

System action: The operation fails.

User response: Perform an AUDIT LIBRARY operation on the designated library, which forces the server to reevaluate its inventory information for volumes in the library.

ANR8313E Volume *volume name* is not present in library *library name*.

Explanation: A mount request is made for the given volume in the specified library, but the volume is not currently checked into the library.

System action: The mount operation fails. If the volume is being mounted for storage pool I/O (as opposed to import/export I/O), its ACCESS attribute is changed to UNAVAILABLE to prevent further mount requests.

User response: Issue a CHECKIN LIBVOLUME command to return the volume into the library, and update the volumes ACCESS attribute to READONLY or READWRITE using the UPDATE VOLUME command. Retry the mount request.

ANR8314E Library *library name* is full.

Explanation: A library operation fails because all of the library's storage locations are occupied.

System action: The operation fails.

User response: Issue a CHECKOUT LIBVOLUME command to make room in the library. Retry the library operation.

ANR8315E Command: The device type of drive *drive name* is not supported in library type libraries.

Explanation: Drives of the type identified in the command are not supported in the given type of library.

System action: The command is not processed.

User response: Determine whether the drive and library combination is supported by the installed level of the server. If so, contact your service representative.

ANR8316E Selecting swap volume to be checked out of library *library name*.

Explanation: A CHECKIN LIBVOL command was issued for a library that has no empty slots to hold the new cartridge. The SWAP=YES parameter was included in the command.

System action: A CHECKOUT LIBVOL command will be automatically be issued, specifying either a scratch volume or, if there are none, a volume with the lowest number of mounts.

User response: Use a supported type of drive. volume from the library and store it in a safe place. Issue a REPLY command to tell the server that the volume has been removed. The volume can be introduced back into the library with the CHECKIN LIBVOLUME command.

ANR8317I The volume in device type *drive drive name* must be manually ejected.

Explanation: This device type does not automatically eject the volume when it is dismounted and requires that the volume be manually ejected from the drive.

System action: None.

User response: Physically eject the volume from the drive.

ANR8318I Request number: Mount side *side* of device type *volume volume name* mount mode in drive *drive name* of library *library name* within time limit < *minutes*.

Explanation: The server requires that the specified volume be mounted as requested. Since the volume is two-sided, this message specifies which side (A or B) is needed by the server for I/O operations.

System action: The server waits for the volume to be mounted.

User response: Mount the volume in the specified drive.

ANR8319I *Request number: Insert device type volume volume name mount mode into library library name within time limit minute(s).*

Explanation: A CHECKIN LIBVOLUME command is in progress, and the specified volume is needed. The server expects the volume to be inserted into the library with the convenience I/O station mechanism.

System action: The server waits until the volume is in the library, or until the time limit expires.

User response: Insert the specified volume into the library. If the volume has already been inserted into the library, no user action is necessary.

ANR8320I *Request number: Insert device type volume volume name mount mode in drive drive name of library library name within time limit minute(s); issue 'REPLY' along with the request ID when ready.*

Explanation: A CHECKIN LIBVOLUME or a LABEL LIBVOLUME command is in progress, and the specified volume is needed. The server expects the volume to be inserted in the designated drive of the given library within the time limit specified in the message.

System action: The server waits until a REPLY command is issued, or until the time limit expires.

User response: Insert the volume into the drive, and then issue a REPLY command, along with the request ID, to tell the server that the volume has been inserted.

ANR8321I *Request number: Remove device type volume volume name from drive drive name of library library name; issue 'REPLY' along with the request ID when ready.*

Explanation: A CHECKOUT LIBVOLUME or a LABEL LIBVOLUME command has completed. You can remove the specified volume from the designated drive and store it outside the library.

System action: The server waits until a REPLY command is issued.

User response: Remove the volume from the drive and store it in a safe place. Issue a REPLY command, along with the request ID, to tell the server that the volume has been removed. The volume can be returned to the library with the CHECKIN LIBVOLUME command.

ANR8322I *Request number: Remove device type volume volume name from entry/exit port of library library name; issue 'REPLY' along with the request ID when ready.*

Explanation: A CHECKOUT LIBVOLUME command has completed. You can remove the specified volume

from the entry/exit port of the given library and store it elsewhere.

System action: The server waits until a REPLY command is issued.

User response: Remove the volume from the library and store it in a safe place. Issue a REPLY command, along with the request ID, to tell the server that the volume has been removed. The volume can be returned to the library with the CHECKIN LIBVOLUME command.

ANR8323I *Request number: Insert device type volume volume name mount mode into entry/exit port of library library name within time limit minute(s); issue 'REPLY' along with the request ID when ready.*

Explanation: A CHECKIN LIBVOLUME or a LABEL LIBVOLUME command is in progress, and the specified volume is needed. Mount the volume in the entry/exit port of the given library within the time limit specified in the message.

System action: The server waits until a REPLY command is issued, or until the time limit expires.

User response: Insert the volume into the library's entry/exit port; and issue a REPLY command, along with the request ID, to tell the server that the volume has been inserted.

ANR8324I *Device type volume volume name is expected to be mounted (mount mode).*

Explanation: The specified volume is expected to be mounted in the near future so the server can access it for reading or writing.

System action: None.

User response: If the volume is stored offline, retrieve it so that it is readily accessible when the server requests that it be mounted.

ANR8325I *Dismounting volume volume name - mount retention period minute mount retention expired.*

Explanation: The specified volume is dismounted because the given mount retention period has expired.

System action: The volume is dismounted.

User response: None.

ANR8326I *Request number: Mount device type volume volume name mount mode in drive drive name of library library name within time limit minutes.*

Explanation: If the volume name includes the names

EXP, IMP, DUMP, or DBBK, the request is for a scratch volume.

System action: The server waits for the volume to be mounted.

User response: Mount the volume in the specified drive.

ANR8327E *Command: Cannot cancel request request number.*

Explanation: The request, whose number is specified by the given command, cannot be canceled. The requested operation must be completed.

System action: The cancel request command is not processed.

User response: Proceed with the requested operation.

ANR8328I *Request number: device type volume volume name mounted in drive drive name.*

Explanation: The server verifies that a requested volume has been mounted properly in the given drive.

System action: The volume is accessed for reading or writing, or both.

User response: None.

ANR8329I *Device type volume volume name is mounted mount mode in drive drive name, status: IDLE.*

Explanation: In response to a QUERY MOUNT command, the server indicates that the given volume is mounted in the specified drive. The volume is currently idle, meaning no active operations are being performed. If the volume remains in the idle state for the amount of time specified by the device class mount retention period, it will be automatically dismounted.

System action: None.

User response: None.

ANR8330I *Device type volume volume name is mounted mount mode in drive drive name, status: IN USE.*

Explanation: In response to a QUERY MOUNT command, the server indicates that the given volume is mounted in the specified drive. The volume is currently in use, meaning that read or write operations, or both, are being performed.

System action: None.

User response: None.

ANR8331I *Device type volume volume name is mounted mount mode in drive drive name, status: DISMOUNTING.*

Explanation: In response to a QUERY MOUNT command, the server indicates that the given volume is mounted in the specified drive. The volume is currently being dismounted by the server.

System action: None.

User response: None.

ANR8332I *Device type volume volume name is mounted mount mode, status: IDLE.*

Explanation: In response to a QUERY MOUNT command, the server indicates that the given volume is mounted for I/O operations. The volume is currently idle, meaning no active operations are being performed. If the volume remains in the idle state for the amount of time specified by the device class mount retention period, it will be automatically dismounted.

System action: None.

User response: None.

ANR8333I *Device type volume volume name is mounted mount mode, status: IN USE.*

Explanation: In response to a QUERY MOUNT command, the server indicates that the given volume is mounted for I/O operations. The volume is currently in use, meaning that read or write operations, or both are being performed.

System action: None.

User response: None.

ANR8334I *Number of matches matches found.*

Explanation: This is a summary message for the QUERY MOUNT command. It indicates the total number of mount points that have been reported in the command output.

System action: None.

User response: None.

ANR8335I *Request number: Verifying label of device type volume volume name in drive drive name.*

Explanation: The server verifies the label of the volume that has been requested by an earlier mount message. This is done to ensure that the correct volume has been mounted by the operator.

System action: The server reads the volume label and checks it for validity.

User response: None.

ANR8336I Verifying label of *device type* volume volume name in drive *drive name*.

Explanation: The server verifies the label of a volume that is needed for read or write operations, or both. This is done to ensure that the correct volume has been mounted.

System action: The server reads the volume label and checks it for validity.

User response: None.

ANR8337I *Device type* volume volume name mounted in drive *drive name*.

Explanation: The server verifies that the specified mount request has been completed properly. Read or write operations, or both, can be performed on the volume.

System action: The label of the volume has been verified.

User response: None.

ANR8338E *Device type* volume volume name cannot be overwritten by EXPORT operation.

Explanation: The specified volume already exists or contains data, so that the server cannot allow new export data to be written to it.

System action: The server detects that the given volume already contains some data that would be overwritten by the requested export operation.

User response: If the specified volume does not contain any valuable data, delete it and retry the export operation.

ANR8339E *Device type* volume intended volume name in drive *drive name* was replaced with volume *incorrect volume name*.

Explanation: The server detects that a previously mounted and verified volume (the desired volume) has been replaced with a different volume (the incorrect volume). No further read or write operations, or both, can occur on the given drive, because data corruption may occur.

System action: The server dismounts the volume from the drive.

User response: Mount the correct volume again if it is in a manual library and retry the operation.

ANR8340I *Device type* volume volume name mounted.

Explanation: The server has mounted the given volume.

System action: Read or write operations, or both, will commence for the volume.

User response: None.

ANR8341I End-of-volume reached for *device type* volume volume name.

Explanation: The server has detected an end-of-volume condition for the given volume.

System action: The volume is marked full. If more data must be stored, the server will access another volume for it.

User response: None.

ANR8342I Request request number for volume volume name canceled by administrator name.

Explanation: A mount request is canceled by the given administrator.

System action: The system cancels the mount request.

User response: None.

ANR8343I Request request number for volume volume name canceled (PERMANENT) by administrator name.

Explanation: A mount request is successfully canceled with the PERMANENT option.

System action: The system cancels the mount request and marks the volume as unavailable.

User response: None.

ANR8344E Command: Invalid request number - request number.

Explanation: A command has been entered with an incorrect request number.

System action: The server does not process the command.

User response: Issue the command with the correct request number.

ANR8345E Command: No match found for this request number.

Explanation: The request number specified by the command is not in the list of outstanding mount requests.

System action: The server does not process the command.

User response: Issue the command with the correct request number.

ANR8346I *Command: No requests are outstanding.*

Explanation: A QUERY REQUEST or CANCEL REQUEST command has been entered although no mount requests are outstanding.

System action: Server operation continues.

User response: None.

ANR8347E *Command: Volume *volume* not found.*

Explanation: A DISMOUNT VOLUME command is issued, but the volume to be dismounted cannot be found.

System action: Server operation continues.

User response: Ensure that the correct volume name is entered.

ANR8348E *Command: Volume *volume* is not "Idle".*

Explanation: A DISMOUNT VOLUME command has been issued, but the volume is still in use and cannot be dismounted.

System action: Server operation continues.

User response: If it is necessary to dismount the volume, cancel the session or process that is using the volume, and reissue the command.

ANR8349E *Command: Device *device* not found.*

Explanation: A DISMOUNT DEVICE command has been issued, but the device to be dismounted cannot be found.

System action: Server operation continues.

User response: Ensure that the correct device has been specified.

ANR8350E *Command: Device *device* is not "Idle".*

Explanation: A DISMOUNT DEVICE command has been issued, but the device is still in use and cannot be dismounted.

System action: Server operation continues.

User response: If it is necessary to dismount the device, cancel the session or process that is using the device, and reissue the command.

ANR8351E *Request number: Mount request for volume *volume name* has timed out.*

Explanation: The mount request has not been satisfied in the requested time.

System action: The server fails the mount request.

User response: Retry the mount request and ensure that the volume is mounted within the time limit for

the manual library. For an automated library, retry the mount request and increase the mount wait time for the device class.

ANR8352I **Requests outstanding:**

Explanation: This message provides a list of currently outstanding mount requests.

System action: The server lists all outstanding mount requests or the one specified on the QUERY REQUEST command.

User response: None.

ANR8353E *Request number: I/O error reading label of volume in drive *drive name*.*

Explanation: The server detects an error while reading the volume label from the volume in the specified drive.

System action: The volume is ejected, and the server continues to wait for the requested volume to be mounted.

User response: Ensure the following:

- The requested volume is properly inserted in the designated drive.
- The volume has been labeled by using the DSMLABEL utility program before you attempt to use it with the server.
- The DEVICE parameter associated with the drive is identified correctly in the DEFINE PATH command, and the drive is currently powered on and ready.

After checking and correcting these potential problems, retry the operation.

ANR8354E *Request number: Incorrect volume (*volume name*) mounted in drive *drive name*.*

Explanation: The user has inserted the named volume into the indicated drive, but it is not the one requested by the server.

System action: The volume is ejected, and the server continues to wait for the requested volume to be mounted.

User response: Ensure that the requested volume is inserted properly into the designated drive.

ANR8355E *I/O error reading label for volume *volume name* in drive *drive name*.*

Explanation: The server detects an error while reading/verifying the volume label for the volume in the specified drive.

System action: The volume is dismounted by the server.

User response: Ensure the following:

- Check the integrity of the data on the volume by issuing an AUDIT VOLUME command. If this error occurs on a volume that is stored inside a SCSI library, the library itself may need to be audited by using the AUDIT LIBRARY command.
- The DEVICE parameter associated with the drive is identified correctly in the DEFINE PATH command, and the drive is currently powered on and ready.

After checking and correcting these potential problems, retry the operation.

ANR8356E **Incorrect volume** *mounted volume name* **was mounted instead of volume** *expected volume name* **in library** *library name*.

Explanation: The incorrect volume has been mounted in the designated library. This error can occur if the library inventory has been altered due to manual intervention or movement of volumes, or both.

System action: The volume is dismounted; the expected volume may be marked unavailable if this error occurs during normal volume mount activity.

User response: Use the AUDIT LIBRARY command to force the library to reevaluate its inventory of volumes.

ANR8357I **Error reading label of volume from slot-element** *element address* **in drive** *drive name* **of library** *library name*.

Explanation: While processing a search-mode CHECKIN LIBVOLUME command for the designated library, the server finds a volume whose label cannot be read.

System action: The volume is dismounted and is not checked into the library.

User response: Remove the volume from the library and ensure that it is properly labeled. After doing so, the volume can be checked into the library.

ANR8358E **Audit operation is required for library** *library name*.

Explanation: The server encounters a problem managing the given library, and determines that an AUDIT LIBRARY operation should be performed.

System action: The server may continue to access the library, but some volumes may not be accessible until an AUDIT LIBRARY command is issued against the library.

User response: Issue an AUDIT LIBRARY command against the library.

ANR8359E **Media fault detected on** *device type* **volume** *volume name* **in drive** *drive name* **of library** *library name*.

Explanation: The server encounters a media fault while accessing the given volume using the specified drive.

System action: The operation that is attempting to access the volume will fail, and the volume will be immediately dismounted from the drive.

User response: In some cases, the server will automatically mark the volume readonly. This will prevent the server from trying to write to the volume. Issue an AUDIT VOLUME command to determine if any data has been lost due to the media failure.

ANR8360I **Volume** *volume name* **has been deleted from MANUAL** *library* *library name*.

Explanation: The specified volume has been deleted by the server. It can be returned to a scratch pool by the mount operator if desired.

System action: The volume is removed from the server's inventory.

User response: None.

ANR8361E **Command: Device type not specified.**

Explanation: The specified command requires that the DEVTYPE parameter be supplied.

System action: The command is not processed.

User response: Reissue the command, and specify a valid DEVTYPE parameter.

ANR8362E **Command: The parameter** *parameter* **is invalid for device type** *device type*.

Explanation: The specified parameter is not valid for a device class with the given device type.

System action: The command is not processed.

User response: Reissue the command with a correct parameter.

ANR8363E **Command: The parameter** *parameter* **is required for device type** *device type*.

Explanation: The specified command requires that the given parameter be supplied when the indicated device type is used.

System action: The command is not processed.

User response: Reissue the command, providing the required parameter value.

ANR8364E *Command:* **Cannot reduce MOUNTLIMIT below number of volumes currently mounted.**

Explanation: The MOUNTLIMIT value cannot be reduced below the number of currently mounted volumes.

System action: The command is not processed.

User response: Wait until the server finishes using some of the mounted volumes, or force the server to dismount idle volumes using the DISMOUNT VOLUME command, then retry this command.

ANR8365E *Command:* **The parameter parameter cannot be changed.**

Explanation: The specified parameter cannot be changed from the value that was provided with the associated DEFINE command.

System action: The command is not processed.

User response: If it is necessary to use a different value for the given parameter, the associated object must be deleted and then redefined using the new parameter value.

ANR8366E *Command:* **Invalid value for parameter parameter.**

Explanation: An invalid value has been provided for the specified parameter.

System action: The command is not processed.

User response: Reissue the command, and specify a valid parameter value. If this is for the ELEMENT parameter on DEFINE DRIVE with AUTODETECT, this message can be issued because the library doesn't support the ability to determine the element number dynamically. In this case, supply the actual element number instead of using AUTODETECT for the ELEMENT parameter. If this is for the SCALECAPACITY parameter on a 3592 device class, verify that this device class has the attribute WORM=NO as WORM and SCALECAPACITY are not compatible.

ANR8367E *Command:* **Multiple parameter values are not allowed.**

Explanation: The designated parameter is specified more than once in the command; this is not allowed.

System action: The command is not processed.

User response: Reissue the command, but specify the given parameter only once.

ANR8368E *Request number:* **Incorrect side (side) of volume volume name mounted in drive drive name.**

Explanation: The user inserted the wrong side of the requested volume into the indicated drive.

System action: The volume is ejected, and the server continues to wait for the requested side of the volume to be mounted.

User response: Insert the correct side of the requested volume into the designated drive.

ANR8369E **Library library name is not defined.**

Explanation: The designated library is not defined, but has been referenced in a mount request.

System action: The mount request is rejected.

User response: Define the given library, or update the LIBRARY parameter of the device class that references it.

ANR8370I *Device type* **volume volume name is mounted mount mode, status: RETRY.**

Explanation: In response to a QUERY MOUNT command, the server indicates that the given volume is mounted for I/O operations. The volume is currently in RETRY, meaning an attempt is being made to re-establish communications with another server. If the volume remains in the retry state for the amount of time specified by the device class retry period, the operation will fail and the volume will be automatically dismounted.

System action: None.

User response: None.

ANR8371I **I/O is being bypassed for volume volume name.**

Explanation: The indicated volume is mounted but the server is bypassing actual I/O operations for the volume. The pool associated with the volume matches the NULLPOOLNAME option in the options file or NULLFILEDEVCLASS YES has been specified in the options file.

System action: None.

User response: None.

ANR8372I *Request number:* **Remove device type volume volume name from drive drive name of library library name.**

Explanation: A LABEL LIBVOLUME command has completed. You can remove the specified volume from the designated drive and store it outside the library.

System action: None.

User response: Remove the volume from the drive and store it in a safe place.

ANR8373I *Request number: Fill the bulk entry/exit port of library library name with all device type volumes to be processed within time limit minute(s); issue 'REPLY' along with the request ID when ready.*

Explanation: A CHECKIN LIBVOLUME or LABEL LIBVOL command with SEARCH=BULK is in progress. Load all volumes to be processed into the multi-slot entry/exit port of the given library within the time limit specified in the message.

System action: The server waits until a REPLY command is issued, or until the time limit expires.

User response: Insert the volumes into the library's entry/exit port; and issue a REPLY command, along with the request ID, to tell the server that the volumes have been inserted.

ANR8374E *Unable to unmount mountpoint mountpoint name.*

Explanation: A removable file device class mountpoint had to be unmounted using the operating system unmount function. The server did not have permission to unmount the directory specified.

System action: The server continues, but cannot use the mountpoint for removable file support until the directory is unmounted.

User response: It may be necessary to run the server as a root user to mounted directories to be unmounted.

ANR8375E *Device type volume volume name cannot be overwritten by BACKUPSET operation.*

Explanation: The specified volume already exists or contains data, so that the server cannot allow new backup set data to be written to it.

System action: The server detects that the given volume already contains some data that would be overwritten by the requested backup set operation.

User response: If the specified volume does not contain any valuable data, delete it and retry the backup set operation.

ANR8376I *Mount point reserved in device class Device class name, status: RESERVED.*

Explanation: In response to a QUERY MOUNT command, the server indicates that there is a mount point reserved for future I/O operations in the given device class.

System action: None.

User response: None.

ANR8377I *Device type volume volume name is mounted mount mode, status: DISMOUNTING.*

Explanation: In response to a QUERY MOUNT command, the server indicates that the given volume is currently being dismounted.

System action: None.

User response: None.

ANR8378I *Device type volume volume name is mounted mount mode, status: RETRY DISMOUNT FAILURE.*

Explanation: In response to a QUERY MOUNT command, the server indicates that it is currently retrying the dismount of the given volume because of a failure during the previous dismount.

System action: None.

User response: None.

ANR8379I *Mount point in device class Device class name is waiting for the volume mount to complete, status: WAITING FOR VOLUME.*

Explanation: In response to a QUERY MOUNT command, the server indicates that there is a mount point in the given device class waiting for the volume mount to complete.

System action: None.

User response: None.

ANR8380I *Device type volume volume name is mounted mount mode in drive drive name, status: RETRY DISMOUNT FAILURE.*

Explanation: Because of the failure of a previous dismount, the server is retrying the dismount of the specified volume from the specified drive. In response to a QUERY MOUNT command, the server indicates that the volume is mounted in the drive.

System action: None.

User response: None.

ANR8381E *Device type volume volume name could not be mounted in drive drive name.*

Explanation: The server could not complete the specified mount request due to an error. Examine previous messages for additional information regarding the specified volume and the operation.

System action: The requested operation fails.

User response: Examine previous messages for additional information regarding the specified volume and the operation.

ANR8382W Library *library name* is now full.

Explanation: During a library check-in operation from a multi-slot entry/exit station, the last storage location was filled before checking the remainder of the entry/exit slots.

System action: The operation stops, but is considered successful if at least one volume is checked in.

User response: If more volumes remain to be checked in, issue a CHECKOUT LIBVOLUME command to make room in the library. Retry the library operation.

ANR8383E Device class *device class name* directory *directory name* is not a SnapLock directory.

Explanation: When processing the named device class, it was discovered that a directory was specified for the device class that is not a NetApp SnapLock WORM Volume. All directories used by a device class for a storage pool with RECLAMATIONTYPE=SNAPLOCK must be Snaplock directories.

System action: If you are trying to define a storage pool with RECLAMATIONTYPE=SNAPLOCK, the command fails. If you are trying to update a device class that is pointed to by a RECLAMATIONTYPE=SNAPLOCK storage pool, the command fails.

User response: If you are trying to define a storage pool with RECLAMATIONTYPE=SNAPLOCK, you need to specify a device class which has all directories which are NetApp SnapLock WORM Volumes. You may select another device class which has all SnapLock directories specified in it. Or you may use the UPDATE DEVCLASS command to remove non-SnapLock directories from the device class DIR list. If you modify an existing device class, you need to ensure that no data is stored in directories that are to be removed from the device class. If this message is issued when you are trying to update a device class, ensure that all directories specified in the directory are SnapLock directories.

ANR8384E Request number: **Incorrect volume** (*volume name*) inserted into library *library name*.

Explanation: The user has inserted the named volume into the indicated library, but it is not the one requested by the server.

System action: The volume is skipped, and the server continues to wait for the requested volume to be inserted.

User response: Ensure that the requested volume is

inserted properly into the designated location in the library.

ANR8385E All entry/exit ports of library *library name* are empty.

Explanation: The entry/exit ports of the library do not contain a volume that can be processed.

System action: The command fails.

User response: Ensure that the volume is inserted properly into the entry/exit port of the library and that the library indicates the volume is inserted and issue the command again. Contact the hardware vendor if the volume is inserted correctly and this error occurs.

ANR8386W Slot *element number* of library *library name* is inaccessible.

Explanation: The slot in the library could not be physically accessed at this time.

System action: The slot is skipped and processing continues with the next slot.

User response: If there is a volume in the slot that needs to be processed, verify that the Entry/Exit door is closed, the slot is accessible, and the device has not logged any device errors before trying the command again. Contact the hardware vendor if slots are incorrectly being reported as inaccessible.

ANR8387I Request number: **All entry/exit ports of library** *library name* are full or inaccessible. Empty the entry/exit ports, close the entry/exit port door, and make the ports accessible.

Explanation: A CHECKOUT LIBVOLUME command cannot find an empty and available entry/exit port to place the volume to be removed.

System action: The server waits until the operator performs the actions requested.

User response: Make at least one entry/exit port empty and accessible. Check the entry/exit ports or the library. Make sure the entry/exit door is closed. If all the entry/exit ports are full remove at least one volume from the entry/exit port. If any of entry/exit are empty then the empty entry/exit ports are inaccessible. Check the library's documentation on how to make the entry/exit port accessible. If the library is incorrectly reporting the status of the entry/exit port contact the library vendor.

ANR8388E Device class *device class name* has no directories specified.

Explanation: When processing the named device class, which is referenced by a storage pool of type RECLAMATIONTYPE=SNAPLOCK, it was discovered

that there were no directories specified for it. One or more directories must be specified for a device class that is used by a storage pool with RECLAMATIONTYPE=SNAPLOCK, and all directories must be NetApp SnapLock WORM Volumes.

System action: The operation fails.

User response: A device class that is referenced by a storage pool of type RECLAMATIONTYPE=SNAPLOCK needs to specify one or more directories which are NetApp SnapLock WORM Volumes. Use the UPDATE DEVCLASS command to define appropriate directories to the device class and retry your request.

ANR8389E Device class *device class name* has storage pools using it with inconsistent RECLAMATIONTYPE parameters, or invalid directories specified in it.

Explanation: When processing the named device class, it was discovered that it was not configured properly. A device class can be referenced by storage pools of type RECLAMATIONTYPE=THRESHOLD or RECLAMATIONTYPE=SNAPLOCK. For storage pools of type RECLAMATIONTYPE=SNAPLOCK, all directories specified in the device class must be on NetApp SnapLock WORM Volumes.

System action: If the Tivoli Storage Manager server is starting, the server continues; however, attempts made to read from or write to that storage pool will fail until the storage pools referencing the device class and the device class are properly configured.

User response: Check the activity log for ANR8502, ANR8383E, and ANR8388E messages. If these messages have been issued, follow the instructions in the User Response section of those messages to resolve the issues.

If the problem is not resolved, use the QUERY DEVCLASS command with the FORMAT=DETAILED option to obtain the specified directories for the device class. Verify that each directory is available to the Tivoli Storage Manager server, e.g., on-line, in read-write mode, configured properly, etc.

If the problem is not resolved, for a device class used by RECLAMATIONTYPE=SNAPLOCK storage pools, check that each directory is a NetApp SnapLock WORM Volume. If not, use the UPDATE DEVCLASS command to update the device class directory structure appropriately.

If the problem is not resolved, use the QUERY STGPOOL command with the FORMAT=DETAILED option to determine which storage pools are pointing to the device class. Verify that storage pools of either type RECLAMATIONTYPE=THRESHOLD or RECLAMATIONTYPE=SNAPLOCK are using the device class. If storage pools of both types are using the device class, modify the storage pool definitions such

that only one type of storage pool uses the device class. If you wish to have storage pools of both reclamation types pointing to the same directory structure, you may create two device classes with the same directory structure, and have storage pools of one reclamation type use one device class while storage pools of the other reclamation type uses the other device class.

If you have made updates to the storage pools and device classes and the problem is not resolved, you may need to restart the Tivoli Storage Manager server.

ANR8390W Failure connecting to library client *library client* to manage volume *volume*.

Explanation: The library manager failed to contact the designated library client for a management operation for the specified volume.

System action: The library management operation fails.

User response: Review the other messages in the activity log relating to this library client and this volume to determine which operations were affected by this failure.

ANR8391E The external library manager *file name* can not be found. The library *library name* is not available.

Explanation: The external library manager listed for this library was not found. The path or the file name is not correct.

System action: The library management operation fails.

User response: Verify the path and the name of the external library mentioned. If it is correct, verify that the file is present on the system and that file permissions allow the server to invoke the file.

ANR8392E The external library manager *file name* does not have executable permission. The library *library name* is not available.

Explanation: The external library manager listed for this library was not found. The path or the file name is not correct.

System action: The library management operation fails.

User response: Verify the path and the name of the external library mentioned. If it is correct, verify that the file is present on the system and that the file permissions allow the server to invoke the file.

ANR8393E Failed to communicate with the external library *library name* through it's defined external library manager path.

Explanation: The external library manager executable file did not start or exited immediately.

System action: The library management operation fails.

User response: Verify the path and the file name of this library's external library manager. If it is correct, verify that the file is present on the system and that the file permissions allow the server to invoke the file. The path and file name can be found by using the QUERY PATH command.

ANR8400I Library *library name* defined.

Explanation: The designated library has been successfully defined.

System action: The library is defined and recorded in the database.

User response: None.

ANR8401E Command: Invalid library name *library name*.

Explanation: The designated library name is invalid; either it contains too many characters, or some of the characters are invalid.

System action: The command is not processed.

User response: Reissue the command using a valid library name.

ANR8402E Command: Library *library name* is already defined.

Explanation: The designated library cannot be defined because it already exists.

System action: The command is not processed.

User response: If you want to define an additional library, reissue the command with a different library name.

ANR8403E Command: Operation not allowed for *library type* libraries.

Explanation: The requested operation is not allowed for libraries of the given type.

System action: The command is not processed.

User response: None.

ANR8404I Drive *Drive name* defined in library *library name*.

Explanation: The designated drive has been successfully defined as a member of the specified library.

System action: The drive is defined and recorded in the database.

User response: None.

ANR8405E Command: Invalid drive name *drive name*.

Explanation: The designated drive name is invalid; either it contains too many characters, or some of the characters are invalid.

System action: The command is not processed.

User response: Reissue the command using a valid drive name.

ANR8406E Command: Drive *drive name* is already defined in library *library name*.

Explanation: The designated drive cannot be defined because it has already been defined for the specified library.

System action: The command is not processed.

User response: If you want to define an additional drive, reissue the command with a different drive name.

ANR8407E Command: The MODEL parameter is required for this command.

Explanation: The MODEL parameter has not been provided; it is required.

System action: The command is not processed.

User response: Reissue the command using the MODEL parameter.

ANR8408E Command: The DEVICE parameter is required for this command.

Explanation: The DEVICE parameter has not been provided; it is required.

System action: The command is not processed.

User response: Reissue the command using the DEVICE parameter.

ANR8409E Command: Library *library name* is not defined.

Explanation: The designated library has not been defined.

System action: The command is not processed.

User response: Reissue the command using a different library name, or define the library before retrying the command.

ANR8410I Library *library name* deleted.

Explanation: The designated library has been deleted successfully.

System action: The library is deleted.

User response: None.

ANR8411E *Command: One or more drives are still defined in library library name.*

Explanation: The designated library cannot be deleted because there are still drives defined within it.

System action: The command is not processed.

User response: Delete all drives from the library, and reissue the command.

ANR8412I Drive *drive name* deleted from library *library name*.

Explanation: The designated drive has been deleted successfully from the specified library.

System action: The drive is deleted.

User response: None.

ANR8413E *Command: Drive drive name is currently in use.*

Explanation: The designated drive cannot be deleted or updated because it is currently in use.

System action: The command is not processed.

User response: Wait until the drive is no longer in use, and reissue the command.

ANR8414E *Command: Drive drive name is not defined in library library name.*

Explanation: The designated drive has not been defined in the given library.

System action: The command is not processed.

User response: Reissue the command using a different drive name. If appropriate, define the drive before retrying the command.

ANR8415E *Command: The parameter parameter is required for this command.*

Explanation: The specified parameter must be provided when processing the given command.

System action: The command is not processed.

User response: Reissue the command, providing the required parameter value.

ANR8416E *Command: The parameter parameter is invalid for library type library type.*

Explanation: The specified parameter is not valid for libraries of the given type. The scratch category must be at least 2 less than the private category for 349x libraries.

System action: The command is not processed.

User response: Reissue the command, using only the proper parameters. If using the scratch category make sure it is at least 2 less than the private category.

ANR8417E *Command: The parameter parameter is invalid for drives in library type libraries.*

Explanation: The specified parameter is not allowed when defining or updating drives in a library of the given type.

System action: The command is not processed.

User response: Reissue the command, using only the proper parameters.

ANR8418E *Command: An I/O error occurred while accessing library library name.*

Explanation: An I/O error occurs while accessing the designated library.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the library is identified correctly in the DEFINE PATH command, and that the library is currently powered on and ready. If the library has an access door, make sure it is closed. After checking and correcting these potential problems, retry the operation.

ANR8419E *Command: The drive or element conflicts with an existing drive in library library name.*

Explanation: Either there are no more physical drives in the library, or the specified ELEMENT parameter conflicts with an existing defined drive in the given library.

System action: The command is not processed.

User response: Specify a valid ELEMENT parameter that is not used by any other drive in the library.

ANR8420E *Command: An I/O error occurred while accessing drive drive name.*

Explanation: An I/O error occurs while accessing the specified drive.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the drive is identified correctly in the DEFINE PATH command, and that the drive is currently powered on and ready. After checking and correcting these potential problems, retry the command.

ANR8421E *Command: Unable to start a process for this command.*

Explanation: The server cannot start a background process to carry out the designated command.

System action: The operation fails.

User response: Check for and correct memory shortages or other server resource constraints, and reissue the command.

ANR8422I *Command: Operation for library library name started as process process ID.*

Explanation: A volume check-in process has been started to handle the insertion of a volume into the given library. The process is assigned the ID specified in the message.

System action: The server starts a background process to perform the operation in response to the CHECKIN LIBVOLUME command entered by an administrator.

User response: To obtain status on the process, issue the QUERY PROCESS command. The process may be canceled with the CANCEL PROCESS command.

ANR8423I **CHECKIN LIBVOLUME process for library library name has been canceled.**

Explanation: A background server process that has been working to check in one or more volumes for the given library is canceled by the CANCEL PROCESS command.

System action: The server process is ended and server operation continues.

User response: None.

ANR8424I **Checking in volume volume name in library library name.**

Explanation: In response to a QUERY PROCESS command, this message displays the status for a CHECKIN LIBVOLUME process on the server. The given volume is being checked in to the designated library.

System action: The background process operation continues.

User response: None. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR8425I **Checking in volumes in search mode in library library name.**

Explanation: In response to a QUERY PROCESS command, this message displays the status for a CHECKIN LIBVOLUME process on the server. Volumes are being checked into the given library automatically using a search for previously-unknown volumes.

System action: The background process operation continues.

User response: None. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR8426E **CHECKIN LIBVOLUME for volume volume name in library library name failed.**

Explanation: The background process for a CHECKIN LIBVOLUME command has failed.

System action: The background process ends, but the volume has not been checked into the library.

User response: Make sure the library and drive devices associated with this command are powered on and ready, and then reissue the command.

ANR8427I **CHECKIN LIBVOLUME for volume volume name in library library name completed successfully.**

Explanation: The specified volume was successfully checked in to the library during processing of a CHECKIN LIBVOLUME or LABEL LIBVOLUME command.

System action: The volume is made available for mounting in the given library.

User response: None.

ANR8428E *Command: The STATUS parameter is required for this command.*

Explanation: The STATUS parameter must be provided with the given command.

System action: The command is not processed.

User response: Reissue the command, and provide a valid STATUS parameter value.

ANR8429E *Command: No drives are currently defined in library library name.*

Explanation: The command cannot be issued until at least one drive has been defined in the given library.

System action: The command is not processed.

User response: Define a drive in the library, using the DEFINE DRIVE command, as well as a path to the

drive, using the DEFINE PATH command. Then retry the failed command.

ANR8430I Volume *volume name* has been checked into library *library name*.

Explanation: A search-mode CHECKIN LIBVOLUME process has found the given volume and automatically checked it into the library.

System action: The volume is added to the given library's inventory.

User response: None.

ANR8431I CHECKIN LIBVOLUME process completed for library *library name*; volume count **volume(s) found**.

Explanation: A search-mode CHECKIN LIBVOLUME process is completed. The specified number of volumes have been successfully added to the library's inventory.

System action: The volumes are made available for use by the server.

User response: None.

ANR8432E Command: Volume *volume name* is already present in library *library name*.

Explanation: The specified volume cannot be checked into the given library because it is already present.

System action: The command is not processed.

User response: Provide the name of a volume that is not already present in the given library. Use the QUERY LIBVOLUME command to obtain a full list of volumes that have already been checked into the library.

ANR8433E Command: Volume *volume name* is not present in library *library name*.

Explanation: The specified volume cannot be checked out of the given library because it is not present.

System action: The command is not processed.

User response: Provide the name of a volume that is present in the given library. Use the QUERY LIBVOLUME command to obtain a full list of volumes that reside in the library.

ANR8434I Command: Operation for volume *volume name* in library *library name* started as process *process ID*.

Explanation: A volume check-out process has been started to handle the removal of a volume from the given library. The process is assigned the ID specified in the message.

System action: The server starts a background process

to perform the operation in response to the CHECKOUT LIBVOLUME command entered by an administrator.

User response: To obtain status on the process, issue the QUERY PROCESS command. The process may be canceled with the CANCEL PROCESS command.

ANR8435I CHECKOUT LIBVOLUME for volume *volume name* in library *library name* has been canceled.

Explanation: A background server process that has been working to check out the volume from the given library is canceled by the CANCEL PROCESS command.

System action: The server process is ended and server operation continues.

User response: None.

ANR8436I Checking out volume *volume name* from library *library name*.

Explanation: In response to a QUERY PROCESS command, this message displays the status for a CHECKOUT LIBVOLUME process on the server.

System action: The background process operation continues.

User response: None. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR8437E CHECKOUT LIBVOLUME for volume *volume name* in library *library name* failed.

Explanation: The background process for a CHECKOUT LIBVOLUME command has failed.

System action: The background process ends, but the volume has not been checked out of the library.

User response: Make sure the library and drive devices associated with this command are powered on and ready, then retry the command.

ANR8438I CHECKOUT LIBVOLUME for volume *volume name* in library *library name* completed successfully.

Explanation: The background process for a CHECKOUT LIBVOLUME command has completed successfully.

System action: The volume is either deleted from the library's inventory (if its status is something other than DATA) or marked not present (if its status is DATA).

User response: None.

ANR8439I SCSI library *library name* is ready for operations.

Explanation: The initialization process for the given library has completed successfully, and the library is ready for use.

System action: The library is made ready for use.

User response: None.

ANR8440E Initialization failed for SCSI library *library name*; will retry in *delay time* minute(s).

Explanation: The initialization process for the given library has failed. It will be retried automatically after the specified amount of time has elapsed.

System action: The initialization will be retried later.

User response: Ensure that the library device is powered on and ready. If the library has an access door, make sure it is in the closed position.

ANR8441E Initialization failed for SCSI library *library name*.

Explanation: The initialization process for the given library has failed, and will not be retried until the next time the server needs to access the library.

System action: The library is made temporarily unavailable.

User response: Make sure the library is powered on and attached.

ANR8442E Command: Volume *volume name* in library *library name* is currently in use.

Explanation: The command cannot be processed because the specified volume is already being used for another operation.

System action: The command is not processed.

User response: Wait until the conflicting volume activity has completed, and then reissue the command. If the volume is currently mounted, but idle, you can dismount it with the DISMOUNT VOLUME command and then retry this operation.

ANR8443E Command: Volume *volume name* in library *library name* cannot be assigned a status of SCRATCH.

Explanation: The volume cannot be assigned to the given library's scratch pool because there is a storage pool volume defined or a volume in the volume history file with this volume name. Such a volume may still contain valid data. Assigning the volume to the library's scratch pool might result in a destructive overwrite of the volume's data.

System action: The command is not processed.

User response: Reissue the command, specifying that the volume be assigned a status of PRIVATE.

ANR8444E Command: Library *library name* is currently unavailable.

Explanation: The requested operation cannot be completed because the specified library is unavailable for I/O operations. The library may still be carrying out its initialization operations.

System action: The command is not processed.

User response: Wait until the library initialization completes or the library becomes ready.

ANR8445I Volume *volume name* in library *library name* updated.

Explanation: The specified library volume has been updated successfully.

System action: The library volume inventory is updated.

User response: None.

ANR8446W Manual intervention required for library *library name*.

Explanation: The specified library requires manual intervention.

System action: Current library activity will be delayed until the required intervention occurs.

User response: If the library has an access door, make sure it is in the closed position. If it has a cartridge carousel, make sure the carousel is installed. The server automatically detects when the appropriate action has been taken; it will then continue its operations.

ANR8447E No drives are currently available in library *library name*.

Explanation: The attempted operation cannot be completed on the specified library because there are no available drives. A drive may be unavailable because an application other than the server may have the driver opened. This message may also be issued if a CHECKIN or LABEL command is issued and no drive is available to service the operation. This can be because all the drives are mounted by other processes or sessions, or the device type was incorrectly specified.

System action: The attempted operation is terminated.

User response: Use the QUERY DRIVE command to check the online status of the drives. Drives that are marked "Unavailable since hh:mm yy/mm/dd" are drives taken offline by the server at the time specified because of hardware failures or the inability to open the drive. If the attempted operation is a CHECKIN or

LABEL command, use the QUERY MOUNT command to determine if all the drives in the library are mounted and wait until one of these is available. If there are mounted volumes with an IDLE status, use the DISMOUNT VOLUME command to free its drive, and retry the original operation.

ANR8448E Scratch volume *volume name* from library *library name* rejected - volume name is already in use.

Explanation: The designated volume has been used to satisfy a scratch mount, but the volume is already defined in a storage pool, or has been used to store server export, database dump, or database backup information as recorded in the server volume history file.

System action: The volume is rejected.

User response: Use a volume that is not in use, or check out and relabel the rejected volume, assigning it a new name in the process, or delete the existing volume that caused the name conflict.

ANR8449E Scratch volume *volume name* rejected - volume name is already in use.

Explanation: The designated volume has been used to satisfy a scratch mount, but the volume is already defined in a storage pool, or has been used to store server export, database dump, or database backup information as recorded in the server volume history file.

System action: The volume is rejected.

User response: Use a volume that is not in use, or rename the rejected volume or delete the existing volume that caused the name conflict.

ANR8450E Command: Library *library name* is currently in use.

Explanation: The designated library cannot be deleted or updated because it is currently in use for an I/O operation.

System action: The command is not processed.

User response: Wait until the library is no longer in use, and then retry the command.

ANR8451I 349X library *library name* is ready for operations.

Explanation: The initialization process for the given library has completed successfully, and the library is ready for use.

System action: The library is made ready for use.

User response: None.

ANR8452E Initialization failed for 349X library *library name*; will retry in *delay time* minute(s).

Explanation: The initialization process for the given library has failed. It is retried automatically after the specified amount of time has elapsed.

System action: The initialization will be retried later.

User response: Ensure that the library device is powered on and ready.

ANR8453E Initialization failed for 349X library *library name*.

Explanation: The initialization process for the given library has failed and will not be retried until the next time the server needs to access the library.

System action: The library is made temporarily unavailable.

User response: None.

ANR8454E Mismatch detected between external label (*volume name from external label*) and media label (*volume name from media label*) in 349X library *library name*.

Explanation: The external label of a volume was found to differ from its media label in the designated library.

System action: The volume will not be accessed.

User response: Remove the volume from the library and ensure that it is properly labeled.

ANR8455E Volume *volume name* could not be located during audit of library *library name*. Volume has been removed from the library inventory.

Explanation: While processing an AUDIT LIBRARY command for the given library, the server cannot find the given volume in the library.

System action: The volume is removed from the library inventory.

User response: If the volume is needed, it should be located and checked into the library using the CHECKIN LIBVOLUME command.

ANR8456E Multiple volumes named *volume name* were found during audit of library *library name*.

Explanation: While processing an AUDIT LIBRARY command for the given library, multiple physical volumes are found to have the same name.

System action: The first instance of the volume is

retained in the server inventory; all other instances are ignored.

User response: Remove all of the redundant instances of the volume from the library. If the volume which the server retained is found to be the incorrect one, it can be checked out with the CHECKOUT LIBVOLUME command; then the correct instance can be checked into the library with a CHECKIN LIBVOLUME command.

ANR8457I *Command: Operation for library library name started as process process ID.*

Explanation: A library audit process has been started for the given library. The process is assigned the ID specified in the message.

System action: The server starts a background process to perform the operation in response to the AUDIT LIBRARY command entered by an administrator.

User response: To obtain status on the process, issue the QUERY PROCESS command. The process may be canceled with the CANCEL PROCESS command.

ANR8458I *AUDIT LIBRARY process for library library name has been canceled.*

Explanation: A background server process that has been working to audit the given library is canceled by the CANCEL PROCESS command.

System action: The server process is ended and server operation continues.

User response: None.

ANR8459I *Auditing volume inventory for library library name.*

Explanation: In response to a QUERY PROCESS command, this message displays the status for an AUDIT LIBRARY process on the server.

System action: Server operation continues.

User response: None. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR8460E *AUDIT LIBRARY process for library library name failed.*

Explanation: The background process for an AUDIT LIBRARY command has failed.

System action: The background process ends.

User response: Make sure the library and drive devices associated with this command are powered on and ready, then reissue the command.

ANR8461I *AUDIT LIBRARY process for library library name completed successfully.*

Explanation: The background process for an AUDIT LIBRARY command has completed successfully.

System action: The library inventory is updated to match the contents of the library as found during the audit operation.

User response: None.

ANR8462I *End-of-side reached for device type volume volume name.*

Explanation: The server has detected an end-of-side condition for the given two sided volume.

System action: The server will access the second side of the volume.

User response: None.

ANR8463E *Device type volume volume name is write protected.*

Explanation: The server has detected a write-protect condition for the given volume.

System action: The server will dismount the volume and continue processing with another volume.

User response: Adjust the write-protect switch on the volume so that writing is allowed. If the volume is an optical volume and the write-protect switch is already set to allow writing, use the MOVE DATA command to move the data off of the volume. Rewritable volumes may be reformatted and reused after the data is moved to another volume.

ANR8464E *command: Invalid update request for library library name.*

Explanation: An invalid update request has been made for the given library. This can occur if a new device name is given and the characteristics of the device do not match the characteristics of the original device.

System action: The server does not process the command.

User response: If a different type of library device has been installed, the old library definition must be deleted with a DELETE LIBRARY command, and a new library must be defined. The UPDATE LIBRARY command cannot be used in this case.

ANR8465I *Library library name updated.*

Explanation: An UPDATE LIBRARY request has been successfully processed for the given library.

System action: The server updates its information about the library.

User response: None.

ANR8466E *command:* **Invalid update request for drive *drive name* in library *library name*.**

Explanation: An invalid update request has been made for the given drive. This can occur if a new device name is given and the characteristics of the device do not match the characteristics of the original device.

System action: The server does not process the command.

User response: If a different type of drive has been installed, the old drive definition must be deleted with a DELETE DRIVE operation, and a new drive must be defined. The UPDATE DRIVE command cannot be used in this case.

ANR8467I **Drive *drive name* in library *library name* updated.**

Explanation: An UPDATE DRIVE request has been successfully processed for the given drive.

System action: The server updates its information about the drive.

User response: None.

ANR8468I *device type* **volume *volume name* dismounted from drive *drive name* in library *library name*.**

Explanation: The specified volume has been dismounted from the given drive.

System action: None.

User response: If the type of the given library is MANUAL, the operator may elect to remove the volume (which has already been ejected) from the drive and store it in an appropriate location. For automated libraries, this message is purely informational.

ANR8469E **Dismount of *device type* volume *volume name* from drive *drive name* in library *library name* failed.**

Explanation: An attempt to dismount the designated volume failed due to an I/O error.

System action: None.

User response: If the type of the given library is MANUAL, the volume can be manually ejected and removed from the drive. For automated libraries, manual intervention may be required to correct the problem.

ANR8470W **Initialization failure on drive *drive name* in library *library name*.**

Explanation: The specified drive could not be initialized at this time.

System action: The initialization of the specified library continues.

User response: Examine previous messages for additional information regarding the specified drive.

ANR8471E **Server no longer polling drive *drive name* in library *library name* - path *path* will be marked off-line.**

Explanation: The server is unable to use the mentioned drive via the specified path. This may be for the following reasons:

- The drive cannot be opened
- In the case of a 3494 or a library that can be partitioned, the drive may be unavailable to the library manager, may be in use by another application, or may be loaded with a cartridge not labeled for server use.

System action: The path to the drive is offline and is not used for tape operations.

User response: Determine the reason the path to the drive is inaccessible, such as hardware errors reported in the system logs. Render any needed corrections to the hardware. Then the path may be made online by issuing the UPDATE PATH command with the ONLINE=YES option.

ANR8472I **Error reading label of volume in drive *drive name* of library *library name*.**

Explanation: While processing a search-mode CHECKIN LIBVOLUME command for the designated library, the server finds a volume whose label cannot be read.

System action: The volume is dismounted and is not checked into the library.

User response: Remove the volume from the library and ensure that it is properly labeled. After doing so, the volume can be checked into the library.

ANR8473I **Volume *volume name* was found in storage element *slot element address* in library *library name*. It may still be in the drive.**

Explanation: The specified volume was found in the storage slot of a cleaner cartridge. After it was loaded into a drive for cleaning, TSM determined that it is not a cleaner cartridge. TSM encountered an error trying to move the cartridge back to the storage slot of the cleaner cartridge. If the volume is a storage pool volume, TSM already attempted to make it unavailable.

ANR8474E • ANR8481I

Review the output of the QUERY VOLUME F=D command for storage pool volumes. Review the output of the QUERY VOLHISTORY command for non-storage pool volumes.

System action: None.

User response: Verify all other cleaner cartridges are in the correct storage slots. Issue the QUERY LIBVOLUME command to obtain the storage slots of all the cartridges currently checked into TSM. Remove the cartridge in the storage slot identified in the ANR8911W message. Remove the specified volume from the drive. Issue an AUDIT LIBRARY command against the library.

ANR8474E *Command: One or more paths are still defined to library library name.*

Explanation: The designated library cannot be deleted because there are still paths defined to it.

System action: The command is not processed.

User response: Delete all paths to this library, and reissue the command.

ANR8475I *Dismount of volume volume name failed. It may still be in the drive.*

Explanation: The specified volume could not be dismounted. TSM encountered an error trying to dismount the volume. If the volume is a storage pool volume, TSM already attempted to make it unavailable. Review the output of the QUERY VOLUME F=D command for storage pool volumes. Review the output of the QUERY VOLHISTORY command for non-storage pool volumes.

System action: None.

User response: Review message ANR8469E in the activity log. Check if the volume is still loaded in the drive. If the volume is not in the drive, determine where the volume is located in the library.

ANR8476E *Operation is not supported for the libtype of library library name.*

Explanation: The operation failed because the libtype of the library is not supported for the operation.

System action: The operation fails.

User response: Use a different libtype such as MANUAL to perform the operation.

ANR8477E *Device type device type is incorrect for drive drive name.*

Explanation: The device type of the specified drive on the library client is not compatible with the device type for the same drive on the library manager.

System action: The operation fails.

User response: Delete the drive definition on the library client, and re-define the drive specifying the correct device. If this does not correct the problem, contact your service representative for assistance.

ANR8478W *Invalid home slot address in inventory for library library name; volume = volume name;slot = slot number.*

Explanation: The specified volume's home slot in the library inventory does not match the database inventory.

System action: The operation fails.

User response: Run 'audit library' against the specified library.

ANR8479W *Unable to audit slot-element slot-element of library library name.*

Explanation: The library audit process was unable to audit storage slot with the specified element address. This is probably due to no drive device being available into which to load the cartridge. It can also be due to library or drive I/O errors occurring during the audit process.

System action: The AUDIT LIBRARY command fails.

User response: Verify that for every type of cartridge in the library at least one drive is defined that can read the media, and that the drive is online and working properly. Check the activity log for I/O errors related to hardware failure and repair.

ANR8480E *The drive Drive Name was not found for library Library Name.*

Explanation: The missing drive needs to be defined to successfully run the current operation.

System action: The operation fails.

User response: Make sure that the drive is defined. If macros are being used, the COMMIT command needs to be issued after the DEFINE DRIVE. Otherwise, this could indicate a server internal error.

ANR8481I *The library library name already has an AUDIT LIBRARY operation pending mount activity.*

Explanation: Libraries of type SHARED can only have one AUDIT LIBRARY operation waiting on mount activity. All subsequent AUDIT LIBRARY operations will be canceled.

System action: The server process is ended and server operation continues.

User response: None.

ANR8483W A device class can not be found for the library *library name*.

Explanation: A library client audits a SHARED type Library, but there is no device class defined for that library.

System action: The AUDIT LIBRARY command fails.

User response: Define or update a device class for the library using the DEFINE DEVCLASS or UPDATE DEVCLASS command.

ANR8485E No drives are available to be mounted in *MODE mode with format FORMAT_CODE* in library *LIBRARY NAME*.

Explanation: The attempted operation cannot be completed on the specified library. Either there are no available drives with the specified format, or the volume has the wrong access mode. A drive can be unavailable because another application opened the drive. This message can also be issued if a CHECKIN or LABEL command is issued and no drive is available to service the operation. This can occur when all drives are mounted by other processes or sessions, or the device type was incorrectly specified.

System action: The attempted operation ends.

User response: Use the QUERY DRIVE command to check the online status of the drives. Drives that are marked "Unavailable since hh:mm yy/mm/dd" are drives taken offline by the server at the time specified because of hardware failures or the inability to open the drive. Use the QUERY MOUNT command to query mounted drives and their mount mode. If there are mounted volumes with an IDLE status, use the DISMOUNT VOLUME command to free the drive, and retry the original operation.

ANR8493I *device type* **volume** *volume name* **mounted in drive** *drive name* **in library** *library name*.

Explanation: The specified volume has been mounted in the specified drive.

System action: None.

User response: For automated libraries, this message is purely informational.

ANR8494E *Command:* **An option specified is not valid for library type libraries.**

Explanation: A requested option is not valid for libraries of the given type for the specified command.

System action: The command is not processed.

User response: None.

ANR8495E *Device type* **volume** *volume name* **cannot be written by BACKUP DB operation.**

Explanation: The specified volume already exists or contains data, so that the server cannot allow new BACKUP DB data to be written to it. Or there is no space available on the destination filesystem to write this backup to.

System action: The server detects that the given volume already contains some data that would be overwritten by the requested BACKUP DB command, or that there is not enough space available.

User response: If the specified volume does not contain any valuable data, delete it and retry the BACKUP DB command.

ANR8496E **Device class** *device class* **not defined in device configuration information file.**

Explanation: The command that has been issued requires that the specified device class be defined in the device configuration information file. This definition was not found or the statements in the file are in the wrong order.

System action: The command is not processed.

User response: Reissue the command, and specify a valid device class. Refresh your device configuration information file by issuing the BACKUP DEVCONFIG command.

ANR8497E **Library** *library* **not defined in device configuration information file.**

Explanation: The specified command requires that the specified library be defined in the device configuration information file. This definition was not found or the statements in the file are in the wrong order.

System action: The command is not processed.

User response: Refresh your device configuration information file by issuing the BACKUP DEVCONFIG command. Make sure a library is defined for the device class. Reissue the command.

ANR8498E **Drive not defined for library** *library* **in device configuration information file.**

Explanation: The specified command requires that the specified drive be defined in the device configuration information file for the specified library. This definition was not found or the statements in the file are in the wrong order.

System action: The command is not processed.

User response: Refresh your device configuration information file by issuing the BACKUP DEVCONFIG command. Make sure a drive is defined for the library associated with the device class. Reissue the command.

ANR8499I Command accepted.

Explanation: The command is accepted and processed by the server.

System action: The server processes the command.

User response: None.

ANR8500E No valid path is defined for library *library name* or any of its drives in device configuration information file.

Explanation: The specified command requires that a path be defined in the device configuration information file for the specified library and its drive. This valid definition was not found, or the statements in the file are in the wrong order.

System action: The command is not processed.

User response: Refresh your device configuration information file by issuing the BACKUP DEVCONFIG command. Make sure a path is defined for the library and its drive associated with the device class. Verify the correct source is used in these path definitions. If the default server name is not used as the source, a SET SERVERNAME command is required in the device configuration information file. Reissue the command.

ANR8501E System return code *return code* received opening volume *server volume name* with file name *file name*

Explanation: The server or storage agent attempted to access the file name indicated but failed to open the volume. The indicated system return code was received. The actual volume name corresponds to the file name that the server uses. The server volume name and the file name may be the same when the server experiences a failure in opening the file.

System action: The volume is not opened.

User response: The server or storage agent can recover from some failures by requesting access to different volumes. If there is a directory definition problem, this message may be displayed multiple times during retries with different volumes. The directory names associated with the device class definition in the server should be checked for correctness in the number and names of directory entries. PATH definitions for each of the FILE drives should be checked that the number of directories in the PATH definition match the number in the server's device class definition and that directories exist and are accessible to servers and storage agents accessing server directories via their own path names. For example, if the server has the following definition:

```
DEFINE DEVCLASS FILE DEVTYPE=FILE
DIR=K:\FILECLASS\DIR1,L:\FILECLASS\DIR2 and a
storage agent has the following PATH definition:
DEFINE PATH STA FILE1 SRCTYPE=SERVER
```

DESTTYPE=DRIVE LIBRARY=FILE DEVICE=FILE DIR=X:\DIR1,X:\DIR2 then system STA must have drive X set to access directory L:\FILECLASS on the server so that directories DIR1 and DIR2 correspond to the correct destinations on the storage agent and that the number of directories match between the PATH and the DEVCLASS definitions.

ANR8502E Errno *errno* received checking WORM directory *directory name* on Filer.

Explanation: The server attempted to access the named directory on the NetApp SnapLock Filer, but the attempt failed with the indicated error code.

System action: If you were trying to define a storage pool or update a device class associated with a storage pool, the command fails. If this error is encountered during server initialization, server initialization continues, but operations involving this storage pool will not be allowed until the issue is resolved.

User response: This may be caused by an error in the NetApp Filer or with the communications between your server and the NetApp Filer. Verify that the network is operational, that the SnapLock Filer is accessible from your server, and consult NetApp SnapLock Filer documentation to resolve the issue; then, retry the command.

ANR8503E A failure occurred in writing to volume *server volume name*.

Explanation: The server or storage agent was writing to the indicated volume name when a failure occurred.

System action: The server or storage agent stops writing to the specified volume.

User response: The server or storage agent can recover from some failures by requesting access to different volumes. If there is a directory definition problem, this message may be displayed multiple times during retries with different volumes. The directory names associated with the device class definition in the server should be checked for correctness in the number and names of directory entries.

The permissions associated with newly created files should be checked to ensure the server and storage agent can write to newly created files. Depending on the system, a mask value may need to be adjusted. The system error or event log should be checked for indications of hardware or software errors from file systems.

For a remotely mounted file system, as when SANergy® is used, ensure that the remote file system is mounted and useable to the storage agent. The file system should be checked to ensure that sufficient space is available. While the server checks space, multiple device classes or servers using the same file system can cause the server's space checking to underestimate available space.

For storage agents, PATH definitions for each of the FILE drives should be checked to ensure that the number of directories in the PATH definition matches the number in the server's device class definition and that directories exist and are accessible to servers and storage agents accessing server directories via their own path names. For example, if the server has the following definition:

```
DEFINE DEVCLASS FILE DEVTYPE=FILE
DIR=K:\FILECLASS\DIR1,L:\FILECLASS\DIR2 and a
storage agent has the following PATH definition:
DEFINE PATH STA FILE1 SRCTYPE=SERVER
DESTTYPE=DRIVE LIBRARY=FILE DEVICE=FILE
DIR=X:\DIR1,X:\DIR2 then system STA must have
drive X set to access directory L:\FILECLASS on the
server so that directories DIR1 and DIR2 correspond to
the correct destinations on the storage agent and that
the number of directories match between the PATH and
the DEVCLASS definitions.
```

ANR8504E A failure occurred in flushing data to volume *server volume name*.

Explanation: The server or storage agent was writing to the indicated volume name when a failure occurred. The failure occurred during a flush operation when the server was attempting to synchronize its progress of data written with that of the file system. If the file system becomes full, it is possible to receive no error indications until the flush operation is attempted.

System action: The server or storage agent stops writing to the specified volume. The transaction in progress is rolled back.

User response: The server or storage agent can recover from some failures by requesting access to different volumes. If there is a directory definition problem, this message may be displayed multiple times during retries with different volumes. The directory names associated with the device class definition in the server should be checked for correctness in the number and names of directory entries.

The permissions associated with newly created files should be checked to ensure the server and storage agent can write to newly created files. Depending on the system, a mask value may need to be adjusted. The system error or event log should be checked for indications of hardware or software errors from file systems.

For a remotely mounted file system, as when SANergy is used, ensure that the remote file system is mounted and useable to the storage agent. The file system should be checked to ensure that sufficient space is available. While the server checks space, multiple device classes or servers using the same file system can cause the server's space checking to underestimate available space.

For storage agents, PATH definitions for each of the FILE drives should be checked to ensure that the

number of directories in the PATH definition matches the number in the server's device class definition and that directories exist and are accessible to servers and storage agents accessing server directories via their own path names. For example, if the server has the following definition:

```
DEFINE DEVCLASS FILE DEVTYPE=FILE
DIR=K:\FILECLASS\DIR1,L:\FILECLASS\DIR2 and a
storage agent has the following PATH definition:
DEFINE PATH STA FILE1 SRCTYPE=SERVER
DESTTYPE=DRIVE LIBRARY=FILE DEVICE=FILE
DIR=X:\DIR1,X:\DIR2 then system STA must have
drive X set to access directory L:\FILECLASS on the
server so that directories DIR1 and DIR2 correspond to
the correct destinations on the storage agent and that
the number of directories match between the PATH and
the DEVCLASS definitions.
```

ANR8505I Verifying path definitions for library *library name* between storage agent *storage agent* and library manager *primary library manager*. Processing *library count* out of *total library count* libraries.

Explanation: The specified library path definition is being verified for storage agent initialization.

System action: The server processes the verification for the specified library.

User response: If the server does not finish verification for all the counted shared libraries, verify connectivity and configuration of the primary library manager paths. Check the library manager of the last storage agent displayed in the library path verification message.

ANR8506E The library *library name* is not compatible with stand-alone, utility operations.

Explanation: The specified library cannot operate in stand-alone mode such as DUMP DB or RESTORE DB.

System action: The requested operation fails.

User response: If this is a FILE library, use a device class that does not use a FILE library. A FILE device class does not need a library, and thus, can be updated with LIBRARY="" and SHARED=NO. Update your device configuration file appropriately for the stand-alone operation, and then if needed, return the device class to its original state using a FILE library or with SHARED=YES when the server is running.

ANR8507W Volume *volume name* is using an encryption key that is not unique and therefore is not secure.

Explanation: Each volume should have a unique encryption key. This volume inappropriately shares an encryption key with other volumes.

ANR8508E • ANR8551E (HP-UX)

System action: The operation completes.

User response: Moving the data from this volume to new volume will create a unique encryption key for the new volume and make the data more secure. Before moving the data, mark this volume READONLY to prevent Tivoli Storage Manager from appending data to the volume. Then, use the MOVE DATA command to move the data from this volume to a new volume in your encryption storage pool.

ANR8508E *Device type* **volume volume name cannot be written by DB2's archive log operation.**

Explanation: The specified volume already exists or contains data, so that the server cannot allow new archive log data to be written to it. Or there is no space available on the destination filesystem to write this backup to.

System action: The server detects that the given volume already contains some data that would be overwritten by the DB's archive log operation, or that there is not enough space available.

User response: If the specified volume does not contain any valuable data, delete it.

ANR8550E (AIX) Error opening filespec.

Explanation: An error occurs while attempting an open operation.

System action: Server processing continues.

User response:

- Refer to the other displayed messages to determine why the open operation has failed. Correct the problem and restart the process.
- If you have entered a file name ensure that the file name is correct and that it exists.

ANR8550E (HP-UX) Error opening file name.

Explanation: An error occurs while the server attempts a file open operation.

System action: Server processing continues.

User response:

- Refer to the other displayed messages to determine why the open operation has failed. Correct the problem and restart the process.
- If you have entered a file name ensure that the file name is correct and that it exists.

ANR8550E (Linux) Error opening file name.

Explanation: An error occurs while the server attempts a file open operation.

System action: Server processing continues.

User response:

- Refer to the other displayed messages to determine why the open operation has failed. Correct the problem and restart the process.
- If you have entered a file name ensure that the file name is correct and that it exists.

ANR8550E (Solaris) Error opening file name.

Explanation: An error occurs while the server attempts a file open operation.

System action: Server processing continues.

User response:

- Refer to the other displayed messages to determine why the open operation has failed. Correct the problem and restart the process.
- If you have entered a file name ensure that the file name is correct and that it exists.

ANR8550E (Windows) Error opening filespec.

Explanation: The server detects an error while attempting an open operation.

System action: Server processing continues.

User response:

- Refer to the other displayed messages to determine why the open operation has failed. Correct the problem and restart the process.
- If you have entered a file name ensure that the file name is correct and that it exists.

ANR8551E (AIX) An error (error code) occurred during a write operation.

Explanation: An error occurs while attempting a write operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the write operation failed; correct the problem and restart the process.

ANR8551E (HP-UX) An error (error code) occurred during a write operation.

Explanation: An error occurs while the server attempts a write operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the write operation failed. Correct the problem and restart the process.

ANR8551E (Linux) An error (*error code*) occurred during a write operation.

Explanation: An error occurs while the server attempts a write operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the write operation failed; correct the problem and restart the process.

ANR8551E (Solaris) An error (*error code*) occurred during a write operation.

Explanation: An error occurs while the server attempts a write operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the write operation failed. Correct the problem and restart the process.

ANR8551E (Windows) An error (*error code*) occurred during a write operation.

Explanation: The server detects an error while attempting a write operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the write operation has failed. Correct the problem and restart the process.

ANR8552E (AIX) An error (*error code*) occurred during a read operation.

Explanation: An error occurs while attempting a read operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the read operation failed; correct the problem and restart the process.

ANR8552E (HP-UX) An error (*error code*) occurred during a read operation.

Explanation: An error occurs while the server attempts a read operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the read operation failed. Correct the problem and restart the process.

ANR8552E (Linux) An error (*error code*) occurred during a read operation.

Explanation: An error occurs while the server attempts a read operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the read operation failed; correct the problem and restart the process.

ANR8552E (Solaris) An error (*error code*) occurred during a read operation.

Explanation: An error occurs while the server attempts a read operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the read operation failed. Correct the problem and restart the process.

ANR8552E (Windows) An error (*error code*) occurred during a read operation.

Explanation: The server detects an error while attempting a read operation.

System action: Server processing continues.

User response: Refer to the other displayed messages to determine why the read operation has failed. Correct the problem and restart the process.

ANR8553E (AIX) *Device type volume volume name* cannot be overwritten by DUMPDB operation.

Explanation: The specified volume already exists or contains data, so that the server cannot allow new DUMPDB data to be written to it.

System action: The server has detected that the given volume already contains some data that would be overwritten by the requested DUMPDB operation.

User response: If the specified volume does not contain any valuable data, delete it and retry the DUMPDB operation.

ANR8553E (HP-UX) *Device type volume volume name* cannot be overwritten by DUMPDB operation.

Explanation: The specified volume already exists or contains data, so that the server cannot allow new DUMPDB data to be written to it.

System action: The server has detected that the given volume already contains data that would be overwritten by the requested DUMPDB operation.

User response: If the specified volume does not

ANR8553E (Linux) • ANR8554W (Solaris)

contain any valuable data, delete it and retry the DUMPDB operation, or specify a different volume name.

ANR8553E (Linux) *Device type* **volume** *volume name*
cannot be overwritten by DUMPDB operation.

Explanation: The specified volume already exists or contains data, so that the server cannot allow new DUMPDB data to be written to it.

System action: The server has detected that the given volume already contains data that would be overwritten by the requested DUMPDB operation.

User response: If the specified volume does not contain any valuable data, delete it and retry the DUMPDB operation, or specify a different volume name.

ANR8553E (Solaris) *Device type* **volume** *volume name*
cannot be overwritten by DUMPDB operation.

Explanation: The specified volume already exists or contains data, so that the server cannot allow new DUMPDB data to be written to it.

System action: The server has detected that the given volume already contains data that would be overwritten by the requested DUMPDB operation.

User response: If the specified volume does not contain any valuable data, delete it and retry the DUMPDB operation, or specify a different volume name.

ANR8553E (Windows) *Device type* **volume** *volume name*
cannot be overwritten by DUMPDB operation.

Explanation: The specified volume already exists or contains data, so that the server cannot allow new DUMPDB data to be written to it.

System action: The server detects that the given volume already contains some data that would be overwritten by the requested DUMPDB operation.

User response: If the specified volume does not contain any valuable data, delete it and retry the DUMPDB operation.

ANR8554W (AIX) *Dump/load command:* **Device class**
device class name **not defined. Devtype of FILE is assumed.**

Explanation: The specified device class name is not defined with the DUMPLOADDB DEVCLASS option, to the server in the server options file or the server is not able to define the specified device class.

System action: Processing continues. The dump/load

process assumes the device class is devtype=FILE and writes to or reads from a file.

User response: Refer to the other displayed messages to determine why the device class is not defined. Correct the problem and restart the command if you do not wish to write to or read from a file.

ANR8554W (HP-UX) *Dump/load command:* **Device class**
device class name **not defined. Devtype of FILE is assumed.**

Explanation: The specified device class name is not defined with the DUMPLOADDB DEVCLASS option, to the server in the server options file or the server is not able to define the specified device class.

System action: Processing continues. The dump/load process assumes the device class is devtype=FILE and writes to or reads from a file.

User response: Refer to the other displayed messages to determine why the device class is not defined. Correct the problem and restart the command if you do not wish to write to or read from a file.

ANR8554W (Linux) *Dump/load command:* **Device class**
device class name **not defined. Devtype of FILE is assumed.**

Explanation: The specified device class name is not defined with the DUMPLOADDB DEVCLASS option, to the server in the server options file or the server is not able to define the specified device class.

System action: Processing continues. The dump/load process assumes the device class is devtype=FILE and writes to or reads from a file.

User response: Refer to the other displayed messages to determine why the device class is not defined. Correct the problem and restart the command if you do not wish to write to or read from a file.

ANR8554W (Solaris) *Dump/load command:* **Device class**
device class name **not defined. Devtype of FILE is assumed.**

Explanation: The specified device class name is not defined with the DUMPLOADDB DEVCLASS option, to the server in the server options file or the server is not able to define the specified device class.

System action: Processing continues. The dump/load process assumes the device class is devtype=FILE and writes to or reads from a file.

User response: Refer to the other displayed messages to determine why the device class is not defined. Correct the problem and restart the command if you do not wish to write to or read from a file.

ANR8555E (AIX) Error *error code (error string)* occurred during a read operation from disk *disk name*.

Explanation: An error occurred while attempting a read from disk.

System action: Server processing continues.

User response: Correct the problem and start the process again.

ANR8555E (HP-UX) An error (*error code, error string*) occurred during a read operation from disk *disk name*.

Explanation: An error occurred while attempting a read from disk.

System action: Server processing continues.

User response: Correct the problem and restart the process.

ANR8555E (Linux) An error (*error code, error string*) occurred during a read operation from disk *disk name*.

Explanation: An error occurred while attempting a read from disk.

System action: Server processing continues.

User response: Correct the problem and restart the process.

ANR8555E (Solaris) An error (*error code, error string*) occurred during a read operation from disk *disk name*.

Explanation: An error occurred while attempting a read from disk.

System action: Server processing continues.

User response: Correct the problem and restart the process.

ANR8555E (Windows) An error (*error code*) occurred during a read operation from disk *disk name*.

Explanation: An error occurred while attempting a read from disk.

System action: Server processing continues.

User response: Correct the problem and restart the process.

ANR8556E (AIX) Error *error code (error string)* occurred during a write operation to disk *disk name*.

Explanation: An error occurred while attempting a write to disk.

System action: Server processing continues.

User response: Correct the problem and restart the process.

ANR8556E (HP-UX) An error (*error code, error string*) occurred during a write operation to disk *disk name*.

Explanation: An error occurred while attempting a write to disk.

System action: Server processing continues.

User response: Correct the problem and restart the process.

ANR8556E (Linux) An error (*error code, error string*) occurred during a write operation to disk *disk name*.

Explanation: An error occurred while attempting a write to disk.

System action: Server processing continues.

User response: Correct the problem and restart the process.

ANR8556E (Solaris) An error (*error code, error string*) occurred during a write operation to disk *disk name*.

Explanation: An error occurred while attempting a write to disk.

System action: Server processing continues.

User response: Correct the problem and restart the process.

ANR8556E (Windows) An error (*error code*) occurred during a write operation to disk *disk name*.

Explanation: An error occurred while attempting a write to disk.

System action: Server processing continues.

User response: Correct the problem and restart the process.

ANR8557W (AIX) • ANR8580E (AIX)

ANR8557W (AIX) Retrying failed I/O operation for disk *disk name*, error number *number*.

Explanation: An error occurred while attempting an I/O operation on a disk volume. The request will be retried.

System action: The failed I/O operation is attempted again.

User response: Correct the problem being reported to avoid more errors in the future, or contact AIX support for assistance.

ANR8558E (AIX) I/O vector element bufP: *buffer address*, len: *buffer length*, offset: *file offset*, errno: *errno*.

Explanation: This is a diagnostic message showing details of an AIO request which had an error. This message is normally preceded by ANR8555E or ANR8556E and offers additional information related to the I/O error.

System action: Server processing continues.

User response: Correct the problem and start the process again.

ANR8577E (AIX) Tivoli Storage Manager was not able to open the SSL keyring file *file name*. The GSKit return code is *return code*.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports will not be possible.

System action: Server operation continues.

User response: Verify that the correct SSL keyring file is in the server instance directory. If the problem persists then delete the keyring file and run the DELETE KEYRING server command so that the server can generate a new keyring file.

ANR8577E (Windows) Tivoli Storage Manager was not able to open the SSL keyring file *file name*. The GSKit key management return code is *return code*.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports will not be possible.

System action: Server operation continues.

User response: Verify that the correct SSL keyring file is in the server instance directory. If problem persists then delete the keyring file and run the DELETE KEYRING server command so that Tivoli Storage Manager can generate a new one.

ANR8578E (AIX) The Tivoli Storage Manager database does not have a password for the SSL key ring file.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports will not be possible.

System action: Server operation continues.

User response: Delete the keyring file so that TSM can generate a new one.

ANR8578E (Windows) The Tivoli Storage Manager database does not have a password for the SSL key ring file.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports will not be possible.

System action: Server operation continues.

User response: Delete the keyring file so that TSM can generate a new one.

ANR8579E (AIX) The SSL key ring file does not exist, but the Tivoli Storage Manager database contains a password for it.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports are not possible.

System action: Server operation continues.

User response: Restore a copy of the key ring file or use DELETE KEYRING so that Tivoli Storage Manager can generate a new keyring file and password.

ANR8579E (Windows) The SSL key ring file does not exist, but the Tivoli Storage Manager database contains a password for it.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports are not possible.

System action: Server operation continues.

User response: Restore a copy of the key ring file or use DELETE KEYRING so that Tivoli Storage Manager can generate a new keyring file and password.

ANR8580E (AIX) An SSL write error occurred on session *session*. The GSKit return code is *gsk return code*.

Explanation: An error occurred during an SSL write operation.

System action: Server operation continues.

User response: Retry the operation.

ANR8580E (Windows) An SSL write error occurred on session *session*. The GSKit return code is *gsk return code*.

Explanation: An error occurred during an SSL write operation.

System action: Server operation continues.

User response: Retry the operation.

ANR8581E (AIX) An SSL read error occurred on session *session*. The GSKit return code is *gsk return code*.

Explanation: An error occurred during an SSL read operation.

System action: Server operation continues.

User response: Retry the operation.

ANR8581E (Windows) An SSL read error occurred on session *session*. The GSKit return code is *gsk return code*.

Explanation: An error occurred during an SSL read operation.

System action: Server operation continues.

User response: Retry the operation.

ANR8582E (AIX) An SSL open socket error occurred on session *session*. The GSKit return code is *gsk return code*.

Explanation: An error occurred during an SSL socket open operation.

System action: Server operation continues.

User response: Retry the operation.

ANR8582E (Windows) An SSL open socket error occurred on session *session*. The GSKit return code is *gsk return code*.

Explanation: An error occurred during an SSL socket open operation.

System action: Server operation continues.

User response: Retry the operation.

ANR8583E (AIX) An SSL socket initialization error occurred on session *session*. The GSKit return code is *gsk return code*.

Explanation: An error occurred during an SSL handshake process.

System action: Server operation continues.

User response: Verify that the client is properly configured for SSL and retry the operation.

ANR8583E (Windows) An SSL socket initialization error occurred on session *session*. The GSKit return code is *gsk return code*.

Explanation: An error occurred during an SSL handshake process.

System action: Server operation continues.

User response: Verify that the client is properly configured for SSL and retry the operation.

ANR8584I (AIX) The SSL TCP/IP Version 6 driver is ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the SSL TCP/IP protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8584I (Windows) The SSL TCP/IP Version 6 driver is ready for connection with clients on port *port number*.

Explanation: The server can now accept sessions with clients using the SSL TCP/IP protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8585I (AIX) The SSL TCP/IP Version 6 driver is ready for connection with administrative clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the SSL TCP/IP protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8585I (Windows) The SSL TCP/IP Version 6 driver is ready for connection with administrative clients on port *port number*.

Explanation: The server can now accept sessions with administrative clients using the SSL TCP/IP protocol on the indicated port number.

System action: Server operation continues.

User response: None.

ANR8586E (AIX) • ANR8590I (Windows)

ANR8586E (AIX) The server was not able to create the keyring file *file name*. The GSKit key management return code is *return code*.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports will not be possible.

System action: Server operation continues.

User response: Verify that permissions to the server instance directory are correct.

ANR8586E (Windows) The server was not able to create the keyring file *file name*. The GSKit key management return code is *return code*.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports will not be possible.

System action: Server operation continues.

User response: Verify that permissions to the server instance directory are correct.

ANR8587E (AIX) The server was not able to create the SSL self-signed certificate. The GSKit key management return code is *return code*.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports will not be possible.

System action: Server operation continues.

User response: Check the GSKit return code and take appropriate action.

ANR8587E (Windows) The server was not able to create the SSL self signed certificate. The GSKit key management return code is *return code*.

Explanation: Initialization of the SSL environment has failed. Connections to SSL ports will not be possible.

System action: Server operation continues.

User response: Check the GSKit return code.

ANR8588E (AIX) The server was not able to export to the SSL public certificate file *file name*. The GSKit key management return code is *return code*.

Explanation: The certificate export file could not be generated for use by the Storage Manager clients.

System action: Server operation continues.

User response: Verify that permissions to the server instance directory are correct.

ANR8588E (Windows) The server was not able to export to the SSL public certificate file *file name*. The GSKit key management return code is *return code*.

Explanation: The certificate export file could not be generated for use by the Storage Manager clients.

System action: Server operation continues.

User response: Verify that permissions to the server instance directory are correct.

ANR8589E (AIX) The server was not able to initialize the GSKit key management environment. The GSKit key management return code is *return code*.

Explanation: The GSKit key management subsystem could not be initialized.

System action: Server operation continues.

User response: Verify that permissions to execute the GSKit key management dynamic-link libraries are correct.

ANR8589E (Windows) The server was not able to initialize the GSKit key management environment. The GSKit key management return code is *return code*.

Explanation: The GSKit key management subsystem could not be initialized.

System action: Server operation continues.

User response: Verify that permissions to execute the GSKit key management dll are correct.

ANR8590I (AIX) Session *session* connection is using SSL version *SSL version* cipher specification *cipher specification*.

Explanation: An SSL connection has been established using the listed SSL version and cipher specification.

System action: Server operation continues.

User response: None.

ANR8590I (Windows) Session *session* connection is using SSL version *SSL version* cipher specification *cipher specification*.

Explanation: An SSL connection has been established using the listed SSL version and cipher specification.

System action: Server operation continues.

User response: None.

ANR8591E (Windows) IBM GSKIT version 7 must be installed on the system.

Explanation: The server requires IBM GSKIT version 7.

System action: Server operation stops.

User response: Install IBM GSKIT version 7 and restart the server.

ANR8675E (AIX) *File name:* File already exists for File or FileText Exit.

Explanation: The specified file already exists and the file-exit option was set to PRESERVE.

System action: Server continues running.

User response: Specify a non-existent file.

ANR8675E (HP-UX) *File name with environment variable DSMSERV_DIR:* File already exists for File or FileText Exit.

Explanation: The specified file already exists and the file-exit option was set to PRESERVE.

System action: Server continues running.

User response: Specify a non-existent file.

ANR8675E (Linux) *File name with environment variable DSMSERV_DIR:* File already exists for File/FileText Exit, overwrite option not set to YES.

Explanation: The specified file already exists and the overwrite option was not set to Yes.

System action: Server continues running.

User response: Specify another file or set the overwrite option to YES in the server options file.

ANR8675E (Solaris) *File name with environment variable DSMSERV_DIR:* File already exists for File/FileText Exit, overwrite option not set to YES.

Explanation: The specified file already exists and the overwrite option was not set to Yes.

System action: Server continues running.

User response: Specify another file or set the overwrite option to YES in the server options file.

ANR8675E (Windows) *File name with path within registry.:* File already exists for File or FileText Exit.

Explanation: The specified file already exists and the File/FileText exit option was set to PRESERVE.

System action: Server continues running.

User response: Specify a non-existent file.

ANR8677E (AIX) *User specified module:* Cannot load into server, AIX system error number number.

Explanation: The server was unable to load the module specified. The module is not a properly C-compiled and linked dynamic module.

System action: Server initialization stops or server continues running if already up.

User response: Use the server supplied sample makefile and export files to compile-link the user-exit module. Make sure the export.ref file contains the server-defined function name, and the module actually contains the server-defined function name, with one void parameter declared.

ANR8677E (HP-UX) *User specified module, with environment variable DSMSERV_DIR:* Cannot load into server, system errno = Error number generated by HP-UX.

Explanation: The server was unable to load the module specified. The module is not a properly C-compiled and linked dynamic module.

System action: Server initialization stops or server continues running if already up.

User response: Use the server supplied sample makefile and export files to compile-link the user-exit module. Make sure the export.ref file contains the server-defined function name, and the module actually contains the server-defined function name, with one void parameter declared.

ANR8677E (Linux) *User specified module, with environment variable DSMSERV_DIR:* Cannot load into server, system errno = Error number generated by Solaris.

Explanation: The server was unable to load the module specified. The module is not a properly C-compiled and linked dynamic module.

System action: Server continues running.

User response: Use the supplied sample makefile, c , and h files to generate the user-exit module. Make sure the module contains product-defined function name adsmV3UserExit, and the module actually contains the product-defined function name, with one void * parameter declared, and returns void.

ANR8677E (Solaris) *User specified module, with environment variable DSMSERV_DIR:* Cannot load into server, system errno = Error number generated by Solaris.

Explanation: The server was unable to load the

ANR8677E (Windows) • ANR8679W (AIX)

module specified. The module is not a properly C-compiled and linked dynamic module.

System action: Server continues running.

User response: Use the server supplied sample makefile, c, and h files to generate the user-exit module. Make sure the module contains server-defined function name adsmV3UserExit, and the module actually contains the server-defined function name, with one void * parameter declared, and returns void.

ANR8677E (Windows) *User specified module, with path within registry:* **Cannot load into server, system errno = Error number generated by Windows.**

Explanation: The server was unable to load the module specified. The module is not a properly C-compiled and linked dynamic module.

System action: Server continues running.

User response: Use the server supplied sample makefile compile-link the user-exit module.

ANR8678E (AIX) **Cannot bind** *User specified module into server.* **AIX system error number.**

Explanation: The server was unable to bind with the module specified.

System action: Server initialization stops or server continues running if already up.

User response: Use the server supplied sample makefile and export files to compile-link the user-exit module. Make sure the export.ref file contains the server-defined function name, and the module actually contains the server-defined function name, with 1 void parameter declared. The module may contain a global variable name that conflicts with the server's.

ANR8678E (HP-UX) **Cannot bind** *User specified module, with environment variable DSMSERV_DIR into server, system errno = Error number generated by HP-UX.*

Explanation: The server was unable to bind with the module specified.

System action: Server initialization stops or server continues running if already up.

User response: Use the server supplied sample makefile and export files to compile-link the user-exit module. Make sure the export.ref file contains the server-defined function name, and the module actually contains the server-defined function name, with one void parameter declared. The module may contain a global variable name that conflicts with the server's.

ANR8678E (Linux) **Cannot bind** *User specified module, with environment variable DSMSERV_DIR into server, system errno = Error number generated by Solaris.*

Explanation: The server was unable to bind with the module specified. The server could not find a function named adsmV3UserExit in the module.

System action: Server continues running.

User response: Use the supplied sample makefile, c and header files to create the user exit module. Make sure the shared library module contains a function named adsmV3UserExit of type void, with one parameter of a void *.

ANR8678E (Solaris) **Cannot bind** *User specified module, with environment variable DSMSERV_DIR into server, system errno = Error number generated by Solaris.*

Explanation: The server was unable to bind with the module specified. The server could not find a function named adsmV3UserExit in the module.

System action: Server continues running.

User response: Use the server supplied sample makefile, c and header files to create the user exit module. Make sure the shared library module contains a function named adsmV3UserExit of type void, with one parameter of a void *.

ANR8678E (Windows) **Cannot find/set** *User specified function name within DLL. in User specified DLL library name, with registry path, system errno = Error number generated by Windows.*

Explanation: The server was unable to find and/or bind with the function name in the DLL specified.

System action: Server continues running.

User response: Use the server supplied sample makefile to compile-link the user-exit module. Make sure there is a function name in the DLL as specified in the server options file. Make sure the function only accepts one argument, a void pointer.

ANR8679W (AIX) **A user-exit module is already loaded.**

Explanation: A user-exit module was loaded previously. Another user-exit module cannot be loaded.

System action: Server initialization stops or server continues running if already up.

User response: To load a new user-exit module, halt the server and then restart the server with the new user-exit module.

ANR8679W (HP-UX) There is already an user-exit loaded.

Explanation: There was a previous successful load of an user-exit module, thus server cannot load another one.

System action: Server initialization stops or server continues running if already up.

User response: To load a new user-exit module, the server must be halted and then restart the server with the new user-exit module.

ANR8679W (Linux) Unable to unload user exit module: system errno = Error number generated by Solaris.

Explanation: The server was not able to unload the user-exit module.

System action: Server continues running.

User response: The server should be stopped at the earliest possible time before the user exit is to be reactivated.

ANR8679W (Solaris) Unable to unload user exit module: system errno = Error number generated by Solaris.

Explanation: The server was not able to unload the user-exit module.

System action: Server continues running.

User response: The server should be stopped at the earliest possible time before the user exit is to be reactivated.

ANR8679W (Windows) There is already an user-exit loaded.

Explanation: There was a previous successful load of an user-exit module, thus server cannot load another one.

System action: Server continues running.

User response: To load a new user-exit module, halt the server and then restart the server with the new user-exit module.

ANR8680W (AIX) A file used for the file or filetext exit is already opened.

Explanation: A file for the file or filetext exit was previously opened. The server cannot open another one.

System action: Server initialization stops or server continues running if already up.

User response: To start a new file for the file or

filetext exit, halt the server, then restart the server with the new file name.

ANR8680W (HP-UX) There is already a file used for the file or filetext exit.

Explanation: There was a previous file open for the file or filetext exit. The server cannot open another one.

System action: Server initialization stops or server continues running if already up.

User response: To start a new file for the file or filetext exit, halt the server, then restart the server with a new file name.

ANR8680W (Linux) There is already a file used for the file or filetext exit.

Explanation: There was a previous file open for the file or filetext exit. The server cannot open another one.

System action: Server initialization stops or server continues running if already up.

User response: To start a new file for the exit, halt the server, then restart the server with a new file name.

ANR8680W (Solaris) There is already a named file used for the file or filetext exit.

Explanation: There was a previous file open for the file or filetext exit. The server cannot open another one.

System action: Server initialization stops or server continues running if already up.

User response: To start a new file for the file or the filetext exit, halt the server, then restart the server with a new file name.

ANR8680W (Windows) There is already a file used for the file or filetext exit.

Explanation: There was a previous file open for the file or filetext exit. The server cannot open another one.

System action: Server continues running.

User response: To start a new file for the exit, halt the server, then restart the server with a new file name.

ANR8681I (AIX) Connected to Tivoli event server at node name on port port.

Explanation: The server successfully established a connection with the Tivoli event server on the specified node name and port.

System action: The server sends events to the Tivoli event server using this connection.

User response: None.

ANR8681I (HP-UX) • ANR8682E (Windows)

ANR8681I (HP-UX) Connected to Tivoli event server at *node name* on port *port*.

Explanation: The server successfully established a connection with the Tivoli event server on the specified *node name* and *port*.

System action: The server sends events to the Tivoli event server using this connection.

User response: None.

ANR8681I (Linux) Connected to Tivoli event server at *node name* on port *port*.

Explanation: The server successfully established a connection with the Tivoli event server on the specified *node name* and *port*.

System action: The server sends events to the Tivoli event server using this connection.

User response: None.

ANR8681I (Solaris) Connected to Tivoli event server at *node name* on port *port*.

Explanation: The server successfully established a connection with the Tivoli event server on the specified *node name* and *port*.

System action: The server sends events to the Tivoli event server using this connection.

User response: None.

ANR8681I (Windows) Connected to Tivoli event server at *node name* on port *port*.

Explanation: The server successfully established a connection with the Tivoli event server on the specified *node name* and *port*.

System action: The server sends events to the Tivoli event server using this connection.

User response: None.

ANR8682E (AIX) Unable to determine port of Tivoli event server on node *node name*.

Explanation: The server was unable to determine the TCP/IP port for the Tivoli event server on node *node name*.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on which the event server is running does not support the TCP/IP Portmapper, then ensure that TECPORT is specified in the server options file.

ANR8682E (HP-UX) Unable to determine port of Tivoli event server on *node name*.

Explanation: The server was unable to determine the TCP/IP port on which the Tivoli event server on *node name* is listening.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on which the event server is running does not support the TCP/IP Portmapper, then ensure that TECPORT is specified in the server options file.

ANR8682E (Linux) Unable to determine port of Tivoli event server on *node name*.

Explanation: The server was unable to determine the TCP/IP port on which the Tivoli event server on *node name* is listening.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on which the event server is running does not support the TCP/IP Portmapper, then ensure that TECPORT is specified in the server options file.

ANR8682E (Solaris) Unable to determine port of Tivoli event server on *node name*.

Explanation: The server was unable to determine the TCP/IP port on which the Tivoli event server on *node name* is listening.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on which the event server is running does not support the TCP/IP Portmapper, then ensure that TECPORT is specified in the server options file.

ANR8682E (Windows) Unable to determine port of Tivoli event server on *node name*.

Explanation: The server was unable to determine the TCP/IP port on which the Tivoli event server on *node name* is listening.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on which the event server is running does not support the TCP/IP Portmapper, then ensure that TECPORT is specified in the server options file.

ANR8683E (AIX) Unable to connect to the Tivoli event server at node *node name* on port *port*.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server on node *node name* at port *port*.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on which the event server is running does not support the TCP/IP Portmapper, then ensure that the value specified for TECPORT in the server options file is correct.

ANR8683E (HP-UX) Unable to connect to the Tivoli event server at *node name* on port *port*.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server on *node name* at port *port*.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on which the event server is running does not support the TCP/IP Portmapper, then ensure that the value specified for TECPORT in the server options file is correct.

ANR8683E (Linux) Unable to connect to the Tivoli event server at *node name* on port *port*.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server on *node name* at port *port*.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on which the event server is running does not support the TCP/IP Portmapper, then ensure that the value specified for TECPORT in the server options file is correct.

ANR8683E (Solaris) Unable to connect to the Tivoli event server at *node name* on port *port*.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server on *node name* at port *port*.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on

which the event server is running does not support the TCP/IP Portmapper, then ensure that the value specified for TECPORT in the server options file is correct.

ANR8683E (Windows) Unable to connect to the Tivoli event server at *node name* on port *port*.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server on *node name* at port *port*.

System action: Event logging to the Tivoli event server is disabled.

User response: Ensure that the Tivoli event server is running on the specified system. If the system on which the event server is running does not support the TCP/IP Portmapper, then ensure that the value specified for TECPORT in the server options file is correct.

ANR8684E (AIX) Unable to connect to the Tivoli event server because TCP/IP is not available.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server because TCP/IP services were not available.

System action: Event logging to the Tivoli event server is disabled.

User response:

- Ensure that COMMMETHOD TCPIP is specified in the server options file.
- If COMMMETHOD TCPIP was specified, use the BEGIN EVENTLOGGING TIVOLI command to manually start event logging to the Tivoli event server once server initialization has completed.

ANR8684E (HP-UX) Unable to connect to the Tivoli event server because TCP/IP is not available.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server because TCP/IP services were not available.

System action: Event logging to the Tivoli event server is disabled.

User response:

- Ensure that COMMMETHOD=TCPIP is specified in the server options file, or that COMMMETHOD=NONE is not specified.
- If COMMMETHOD=TCPIP was specified, use the BEGIN EVENTLOGGING TIVOLI command to manually start event logging to the Tivoli event server once server initialization has completed.

ANR8684E (Linux) Unable to connect to the Tivoli event server because TCP/IP is not available.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server because TCP/IP services were not available.

System action: Event logging to the Tivoli event server is disabled.

User response:

- Ensure that COMMMETHOD=TCPIP is specified in the server options file, or that COMMMETHOD=NONE is not specified.
- If COMMMETHOD=TCPIP was specified, use the BEGIN EVENTLOGGING TIVOLI command to manually start event logging to the Tivoli event server once server initialization has completed.

ANR8684E (Solaris) Unable to connect to the Tivoli event server because TCP/IP is not available.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server because TCP/IP services were not available.

System action: Event logging to the Tivoli event server is disabled.

User response:

- Ensure that COMMMETHOD=TCPIP is specified in the server options file, or that COMMMETHOD=NONE is not specified.
- If COMMMETHOD=TCPIP was specified, use the BEGIN EVENTLOGGING TIVOLI command to manually start event logging to the Tivoli event server once server initialization has completed.

ANR8684E (Windows) Unable to connect to the Tivoli event server because TCP/IP is not available.

Explanation: The server was unable to establish a TCP/IP connection with the Tivoli event server because TCP/IP services were not available.

System action: Event logging to the Tivoli event server is disabled.

User response:

- Ensure that COMMMETHOD=TCPIP is specified in the server options file, or that COMMMETHOD=NONE is not specified.
- If COMMMETHOD=TCPIP was specified, use the BEGIN EVENTLOGGING TIVOLI command to manually start event logging to the Tivoli event server once server initialization has completed.

ANR8685I (AIX) Core dump being generated to file *core dump file*

Explanation: The server has started generating a coredump to the specified file as a result of a user request.

System action: Server operation continues.

User response: None.

ANR8686I (AIX) Core dump successfully generated

Explanation: The server has successfully generated the requested core dump.

System action: Server operation continues.

User response: None.

ANR8687E (AIX) Error generating core dump, errno *system errno*.

Explanation: The server was unable to generate the requested core dump. The errno indicates the reason AIX was unable to complete the request.

System action: Server operation continues.

User response: None.

ANR8740W Number of automated library slots (*slots in use*) exceeds license terms (*slots licensed*).

Explanation: The number of slots in use within automated libraries exceeds the licensed value.

System action: The operation completes.

User response: Contact your service representative to update license values for slots in automated libraries, or reduce the number of slots in use by issuing CHECKOUT LIBVOLUME commands as necessary.

ANR8741E CHECKIN LIBVOLUME not permitted with current license terms.

Explanation: The CHECKIN LIBVOLUME operation is not permitted because the current license terms do not allow it.

System action: The command fails.

User response: Contact your service representative to update license values for slots in automated libraries, or reduce the number of slots in use by issuing CHECKOUT LIBVOLUME commands as necessary.

ANR8742E This server is not licensed to support the *device type* device type. Device Support Module *module number* is required.

Explanation: A DEFINE DRIVE command or a

volume mount operation cannot be processed because the server is not licensed to support the required device type.

System action: The operation fails.

User response: Contact your service representative to update the server license terms so that support for the required device type is enabled.

ANR8743E This server is not licensed to support library *device name*. Device Support Module *module number* is required.

Explanation: Either a DEFINE LIBRARY command, a volume mount operation, or library initialization cannot be processed because the server is not licensed to support the given library.

System action: The operation fails.

User response: Contact your service representative to update the server license terms so that support for the given library device is enabled.

ANR8744E Command: Current license terms do not permit this operation.

Explanation: The specified command failed because the current license terms do not permit it.

System action: The operation fails.

User response: Contact your service representative to update the server license terms so that the requested operation can be processed.

ANR8745E Support for the 3590 device type is disabled for library *library name*.

Explanation: The requested operation fails because support for the 3590 device type is not currently enabled for the specified library.

System action: The operation fails.

User response: Make sure the ENABLE3590LIBRARY option is specified in the server options file, and that the scratch category number for 3590 volumes does not conflict with the private category or the CARTRIDGE volume scratch category.

ANR8746E Device type *device type* is not supported in this release.

Explanation: The specified device type cannot be used by this release/platform of the server.

System action: The device cannot be used.

User response: Contact your sales or service representative to upgrade to the latest release of the server.

ANR8747I Checking in volume *volume name* in library *library name*- CANCEL PENDING.

Explanation: In response to a QUERY PROCESS command, this message displays the status for a CHECKIN LIBVOLUME process on the server. The given volume was being checked in to the designated library, but the process was canceled by an administrator.

System action: The background process operation is in a wait queue. When the process comes off the queue, it will be terminated.

User response: None.

ANR8748I Checking in volumes in search mode in library *library name*- CANCEL PENDING.

Explanation: In response to a QUERY PROCESS command, this message displays the status for a CHECKIN LIBVOLUME process on the server. Volumes were being checked into the given library in search mode, but the process was canceled by an administrator.

System action: The background process operation is being terminated.

User response: None.

ANR8749E Library order sequence check on library *library name*.

Explanation: An attempt has been made to mount or demount a volume, but the attempt fails for one of the following reasons:

- Mount is already in progress or a volume is already mounted.
- Mount is already pending.
- Demount is already pending.
- Demount was requested but no volume is mounted.

System action: The operation fails.

User response: This error usually occurs when a demount fails and a cartridge is left in the drive. All subsequent mounts fail while attempting to insert another cartridge into the same drive. Demount the cartridge using the library manager or perform an AUDIT LIBRARY operation on the designated library. Retry the operation.

ANR8750E Volume is incompatible with specified device type in library *library name*.

Explanation: An attempt has been made to mount or check in a volume, but the attempt fails because the cartridge being mounted is not compatible with the

ANR8751W • ANR8760I

drive (For example, attempting to mount a 3590 cartridge on a 3490 drive).

System action: The operation fails.

User response: Ensure the DEVTYPE parameter on the CHECKIN command matches the device type of the drive. Retry the operation.

ANR8751W This server is not licensed to support the *device type* device type. Managed Library license is required.

Explanation: This message is issued when a DEFINE DRIVE command or a volume mount operation uses a device class that is not licensed on the server.

System action: The operation fails if this is a try-and-buy server. For purchased servers, this message is to warn you that you are not in compliance with registered license terms.

User response: Contact your service representative to update the server license terms so that support for the required device type is enabled.

ANR8752W This server is not licensed to support library *device type*. Managed Library license is required.

Explanation: This message is issued when a DEFINE LIBRARY command or a volume mount operation uses a device class that is not licensed on the server.

System action: The operation fails if this is a try-and-buy server. For purchased servers, this message is to warn you that you are not in compliance with registered license terms.

User response: Contact your service representative to update the server license terms so that support for the required device type is enabled.

ANR8753W This server is not licensed to support library *library name*. Library Sharing is required.

Explanation: This message is issued when a DEFINE LIBRARY command or library initialization for a library that requires library sharing and library sharing is not licensed on the server.

System action: The operation fails if this is a try-and-buy server. For purchased servers, this message is to warn you that you are not in compliance with registered license terms.

User response: Contact your service representative to update the server license terms so that support for the required device type is enabled.

ANR8754E Command: There is already a request to delete library *library name*.

Explanation: The designated library cannot be deleted or updated because there is a request to delete the library already.

System action: The command is not processed.

User response: None.

ANR8755E Command: There is already a request to update library *library name*.

Explanation: The designated library cannot be deleted because there is a request to update the library already.

System action: The command is not processed.

User response: None.

ANR8756E For optical libraries, you must specify CHECKLABEL=YES.

Explanation: Optical libraries require the CHECKLABEL parameter to be set to YES

System action: The command fails.

User response: Reissue the command and specify the CHECKLABEL=YES option.

ANR8757W This server is not licensed to support library *device type*. Extended Edition license is required.

Explanation: This message is issued when a DEFINE LIBRARY command or a volume mount operation uses a device class that is not licensed on the server.

System action: The operation fails if this is a try-and-buy server. For purchased servers, this message is to warn you that you are not in compliance with registered license terms.

User response: Contact your service representative to update the server license terms so that support for the required device type is enabled.

ANR8760I Cancel in progress.

Explanation: The MOVE MEDIA command has been canceled and will end when resources have been freed for the background process. This message may be displayed in response to a QUERY PROCESS command for a MOVE MEDIA command.

System action: Server operation continues.

User response: None.

ANR8761I Number of volumes processed: *number*

Explanation: The MOVE MEDIA command has processed the number of volumes displayed. This message may be displayed in response to a QUERY PROCESS command for a MOVE MEDIA command.

System action: Server operation continues.

User response: None.

ANR8762I Number of volumes processed: *number*.
Ejecting volume *volume name* from
library *library name*.

Explanation: The MOVE MEDIA command displays the number of volumes already processed and the name of the volume currently being ejected from the indicated library. This message may be displayed in response to a QUERY PROCESS command for a MOVE MEDIA command.

System action: Server operation continues.

User response: None.

ANR8763E Command: Volume *volume name* not
processed: library *library name* not
defined.

Explanation: The indicated volume is not processed since the designated library has not been defined or has been deleted.

System action: The volume is not processed.

User response: Reissue the command using a different library name, or define the library before retrying the command.

ANR8764E Command: Volume *volume name* not
processed: the operation is not allowed
for library type *library type*.

Explanation: The indicated volume is not processed since the requested operation is not allowed for libraries of the given type.

System action: The volume is not processed.

User response: None.

ANR8765I Request number: device type *volume* *volume name* in location *location name* is required for use in library *library name*; CHECKIN LIBVOLUME required within *time limit* minutes.

Explanation: A mount request has been made for a volume that is defined in a storage pool, but which is currently checked out of the given library and stored in the location shown.

System action: The server waits until it detects that

the volume has been checked into the library, or the time limit expires.

User response: Obtain the required volume from the indicated location, and insert it into the library by issuing a CHECKIN LIBVOLUME command. Use the SWAP=YES option of the CHECKIN LIBVOLUME command if the library is currently full; this process allows the server to select an appropriate volume to be swapped out in order to make room for the required volume.

ANR8766I MOVE MEDIA command: CHECKOUT LIBVOLUME command for volume *volume name* in library *library name* completed successfully; Place the ejected volume in location *location name*.

Explanation: The CHECKOUT LIBVOLUME operation has completed successfully for the indicated volume in the given library. Place the ejected volume in the indicated location.

System action: The volume is either deleted from the library inventory (if its status is something other than DATA) or marked not present (if its status is DATA).

User response: If an *UNKNOWN* location is displayed, issue UPDATE STGPOOL OVFLOCATION command to define an overflow location name to be used on the subsequent MOVE MEDIA command. For the volumes ejected with an *UNKNOWN* location, use UPDATE VOLUME LOCATION command to update its location to your overflow location name.

ANR8767I Number of volumes processed: *number* volumes processed. Volumes sent to library *library name* for checkout: *number* volumes sent.

Explanation: The MOVE MEDIA command has processed the number of volumes shown. Currently, the MOVE MEDIA command has sent for processing the number of volumes shown to the library shown. This message may be displayed in response to a QUERY PROCESS command for a MOVE MEDIA command.

System action: Server operation continues.

User response: None.

ANR8768E File *file name* on volume *drive name* could not be found.

Explanation: The server was unable to find the specified file name on the indicated volume. For removable file device classes, each volume maintains data using a file name which is the same as the volume name and the label value on the volume.

System action: The volume is rejected.

User response: Ensure that the proper volume has been placed into the drive. If you are creating a

removable file device class volume by copying data from a FILE device class volume, the media must have a label which is the same as the volume name. The file which is copied to the volume must be renamed to have the same name as the label.

ANR8769E External media management function
request type returned result=result.

Explanation: A request of the indicated function type was sent to the external library manager program, which returned a result code which was not SUCCESS.

System action: The server continues, but the server operation that was being attempted fails.

User response: Consult the documentation for the external media management program to determine how to recover from the error condition. Then attempt the server operation again.

ANR8770W Unable to load external library manager
filespec.

Explanation: A library of LIBTYPE=EXTERNAL is defined but the server cannot load the external library manager.

System action: The server continues, but the external library cannot be accessed.

User response: Verify that the EXTERNALMANAGER parameter for the external library is specified correctly on the DEFINE LIBRARY or UPDATE LIBRARY command.

ANR8771E Volume *volume name* in library *library name* is deleted. External Library is not synchronized with the server. Audit required.

Explanation: The server deleted a volume from its inventory, and its attempt to inform the external library manager has failed.

System action: The server may continue to access the library, but some volumes may not be accessible until the external library is synchronized with the server.

User response: Perform the appropriate type of processing on the external library in order to synchronize it with the server.

ANR8772I Moving volume *volume name* (if known) from drive *drive name* to slot *slot element number* in library *library name*.

Explanation: A volume found in the drive during library initialization is being moved to the slot.

System action: The volume is moved from the drive to the slot.

User response: None.

ANR8773E Incompatible options
CHECKLABEL=NO and SEARCH=YES
for SCSI libraries.

Explanation: If a barcode reader is not installed and detected by the server, the server requires the ability to check the tape label when searching for new volumes in a SCSI tape library. The CHECKLABEL=NO and SEARCH=YES parameters on the CHECKIN LIBVOL command are not compatible.

System action: The command fails.

User response: Reissue the CHECKIN LIBVOL command and specify CHECKLABEL=YES.

ANR8774W Volume *volume name* not checked into library *library name* but is using category *category number*.

Explanation: While processing a DEFINE LIBRARY or AUDIT LIBRARY command for the given library, the server found a volume that was not checked into the library (with the CHECKIN LIBVOL command), but is assigned to one of the categories in use by that library.

System action: If the volume category equals the value of the library SCRATCHCAT the category is changed to the value of the library PRIVATECAT. This is to prevent the library from loading the volume when a scratch volume is requested.

User response: If the volume is to be used by the server, it does not have to be reassigned but it must be checked into the library with the CHECKIN LIBVOL command. If the volume is not to be used by the server, use the mtlb program to reassign the volume to its correct category. For details about the mtlb program, refer to the documentation provided with the library device.

ANR8775I Drive *drive name* unavailable at library manager.

Explanation: The specified drive availability status at the library manager has changed from available to unavailable.

System action: The drive status on the server is updated to reflect the availability to that of the library manager. The drive will not be considered as a candidate for the mount or demount request.

User response: Contact your service representative to determine the cause of the drive becoming unavailable. Once the service representative has determined the cause and changed the availability status to available at the library manager, the server will resume use of the drive.

ANR8776W Volume *volume name* in drive *drive name* contains lost VCR data; performance may be degraded.

Explanation: The Vital Cartridge Records of the cartridge in the drive are lost or corrupted. This results in the inability of the drive to do fast locates to file positions on the cartridge, which causes the locate performance for read or append operations to become degraded.

System action: The server continues the operation.

User response: There are two methods to restore the VCR data. The first method uses the MOVE DATA command to move the data off the tape and to return the tape to scratch or empty status. The VCR data is rebuilt when the empty tape is rewritten from the beginning-of-tape. The second method rebuilds the VCR by loading the tape and locating directly to the end-of-data. This is done by the server in normal use when new data is appended to the end of the tape. It can also be done independent of the server by loading the tape in an unused drive and using the tapeutil program. Select the tapeutil option "Space to End-of-Data".

ANR8777E Mount for volume *volume name* failed; media performance is degraded.

Explanation: The VCR data on the volume is lost or corrupted, resulting in degraded tape positioning. The mount fails because the tape drive was configured to fail mounts that indicate this condition.

System action: The client command fails and the transaction is rolled back.

User response: Until the VCR data can be restored, the user can issue the UPDATE VOLUME command to make the volume unavailable. There are two methods to restore the VCR data. The first method uses the MOVE DATA command to move the data off the tape and to return the tape to scratch or empty status. The VCR data is rebuilt when the empty tape is rewritten from the beginning-of-tape. The second method rebuilds the VCR by loading the tape and locating directly to the end-of-data. This is done by the server in normal use whenever data is appended to the end of the tape. It can also be done independent of the server by loading the tape in an unused drive and using the tapeutil program. Select the tapeutil option "Space to End-of-Data".

ANR8778W Scratch volume *volume name* changed to Private Status to prevent re-access.

Explanation: The scratch volume encountered an error during mount processing that makes it unusable. The status of the volume is changed to private so that it is not selected for future scratch mounts. (Although the status has become private, it is not defined to a storage pool.)

System action: Processing continues with another scratch volume.

User response: See previous error messages to determine the cause of the mount failure, and correct the problem. If the problem is a mislabeled volume or unreadable label, relabel the scratch volume using the dsmlabel utility with the "-overwrite" option. If the volume is missing from its home slot, issue the AUDIT LIBRARY command against the library. If the volume has lost or corrupted VCR-data, relabel the volume. (This reinitializes the VCR-data by writing to the volume from beginning-of-tape.) Once the problem is corrected, update the status of the volume to scratch by using the UPDATE LIBVOL command.

ANR8779E Unable to open drive *drive name*, error number=*errno value* from open system call.

Explanation: The drive cannot be opened by the server. In AIX, error number is the value of errno returned by the operating system. In OS/2, it is the value of the return code from the call to DosOpen.

System action: The transaction needing the drive fails.

User response: Use the error number in conjunction with operating system documentation to narrow the scope of the cause. Inspect the drive. Ensure the drive is powered on and ready, the cables are properly connected and terminated, and that the device is properly configured to the operating system.

ANR8780E Volume in drive *drive name* has no label.

Explanation: The volume in the indicated drive does not have a label. The server requires that all media be uniquely labeled.

System action: The volume is rejected and the server prompts for a new volume.

User response: Use the appropriate labeling utility to label the media. In OS/2 and Windows NT, the LABEL command is used to label removable disk cartridges, diskettes and other media which appear as drive letters.

ANR8781E Volume in drive *drive name* has invalid label *label*.

Explanation: The volume in the indicated drive has the label shown. The name does not conform with server requirements. The server requires that all media be uniquely labeled and, for removable media, that the label with file naming conventions. The label found exceeded the maximum label size for removable media or did not conform to server labeling requirements. If ????? is shown for the label, it indicates that server was unable to read the label.

System action: The volume is rejected.

User response: Use the appropriate labeling utility to

label the media. In OS/2 and Windows NT, the LABEL command is used to label removable disk cartridges, diskettes and other media which appear as drive letters. This label must still conform to server requirements.

ANR8782E Volume *volume name* could not be accessed by library *library name*.

Explanation: The designated volume is in the inventory of the Library Manager, but the physical location is either inaccessible or unknown.

System action: The operation fails. The access mode of the volume is changed to UNAVAILABLE.

User response: Ensure that the cartridge is physically in the library, and reinventory the library. If the volume location is resolved, restore the access mode of the volume to its previous value using the UPDATE VOLUME command.

ANR8783E Label on volume in drive *drive name* could not be read.

Explanation: The server was unable to read the label on the indicated drive.

System action: The volume is rejected.

User response: Use the appropriate labeling utility to label the media. In OS/2 and Windows NT, the LABEL command is used to label removable disk cartridges, diskettes and other media which appear as drive letters. This label must still conform to server requirements.

ANR8784E File *file name* on volume *drive name* could not be created.

Explanation: The server was unable to create the indicated file on the indicated volume. The server creates a file on removable media in which to store data.

System action: The volume is rejected.

User response: Ensure that the media is not defective, and is properly formatted. Ensure that there are not large numbers of files already in the root of the file system. Some file systems have limits on the number of files that may be created in the root directory.

ANR8785E Out-of-space in file system for *device type* volume *volume name*.

Explanation: The server detected an out-of-space condition for the file system in which the given volume resides.

System action: The operation fails.

User response: The file system must be expanded to accommodate volume growth.

ANR8786I Request number: Remove *device type* volume from entry/exit port; insert volume *volume name* mount mode into entry/exit port of library *library name* within *time limit* minute(s); issue 'REPLY' along with the request ID when ready.

Explanation: A CHECKIN LIBVOLUME command is in progress, and the specified volume is needed. However, there is a volume awaiting to be removed from the entry/exit port before the specified volume is inserted into the port of the given library.

System action: The server waits until a REPLY command is issued.

User response: Remove the volume from the library and insert the correct volume into the entry/exit port. Issue a REPLY command, along with the request ID, to tell the server that the volume has been removed and a new volume has been inserted.

ANR8787W Unable to read the barcode label(s) in library *library name*.

Explanation: A command is issued with the CHECKLABEL=BARCODE option. The library is unable to detect that the cartridges have valid barcode labels. The barcode reader is disabled or it is unable to read the labels.

System action: Unless the command is checking in cleaning cartridges, the process continues by loading the cartridges into the library's drives and reading the label from the tape. Cleaning cartridges have no internal label that can be checked by loading it in the drive.

User response: Cancel the process if you do not want to load all of the cartridges into the library's drives. Examine the cartridges to ensure they have barcode labels and they are compatible with the barcode reader. Not all vendors' labels are readable by all libraries. Check that the barcode reader is configured and functioning properly, if necessary.

ANR8788W Unable to read the barcode of cartridge in slot-id *Element number of slot* in library *library name*; loading in drive to read label.

Explanation: The library barcode reader is unable to read the label of a tape cartridge. The cartridge is found in the slot with the given element number.

System action: The cartridge is loaded into a drive and its label will be read from the tape.

User response: Cancel the process if you do not want to load any cartridges into the library's drives. Examine the cartridge to ensure it has a barcode label and that it is compatible with the barcode reader. Not all vendors' labels are readable by all libraries. Check that the

barcode reader is configured and is functioning properly, if necessary.

ANR8789W **Dynamic drive recovery being attempted on *device type* volume *volume name* due to errors.**

Explanation: Due to a drive or media fault, the server is moving the volume to a new drive.

System action: Read or write operations resume on the volume once it is remounted.

User response: None.

ANR8790I *device type* **volume *volume name* re-mounted in drive *drive name*.**

Explanation: Due to a drive or media fault, the server has moved the volume to the specified drive. Read or write operations resume on the volume.

System action: The label of the volume has been verified.

User response: None.

ANR8791E **Unable to move *device type* volume *volume name* to another drive.**

Explanation: Dynamic drive recovery was being attempted on the volume, but was unable to move the volume to another drive.

System action: The originating process terminates.

User response: See previous error messages to determine the cause of the DDR failure, and correct the problem. If the problem is an unreadable label, any data on the volume may be lost.

ANR8792E **Unrecoverable drive failures on drive *drive name*; drive is now taken offline.**

Explanation: The drive has been determined to be faulty because of recurrent failures.

System action: The drive is now marked offline.

User response: Service the drive for failures. Delete and redefine the drive to bring it back online.

ANR8793E **Dynamic drive recovery failed for *device type* volume *volume name* because not enough drives are available.**

Explanation: To recover a volume on another drive, there must be at least one other drive available that is not associated with the transaction which is driving the recovery. In addition, the maximum number of drives that can have dynamic drive recovery performed at the same time is one less than the number of drives. This is to prevent deadlock from occurring between two recovering transactions. One of these criteria has failed.

System action: No DDR is performed and the transaction fails.

User response: Restart the transaction.

ANR8794E **Retry of *operation name* operation failed for *device type* volume *volume name*.**

Explanation: After successfully mounting the volume on another drive, due to an I/O error, the original operation fails when retried.

System action: No further recovery is performed and the transaction fails.

User response: Restart the transaction.

ANR8795I **Retry of *operation name* operation for *device type* volume *volume name* is successful.**

Explanation: After mounting the volume on another drive, due to an I/O error, the operation is tried successfully.

System action: The transaction continues from the point of interruption from the failure.

User response: None.

ANR8796W **Drive *drive name* of library *library name* is not online; UPDATE DRIVE required.**

Explanation: During the initialization of a library, the server finds that the drive was updated to be offline.

System action: The drive will not be accessible by the library during tape operations.

User response: The drive may be made online by issuing the UPDATE DRIVE command with the ONLINE=YES option.

ANR8797W ***command*: Drive *drive name* of library *library name* is inaccessible.**

Explanation: The server is unable to use the mentioned drive. This may be for the following reasons:

- The drive cannot be opened.
- In the case of a 3494 or a library that can be partitioned, the drive may be unavailable to the library manager, may be in use by another application, or may be loaded with a cartridge not labeled for server use.

System action: The drive is temporarily made offline and is not used for tape operations. The server polls the drive at one-half minute intervals to check if the condition has cleared. Once the drive is accessible again, the drive is brought online.

User response: Determine the reason the drive is inaccessible, such as hardware errors reported in the

system logs. Render any needed corrections to the drive. The drive will be brought online automatically when the polling process detects that it has become accessible.

ANR8798W Drive *drive name* in library *library name* is busy; some transactions may fail.

Explanation: The drive being made offline is currently mounted with an open tape volume. If the transaction using the volume requires subsequent tape mounts and is unable to acquire a drive, the transaction will fail.

System action: If this tape volume is one of a sequence of volumes that are required to process a transaction, a drive must be available for each mount. This may be any drive in the library, but if all other library drives are currently busy and are still busy at the time the new tape must be mounted, the transaction will fail.

User response: If possible, make the drive online until the transaction using it ends. If there is an idle volume on the drive, dismount the volume first.

ANR8799I Command: Operation for library *library name* started as process *process ID*.

Explanation: A LABEL process has been started to write the label on the specified volume in the given library. The process is assigned the ID specified in the message.

System action: The server starts a background process to perform the operation in response to the LABEL command entered by an administrator.

User response: To obtain status on the process, issue the QUERY PROCESS command. The process may be canceled with the CANCEL PROCESS command.

ANR8800I LABEL LIBVOLUME for volume *volume name* in library *library name* completed successfully.

Explanation: The background process to LABEL a volume has succeeded.

System action: The volume's label has been rewritten.

User response: None.

ANR8801I LABEL LIBVOLUME process *process Id* for library *library name* completed; count of labeled volumes **volume(s) labeled**, count of checked in volumes **volume(s) checked-in**.

Explanation: A search-mode process to LABEL volumes has succeeded.

System action: The volumes have been labeled.

User response: None.

ANR8802E LABEL LIBVOLUME process *process Id* for library *library name* failed.

Explanation: The Label process terminated with a failure.

System action: The process ends.

User response: See previous error messages to determine the cause of the failure, and correct the problem.

ANR8803I LABEL VOLUME process *process Id* for library *library name* has been canceled; count of labeled volumes **volume(s) labeled**, count of checked in volumes **volume(s) checked-in**.

Explanation: A background server process that has been working to label the volumes for the given library is canceled by the CANCEL PROCESS command. The counts provided are for any volumes processed prior to the cancel.

System action: The server process is ended and server operation continues.

User response: None.

ANR8804I Labeling volume *volume name* in library *library name*.

Explanation: In response to a QUERY PROCESS command, this message displays the status for a LABEL process on the server.

System action: The background process continues.

User response: None. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR8805I Labeling volumes in library *library name*; volume count **volume(s) labeled**.

Explanation: In response to a QUERY PROCESS command, this message displays the status of a LABEL process with the SEARCH option.

System action: The background process continues.

User response: None. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR8806E Could not write volume label *volume name* on the tape in library *library name*.

Explanation: The Label process could not write the label on the tape specified.

System action: For a LABEL operation with SEARCH=YES, the background process continues to the next volume. For an individual volume, the process

ends. The volume is not labeled and is not checked into the library.

User response: Make sure the library and drive devices associated with this command are powered on and ready, and then reissue the command.

ANR8807W Could not write label *volume name* on the volume in drive *drive name* of library *library name* because volume is already labeled *existing volume name*.

Explanation: The check in or label process could not write the label on the tape specified because the volume is already labeled.

System action: The check in process will not overwrite volumes that are already labeled, and the label process will only overwrite volumes when OVERWRITE=YES is specified. The volume is not labeled and cannot be checked in to the library. If SEARCH=YES, the process continues to the next volume. For an individual volume, the process ends.

User response: Reissue the command with the correct parameters.

ANR8808E Could not write label *label name* on the volume in drive *drive name* of library *library name* because that volume is already labeled with *volume name* which is still defined in a storage pool or volume history.

Explanation: An attempt was made to overwrite the label of a volume that is still defined to a storage pool or is still found in the volume history file. Such a volume may still contain valid data.

System action: The server process is ended and server operation continues.

User response: It is usually not necessary to re-label volumes. If the volume must be relabeled, that volume must first be removed from the storage pool or volume history file where it is defined.

ANR8809I *Request number:* Please provide the label name for the volume in slot element *slot element number* of library *library name* by issuing REPLY n LABEL=*xxx* within *time limit* minutes, where n is the request ID and *xxx* is the desired label name.

Explanation: A LABEL LIBVOLUME command is in progress, and the name of the next volume is needed.

System action: The server waits until a REPLY command is issued.

User response: Issue a REPLY command, along with the request ID, and the volume name for the next cartridge.

ANR8810I Volume *volume name* has been labeled in library *library name*.

Explanation: The Label process with the search option has found and labeled a volume.

System action: The process ends.

User response: None.

ANR8811E *Command:* The LABELSOURCE parameter is required when using SEARCH with this command.

Explanation: The LABELSOURCE parameter must be provided with the given command.

System action: The command is not processed.

User response: Reissue the command, and provide a valid LABELSOURCE parameter value.

ANR8812E *Command:* The SEARCH parameter is required when using LABELSOURCE with this command.

Explanation: When using the LABELSOURCE option with this command, the SEARCH parameter must be also provided.

System action: The command is not processed.

User response: Reissue the command, and provide a valid SEARCH parameter value.

ANR8813W Unable to read the barcode of cartridge in slot element *Element number of slot* in library *library name*.

Explanation: The library barcode reader is unable to read the label of a tape cartridge. The cartridge is found in the slot with the given element number.

System action: When LABELSOURCE=BARCODE is specified on the LABEL LIBVOLUME command, volumes without a barcode cannot be labeled. When the VOLRANGE or VOLLIST option is specified on the CHECKIN LIBVOLUME command, volumes without a barcode cannot be checked in.

User response: Examine the cartridge to ensure it has a barcode label and that it is compatible with the barcode reader. Not all vendors' labels are readable by all libraries. Check that the barcode reader is configured and is functioning properly, if necessary.

ANR8814I Remove volume *Volume name* from slot element *Slot element number* of library *Library name*.

Explanation: LABEL LIBVOLUME has ended for the specified volume and that volume must be removed from the library because either it was not checked in or there was an error.

System action: The server continues normal operation.

User response: Remove the specified volume from the library.

ANR8815I Remove volume *Volume name* from port element *Port element number of library* *Library name*.

Explanation: LABEL LIBVOLUME has ended for the specified volume and that volume must be removed from the library because either it was not checked in or there was an error.

System action: The server continues normal operation.

User response: Remove the specified volume from the library.

ANR8816E *command*: Volume *Volume name* in library *Library name* cannot be labeled because it is currently defined in a storage pool or in the volume history file.

Explanation: During command *command* processing, a volume cannot be used because there is a storage pool volume defined or a volume in the volume history file with this volume name. Such a volume may still contain valid data. Applying the volume name to the cartridge can overwrite data and or cause library inventory corruption. If the volume is in the volume history file, it has been previously used by for an export, database dump, database backup operation, or by a library client (as recorded in the volume history).

System action: If the SEARCH=YES option was specified, the current volume is skipped and command processing continues with the next volume found. If SEARCH=NO was specified, command processing terminates.

User response: If the volume is present in an automated library, it should either be removed or checked into the library's inventory in the PRIVATE category.

ANR8817E Name length for volume "*Volume name*" invalid; max is *Maximum name length*.

Explanation: During LABEL LIBVOL processing, the volume name provided to be written on the label exceeds the maximum length for the type of cartridge.

System action: The label process fails for that cartridge.

User response: Reissue the LABEL LIBVOL command and provide a volume name that is not longer than the maximum listed.

ANR8818E I/O Error on library *library name*; request for op. *operation/function* to the 3494 Library Manager has timed out.

Explanation: A command for the operation was issued to the Library Manager and a response was not received within the maximum timeout period.

System action: The operation and the transaction fails.

User response: Verify that communications with the library is operational, that it is online and ready for commands. Increase the time-out limit of the Library Manager Control Point device driver. If the problem persists, provide your service representative with the 3494 Library Manager transaction logs.

ANR8819E Unable to read the barcode label(s) in library *library name*.

Explanation: A LABEL command was issued with the LABELSOURCE=BARCODE option. The library was unable to detect that the cartridges had valid barcode labels or the library did not have a barcode reader. If a barcode reader is present the reader might be disabled or it is unable to read the labels.

System action: Examine the cartridges to ensure they have barcode labels and they are compatible with the barcode reader. Not all vendors' labels are readable by all libraries. Check that the barcode reader is configured and functioning properly.

User response: None.

ANR8820W Repairing VCR data for Volume *volume name* in drive *drive name*; dismount may be delayed.

Explanation: The Vital Cartridge Records of the cartridge in the drive are lost or corrupted, which results in the inability of the drive to do fast locates to file positions on the cartridge. The VCR is being rebuilt during the volume dismount process in order to avoid performance degradation on future mounts of the volume.

System action: The server continues the dismount operation. There may be a long delay because the VCR is rebuilt by spacing the tape forward to the end-of-data.

User response: None.

ANR8821E Barcode of element *slot element address*, '*hardware barcode string*', exceeds maximum length characters in length.

Explanation: A barcode is encountered that was longer than a valid volume name.

System action: The barcode is not considered valid and will not be used for the server process.

User response: Replace the cartridge's barcode with one that is supported by the library and whose number of characters does not exceed the maximum length.

ANR8822E *'Volume name' is not a valid volume name.*

Explanation: The specified string is not a valid volume name.

System action: The program prompts for a new volume name.

User response: Enter a volume name that is within the length constraints for the media type being labeled, and which contains only alphanumeric characters.

ANR8823E **Hardware configuration error in library** *library name: number of drives* **drives,** *number of storage slots* **storage slots.**

Explanation: The library device returned a count of zero for either the drives or the slots. The drives may have not yet been configured to the operating system, or to the library. The library must have at least one drive and multiple slots when properly configured in order to be defined to the server.

System action: The operation fails.

User response: Configure the drives to the operating system, and reinitialize the library.

ANR8824E **I/O Error on library** *library name;* **request request id for operation operation/function to the 3494 Library Manager been lost.**

Explanation: A command for the operation was issued to the Library Manager and a response was not received within the maximum timeout period.

System action: The operation and the transaction fails.

User response: Verify that communications with the library is operational, that it is online and ready for commands. If the problem persists, provide your service representative with the 3494 Library Manager transaction logs and the request id from the failed operation.

ANR8825E *'Volume range' is not a valid volume range.*

Explanation: The specified string is not a valid volume range.

System action: The program prompts for a new volume range.

User response: Enter the volume names in the range that is within the length constraints for the media type being labeled, and which contains only alphanumeric characters. The volume names of the beginning and ending volume must be the same in length and the

incrementals must be in digits.

ANR8826E **No Entry/Exit found on library** *library name.*

Explanation: A CHECKIN LIBVOLUME SEARCH=BULK command was issued on a library that has no Entry/Exit ports.

System action: None.

User response: None.

ANR8827E **No Entry/Exit port is available on library** *library name.*

Explanation: A CHECKOUT LIBVOL command was issued on a library where all its Entry/Exit Ports were found to be full or inaccessible.

System action: None.

User response: Empty all the entry/exit ports on the library, close the entry/exit port door, make sure the ports are accessible, and try the command again.

ANR8828E **Slot element number of library** *library name* **is inaccessible.**

Explanation: The slot in the library could not be physically accessed at this time.

System action: None.

User response: Verify that the Entry/Exit door is closed and the device has not logged any device errors before trying the command again.

ANR8829I **Remove volume** *volume name* **from slot element number of library** *library name* **at your convenience.**

Explanation: A volume has been checked out from the library and placed in a multiple entry/exit port library. The volume needs to be removed from the library, but the operation is not critical.

System action: None.

User response: Remove the volume from the entry/exit slot.

ANR8830E **Internal Device type drive diagnostics detect excessive media failures for volume** *Volume name (MIM MIM Code).* **Access mode is now set to "read-only".**

Explanation: The tape drive's microcode performed an analysis of the media during the prior mount of the volume and determined that the number of temporary errors and other indicators exceed the threshold for reliable data recording.

System action: The volume is made read-only.

User response: Check system error logs for entries made by the device relative to media errors. It is recommended to move the data off the volume in order to minimize the impact of future errors and further damage to the media.

ANR8831W Because of media errors for volume *Volume name*, data should be removed as soon as possible.

Explanation: Errors previously encountered on the volume leave the access to the data in a questionable state. The errors may be permanent temporary media failures such as the corruption of the Volume Control Region of a Magstar™ drive.

System action: None.

User response: Move the data off the volume. This can be done with the MOVE DATA command. In some cases the tape is reusable by returning it to scratch. Check system error logs for entries made by the device relative to media errors. If the errors cannot be isolated or resolved, contact your support representative. Return the tape to scratch or dispose of it.

ANR8832E CHECKIN LIBVOLUME for volumes in search mode in library *library name* failed.

Explanation: The background process for a CHECKIN LIBVOLUME command has failed.

System action: The background process ends, but volumes have not been checked into the library.

User response: Make sure the library and drive devices associated with this command are powered on and ready, and then reissue the command.

ANR8833E Command: Volume *volume name* in library *library name* is currently being checked in or checked out.

Explanation: The command cannot be processed because the specified volume is being checked in or checked out of the library.

System action: The command is not processed.

User response: Wait until the conflicting checkin or checkout has completed, and then reissue the command.

ANR8834E Library volume *volume name* is still present in library *library name* drive *drive name*, and must be removed manually.

Explanation: Library operations cannot be performed using the drive because a volume is still mounted in it. This may be due to a prior dismount failure that occurred on the drive.

System action: The command fails. The drive may be taken offline.

User response: See previous error messages and the system error logs to determine the cause of the dismount failure or any other reason the volume would still be loaded in the drive. Hardware diagnostics may be required. If necessary, remove the volume manually and place it in its storage cell. If the storage cell is unknown, place the volume in any cell and issue the AUDIT LIBRARY command. Use the QUERY DRIVE command to determine the online status of the drive. If the drive is still functioning, change the status with the UPDATE DRIVE command.

ANR8835W Error returning volume *volume name* to scratch.

Explanation: The server external library manager sent a RELEASE request to the external agent for the named volume, but the external agent was unable comply with the request. The server, however, marked the volume scratched in its inventory; consequently, the server inventory and the external agent inventory are not consistent. This message is issued to inform the customer that the external agent inventory must be made consistent with the server inventory using the facilities of the external agent.

System action: The server has returned the volume to scratch status.

User response: Consult the documentation for the external agent and take the appropriate action to make the agent inventory consistent with the server inventory.

ANR8836E Function *RSM_function* failed in *server_function* processing, return *return code*, call *call number*.

Explanation: The library function that uses the API to the Windows NT Removable Storage Manager failed with a return code from the API. The call number represents the exact API call issued in the program.

System action: The function fails.

User response: Use the RSM documentation to determine the source of the problem.

ANR8837E RSM Library *Library Name* not supported on this Windows platform.

Explanation: The libtype=RSM was used on a Windows platform that does not support RSM.

System action: The function fails.

User response: Use another library type to define the library.

ANR8838E I/O error on drive *drive name*: excessive unit attentions received from device.

Explanation: An operation to the drive failed with a device unit attention. These are normally cleared when the operation is retried, but in this case subsequent recover and retry attempts persistently fail with unit attention. This indicates a device failure.

System action: The operation fails.

User response: See accompanying error messages and the system error logs to determine any reason for the drive failure. Hardware diagnostics may be required. It may be necessary to manually unload the volume and mark the drive offline with the UPDATE DRIVE command.

ANR8839W Drive *drive name* of library *library name* is accessible.

Explanation: The server is now able to use the mentioned drive that was inaccessible. However, the administrator has marked the drive offline while the drive was being polled.

System action: The drive is left offline and is not used for tape operations.

User response: Issue the UPDATE DRIVE command to bring the drive back online.

ANR8840E Unable to open device *device name* with file handle *error number* and PVRRC *return code*.

Explanation: The library was inaccessible, thus causing an open request to fail. This will in turn cause the pending request to fail.

System action: A drive is marked inaccessible and the server starts polling the drive to determine if the library and drive are inaccessible. In most cases, the library had a temporary failure and recovers. When the server determines that the library is available, the drive will be brought back online.

User response: Verify the library is online. Verify cable connections between the library and the server. If the problem persists contact your service representative.

ANR8841I Remove volume from slot *element number* of library *library name* at your convenience.

Explanation: A volume has been placed in a multiple entry/exit port library because the volume should be placed back in the entry/exit port as a result of the successful completion of a server command, or there was a problem during a server command. The volume needs to be removed from the library, but the operation is not critical.

System action: None.

User response: Remove the volume from the entry/exit slot. Examine previous messages for additional information regarding the specified volume and the command.

ANR8842E The *Device type* drive detected a marginal sector and could not reallocate the sector for volume *Volume name*. Access mode is now set to "read-only".

Explanation: The optical drive detected a marginal sector (media error) while reading the volume. The drive read the sector successfully but could not reallocate the sector because of a previous media error.

System action: The volume is made read-only.

User response: Check system error logs for entries made by the device relative to media errors. It is recommended to move the data off the volume in order to minimize the impact of future errors and further damage to the media.

ANR8843E Initialization failed for *library type* library *library name* - the library will be inaccessible.

Explanation: The initialization process for the given library has failed. The server is unable to use the library. This may be for the following reasons:

- The library is defined without a path.
- The device for the library is removed by a DELETE PATH command.
- The data mover controlling the library is offline.
- The path to the library is offline.

System action: The library is made offline and will not be used for any library operations.

User response: Determine the reason the library is inaccessible. Render any needed corrections to the library, shut down the server, and re-bring up the server so that the library can be completely initialized.

ANR8844E Unable to open remote drive *drive name*, error code=*error value* from server plugin.

Explanation: The indicated remote drive cannot be opened by the server. The error code displayed is the return code from server plugin routine.

System action: The transaction needing the drive fails.

User response: Use the return code displayed to determine the cause of the open failure or any other reason the drive cannot be opened. Hardware diagnostics may be required. Inspect the drive. Ensure that the drive is powered on and ready, the cables are properly connected and terminated, and the device is properly configured to the operating system.

ANR8845E Loadable module *module name* is required for remote operation.

Explanation: The indicated loadable module is required by the server to perform an operation on a remote drive or library, but the module has not loaded. Message ANR4726I is issued during server initialization when the module is loaded.

System action: The remote operation fails.

User response: Check the server activity log for message ANR4726I, indicating if the module was loaded. If you see this message during server initialization for this module, please contact your service representative. If you do not see this message, make sure the loadable module has not been deleted, or contact your service representative.

ANR8846E Volume *volume name* is assigned to a category that does not belong to library *library name*.

Explanation: The attempted operation on the volume cannot proceed because it is assigned to a category other than the insert, private, or scratch category used by the library.

System action: The attempted operation is terminated.

User response: Use the `mtlib` utility to query the volume's category. If the volume is not in use by another library, use `mtlib` to reassign the category or choose another volume that is assigned to the proper category.

ANR8847E No *device type*-type drives are currently available in library *library name*.

Explanation: The attempted operation cannot be completed on the specified library because there are no available drives of the specified type. A drive may be unavailable because a different application has the drive opened. This message may also be issued if a CHECKIN or LABEL command is issued and no drive is available to service the operation. This can be because all the drives are mounted by other processes or sessions, or the device type was incorrectly specified. This can also be issued when incorrect barcode labels are placed on the wrong type of media (e.g. LTO2 barcode label on an LTO1 cartridge).

System action: The attempted operation is terminated.

User response: Use the QUERY DRIVE command to check the online status of the drives. Drives that are marked "Unavailable since hh:mm yy/mm/dd" are drives taken offline by the server at the time specified because of hardware failures or the inability to open the drive. If the attempted operation is a CHECKIN or LABEL command, use the QUERY MOUNT command to determine if all the drives in the library are mounted and wait until one of these is available. If there are mounted volumes with an IDLE status, use the

DISMOUNT VOLUME command to free its drive, and retry the original operation. Finally, the DEVTYPE parameter is required for CHECKIN and LABEL commands specifying 3590 volumes in a 349X library that also contains 3490 drives. This is because this library also supports 3490 volumes, and the default device type on CHECKIN and LABEL commands is CART (3490).

ANR8848W Drive *drive name* of library *library name* is inaccessible; server has begun polling drive.

Explanation: The server is unable to use the mentioned drive. This may be for the following reasons:

- The drive cannot be opened
- In the case of a 3494 or a library that can be partitioned, the drive may be unavailable to the library manager, may be in use by another application, or may be loaded with a cartridge not labeled for server use.

System action: The drive is temporarily made offline and is not used for tape operations. The server polls the drive at one-half minute intervals to check if the condition has cleared. Once the drive is accessible again, the drive is brought online.

User response: Determine the reason the drive is inaccessible, such as hardware errors reported in the system logs. Render any needed corrections to the drive. The drive will be brought online automatically when the polling process detects that it has become accessible.

ANR8849E Command: There is already a request to delete drive *drive name*.

Explanation: The designated drive cannot be deleted or updated because there is a request to delete the drive already.

System action: The command is not processed.

User response: None.

ANR8850I ACSLS library *library name* is ready for operations.

Explanation: The initialization process for the given library has completed successfully, and the library is ready for use.

System action: The library is made ready for use.

User response: None.

ANR8851E Initialization failed for ACSLS library
library name; will retry in delay time
minute(s).

Explanation: The initialization process for the given library has failed. It is retried automatically after the specified amount of time has elapsed.

System action: The initialization will be retried later.

User response: Ensure that the library device is powered on and ready.

ANR8852E Initialization failed for ACSLS library
library name.

Explanation: The initialization process for the given library has failed and will not be retried until the next time the server needs to access the library.

System action: The library is made temporarily unavailable.

User response: None.

ANR8853E Incompatible options
CHECKLABEL=NO and SEARCH=YES
for ACSLS libraries.

Explanation: The CHECKLABEL=NO and SEARCH=YES parameters on the CHECKIN LIBVOL command are not compatible.

System action: The command fails.

User response: Reissue the CHECKIN LIBVOL command and specify CHECKLABEL=YES.

ANR8854E ACSAPI(command name) invocation
failed, status=acs status.

Explanation: The ACSLS library API invocation for the given command failed.

System action: Depends on the server function and command, library may be unavailable.

User response: Contact your ACS System Administrator and perform ACSLS library problem determination.

ANR8855E ACSAPI(command name) response with
unsuccessful status, status=acs status.

Explanation: The ACSLS library API responded with an unsuccessful status as indicated.

System action: Depends on the server function and command, library may be unavailable.

User response: If the status indicates STATUS_CAP_IN_USE, it might be CAP priorities not set to non-zero. It might also be CAPs are not set to automatic mode, or CAPs are in manual mode during manual checkin. If CAP mode and priorities are set

correctly, contact your ACS System Administrator and perform ACSLS library problem determination.

ANR8856E ACSAPI sequence(sequence number)
request(request number) timed out, elapse
time=hours:minutes:seconds.

Explanation: The ACSLS client has received no response from the ACSLS server for the period as indicated in the elapsed time. The ACSLS library API function with the associated sequence number is canceled if the request number is non-zero.

System action: Depends on the server function and command, library may be unavailable.

User response: Contact your ACS System Administrator and perform ACSLS library problem determination.

ANR8857I ACS access control set to user_id - user
id, status=acs status.

Explanation: The ACSLS ACCESSID structure for command and volume access control is set the user_id as indicated.

System action: None.

User response: Ensure the indicated user_id is the same as specified in the environment variable ACSAPI_USER_ID.

ANR8858W Unable to lock drive *drive id,drive id,drive*
id,drive id, status=acs status.

Explanation: The ACSLS library function acs_lock_drive failed for the specified drive.

System action: Depends on the server function and command, library drive may be unavailable. or may be temporary unavailable in a shared library environment.

User response: Contact your ACS System Administrator and perform ACSLS library problem determination if the problem persists.

ANR8859W Unable to lock volume *volume id,*
status=acs status.

Explanation: The ACSLS library function acs_lock_volume failed for the specified volume.

System action: Depends on the server function and command, library volume is unavailable.

User response: Contact your ACS System Administrator and perform ACSLS library problem determination if the problem persist.

ANR8860W Volume *volume id* is already locked by user *id*.

Explanation: The specified volume is already locked by other user or has a different lock id.

System action: Depends on the function, the volume maybe bypassed or the process maybe terminated.

User response: This may not be an error in a shared configuration. However, if the existing volume lock is not needed, contact your ACSLS system administrator to clear the lock the volume.

ANR8861I Wait and monitor the ACSSA console message to remove volume *volume id* from CAP.

Explanation: The specified volume is about to put into CAP for removal. Monitor the ACSSA console and removed the volume after it has been placed into the CAP as indicated in the ACSSA message.

System action: None.

User response: Monitor the ACSSA console and wait.

ANR8862I Unable to access ACS volume *volume id*.

Explanation: The specified ACSLS volume can not be accessed in the library. The possible reasons might be the volume is in use, the user is not authorized, the volume does not exist in the library.

System action: Depends on the server function and command, library volume is unavailable.

User response: Contact your ACS System Administrator and perform ACSLS library problem determination if the problem persist..

ANR8863I Unlocking library *library name* volumes from the ACSLS server.

Explanation: The volumes of the specified library are being unlocked from the ACSLS server.

System action: The operation continues. The process may take a while depends on the number of volumes in the library.

User response: None.

ANR8864I ACSLS library *library name* is being re-initialized.

Explanation: The specified ACSLS library is being re-initialized.

System action: The operation continues. The process may take a while depends on the number of volumes in the library. All volumes in the library are being locked.

User response: None.

ANR8865W Volume *volume name* bypassed for command, status=*acs_status*.

Explanation: The specified volume is bypassed. The volume is not in a valid status for the specified function.

System action: The operation continues.

User response: Determine the volume status from the ACSSA and re-issue the command if necessary.

ANR8866E Incompatible option REMOVE=BULK for ACSLS libraries.

Explanation: The REMOVE=BULK option is not supported for ACSLS libraries. The final response of ACSAPI *acs_eject* does not return to the application until the volume is removed from CAP.

System action: The command fails.

User response: Reissue the CHECKOUT LIBVOL command and specify REMOVE=YES or NO.

ANR8867I Processing volume *volume id* for the command *command*.

Explanation: The specified volume is being processed for the specified command.

System action: The command process continues.

User response: None.

ANR8868E Ejecting Volume *volume name* Failed, status = *acs_status*.

Explanation: The volume is failed to be ejected from the library due to the status as indicated

System action: The operation continues.

User response: Determine the volume status from the message and do something as needed

ANR8869E Command: There is already a request to update drive *drive name*.

Explanation: The designated drive cannot be deleted because there is a request to update the drive already.

System action: The command is not processed.

User response: None.

ANR8870E The path to the library *library name* is unavailable.

Explanation: There is no path to the given library, or the path to the library is offline, or the source entity of the path to the library is offline.

System action: The library is inaccessible.

User response: Ensure that a path is defined to the

library. If there is path defined to the library, make sure the path is online and the source entity of the path is also online.

ANR8871I The device name *device name* specified has been changed to *device name*.

Explanation: The specified device name on the DEFINE PATH or UPDATE PATH command has been changed to recommended device name.

System action: The command process continues.

User response: None.

ANR8872E No path is available for drive *drive name* - could not unload volume *volume name* from drive.

Explanation: There is no path to the given drive or the path to the drive is offline or the source of the path to the drive is offline. The indicated volume may be still on the drive.

System action: The drive is inaccessible.

User response: Ensure that a path is defined to the drive. If there is a path defined to the drive, make sure that the path is online and that the source of the path is also online. Run the AUDIT LIBRARY command after the problem is corrected.

ANR8873E The path from source *source name* to destination *drive name* is taken offline.

Explanation: There is problem using the indicated path. The path is now marked offline.

System action: The path is inaccessible.

User response: Determine the reason the path is inaccessible, such as hardware problem. Render any needed corrections. Then, the path may be made online by issuing the UPDATE PATH command with the ONLINE=YES option.

ANR8874E The type of device used by the media in element *element number of library library name* cannot be determined by the hardware. Volume is not processed.

Explanation: The library's mechanism for determining the type of media in a slot or EE port failed. This is usually the barcode reader or some other sensor that is part of the robotics.

System action: The volume is skipped by the process.

User response: Determine the reason the library could not determine the media type, such as deteriorated barcode, scanner failure, or other hardware problem as determined by system engineer. If the barcode label is replaced on a private volume containing data, it must be with a label having the volume name. Scratch

volumes or empty private volumes can be replaced with any barcode but they must be re-labeled if the barcode name changes.

ANR8875E An illegal move was attempted involving the media in element *element number of library library name*. Its type is incompatible with the destination element *element number*.

Explanation: The server tried to move one type of volume into a drive or slot of another type that is incompatible. This is most likely because another volume has taken its slot, or the server's information for this volume has otherwise been corrupted.

System action: The process fails.

User response: Issue the AUDIT LIBRARY command, and retry the operation.

ANR8876E The media in element *element number of library library name* is a cleaner.

Explanation: The library hardware has determined that the media in the stated slot is a cleaner cartridge. It cannot be processed by the CHECKIN command without the STATUS=CLEANER parameter, and it cannot be labeled by the LABEL command.

System action: The process skips the media, or if it is the only media being processed the process fails.

User response: Issue the AUDIT LIBRARY command, and retry the operation.

ANR8877E Volume *volume name* is incompatible type with device class *devclass name* in library *library name*.

Explanation: An attempt has been made to service a mount request, but the attempt fails because the media type of the cartridge being mounted is not compatible with the devclass requesting the mount. This is usually a conflict between WORM and Read-Write characteristics.

System action: The operation fails.

User response: If this is not a 3592 device or media, The volume was probably not checked in with the CHECKLABEL=YES parameter of the CHECKIN command. Check the volume out (the REMOVE=NO may be useful) and check the volume back into the library with this parameter to ensure that the mediatype is determined and saved. If this is a 3592 device or media, the volume probably has an incorrect barcode label indicating that it had the wrong WORM property. The label needs to be swapped for the opposite WORM type (e.g. WORM to non-WORM or non-WORM to WORM) or simply removed entirely from the library.

ANR8878E Failed to close the remote library *library name(device name)*.

Explanation: An attempt to close a remote Library device attached to a NAS File Server failed.

System action: The operation fails.

User response: Examine previous messages for additional information regarding the specified library.

ANR8879E Failed to close the SCSI session for the remote library *library name(device name)*.

Explanation: An attempt to close a SCSI session for a remote Library device attached to a NAS File Server failed.

System action: The operation fails.

User response: Examine previous messages for additional information regarding the specified library.

ANR8880W Device type of drive *Drive name* in library *Library name* was determined to be **GENERIC_TAPE**.

Explanation: The device type of a drive is determined when the path for that drive is defined. If the wrong device file was used in the device parameter of DEFINE PATH the device type of the drive will often be GENERIC_TAPE. If you are using the TSM device driver or the IBMTape device driver, then you should not have a device type of GENERIC_TAPE. You should only have a device type of GENERIC_TAPE if you are using the native OS device driver.

System action: None.

User response: Verify that GENERIC_TAPE is the desired device type for this drive. While the device type GENERIC_TAPE is valid, it is often a mistake, and thus, should be verified that it is the intended device type. If GENERIC_TAPE is not the intended device type, all paths for this drive and the drive itself will have to be deleted and redefined.

ANR8881W Insufficient space for new volume in directory *directory* for device class *device class name*.

Explanation: The server found that the indicated directory had insufficient space in which to create a new volume.

System action: Other directories available to the device class are used, if any. If no directories with space are available, the operation fails. This message is issued periodically as requests are made for space in this directory.

User response: The file system must be expanded to accommodate volume growth.

ANR8882I *Request number:* Please provide the label name for the volume in drive *drive name* of library *library name* by issuing **REPLY n LABEL=xxx** within *time limit* minutes, where *n* is the request ID and *xxx* is the desired label name.

Explanation: A mount is in progress with AUTOLABEL, and the name of the volume is needed.

System action: The server waits until a REPLY command is issued.

User response: Issue a REPLY command, along with the request ID, and the volume name for the cartridge.

ANR8883W The volume *volume name* in slot *element number* is in the library *library name* but not in the TSM's inventory database. Please either check in this volume or remove it from the library;

Explanation: .

System action: .

User response: The Audit Library command found this volume in this library but they are not in TSM's inventory database. This volume can be either checked in or removed from this library.

ANR8884W Attempted to label a written WORM medium in the drive *drive name* with volume *volume name* (**OP=internal code, Error Number=internal code, CC=internal code, KEY=internal code, ASC=internal code, ASCQ=internal code, SENSE=sense data, Description=error description**). Refer to Appendix C in the 'Messages' manual for recommended action.

Explanation: An I/O error has occurred while labeling on the written WORM medium.

System action: The operation fails.

User response: Ensure the WORM medium in the drive is not a written WORM medium.

ANR8901E *Command:* Incompatible options **STATUS=CLEANER** and **CHECKLABEL=YES**.

Explanation: Cleaner cartridges do not have internal labels that can be checked by loading them into the drive.

System action: The command fails.

User response: Reissue the CHECKIN LIBVOL command and include the parameter, CHECKLABEL=BARCODE (with SEARCH=YES specified), or include the parameter CHECKLABEL=NO (with the required volume name

specified in the CHECKIN command).

ANR8902W Unable to read the barcode of cleaner cartridge in slot-id *Element number of slot in library library name; cleaner not checked in.*

Explanation: The library barcode reader is unable to read the label of a cartridge that is checked in as a cleaner. The cartridge is found in the slot with the given element number.

System action: The cartridge is not checked in. If the library is being searched, the checkin process continues with the next volume.

User response: Examine the cartridge to ensure it has a barcode label and that it is compatible with the barcode reader. Not all vendors' labels are readable by all libraries. Check that the barcode reader is configured and is functioning properly. The cleaner cartridge can be checked in without use of the barcode label by issuing the CHECKIN LIBVOL command.

ANR8903E Command: Missing CLEANINGS parameter for cleaner cartridge checkin.

Explanation: When checking in a cleaner cartridge, the CLEANINGS parameter is required.

System action: The command fails.

User response: Reissue the CHECKIN LIBVOL command and specify a value for the CLEANINGS parameter which is used to determine the number of times a cleaner can be mounted to clean a drive.

ANR8904I Command: Cleaning operation for drive drive name in library library name started as process process ID.

Explanation: A command-driven process is started to clean the specified drive. The process is assigned the ID that is in the message.

System action: In response to the CLEAN DRIVE command that is issued by an administrator, the server starts a background process to perform the operation.

User response: To obtain status on the process, issue the QUERY PROCESS command. The process may be canceled with the CANCEL PROCESS command.

ANR8905I CLEAN DRIVE process for drive drive name in library library name is been canceled.

Explanation: A background server process is has been working to clean the specified drive and is canceled by the CANCEL PROCESS command.

System action: The cleaning process is ended.

User response: None.

ANR8906I Cleaning drive drive name in library library name.

Explanation: In response to a QUERY PROCESS command, this message displays the status for a CLEAN DRIVE process on the server. The given volume is being checked in to the designated library.

System action: The background process operation continues. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

User response: None. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR8907E CLEAN DRIVE for drive drive name in library library name failed.

Explanation: The background process for a CLEAN DRIVE fails.

System action: The background process ends, but the drive is not cleaned.

User response: Make sure the library and drive devices associated with this command are powered on and ready. Reissue the command.

ANR8908I CLEAN DRIVE for drive drive name in library library name completed successfully.

Explanation: The specified drive is successfully cleaned in the library during processing of a CLEAN DRIVE command.

System action: The drive is available for normal library operations.

User response: None.

ANR8909I Cleaning drive drive name in library library name- CANCEL PENDING.

Explanation: In response to a QUERY PROCESS command, this message displays the status for a CLEAN DRIVE process on the server.

System action: The background process operation is terminated.

User response: None.

ANR8910I No cleaner, or no cleaner with cleanings left, found in library library name.

Explanation: A drive is selected to be loaded with a cleaner cartridge, but no cleaner, or cleaner with cleanings left, is found in the library's inventory.

System action: The drive is available for normal library operations.

User response: A cleaner should be checked in to the library by issuing the CHECKIN LIBVOL command.

ANR8911W The cartridge in storage element *slot element address* in library *library name* is not a cleaner cartridge as was expected.

Explanation: The cartridge is listed in the library's inventory with a cleaner volume status. After loading the cartridge in the specified storage cell into a drive for cleaning, it is determined that it is not a cleaner cartridge.

System action: The drive is available for normal library operations.

User response: Verify all other cleaner cartridges are in the correct storage cells. Issue the QUERY LIBVOLUME command to obtain the storage cells of all the cartridges currently checked into TSM. The cartridge should be checked out of the library by issuing the CHECKOUT LIBVOL command if the cartridge is still listed in the library's inventory with a cleaner volume status. If necessary a cleaner cartridge should be checked in to replace it.

ANR8912E Unable to verify the label of volume from slot-element *element-address* in drive *drive name* in library *library name*.

Explanation: The volume from the slot that is identified by the element address is loaded into a drive. The drive cannot be opened following the load. The label cannot be read to process the volume.

System action: The volume is stored, and processing continues with the next available slot.

User response: Check the system error logs for errors reported by the drive that are related to this volume. Make sure that the cartridge is not a cleaner cartridge that would have been loaded by mistake. If the cartridge is a cleaner, issue the QUERY LIBVOL command to get the correct storage slot for the cleaner and move the cleaner to that slot. If the cleaner is not in the library's inventory, use the CHECKIN LIBVOL to check the cleaner in. During Audit Library, remove the bad volume from the reported slot and run Audit Library again.

ANR8913I Drive *drive name* in library *library name* is currently busy; Cleaning is scheduled.

Explanation: A background process to clean the drive is unable to acquire the drive because the drive is busy.

System action: The background process operation completes. The drive is scheduled to be cleaned when it is unloaded.

User response: None.

ANR8914I Drive *drive name* in library *library name* needs to be cleaned.

Explanation: The drive has returned indicating to the server that it needs to be cleaned.

System action: The server marks the drive to be cleaned. If the drive is enabled for server-managed cleaning, and a cleaner cartridge is checked into the library, the server will load the cleaner into the drive after the current volume is dismounted. See the DEFINE DRIVE and QUERY DRIVE commands for information on enabling server-managed cleaning. See the CHECKIN LIBVOL command for checking a cleaner into the library.

User response: None.

ANR8915I Cleaning cartridge *cleaner name* in library *library name* is near end of life; has *cleanings left* uses left.

Explanation: A cleaner cartridge is found and used, but its number of uses it has left is nearly exhausted.

System action: The cleaning operation continues.

User response: As the cleaner is used, monitor the number of cleanings that remain with the QUERY LIBVOL command. Remove the cleaner when all cleanings are exhausted. A new cleaner may be checked in so that the library is not left without a useful cleaner when the old cleaner is exhausted.

ANR8916I Drivemapping for drive *Drive name* in library *library name* on storage agent *storage agent name* defined.

Explanation: A drive mapping has been successfully defined for the specified drive.

System action: The drivemapping is defined and recorded in the database.

User response: None.

ANR8917I Drive mapping for drive *Drive name* in library *library name* on storage agent *storage agent name* updated.

Explanation: An UPDATE DRIVEMAPPING request has been successfully processed for the given drive.

System action: The server updates its information about the drive mapping.

User response: None.

ANR8918I Drive mapping for drive *Drive name* in library *library name* on storage agent *storage agent name* deleted.

Explanation: The drive mapping for the specified

storage agent, library, and drive has been deleted successfully.

System action: The drive mapping is deleted.

User response: None.

ANR8919I Initialization and recovery has started for shared library *library name*.

Explanation: The shared library has started to initialize or recover to resynchronize the library manager and library client.

System action: None.

User response: This process should resynchronize all of the drives that are currently being used by this library client. This process might also start after a communication error or if the library client has not been able to verify drive status with the library manager.

ANR8920I Initialization and recovery has ended for shared library *library name*.

Explanation: Initialization or recovery has ended the library manager and library client should be synchronized.

System action: None.

User response: The drives previously owned by the library client should now indicate they are free on the library manager. Verify this with the QUERY DRIVE command on the library manager. If ownership of the drives is still in question restart the library client and library manager.

ANR8921E Unable to start library polling thread.

Explanation: Library sharing requires that this polling thread starts. This thread keeps the library manager and library client synchronized with regards to drive ownership. These thread are started when the library is defined or when the server is first initialized.

System action: None.

User response: Since the polling thread did not start, the user must restart the server in order for library sharing to correctly work. Failure to restart the server and get these polling services running can cause unusual results for library clients.

ANR8922I A device class for library *library name* was not found.

Explanation: A library client request a mount operation to be performed by the library manager. The library manager is missing a device class definition for that library.

System action: None.

User response: Define a device class for the library using the DEFINE DEVCLASS command.

ANR8923I Dismount failed because drive *drive name* in library *library name* is not currently owned by *drive owner name*.

Explanation: A library client attempted to dismount a drive that was not currently owned by the library client.

System action: None.

User response: None.

ANR8925W Drive *drive name* in library *library name* has not been confirmed for use by server *server name* for over *elapsed time* seconds. Drive will be reclaimed for use by others.

Explanation: The library server was unable to contact the library client for the given interval to verify that the library client is still using the drive. At this point the error recovery logic of the library manager will reclaim the drive (including dismounting the client's volume if possible) and allow other to use the drive.

System action: None.

User response: Verify that the library client with the above server name is still running. Verify that the sessions have not been disabled and the network is still working between the two host machines. Verify that the server definition (QUERY SERVER) on both the library manger and the library client are correct.

ANR8926W An Error was encountered while confirming the use of drive *drive name* in shared library *library name*.

Explanation: The library client was unable to confirm the usage of the drive to the with the library manager.

System action: None.

User response: Verify that the sessions have not been disabled and the network is still working between the two host machines. Verify that the server definition (QUERY SERVER) on both the library manger and the library client are correct.

ANR8927W This library client has been unable to contact the library manager for *elapsed time* seconds. Releasing ownership of all drives in the shared library *library name*.

Explanation: The library client was unable to confirm the usage of the drive with the library manager. The library client will now dismount all volumes that it currently owns.

System action: None.

User response: Verify that the sessions have not been disabled and the network is still working between the two host machines. Verify that the server definition (QUERY SERVER) on both the library manger and the library client are correct.

ANR8928W Library *library name* specified for shared file device class *device class name* was not defined as shared. The device class will not be shareable unless the library is updated.

Explanation: A pre-existing library was specified for a new shared file device class. However, files in the device class cannot be shared unless the library is also shared.

System action: None.

User response: Issue the UPDATE LIBRARY libname SHARED=YES command to make the library shared.

ANR8929E Library *library name* specified for shared file device class *device class name* was not defined as a FILE library.

Explanation: A pre-existing library was specified for a new shared file device class. However, the existing library was not created with the LIBTYPE=FILE parameter.

System action: None. The device class is not created.

User response: Specify a library name that was created with the LIBTYPE=FILE and SHARED=YES parameters, or specify a library name which does not exist, in which case, the library will be created. You can also not specify the LIBRARY parameter, a library name will be created.

ANR8930W An attempt to define *drives to create* drives failed for library *library name*. The device class has a mount limit of *mount limit* but the number of drives in the associated library is less than the mount limit.

Explanation: When a shared device class is created or updated, an attempt is made to define additional file drives in the associated library up to the mount limit, if the number of drives is less than the mount limit. One or more failures occurred in defining additional drives. The number of drives does not correspond to the mount limit for the associated device class. This can cause resource balancing problems between the server and storage agents.

System action: The server continues operation.

User response: Use the QUERY DRIVE command to get the names of the drives associated with the library. Use the QUERY DEVCLASS deviceclass F=D command to find the mount limit of the associated device class. Use the DEFINE DRIVE command along with the

DEFINE PATH command for this new drive with DEVICE=FILE to define additional drives in the file library to match the mountlimit of the associated device class.

ANR8931W An attempt to delete *drives to delete* drives failed for library *library name*. The device class has a mount limit of *mount limit* but the number of drives in the associated library is greater than the mount limit.

Explanation: When a shared device class is updated and the number of drives in the associated library is greater than the mount limit of the device class, an attempt is made to delete drives so that there are as many drives as the mount limit. One or more failures occurred in deleting drives. The number of drives does not correspond to the mount limit for the associated device class. This can cause resource balancing problems between the server and storage agents.

System action: The server continues operation.

User response: Use the QUERY DRIVE command to get the names of the drives associated with the library. Use the QUERY DEVCLASS deviceclass F=D command to find the mount limit of the associated device class. Use the DELETE DRIVE command to delete drives until the number of drives in the library corresponds to the device class's mount limit.

ANR8932W The drive map for server *servername*, library *library name*, drive name *drive name* has directory *directory* which is different than other drive maps for drives within the same library.

Explanation: A shared file was about to be created. In doing so, it was determined that there are differing definitions for the directories associated with the drive maps between the indicated drive map and other drive maps for drives in the same library. This could cause data to be written in unanticipated locations or may prevent data from being written.

System action: The server continues operation using the indicated directory.

User response: Use the QUERY DRIVEMAP command with the F=D parameter to list the directories associated with drive maps for drives in the indicated library and ensure that the directories are correct and identical. Use the UPDATE DRIVEMAP command to update any incorrect directory entries.

ANR8933W File *volumename* in library *library* does not exist in the expected directory.

Explanation: A FILE volume was being dismounted from a file drive. The file does not exist in the directory in which it was expected to be found.

System action: The server continues operation.

User response: It is possible that a drive mapping is incorrect and that a storage agent is using a valid, but different directory than that of the server. In this case, the storage agent can access the file, but the server cannot. Use the QUERY PATH command with the F=D parameter to list the directories associated with drive maps for drives in the indicated library and ensure that the directories are correct and identical. Use the UPDATE PATH command to update any incorrect directory entries. To move the file into the correct directory, use the Windows move command or the Unix mv command, depending on your platform.

ANR8934W File *volumename* in library *library* associated with device class *device class* could not be inserted into the library inventory.

Explanation: A FILE volume was being inserted into the library inventory. The file was not found in the directory associated with the device class that references the library. However, an entry for the indicated file name is already in the library inventory.

System action: The server continues operation.

User response: It is possible that a drive mapping is incorrect and that a storage agent is using a valid, but different directory than that of the server. In this case, the storage agent can access the file, but the server cannot. Use the QUERY DRIVEMAP command with the F=D parameter to list the directories associated with drive maps for drives in the indicated library and ensure that the directories are correct and identical. Use the UPDATE DRIVEMAP command to update any incorrect directory entries. To move the file into the correct directory, use the Windows move command or the Unix mv command, depending on your platform.

ANR8935E A compatible device class for shared library *library name* on server *server name* was not found.

Explanation: The library client server has a device class definition that is not compatible with the device class definition on this server. The device type and recording format need to be the same on both servers or one of the servers can have a device type of generic tape.

ANR8936W The path conversion of drive *drive name* in library *library name* with device name *device name* failed. UPDATE DRIVE required.

Explanation: During the initialization of a library, the server finds that the drive path was removed.

System action: The drive will not be accessible by the library during tape operations.

User response: The drive may be made accessible by issuing the UPDATE DRIVE command with the DEVICE= option.

ANR8937W The device name for drive *drive name* in library *library name* is missing. UPDATE DRIVE required.

Explanation: The device name for a drive was found to be missing.

System action: The drive will not be accessible by the server for tape operations.

User response: The drive may be made accessible by issuing the UPDATE DRIVE command with the DEVICE= option.

ANR8938E Initialization failed for Shared library *library name*; will retry within *delay time* minute(s).

Explanation: The initialization process for the given library has failed. It will be retried automatically in the specified time.

System action: The initialization will be retried later.

User response: Ensure that the library manager server is running, and the library is initialized.

ANR8939E The adapter for tape drive *drive name* cannot handle the block size needed to use the volume.

Explanation: The adapter cannot read and write the block size need for the volume because the MAXIMUMSGLIST parameter of the adapter is set to less than hex 41.

System action: The volume will not be mounted in the drive.

User response: The adapter must be updated to handle a larger block size. The setting is usually MAXIMUMSGLIST in the Windows registry under:

```
HKEY_LOCAL_MACHINE->SYSTEM->Current Control
Set->Services->{vendor device name}->Parameters-
>Device
```

Note that "{vendor device name}" should be substituted with the name of the vendors device. For example, the Qlogic 2200 would use "QI2200" for the respective vendor device name.

MAXIMUMSGLIST should be set to hex 41 to work properly with Tivoli Storage Manager.

You can also run the DSMMAXSG utility to set the MaximumSGList value to 0x41(65) for all HBAs.

For additional information, see the HBA documentation or contact the vendor for the HBA.

For additional questions, contact IBM support.

ANR8940E Path definition for file drive *drive name* in library *library name* for server *server* or storage agent *name* does not have a matching directory in the device class directory attribute for volume *volume name*.

Explanation: A library client or storage agent requested a mount of a file volume in a drive that is contained in a file library but the path definition does not contain a matching directory name. There must be a matching directory in the PATH definition for each drive in a file library and the corresponding directories in the device class associated with the library. The directories in the PATH definition must point to the same storage as those of the device class definition, from the perspective of the specific server or storage agent. The list of directories must have entries for each directory in which file volumes are to be read or written by the specified server or storage agent.

System action: The operation will fail.

User response: Ensure that DIRECTORY attribute of the above path definition contains matching directories for each of the directories in the server's device class definition.

ANR8941W The volume from slot-element *element-address* in drive *drive name* in library *library name* is blank.

Explanation: The volume in the slot is not labeled and is blank.

System action: The volume is skipped, and processing continues with the next available slot. If the volume is checked in, it is removed from the inventory.

User response: Label the volume using LABEL LIBVOL, and check it in using CHECKIN LIBVOL.

ANR8942E Could not move volume *volume name* from slot-element *element-address* to slot-element *element-address*.

Explanation: Could Not move volume from slot to slot.

System action: Move volume operation failed.

User response: None.

ANR8943E Hardware or media error on library *library name* (OP=*internal code*, CC=*internal code*, KEY=*internal code*, ASC=*internal code*, ASCQ=*internal code*, SENSE=*sense data*, Description=*error description*). Refer to Appendix C in the 'Messages' manual for recommended action.

Explanation: A hardware or media error has occurred while operating on the specified library.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the library was identified correctly in the DEFINE PATH command and that the library device is currently powered on and ready. If the library has an access door, make sure it is closed. The library reference manual usually contains tables that explain the values of the KEY, ASC, and ASCQ fields.

ANR8944E Hardware or media error on drive *drive name* with volume *volume name* (OP=*internal code*, Error Number=*internal code*, CC=*internal code*, KEY=*internal code*, ASC=*internal code*, ASCQ=*internal code*, SENSE=*sense data*, Description=*error description*). Refer to Appendix C in the 'Messages' manual for recommended action.

Explanation: A hardware or media error has occurred while operating on the specified drive.

System action: The operation fails.

User response: Ensure that the DEVICE parameter associated with the drive was identified correctly in the DEFINE PATH command and that the drive is currently powered on and ready. The drive reference manual usually contains tables that explain the values of the KEY, ASC, and ASCQ fields.

ANR8945W Scratch volume mount failed *volume name*.

Explanation: Scratch volume mount failed.

System action: Scratch volume mount operation failed.

User response: None.

ANR8946W There were more labels in the vollist than volumes available to label.

Explanation: Label Libvolume command still finishes without error, but the last labels provided were not used. Labeling finished when there were no more volumes available.

System action: All available volumes were labeled, but additional volume names were not utilized from the vollist.

User response: None.

ANR8947W There were less labels in the vollist than volumes available.

Explanation: Label Libvolume command still finishes without error, but volumes are left unlabeled.

System action: Additional volumes were left unlabeled.

User response: None.

ANR8948S Device *device*, volume *volume name* has issued the following **Critical TapeAlert:**
alertmessage

Explanation: The specified device while loaded with the named volume has issued a TapeAlert critical message. This message is a feature of the hardware and is from the device, not the TSM server. It is surfaced at the termination of the current operation but is independent of the operation.

System action: The operation may or may not fail, depending on other error indications such as check conditions from the device. The TapeAlert message does not by itself indicate failure. See other messages related to the device or volume in the activity log.

User response: Proper response may be indicated in the text of the TapeAlert. The context of the TapeAlert may need to be determined from other activity log messages in order to follow its recommendations.

ANR8949E Device *device*, volume *volume* has issued the following **Critical TapeAlert:**
alertmessage

Explanation: The specified device regardless loaded or not without the named volume has issued a TapeAlert critical message. This message is a feature of the hardware and is from the host interface, not the TSM server. It is surfaced at the termination of the current operation but is independent of the operation.

System action: The operation will fail. The TapeAlert message does not by itself indicate failure. See other messages related to the device or volume in the activity log.

User response: Proper response may be indicated in the text of the TapeAlert. The context of the TapeAlert may need to be determined from other activity log messages in order to follow its recommendations.

ANR8950W Device *device*, volume *volume* has issued the following **Warning TapeAlert:**
alertmessage

Explanation: The specified device without the volume name has issued a TapeAlert Warning message. This message is a feature of the hardware and is from the device, not the TSM server. It is surfaced at the termination of the current operation but is independent of the operation.

System action: The operation will fail. See other messages related to the device or volume in the activity log.

User response: Proper response may be indicated in the text of the TapeAlert. The context of the TapeAlert may need to be determined from other activity log messages in order to follow its recommendations.

ANR8951I Device *device*, volume *volume* has issued the following **Information TapeAlert:**
alertmessage

Explanation: The specified device while loaded with the named volume has issued a TapeAlert information message. This message is a feature of the hardware and is from the device, not the TSM server. It is surfaced at the termination of the current operation but is independent of the operation.

System action: The operation may or may not fail, depending on other error indications such as check conditions from the device. The TapeAlert message does not by itself indicate failure. See other messages related to the device or volume in the activity log.

User response: Proper response may be indicated in the text of the TapeAlert. The context of the TapeAlert may need to be determined from other activity log messages in order to follow its recommendations.

ANR8952E Library serial number does not match that defined for library name .

Explanation: The serial number defined for the specified library does not match the serial number discovered. The pending operation will fail.

System action: The library is taken offline when the mismatch is discovered. Verify the serial number and the device name for the library against those defined. If they do not match, the definitions for the library are incorrect and need updated. Once the serial number is updated, the library will be brought back online.

User response: Update the serial number or device name for the specified library with the correct values.

ANR8953I Library *library name* with serial number *serial number* is updated with the newly discovered serial number *serial number*.

Explanation: The serial number for the library defined does not match with the serial number discovered. The newly discovered serial number will replace the existing definition for this library since autodetect is on.

System action: The existing serial number for the specified library is replaced by the newly discovered serial number.

User response: None.

ANR8954E Failed to obtain a path for drive *drive name* for library *library name*.

Explanation: An attempt to acquire a path for the drive failed. This most likely means that a path is not defined for this drive.

System action: The operation fails.

User response: Ensure that a path is defined for this

drive. If one is defined, make sure it is defined correctly: correct source and destination type, etc.

ANR8955I Drive *drive name* in library *library name* with serial number *serial number* is updated with the newly discovered serial number *serial number*.

Explanation: The serial number for the drive defined does not match with the serial number discovered. The newly discovered serial number will replace the existing definition for this drive since autodetect is on.

System action:

User response: None.

ANR8956E Serial number defined for library *library name* does not match the discovered serial number.

Explanation: The serial number for the library defined does not match the serial number discovered due to autodetect is set to NO. The pending operation will fail.

System action: A mismatch between the serial number for library and the newly discovered serial number is detected.

User response: Update the serial number for the specified library with the correct values.

ANR8957E Command: The serial number reported by the library did not match the serial number in the library definition.

Explanation: The serial number of the library in the database did not match the serial number of the library found using the device special file specified. UPDATE PATH cannot be used to change libraries, and thus, the new device must have the same serial number as stored in the database unless the serial number in the database is empty.

System action: The command is not processed.

User response: Reissue the command, and specify a valid DEVICE parameter value. If this is a new or different library with a different serial number, a new library and path should be defined with DEFINE LIBRARY and DEFINE PATH.

ANR8958E Command: Autodetect is OFF and the serial number reported by the drive did not match the serial number in the drive definition.

Explanation: An invalid value has been provided for the specified parameter.

System action: The command is not processed.

User response: Reissue the command, and specify a valid parameter value.

ANR8959W Path to the library or the device does not exist.

Explanation: A path to the library or the device does not exist yet.

System action: This may not be an error.

User response: None.

ANR8960I Command: The display of Tape Alerts from SCSI devices is *status*.

Explanation: Whether the status of Tape Alerts from SCSI devices will be display.

System action: The command is processed.

User response: None.

ANR8961E Serial number defined for library *library name* and drive *drive name* is blank and does not match the discovered drive serial number *serial number*.

Explanation: A device has been swapped and we are not able to get the new path.

System action: .

User response: None.

ANR8962E Serial number defined for library *library name* is blank and does not match the discovered library serial number.

Explanation: A device has been swapped and we are not able to get the new path.

System action: .

User response: None.

ANR8963E Unable to find path to match the serial number defined for drive *drive name* in library *library name*.

Explanation: A device may have hardware problems or a device path may have been changed and the TSM server cannot find the new path with the SAN Discovery option set to OFF or PASSIVE. The TSM server cannot get device information when it cannot open the device. Therefore, the TSM server cannot validate the drive serial number to see if this drive with the failed open operation is the same drive as it previously used. The causes of this failed open device may be a bad cable, a bad drive or a bad HBA card. However, if an incorrect drive is used (for example, an incorrect device path) and with the SAN discovery option set to OFF or PASSIVE, the TSM server will not search the SAN environment to get a proper device.

System action: The TSM server may mark this device offline for SAN Discovery option OFF.

User response: Users should check the TSM server option file first. If SAN discovery option is set to OFF or PASSIVE, set it to ON and check for hardware errors on the device. If the SAN discovery option is set to ON, then check the device to see if there is a hardware problem.

ANR8964W Unable to update the path in the database *path source name and drive drive name.*

Explanation: The system is not able to update the path information in the database.

System action: .

User response: None.

ANR8965W The server is unable to obtain the serial number of the SCSI device *device name.*

Explanation: The server cannot detect a device serial number from the HBA API or the device itself, so the server is not able to automatically correct the path for the device.

System action: Server operation continues.

User response: Verify the following:

- The device name in the path definition is correct.
- The correct version of the HBA API is installed to the system.
- The SAN discovery option is set to ON in the options file.

ANR8966E Cannot get device number for the drive *drive name.*

Explanation: The server is unable to obtain the device number for the specified drive. This could occur if an invalid device name is specified for the drive or if there is hardware errors.

System action: The drive is temporarily made offline and is not used for tape operations. The server polls the drive at one-half minute intervals to check if the condition has cleared. Once the drive is accessible again, the drive is brought online.

User response: Determine the reason the drive is inaccessible, such as hardware errors reported in the system logs or an invalid device name was specified for the drive. Render any needed corrections to the drive. The drive will be brought online automatically when the polling process detects that it has become accessible.

ANR8967E Command: The drive serial conflicts with an existing drive in library *library name.*

Explanation: The serial number already exists in the drives in the given library.

System action: The command is not processed.

User response: Specify a valid serial parameter for this drive.

ANR8968E Unable to create path for device *device.*

Explanation: An attempt to contact the drive with a given device name failed. This probably means the device name is incorrect, but this attempt can also fail for other reasons.

System action: Operation failed.

User response: The device parameter is probably not valid. This could be temporary, but not necessarily. If this occurs while upgrading from Tivoli Storage Manager Version 4.1 or previous (where paths were not used), then the drive needs to be deleted, redefined, and a new path needs to be defined with a valid device parameter. If this occurs on a Tivoli Storage Manager server that already has paths (Version 4.2 or higher), then just update the drive to online. The device parameter on the drive path can also be updated before the drive is turned online, if you know the device parameter should be changed.

ANR8969E The owner of volume *Volume name can not be updated to owner Owner name.*

Explanation: A command was issued updating ownership of a volume. The owner of this particular volume can not be changed.

System action: The command is not processed.

User response: None.

ANR8970E Unable to open special file *specialfile for tracing parameter device driver; errno = errno.*

Explanation: The special file created by the device driver for tracing purposes could not be opened by the server. This file should be created when the device driver is configured on the system.

System action: Device driver tracing could not be started.

User response: Make sure that the special file exists and can be accessed by the server. If the device driver has not been completely configured and special files created for all devices, do so. The device driver can also be traced by specifying the name of a library or drive that has been defined to the TSM Server.

ANR8971E Unable to validate directory name *directory name for parameter command*

Explanation: The specified directory name was being used in the indicated command. The server attempted to validate that the directory was accessible so that it could be used in the command definition. The server

was unable to validate that the directory was accessible.

System action: The command fails. The server continues.

User response: Make sure that the directory exists and can be accessed by the server.

ANR8972E *command: Unable to find the element number for drive drive name in library library name.*

Explanation: Because the drive serial number does not match any drive serial number in the serial/element number map reported by the library, the element number cannot be determined.

System action: The command is not processed.

User response: Make sure the serial number entered for the drive is correct if AUTODETECT is not active. If AUTODETECT is active, the drive serial number might be incorrect or the library reported an incorrect serial/element number map. Contact your service representative.

ANR8973E **Reset has failed to break the reservation set by another system for device device name with path path name.**

Explanation: The attempt to reset the device reservation set by another system has failed.

System action: .

User response: If this tape device is a Fibre Channel direct attached device on Windows 2003, please make sure the HBA driver is a StorPort driver by checking the HBA vendor's support web site. The device reset (LUN Reset) on Windows 2003 requires StorPort driver. Otherwise, the device may have to be rebooted to reset the reservation. If not rebooted, this device will not be accessible. If "RESETDrive" keyword for the update library command is set to NO, device reset will not be attempted.

ANR8974I **Found new path for path source name and target name target name old path old path name new path new path name. Path information will be updated remotely.**

Explanation: A new path has been found for the device on the library client or storage agent. Will try to update the path information on the library manager.

System action: .

User response: The path change may be caused by system reboot or cable swap or device addition or removal.

ANR8975I **Found new path for path source name and target name target name old path old path name new path new path name. Path information is updated.**

Explanation: A new path has been found for the device and the path information has been updated.

System action: .

User response: The path change may be caused by system reboot or cable swap or device addition or removal.

ANR8976E **Unable to open special file specialfile for LUN reset with errno = errno.**

Explanation: The special file created by the device driver for LUN reset purposes could not be opened by the server. This file should be created when the device driver is configured on the system

System action: LUN reset could not be started.

User response: Make sure that the special file exists and can be accessed by the server. If the device driver has not been completely configured with special files created for all devices, resolve the device driver configuration.

ANR8977W **The volume loaded into library library name did not have a valid label. Please load a scratch volume with a valid label.**

Explanation: During normal operations a MANUAL library will prompt the user for the desired volume name if the volume does not have a valid label and the AUTOLABEL parameter is turned on. However, the utility mode of DUMPDB cannot prompt the user for a desired volume name.

System action: The server unloads the volume and asks for a new scratch volume with a valid label.

User response: The user needs to insert scratch volumes with valid labels or reissue the DUMPDB command and specify the desired volume name on the command line with the VOLUMENAMES parameter. See the DUMPDB documentation.

ANR8978W **The number of drives in library library name has been increased from original drive count to new drive count Please restart the TSM server to update the configuration;**

Explanation: The number of drives in the library has been increased. The new configuration will be recorded if TSM server is restarted.

System action: .

User response: Number of drives in the library has been increased. The user needs to restart the TSM

server to capture the new configuration.

ANR8979I *Command: Operation for library library name started as process process ID.*

Explanation: A scan library process has been started for the given library. The process is assigned the ID specified in the message.

System action: The server starts a background process to perform the operation in response to the SCAN LIBRARY command entered by an administrator.

User response: To obtain status on the process, issue the QUERY PROCESS command. The process may be canceled with the CANCEL PROCESS command.

ANR8980I *SCAN LIBRARY process for library library name has been canceled.*

Explanation: A background server process that has been working to scan the given library is canceled by the CANCEL PROCESS command.

System action: The server process is ended and server operation continues.

User response: None.

ANR8981I *Scanning for library library name.*

Explanation: In response to a QUERY PROCESS command, this message displays the status for an SCAN LIBRARY process on the server.

System action: Server operation continues.

User response: None. The process may be canceled by an authorized administrator using the CANCEL PROCESS command.

ANR8982E *SCAN LIBRARY process for library library name failed.*

Explanation: The background process for an SCAN LIBRARY command has failed.

System action: The background process ends.

User response: Make sure the library and drive devices associated with this command are powered on and ready, then reissue the command.

ANR8983I *SCAN LIBRARY process for library library name completed successfully.*

Explanation: The background process for an SCAN LIBRARY command has completed successfully.

System action: The library has been scanned.

User response: None.

ANR8984E *The drive drive name in library library name is incapable of performing any drive encryption operations.*

Explanation: The server queried the drive's encryption capability, and the query failed or the query showed that the drive does not have encryption capabilities.

System action: The mount operation fails.

User response: If this message occurs on a scratch mount and drive encryption has not been utilized yet, you can turn drive encryption off by updating the DRIVEENCRYPTION parameter on the device class. Otherwise, verify your hardware configuration. First, verify that all the drives in this logical library support drive encryption. Second, verify that the device driver controlling all of the drives in this library also supports drive encryption. If both the drives and the device driver support drive encryption, call your drive hardware support.

ANR8985E *The drive drive name in library library name is using an encryption method that is incompatible with the current server settings.*

Explanation: The server requires the drive to use various drive encryption methods based on the DRIVEENCRYPTION device class parameter for empty volumes or based on the previous encryption method used for filling volumes. The server is unable to properly handle the volume's encryption key without resolving this conflict.

System action: The mount operation fails.

User response: If this message occurs while mounting an empty volume the encryption method setup in your hardware environment is incompatible with the DRIVEENCRYPTION setting in your device class. Either update the device class or your hardware's encryption method such that these setting no longer conflict. If this message occurs while mounting a filling volume, either update your hardware configuration to the same method used while originally backing up this volume, which can be determined by the QUERY VOLUME FORMAT=DETAIL command, or update this volume's access to UNAVAILABLE.

ANR8986E *The server currently doesn't allow AES encryption which is required for drive encryption support with the DRIVEENCRYPTION=ON parameter on the device class.*

Explanation: Without AES encryption support the server cannot generate adequately strong enough encryption keys for drive encryption.

System action: The mount operation fails.

User response: Update the DRIVEENCRYPTION

ANR8987W • ANR9580W (Linux)

parameter on the device class to a value other than ON.

ANR8987W The server will not encrypt the volume *volume name*.

Explanation: Drive encryption with the device class parameter setting of DRIVEENCRYPTION=ON will only encrypt storage pool volumes. Thus, backupsets, DB backups, and export volumes will not be encrypted.

System action: The mount continues, but encryption is not used.

User response: If encryption is needed for this volume or other backupsets, DB backups, or export volumes, use a different method of encryption: use a device class parameter of DRIVEENCRYPTION=ALLOW and a hardware method of 'Library' or 'System' (do not use the 'Application' method).

ANR8988E Library *Library Name* failed to relabel volume *Volume Name* after it returned to scratch.

Explanation: The RELABELSCRATCH option is enabled, and while attempting to relabel the volume the operation failed.

System action: None.

User response: Verify the volume is still checked into the library with the QUERY LIBVOL command. If it is not checked in, use LABEL LIBVOL or CHECKIN LIBVOL to check the volume back into the library.

ANR8989E Unable to establish a communication session with the primary library manager.

Explanation: The requested operation required that a communication session be established with a library manager. The library manager was found to be unavailable at this time.

System action: None.

User response: Verify the primary library manager is up and operational. Once the server is verified to be operational, retry the operation.

ANR9579W (HP-UX) *Command:* Unable to locate file *file name*.

Explanation: The specified file cannot be found. Note: PREPARE assumes that the volume formatting program (dsmfmt) is located in the same directory as the server executable file.

System action: PREPARE uses the following default file names in the plan file:

- For the server executable the default is /opt/tivoli/tsm/server/bin/dsmserv.

- For the volume formatting program the default is /opt/tivoli/tsm/server/bin/dsmfmt.

User response: Determine why file does not exist; create if necessary.

ANR9579W (Linux) *command:* Unable to locate file *file name*.

Explanation: The specified file cannot be found. Note: PREPARE assumes that the volume formatting program (dsmfmt) is located in the same directory as the server executable file.

System action: PREPARE uses the following default file names in the plan file:

- For the server executable the default is /opt/IBMdsm-s/bin/dsmserv.
- For the volume formatting program the default is /opt/IBMdsm-s/bin/dsmfmt.

User response: Determine why file does not exist; create if necessary.

ANR9579W (Solaris) *Command:* Unable to locate file *file name*.

Explanation: The specified file cannot be found. Note: PREPARE assumes that the volume formatting program (dsmfmt) is located in the same directory as the server executable file.

System action: PREPARE uses the following default file names in the plan file:

- For the server executable the default is /opt/tivoli/tsm/server/bin/dsmserv.
- For the volume formatting program the default is /opt/tivoli/tsm/server/bin/dsmfmt.

User response: Determine why file does not exist; create if necessary.

ANR9580W (Linux) *Command:* Generated replacement volume name *volume name* may not be a valid raw partition name. Original volume name: *volume name*. Stanza is *stanza name*.

Explanation: Appending the replacement volume name postfix to the original volume name has created a name that may not be a valid raw partition name.

System action: Replacement volume name is used in the recovery plan stanza.

User response: Manually update the generated recovery plan stanza with a legal replacement name. The replacement name can be another raw partition name or a regular file name.

ANR9580W (Solaris) *Command: Generated replacement volume name *volume name* may not be a valid raw partition name. Original volume name:*volume name*. Stanza is *stanza name*.*

Explanation: Appending the replacement volume name postfix to the original volume name has created a name that may not be a valid raw partition name.

System action: Replacement volume name is used in the recovery plan stanza.

User response: Manually update the generated recovery plan stanza with a legal replacement name. The replacement name can be another raw partition name or a regular file name.

ANR9581W (HP-UX) *Command: Volume file name not found while building stanza recovery plan stanza name.*

Explanation: This volume is defined to the server but does not exist. The device class associated with the volume is DISK or the device class device type is FILE.

System action: The entry for the volume is not included in the recovery plan stanza.

User response: Determine why file does not exist; create if necessary.

ANR9581W (Linux) *command: Volume file name not found while building stanza recovery plan stanza name.*

Explanation: This volume is defined to the server but does not exist. The device class associated with the volume is DISK or the device class device type is FILE.

System action: The entry for the volume is not included in the recovery plan stanza.

User response: Determine why file does not exist; create if necessary.

ANR9581W (Solaris) *Command: Volume file name not found while building stanza recovery plan stanza name.*

Explanation: This volume is defined to the server but does not exist. The device class associated with the volume is DISK or the device class device type is FILE.

System action: The entry for the volume is not included in the recovery plan stanza.

User response: Determine why file does not exist; create if necessary.

ANR9582E (HP-UX) *Command: Generated file name too long. Length of directory or prefix 'prefix' plus 'name' exceeds maximum characters characters.*

Explanation: The file name generated is too long. The maximum valid length is shown in the message.

System action: The recovery plan file was not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9582E (Linux) *command: Generated file name too long. Length of directory or prefix 'prefix' plus 'name' exceeds maximum characters characters.*

Explanation: The file name generated is too long. The maximum valid length is shown in the message.

System action: The recovery plan file was not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9582E (Solaris) *Command: Generated file name too long. Length of directory or prefix 'prefix' plus 'name' exceeds maximum characters characters.*

Explanation: The file name generated is too long. The maximum valid length is shown in the message.

System action: The recovery plan file was not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9583E (HP-UX) *Command: Cannot generate fully qualified file name for 'name'.*

Explanation: A failure occurred expanding the specified file name.

System action: Recovery plan file not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

ANR9583E (Linux) • ANR9586E (Solaris)

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9583E (Linux) *command: Cannot generate fully qualified file name for 'name'.*

Explanation: A failure occurred expanding the specified file name.

System action: Recovery plan file not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9583E (Solaris) *Command: Cannot generate fully qualified file name for 'name'.*

Explanation: A failure occurred expanding the specified file name.

System action: Recovery plan file not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9584E (HP-UX) *command: Cannot generate server options file name.*

Explanation: A failure occurred generating the server options file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9584E (Linux) *command: Cannot generate server options file name.*

Explanation: A failure occurred generating the server options file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9584E (Solaris) *Command: Cannot generate server options file name.*

Explanation: A failure occurred generating the server options file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9585E (HP-UX) *Command: Cannot generate a volume history file name.*

Explanation: A failure occurred generating the volume history file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9585E (Linux) *command: Cannot generate a volume history file name.*

Explanation: A failure occurred generating the volume history file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9585E (Solaris) *Command: Cannot generate a volume history file name.*

Explanation: A failure occurred generating the volume history file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9586E (HP-UX) *Command: Cannot generate a device configuration file name.*

Explanation: A failure occurred generating the device configuration file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9586E (Linux) *command: Cannot generate a device configuration file name.*

Explanation: A failure occurred generating the device configuration file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9586E (Solaris) *Command: Cannot generate a device configuration file name.*

Explanation: A failure occurred generating the device configuration file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9600E (AIX) Invalid information passed to NETLS license interface.

Explanation: The server licensing functions encountered an internal error in accessing license information for the server storage capacity and number of registered clients.

System action: Server operation continues. New licensing information is not used by the server.

User response: Contact your service representative for assistance in resolving the error.

ANR9600E (Solaris) Failed to allocate memory for shared memory communications. Error: error text.

Explanation: An error has occurred when attempting to get memory for the shared communications option.

System action: Shared memory communications will not be activated.

User response: The maximum shared memory is, most likely, too small. To increase on SUN, update `"/etc/system"` with `"set shmsys:shminfo_shmmax=268435456"` (a recommended size).

ANR9601E (AIX) The NETLS license interface was not initialized properly.

Explanation: The server licensing functions encountered an internal error in accessing license information for the server storage capacity and number of registered clients.

System action: Server operation continues. New licensing information is not used by the server.

User response: Contact your service representative for assistance in resolving the error.

ANR9601E (Solaris) Failed to allocate message queue for the shared memory communications Error: error text.

Explanation: An error has occurred when attempting to get memory for the shared communications option.

System action: Shared memory communications will not be activated.

User response: If the error given is `"ENOSPC"`, the maximum number of system message queue have likely been exceeded. update `"/etc/system"` with `"set shmsys:msginfo_msgmni=100"`. Any other error suggests an internal problem and should be reported.

ANR9602E (AIX) Invalid JOB information passed to the NETLS Interface.

Explanation: The server licensing functions encountered an internal error in accessing license information for the server storage capacity and number of registered clients.

System action: Server operation continues. New licensing information is not used by the server.

User response: Contact your service representative for assistance in resolving the error.

ANR9602E (Solaris) Error *errno* while attaching memory segment for shared memory communications.

Explanation: An error occurred while attempting to attach a shared memory segment for a shared communications session.

System action: The shared memory communications session does not initialize.

User response: Check the SUN documentation for the `shmat` subroutine and determine what the `errno` indicates, and take the appropriate action to correct the error.

ANR9603E (AIX) The NETLS Nodelock file could not be created.

Explanation: The server was not able to create the file `/usr/lib/netls/conf/nodelock` which is used for storing license password information.

System action: Server operation continues. New licensing information is not used by the server.

User response: If the server is not running with root authority, make sure that directory authorities in the `/usr/lib/netls/conf` path are set so that the user ID under which the server is running can create, read, and write to the `/usr/lib/netls/conf/nodelock` file. If the server is running with root authority, contact your service representative for assistance in resolving this problem.

ANR9604E (AIX) The NETLS license interface encountered an internal error.

Explanation: The server licensing functions encountered an internal error in accessing license information for the server storage capacity and number of registered clients.

System action: Server operation continues. New licensing information is not used by the server.

User response: Contact your service representative for assistance in resolving the error.

ANR9605E (AIX) • ANR9611E (AIX)

ANR9605E (AIX) An invalid vendor ID was passed to NETLS.

Explanation: The server licensing functions encountered an internal error in accessing license information for the server storage capacity and number of registered clients.

System action: Server operation continues. New licensing information is not used by the server.

User response: Contact your service representative for assistance in resolving the error.

ANR9606E (AIX) NETLS failed to find socket families to contact a server.

Explanation: The server licensing functions encountered an internal error in accessing license information for the server storage capacity and number of registered clients.

System action: Server operation continues. New licensing information is not used by the server.

User response: Contact your service representative for assistance in resolving the error.

ANR9607E (AIX) No NETLS Servers found.

Explanation: The server licensing functions encountered an internal error in accessing license information for the server storage capacity and number of registered clients.

System action: Server operation continues. New licensing information is not used by the server.

User response: Contact your service representative for assistance in resolving the error.

ANR9608E (AIX) A NETLS Security Breach was encountered.

Explanation: The server licensing functions encountered an internal error in accessing license information for the server storage capacity and number of registered clients.

System action: Server operation continues. New licensing information is not used by the server.

User response: Contact your service representative for assistance in resolving the error.

ANR9609E (AIX) Incorrect license entered: Password entered = *password* Annotation entered = *annotation*.

Explanation: The license information entered for a REGISTER LICENSE command is not correct.

System action: None.

User response: Register the license again with the

REGISTER LICENSE command. Be sure to correctly enter the license information.

ANR9610E (AIX) Unable to create directory: *directory*.

Explanation: The REGISTER LICENSE command is unable to either create or verify the specified directory structure.

System action: None.

User response: If the server is not running with root authority, make sure that directory authorities in the /usr/lib/netls/conf path are set so that the user ID under which the server is running can create, read, and write to the /usr/lib/netls/conf/nodelock file. If the server is running with root authority, contact your service representative for assistance in resolving this problem.

ANR9610E (Linux) Unable to create directory: *directory*.

Explanation: The REGISTER LICENSE command is unable to either create or verify the specified directory structure.

System action: None.

User response: If the server is not running with root authority, make sure that directory authorities in the given directory path are set so that the user under which the server is running can create, read, and write to the server's license file. If the server is running with root authority, contact your service representative for assistance in resolving this problem.

ANR9610E (Solaris) Unable to create directory: *directory*.

Explanation: The REGISTER LICENSE command is unable to either create or verify the specified directory structure.

System action: None.

User response: If the server is not running with root authority, make sure that directory authorities in the given directory path are set so that the user under which the server is running can create, read, and write to the server's license file. If the server is running with root authority, contact your service representative for assistance in resolving this problem.

ANR9611E (AIX) Unable to open NODELOCK file: *file*.

Explanation: The REGISTER LICENSE command is unable to either create or open the nodelock file.

System action: None.

User response: If the server is not running with root authority, make sure that directory authorities in the

`/usr/lib/netls/conf` path are set so that the user ID under which the server is running can create, read, and write to the `/usr/lib/netls/conf/nodelock` file. If the server is running with root authority, contact your service representative for assistance in resolving this problem.

ANR9612E (AIX) Error writing to NODELOCK file.

Explanation: The REGISTER LICENSE command fails writing to the nodelock file.

System action: None.

User response: If the server is not running with root authority, make sure that directory authorities in the `/usr/lib/netls/conf` path are set so that the user ID under which the server is running can create, read, and write to the `/usr/lib/netls/conf/nodelock` file. If the server is running with root authority, contact your service representative for assistance in resolving this problem.

ANR9613W (AIX) Error loading *modname* for Licensing function: *error string*.

Explanation: The server cannot load file module *modname* to initialize licensing functions due to error *error string*.

System action: Server operation continues. Default licensing values are in effect for running the server.

User response: The `dsmreg.lic` module is accessed as part of the load process for licensing. It should be in the same directory as the `dsmserv` executable or it must be in a directory that is pointed to by the `DSMSERV_DIR` environment variable. The `dsmreg.lic` module is only installed when you purchase the product.

ANR9613W (HP-UX) Error loading *modname* for Licensing function: *error string*.

Explanation: The server cannot load file module *modname* to initialize licensing functions due to error *error string*.

System action: Server operation continues. Default licensing values are in effect for running the server.

User response: The `dsmreg.lic` module is accessed as part of the load process for licensing. It should be in the same directory as the `dsmserv` executable or it must be in a directory that is pointed to by the `DSMSERV_DIR` environment variable. The `dsmreg.lic` module is only installed when you purchase the product.

ANR9613W (Linux) Error loading *modname* for Licensing function.

Explanation: The server cannot load file module *modname* to initialize licensing functions.

System action: Server operation continues. Default licensing values are in effect for running the server.

User response: `dsmreg.lic` is accessed as part of the load process for licensing. It should be in the same directory as the `dsmserv` executable file or it must be in a directory that is pointed to by the `DSMSERV_DIR` environment variable. The `dsmreg.lic` module is only installed when you purchase the product.

ANR9613W (Solaris) Error loading *modname* for Licensing function: *error string*.

Explanation: The server cannot load file module *modname* to initialize licensing functions due to error *error string*.

System action: Server operation continues. Default licensing values are in effect for running the server.

User response: `dsmreg.lic` is accessed as part of the load process for licensing. It should be in the same directory as the `dsmserv` executable file or it must be in a directory that is pointed to by the `DSMSERV_DIR` environment variable. The `dsmreg.lic` module is only installed when you purchase the product.

ANR9614E (AIX) Unable to open license file: *file*.

Explanation: The REGISTER LICENSE command is unable to create or open the server license file.

System action: None.

User response: Make sure that the user ID under which the server is running has the authority required to create or write, or both, to the license file in the directory in which the server is running. If this does not resolve the problem, contact your service representative for assistance.

ANR9614E (Linux) Unable to open license file: *file*.

Explanation: The REGISTER LICENSE command is unable to either create or open the server license file.

System action: None.

User response: Make sure that the user ID under which the server is running has the authority required to create or write, or both, to the license file in the directory in which the server is running. If this does not resolve the problem, contact your service representative for assistance.

ANR9614E (Solaris) Unable to open license file: *file*.

Explanation: The REGISTER LICENSE command is unable to either create or open the server license file.

System action: None.

User response: Make sure that the user ID under which the server is running has the authority required to create or write, or both, to the license file in the directory in which the server is running. If this does not resolve the problem, contact your service representative for assistance.

ANR9615E (AIX) Error writing to admserv.licenses file.

Explanation: The REGISTER LICENSE command fails writing to the server license file.

System action: None.

User response: Make sure that the user ID under which the server is running has the authority required to create or write, or both, to the license file in the directory in which the server is running. Also, ensure that free space is available in the file system so that the license information can be written to the file. If this does not resolve the problem, contact your service representative for assistance.

ANR9615E (Linux) Error writing to admserv.licenses file.

Explanation: The REGISTER LICENSE command fails writing to the server license file.

System action: None.

User response: Make sure that the userid under which the server is running has the authority required to create and/or write to the license file in the directory in which the server is running. Also ensure that there is free space available in the filesystem so that the license information can be written to the file. If this does not resolve the problem contact your service representative for assistance.

ANR9615E (Solaris) Error writing to admserv.licenses file.

Explanation: The REGISTER LICENSE command fails writing to the server license file.

System action: None.

User response: Make sure that the userid under which the server is running has the authority required to create and/or write to the license file in the directory in which the server is running. Also ensure that there is free space available in the filesystem so that the license information can be written to the file. If this does not resolve the problem contact your service representative for assistance.

ANR9616I (AIX) Invalid license record *record value* found in license file - it will be skipped.

Explanation: The license manager found an invalid record in the server license file (admserv.licenses). The record is ignored.

System action: The invalid record is ignored.

User response: Erase the admserv.licenses file and reregister your licenses.

ANR9616W (Linux) Invalid license record *record value* found in license file - it will be ignored.

Explanation: The license manager found an invalid record in the server license file (admserv.licenses). The record is ignored.

System action: The invalid record is ignored.

User response: Erase the admserv.licenses file and reregister your licenses. Refer to the licenses provided to you to ensure that only valid licenses are specified with the REGISTER LICENSE command.

ANR9616W (Solaris) Invalid license record *record value* found in license file - it will be ignored.

Explanation: The license manager found an invalid record in the server license file (admserv.licenses). The record is ignored.

System action: The invalid record is ignored.

User response: Erase the admserv.licenses file and reregister your licenses. Refer to the licenses provided to you to ensure that only valid licenses are specified with the REGISTER LICENSE command.

ANR9617I (AIX) Invalid license authorization: *authorization string*.

Explanation: The license authorization specified for a REGISTER LICENSE command is not valid.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: Examine the license authorization string that was entered with the REGISTER LICENSE command. Reenter the command if the license authorization was not specified correctly. If the license authorization has been specified correctly, contact your service representative.

ANR9617W (Linux) Invalid license authorization:
authorization string.

Explanation: The license authorization specified for a REGISTER LICENSE command is not valid.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: Examine the license authorization that was entered using the REGISTER LICENSE command. Reenter the command if the license authorization was not specified correctly. If the license authorization has been specified correctly, contact your service representative.

ANR9617W (Solaris) Invalid license authorization:
authorization string.

Explanation: The license authorization specified for a REGISTER LICENSE command is not valid.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: Examine the license authorization that was entered using the REGISTER LICENSE command. Reenter the command if the license authorization was not specified correctly. If the license authorization has been specified correctly, contact your service representative.

ANR9618E (AIX) License registration is not supported on this server.

Explanation: The REGISTER LICENSE command fails because the license authorization module cannot be found.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: The license authorization file is required for formal licensing for the AIX/6000 server. The file is delivered when the product is purchased, but it is not available in the product service stream or with demonstration copies of the server. If you have purchased the server, contact your service representative for assistance in resolving this problem.

ANR9618E (Linux) License registration is not supported on this server.

Explanation: The REGISTER LICENSE command failed because the license authorization module could not be found.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: The license authorization file is required for formal licensing for the server. The file is delivered when the product is purchased, but is not available in the product service stream or with demonstration copies of the server. If you have purchased the server, please contact your service representative for assistance in resolving this problem.

ANR9618E (Solaris) License registration is not supported on this server.

Explanation: The REGISTER LICENSE command failed because the license authorization module could not be found.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: The license authorization file is required for formal licensing for the server. The file is delivered when the server is purchased, but is not available in the product service stream or with demonstration copies of the server. If you have purchased the server, please contact your service representative for assistance in resolving this problem.

ANR9622I (AIX) An EVALUATION LICENSE for support of Tivoli Space Management will expire on *expiration date*.

Explanation: The AIX/6000 server is distributed with an evaluation license for Tivoli Space Management support. If no formal license is found for the server and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

System action: The Tivoli Space Management license allows clients to utilize the server for storing files migrated during space management. The server checks this license when files are migrated to the server from client nodes to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server will not support Tivoli Space Management after the expiration date shown.

ANR9623I (AIX) An EVALUATION LICENSE for support of Tivoli Disaster Recovery Manager will expire on *expiration date*.

Explanation: The AIX/6000 server is distributed with an evaluation license for Tivoli Disaster Recovery Manager support. If no formal license is found for the server and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

ANR9624E (AIX) • ANR9624I (Windows)

System action: The Tivoli Disaster Recovery Manager license allows customers to store information in the server regarding machines and recovery media, allows management of offsite recovery media, collects and stores information in the server for server recovery and allows data base and storage pool backups to a device class of type server. The server checks this license when machines or recovery media are defined to the server, when PREPARE or MOVE DRMMEDIA are invoked and when a data base backup or storage pool backup to a device class of type server are performed to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server will not support Tivoli Disaster Recovery Manager after the expiration date shown.

ANR9624E (AIX) Unexpected error encountered in iFor/LS (SystemView License Use Management) routine *license interface name status=xreported status code.*

Explanation: The server encountered an unexpected error in accessing the SystemView® License Use Management function specified.

System action: The server license monitoring operation fails

User response: The SystemView License Use Management product is installed during normal AIX server installation. Check to make sure that server was installed correctly. If the installation was successful, re-boot your AIX system and re-start the server. If this message continues to be issued, contact your service representative.

ANR9624I (HP-UX) An EVALUATION LICENSE for support of Tivoli Space Management will expire on *expiration date.*

Explanation: The server is distributed with an evaluation license for Tivoli Space Management support. If no formal license is found for the server and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

System action: The Tivoli Space Management license allows clients to utilize the server for storing files migrated during space management. The server checks this license when files are migrated to the server from client nodes to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server

will not support Tivoli Space Management after the expiration date shown.

ANR9624I (Linux) An EVALUATION LICENSE for support of Tivoli Space Management will expire on *expiration date.*

Explanation: The server is distributed with an evaluation license for Tivoli Space Management support. If no formal license is found for the server and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

System action: The Tivoli Space Management license allows clients to utilize the server for storing files migrated during space management. The server checks this license when files are migrated to the server from client nodes to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server will not support Tivoli Space Management after the expiration date shown.

ANR9624I (Solaris) An EVALUATION LICENSE for support of Tivoli Space Management will expire on *expiration date.*

Explanation: The server is distributed with an evaluation license for Tivoli Space Management support. If no formal license is found for the server and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

System action: The Tivoli Space Management license allows clients to utilize the server for storing files migrated during space management. The server checks this license when files are migrated to the server from client nodes to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server will not support Tivoli Space Management after the expiration date shown.

ANR9624I (Windows) An EVALUATION LICENSE for support of Tivoli Space Management will expire on *expiration date.*

Explanation: The server is distributed with an evaluation license for Tivoli Space Management support. If no formal license is found for the server and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

System action: The Tivoli Space Management license allows clients to utilize the server for storing files migrated during space management. The server checks this license when files are migrated to the server from client nodes to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server will not support Tivoli Space Management after the expiration date shown.

ANR9625E (AIX) Could not open file *file name*.

Explanation: The server could not open the license certificate file specified.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9625I (HP-UX) An EVALUATION LICENSE for support of Tivoli Disaster Recovery Manager will expire on *expiration date*.

Explanation: The server is distributed with an evaluation license for Tivoli Disaster Recovery Manager support. If no formal license is found for the server and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

System action: The Tivoli Disaster Recovery Manager license allows customers to store information in the server regarding machines and recovery media, allows management of offsite recovery media, collects and stores information in the server for server recovery and allows data base and storage pool backups to a device class of type server. The server checks this license when machines or recovery media are defined to the server, when PREPARE or MOVE DRMMEDIA are invoked and when a data base backup or storage pool backup to a device class of type server are performed to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server will not support Tivoli Disaster Recovery Manager after the expiration date shown.

ANR9625I (Linux) An EVALUATION LICENSE for support of Tivoli Disaster Recovery Manager will expire on *expiration date*.

Explanation: The server is distributed with an evaluation license for Tivoli Disaster Recovery Manager support. If no formal license is found for the server, and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

System action: The Tivoli Disaster Recovery Manager license allows customers to store information in the server regarding machines and recovery media, allows management of offsite recovery media, collects and stores information in the server for server recovery, and allows data base and storage pool backups to a device class of type server. The server checks this license when machines or recovery media are defined to the server, when PREPARE or MOVE DRMMEDIA are invoked, and when a data base backup or storage pool backup to a device class of type server are performed to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server will not support Tivoli Disaster Recovery Manager after the expiration date shown.

ANR9625I (Solaris) An EVALUATION LICENSE for support of Tivoli Disaster Recovery Manager will expire on *expiration date*.

Explanation: The server is distributed with an evaluation license for Tivoli Disaster Recovery Manager support. If no formal license is found for the server and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

System action: The Tivoli Disaster Recovery Manager license allows customers to store information in the server regarding machines and recovery media, allows management of offsite recovery media, collects and stores information in the server for server recovery and allows data base and storage pool backups to a device class of type server. The server checks this license when machines or recovery media are defined to the server, when PREPARE or MOVE DRMMEDIA are invoked and when a data base backup or storage pool backup to a device class of type server are performed to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server will not support Tivoli Disaster Recovery Manager after the expiration date shown.

ANR9625I (Windows) An EVALUATION LICENSE for support of Tivoli Disaster Recovery Manager will expire on *expiration date*.

Explanation: The server is distributed with an evaluation license for Tivoli Disaster Recovery Manager support. If no formal license is found for the server and the evaluation period has not lapsed, this message is displayed each time the server checks the server license terms.

System action: The Tivoli Disaster Recovery Manager license allows customers to store information in the server regarding machines and recovery media, allows management of offsite recovery media, collects and stores information in the server for server recovery and allows data base and storage pool backups to a device class of type server. The server checks this license when machines or recovery media are defined to the server, when PREPARE or MOVE DRMMEDIA are invoked and when a data base backup or storage pool backup to a device class of type server are performed to ensure that the server is licensed to perform this function.

User response: If you are interested in using the server, contact your service representative to obtain formal licenses for the server before the evaluation period has elapsed. Without formal licenses, the server will not support Tivoli Disaster Recovery Manager after the expiration date shown.

ANR9626E (AIX) Invalid license certificate file: *file name*.

Explanation: The specified file does not contain valid license certificate information.

System action: The license registration command ignores the contents of the file.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9627E (AIX) Cannot access node license lock file: *file name*.

Explanation: The server was not able to access the specified file. The node lock file contains licensing information for the server.

System action: The license function fails.

User response: Examine the file specification displayed and ensure that the file attributes will allow the server to access the file. The location of the file is either in the directory from which the server is started, or in the directory specified by the DSMSERV_DIR environment variable. Re-specify the DSMSERV_DIR environment variable if this specification is in error. Also ensure that there is sufficient space on the drive

specified for the file. If the problem persists after these corrections have been made, contact your service representative.

ANR9628E (Windows) Unexpected error encountered in iFor/LS (SystemView License Use Management) routine *license interface name status=xreported status code*.

Explanation: The server encountered an unexpected error in accessing the SystemView License Use Management function specified.

System action: The server license monitoring operation fails

User response: The SystemView License Use Management product is installed during normal server installation. Check to make sure that the product was installed correctly. If the installation was successful, re-boot your system and re-start the server. If this message continues to be issued, contact your service representative.

ANR9629E (Windows) Could not open file *file name*.

Explanation: The server could not open the license certificate file specified.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9630E (Windows) Invalid license certificate file: *file name*.

Explanation: The specified file does not contain valid license certificate information.

System action: The license registration command ignores the contents of the file.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9631E (Windows) Cannot access node license lock file: *file name*.

Explanation: The server was not able to access the specified file. The node lock file contains licensing information for the server.

System action: The license function fails.

User response: Examine the file specification

displayed and ensure that the file attributes will allow the server to access the file. The location of the file is either in the directory from which the server is started, or in the directory specified by the DSMSEV_DIR environment variable. Re-specify the DSMSEV_DIR environment variable if this specification is in error. Also ensure that there is sufficient space on the drive specified for the file. If the problem persists after these corrections have been made, contact your service representative.

ANR9632I (Windows) Cannot load licensing DLL library: *DLL file name* : the server will assume evaluation licensing mode.

Explanation: The server was not able to load the specified dynamic link library.

System action: Server licensing assumes Try and Buy mode with licenses for 180 days.

User response: The named DLL library(ies) are required for the server to support feature licensing. If you are running an evaluation copy of the server, this message should not cause concern and is normal. If the libraries are installed and this message continues to be issued, contact a support representative for assistance.

ANR9634E (AIX) command name: No license certificate files were found with the file name specification specification.

Explanation: The server did not find any license certificate file(s) with the file name specification entered.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. The file name specification indicates the fully qualified file name the server was trying to read. The directory used to locate the license certificate files when no explicit path is provided is determined as follows:

- The directory path pointed by the environmental variable DSMSEV_DIR if this variable is defined
- The current working directory of the server process if the DSMSEV_DIR variable is not defined

If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9634E (HP-UX) command name: No license certificate files were found with the file name specification specification.

Explanation: The server did not find any license certificate file(s) with the file name specification entered.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9634E (Linux) command name: No license certificate files were found with the file name specification specification.

Explanation: The server did not find any license certificate file(s) with the file name specification entered.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9634E (Solaris) command name: No license certificate files were found with the file name specification specification.

Explanation: The server did not find any license certificate file(s) with the file name specification entered.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9634E (Windows) command name: No license certificate files were found with the file name specification specification.

Explanation: The server did not find any license certificate file(s) with the file name specification entered.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9635E (HP-UX) Invalid license certificate file: file name.

Explanation: The specified file does not contain valid license certificate information.

ANR9635E (Linux) • ANR9637E (HP-UX)

System action: The license registration command ignores the contents of the file.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9635E (Linux) Invalid license certificate file: *file name*.

Explanation: The specified file does not contain valid license certificate information.

System action: The license registration command ignores the contents of the file.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9635E (Solaris) Invalid license certificate file: *file name*.

Explanation: The specified file does not contain valid license certificate information.

System action: The license registration command ignores the contents of the file.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9635E (Windows) Invalid license certificate file: *file name*.

Explanation: The specified file does not contain valid license certificate information.

System action: The license registration command ignores the contents of the file.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9636E (HP-UX) Could not open file *file name*.

Explanation: The server could not open the license certificate file specified.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9636E (Linux) Could not open file *file name*.

Explanation: The server could not open the license certificate file specified.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9636E (Solaris) Could not open file *file name*.

Explanation: The server could not open the license certificate file specified.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9636E (Windows) Could not open file *file name*.

Explanation: The server could not open the license certificate file specified.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9637E (HP-UX) Cannot access node license lock file: *file name*.

Explanation: The server was not able to access the specified file. The node lock file contains licensing information for the server.

System action: The license function fails.

User response: Examine the file specification displayed and ensure that the file attributes will allow the server to access the file. The location of the file is either in the directory from which the server is started, or in the directory specified by the DSMSEV_DIR environment variable. Re-specify the DSMSEV_DIR

environment variable if this specification is in error. Also ensure that there is sufficient space on the drive specified for the file. If the problem persists after these corrections have been made, contact your service representative.

ANR9637E (Linux) Cannot access node license lock file: *file name.*

Explanation: The server was not able to access the specified file. The node lock file contains licensing information for the server.

System action: The license function fails.

User response: Examine the file specification displayed and ensure that the file attributes will allow the server to access the file. The location of the file is either in the directory from which the server is started, or in the directory specified by the DSMSE_RV__{DIR} environment variable. Re-specify the DSMSE_RV__{DIR} environment variable if this specification is in error. Also ensure that there is sufficient space on the drive specified for the file. If the problem persists after these corrections have been made, contact your service representative.

ANR9637E (Solaris) Cannot access node license lock file: *file name.*

Explanation: The server was not able to access the specified file. The node lock file contains licensing information for the server.

System action: The license function fails.

User response: Examine the file specification displayed and ensure that the file attributes will allow the server to access the file. The location of the file is either in the directory from which the server is started, or in the directory specified by the DSMSE_RV__{DIR} environment variable. Re-specify the DSMSE_RV__{DIR} environment variable if this specification is in error. Also ensure that there is sufficient space on the drive specified for the file. If the problem persists after these corrections have been made, contact your service representative.

ANR9637E (Windows) Cannot access node license lock file: *file name.*

Explanation: The server was not able to access the specified file. The node lock file contains licensing information for the server.

System action: The license function fails.

User response: Examine the file specification displayed and ensure that the file attributes will allow the server to access the file. The location of the file is either in the directory from which the server is started, or in the directory specified by the DSMSE_RV__{DIR} environment variable. Re-specify the DSMSE_RV__{DIR} environment variable if this specification is in error.

Also ensure that there is sufficient space on the drive specified for the file. If the problem persists after these corrections have been made, contact your service representative.

ANR9638W (HP-UX) License registration is not supported on this server.

Explanation: The REGISTER LICENSE command fails because the license authorization module cannot be found.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: The license authorization file is required for formal licensing for the HP-UX server. The file is delivered when the server is purchased, but it is not available in the product service stream or with demonstration copies of the server. If you have purchased the server, contact your service representative for assistance in resolving this problem.

ANR9638W (Linux) License registration is not supported on this server.

Explanation: The REGISTER LICENSE command fails because the license authorization module cannot be found.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: The license authorization file is required for formal licensing for the server. The file is delivered when the product is purchased, but it is not available in the product service stream or with demonstration copies of the server. If you have purchased the server, contact your service representative for assistance in resolving this problem.

ANR9638W (Solaris) License registration is not supported on this server.

Explanation: The REGISTER LICENSE command fails because the license authorization module cannot be found.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: The license authorization file is required for formal licensing for the Sun Solaris server. The file is delivered when the server is purchased, but it is not available in the product service stream or with demonstration copies of the server. If you have purchased the server, contact your service representative for assistance in resolving this problem.

ANR9638W (Windows) License registration is not supported on this server.

Explanation: The REGISTER LICENSE command fails because the license authorization module cannot be found.

System action: Server operation continues; licensing terms are not changed by the REGISTER LICENSE command.

User response: The license authorization file is required for formal licensing for the Windows server. The file is delivered when the product is purchased, but it is not available in the product service stream or with demonstration copies of the server. If you have purchased the server, contact your service representative for assistance in resolving this problem.

ANR9639W (HP-UX) Unable to load shared library *shared library*.

Explanation: The server module is unable to load the indicated shared library.

System action: Server operation continues, but the function that requires the shared library will be inoperative.

User response: Ensure that the shared library is accessible. If this is an evaluation copy of the server, then this message is normal for the DSMREG library, since the library is only provided with purchased servers. The server licensing will assume "Try and Buy" mode with sample licensed options for a period of time.

ANR9639W (Linux) Unable to load Shared License File *shared library*.

Explanation: The server was unable to load the shared library.

System action: Server operation continues, but functions that require the shared library will be inoperative.

User response: Make sure the shared library is accessible/readable. This message is normal for those servers in the Try-N-Buy mode.

ANR9639W (Solaris) Unable to load Shared License File *shared library*.

Explanation: The server was unable to load the shared library.

System action: Server operation continues, but functions that require the shared library will be inoperative.

User response: Make sure the shared library is accessible/readable. This message is normal for those servers in the Try and Buy mode.

ANR9640E (HP-UX) Unable to load procedure address from shared library *shared library*.

Explanation: The server module is unable to load the address of a routine in the indicated shared library.

System action: Server operation continues, but the function that requires the shared library will be inoperative.

User response: Ensure that the shared library is accessible. If the problem persists, contact your service representative.

ANR9640E (Linux) Unable to load procedure address from shared library *shared library license module*.

Explanation: The server module is unable to load the address of a routine in the indicated shared library for license loading.

System action: Server operation continues, but the function that requires the shared library will be inoperative.

User response: Ensure that the shared library is accessible. If the problem persists, contact your Customer Service Representative.

ANR9640E (Solaris) Unable to load procedure address from shared library *shared library license module*.

Explanation: The server module is unable to load the address of a routine in the indicated shared library for license loading.

System action: Server operation continues, but the function that requires the shared library will be inoperative.

User response: Ensure that the shared library is accessible. If the problem persists, contact your customer service representative.

ANR9641W (HP-UX) One or more EVALUATION LICENSES will expire on *expiration date*.

Explanation: Although you are running with a purchased version of the server, there are one or more licenses registered that will expire on the date specified. This is usually the case when you have been using evaluation licenses prior to purchasing the product.

System action: Server operation continues.

User response: Halt the server and erase the nodelock file in the server startup directory. After restarting the server, use the REGISTER LICENSE command to define the licensed features that you have purchased with your server. These licenses should NOT have an expiration date, so this message should not appear after

re-registering the proper licenses. If this message persists, contact your service representative.

ANR9641W (Linux) One or more EVALUATION LICENSES will expire on *expiration date*.

System action: Server operation continues.

User response: Halt the server and erase the nodelock file in the server startup directory. After restarting the server, use the REGISTER LICENSE command to define the licensed features that you have purchased with your server. These licenses should NOT have an expiration date, so this message should not appear after re-registering the proper licenses. If this message persists, contact your service representative.

ANR9641W (Solaris) One or more EVALUATION LICENSES will expire on *expiration date*.

System action: Server operation continues.

User response: Halt the server and erase the nodelock file in the server startup directory. After restarting the server, use the REGISTER LICENSE command to define the licensed features that you have purchased with your server. These licenses should NOT have an expiration date, so this message should not appear after re-registering the proper licenses. If this message persists, contact your service representative.

ANR9642E (HP-UX) The specified license authorization code (*license authorization code*) **is invalid.**

Explanation: The license authorization code which you entered using the REGISTER LICENSE command is invalid.

System action: No additional licenses are registered. Server operation continues.

User response: Obtain a valid license authorization code and try the command again.

ANR9642E (Linux) The specified license authorization code (*license authorization code*) **is invalid.**

Explanation: The license authorization code which you entered using the REGISTER LICENSE command is invalid.

System action: No additional licenses are registered. Server operation continues.

User response: Obtain a valid license authorization code and try the command again.

ANR9653E (HP-UX) Unexpected error encountered in iFor/LS (SystemView License Use Management) routine *license interface name status=xreported status code*.

Explanation: The server encountered an unexpected error in accessing the SystemView License Use Management function specified.

System action: The server license monitoring operation fails

User response: The SystemView License Use Management product is installed during normal AIX server installation. Check to make sure that server was installed correctly. If the installation was successful, re-boot your AIX system and re-start the server. If this message continues to be issued, contact your service representative.

ANR9653E (Solaris) Unexpected error encountered in iFor/LS (SystemView License Use Management) routine *license interface name status=xreported status code*.

Explanation: The server encountered an unexpected error in accessing the SystemView License Use Management function specified.

System action: The server license monitoring operation fails

User response: The SystemView License Use Management product is installed during normal AIX server installation. Check to make sure that server was installed correctly. If the installation was successful, re-boot your AIX system and re-start the server. If this message continues to be issued, contact your service representative.

ANR9654E (HP-UX) Could not open file *file name*.

Explanation: The server could not open the license certificate file specified.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9654E (Solaris) Could not open file *file name*.

Explanation: The server could not open the license certificate file specified.

System action: The license registration command fails.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an

ANR9655E (HP-UX) • ANR9676E (Linux)

error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9655E (HP-UX) Invalid license certificate file:
file name.

Explanation: The specified file does not contain valid license certificate information.

System action: The license registration command ignores the contents of the file.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9655E (Solaris) Invalid license certificate file:
file name.

Explanation: The specified file does not contain valid license certificate information.

System action: The license registration command ignores the contents of the file.

User response: Examine the file specification entered, including wildcard characters, to determine if it names the license certificate file(s) you intended to use. If an error is found, re-try the command with the corrected specification. If an error cannot be found, contact your service representative.

ANR9656E (HP-UX) Cannot access node license lock file: *file name.*

Explanation: The server was not able to access the specified file. The node lock file contains licensing information for the server.

System action: The license function fails.

User response: Examine the file specification displayed and ensure that the file attributes will allow the server to access the file. The location of the file is either in the directory from which the server is started, or in the directory specified by the DSMSERV_DIR environment variable. Re-specify the DSMSERV_DIR environment variable if this specification is in error. Also ensure that there is sufficient space on the drive specified for the file. If the problem persists after these corrections have been made, contact your service representative.

ANR9656E (Solaris) Cannot access node license lock file: *file name.*

Explanation: The server was not able to access the specified file. The node lock file contains licensing information for the server.

System action: The license function fails.

User response: Examine the file specification displayed and ensure that the file attributes will allow the server to access the file. The location of the file is either in the directory from which the server is started, or in the directory specified by the DSMSERV_DIR environment variable. Re-specify the DSMSERV_DIR environment variable if this specification is in error. Also ensure that there is sufficient space on the drive specified for the file. If the problem persists after these corrections have been made, contact your service representative.

ANR9676E (AIX) Error *errno* attaching memory segment for shared memory communications.

Explanation: An error occurred while attempting to attach a shared memory segment for a shared communications session.

System action: The shared memory communications session does not initialize.

User response: Check the AIX documentation for the shmat subroutine and determine what the error number indicates. On AIX, if the error number is EMFILE, make sure the EXTSHM environment variable is set to ON before starting the server. This allows the server to support more than 3 concurrent shared memory sessions.

ANR9676E (HP-UX) Error *errno* attaching memory segment for shared memory communications.

Explanation: An error occurred while attempting to attach a shared memory segment for a shared communications session.

System action: The shared memory communications session does not initialize.

User response: Check the AIX documentation for the shmat subroutine and determine what the error number indicates. On AIX, if the error number is EMFILE, make sure the EXTSHM environment variable is set to ON before starting the server. This allows the server to support more than 3 concurrent shared memory sessions.

ANR9676E (Linux) Error *errno* attaching memory segment for shared memory communications.

Explanation: An error occurred while attempting to attach a shared memory segment for a shared communications session.

System action: The shared memory communications session does not initialize.

User response: Check the AIX documentation for the

shmat subroutine and determine what the error number indicates. On AIX, if the error number is EMFILE, make sure the EXTSHM environment variable is set to ON before starting the server. This allows the server to support more than 3 concurrent shared memory sessions.

ANR9677E (AIX) Failed to allocate memory for shared memory communications. Error: *error text.*

Explanation: An error has occurred when attempting to get memory for the shared communications option.

System action: Shared memory communications will not be activated.

ANR9677E (HP-UX) Failed to allocate memory for shared memory communications. Error: *error text.*

Explanation: An error has occurred when attempting to get memory for the shared communications option.

System action: Shared memory communications will not be activated.

User response: None.

ANR9677E (Linux) Failed to allocate memory for shared memory communications. Error: *error text.*

Explanation: An error has occurred when attempting to get memory for the shared communications option.

System action: Shared memory communications will not be activated.

User response: None.

ANR9678E (AIX) Failed to allocate message queue for the shared memory communications
Error: *error text.*

Explanation: An error has occurred when attempting to get memory for the shared communications option.

System action: Shared memory communications will not be activated.

ANR9678E (HP-UX) Failed to allocate message queue for the shared memory communications
Error: *error text.*

Explanation: An error has occurred when attempting to get memory for the shared communications option.

System action: Shared memory communications will not be activated.

User response: None.

ANR9678E (Linux) Failed to allocate message queue for the shared memory communications
Error: *error text.*

Explanation: An error has occurred when attempting to get memory for the shared communications option.

System action: Shared memory communications will not be activated.

User response: None.

ANR9678W (Windows) File name used for server executable. A server is currently running as a service.

Explanation: The name of the executable used when the server is running as a service cannot be used in the plan file.

System action: PREPARE uses file name identified in the message within the plan file and generation of the plan file continues.

User response: None.

ANR9679W (AIX) Command: Unable to locate file file name.

Explanation: The specified file cannot be found. Note: PREPARE assumes that the volume formatting program (dsmfmt), is located in the same directory as the server executable file.

System action: PREPARE uses the following default file names in the plan file:

- For the server executable the default is /usr/tivoli/tsm/server/bin/dsmserv.
- For the volume formatting program the default is /usr/tivoli/tsm/server/bin/dsmfmt.

User response: Determine why file does not exist; create if necessary.

ANR9679W (Windows) Command: Unable to locate file file name.

Explanation: The specified file cannot be found.

System action: PREPARE uses the following default file names in the plan file:

- For the server executable the default is c:\progra~1\tivoli\tsm\server\dsm serv.

User response: Determine why file does not exist; create if necessary.

ANR9680W (AIX) Command: Could not obtain AIX logical volume information for volume name while building stanza recovery plan stanza name.

Explanation: This volume is defined to the server but PREPARE can not obtain AIX logical volume

ANR9680W (HP-UX) • ANR9683E (AIX)

information for it from the AIX Object Data Manager (ODM).

System action: The entry for the volume is not included in the recovery plan stanza.

User response: This message should be preceded by another error message which contains the ODM error code.

ANR9680W (HP-UX) *Command: Could not obtain logical volume information for volume name while building stanza recovery plan stanza name.*

Explanation: This volume is defined to the server but PREPARE can not obtain logical volume information for it.

System action: The entry for the volume is not included in the recovery plan stanza.

User response: This message should be preceded by another error message which contains an error code.

ANR9680W (Solaris) *Command: Could not obtain logical volume information for volume name while building stanza recovery plan stanza name.*

Explanation: This volume is defined to the server but PREPARE can not obtain logical volume information for it.

System action: The entry for the volume is not included in the recovery plan stanza.

User response: This message should be preceded by another error message which contains an error code.

ANR9680W (Windows) *Unable to locate path for component in registry.*

Explanation: The path to the component could not be found in the registry.

System action: PREPARE uses the following default path names in the plan file:

- For the components installation directory the default is c:\progra~1\tivoli\tsm\server\
- For the administrative command line client the default is c:\progra~1\tivoli\tsm\baclient\
- For the disk formatting utility the default is c:\progra~1\tivoli\tsm\utils\

User response: Determine why path does not exist; install components if necessary.

ANR9681W (AIX) *Command: Volume file name not found while building stanza recovery plan stanza name.*

Explanation: This volume is defined to the server but does not exist. The device class associated with the

volume is DISK or the device class device type is FILE.

System action: The entry for the volume is not included in the recovery plan stanza.

User response: Determine why the file does not exist; create it if necessary.

ANR9681W (Windows) *Command: Volume file name not found while building stanza recovery plan stanza name.*

Explanation: This volume is defined to the server but does not exist. The device class associated with the volume is DISK or the device class device type is FILE.

System action: The entry for the volume is not included in the recovery plan stanza.

User response: Determine why file does not exist; create if necessary.

ANR9682E (AIX) *Command: Generated file name too long. Length of directory or prefix 'prefix' plus 'name' exceeds maximum characters characters.*

Explanation: The file name generated is too long. The maximum valid length is shown in the message.

System action: The recovery plan file was not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9682E (Windows) *Command: Generated file name too long. Length of directory or prefix 'prefix' plus 'name' exceeds maximum characters characters.*

Explanation: The file name generated is too long. The maximum valid length is shown in the message.

System action: The recovery plan file was not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9683E (AIX) *Command: Cannot generate fully qualified file name for 'name'.*

Explanation: A failure occurred expanding the specified file name.

System action: Recovery plan file not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9683E (Windows) Command: Cannot generate fully qualified file name for 'name'.

Explanation: A failure occurred expanding the specified file name.

System action: Recovery plan file not created.

User response: Reissue the command specifying a valid prefix. The following commands are used to specify the prefix:

- SET DRMPLANPREFIX
- SET DRMINSTRPREFIX
- PREPARE

ANR9684E (AIX) Command: Cannot generate server options file name.

Explanation: A failure occurred generating the server options file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9684E (Windows) Command: Cannot generate server options file name.

Explanation: A failure occurred generating the server options file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9685E (AIX) Command: Cannot generate a volume history file name.

Explanation: A failure occurred generating the volume history file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9685E (Windows) Command: Cannot generate a volume history file name.

Explanation: A failure occurred generating the volume history file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9686E (AIX) Command: Cannot generate a device configuration file name.

Explanation: A failure occurred generating the device configuration file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9686E (Windows) Command: Cannot generate a device configuration file name.

Explanation: A failure occurred generating the device configuration file name.

System action: Recovery plan file not created.

User response: See accompanying messages for more information.

ANR9687W (Windows) Cannot load the Microsoft dll NTMSAPI.DLL. Removable Media Support will not be available.

Explanation: The Microsoft dll NTMSAPI.DLL is required for removable media. It is usually found in the Windows System32 directory but can be removed if the Windows feature called Removable Media is turned off. In Windows 2008, Removable Media is off by default.

System action: Processing continues.

User response: Ignore this message if storing to a drive or turn on the Removable Media feature in Windows.

ANR9710E Insufficient memory to continue operations.

Explanation: There is not enough memory to operate the label utility program.

System action: The program is halted.

User response: Provide more memory for the program to use.

ANR9711E Unrecognized argument 'argument'.

Explanation: The specified argument is not recognized as one that is supported by the label utility program.

System action: The program is halted.

User response: Retry the label utility program with the correct argument syntax.

ANR9712E Argument has invalid value '*argument*'.

Explanation: The value specified for the given argument is not valid.

System action: The program is halted.

User response: Retry the label utility program with the correct argument syntax.

ANR9713E Only one library can be specified.

Explanation: Only one library can be specified in the argument list for the label utility program.

System action: The program is halted.

User response: Retry the label utility program with the correct argument syntax.

ANR9714E No drives were specified.

Explanation: At least one drive must be specified for use by the label utility (DSMLABEL) program.

System action: The program is halted.

User response: Retry the label utility program with the correct argument syntax.

ANR9715E Error starting label activity for drive *drive name*.

Explanation: The label utility is unable to start its activity for the given drive.

System action: The program is halted.

User response: Increase the number of allowed threads or processes in the system, then retry the operation.

ANR9716E Device '*library name*' is not accessible, or is not recognized as a supported library type.

Explanation: The device specified for the library cannot be accessed or is not recognized as a supported device.

System action: The program is halted.

User response: Retry the operation, specifying a valid supported library.

ANR9717E Element address *element address* is not valid for drive '*drive name*'.

Explanation: The specified element address does not represent a valid drive location in the associated library.

System action: The program is halted.

User response: Retry the operation, specifying a valid element address for the drive.

ANR9718E Device '*drive name*' is not recognized as a supported drive type.

Explanation: The device specified for the drive is not recognized as a supported device.

System action: The program is halted.

User response: Retry the operation, specifying a valid supported drive.

ANR9719E Too many drives were specified.

Explanation: The number of drives specified on the command line exceeds the limits of the program.

System action: The program is halted.

User response: Retry the operation, specifying only up to the maximum number of supported drives. The program can be invoked with the -help argument to determine this maximum value.

ANR9720I Volume '*volume name*' was labeled successfully using drive '*drive name*'.

Explanation: The volume is successfully labeled.

System action: The program continues operation.

User response: None.

ANR9721E '*Volume name*' is not a valid volume name.

Explanation: The specified string is not a valid volume name.

System action: The program prompts for a new volume name.

User response: Enter a volume name that is within the length constraints for the media type being labeled, and which contains only alphanumeric characters.

ANR9722I Insert a new volume in drive '*drive name*', then enter the name (1-*maximum length* characters) to be used for its label; or just press ENTER to quit this program:

Explanation: The program prompts for a new volume to be mounted in the given drive so that a label can be written to it.

System action: The program waits for the volume name to be entered.

User response: Mount a new volume, then type a volume name for it and press ENTER; or, if you want to quit the program, press ENTER without entering a volume name.

ANR9723I Insert side A of a new volume in drive '*drive name*', then enter the name (1-maximum length characters) to be used for its label; or just press ENTER to quit this program:

Explanation: The program prompts for a new volume to be mounted in the given drive so that a label can be written to it.

System action: The program waits for the volume name to be entered.

User response: Mount side A of a new volume, then type a volume name for it and press ENTER; or, if you want to quit the program, press ENTER without entering a volume name.

ANR9724I Flip the volume in drive '*drive name*' to side B, then press ENTER.

Explanation: The program prompts for a two-sided volume to be flipped so that its second side can be labeled.

System action: The program waits for the ENTER key to be pressed.

User response: Flip the volume in the drive, and press ENTER.

ANR9725E The volume in drive '*drive name*' is already labeled (*volume name*).

Explanation: The volume in the specified drive cannot be labeled because it already contains a valid label with the given name.

System action: The volume is not labeled.

User response: If an overwrite of the existing label with a new label is desired, restart the DSMLABEL utility program by using the -overwrite argument.

ANR9726E I/O error writing label for volume '*volume name*' in drive '*drive name*'.

Explanation: An I/O error occurs while attempting to write the label for the specified volume in the given drive.

System action: The volume is not labeled.

User response: Ensure that the volume is not write protected, the drive is powered on and ready, and the device parameter has the correct value.

ANR9727E Media fault detected on volume '*volume name*' in drive '*drive name*'.

Explanation: A media fault condition is detected for the specified volume in the given drive.

System action: The volume is not labeled.

User response: Remove the volume from use, since the media is questionable. If the media in question requires formatting, such as an unformatted optical disk, retry the operation by starting the program with the '-format' argument.

ANR9728E Error ejecting volume from drive '*drive name*'.

Explanation: An error occurs while ejecting the volume from the given drive.

System action: All further activity on the given drive is suspended.

User response: Ensure that the drive is in proper operating condition before resuming its use.

ANR9729E I/O error formatting volume '*volume name*' in drive '*drive name*'.

Explanation: An I/O error occurs while attempting to format the media for the specified volume in the given drive.

System action: The volume is not labeled.

User response: Ensure that the volume is not write protected, that the drive is powered on and ready, and that the media is not damaged.

ANR9730I Manual intervention required for library device '*library device name*'.

Explanation: The specified library device requires manual intervention before it can be accessed for normal operations.

System action: The operation will be retried periodically until either the required action is performed or a timeout occurs.

User response: If the library has an access door, make sure it is in the closed position. If it has a cartridge carousel, make sure the carousel is installed.

ANR9731I Insert a new volume into the entry/exit port of library '*library device name*', then enter the name (1-maximum length characters) to be used for its label; or just press ENTER to quit this program:

Explanation: The program prompts for a new volume to be mounted in the entry/exit port of the given library so that a label can be written to it.

System action: The program waits for the volume name to be entered.

User response: Insert a new volume into the entry/exit port, then type a volume name for it and press ENTER; or, if you want to quit the program, press ENTER without entering a volume name.

ANR9732I Insert a new volume in the entry/exit port of library '*library device name*' with side A facing up, then enter the name (1-maximum length characters) to be used for its label; or just press ENTER to quit this program:

Explanation: The program prompts for a new volume to be mounted in the entry/exit port of the given library so that a label can be written to it.

System action: The program waits for the volume name to be entered.

User response: Insert a new volume into the entry/exit port, then type a volume name for it and press ENTER; or, if you want to quit the program, press ENTER without entering a volume name.

ANR9733I Insert a new volume in drive '*drive name*' of library '*library device name*', then enter the name (1-maximum length characters) to be used for its label; or just press ENTER to quit this program:

Explanation: The program prompts for a new volume to be mounted in the given drive so that a label can be written to it.

System action: The program waits for the volume name to be entered.

User response: Mount a new volume, close the library access door, and then type a volume name for it and press ENTER; or, if you want to quit the program, press ENTER without entering a volume name.

ANR9734I Insert side A of a new volume in drive '*drive name*' of library '*library device name*', then enter the name (1-maximum length characters) to be used for its label; or just press ENTER to quit this program:

Explanation: The program prompts for a new volume to be mounted in the given drive so that a label can be written to it.

System action: The program waits for the volume name to be entered.

User response: Mount side A of a new volume, close the library access door, and then type a volume name for it and press ENTER; or, if you want to quit the program, press ENTER without entering a volume name.

ANR9735I Enter the name (1-maximum length characters) for the next volume to label in library '*library device name*'; or just press ENTER to quit this program:

Explanation: The program prompts for the name of the next volume to be labeled in the given library.

System action: The program waits for the volume name to be entered.

User response: Type the name for the next volume to be labeled and then press ENTER; or, if you want to quit the program, press ENTER without entering a volume name.

ANR9736E An I/O error occurred while accessing library device '*library device name*'.

Explanation: An attempted I/O operation for the given library failed.

System action: If the error is noncritical, operation continues; otherwise, the program is halted.

User response: Ensure that the library device is powered on and ready, any access doors are closed, the device parameter has the correct value, and then retry the operation that was in progress when the error occurred.

ANR9737I Remove the volume from drive '*drive name*' in library '*library device name*', then press ENTER.

Explanation: All activity associated with the volume in the given drive is complete, so it should be removed.

System action: The program waits until the ENTER key is pressed.

User response: Remove the volume from the specified drive, then close the library access door and press ENTER.

ANR9738I Remove the volume from the entry/exit port of library '*library device name*', then press ENTER.

Explanation: All activity associated with the volume in the entry/exit port is complete, so it should be removed.

System action: The program waits until the ENTER key is pressed.

User response: Remove the volume from the entry/exit port, and press ENTER.

ANR9739I Initializing library device '*library device name*'.

Explanation: The specified library device is being initialized for use by the labeling utility program.

System action: The library device is prepared for use.

User response: None.

ANR9740E Volume '*volume name*' is not in the INSERT category.

Explanation: The specified volume cannot be labeled because it is not in the library's "insert" category. This restriction is provided as a safeguard against labeling volumes that are in use, and possibly destroying valid data.

System action: The volume is not labeled.

User response: If you are sure the volume contains no valid data, it can be removed from the library and then reinserted with the library's convenience I/O station. This will cause the volume's category code to be changed to the INSERT category, and thus allow the labeling operation to work.

ANR9741E Drives '*drive name*' and '*drive name*' cannot use the same element address.

Explanation: The element addresses specified for the given drives are the same. This is not allowed, since the element address is the only way in which the robot can distinguish between different drives in a SCSI library.

System action: The program is stopped.

User response: Restart the program, providing valid and unique element addresses. Appropriate values can be determined with the worksheets in *Administrator's Guide*.

ANR9742E The element address for drive '*drive name*' is missing or invalid.

Explanation: The element address value for the specified drive is omitted, or an illegal value has been provided.

System action: The program is stopped.

User response: Restart the program, providing a valid element address. Appropriate values can be determined with the worksheets in *Administrator's Guide*.

ANR9743I Attempting to label volume '*volume name*' using drive '*drive name*'...

Explanation: The specified volume is in the process of being labeled in the given drive.

System action: Labeling activity continues.

User response: None.

ANR9744E Volume '*volume name*' is not present in library '*library name*'.

Explanation: The specified volume is not present in the given library, so it cannot be labeled.

System action: Labeling activity continues for other volumes.

User response: Insert the volume into the library, then retry the operation.

ANR9745E Only one trace argument is allowed.

Explanation: More than one trace argument has been encountered, but only one is allowed.

System action: The program is halted.

User response: Retry the program, specifying at most one trace argument.

ANR9746E Unable to open trace file '*file name*'.

Explanation: An error occurs while opening the specified file for writing trace data.

System action: The program is halted.

User response: Retry the program, specifying a valid file name for the trace file.

ANR9747I Unable to write to trace file.

Explanation: An error occurs while writing data to the trace file.

System action: The program continues, but trace data may be lost.

User response: Make sure the disk that contains the trace file is not full or defective and then retry the operation.

ANR9748I Insert a new volume into slot with element number '*slot element address*' of library '*library device name*', then enter the name (1-maximum length characters) to be used for its label; or just press ENTER to quit this program:

Explanation: The program prompts for a new volume to be inserted into the given slot with the specified element number so that a label can be written to it. For the slot and element number diagram of your library, refer to the documentation provided with the current PTF level or refer to the *Administrator's Guide* for your release and platform.

System action: The program waits for the volume name to be entered.

User response: Insert a new volume, close the library access door, type a volume name for it, and press ENTER; or, if you want to quit the program, press ENTER without entering a volume name.

ANR9749I Insert a new volume into slot with element number '*slot element address*' of library '*library device name*' with side A facing up, then enter the name (1-maximum length characters) to be used for its label; or just press ENTER to quit this program:

Explanation: The program prompts for a new volume to be inserted into the slot with the specified element number so that a label can be written to it. For the slot and element number diagram of your library, refer to the documentation provided with the current PTF level or refer to the *Installing the Server and Administrative Client* manual for your release and platform.

System action: The program waits for the volume name to be entered.

User response: Insert side A of a new volume, close the library access door, type a volume name for it, and press ENTER; or, if you want to quit the program, press ENTER without entering a volume name.

ANR9750I Remove the volume from slot with element number '*slot element address*' in library '*library device name*', then press ENTER.

Explanation: All activity associated with the volume in the given slot with the specified element number is complete, so it should be removed. For the slot and element number diagram of your library, refer to the documentation provided with the current PTF level or refer to the *Administrator's Guide* for your release and platform.

System action: The program waits until the ENTER key is pressed.

User response: Remove the volume from the specified slot, close the library access door, and press ENTER.

ANR9751E The volume in drive '*drive name*' is not compatible with the drive.

Explanation: The volume cannot be used in the drive. It is most likely an outdated media type that the drive cannot write.

System action: The volume is not labeled.

User response: Remove the volume; replace it with a different type known to work in the drive, or press ENTER to end the program.

ANR9752E Could not access drive '*drive name*'. It may be in use by another application.

Explanation: The specified drive cannot be accessed.

System action: The program is halted.

User response: Ensure that the drive name is correct

and the device is not in use by another application, then retry the operation.

ANR9753E Skipping slot element address '*slot element address*', which has no barcode.

Explanation: The cartridge in the indicated slot will not be labeled, since it does not have a valid barcode.

System action: The program attempts to label the next cartridge.

User response: Examine the cartridge to see if it has a barcode. Add a barcode if required.

ANR9754I Barcode of element *slot element address*, '*hardware barcode string*', exceeds maximum length characters in length.

Explanation: A barcode is encountered that was longer than a valid volume name.

System action: The barcode is not considered valid and will not be used for the server process.

User response: Replace the cartridge's barcode with one that is supported by the library and whose number of characters does not exceed the maximum length.

ANR9755E There are no barcodes available.

Explanation: The hardware did not return any valid barcode data for any cartridge.

System action: The program terminates without attempting to label any cartridges.

User response: Make sure the hardware supports barcodes, or that barcode labels have been affixed to the cartridges.

ANR9756I No volumes were found.

Explanation: No volumes are found in the library. This means that in a 349x ATL, no volumes were found in the insert category (x`FF00`), and that in a SCSI autochanger, no cartridges were loaded into the library.

System action: The program terminates normally.

User response: Insert cartridges into the library. For a 349x ATL, this may involve changing the category of previously inserted cartridges to be relabeled.

ANR9757E ACS drive id *ACS drive id* is not valid for drive '*drive name*'.

Explanation: The specified ACS drive id does not represent a valid drive location in the associated library.

System action: The program is halted.

User response: Retry the operation, specifying a valid drive id for the drive.

ANR9758W Error mounting volume '*volume name*'.

Explanation: An error occurs while mounting the volume to the drive. This may not be an error since the volume or drive maybe in use or locked in a shared environment.

System action: The specified volume is bypassed for labeling.

User response: Ensure that the volume is not locked or in use if label is required.

ANR9759E unsuccessful ACSAPI response, *status=acs status*.

Explanation: The ACSLS library API responded with an unsuccessful status as indicated.

System action: Depends on the ACS API for labeling, the process may continue as the error may not be a problem.

User response: If the label process terminates, contact your ACS System Administrator and perform ACSLS library problem determination.

ANR9760I Wait and monitor the ACSSA console message to remove volume *volume id* from CAP.

Explanation: The specified volume is about to put into CAP for removal. Monitor the ACSSA console and removed the volume after it has been placed into the CAP as indicated in the ACSSA message.

System action: None.

User response: Monitor the ACSSA console and wait.

ANR9761E The path of drive *drive name* in library *library name* has been changed from *original drive path* to *new drive path* The new path will not be updated because we can not get the model type using new path.

Explanation: The drive's new path can not be updated because we detect a different device type compared to the Database using this new path. The problem may be the new path has an incorrect format for the device driver.

System action: .

User response: The user needs to check if there are two device special file names for the same drive. For AIX, please make sure the IBM drive is /dev/rmt and TSM drive is /dev/mt. For Solaris, please make sure the Solaris native device driver is not installed.

ANR9771E Volume *volume name* has an incorrect barcode label describing the volume's WORM type.

Explanation: In an attempt to CHECKIN or LABEL a volume it was discovered that the volume's true WORM characteristic didn't match that described by its barcode label.

System action: The volume is not checked in.

User response: The volume was probably mislabeled. Find the volume in the library. Simply remove the volume, or swap the barcode label with a label of the opposite WORM characteristic (WORM for non-WORM or vice versa) and retry the check in command.

ANR9773E Hardware configuration error in library *library name: number of drives drives, number of storage slots storage slots*.

Explanation: The library device returned a count of zero for either the drives or the slots. The drives may have not yet been configured to the operating system, or to the library. The library must have at least one drive and multiple slots when properly configured in order to be defined to the server.

System action: The operation fails.

User response: Configure the drives to the operating system, and reinitialize the library.

ANR9774W Volume *volume name* should be freed of data as soon as possible.

Explanation: The server has received an indication from the 3995 that the indicated volume is out of spare sectors for re-allocation. Spare sectors are reserved to take the place of sectors that experience I/O problems. The re-allocation can take place on either a read or write.

System action: The indicated volume is marked read-only by the server.

User response: A MOVE DATA command should be used as soon as possible to move the data from this cartridge to other cartridges in the library. This cartridge should NOT be marked read-write again through the UPDATE VOLUME command.

ANR9775E Error while writing on volume *volume name* (RC=*internal code*).

Explanation: An I/O error has occurred while writing on the specified volume.

System action: The operation fails.

User response: Ensure that the 3995 volume is accessible and that the media is usable. Diagnostics may have to be run on the 3995 with the specified volume. If the problem persists, contact your service

ANR9776I • ANR9784E

representative and provide the internal code values from this message. The internal code is returned to the server from the OS/2 operating system.

ANR9776I File *file name* is being erased and deleted. Data erasure may take several minutes.

Explanation: A file is being deleted from an optical library cartridge. The file is deleted when a LAN3995 device class volume is deleted. File deletion includes erasure of data. The erasure process can take several minutes to complete.

System action: The operation continues.

User response: None.

ANR9778E Unable to establish a communication session with the primary library manager.

Explanation: The requested operation required that a communication session be established with a library manager. The library manager was found to be unavailable at this time.

System action: None.

User response: Verify the primary library manager is up and operational. Once the server is verified to be operational, retry the operation.

ANR9779E Unable to acquire a drive for volume *volume name* from the library manager.

Explanation: The library manager was unable to assign a drive to the library client. There are a couple of situations that can cause this error.

- All drives are currently allocated to other library clients or the library manager.
- The request for a specific drive cannot be satisfied. This can occur if a drive on the library client side is marked offline or is currently busy with another process.
- A communication error occurred during the request to mount a volume.
- The requested volume was not present in the library manager's inventory

System action: None.

User response: Verify that a drive is available on the library manager side and the drive is currently not busy or marked offline on the library client. Set the mount retention on the device class on the library manager and the library clients to a lower value. Using a lower mount retention value can free up drives.

ANR9780E Volume *volume name* is not mounted in drive from the library *drive name*.

Explanation: A communication error occurred while dismount the volume.

System action: None.

User response: Verify the library manager is up and operational. Verify that the library manager and library client can communicate using command routing.

ANR9781E Volser *volume name* was not found to be mounted on the library manager.

Explanation: According to the library manager the requested volume is no longer mounted. The can occurred if the library manager forced the volume to be dismounted because of a communication error.

System action: None.

User response: Verify that the volume has been dismounted.

ANR9782E Primary Library Manager *primary library manager name* is NOT defined as a server.

Explanation: The primary library manager server has not be defined to this server.

System action: None.

User response: Define the server to this server using the DEFINE SERVER command.

ANR9783E Primary Library Manager does not contain a valid value.

Explanation: The primary library manager server has not be defined to this server.

System action: None.

User response: Define the server to this server using the DEFINE SERVER command.

ANR9784E Secondary Library Manager *secondary library manager name* is NOT defined as a server.

Explanation: The secondary library manager server name has not be defined to this server.

System action: None.

User response: Define the server to this server using the DEFINE SERVER command.

ANR9785E Drive *drive name*, is not defined on the library manager.

Explanation: A drive is being defined that does not exist or is being managed by the library manager.

System action: None.

User response: Verify drive name with the library manager.

ANR9786E A communication error has occurred. Operation ending.

Explanation: A communication error occurred.

System action: None.

User response: Verify the library manager is up and operational. Verify that the library manager and library client can communicate using command routing.

ANR9787E The owner name specified is not defined to this server.

Explanation: A command was issued specifying ownership of a volume. The name of the owner given was not defined to this server.

System action: None.

User response: Define the server to this server using the DEFINE SERVER command.

ANR9788E Command: Library *library name* is not defined - the primary library manager not defined.

Explanation: The designated library is not defined because the primary library manager is not defined as a server to this server.

System action: The command is not processed.

User response: Define the server to this server using the DEFINE SERVER command.

ANR9789E Command: Library *library name* is not defined - the secondary library manager not defined.

Explanation: The designated library is not defined because the secondary library manager is not defined as a server to this server.

System action: The command is not processed.

User response: Define the server to this server using the DEFINE SERVER command.

ANR9790W Request to mount volume *Volume Name* for library client *Library Client Name* failed.

Explanation: A library client requested a volume to be mount by the library manager, which in turn failed.

System action: None.

User response: Verify the status of all drives are currently online and not in use by other library clients or the library manager itself. Free up drive resources as needed.

ANR9791I Volume *Volume Name* in library *Library Name* ownership is changing from *Current volume owner* to *New Volume owner*.

Explanation: In a shared library, the volume ownership has been changed from current owner to new owner.

System action: None.

User response: None.

ANR9792E Library *Library Name* on library manager *Library Manager Name* is currently not being shared.

Explanation: A define library command attempted to define a shared library that was not being shared by the library manager.

System action: None.

User response: Verify the library on the library manager is being shared. If the library is not being shared, update the library shared status to yes.

ANR9793I *process name* in library *library name*-CANCEL PENDING.

Explanation: In response to a QUERY PROCESS command, this message displays the status for a process on the server. The command was started, but the process was canceled by an administrator.

System action: The background process operation is being terminated.

User response: None.

ANR9794E Unable to load the RSM dynamic link library *dynamic link library*.

Explanation: The server module is unable to load the indicated dynamic link library.

System action: Server operation continues, but the function that requires the dynamic link library will be inoperative.

User response: Ensure that the installed Windows

ANR9795E • ANR9820I (Windows)

version supports RSM. Ensure that the Removable Storage Manager is installed and the system DLL is accessible.

ANR9795E *Command: Invalid storage agent name storage agent name.*

Explanation: The designated storage agent name is invalid; either it contains too many characters, or some of the characters are invalid.

System action: The command is not processed.

User response: Reissue the command using a valid storage agent name.

ANR9796E *Command: Drive mapping is already defined for drive drive name in library library name on storage agent storage agent name.*

Explanation: The designated drive mapping cannot be defined because it has already been defined for the specified drive, library, and storage agent.

System action: The command is not processed.

User response: If you want to define an additional drive mapping, reissue the command with a different drive name.

ANR9797E *Command: Drive mapping for drive drive name is not defined in library library name on storage agent storage agent name.*

Explanation: The designated drive map has not been defined for the given drive in the given library on the given storage agent.

System action: The command is not processed.

User response: Reissue the command using a different drive name. If appropriate, define the drive before retrying the command.

ANR9798E *Command: One or more paths are still defined for drive drive name in library library name.*

Explanation: The designated drive cannot be deleted because there are still paths defined for it.

System action: The command is not processed.

User response: Delete all paths for the drive, and reissue the command.

ANR9799E *Command: Library Library Name is currently not being shared.*

Explanation: The command attempted to perform an operation that is not allowed unless the library is allowed to be shared.

System action: None.

User response: Verify the library on the library manager is being shared. If the library is not being shared, update the library shared parameter to yes.

ANR9800E *Library Library Name is currently not being shared and attempted an operation only allowed for shared libraries.*

Explanation: The command attempted to perform an operation that is not allowed unless the library is allowed to be shared.

System action: None.

User response: Verify the library on the library manager is being shared. If the library is not being shared, update the library shared parameter to yes.

ANR9801I (Windows) ANR9801: Ready for operations.

Explanation: The device driver has successfully initialized and is ready to accept requests from the server.

System action: Processing continues.

User response: None.

ANR9803W (Windows) ANR9803: ERROR! Insufficient free memory to initialize driver.

Explanation: The server device driver is unable to initialize due to an inability to acquire dynamic storage.

System action: Processing continues. The device driver is not available to process requests from the server.

User response: For minimum storage requirements, refer to *Licensed Program Specifications/2*. You must have sufficient memory in your system to initialize Windows and the device drivers you want to use.

ANR9810I (Windows) ANR9810: SCSI Tape Device Driver Initializing...

Explanation: The server SCSI tape device driver has been invoked by the system and is initializing.

System action: Processing continues.

User response: None.

ANR9820I (Windows) ANR9820: SCSI Autochanger Device Driver Initializing...

Explanation: The server SCSI automatic changer device driver has been invoked by the system and is initializing.

System action: Processing continues.

User response: None.

ANR9900W (AIX) Attention -- Accounting records could not be written to the file: *filespec*.

Explanation: The server detects an error while trying to open the accounting file.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9900W (HP-UX) Attention -- Accounting records could not be written to the file: *file name*.

Explanation: The server detects an error while trying to open the accounting file.

System action: Server processing continues, but no accounting records are written.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9900W (Linux) Attention -- Accounting records could not be written to the file: *file name*.

Explanation: The server detects an error while trying to open the accounting file.

System action: Server processing continues, but no accounting records are written.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9900W (Solaris) Attention -- Accounting records could not be written to the file: *file name*.

Explanation: The server detects an error while trying to open the accounting file.

System action: Server processing continues, but no accounting records are written.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9900W (Windows) Attention -- Accounting records could not be written to the file: *filespec*.

Explanation: The server detects an error while trying to open the accounting file.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9901W (AIX) Attention -- Accounting records could not be written to the file: *filespec*.

Explanation: The server detects an error while trying to write an accounting record.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9901W (HP-UX) Attention -- Accounting records could not be written to the file: *file name*.

Explanation: The server detects an error while trying to write an accounting record.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9901W (Linux) Attention -- Accounting records could not be written to the file: *file name*.

Explanation: The server detects an error while trying to write an accounting record.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9901W (Solaris) Attention -- Accounting records could not be written to the file: *file name*.

Explanation: The server detects an error while trying to write an accounting record.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9901W (Windows) Attention -- Accounting records could not be written to the file: *filespec*.

Explanation: The server detects an error while trying to write an accounting record.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9902W (AIX) • ANR9905W (HP-UX)

ANR9902W (AIX) Attention -- Accounting records could not be written to the file: *filespec*.

Explanation: The server detects an error while trying to close the accounting file.

System action: Server processing continues.

User response: Ensure that sufficient disk space is available and that the accounting file is not marked as read-only.

ANR9902W (HP-UX) Attention -- Accounting records could not be written to the file: *file name*.

Explanation: The server detects an error while trying to close the accounting file.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9902W (Linux) Attention -- Accounting records could not be written to the file: *file name*.

Explanation: The server detects an error while trying to close the accounting file.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9902W (Solaris) Attention -- Accounting records could not be written to the file: *file name*.

Explanation: The server detects an error while trying to close the accounting file.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9902W (Windows) Attention -- Accounting records could not be written to the file: *filespec*.

Explanation: The server detects an error while trying to close the accounting file.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the accounting file is not marked as read-only.

ANR9903W (HP-UX) Create thread failed. Your system is configured for a maximum of *thread count* threads. Consider configuring a maximum of 1024 threads.

Explanation: The server is unable to create a new thread.

System action: Server processing continues.

User response: Consider increasing the maximum thread count on the system.

ANR9904W (AIX) Need to run as root for *function* function to open the HBA for failover support.

Explanation: There will be no tape failover support function since this TSM server does not run as root.

System action: Server processing continues.

User response: Ensure to login as root for TSM tape failver function to open HBA.

ANR9904W (HP-UX) Create thread failed. Try the operation again later.

Explanation: The server is unable to create a new thread due to resource constraints.

System action: Server processing continues.

User response: Try the operation again later.

ANR9905W (AIX) Unable to open file *file*. Error message generated by AIX

Explanation: The server was unable to open the indicated file.

System action: The operation that was to use the indicated file fails.

User response: Determine the reason for being unable to open the file and re-attempt the operation. Common reasons for being unable to open the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner.

ANR9905W (HP-UX) Unable to open file *file*. Error message generated by HP-UX.

Explanation: The server was unable to open the indicated file.

System action: The operation that was to use the indicated file fails.

User response: Determine the reason for being unable to open the file and re-attempt the operation. Common reasons for being unable to open the file include providing the wrong name, having insufficient

authorization to open the file and not being the file's owner.

ANR9905W (Linux) Unable to open file *file*. Error message generated by Linux.

Explanation: The server was unable to open the indicated file.

System action: The operation that was to use the indicated file fails.

User response: Determine the reason for being unable to open the file and re-attempt the operation. Common reasons for being unable to open the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner.

ANR9905W (Solaris) Unable to open file *file*. Error message generated by Solaris.

Explanation: The server was unable to open the indicated file.

System action: The operation that was to use the indicated file fails.

User response: Determine the reason for being unable to open the file and re-attempt the operation. Common reasons for being unable to open the file include providing the wrong name, having insufficient authorization to open the file and not being the file's owner.

ANR9950W (Windows) Attention -- License option could not be written to the file: *filespec*.

Explanation: The server detects an error while trying to write to the options file.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the options file is not marked as read-only.

ANR9951W (Windows) Attention -- License option could not be written to the file: *filespec*.

Explanation: The server detects an error while trying to close the options file.

System action: Server processing continues.

User response: Ensure that there is sufficient disk space and that the options file is not marked as read-only.

ANR9952E (Windows) Command: Invalid value specified for licensed storage capacity - *value*.

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command using a valid value.

ANR9953E (Windows) Command: Invalid value specified for number of licensed clients - *value*.

Explanation: The specified command has been issued with an invalid value.

System action: Server operation continues, but the command is not processed.

User response: Issue the command using a valid value.

ANR9955W (Windows) Unable to load dynamic link library *dynamic link library*.

Explanation: The server module is unable to load the indicated dynamic link library.

System action: Server operation continues, but the function that requires the dynamic link library will be inoperative.

User response: Ensure that the dynamic link library directories are accessible. If this is an evaluation copy of the server, then this message is normal for the DSMREG library, since the library is only provided with purchased Windows servers. The server licensing will assume "Try and Buy" mode with sample licensed options for a period of time.

ANR9956E (Windows) Unable to load procedure address from dynamic link library *dynamic link library*.

Explanation: The server module is unable to load the address of a routine in the indicated dynamic link library.

System action: Server operation continues, but the function that requires the dynamic link library will be inoperative.

User response: Ensure that the dynamic link library directories are accessible. If the problem persists, contact your service representative.

ANR9957W (Windows) One or more EVALUATION LICENSES will expire on *expiration date*.

Explanation: Although you are running with a purchased version of the server, there are one or more licenses registered that will expire on the date specified. This is usually the case when you have been using evaluation licenses prior to purchasing the server for Windows.

System action: Server operation continues.

User response: Halt the server and erase the nodelock file in the server startup directory. After restarting the server, use the REGISTER LICENSE command to define the licensed features that you have purchased with your Windows server. These licenses should NOT have an expiration date, so this message should not appear after re-registering the proper licenses. If this message persists, contact your service representative.

ANR9958W (Windows) Node entry *node name* was removed from this server's definition in Active Directory.

Explanation: In response to a REMOVE NODE command, the requested backup-archive node has been removed from this server's definition in Active Directory.

System action: None.

User response: None.

ANR9959W (Windows) Node entry *node name* was not removed from this server's definition in Active Directory.

Explanation: In response to a REMOVE NODE command, the requested backup-archive node has not been removed from this server's definition in Active Directory.

System action: None.

User response: To remove a node entry in the Active Directory, the option "adunregister" has to be set to "yes" in the server options file. A domain controller must also be available. The Active Directory Configuration wizard can be used to manually update the server definition.

ANR9960W (Windows) Node entry *node name* has been added to this server's definition in Active Directory.

Explanation: The requested backup-archive node entry has been added to this server's definition in Active Directory in response to a REGISTER NODE command.

System action: None.

User response: None.

ANR9961W (Windows) Node entry *node name* has not been added to this server's definition in Active Directory.

Explanation: The requested backup-archive node entry has not been added to this server's definition in Active Directory in response to a REGISTER NODE command.

System action: None.

User response: To register a node entry in the Active Directory, the option "adregister" has to be set to "yes" in the server options file. A domain controller must also be available. The Active Directory Configuration wizard can be used to manually update the server definition.

ANR9962W (Windows) Node entry *node name* was renamed in this server's definition in Active Directory.

Explanation: In response to a RENAME NODE command, the requested backup-archive node has been renamed to the new name shown.

System action: None.

User response: None.

ANR9963W (Windows) Node entry *node name* was not renamed in this server's definition in Active Directory.

Explanation: In response to a RENAME NODE command, the requested backup-archive node has not been renamed.

System action: None.

User response: To Rename Node in the Active Directory, the options "adregister" and "adunregister" have to be set to "yes" in the server options file. A domain controller must also be available. The Active Directory Configuration wizard can be used to manually update the server definition.

ANR9964W (Windows) Failed to access Active Directory. RC: *return code*

Explanation: Could not communicate with an Active Directory server.

System action: Server operation continues.

User response: Try using the option "adsetdc" in the server options file to explicitly provide the TCP/IP address of the domain controller where Active Directory is located.

ANR9965W (Windows) Could not create the initial node list in Active Directory for this server.

Explanation: At startup the server's registered nodes

could not be added to the server definition in Active Directory

System action: Server operation continues.

User response: Try using the option "adsetdc" in the server options file to explicitly provide the TCP/IP address of the domain controller where Active Directory is located.

ANR9966I (Windows) NodeName *node name*.

Explanation: The NodeName is registered in Active Directory.

System action: Server operation continues.

User response: None.

ANR9967I (Windows) Server *server name* **was defined in Active Directory.**

Explanation: The server is registered in Active Directory.

System action: None.

User response: None.

ANR9968I (Windows) Success accessing Active Directory.

Explanation: Active Directory Server could be contacted.

System action:

User response: None.

Server ANE messages list

This section lists the server ANE messages. ANE messages are client events logged to the server. The messages are listed in ascending numeric order.

ANE4000E Error processing 'filespace-name': file space does not exist

Explanation: The specified file space (domain) is incorrect or does not exist on the workstation.

System action: Processing stopped.

User response: Retry the operation specifying an existing domain (drive letter or file system name).

ANE4001E Error processing 'filespace-name': file space not known to server

Explanation: The number defining the correspondence between drive letter or file (domain name) and volume label is not known to the server.

System action: Processing stopped.

User response: Report the program error to your service representative.

ANR9969E (Windows) Unable to open volume *volume name*. **The most likely reason is that another TSM server is running and has the volume allocated.**

Explanation: Only one TSM server can have a given volume open at a time.

System action: The TSM server does not start.

User response: See if another TSM server is already running and if so use it.

ANR9999D (*component*)(*code*):(*text*)

Explanation: The diagnostic text of this message is related to a server process or algorithm. The information is intended for reporting processing exceptions and other non-standard situations that occur on the server. The (component), (code), and (text) vary, and server processing may continue, depending upon the cause of the message and the server process or algorithm issuing the message.

System action: Issue the SET CONTEXTMESSAGING command and set the message context reporting to ON. This allows you to receive additional information when the server produces its message. See the *Administrator's Reference* for more information.

User response: Examine any error messages that were displayed before or after this message and correct any problems, if possible. If you cannot determine or resolve the cause of this message, contact your support representative. Report the entire text of this message when contacting your support representative.

ANE4002E Error processing 'filespace-name': volume label does not exist

Explanation: The selected drive does not have a label.

System action: Tivoli Storage Manager is unable to do the requested operation without a drive or label entered.

User response: If the drive is a floppy drive, place a disk with a volume label in it and retry the operation. If the disk is a hard drive, ensure the drive has a volume label, and retry the operation.

ANE4003E Error processing 'filespace-name': duplicate volume label encountered

Explanation: The selected drive has a duplicate volume label. Because Tivoli Storage Manager uses the volume label to keep track of backup/archive information, it cannot back up or archive files from a drive with a duplicate volume label.

ANE4004E • ANE4013E

System action: Tivoli Storage Manager cannot select the drive.

User response: If the volume needs to be available to the system, exit Tivoli Storage Manager, and assign a volume label to the drive. Restart Tivoli Storage Manager and retry the operation.

ANE4004E Error processing '*filesystem namepath-namefile-name*': **destination file or directory is write locked**

Explanation: The file or directory being restored or retrieved from the server cannot be written to because the destination is write locked. Another operation might have the file open and will not allow it to be updated.

System action: File skipped.

User response: Either determine which operation has the file write locked, or restore the file to another name or location.

ANE4005E Error processing '*filesystem namepath-namefile-name*': **file not found**

Explanation: The file being processed for backup, archive or migrate no longer exists on the client. Another process deletes the file before it can be backed up, archived or migrated by Tivoli Storage Manager.

System action: File skipped.

User response: None.

ANE4006E Error processing '*filesystem namepath-namefile-name*': **directory path not found**

Explanation: You specified an incorrect directory path.

System action: Processing stopped.

User response: Correct the syntax specified on the call and retry the operation.

ANE4007E Error processing '*filesystem namepath-namefile-name*': **access to the object is denied**

Explanation: Access to the specified file or directory is denied. You tried to read from or write to a file and you do not have access permission for either the file or the directory.

System action: Processing stopped.

User response: Ensure that you specified the correct file or directory name, correct the permissions, or specify a new location.

ANE4008E Error processing '*filesystem namepath-namefile-name*': **file is temporarily unavailable**

Explanation: File is temporarily unavailable.

System action: File skipped.

User response: Check and see if file is locked by other process. If not, retry the command.

ANE4009E Error processing '*filesystem namepath-namefile-name*': **disk full condition**

Explanation: No more files can be restored or retrieved because the destination disk is full.

System action: Processing stopped.

User response: Free up disk space, or restore or retrieve the file to another disk.

ANE4010E Error processing '*filesystem namepath-namefile-name*': **stale NFS handle**

Explanation: An NFS file system becomes stale.

System action: File system skipped.

User response: Check the NFS mounted filesystem.

ANE4011E Error processing '*filesystem namepath-namefile-name*': **no file handles available**

Explanation: All file handles for your system are currently in use. No more are available.

System action: Processing stopped.

User response: Either free some file handles by ending other processes, or modify your system setup to allow for more files to be open at the same time.

ANE4012E Error processing '*filesystem namepath-namefile-name*': **file already exists**

Explanation: The file being restored or retrieved exists.

System action: File is replaced or skipped depending on client options.

User response: None.

ANE4013E Error processing '*filesystem namepath-namefile-name*': **invalid file handle**

Explanation: An internal system error occurred. A file operation failed because an invalid file handle was passed.

System action: Processing stopped.

User response: Report the problem to your system administrator, and then retry the operation.

ANE4014E Error processing '*filesystem namepath-namefile-name*': **unknown system error (error-code) encountered. Program ending.**

Explanation: An unknown and unexpected *error-code* occurred within the client program. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, see your administrator.

ANE4015E Error processing '*filesystem namepath-namefile-name*': **unexpected error (error-code) encountered**

Explanation: An unexpected error occurred. This might be a low-level system or communication error that Tivoli Storage Manager cannot handle or recover from.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, determine where the problem exists. See your system administrator for further help.

ANE4016E Error processing '*filesystem namepath-namefile-name*': **file is being executed; write permission denied**

Explanation: The current file cannot be opened to write to because it is currently being run by another operation.

System action: File skipped.

User response: Stop the operation that is running the file and retry the operation, or restore or retrieve the file to a different name or directory.

ANE4017E Error processing '*filesystem namepath-namefile-name*': **too many symbolic links were detected while resolving name**

Explanation: While trying to resolve the file name, too many symbolic links were found.

System action: File skipped.

User response: Ensure that you do not have a looping symbolic link for the file.

ANE4018E Error processing '*filesystem namepath-namefile-name*': **file name too long**

Explanation: The file name specified is too long to be handled by Tivoli Storage Manager.

System action: File is skipped.

User response: See the appropriate *Using the Backup-Archive Client* book for the particular operating system, for the file names that are handled by Tivoli Storage Manager.

ANE4019E Error processing '*filesystem namepath-namefile-name*': **file system is locked by system**

Explanation: File system cannot be accessed because it is locked by the system.

System action: Tivoli Storage Manager cannot complete the operation.

User response: See your system administrator.

ANE4020E Error processing '*filesystem namepath-namefile-name*': **format unknown**

Explanation: Tivoli Storage Manager tried to restore or retrieve a file, but it had an unknown format.

System action: File skipped.

User response: See your system administrator.

ANE4021E Error processing '*filesystem namepath-namefile-name*': **file system not ready**

Explanation: The file system/drive was not ready for access.

System action: Processing stopped.

User response: Ensure that the drive is available to Tivoli Storage Manager, and then retry the operation.

ANE4022E Error processing '*filesystem namepath-namefile-name*': **file system is invalid**

Explanation: The drive was not available for access. A directory exists that does not have either a '.' or '..' entry.

System action: Processing stopped.

User response: Ensure that the drive is operational, and then retry the operation. If unsuccessful, have your service representative check the error log.

ANE4023E Error processing '*filesystem
namepath-namefile-name*': file input/output error

Explanation: An error was found while reading from or writing to the file.

System action: File skipped.

User response: Check your system to ensure that it is operating properly. For OS/2, run CHKDSK /F for the failing drive which can be found in dsmerror.log.

ANE4024E Error processing '*filesystem
namepath-namefile-name*': file write error

Explanation: An error was found while writing to the file.

System action: File skipped.

User response: Check your system to ensure that it is operating properly.

ANE4025E Error processing '*filesystem
namepath-namefile-name*': file exceeds user or system file limit

Explanation: A file being backed up/restored or archived/retrieved exceeds system set limits for this user. Shown below are the filesize limits corresponding to various platforms.

AIX 68,589,453,312 (64GB)

HP-UX 1,099,511,627,775 (1TB-1)

Linux 2,147,483,647 (2GB)

Mac pre-OS9
2,147,482,624 (2GB-1K)

Mac OS9
18,446,744,073,709,551,616 (16EB)

NetWare
4,294,963,200 (4GB -4KB)

NUMA-Q DYNIX/ptx
4.5 1,095,216,660,480 (1TB-4GB)

OS/390 4,294,967,295 (4GB)

SGI 18,446,744,073,709,551,615 (16EB-1)

Solaris 2.6 or higher
1,099,511,627,775 (1TB-1)

Tru64 UNIX
1,099,511,627,776 (1TB)

UnixWare
2,147,483,647 (2GB)

Windows 95 (FAT16)
2,147,483,647 (2GB)

Windows 98 (FAT32)
4,294,967,295 (4GB)

Windows NT/2000 (NTFS)
17,592,185,978,880 (16TB-64K)

System action: File skipped.

User response: Ensure that the system limits are set properly.

ANE4026W Error processing '*filesystem
namepath-namefile-name*': size of '*file-size*' exceeded the maximum file size limit on your system

Explanation: You tried to restore or retrieve a file that has exceeded the maximum file size limitation on your system.

System action: Tivoli Storage Manager cannot restore or retrieve the file.

User response: Restore or retrieve this file on a system that supports the file size. See your system administrator.

ANE4027S Error processing '*filesystem
namepath-namefile-name*': internal program message '*value*' encountered

Explanation: An unexpected catastrophic program failure occurred, indicated by *value*.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, see your system administrator or service representative.

ANE4028E Error processing '*filesystem
namepath-namefile-name*': cannot create file/directory entry

Explanation: The directory path for files being restored or retrieved cannot be created.

System action: File skipped.

User response: Ensure that you have the proper authorization to create the directory for file being restored or retrieved.

ANE4029E Error processing '*filesystem
namepath-namefile-name*': unable to build a directory path; a file exists with the same name as a directory

Explanation: Tivoli Storage Manager tried to create a directory path, but is unable to because a file exists that has the same name as a directory.

System action: Processing stopped.

User response: Remove the file that has the same name as the directory. Refer to the last restore/retrieve operation and check all directories along the path.

ANE4030E Error processing '*filesystem namepath-namefile-name*': **disk space limit for this process reached**

Explanation: The disk space allocated for the client owner is full.

System action: Processing stopped.

User response: Free up disk space and retry the restore or retrieve operation.

ANE4031E Error processing '*filesystem namepath-namefile-name*': **destination directory path length exceeds system maximum**

Explanation: The path name specified plus the path name in the restored file name combine to create a name whose length exceeds the system maximum.

System action: Processing stopped.

User response: Specify a destination path that, when combined, is less than the system maximum.

ANE4032E Error processing '*filesystem namepath-namefile-name*': **file is not compressed.**

Explanation: A file that was flagged as compressed was not compressed, and the system failed.

System action: Processing stopped.

User response: See your system administrator to report this problem. This error is a system failure.

ANE4033E Error processing '*filesystem namepath-namefile-name*': **file compressed on a different client machine that has more memory**

Explanation: You are trying to restore a file that was backed up and compressed on another client workstation that had more memory than your client workstation. You cannot restore this file. When the file is restored, it is expanded and your workstation does not have enough memory.

System action: Tivoli Storage Manager canceled the operation.

User response: Obtain a machine with more memory and retry the operation.

ANE4034E Error processing '*filesystem namepath-namefile-name*': **unknown system error**

Explanation: An unknown error occurred. This might be a low-level system or communication error that Tivoli Storage Manager cannot handle or recover from.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, determine where the problem exists. See your system administrator for further help.

ANE4035W Error processing '*filesystem namepath-namefile-name*': **file currently unavailable on server.**

Explanation: You tried to restore or retrieve a file that is currently not available from the server.

System action: Tivoli Storage Manager cannot restore or retrieve the file.

User response: See your system administrator to determine why the file is unavailable and then try your operation again.

ANE4036E An error occurred saving the registry key.

Explanation: The active registry key cannot be saved.

System action: Registry backup operation terminates.

User response: See your system administrator.

ANE4037E File '*file-namefile-namefile-name*' changed during processing. **File skipped.**

Explanation: The specified *file-name* was skipped during backup, archive, or migrate because it was changing during the attempt to process it.

System action: Tivoli Storage Manager skipped the file.

User response: If you want the file backed up, archived, or migrated retry the operation. If it fails, determine why the file is being changed. For more information on backing up, archiving, or migrating changing files, see your system administrator.

ANE4038E An error occurred processing file system '*filesystem name*'.

Explanation: File system '*filesystem name*' is corrupted or contains one or more corrupted directories and cannot be processed.

System action: File system is skipped.

User response: Check your system to ensure that it is operating properly. For the Windows environment, run CHKDSK utility for the failing drive. More information about corrupted directories can be found in *dsmerror.log*.

ANE4040E Error processing '*filesystem namepath-namefile-name*': **file system *filesystem name* has exceeded its space management quota.**

Explanation: Tivoli Storage Manager detects that the

ANE4041W • ANE4049I

file system has exceeded its quota. No more data can be migrated out of this file system.

System action: Tivoli Storage Manager will not migrate files from this file system.

User response: Recall some files, or ask the system administrator to increase the quota for this file system.

ANE4041W Error processing 'filespace namepath-namefile-name': Out of free space or inodes in file system filespace name to migrate or recall.

Explanation: The file system is full. No more free space or free inodes are available to be allocated for the transaction file that is needed when a file is being migrated or recalled.

System action: Tivoli Storage Manager terminates the current operation for this file system.

User response: Remove some files in the file system, and then run reconciliation. Retry the operation.

ANE4042E Object name 'filespace namepath-namefile-name' contains one or more unrecognized characters and is not valid.

Explanation: The filename, directory name, or volume label syntax is incorrect.

System action: File skipped.

User response: You need to check the disk for errors.

ANE4044E Error processing 'filespace-namepath-namefile-name': Case-sensitive name conflict exists.

Explanation: While processing the specified file on the workstation, another file name was encountered with a similar name which only differed in case. The Backup-Archive client does not allow names which differ only in case on this platform and cannot guarantee the integrity of the file, so the file is skipped.

System action: This object will be skipped.

User response: Rename the file in question to a unique name.

ANE4045E Error processing 'filespace-namepath-namefile-name': Case-sensitive name conflict exists. The directory tree will be skipped.

Explanation: While processing the specified file on the workstation, another object name was encountered with a similar name which only differed in case. The Backup-Archive client does not allow names which differ only in case on this platform and cannot guarantee the integrity of the file, so the directory and

all of the objects contained within it are skipped.

System action: This object will be skipped.

User response: Rename the file in question to a unique name.

ANE4046E There is an error processing 'filespace-namepath-namefile-name': the object is corrupted and unreadable.

Explanation: You tried to read from or write to a file or directory that is corrupted. The corrupted file is skipped. If this is a directory, the objects contained in the directory and its subdirectories are skipped.

System action: This object will be skipped.

User response: Check your system to ensure that the filespace is not corrupted by using system tools like chkdisk (Windows) or fsck (UNIX).

ANE4047E There is a read error on 'file-namefile-namefile-name'. The file is skipped.

Explanation: The specified *file-name* was skipped during backup archive because the file could not be read.

System action: TSM skipped the file.

User response: Check your system to ensure that it is operating properly.

ANE4048W LAN-Free connection failed.

Explanation: ENABLELANFREE option is set to YES for this session, but an attempt to establish LAN-Free connection failed.

System action: The TSM client will failover to non LAN-Free support.

User response: Review the TSM error.log for LAN-Free failures. Check your LAN-Free setup and verify that all components are working properly.

ANE4049I Established LAN-Free connection.

Explanation: ENABLELANFREE option is set to YES for this session and the TSM client successfully established LAN-Free connection with server, after the LAN-Free connection was broken.

System action: The TSM client will communicate with the server via LAN-Free.

User response: Review the TSM error.log for LAN-Free errors. Check your LAN-Free setup and verify that all components are working properly.

ANE4900W Schedule '*schedule name*' has opened a new session with the server.

Explanation: A scheduled event ended due to a connection failure. The scheduled event had to be restarted outside of its normal start-up window to continue the operation.

System action: Be advised that there are multiple sessions associated with the scheduled event.

User response: None.

ANE4973E An error occurred accessing NTFS security information for file '*filesystem namepath-namefile-name*'

Explanation: An access denied error occurred while attempting to access NTFS security information.

System action: The object is skipped.

User response: See your system administrator or bypass the failing check by using SkipNTSecu rity option.

ANE4974E Error processing '*filesystem namepath-namefile-name*': a required NT privilege is not held.

Explanation: The user account running TSM does not possess a required NT user right/privilege for performing the current operation.

System action: The object is skipped.

User response: Your system administrator has the authority to grant the needed privilege.

ANE4987E Error processing '*filesystem namepath-namefile-name*': the object is in use by another process

Explanation: Access to the specified file or directory is denied. You tried to read from or write to a file and you do not have access permission for either the file or the directory.

System action: Processing stopped.

User response: Ensure that you specified the correct file or directory name, correct the permissions, or specify a new location.

ANE4988W File '*filesystem namepath-namefile-name*' is currently unavailable on server and has been skipped.

Explanation: You tried to restore or retrieve a file that is currently not available from the TSM server.

System action: TSM cannot restore or retrieve the file.

User response: Try to restore or retrieve after the file

was made available on the server. See your system administrator.

ANE4989E Error processing '*filesystem namepath-namefile-name*': the directory is in use by another process. All objects in the directory and any of its subdirectories are skipped.

Explanation: The specified directory is being used by another process. You tried to read from or write to directory that is currently being used by another process. The objects contained in the directory and its subdirectories are not backed up.

System action: Processing stopped for that directory. If other files and directories were also specified in this backup, they are processed.

User response: Ensure that you specified the correct directory name; Correct the permissions, or specify a new location. If the directory name is correct, retry the backup when no process has exclusive use of the directory.

ANE4991I *Application_type Application_message_ID*
Message

Explanation: This is a message sent by the application that you are currently running with Tivoli Storage Manager.

System action: Tivoli Storage Manager logs the application message.

User response: Refer to the documentation for the application that you are using.

ANE4992W *Application_type Application_message_ID*
Message

Explanation: This is a message sent by the application that you are currently running with Tivoli Storage Manager.

System action: Tivoli Storage Manager logs the application message.

User response: Refer to the documentation for the application that you are using.

ANE4993E *Application_type Application_message_ID*
Message

Explanation: This is a message sent by the application that you are currently running with Tivoli Storage Manager.

System action: Tivoli Storage Manager logs the application message.

User response: Refer to the documentation for the application that you are using.

ANE4994S • ANE4999E

ANE4994S *Application_type Application_message_ID*
Message

Explanation: This is a message sent by the application that you are currently running with Tivoli Storage Manager.

System action: Tivoli Storage Manager logs the application message.

User response: Refer to the documentation for the application that you are using.

ANE4999E **Unable to log message '*message number*' to server: message too long.**

Explanation: The message text and inserts were too large to send to the server in the available internal buffer.

System action: Refer to the local client error log for more information

User response: None.

Chapter 3. Client messages reference

This section contains messages for the following clients:

- Administrative clients
- Application program interface clients
- Backup–archive and space management (HSM) clients
- Data Protection clients:
 - DB2 UDB and Hardware Devices Snapshot Integration Modules
 - Microsoft Exchange VSS and Hardware Devices Snapshot Integration Modules

Client messages changes

This section lists the new, changed, and deleted client messages. The changes occurred since the last edition of this publication, November 2007.

Client messages list

This section lists the client messages. The messages are listed in ascending numeric order.

The messages for these clients contain a common **ANS** message prefix and a unique message number. The messages are listed in numeric order.

This section also contains Diagnosis, Modification, or Tuning Information. Some of these messages include information about the Tivoli Storage Manager error log that you can use when working with your service representative.

ANS0101E Unable to open English message repository *file name*.

Explanation: The default English message repository file cannot be opened. Either the file access permissions prevent reading the file or the file is not present in the expected location.

System action: TSM is unable to complete the requested operation. Processing is terminated.

User response: Make sure the file in your DSM_DIR is set up properly. If the problem continues, see your system administrator for further help.

Explanation: The message repository file header record cannot be obtained.

System action: TSM is unable to complete the requested operation.

User response: Make sure the file has not been altered from the installation. If the problem continues, see your system administrator for further help.

ANS0102W Unable to open the message repository *file name*. The American English repository will be used instead.

Explanation: The default message repository file for the current locale cannot be opened. Either the file access permissions prevent reading the file, the file is not present in the expected location, or the language specified in the option file is not supported on this workstation.

System action: TSM continues processing using the English language message repository.

User response: Make sure the file in your DSM_DIR is set up properly. If the problem continues, see your system administrator for further help.

ANS0105E Error trying to read index for message *number* from repository *file name*.

Explanation: The message text for the specified message number cannot be read.

System action: TSM is unable to complete the requested operation.

User response: Make sure the file has not been altered from the installation. If the problem continues, see your system administrator for further help.

ANS0106E Message index not found for message *number*.

Explanation: The message repository file does not contain the message text for the message number.

System action: TSM is unable to complete the requested operation.

User response: Make sure the DSM_DIR is set up properly and it does not point to an old copy. If the problem continues, see your system administrator for further help.

ANS0103E Error trying to read header record from message repository *file name*.

ANS0107E Error trying to read header for message number from repository file name.

Explanation: The message header information cannot be obtained for the message number in the message file.

System action: TSM is unable to complete the requested operation.

User response: Make sure the file has not been altered from the installation. If the problem continues, see your system administrator for further help.

ANS0108E Error trying to read text for message number from repository file name.

Explanation: The message text cannot be obtained for the message number in the message file.

System action: TSM is unable to complete the requested operation.

User response: Make sure the file has not been altered from the installation. If the problem continues, see your system administrator for further help.

ANS0109E Insufficient memory for allocation of message structure.

Explanation: There is not enough memory in your system to allocate the storage needed for the message text.

System action: TSM is unable to complete the requested operation.

User response: Stop TSM and restart TSM. Then retry the operation. If unsuccessful, close all unneeded applications and retry the operation.

ANS0110E Unable to open error log file file name for output.

Explanation: The error log cannot be opened for output.

System action: TSM is unable to complete the requested operation. File permissions may be set such that writing is not allowed.

User response: Stop and restart TSM. Then retry the operation. If unsuccessful, make sure the file is not being locked by another application and that file permissions allow write access.

ANS0113E Message repository file name has an invalid control record.

Explanation: The message repository file contains an incorrect control information.

System action: TSM is unable to complete the requested operation.

User response: Make sure the message file was not altered from the installation. Check DSM_DIR to make sure it is set up properly.

ANS0118E Unable to open schedule log file 'file name' for output.

Explanation: The schedule log file cannot be opened for output.

System action: TSM is unable to complete the requested operation.

User response: Stop TSM and restart TSM. Then retry the operation. If unsuccessful, make sure the file has not been locked by another application.

ANS0119E Error trying to read response string for message number from repository file name.

Explanation: The response string information for the message number cannot be obtained from the message repository file. It is possible the message repository has been corrupted.

System action: TSM is unable to complete the requested operation.

User response: Make sure the message file was not altered from the installation. Check DSM_DIR to make sure it is set up properly.

ANS0120E Message number number contains an invalid multibyte sequence for the current locale.

Explanation: An illegal multibyte sequence for the current locale was found in the message. Either the message repository has been corrupted or is coded in a language other than that of the current locale.

System action: TSM is unable to complete the requested operation.

User response: If the message repository is not corrupted, process the operation in the supported locale.

ANS0121W Unable to open the iconv converter for the message repository file name. The American English repository will be used instead.

Explanation: The iconv converter for the default message repository for the current locale cannot be opened. The iconv converter used to convert from UTF-8 to the current locale is not installed on this work station.

System action: TSM continues processing using the English language message repository.

User response: Make sure the required iconv

converter is installed properly. If the problem continues, see your system administrator for further help.

ANS0201E Invalid parameter was found.

Explanation: The system encountered an internal program error due to an invalid parameter.

System action: The system returns to the calling procedure.

User response: Ask your service representative to check the error log.

ANS0202E Not authorized to restore the other node's data.

Explanation: The client is not authorized to restore the other node's data.

System action: The system returns to the calling procedure.

User response: Get authorization from the other node.

ANS0203E The objName field has no leading directory separator.

Explanation: The objName field does not have a leading directory separator.

System action: The system returns to the calling procedure.

User response: Correct the value for the objName.

ANS0204E Wildcards are not allowed in the objName directory path.

Explanation: Wildcards are not allowed in the objName directory path.

System action: The system returns to the calling procedure.

User response: Correct the value for the objName.

ANS0205E Unable to open error log file.

Explanation: The system is unable to open the error log file.

System action: The system returns to the calling procedure.

User response: Verify the DSMI_LOG value and access permission. On the AS/400 platform, verify the value specified for ERRORLOGNAME in the API options file.

ANS0206E The log file cannot be written to.

Explanation: There was an error writing to the log file.

System action: The system returns to the calling procedure.

User response: Verify the DSMI_LOG value and access permission. on the AS/400 platform, verify the value specified for ERRORLOGNAME in the API options file.

ANS0207E The log file name was not specified.

Explanation: The system is unable to open the error log file.

System action: The system returns to the calling procedure.

User response: Verify the DSMI_LOG value and access permission. On the AS/400 platform, verify the value specified for ERRORLOGNAME in the API options file.

ANS0208E The TCP/IP WINSOCK.DLL file cannot be found.

Explanation: The TCP/IP WINSOCK.DLL file cannot be found.

System action: Processing stopped.

User response: Verify your TCP/IP installation.

ANS0209E An error occurred while loading a library.

Explanation: An error occurred while loading a library. The TCP/IP DLL load failed.

System action: Processing stopped.

User response: Verify your TCP/IP installation.

ANS0210E The TCP/IP load function failed.

Explanation: An error occurred while locating a function. The TCP/IP load function failed.

System action: Processing stopped.

User response: Verify your TCP/IP installation.

ANS0211E The object name pointer is NULL.

Explanation: There is no value provided for the object name pointer.

System action: The system returns to the calling procedure.

User response: Provide an address for the dsmObjName structure.

ANS0212E The data block pointer is NULL.

Explanation: There is no value provided for the data block pointer.

System action: The system returns to the calling procedure.

User response: Provide an address for the DataBlk structure.

ANS0213E The object attribute pointer is NULL.

Explanation: There is no value provided for the object attribute pointer.

System action: The system returns to the calling procedure.

User response: Provide an address for the ObjAttr structure.

ANS0214E There is no server session information.

Explanation: The server did not respond with the session information.

System action: The system returns to the calling procedure.

User response: Verify the server status.

ANS0215E There is no server policy information.

Explanation: The server did not respond with the policy information.

System action: The system returns to the calling procedure.

User response: Verify the server policy definitions.

ANS0216E The dataBlk bufferLen value is zero.

Explanation: The value for the dataBlk bufferLen is zero.

System action: The system returns to the calling procedure.

User response: Provide a non-zero value for the bufferLen.

ANS0217E The dataBlk bufferPtr is NULL.

Explanation: There is no value provided for the dataBlk bufferPtr.

System action: The system returns to the calling procedure.

User response: Provide an address for the bufferPtr.

ANS0218E The objType is invalid.

Explanation: The value for the objType is invalid.

System action: The system returns to the calling procedure.

User response: The value for dsmObjName.objType must be:

DSM_OBJ_FILE or DSM_OBJ_DIRECTORY for Backup, or

DSM_OBJ_FILE for Archive.

ANS0219E The dsmEndTxn vote is invalid.

Explanation: The dsmEndTxn vote is invalid.

System action: The system returns to the calling procedure.

User response: The vote must be DSM_VOTE_COMMIT or DSM_VOTE_ABORT.

ANS0220E An invalid option was found during option parsing.

Explanation: An invalid option was found.

System action: The system returns to the calling procedure.

User response: Verify the options in dsm.opt, dsm.sys, and the options string. Check the error log for more details about the error. on the AS/400 platform, verify the options in *LIB/QOPTTSM(APIOPT).

ANS0221E There was an error in the TSM API internals.

Explanation: The system encountered an error in the API internals.

System action: The system returns to the calling procedure.

User response: Shut down the process and retry the operation. Verify that any previous dsmInit calls were cleaned up and terminated by a dsmTerminate call. If the problem continues, contact your system administrator or service representative.

ANS0222E The repository type is invalid.

Explanation: The repository type is invalid.

System action: The system returns to the calling procedure.

User response: For dsmDeleteFS the repository must be one of the following:

- DSM_ARCHIVE_REP
- DSM_BACKUP_REP
- DSM_REPOS_ALL.

ANS0223E Filespace name should start with the directory delimiter.

Explanation: The filesystem name is invalid.

System action: The system returns to the calling procedure.

User response: Filespace name should start with the directory delimiter.

ANS0224E The object name is either an empty string or has no leading delimiter.

Explanation: The object name is invalid because of an empty string or there is no leading delimiter.

System action: The system returns to the calling procedure.

User response: Verify the format of the dsmObjName full path.

ANS0225E Low level qualifier of the object name should start with the directory delimiter.

Explanation: The low level qualifier for the object name is invalid.

System action: The system returns to the calling procedure.

User response: Start the low level qualifier of the object name with the directory delimiter.

ANS0226E The object owner is invalid.

Explanation: The object owner must be either the root user, or the object owner must be the same as the session owner.

System action: The system returns to the calling procedure.

User response: Verify the session owner and object owner.

ANS0227E The dsmBindMC sendType is invalid.

Explanation: The dsmBindMC sendType is invalid.

System action: The system returns to the calling procedure.

User response: The sendType must be one of the following:

- stBackup
- stArchive
- stBackupMountWait
- stArchiveMountWait

ANS0228E The dsmSendObj sendType is invalid.

Explanation: The dsmSendObj sendType is invalid.

System action: The system returns to the calling procedure.

User response: The sendType must be one of the following:

- stBackup
- stArchive
- stBackupMountWait
- stArchiveMountWait

ANS0229E The dsmDeleteObj delType is invalid.

Explanation: The dsmDeleteObj delType is invalid.

System action: The system returns to the calling procedure.

User response: The delType must be dtBackup or dtArchive.

ANS0230E The query Backup objState is invalid.

Explanation: The query Backup objState is invalid.

System action: The system returns to the calling procedure.

User response: The qryBackupData.objState must be one of the following:

- DSM_ACTIVE
- DSM_INACTIVE
- DSM_ANY_MATCH

ANS0231E The management class name was not found.

Explanation: A query or send operation is unable to find the management class name.

System action: The system returns to the calling procedure.

User response: Verify the management class name.

ANS0232E The drive letter is not an alphabetic character.

Explanation: The drive letter is not an alphabetic character. This return code is valid on Microsoft Windows only.

System action: The system returns to the calling procedure.

User response: Verify that the drive designation is an alphabetic character. The referenced field is dsmDosFSAttrib.driveLetter.

ANS0233E The Register Filespace name is NULL.

Explanation: There is no value provided for the Register Filespace name.

System action: The system returns to the calling procedure.

User response: Provide a file space name on dsmRegisterFS.

ANS0234E The new password value is NULL or blank.

Explanation: There is no value provided for new password.

System action: The system returns to the calling procedure.

User response: Provide a new password on dsmChangePW.

ANS0235E The old password value is NULL or blank.

Explanation: There is no value provided for old password.

System action: The system returns to the calling procedure.

User response: Provide an old password on dsmChangePW.

ANS0236E On dsmInit, the owner is not allowed to establish a session when PASSWORDACCESS=generate.

Explanation: PASSWORDACCESS=GENERATE establishes a session with the current login user as the owner. The application should set clientOwnerNameP to NULL when PASSWORDACCESS=GENERATE is in effect.

System action: The system returns to the calling procedure. Whether the application can continue processing depends on how the application handles the error.

User response: This message applies to applications that utilize the TSM API, and is intended primarily for the vendor of the application for which the message is issued. Depending on the application, this could be a configuration issue.

Consult the documentation for the application and verify that the application is configured correctly. If the problem persists, contact the application vendor for further assistance.

ANS0237E On dsmInit, the node is not allowed when PASSWORDACCESS=generate.

Explanation: PASSWORDACCESS=generate establishes a session with the current hostname as the node.

System action: The system returns to the calling procedure.

User response: When using PASSWORDACCESS=generate, set clientNodeNameP to NULL.

ANS0238E The sequence of calls is invalid.

Explanation: The sequence of calls is invalid.

System action: The system returns to the calling procedure.

User response: Verify the transaction call sequence.

ANS0239E On dsmSendObj, wildcards are not allowed for the objName.

Explanation: On dsmSendObj, wildcards are not allowed for the objName.

System action: The system returns to the calling procedure.

User response: Provide a fs, hl, and ll on the dsmObjName.

ANS0240E The file space to delete/set access cannot be found.

Explanation: The file space to delete cannot be found.

System action: The system returns to the calling procedure.

User response: Verify the file space name.

ANS0241E On dsmSendObj, dsmDeleteObj, or dsmUpdateFS the file space is not registered.

Explanation: On dsmSendObj, dsmDeleteObj, or dsmUpdateFS, the file space is not registered.

System action: The system returns to the calling procedure.

User response: Verify the file space name.

ANS0242W On dsmRegisterFS the file space is already registered.

Explanation: On dsmRegisterFS the file space is already registered.

System action: The system returns to the calling procedure.

User response: Verify the filespace name.

ANS0243E On dsmBeginGetData the objID is NULL.

Explanation: On dsmBeginGetData, the objID is NULL.

System action: The system returns to the calling procedure.

User response: Verify the following:

The dsmGetList is not NULL.

Each objID is not NULL.

The dsmGetList numObjId is not zero.

ANS0244E On dsmInit the caller's API version is different than the TSM library version.

Explanation: On dsmInit the caller's API version has a higher value than the TSM library version.

System action: The system returns to the calling procedure.

User response: Install the latest TSM API library and trusted agent module.

ANS0245E The caller's structure version is different than the TSM library version.

Explanation: The caller's structure version is different than the TSM library version.

System action: The system returns to the calling procedure.

User response: Ensure that the stVersion field is set with the value in the header file. Recompile the application with the latest header files.

ANS0246E Issue dsmEndTxn and then begin a new transaction session.

Explanation: This transaction must be ended and a new one must be started due to one of the following reasons:

The destination changed.

The byte limit is exceeded

The maximum number of objects is exceeded.

System action: The system returns to the calling procedure.

User response: Issue dsmEndTxn and start a new transaction session.

ANS0247E The backup or archive object is excluded from processing.

Explanation: The backup or archive object is excluded from processing.

System action: The system returns to the calling procedure.

User response: Verify the objName and Exclude lists.

ANS0248E The backup object does not have a copy group.

Explanation: The backup object does not have a copy group.

System action: The system returns to the calling procedure.

User response: Verify server policy definitions.

ANS0249E The archive object does not have a copy group.

Explanation: The archive object does not have a copy group.

System action: The system returns to the calling procedure.

User response: Verify server policy definitions.

ANS0250E Memory used by the TSM API has been corrupted.

Explanation: Memory used by the TSM API has been corrupted.

System action: The system returns to the calling procedure.

User response: Retry the operation. If the problem continues, contact your system administrator or service representative.

ANS0251E The sendObj Archive description is too long.

Explanation: The sendObj Archive description is too long.

System action: The system returns to the calling procedure.

User response: The sndArchiveData.descr string must be less than or equal to DSM_MAX_DESCR_LENGTH.

ANS0252E The sendObj ObjAttr.objInfo is too long.

Explanation: The sendObj ObjAttr.objInfo is too long.

System action: The system returns to the calling procedure.

User response: The objInfo field must be less than or equal to DSM_MAX_OBJINFO_LENGTH.

ANS0253E The sendObj dsmObjName.hl is too long.

Explanation: The sendObj dsmObjName.hl is too long.

System action: The system returns to the calling procedure.

User response: The hl field must be less than or equal to DSM_MAX_HL_LENGTH.

ANS0254E The password, or encryptionPassword string provided is too long.

Explanation: The value provided for password or encryptionPassword is too long.

System action: The system returns to the calling procedure.

User response: The password or encryptionPassword field must be less than DSM_MAX_VERIFIER_LENGTH.

ANS0255E The sendObj dsmObjName.fs is too long.

Explanation: The sendObj dsmObjName.fs is too long.

System action: The system returns to the calling procedure.

User response: The fs field must be less than or equal to DSM_MAX_FS_LENGTH.

ANS0256E The sendObj dsmObjName.ll is too long.

Explanation: The sendObj dsmObjName.ll is too long.

System action: The system returns to the calling procedure.

User response: The ll field must be less than or equal to DSM_MAX_LL_LENGTH.

ANS0257E On RegisterFS or UpdateFS the fsAttr's fsInfo is too long.

Explanation: On RegisterFS or UpdateFS the fsAttr's fsInfo is too long.

System action: The system returns to the calling procedure.

User response: The fsInfo field must be less than or equal to DSM_MAX_FSINFO_LENGTH.

ANS0258I On dsmGetNextQObj or dsmGetData there is more available data.

Explanation: On dsmGetNextQObj or dsmGetData there is more available data.

System action: The system returns to the calling procedure.

User response: Call the function again.

ANS0259E The dataBlk buffer is too small for the query response.

Explanation: The dataBlk buffer is too small for the query response.

System action: The system returns to the calling procedure.

User response: On dsmGetNextQObj ensure that the dataBlk buffer is at least as big as the query response structure.

ANS0260E An invalid option keyword was found during option parsing.

Explanation: An invalid option keyword was found in the dsmInit configuration file, the option string, dsm.sys, or dsm.opt.

System action: The system returns to the calling procedure.

User response: Correct the spelling of the option keywords. Verify that the dsmInit configuration file only has a subset of the dsm.sys options. Check the error log for more details about the error.

ANS0261E The configuration file specified on dsmInit cannot be opened.

Explanation: The configuration file specified on dsmInit cannot be opened.

System action: The system returns to the calling procedure.

User response: Verify the file name.

ANS0262E The Include/Exclude definition file was not found.

Explanation: The Include/Exclude definition file was not found.

System action: The system returns to the calling procedure.

User response: Verify the file name on the Inclexcl option.

ANS0263E Either the dsm.sys file was not found, or the Inclexcl file specified in dsm.sys was not found.

Explanation: Either the dsm.sys file was not found, or the Inclexcl file specified in dsm.sys was not found.

System action: The system returns to the calling procedure.

User response: The dsm.sys file must be in the directory referenced by the environment variable

DSMI_DIR. Verify the file name on the Inclexcl option in the dsm.sys file.

ANS0264E Only a UNIX root user can execute dsmChangePW or dsmDeleteFS.

Explanation: Only a UNIX root user can execute dsmChangePW or dsmDeleteFS.

System action: The system returns to the calling procedure.

User response: Run this program as a root user.

ANS0265E You must issue dsmBindMC before dsmSendObj.

Explanation: You must issue dsmBindMC before dsmSendObj.

System action: The system returns to the calling procedure.

User response: Modify your program.

ANS0266I The dsmEndTxn vote is ABORT, so check the reason field.

Explanation: After a dsmEndTxn call, the transaction is aborted by either the server or client with a DSM_VOTE_ABORT and the reason is returned.

System action: The system returns to the calling procedure.

User response: Check the reason field for the code which explains why the transaction has been aborted.

ANS0267E Invalid command line option/value: 'option'

Explanation: The *option* is not valid on this command line.

System action: Processing stops

User response: Verify that the option and value are not misspelled and are valid with the current command.

ANS0268E Server problem: Destination not defined.

Explanation: Server problem: Destination not defined.

System action: Processing stopped.

User response: Have your service representative check the error log.

ANS0269S The structured file data type is unknown.

Explanation: An unknown and unexpected error code occurred within the client program. The structured file data type is unknown. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

ANS0270S The data buffer overflowed.

Explanation: The data buffer overflowed. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

ANS0271E No more files can be restored or retrieved since the destination directory is full.

Explanation: No more files can be restored or retrieved since the destination directory is full.

System action: Processing stopped.

User response: Free up disk space, or restore or retrieve the file to another disk.

ANS0272I The operation is finished.

Explanation: The operation is finished.

System action: The system returns to the calling procedure.

User response: Proceed with next function call.

ANS0273E The trusted agent execution/owner permissions are invalid.

Explanation: The trusted agent execution/owner permissions are invalid.

System action: Processing stopped.

User response: Have your system administrator check the installation instructions for the client to ensure that the trusted agent permissions are set correctly.

ANS0274S Process killed.

Explanation: Processing stopped. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

ANS0275S Trusted agent would block the operation.

Explanation: The trusted agent blocks the operation. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

ANS0276S The area for the include/exclude pattern is too small.

Explanation: The area for the include/exclude pattern is too small. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

ANS0277S There is no closing bracket in the pattern.

Explanation: There is no closing bracket in the pattern. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

ANS0278S The transaction will be aborted.

Explanation: The server encountered an error and will abort the transaction.

System action: The transaction will be aborted. The reason code is passed on the dsmEndTxn call.

User response: Issue the dsmEndTxn with a vote of DSM_VOTE_COMMIT and examine the reason code.

ANS0279I A file was skipped during a restore operation because the file is off line and the application has chosen not to wait for a tape mount.

Explanation: A file was skipped during a restore operation because the file is off line and the application has chosen not to wait for a tape mount.

System action: File skipped.

User response: Verify the application sets the mountWait value correctly on dsmBeginGetData.

ANS0280E Unable to find Trusted Agent module.

Explanation: TSM was unable to find the TSM Trusted Agent module in the specified directory. The name of the TSM Trusted Agent module is dsmtca.

System action: TSM ends.

User response: Make sure the Trusted Agent module is in the directory specified by DSMI_DIR.

ANS0281E Access denied for dsmapitca.

Explanation: An attempt to access a system function has been denied.

System action: Processing stopped.

User response: Contact your system administrator.

ANS0282E Password file is not available.

Explanation: The file containing the stored password for the specified *server-name* is unavailable.

System action: TSM ends.

User response: The root user must set and store a new password.

ANS0283E High level qualifier of the object name should start with the directory delimiter.

Explanation: The high level qualifier for the object name is invalid.

System action: The system returns to the calling procedure.

User response: High level qualifier of the object name should start with the directory delimiter.

ANS0284E The number of objects on dsmBeginGetData exceeds DSM_MAX_GET_OBJ | DSM_MAX_PARTIAL_GET_OBJ.

Explanation: The number of objects (numObjId) specified on the dsmBeginGetData call exceeds DSM_MAX_GET_OBJ | DSM_MAX_PARTIAL_GET_OBJ.

System action: The system returns to the calling procedure.

User response: Check the number of objects before calling dsmBeginGetData. If it is greater than DSM_MAX_GET_OBJ | DSM_MAX_PARTIAL_GET_OBJ, then issue multiple Get call sequences.

ANS0285E The update action is invalid.

Explanation: The dsmUpdateFS or dsmUpdateObj action is invalid.

System action: The system returns to the calling procedure.

User response: Correct the action value. Valid values are defined in dsmapihd.h and documented in our Using the API book.

ANS0286E The key file is missing.

Explanation: The key file for Tivoli Data Protection application client for Oracle cannot be found.

System action: The system returns to the calling procedure.

User response: Ensure that you have ordered the Tivoli Data Protection application client which contains TDP for Oracle, and install the key file.

ANS0287E The key file content is invalid.

Explanation: The key file content for Tivoli Data Protection application client for Oracle is invalid.

System action: The system returns to the calling procedure.

User response: Ensure that you have ordered the Tivoli Data Protection application client which contains the TDP for Oracle, and install the key file.

ANS0296I Encryption key passwords are not the same. Please try again...

Explanation: TSM found that the encryption key passwords do not match.

System action: You are prompted for the encryption key password.

User response: Enter the correct encryption key password.

ANS0297E Error opening specified file.

Explanation: The specified file could not be located or opened.

System action: Attempts to open file failed.

User response: Make sure the file exists.

ANS0298E Session Rejected: The specified user id is currently locked

Explanation: The user id you specified is currently locked on the server.

System action: Session was not started.

User response: Check with your system administrator

to find out why your user id is locked.

ANS0299E Scheduler cannot be started manually because the value of MANAGEDSERVICES option is SCHEDULE.

Explanation: if MANAGEDSERVICES SCHEDULE is indicated in the option file, the TSM scheduler cannot be started in the traditional manner.

System action: Scheduler stopped.

User response: If you are not going to use dsmcad to manage the schedule anymore, stop dsmcad and remove MANAGEDSERVICES option from the option file.

ANS0301E The TSM DLL dsm3270.dll cannot be found in the user's path.

Explanation: The TSM DLL dsm3270.dll cannot be found in the user's path.

System action: Communications link is not established.

User response: Make sure that the TSM DLL dsm3270.dll is in a directory that is included in the user's path.

ANS0302I Successfully done.

Explanation: The operation successfully completed.

System action: None.

User response: None.

ANS0304E Unable to generate password because password access is not set to GENERATE.

Explanation: User issued the Generate Password command, but password access is not set to GENERATE in the options file.

System action: TSM none.

User response: Add PASSWORDACCESS GENERATE to your dsm.opt file .

ANS0305E Unable to generate password because no NAS Node was specified.

Explanation: User issued the Generate Password command with class=NAS, but no NAS node was specified.

System action: None.

User response: Retry the command and use the -nasnodename option.

ANS0306E Unable to generate password because Class type is invalid or unknown.

Explanation: User issued the Generate Password command with an invalid or unknown class.

System action: None.

User response: Retry the command and use a supported class type option (class=CLIENT or class=NAS).

ANS0307I Password generated.

Explanation: User issued the Generate Password command and it was successful.

System action: None.

User response: None.

ANS0308E Remote operation failed to start on *obj-name*. Status: *status* reason: *reason*

Explanation: The request to start a remote operation has failed for the indicated node and filesystem. The status and the reason for the failure are shown.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS0309E Remote operation failed to start on *obj-name*. Status: *status*

Explanation: The request to start a remote operation has failed for the indicated node and filesystem. The status of the failure is shown.

System action: IBM Tivoli Storage Manager ended the current operation.

User response: Contact your system administrator for more information.

ANS0311E The tsmBuffHandle is invalid, or the value of dataPtr is invalid.

Explanation: An invalid value for a handle or dataPtr has been passed into the API.

System action: The system returns to the calling procedure.

User response: There is a problem with the calling application. Verify the values of the tsmBuffHandle and dataptr passed to the API.

ANS0312E The number of bytes copied into the tsmBuffer is larger than the allowed value.

Explanation: An invalid number of bytes was copied to a tsmBuffer.

System action: The system returns to the calling procedure.

User response: There is a problem with the calling application. Verify the number of bytes copied into the tsmBuffer.

ANS0313E dsmTerminate cannot finish because the application is holding on to 1 or more tsmBuffers.

Explanation: An application is trying to terminate a session, but is still holding some tsmBuffers.

System action: The system returns to the calling procedure.

User response: The application must return all buffers for this session by calling tsmReleaseBuffer, and then issue dsmTerminate.

ANS0314E An internal error occurred in the tsmBuffer array.

Explanation: An internal API buffer array error occurred.

System action: The system returns to the calling procedure.

User response: Try the operation again. If the problem continues, contact your system administrator or service representative.

ANS0315E Unable to open message text file.

Explanation: The system is unable to open the message txt file (dscenu.txt or dsmclientV3.cat for AIX). On the AS/400 platform this file is QANSAPI/QAANSENU(TXT).

System action: The system returns to the calling procedure.

User response: Verify that the dscenu.txt file is in the directory pointed to by DSMI_DIR. For AIX, verify that the dsmclientV3.cat file has a symbolic link to /usr/lib/nls/msg/<locale>/dsmclientV3.cat .

ANS0316E Unable to use message text file.

Explanation: The system is unable to use the message text file (dscenu.txt or dsmclientV3.cat for AIX) because of an invalid header. On the AS/400 platform this file is QANSAPI/QAANSENU(TXT).

System action: The system returns to the calling procedure.

User response: Install the message text file again.

ANS0317E Unable to use message text file.

Explanation: The system is unable to use the message txt file (dscenu.txt or dsmlclientV3.cat for AIX) because of an invalid control record. On the AS/400 platform this file is QANSAPI/QAANSENU(TXT).

System action: The system returns to the calling procedure.

User response: Install the message text file again.

ANS0318E Invalid value for DATEFORMAT specified.

Explanation: An invalid value is specified for DATEFORMAT.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

ANS0319E Invalid value for TIMEFORMAT specified.

Explanation: An invalid value is specified for TIMEFORMAT.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

ANS0320E Invalid value for NUMBERFORMAT specified.

Explanation: An invalid value is specified for NUMBERFORMAT.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

ANS0321E msg parameter for dsmRCMsg is a NULL pointer.

Explanation: The message parameter for dsmRCMsg is a NULL pointer.

System action: The system returns to the calling procedure.

User response: Allocate enough space for the message parameter.

ANS0322E no text available for this return code.

Explanation: The dsmRC parameter for dsmRCMsg is an unsupported return code.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

ANS0323E partialObjOffset value for partial object retrieve is invalid.

Explanation: The partialObjOffset value for partial object retrieve is invalid.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

ANS0324E partialObjLength value for partial object retrieve is invalid.

Explanation: partialObjLength value for partial object retrieve is invalid.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

ANS0325E Partial Object Retrieve is not supported on this server.

Explanation: The TSM server specified by the user does not support partial object retrieve.

System action: The system returns to the calling procedure.

User response: Specify a TSM server which supports the partial object retrieve function.

ANS0326E This node has exceeded its maximum number of mount points.

Explanation: Either no tape or sequential disk mount points are permitted for this operation, or the maximum number of mount points allowed are already in use. The operation can not be completed. The TSM administrator defines the maximum number of mount points with the MAXNUMMP property of your node definition.

System action: The object is skipped

User response: If you are performing any other TSM operations that might be using mount points, wait until those operations are complete, then try the failed operation again. Otherwise contact your TSM administrator for further assistance

ANS0327E A duplicate object was found, operation cannot complete.

Explanation: A duplicate object was found, operation cannot complete.

System action: The requested operation failed.

User response: Try the operation with a different file specification.

ANS0328E The specified objects failed the merge test.

Explanation: The specified objects failed the merge test, operation cannot complete.

System action: The requested operation failed.

User response: See documentation for the merge test parameters.

ANS0330E The dsmSetAccess access Type is invalid.

Explanation: The dsmSetAccess accessType is invalid.

System action: The system returns to the calling procedure.

User response: The accessType must be one of the following:

atBackup
atArchive

ANS0331E No files have been previously backed up for this filename/filespace.

Explanation: You tried to set access to files when no files for the specified filename, drive or file system were previously backed up.

System action: Processing stopped.

User response: Ensure that the correct drive or file system was specified and that files are backed up for you to set access.

ANS0332E No files have been previously archived for this filename/filespace.

Explanation: You tried to set access to files when no files for the specified filename, drive or file system were previously archived.

System action: Processing stopped.

User response: Ensure that the correct drive or file system was specified and that files are archived for you to set access.

ANS0333E Unknown Remote Mover type

Explanation: The specified Remote Mover type is unknown.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS0334E An Operation for the requested node and filespace is already in progress.

Explanation: A request has been made to use a data mover to perform an operation for the indicated node and filespace. Since an operation for this node and filespace is already in progress, the new operation cannot be performed.

System action: TSM ended the current operation.

User response: Retry the operation at a later time.

ANS0335E System resource in use

Explanation: A required resource is in use by another command or process.

System action: TSM ended the current operation.

User response: Retry the operation at a later time.

ANS0336E Server plugin communication error

Explanation: Communication between a server plugin module and a NAS filer failed.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS0337E Server plugin detected unsupported NAS filer operating system.

Explanation: A plugin module detected that a NAS filer is running an unsupported operating system or operating system level.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS0338E An invalid operation was attempted on a node

Explanation: The operation is not valid.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS0339E The specified target storage pool is not defined.

Explanation: The storage pool is not defined.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS0340E A target storage pool does not have the correct data format for the given node type.

Explanation: none

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS0341E No associated data mover is defined for the given node.

Explanation: none

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS0342E The CRC received from the Server does not match the CRC calculated by the client.

Explanation: The server sent a CRC for a buffer. The client calculated a CRC for the same buffer. These did not match. The mismatch indicates a communication failure.

System action: In some cases, the client can indicate the failure to the server and retry the operation.

User response: Check the trace log for additional information and retry the operation. If the problem persists, contact your system administrator.

ANS0343E An invalid operation was attempted on a group leader or group member.

Explanation: An invalid operation was attempted on a logical group.

System action: The current operation stops.

User response: Retry a valid operation.

ANS0344E Cannot Send data with a zero byte sizeEstimate.

Explanation: You cannot send data for an object with size estimate = 0.

System action: The system returns to the calling procedure.

User response: Set size estimate greater than 0 in dsmSendObj.

ANS0345E Remote disk not defined.

Explanation: An operation was attempted on a remote disk that is not defined.

System action: The current operation stops.

User response: Define the proper remote disk.

ANS0346E Input destination does not match expected destination.

Explanation: Input destination does not match expected destination.

System action: The current operation stops.

User response: Retry operation with proper destination.

ANS0347E Data mover is not available.

Explanation: Data mover is not available.

System action: The current operation stops.

User response: Retry operation with a proper Data mover.

ANS0348E Operation failed because the copy continue option was set to NO.

Explanation: Operation failed because the copy continue option was set to NO.

System action: The current operation stops.

User response: This abort code indicates that a store operation, like backup or archive failed because the copy continue option was set to NO. The sysadmin will need to resolve the problem on the server end.

ANS0349E Transaction failed because of a problem during a store operation.

Explanation: Transaction failed because of a problem during a store operation. This error is typical when the next storage pool has a different copy storage pool list and we switch to this pool in the middle of a transaction.

System action: Transaction is aborted.

User response: Resend objects in separate transactions.

ANS0350E The current client configuration does not comply with the value of the DATAWRITEPATH or DATAREADPATH server option for this node.

Explanation: The values of the DATAWRITEPATH and DATAREADPATH server options specify where the client is allowed to send data, and where data is read from. The values for the specified node name should correspond with the client configuration. For example, you will get this error message if DATAWRITEPATH contains a LAN value and the client is configured to use LAN-free protocol, or vice versa.

System action: Processing stopped.

ANS0351E • ANS0359E

User response: Check the client, server, and storage agent logs to determine why the client was not able to send data LAN-free. Make sure the client configuration and server options are compatible.

ANS0351E **The node or user does not have proper authority to perform this operation**

Explanation: The node or user does not have proper authority to perform this operation.

System action: The transaction is ended.

User response: Check the authority for the specified object.

ANS0352E **The operation is not permitted due to server licenses values.**

Explanation: The node or user is trying to perform an operation that either exceeds license values, or is not licensed.

System action: The session is rejected or the transaction is cancelled, ending the current operation.

User response: See your system administrator.

ANS0353E **When using useTsmBuffers, dataBlk must be NULL in calls to dsmSendObj and dsmGetObj.**

Explanation: The value for dataBlk must be NULL when using useTsmBuffers.

System action: The system returns to the calling procedure.

User response: There is a problem with the calling application. Contact your application provider

ANS0354E **Encryption is not allowed when using useTsmBuffers.**

Explanation: useTsmBuffers does not support encryption.

System action: The system returns to the calling procedure.

User response: Try the operation again, without using useTsmBuffers, or disable encryption for this operation.

ANS0355E **This object cannot be restored/retrieved using useTsmBuffers, because it is compressed.**

Explanation: useTsmBuffers does not support compression.

System action: The system returns to the calling procedure.

User response: Try the operation again, without using useTsmBuffers.

ANS0356E **This object cannot be restored/retrieved using useTsmBuffers, because it is encrypted.**

Explanation: useTsmBuffers does not support encryption.

System action: The system returns to the calling procedure.

User response: Try the operation again, without using useTsmBuffers.

ANS0357E **When using useTsmBuffers, a restore/retrieve with partial object restore is not allowed.**

Explanation: useTsmBuffers does not support partial object restore.

System action: The system returns to the calling procedure.

User response: Make sure the calling application is either using Partial object restore or useTsmBuffers.

ANS0358E **No encryption key was found. If you are using -encryptkey=prompt make sure there is a value in the encryptionPasswordP field and that bEncryptKeyEnabled is set to true.**

Explanation: There was no encryption key found in the password file, or no key was provided by the application.

System action: The system returns to the calling procedure.

User response: If you are using -encryptkey=prompt, make sure there is a value in encryptionPasswordP and that bEncryptKeyEnabled is set to true.

ANS0359E **Conflicting encryption key options have been specified.**

Explanation: When using the ENABLEENCRYPTKEY option, the parameter bEncryptKeyEnabled for the TSM API dsmInitExIn_t and tsmInitExIn_t structures cannot be set to bTrue.

System action: The system returns to the calling procedure.

User response: Either remove the ENABLEENCRYPTKEY option from the options file, or set the parameter bEncryptKeyEnabled to bFalse in the program using the TSM API.

ANS0360E The CAD cannot start because the value of the MANAGEDSERVICES option is NONE.

Explanation: The CAD will not start if MANAGEDSERVICES NONE is set in the option file. The CAD is designed to manage the web client or TSM schedules. By specifying NONE, the CAD will not manage any services.

System action: The CAD will stop processing.

User response: Specify either WEBCLIENT or SCHEDULER for the MANAGEDSERVICES option in the option file then restart the CAD.

ANS0361I DIAG:

Explanation: The message text is provided for diagnostic purposes and is meant to provide information to IBM support in problem determination.

System action: None.

User response: None.

ANS0400E License file could not be opened.

Explanation: The license file was not found, or could not be opened because of permissions or the file is corrupted.

System action: The system returns to the calling procedure.

User response: Check permissions on file. See if the license file is in the correct place.

ANS0401E Read failure on the license file.

Explanation: The license file was not found, or could not be opened because of permissions, or the file is corrupted.

System action: The system returns to the calling procedure.

User response: Check permissions on file. See if the license file is in the correct place.

ANS0402E Write failure on the license file.

Explanation: The license file was not found, or could not be opened because of permissions or the file is corrupted.

System action: The system returns to the calling procedure.

User response: Check permissions on file. See if license file is in the correct place.

ANS0403E Data in the license file is not in a valid format.

Explanation: The license file is not valid.

System action: The system returns to the calling procedure.

User response: User needs to obtain a new license.

ANS0404E The checksum in the license file does not match the licenseregistration string.

Explanation: The registration string is not valid.

System action: The system returns to the calling procedure.

User response: User needs to obtain a new license.

ANS0405E This is an expired try and buy license.

Explanation: The registration string is not valid.

System action: The system returns to the calling procedure.

User response: User needs to obtain a new license.

ANS0410E Oracle passed invalid mode

Explanation: Invalid mode passed by Oracle.

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

ANS0411E Oracle passed null file name

Explanation: Null filename passed by Oracle.

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

ANS0412E Wrong data block size

Explanation: Wrong Block Size

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

ANS0413E Object exists

Explanation: Backup or Restore Object already exists.

System action: The system returns to the calling procedure.

User response: If backing up an object, be sure to generate a unique object name.

ANS0414E Not same Oracle handle

Explanation: The handle passed from Oracle is not the same handle that TSM passed back.

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

ANS0415E End of file reached

Explanation: End of file reached.

System action: The system returns to the calling procedure.

User response: None

ANS0416E Wrong Read State

Explanation: The operation must be in READ state.

System action: The system returns to the calling procedure.

User response: Contact your service representative.

ANS0417E Runtime API version is outdated

Explanation: Runtime API is lower than compile time API.

System action: The system returns to the calling procedure.

User response: Use the WHAT command to find out the compile time API level. Obtain the same or higher level of API library.

ANS0418E Wrong write state

Explanation: The operation must be in WRITE state.

System action: The system returns to the calling procedure.

User response: Contact your service representative.

ANS0419E Invalid flag passed

Explanation: Invalid flag passed from Oracle.

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

ANS0420W Warning! Restoring inactive system state objects is not recommended. Do you wish to continue?

Explanation: Restoring inactive system state objects may cause system instability. Examples of possible problems include:

- Applications that were installed after the time the system state was backed up cannot function properly after restoring the inactive system state
- Critical operating system updates installed after the inactive system state backup was made can no longer be available, or may not function correctly.

Restoring inactive system state objects is not recommended unless you are certain that this is what you need to do.

System action: If user responds with yes, the client will restore the object. If user responds with no, the client will cancel the operation.

User response: Reply to the prompt. If you are unsure, reply no, and consult your system administrator or operating system vendor before proceeding further.

ANS0990W Options file '*file-name*' could not be found. Default option values will be used.

Explanation: Common reasons for this warning include:

- The default options file does not exist, and
- You did not specify the -OPTFILE option when starting the TSM client, and
- the environment variable DSM_CONFIG was not set.

System action: TSM client assumes default values for all client options and continues processing, using the default server name and associated options found in the dsm.sys file.

User response: If the default system action is acceptable, you can eliminate this message by creating an empty dsm.opt file in the installation directory.

If you have a client user options file (dsm.opt), either place it in the installation directory or set the DSM_CONFIG environment variable to the fully-qualified path and file name of your options file.

Review the information on configuring TSM in the TSM client manual specific to your operating system. If the problem persists, ask your TSM administrator for further assistance.

ANS0991I TSM scheduler is listening for server requests on port *port number*

Explanation: This message indicates the port number on which the clients is listens for server requests. If the port number in the message differs from the default value or what you specified with the TCPCLIENTPORT option, it is because the port was in use by a different process.

System action: Processing continues.

User response: Normally no further action is required. If you require TSM to use a specific port number, you

need to configure your system or applications so the number is available. Restart the TSM client and confirm it uses the desired port.

ANS0992E The destination filesystem or drive letter is unavailable. For more details please see `dsmerror.log`.

Explanation: The system is trying to restore or retrieve to a destination that cannot be reached. The specified filesystem name or drive letter is not valid, or does not exist, or you are specifying a local share name that cannot be resolved.

System action: Objects which are part of this filesystem are not processed.

User response: Try the command again, and specify a different destination for the object that was not processed.

ANS1000E An unsupported communications method was specified.

Explanation: None.

System action: processing stops.

User response: Specify a communications interface that is supported by the TSM client on your operating system. See the TSM client manual for your operating system for further information on configuring TSM client communications.

ANS1001E Volume being backed up was not a system volume. Skipped.

Explanation: User specified to back up system volume only. This volume was not backed up since this volume is not a system volume.

System action: Volume was not backed up.

User response: Use All option or use image backup command to backup this volume.

ANS1002I MOS image is being created. It may take a while.

Explanation: Mini Operating System image is being created. It may take a while to create it.

System action: TSM is gathering necessary information.

User response: None.

ANS1003E Backup failed to start for node = *node-name*, file system = *fs-name*, **errno** = *error-code*, **reason** : *error-reason*

Explanation: An attempt to start backup for remote node failed.

System action: Backup fails.

User response: Retry the operation. If the problem persists, contact the server administrator.

ANS1004W Node has exceeded max tape mounts allowed. Operation for '*filesystem-name*' will be tried again later.

Explanation: Node has exceeded max tape mounts allowed. The operation will be tried again later.

System action: The operation will be retried.

User response: Increase the number of allowed tape mounts for this node on the server to avoid this situation again.

ANS1005I TCP/IP read error on socket = *socket-id*, **errno** = *error-code*, **reason** : '*error-reason*'.

Explanation: An attempt to receive data using TCP/IP connection failed. If reason : 'Connection reset by peer', it is possible that the server control connection timed out. This can occur if the file transfer time is greater than the IDLETIMEOUT value set on the server.

System action: TCP/IP connection to server fails.

User response: If the timeout was due to a large file transfer time, you can ignore this message. The client will reconnect with the server automatically, finish transferring the data, and send statistics. You can also consider increasing the IDLETIMEOUT value in the server options file.

ANS1006I TCP/IP write error on socket = *socket-id*, **errno** = *error-code*, **reason** : *error-reason*

Explanation: An attempt to send data using TCP/IP connection failed.

System action: Connection to server fails.

User response: Retry the operation. If the problem persists, contact your system administrator.

ANS1007E Sending of object '*object-nameobject-nameobject-name*' failed. There is no backup copy group.

Explanation: The management class for this file (*object-name*) does not have a backup copy group. Either the default management class does not have a backup copy group, or an INCLUDE statement is attempting to bind the file to a management class that does not have a backup copy group.

System action: TSM did not back up the file.

User response: Run DSMC QUERY MGMTCLASS -DETAIL to view information about available management classes.

- If the file is being bound to the default management class, make sure the management class has a backup copy group.

ANS1008E • ANS1018E

- If the file is being bound to a management class specified in an INCLUDE statement, make sure that the management class has a backup copy group.
- If you have more than one TSM server, make sure you are connecting to the correct server.
- If you are unable to find a suitable management class, contact your TSM administrator for further assistance.

ANS1008E **Sending of object 'object-nameobject-name object-name' failed: No Archive Copy Group**

Explanation: The management class for this file (*object-name*) did not have an archive copy group specified.

System action: TSM did not back up the file.

User response: See your system administrator.

ANS1009W **An error occurred processing the operating system include/exclude statements. The error was detected while processing: subsystemname.**

Explanation: The client encountered an error while obtaining the automatic include/exclude statements from the operating system. Possible reasons for this error include:

- The specified registry key cannot be opened for reading
- The entry under this key has incorrect data

System action: Processing continues without the full list of operating system include/exclude statements.

User response: Ensure that you have access to the specified registry key and that entries are a MULTISZ values that contain:

- Individual files
- Directories
- Wild card entries
- Environment variables
- /s switch (the /s switch is used on directory and/or wild card entries and signifies that all subdirectories of this directory should be excluded)

If the cause of this message can not be determined or resolved, contact IBM technical support for further assistance.

ANS1010E **Error processing 'filespace-name': Unsupported file system operation.**

Explanation: The file system does not support an operation required to process the file or directory.

System action: The file or directory is skipped. Depending on the specific error encountered, processing on Solaris clients might stop.

User response: Verify that the file system is supported by the TSM client. If a restore or retrieve failed, retry the operation to another location. If the problem persists, look for other indications of system problems. It may be necessary to run the operating system utility that checks and repairs file system inconsistencies. If the problem still cannot be resolved, contact your TSM administrator for further assistance.

ANS1015E **The session is rejected. The server does not allow a signon of a client that is not archive-retention protection enabled.**

Explanation: The client cannot establish a connection to the server because the server is archive-retention protection enabled and the client is not.

System action: The session is not started.

User response: See your system administrator.

ANS1016I **No eligible files were found.**

Explanation: The backup or archive operation completed, but no files were processed. Possible reasons for this include:

 The directory that was backed up or archived contains no files

 The files are excluded from backup or archive

System action: None

User response: Check the path you entered.

ANS1017E **Session rejected: TCP/IP connection failure**

Explanation: An attempt to connect to the server using TCP/IP communications failed. This can be a result of incorrect TCP/IP option settings in your client options file. This error can also occur if the LAN connection went down or if your system administrator canceled a backup operation.

System action: Session rejected. Processing stopped.

User response: Retry the operation, or wait until the server comes back up and retry the operation. If the problem continues, see your system administrator for further help.

ANS1018E **Port port number is already in use**

Explanation: The port specified by the TCPCLIENTPORT option is in use by a different process.

System action: Processing stopped.

User response: Contact the server administrator to set up a different port for server-initiated connections. Update the TCPCLIENTPORT with this new port number.

ANS1019E The volume could not be opened.

Explanation: An error occurred when TSM tried to open the volume for a backup or restore operation.

System action: The requested operation does not run.

User response: Examine the client error log for additional messages related to this error. Verify that the volume is available, and is not locked by another process. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1020E System object backup failed.

Explanation: An error occurred while backing up Windows system object files. The backup did not complete.

System action: Processing stopped.

User response: Ask your system administrator to check the error log. Restart the Windows service associated with the system object indicated in the error log, and retry the backup operation

ANS1021E System object restore failed.

Explanation: An error occurred while restoring Windows system object files. The restore did not complete.

System action: Processing stopped.

User response: Ask your system administrator to check the error log. Restart the machine, and then restore the system object indicated in the error log again.

**ANS1022E Cancel failed for node: *node-name*
filesystem: *fs-name* operation: *op-type*
error: *error***

Explanation: The request to cancel a remote operation has failed. The node, filesystem, operation and reason for the failure are shown.

System action: TSM operation not cancelled.

User response: Contact your system administrator for more information.

ANS1023E Session rejected: Node type mismatch

Explanation: Your node name is associated with a different type of operating system (such as OS/2 or AIX) and cannot be used on this system.

System action: TSM canceled the current operation.

User response: If you need a new node name, see your system administrator to assign a new one to you. Generally, you have a unique node name for each

machine and operating system pair that requires access to the server.

ANS1024E Failed to update backup attributes on server for 'backup type' backup for 'filesystem namepath-namefile-name', object id 'object-id:object-id' return code 'return code'.

Explanation: TSM failed to update attributes for the named backup object on the server. The server may not reflect correct state of the backup.

System action: Processing continues.

User response: Check preceding error messages in error log for more information. Retry the operation. If problem continues, contact your TSM administrator.

ANS1025E Session rejected: Authentication failure

Explanation: Authentication failure. You entered an incorrect password.

System action: TSM canceled the current operation.

User response: Enter your correct password. If you cannot remember the correct password, see your system administrator to have a new one assigned for your node name.

ANS1026E The session is rejected: There was a communications protocol error.

Explanation: An unexpected network message was received by the client. This could be caused by network problems or a programming error.

System action: TSM canceled the current operation.

User response: Verify that your communication path is functioning properly and try the operation again. If the problem persists, contact your TSM administrator for further assistance.

ANS1028S An internal program error occurred.

Explanation: TSM encountered an unexpected condition and can not continue the operation. This might be a programming error.

System action: processing stops.

User response: Try the operation again. If the problem persists, contact your TSM administrator or IBM technical support for further assistance.

ANS1029E Communication with the TSM server is lost.

Explanation: This message is issued after the session with the TSM server is unexpectedly lost. The client error log might contain additional information regarding this problem.

System action: processing stops.

User response:

- Restart the TSM client and retry the operation.
- If the problem persists, review the client error log for other messages that might be related to this problem.
- Verify that network connectivity exists between the TSM client machine and the TSM server machine.
- Contact your TSM administrator for further assistance. The TSM administrator can review the TSM server activity log for additional information about the problem.

ANS1030E The operating system refused a TSM request for memory allocation.

Explanation: TSM requires access to memory in order to store information as processing proceeds. In this case, more memory was requested than the operating system would allocate. Possible reasons include:

The system is low on memory.

The process in which the program runs has exceeded the maximum memory that it is allowed to allocate.

Some other error condition occurred that caused the program to think it is out of memory.

System action: TSM cannot complete the requested operation.

User response: Close all unneeded applications and try the operation again. If the operation still fails, try dividing the task into several smaller units. For example, if a file specification contains several high level directories, run the TSM task serially for each directory. If the TSM task is an incremental backup, use the option "-memoryefficientbackup=yes".

For UNIX systems that support resource limits, check to see `b` if the memory resource limit is too low by entering the following command: `ulimit -a`

Based on the resulting data, you can ask the UNIX system root user to increase resource limits so that it will override the current default. The UNIX system root user has the authority to increase resource limits.

ANS1031E The attempt to establish a TCP/IP connection timed out before the connection was made.

Explanation: None.

System action: processing stops.

User response:

- Restart the TSM client and retry the operation.
- Check the client options file and verify that TCPSERVERADDRESS and TCPPORT specify the correct TCP/IP address and port number for your TSM server.

- Verify that network connectivity exists between the TSM client machine and the TSM server machine.
- If the problem persists, see your TSM administrator for further assistance.

ANS1032E An attempt to establish a TCP/IP connection was rejected by the host

Explanation: An attempt to establish a TCP/IP connection was rejected by the server.

System action: Processing stopped.

User response: The server was not fully initialized, is not currently running, was not enabled for TCP/IP communications, or an incorrect TCP/IP port number was specified. If the problem continues, see your system administrator.

ANS1033E An invalid TCP/IP address was specified.

Explanation: The TCP/IP address specified by the TSM client's TCPSERVERADDRESS setting could not be found on the network. Common reasons for this error include:

- The TCPSERVERADDRESS client option specifies the wrong TCP/IP address for the TSM server".
- The machine that hosts the TSM server is not on the network.
- A network problem is preventing the TSM client from reaching the machine that hosts the TSM server.

System action: processing stops.

User response: Verify that the TCPSERVERADDRESS and TCPPORT settings have the correct values for your TSM server. Use your operating system's "ping" (or similar) utility to ensure that your machine can locate the machine that hosts the TSM server across the network. Try the operation again. If the problem persists, ask your TSM administrator for further assistance.

ANS1034E The specified TCP/IP host name is unreachable

Explanation: The TCP/IP host name specified in the TCPSERVERADDRESS statement cannot be reached.

System action: Processing stopped.

User response: Check your options file for the correct TCPSERVERADDRESS statement. See your administrator for the correct name of the server.

ANS1035S Options file '*file-name*' could not be found.

Explanation: Common reasons for this error include:

- The default options file does not exist.

- You specified the -OPTFILE option when starting the TSM client, but the options file you provided does not exist.
- The DSM_CONFIG (or DSMI_CONFIG if you are using the TSM API) environment variable specifies an options file that does not exist.

System action: TSM client processing stops.

User response: Make sure that the options file you want to use exists. Review the information on configuring TSM in the TSM client manual specific to your operating system. If the problem persists, ask your TSM administrator for further assistance.

ANS1036S The option '*option*' or the value supplied for it is not valid. It was found in options file '*file-name*' at line number: *number* The complete entry: '*entry*'

Explanation: The specified *option* in the TSM options file (*file-name*) is in error. Either the option itself or its value are invalid.

System action: Processing stopped.

User response: Correct the options file entry.

ANS1037S Invalid keyword specified

Explanation: TSM found an incorrect keyword in the options file.

System action: Processing stopped.

User response: Correct the options file with valid entries.

ANS1038S Invalid option specified

Explanation: An incorrect option was specified to TSM.

System action: Processing stopped.

User response: Correct the options used for running TSM.

ANS1039S The include or exclude pattern cannot be parsed.

Explanation: The pattern is formatted incorrectly or is too complex for TSM to interpret.

System action: Processing stopped.

User response: Verify that the include or exclude pattern is specified correctly. If the pattern is correct, then contact IBM technical support for further assistance.

ANS1040S Include/Exclude pattern is missing a closing bracket

Explanation: The include or exclude pattern is incorrectly constructed. The closing bracket is missing.

System action: Processing stopped.

User response: Correct the syntax for the pattern.

ANS1041S Include/Exclude pattern must start with a directory delimiter

Explanation: The include or exclude pattern must start with a directory delimiter.

System action: Processing stopped.

User response: Correct the syntax for the pattern.

ANS1042S Include/Exclude pattern has a '...' without beginning/ending directory delimiter

Explanation: The include/exclude pattern has a '...' without a beginning or ending directory delimiter.

System action: Processing stopped.

User response: Correct the syntax for the pattern.

ANS1043S Quotes are not matched

Explanation: The quotes specified in the pattern are not the same and do not make a set.

System action: Processing stopped.

User response: Correct the pattern by using matching quotes in the syntax.

ANS1044S Unresolved environment name '*environment-name*'. This filespace is being ignored. Processing Continues.

Explanation: The specified *environment-name* in the options file is invalid.

System action: TSM attempts to continue the current operation.

User response: Check the environment variable in the options file and use a valid environment variable. Retry the operation.

ANS1045S Environment variable syntax error.

Explanation: Incorrect syntax is specified in the options file. Make sure that the variable is enclosed in curly braces.

System action: TSM attempts to continue the current operation.

User response: Check the syntax of environment

ANS1046S • ANS1055I

variable in the options file. Correct it and retry the operation.

ANS1046S Environment string for variable '*environment-name*' too long. Anything beyond 1024 characters is being ignored

Explanation: Environment variable expanded to a string which is too long. Make sure that the string is no more than 1023 characters long.

System action: TSM attempts to continue the current operation.

User response: Check the length of environment string and break it up into smaller strings using multiple environment variables.

ANS1047E The destination file system is unavailable. The following object was skipped: File space:*filesystem-name*
Pathname:*path-name*
Filename:*file-name*

Explanation: The client is trying to restore or retrieve the specified object to a destination that is not valid, does not exist, or cannot be reached.

System action: The object is not restored or retrieved. Processing continues with the next object.

User response: Try the command again using a different destination.

ANS1048E Device '*volname*' is not local

Explanation: The selected path is not a local device and therefore is not a valid object for image operations.

System action: The requested logical volume operation is not performed.

User response: Choose another object.

ANS1049E '*filename*' is not a valid destination file for image restore

Explanation: The filename you specified is not a valid name for a file or it is a directory.

System action: Restore processing stopped.

User response: Specify a correct filename for image restore.

ANS1050E The volume *volume-name* could not be locked.

Explanation: An error occurred when TSM tried to open the volume for a backup or restore operation.

System action: The requested operation does not run.

User response: Examine the client error log for additional messages related to this error. Verify that the

volume is available, and is not locked by another process. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1051I Invalid password

Explanation: You entered an invalid password.

System action: TSM cannot connect to the server without the correct password.

User response: Enter the password, or ask your system administrator for the correct password.

ANS1052E Direct connection to the Storage Agent is not allowed.

Explanation: You cannot connect directly to the Storage Agent.

System action: Processing stopped.

User response: To perform Lanfree operations using the Storage Agent, specify the ENABLELANFREE option in your options file, and restart the process.

ANS1053I Existing filesystem *filesystem-name* has been renamed to *filesystem-name*

Explanation: The existing filesystem name using the volume label has been renamed to the UNC format naming convention.

System action: Processing continues.

User response: None.

ANS1054E Existing filesystem *filesystem-name* cannot be renamed to new filesystem *filesystem-name*. TSM return code = *retcode*.

Explanation: The client was unable to migrate a file space name from the volume label naming convention to the UNC naming convention.

System action: Processing stopped.

User response: Check the client error log and the TSM server activity log for any other messages that might help identify the problem. If the problem cannot be resolved, contact IBM technical support for additional assistance.

ANS1055I Trying to rename existing filesystem *filesystem-name* to new filesystem *filesystem-name*, but drive letters do not match, old=*drive-letter*, new=*drive-letter*. Ignore the old filesystem and backup to the new filesystem.

Explanation: Trying to rename the existing filesystem name using the volume label to the UNC format naming convention but the drive letters do not match.

Leave the existing file space alone and create a new file space.

System action: Processing continues.

User response: None.

ANS1056E Share/network path *share* cannot be resolved. Path does not exist.

Explanation: For backup: Trying to backup share/network, which either does not exist or does not have the correct privilege to access the share. For restore : Trying to restore to a share/network path that cannot be resolved. The directory path does not exist.

System action: Processing stopped.

User response: Retry the command and specify a destination, or restore the directory tree first before trying to restore the share point.

ANS1057I File space *file space-name* cannot be renamed to new file space *file space-name*, because the new file space already exists.

Explanation: The client was unable to migrate a file space name from the volume label naming convention to the UNC naming convention because the new file space already exists on the TSM server.

System action: The operation proceeds using the new file space. The old file space is ignored.

User response: No action is necessary, but if the data in the old file space is no longer needed, it can be deleted from the TSM server.

ANS1058E The restore destination cannot be reached.

Explanation: Either the destination file system is invalid or it cannot be reached.

System action: Processing stopped.

User response: Try the command again using a different destination.

ANS1059E Two inactive objects with the same image name were selected. Process terminates

Explanation: You selected more than one inactive version of the same image object (logical volume). The system has no way to decide which you want to restore.

System action: The requested logical volume restore is not performed.

User response: Retry the operation, selecting an active version or only one inactive version of the volume you wish to restore.

ANS1060E The specified path is not a mounted filesystem

Explanation: You entered a file system name that does not correspond to a mounted file system for this system. It is possible the file system name is misspelled, or simply that the file system is not currently mounted.

System action: The requested logical volume operation is not performed.

User response: Retry the operation, using name of a mounted file system.

ANS1061E The specified device corresponds to a mounted file system; you must specify the file system by name.

Explanation: You entered a logical device name that is mapped to a mounted file system. This volume must only be referenced by its file system name.

System action: The requested logical volume operation is not performed.

User response: Try the operation again, using the file system name instead of the device name.

ANS1062E Only a single image may be selected when a destination is entered.

Explanation: You selected more than one image object (logical volume) to be restored. You also specified a destination. The system cannot place more than one image into a single destination volume. When more than one object is selected, each must be restored to its original location.

System action: The requested logical volume restore is not performed.

User response: Retry the operation, selecting one object to be restored to the given destination, or retry the operation without entering the destination.

ANS1063E The specified path is not a valid file system or logical volume name.

Explanation: None.

System action: The logical volume operation is not performed.

User response: Try the operation again using a valid path.

ANS1064E An unexpected error occurred while processing the image operation.

Explanation: None.

System action: The requested operation does not run.

User response: Examine the client error log for any

ANS1065E • ANS1073E

additional messages that may have been issued before or after this message. Correct any problems, if possible. If the cause of this message can not be determined or resolved, contact IBM technical support for further assistance.

ANS1065E Library version of the image utility does not match that of the TSM API

Explanation: The current system has a mix of installed components.

System action: The requested logical volume operation is not performed.

User response: Re-install all TSM components

ANS1066E The restore operation completed successfully, but the file system could not be remounted.

Explanation: None.

System action: The file system is left unmounted.

User response: Use the mount command to mount the file system. On AIX, run fsck if requested by the operating system.

ANS1067E A call to a system function returned an unexpected error.

Explanation: If you are performing a JFS2 snapshot based operation, it is possible that the snapshot was not large enough to contain all the changes made to the filesystem after the snapshot was created. This could cause the snapshot to become invalid thereby preventing TSM client from reading the snapshot.

System action: The requested operation does not run.

User response: Examine the client error log for additional messages related to this error. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

If you are performing a JFS2 snapshot based operation, please use the default snapshotcachesize of 100% and ensure that the volume group has sufficient disk space to allocate snapshots at least as large as the file system and retry the operation.

ANS1068E Device is not local

Explanation: The selected path is not a local device and therefore is not a valid object for image operations

System action: The requested logical volume operation is not performed.

User response: Choose another object.

ANS1069E An error occurred while reading data from the device

Explanation: An error occurred while reading data from the device. Windows Only: This could be due to bad sectors on the drive.

System action: The requested logical volume operation is not performed.

User response: Retry the operation, then check the error log for more information. Windows Only: Please run chkdsk /r and retry the operation. If the problem persists, a possible workaround is to back up the entire drive using a regular (non-image) backup. Please ensure that all your data is backed up. Then format the drive using a full format (without the /q quick format option). Then restore the data and retry the image backup operation.

ANS1070E Write error

Explanation: An error occurred while writing data to the device.

System action: The requested logical volume operation is not performed.

User response: Re-try the operation, check error log for more information.

ANS1071E Invalid domain name entered: 'domain-name'

Explanation: You entered an invalid domain *domain-name*. Check whether the domain name is a file system and the file system is mounted. A directory cannot be specified in the domain option, unless it is a virtual mount point.

System action: Processing continues if there are other file systems in the domain option to back up.

User response: Enter a valid drive or file system name (domain).

ANS1072E Unable to continue operation; Drive 'drive-name' has no volume label.

Explanation: The specified *drive-name* in the domain list does not have a volume label.

System action: Processing stopped.

User response: Use the system format utility to place a unique volume label on all drives on which you intend to run TSM.

ANS1073E The file space for domain '*domain-name*' could not be found on the TSM server.

Explanation: The specified file space was expected to be found on the server, but it no longer exists. It is possible that a command was issued to delete the file

space from the server while the current operation was in progress.

System action: TSM processing stops.

User response: Try the operation again. If the problem recurs, check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1074W The operation was stopped by the user.

Explanation: The operation was stopped at the request of the user. This usually occurs when the 'Q' key is pressed two times.

System action: Processing stopped.

User response: None.

ANS1075E (The operating system refused a TSM request for memory allocation.

Explanation: TSM requires access to memory in order to store information as processing proceeds. In this case, more memory was requested than the operating system would allocate. Possible reasons include:

The system is low on memory.

The process in which the program runs has exceeded the maximum memory that it is allowed to allocate.

Some other error condition occurred that caused the program to think it is out of memory.

System action: TSM cannot complete the requested operation.

User response: Close all unneeded applications and try the operation again. If the operation still fails, try dividing the task into several smaller units. For example, if a file specification contains several high level directories, run the TSM task serially for each directory. If the TSM task is an incremental backup, use the option "-memoryefficientbackup=yes".

For UNIX systems that support resource limits, you can check if the memory resource limit is too low by entering the following command: `ulimit -a`

Based on the resulting data, you can ask the UNIX system root user to increase resource limits so that it will override the current default. The UNIX system root user has the authority to increase resource limits.

ANS1076E The specified directory path could not be found.

Explanation: An invalid or unreachable directory path was specified.

System action: Processing stopped.

User response: Try the operation again using a valid directory path.

ANS1078S Unknown system error *error-code* occurred.

Explanation: An error unknown to TSM *error-code* occurred within the client program.

System action: The client stops.

User response: Check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1079E No file specification entered

Explanation: You did not enter a file specification as prompted.

System action: TSM did not continue with the requested operation.

User response: Enter a file specification to continue.

ANS1081E Invalid search file specification '*string*' entered

Explanation: You entered a file specification or search *string* that contains incorrect characters or contains wildcard characters in the drive specification or file system name.

System action: Processing stopped.

User response: Enter a correct file specification as described in the appropriate *Using the Backup-Archive Client* book for the particular operating system.

ANS1082E Invalid destination file specification '*file-name*' entered

Explanation: You entered a destination *file-name* specification that contains incorrect characters or has wildcard characters in the specification.

System action: Processing stopped.

User response: Enter a correct file specification as described in the appropriate *Using the Backup-Archive Client* book for the particular operating system.

ANS1083E No files have previously been archived for '*filespace-name*'

Explanation: You tried to retrieve files when no files for the specified drive or file system (*filespace-name*) were previously archived.

System action: Processing stopped.

User response: Ensure that the correct drive or file

ANS1084E • ANS1093E

system was specified and that files are archived for you to retrieve.

ANS1084E No files have previously been backed up for '*filespace-name*'

Explanation: You tried to restore files when no files for the specified drive or file system (*filespace-name*) were previously backed up.

System action: Processing stopped.

User response: Ensure that the correct drive or file system was specified and that files are backed up for you to restore.

ANS1085E No memory available to store Archive Management Class override name

Explanation: Not enough memory was available for the operation.

System action: Processing stopped.

User response: Retry the operation or restart the system with fewer programs in memory.

ANS1086E File not found during Backup, Archive or Migrate processing

Explanation: The file being processed for backup, archive or migrate no longer exists on the client. Another process deleted the file before it could be backed up, archived or migrated by TSM.

System action: File skipped.

User response: None.

ANS1087E Access to the specified file or directory is denied

Explanation: Access to the specified file or directory is denied. You tried to read from or write to a file and you do not have access permission for either the file or the directory.

System action: Processing stopped.

User response: Ensure that you specified the correct file or directory name, correct the permissions, or specify a new location.

ANS1088E File space '*filespace-name*' does not exist

Explanation: The specified file space (domain) is incorrect or does not exist on the machine.

System action: Processing stopped.

User response: Retry the operation specifying an existing domain (drive letter or file system name).

ANS1089E Destination directory path length exceeds system maximum

Explanation: The path name specified plus the path name in the restored file name combine to create a name whose length exceeds the system maximum.

System action: Processing stopped.

User response: Specify a destination path that, when combined, is less than the system maximum.

ANS1090E The LVM1 device is no longer supported by this client.

Explanation: The selected path refers to a volume device managed by LVM version 1. LVM 1 is no longer supported by this version of client and therefore is not a valid object for image operations.

System action: The requested logical volume operation is not performed.

User response: Use earlier versions of the client that support LVM1 to perform the logical volume operation. Alternatively, you can upgrade to LVM2 and migrate the volume to LVM2. LVM2 is supported by this client for logical volume operations.

ANS1091E Communications error with server during object query

Explanation: An unexpected communications error occurred during an object query to the server.

System action: Processing stopped.

User response: Verify that communications are active between the client and server machines. Server outages, processor outages, and communication controller outages can cause this error.

ANS1092W No files matching search criteria were found

Explanation: You entered a search pattern or file name that cannot be found in the server database.

System action: Processing stopped.

User response: Ensure that your search pattern is correct, or specify a new search string.

ANS1093E Your TSM server does not support point-in-time processing.

Explanation: The client has requested a point-in-time query or restore operation, but the TSM server to which the client is connected does not support point-in-time operations.

System action: Processing stopped.

User response: Make sure that you are connected to the correct TSM server. If you are connected to the

correct server, then try the command again without specifying any point-in-time options.

ANS1094E Server does not support Query Node command.

Explanation: The server to which you are connected does not support Query Node command.

System action: Processing stopped.

User response: Use a TSM Server that supports Query Node command.

ANS1096S Either the node does not exist on the server or there is no active policy set for the node.

Explanation: This error occurs when you try to access another node's data. Either the node is not registered with the TSM server, or there is no active policy set for the node.

System action: Processing stops.

User response: Verify that the node whose data you are trying to access is registered with the TSM server. If you have more than one TSM server, make sure you are connecting to the correct server, then try the operation again. If the problem persists, contact your TSM administrator for further assistance.

ANS1097E The client help text cannot be read from the help file.

Explanation: The help file was opened successfully and its table of contents are available, but there is a problem reading the text from the help file.

System action: Processing stopped.

User response: If the DSM_DIR environment variable is set, verify that it points to the directory containing the current level of TSM program files, then try the operation again. If the problem recurs, re-install the TSM client software. If the problem persists, IBM technical support for further assistance.

ANS1098E Process terminated; Program memory exhausted.

Explanation: The program used all available storage.

System action: Processing stopped.

User response: Free any unnecessary programs (TSRs) that are running, and retry the operation. Reducing the scope of queries and the amount of data returned can also solve the problem.

ANS1099E File 'filename' not previously archived

Explanation: You tried to give access to a file, which is not stored on the server.

System action: Processing stopped.

User response: Ensure that the correct filename is specified.

ANS1100E File 'filename' not previously backed up

Explanation: You tried to give access to a file, which is not stored on the server.

System action: Processing stopped.

User response: Ensure that the correct filename is specified.

ANS1101E User is not authorized to encrypt filename.

Explanation: The user is not authorized to encrypt the file. Normally, only a TSM authorized user or a root user can use TSM encryption. However, a certain combination of PASSWORDACCESS and ENCRYPTKEY options may allow encryption operations by a non-authorized user.

System action: The file is not backed up or restored.

User response: Log in as a root or TSM authorized user and retry the operation. Refer to *Backup-Archive Client Installation and User's Guide* for the correct usage of the ENCRYPTKEY option.

ANS1102E An excessive number of command line arguments are passed to the program.

Explanation: This command processing routine received more operands than it can use. The rules are:

- Query can contain only one file specification.
- Restore and Retrieve can contain two file specifications.
- Archive, Incremental, and Selective can contain a maximum of 20 file specifications. To bypass the 20-operand limit, use the -REMOVEOPERANDLIMIT option on the failing archive, incremental, or selective command.

Note: The TSM Client operates much more efficiently if it expands wild cards internally, rather than accepting the expanded list from the shell.

System action: Processing stopped.

User response: Reduce the number of arguments and retry the operation. For UNIX-based systems, ensure that you have surrounded the specification containing pattern matching characters with quotes. As an alternative, use the -REMOVEOPERANDLIMIT option on the failing archive, incremental, or selective command.

ANS1103E Invalid management class entered

Explanation: You entered an invalid management class.

System action: TSM is unable to do the requested operation.

User response: Retry the operation using a valid management class.

ANS1104E The management class for this file does not have a valid archive copy group. This file will not be archived.

Explanation: The management class for this file does not have an archive copy group specified. This file will not be archived.

System action: Processing stopped.

User response: Add a valid archive copy group to the management class, and then retry the operation.

ANS1105E The management class for this file does not have a valid backup copy group. This file will not be backed up.

Explanation: The management class for this file does not have a backup copy group specified. This file will not be backed up.

System action: Processing stopped.

User response: Add a valid backup copy group to the management class, and then retry the operation.

ANS1106E ENCRYPTKEY SAVE not configured correctly. Encryption not used.

Explanation: This message is issued for TSM Authorized Users and root users when ENCRYPTKEY SAVE and PASSWORDACCESS PROMPT options are set. Please note that these are the default values. These values do not allow encryption.

System action: The file is not encrypted.

User response: To save encryption keys, you must change configuration values. Add PASSWORDACCESS GENERATE to your system option file.

ANS1107E Invalid option/value: 'option'

Explanation: You specified an incorrect TSM option or option value *option*.

System action: For the command line client: Processing stops.

For the native GUI client: There is a small set of options critical to the initialization of the client. If an error is found in one of these, this message is presented and the client terminates without further processing.

User response: Specify a correct TSM option as

defined in the appropriate *Using the Backup-Archive Client* book for the particular operating system.

ANS1108E Invalid option (option) for the function command

Explanation: There are two possible reasons for this message:

- The *option* option was specified for a command or subcommand (*function*) that cannot make use of that option.
- The option appears on the initial command line and is not valid there.

System action: Processing stopped.

User response: See the *Backup-Archive Client Installation and User's Guide* for correct use of the named option.

ANS1109E User is not authorized to encrypt the file.

Explanation: The user is not authorized to encrypt the file. Normally, only a TSM authorized user or a root user can use TSM encryption. However, a certain combination of PASSWORDACCESS and ENCRYPTKEY options may allow encryption operations by a non-authorized user.

System action: The file is not backed up or restored.

User response: Log in as a root or TSM authorized user and retry the operation. Refer to *Backup-Archive Client Installation and User's Guide* for the correct usage of the ENCRYPTKEY option.

ANS1110E The client help file *file-name* could not be opened.

Explanation: This usually occurs when the help file *file-name* cannot be found.

System action: Processing stopped.

User response: If the DSM_DIR environment variable is set, verify that it points to the directory containing the current level of TSM program files, then try the operation again. If the problem recurs, re-install the TSM client software. If the problem persists, IBM technical support for further assistance.

ANS1111E The table of contents cannot be read from the help file.

Explanation: The help file was opened successfully but there was a problem reading the table of contents.

System action: Processing stopped.

User response: If the DSM_DIR environment variable is set, verify that it points to the directory containing the current level of TSM program files, then try the operation again. If the problem recurs, re-install the

TSM client software. If the problem persists, IBM technical support for further assistance.

ANS1113E The snapshot cache location is not valid.

Explanation: The snapshot cache location must point to a local volume that is formatted with NTFS. The default cache location is on the same volume where the snapshot is being performed. The operation will continue without snapshot support.

System action: The client does not execute the snapshot backup operation.

User response: Specify a different snapshot cache location using the `SNAPSHOTCACHELOCATION` option.

ANS1114I Waiting for mount of offline media.

Explanation: The server is waiting for the requested media to become available before the operation can continue.

System action: TSM waits for requested data.

User response: None.

ANS1115W File '*file-name file-namefile-name*' excluded by Include/Exclude list

Explanation: You can not back up, archive, or migrate files that are excluded.

System action: TSM does not process the file.

User response: If the file is intentionally excluded, then this message can be ignored. Otherwise modify the include/exclude list, restart the client, and try the operation again. Contact your TSM administrator for further assistance.

ANS1116E The process is running in a non-interactive mode, but requires user input.

Explanation: This process requires keyboard input, but non-interactive processes are unable to read input from keyboard.

System action: processing stops.

User response: Perform the following actions to resolve this error:

- Run the product in interactive mode.
- Ensure your password is set correctly.

ANS1117E The PICK and LATEST options are not valid together

Explanation: During a restore, PICK and LATEST options cannot be used together.

System action: Processing stopped.

User response: Try again using either the PICK or the LATEST option.

ANS1118I Invalid file space number entered. Try again.

Explanation: The number that represents a file space was incorrect while you were using the PICK option.

System action: TSM waits for your specification.

User response: Enter a correct file space number.

ANS1119I Initiating the removal of '*filespace-name*' file space.

Explanation: Indicates that file space deletion has started on the specified *filespace-name* .

System action: None.

User response: None.

ANS1120E Removal of file space '*filespace-name*' failed

Explanation: None.

System action: processing stops.

User response: Try to remove the file space again. If the problem continues, ask your TSM administrator to delete the file space for you.

ANS1121I A request for removal of file space '*filespace-name*' has been successfully sent to the server.

Explanation: TSM has requested deletion of the specified *filespace-name*. The deletion process may not have actually been completed when this message is displayed. To verify successful deletion, consult the server logs.

It is possible for errors to occur on the server during the deletion process, or the file space might contain archive objects in deletion-hold status. In either case, the file space will not be deleted.

System action: None.

User response: None.

ANS1122W File space '*filespace-name*' does not exist on the server. The file space might have been deleted by another client using your client's node name or an administrator.

Explanation: The specified *filespace-name* does not exist on the server. Your system administrator deleted the file space or another client using your client's node name might have deleted it.

System action: None.

ANS1123E • ANS1132E

User response: None.

ANS1123E The vertical screen dimension is too small to display the Help directory. Increase your window height.

Explanation: Execution of the HELP command requires space for both the user prompts and at least one line of the HELP directory.

System action: The help directory is not displayed, and the help command cannot complete.

User response: Increase the size of your display window to allow more rows of text to be displayed.

ANS1125E Unmatched Quotes: 'string'

Explanation: The quotes specified in the pattern are not the same and do not make a set.

System action: Processing stopped.

User response: Correct the pattern using matching quotes in the syntax.

ANS1126E The file space cannot be deleted because this node does not have permission to delete archived or backed up data.

Explanation: You cannot delete the file space data unless your TSM administrator has authorized your node to do so. Authorization permits you to delete backup data, archive data, or both.

System action: Delete processing fails.

User response: Use the DSMC QUERY SESSION command to verify your authorization. Ask your TSM administrator to provide the necessary authorization or to delete the file space for you.

ANS1127E Your node does not have permission to delete archived files.

Explanation: You cannot delete archived files unless your TSM administrator has authorized your node to do so.

System action: TSM does not delete the archived files.

User response: Use the DSMC QUERY SESSION command to verify your authorization. Ask your TSM administrator to provide the necessary authorization.

ANS1128S The management class assigned to directories does not exist.

Explanation: The management class named on the DIRMC option does not exist in your assigned policy set on the server. The error log contains an entry showing the invalid management class name.

System action: processing stops.

User response: Remove the current DIRMC option from the client options file, then run DSMC QUERY MGMTCLASS -DETAIL to view information about available management classes. Make sure the management class you select has a backup copy group. If you have more than one TSM server, make sure you are connecting to the correct server. If you are unable to find a suitable management class, contact your TSM administrator for further assistance.

ANS1129S There is no backup copy group in the management class used for directories.

Explanation: The DIRMC option names a management class that contains no backup copy group.

System action: processing stops.

User response: Remove the current DIRMC option from the client options file, then run DSMC QUERY MGMTCLASS -DETAIL to view information about available management classes. Make sure the management class you select has a backup copy group. If you have more than one TSM server, make sure you are connecting to the correct server. If you are unable to find a suitable management class, contact your TSM administrator for further assistance.

ANS1130E The drive has no label. The operation cannot continue.

Explanation: Backup or archive of removable media requires that the media have a volume label. An attempt was made to back up or archive data on a removable volume that has no label.

System action: The requested operation does not run.

User response: Create a volume label on the removable media, then try the operation again.

ANS1131E A duplicate volume label exists. The operation cannot continue.

Explanation: For removable media, TSM uses the volume label as the file space name. To prevent data from different volumes being stored in the same file space on the TSM server, backup or archive of removable media volumes having duplicate volume labels is not allowed.

System action: The requested operation does not run.

User response: Change the volume labels on the removable media volumes so that there are no duplicate labels. Then restart TSM and try the operation again.

ANS1132E 'Access rule' Access Rule already defined for node 'node'. Old rule must be deleted before new one can be defined.

Explanation: You are trying to define authorization for

the specified node, which already has authorization defined.

System action: TSM did not redefine authorization for the specified node.

User response: Update the authorization, or delete the old rule and define a new one, or use the current authorization.

ANS1133W An expression might contain a wildcard not enclosed in quotes.

Explanation: The command cannot be processed because a UNIX shell expands a wildcard expression, such as an asterisk (*) or a question mark (?), that has no quotes.

If the expression contains no wildcard characters and you wish to place more than the stated limit of operands on the Archive, Selective, or Incremental command, add the -REMOVEOPERANDLIMIT option to the command, and try it again.

System action: Command dependent.

User response: Enclose the wildcard expression in quotes, or add the -REMOVEOPERANDLIMIT option and enter the command again.

ANS1134E Drive *drive-name* is an invalid drive specification

Explanation: The specified *drive-name* was found to be invalid; the drive probably has not been defined.

System action: TSM skips the invalid drive and continues to the next drive.

User response: Check the invalid drive.

ANS1135E Drive *drive-name1* is a virtual drive of *drive-name2*. It cannot be backed up or archived.

Explanation: Drive *drive-name1* was found to be a substitute (SUBST) of drive *drive-name2*. The SUBST drive cannot be backed up or archived.

System action: The SUBST drive is skipped. Processing continues with the next drive.

User response: Do not specify any file specifications for a drive that is a substitute of another drive. Remove any explicit substitute drives from the DOMAIN statement or use the <drive:> notation to remove a substitute drive if ALL-LOCAL is specified.

ANS1136E Not file owner

Explanation: The file cannot be backed up because the client is not the file owner.

System action: TSM skips the file.

User response: None.

ANS1137W Invalid Index '*number*' skipped.

Explanation: An incorrect *number* was entered for the Index.

System action: Processing stopped.

User response: Correct the Index entry and retry the operation.

ANS1138E The '*command-name*' command must be followed by a subcommand

Explanation: You entered an incomplete *command-name*.

System action: Processing stopped.

User response: Enter the correct syntax of the command and continue.

ANS1139W '*object-nameobject-name object-name*' was restored as '*temp-name*'. A reboot is required to complete the restore.

Explanation: The file being restored was in use by another application, so it could not be immediately replaced. The file will be replaced during the next reboot of the operating system. It is important to note that until the reboot occurs, the system or its applications might be unstable. The degree of instability depends on the criticality of the file to the operating system or applications.

System action: TSM restored the file with a temporary name, and instructed the operating system to replace the original file with the restored file during the next boot of the operating system.

User response: Reboot the machine as soon as possible after the TSM restore operation ends.

ANS1140E Invalid format for Set Access command.

Explanation: None.

System action: Processing stopped.

User response: Enter the SET ACCESS command using the correct syntax.

ANS1141W Unknown command - *command-name*

Explanation: You entered an incorrect *command-name*.

System action: None.

User response: Enter the correct command.

ANS1143E The DIRSONLY and FILESONLY options are not valid together

Explanation: The DIRSONLY and FILESONLY options cannot be used together.

System action: Processing stopped.

ANS1144W • ANS1152W

User response: Try again using either the DIRSONLY or the FILESONLY option.

ANS1144W Password authentication not active on server

Explanation: None.

System action: Processing stopped.

User response: Because password authentication is turned off on the server, you do not need to update the password.

ANS1145E The maximum macro nesting level has been exceeded. Macros may be nested up to 10 levels.

Explanation: None.

System action: The macro is ignored and an error is returned.

User response: Reduce the level of macro nesting.

ANS1146E Macro file '*file spec*' cannot be opened.

Explanation: A macro command has been entered that specifies the macro file name shown. However, that file cannot be opened for reading.

System action: The macro is ignored and an error is returned.

User response: Enter the command with the proper macro name.

ANS1147E File is temporarily unavailable.

Explanation: File is temporarily unavailable.

System action: File skipped.

User response: Check and see if file is locked by other process. If not, retry the command.

ANS1148I '*Command-name*' command successfully completed

Explanation: The specified *command-name* was successfully completed.

System action: TSM completed the command.

User response: Continue with normal operations.

ANS1149E No domain is available for incremental backup. The domain may be empty or all file systems in the domain are excluded.

Explanation: An incremental backup was started, but no domain was selected. There are two possible reasons for this message:

- The client is a diskless workstation for which no local file systems exist.
- An attempt was made to back up a file system that is excluded with the EXCLUDE.FS option.

System action: processing stops.

User response: Choose a domain and restart the incremental backup. Make sure that the DOMAIN statement specifies the file systems you wish to back up. Prevent this message by not trying to back up the file system that is excluded with EXCLUDE.FS. If this file system should be backed up, then remove the EXCLUDE.FS option.

ANS1150E Unable to restore current user profile because you are running as a local system account.

Explanation: The local system account does not have a profile. Therefore you cannot restore its profile.

System action: Processing stops.

User response: Log on to the user whose profile you want to restore.

ANS1151E '*drive-name1*' is not a cluster disk.

Explanation: The indicated file system is not a cluster disk. Because the CLUSTERNODE option is set to YES, the file system cannot be backed up or archived.

System action: Processing stops.

User response: If the CLUSTERNODE option is incorrectly set to YES, then change the option to NO and try the operation again. Otherwise see the client manual for further information about configuring the TSM client to run in a cluster environment.

ANS1152W The kernel level is below the required level for LVM support. No LVM volumes will be available for image operations.

Explanation: The LVM support for image operations requires kernel level to be minimum at 2.6. LVM volumes will not be recognized by the TSM client.

System action: All subsequent logical volume operations on LVM volumes will fail.

User response: Use earlier versions of the client that support LVM1 to perform the logical volume operations. Alternatively, you can upgrade the kernel to the required level to fully utilize logical volume operations on LVM2.

ANS1153E *'drive-name1'* is a cluster disk.

Explanation: The indicated file system is a cluster disk. Because the CLUSTERNODE option is set to NO, the file system cannot be backed up or archived.

System action: Processing stops.

User response: If the CLUSTERNODE option is incorrectly set to NO, then change the option to YES and try the operation again. Otherwise see the client manual for further information about configuring the TSM client to run in a cluster environment.

ANS1154E Object name *'filespace namepath-name file-name'* contains an invalid multibyte sequence for the current locale.

Explanation: An illegal multibyte sequence for the current locale was found in the object name. Either the path or file name has been corrupted or is coded in a language other than that of the current locale.

System action: Object skipped.

User response: If the file name and path are not corrupted, process the file in the locale for which it is valid.

ANS1155E No domain is available for image backup.

Explanation: An image backup was started, but no domain was specified.

System action: Processing stopped.

User response: Choose a domain and restart the image backup. Set the image domain using the domain.image option in your dsm.opt file, either manually, or by using the GUI preferences editor.

ANS1156E NODENAME cannot be the local machine name when CLUSTERNODE is set to YES

Explanation: When TSM is running as a cluster node, the node name cannot be the local machine name.

System action: Processing stops.

User response: Change the node name either to the cluster name or to any other name, and restart TSM.

ANS1157E The registry cannot be backed up or restored when the client is running as a cluster node.

Explanation: When the CLUSTERNODE option is set to YES, the registry cannot be backed up or restored.

System action: The registry is not backed up or restored.

User response: If the CLUSTERNODE option is

incorrectly set to YES, then change the option to NO and try the operation again. Otherwise see the client manual for further information about configuring the TSM client to run in a cluster environment.

ANS1158E The event logs cannot be backed up or restored when the client is running as a cluster node.

Explanation: When the CLUSTERNODE option is set to YES, the event logs cannot be backed up or restored.

System action: The event logs are not backed up or restored.

User response: If the CLUSTERNODE option is incorrectly set to YES, then change the option to NO and try the operation again. Otherwise see the client manual for further information about configuring the TSM client to run in a cluster environment.

ANS1159E The specified file is being used by another process

Explanation: The specified file is being used by another process. You tried to read from or write to a file that is currently being used by another process.

System action: Processing stopped.

User response: Ensure that you specified the correct file or directory name, correct the permissions, or specify a new location.

ANS1162E Filesystem could not be mounted

Explanation: The system call to mount the file system failed.

System action: The file system remains unmounted.

User response: Use the mount command to mount the file system. On AIX, run fsck if requested by the operating system.

ANS1163E Filesystem could not be unmounted.

Explanation: The system call to unmount the file system failed.

System action: The logical volume operation is not performed.

User response: Make sure the device or file system is not being accessed, then retry the operation.

ANS1164E Filesystem is not mounted

Explanation: The named file system is not currently mounted. It must be mounted for TSM to perform an image backup.

System action: The logical volume operation is not performed.

ANS1165E • ANS1185E

User response: Mount the file system.

ANS1165E Destination is smaller than source

Explanation: The space allocation for the selected destination is smaller than the source.

System action: The restore operation is not performed.

User response: Choose a different, bigger destination or increase the size of the destination file space.

ANS1166E Source and destination are not the same file system type.

Explanation: The source and destination file system types do not match.

System action: The requested logical volume operation is not performed.

User response: Choose a destination that has the same file system type as the source.

ANS1168E ERROR: could not create image object.

Explanation: Creation of the image object failed for one of the following reasons:

- The image command was executed by a non-root user
- The image plugin library was not found.

User response: Retry the operation after correcting the cause for failure.

System action: The requested logical volume function is not performed.

ANS1169W There is no table of contents for *image-name*.

Explanation: The image item for which a table of contents was requested is either a RAW logical volume or it was backed up without the -TOC option.

System action: No table of contents is displayed.

User response: Select another image object for TOC display.

ANS1170I Invalid selection number entered. Try again.

Explanation: You entered a number not shown in the list of images. It is either less than one or greater than the highest item number displayed.

System action: TSM waits for you to enter a valid selection.

User response: Enter a number from the list or 'Q' to quit.

ANS1177E Must specify a path for this operation.

Explanation: A path must be specified for this operation to execute successfully.

System action: Processing stops.

User response: Specify a valid path and execute the command again.

ANS1181E There was a communication failure with the journal service.

Explanation: An error occurred using named pipe communication with the journal service.

System action: Processing stops.

User response: Restart the journal service, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1183E An unknown error occurred while processing system object '*sys-obj-name*': MS API function '*func-name*' failed with error *error* (*error*)

Explanation: An unknown error occurred while processing a system object. The error information captured indicates the reason for the failure. This information can be used to diagnose the problem.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS1184W The *command subcommand* command is not supported on this client.

Explanation: The *command subcommand* command is not supported for the client running on this operating system on this computer.

User response: None.

System action: The command is not processed.

ANS1185E The help search argument you supplied "*string*" is either too long or contains unmatched quotes.

Explanation: Valid arguments are the names of things like section numbers, command names, option names and message numbers. All of these search arguments are short and none requires quoting.

System action: The help request is not executed and you are given another chance to enter a valid argument, display the table of contents, or exit help.

User response: Respond to the subsequent prompt as directed.

ANS1186I The help file contains no message help section. Requests for message help will all result in topic not found. Enter a section number, option name, command name, or a command and subcommand. Otherwise press enter or 't' to display the table of contents or 'q' to exit help:

Explanation: The named file does not have the proper content to support the help command for messages. The initial scan of the help file found no messages section.

System action: The help command pauses and allows you to make another selection.

User response: During installation of TSM a proper help file was created. Your system administrator can assist you with retrieving the original help file to replace the named invalid file.

ANS1187E The named helpfile "filename" has invalid content.

Explanation: The named file does not have the proper content to support the help command. One or more sections could not be identified.

System action: The help command is terminated.

User response: During installation of TSM a proper help file was created. Your system administrator can assist you with retrieving the original help file to replace the named invalid file.

ANS1188E The selected filesystem is managed by HSM, and therefore is not a valid object for image operations

Explanation: Due to the nature of HSM, image backup is not allowed on managed filesystems.

System action: The requested logical volume operation is not performed.

User response: None.

ANS1189E The DIRONLY and V2ARCHIVE options are not valid together

Explanation: The DIRONLY and V2ARCHIVE options cannot be used together.

System action: Processing stopped.

User response: Try again using either the DIRONLY or the V2ARCHIVE option.

ANS1190E Symbolic link 'linkname' to 'target' was successfully deleted.

Explanation: Log 'linkname' cannot be a symbolic link.

System action: The symbolic link 'linkname' is deleted, the log is recreated, and processing stops.

User response: Check the location of the new file. To specify the location of log files, refer to the user's manual for the 'errorlogname' option, the 'schedlogname' option, and the 'DSM_LOG' environmental variable.

ANS1191E Unable to delete symbolic link 'link'.

Explanation: Log 'linkname' cannot be a symbolic link.

System action: Processing stops.

User response: Delete the symbolic link 'linkname'.

ANS1192E Specifying the error log 'link' as a symbolic link is not allowed.

Explanation: Error log 'linkname' cannot be a symbolic link.

System action: The symbolic link 'linkname' is deleted, the error log is recreated, and processing stops.

User response: Check the location of the new error log. To specify the location of the error logs, refer to the user's manual for the 'errorlogname' option and 'DSM_LOG' environmental variable.

ANS1193E Specifying the trace file 'link' as a symbolic link is not allowed.

Explanation: For reasons of security and system integrity, the trace file 'linkname' cannot be a symbolic link.

System action: The symbolic link 'linkname' is deleted, the trace file is recreated, and processing stops.

User response: Use the TRACEFILE option to specify the actual trace file location without the use of symbolic links.

ANS1194E Specifying the schedule log 'link' as a symbolic link is not allowed.

Explanation: Schedule log 'linkname' cannot be a symbolic link.

System action: The symbolic link 'linkname' is deleted, the schedule log is recreated, and processing stops.

User response: Check the location of the new schedule log. To specify the location of the schedule log, refer to the user's manual for the 'schedlogname' option.

ANS1197E The snapshot cache size was exceeded during the snapshot backup.

Explanation: The image snapshot backup was not able to complete because while creating the snapshot TSM exceeded the snapshot cache size allowed via the SNAPSHOTCACHESize option.

System action: Processing stopped.

User response: Increase the SNAPSHOTCACHESize value for this volume and retry the operation.

ANS1198E An invalid snapshot cache location was entered: .

Explanation: The SNAPSHOTCACHELocation option value entered for this volume is not valid. The value for this option must be an existing, full directory path.

System action: Processing stopped.

User response: Please enter a valid SNAPSHOTCACHELocation value and retry the operation.

ANS1199E The PRESNAPSHOTCMD command failed. The image snapshot backup will not be executed.

Explanation: The command specified by the PRESNAPSHOTCMD option must complete successfully in order to execute the image snapshot backup. If the command completed with a return code of 0 (zero), it is considered to have completed successfully. If the command completed with any other return code, it is considered to have failed. If the command failed then the image snapshot backup is not executed.

System action: The client does not execute the image snapshot backup operation.

User response: Identify and repair the problem that caused the command to fail. If a non-zero return code is normal for this command, then consider wrapping the command in a script that always exits with a return code of zero.

ANS1200W The POSTSNAPSHOTCMD command completed with a non-zero return code.

Explanation: If the command specified by the POSTSNAPSHOTCMD option completed with a non-zero return code, then the image snapshot backup operation will continue, but with a warning-level result. Note that the result of the POSTSNAPSHOTCMD command will not supercede a higher result from the image snapshot backup command. For example, if the image snapshot backup command completed with a return code of 12, the image snapshot backup will be considered to have completed with a return code of 12, regardless of the outcome of the POSTSNAPSHOTCMD command.

System action: The image snapshot backup continues, but with a warning return code of at least 8.

User response: Identify and repair the problem that caused the command to fail. If a non-zero return code is normal for this command, then consider wrapping the command in a script that always exits with a return code of zero.

ANS1201E TSM cannot build a directory path because a file exists with the same name as the directory.

Explanation: None

System action: Processing stopped.

User response: Remove or rename the file that has the same name as the directory. Alternatively, you can restore the directory to a different location.

ANS1202E TOC backup for the image failed. Check log files.

Explanation: An error occurred during backup of the table of contents. Check the error log for more information.

System action: The requested logical volume operation is not performed.

User response: Check error log.

ANS1203E Table of Contents not available for selected backup set. Please contact server administrator.

Explanation: There is no TOC for selected backup set

System action: Expansion of selected backup set will not be possible. Will only be able to restore the whole backup set.

User response: Please contact server administrator to regenerate TOC for backup set before backup set can be expanded.

ANS1204E This client is not supported by the TSM express server

Explanation: This client is not supported by the TSM express server. This can occur if:

1. the client is configured as an TSM express client using the CLIENTVIEW option
2. the client is trying to connect to an TSM express server.

System action: Processing stops.

User response: Log in using a supported TSM express client.

ANS1205E This is not a supported TSM express platform

Explanation: This is not a supported TSM express platform.

System action: Processing stops.

User response: Log in using a supported TSM express client.

ANS1206E TOC backup of a raw device is not supported. But the raw device is backed up.

Explanation: TOC backup of a raw device is not supported. But the raw device is backed up.

System action: Raw device is backed up with no TOC object.

User response: NONE.

ANS1207E No TOC has been previously backed up for this file system.

Explanation: The user is trying to query the TOC of a file system. TOC backup for that file system has not been previously done.

System action: Query stopped.

User response: Backup the file system again with -TOC option.

ANS1209E The option is not supported with the command using the -FILELIST option.

Explanation: The specified option is not supported with the specified command.

User response: None.

System action: The command is not processed.

ANS1212I Invalid Process number entered. Try again.

Explanation: You entered a number not shown in the list of processes. It is either less than one or greater than the highest item number displayed.

System action: TSM waits for you to enter a valid selection.

User response: Enter a number from the list or 'Q' to quit.

ANS1213W Snapshot image backup is not possible for device *device-name*. starting static image backup.

Explanation: On Linux platforms, snapshot image backup is only possible for logical volumes created by the Linux logical volume manager (LVM). Since the default image backup type is snapshot, backing up a partition which is not created using LVM automatically leads to a static image backup.

System action: Snapshot image backup will failover to static image backup

User response: To avoid this message, use the `imagetype` option to specify static or dynamic image backup.

ANS1214E The logical volume group does not have enough free space to contain the volume snapshot.

Explanation: The snapshot is created in the volume group that contains the logical volume being backed up. There is insufficient free space in the volume group to contain the snapshot.

System action: The operation ends.

User response: Decrease the `SNAPSHOTCACHESIZE` value or make additional space available in the logical volume group. Then try the operation again.

ANS1215E On volumes that are RAW or formatted FAT32 the snapshot cache location cannot be located on the same volume that is being backed up.

Explanation: When the snapshot cache location is located on the same volume that is being backed up the volume must be formatted with NTFS. The default cache location is on the same volume where the snapshot is being performed.

System action: The client does not execute the image snapshot backup operation.

User response: Specify a different snapshot cache location using the `SNAPSHOTCACHELOCATION` option.

ANS1216E Not authorized to run TSM. See the administrator for your system.

Explanation: The system options file for the server that you are attempting to connect to contains a user entry, a group entry, or both a user and group entry. Your user ID, or group ID, was not found in any of the entries. You are currently not authorized to run TSM to this server.

System action: TSM initialization fails and the program ends.

User response: See the TSM administrator for your system, and ask to be added to the user or group list for this server.

ANS1217E Server name not found in System Options File

Explanation: The system options file does not contain the `SERVERNAME` option.

System action: TSM initialization fails and the program ends.

User response: See the TSM administrator for your system, and make sure that the system options file contains the server name.

ANS1218E TCPSERVERADDRESS not defined for this server in the System Options File

Explanation: The TCPSERVERADDRESS for this server is not defined in the server name stanza in the system options file.

System action: TSM initialization fails and the program ends.

User response: See the TSM administrator for your system, and make sure that the server to which you are trying to connect, has a valid TCPSERVERADDRESS defined in the system options file.

ANS1219E A virtual node name must not equal either a node name or the system host name.

Explanation: A VIRTUALNODENAME option was entered with a name the same as either a NODENAME option or the system host name.

System action: Initialization fails and the program ends.

User response: If the virtual node name entered was the same as the host name, remove the virtual node name option. If it was the same as the node name option, you can remove either one, depending upon the intended usage. Node name is used to assign an alternate name to your system. Virtual node name is used to access another system's server data.

ANS1220E The TSM server is out of resources.

Explanation: A lack of a storage resource or a maximum value condition does not allow any new activity.

System action: TSM canceled the current operation.

User response: Try the operation again at a later time. If the problem continues, contact your TSM administrator to isolate what resource is unavailable. The TSM administrator can check the TSM server activity log for messages that might explain the problem.

ANS1221E Transaction aborted

Explanation: The current transaction between the server and the client stopped. A server, client, or communication failure cannot be recovered.

System action: TSM canceled the current operation.

User response: Retry the operation. If the problem continues, see your system administrator to isolate the problem.

ANS1222E Disk space limit for this process reached

Explanation: The disk space allocated for the client owner is full.

System action: Processing stopped.

User response: Free up disk space and retry the restore or retrieve operation.

ANS1223E File is not compressed; System failure.

Explanation: A file that was flagged as compressed was not compressed, and the system failed.

System action: Processing stopped.

User response: See your system administrator to report this problem. This error is a system failure.

ANS1224E File compressed on a different client machine that has more memory

Explanation: You are trying to restore a file that was backed up and compressed on another client workstation that had more memory than your client workstation. You cannot restore this file. When the file is restored, it is expanded and your workstation does not have enough memory.

System action: TSM canceled the operation.

User response: Obtain a machine with more memory and retry the operation.

ANS1225E Insufficient memory for file compression/expansion

Explanation: Not enough memory is available to do data compression or expansion. For a restore or retrieve, the file cannot be recalled from the server until more storage is made available. For a backup or archive, try running without compression if storage cannot be made available.

System action: Processing stopped.

User response: Free up extra storage for the operation to continue, or run the backup or archive process without compression enabled.

ANS1226E Destination file or directory is write locked

Explanation: The file or directory being restored or retrieved from the server cannot be written to because the destination is write locked. Another operation might have the file open and will not allow it to be updated.

System action: File skipped.

User response: Either determine which operation has the file write locked, or restore the file to another name or location.

ANS1227E Processing stopped; Disk full condition

Explanation: No more files can be restored or retrieved because the destination disk is full.

System action: Processing stopped.

User response: Free up disk space, or restore or retrieve the file to another disk.

**ANS1228E Sending of object '*object-name*object-name
object-name' failed**

Explanation: The specified file (*object-name*) cannot be sent to the server. This message is accompanied by at least one other message that has more specific information about why the file could not be processed.

System action: File skipped.

User response: Check previous messages pertaining to this file that indicate the reason for the failure. Where applicable, correct the conditions that prevented the file from being sent to the server. The specific corrective actions will depend on the reason for the failure.

**ANS1229E MODE=INCREMENTAL is not valid on
file-space. Image backup not processed.**

Explanation: Because the file space has been the subject of at least one progressive incremental backup, the MODE=INCREMENTAL option (incremental by image date) cannot be used with the backup image command.

System action: File system skipped.

User response: If an image backup of the named file space is desired, retry the command without the MODE=INCREMENTAL option. To prevent this behavior in the future, delete the file space from the server and do only BACKUP IMAGE -mode=selective and BACKUP IMAGE -mode=incremental from that point on.

ANS1230E Stale NFS File Handle

Explanation: An NFS file system becomes stale.

System action: File system skipped.

User response: Check the NFS mounted filesystem.

ANS1231E No file handles available

Explanation: All file handles for your system are currently in use. No more are available.

System action: Processing stopped.

User response: Either free some file handles by ending other processes, or modify your system setup to allow for more files to be open at the same time.

ANS1232E The file exists and cannot be overwritten.

Explanation: The file being restored or retrieved exists and cannot be overwritten due to lack of authority or access permissions.

System action: The file is skipped.

User response: Verify that you have sufficient access permissions to overwrite the file, then try the operation again. If the problem persists, contact your system administrator or TSM administrator for further assistance.

**ANS1233E An invalid file handle was passed;
system error.**

Explanation: An internal system error occurred: A file operation failed because of an invalid file handle.

System action: processing stops.

User response: Try the operation again. If the failure persists, obtain a service trace that captures the problem and contact IBM technical support for additional assistance. Your TSM administrator can help you configure the trace.

ANS1234E Protocol violation

Explanation: A communications protocol error occurred. The communication subsystem is not properly defined or is itself in error.

System action: TSM ended the current operation.

User response: Verify that the communication processes are operating properly, and then retry the operation.

**ANS1235E An unknown system error has occurred
from which TSM cannot recover.**

Explanation: An unknown error occurred. This might be a low-level system or communication error from which TSM cannot recover.

System action: Processing stops.

User response: Try the operation again. If the problem persists, review the TSM error log for any related messages. Obtain a service trace that captures the problem and contact IBM technical support for additional assistance. Your TSM administrator can help you configure the trace.

ANS1236E An unexpected error occurred.

Explanation: This is usually caused by a low-level system error or communication error from which TSM cannot recover.

System action: Processing stopped.

ANS1237E • ANS1248E

User response: Examine the client error log for any additional messages that might be related to this problem. Try the operation again. If the problem persists, contact TSM technical support for further assistance.

ANS1237E A problem has occurred on the TSM server.

Explanation: The TSM client error log and the TSM server activity log might contain additional information about this error.

System action: Processing stops.

User response: Try the operation again. If the problem persists, examine the TSM client error log and TSM server activity log for additional information about this error. If the problem cannot be resolved, then obtain a SERVICE trace that captures the problem and contact IBM technical support for additional assistance. Your TSM administrator can help you configure the trace.

ANS1238S A policy management problem has occurred on the TSM server.

Explanation: The TSM client error log and TSM server activity log may contain additional information about this error.

System action: Processing is stops.

User response: Try the operation again. If the problem persists, examine the TSM client error log and TSM server activity log for additional information about this error. If the problem cannot be resolved, then obtain a SERVICE trace that captures the problem and contact IBM technical support for additional assistance. Your TSM administrator can help you configure the trace.

ANS1241E File is in use; Write permission denied.

Explanation: The current file cannot be opened to write to because it is currently being run by another operation.

System action: File skipped.

User response: Stop the operation that is running the file and retry the operation, or restore or retrieve the file to a different name or directory.

ANS1242E Too many symbolic links were detected while resolving name

Explanation: While trying to resolve the file name, too many symbolic links were found.

System action: File skipped.

User response: Ensure that you do not have a looping symbolic link for the file.

ANS1243E The file name is too long and can not be processed by TSM

Explanation: None.

System action: The file is skipped.

User response: See the client manual for the operating system on which you are receiving this error. The "File specification syntax" section of the manual explains file name lengths supported by TSM.

ANS1244E File system is locked by system

Explanation: File system cannot be accessed because it is locked by the system.

System action: TSM cannot complete the operation.

User response: See your system administrator.

ANS1245E The file has an unknown format.

Explanation: TSM tried to restore or retrieve a file, but it had an unknown format.

System action: The file is skipped.

User response: The file was either backed up by another application, or the data is invalid. If the file belongs to this system, try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1246E A command-line argument exceeded the maximum length (*maximum length*) for a single token.

Explanation: Command-line arguments may not exceed *maximum length* characters.

System action: The command is not processed.

User response: Correct the command and retry the operation.

ANS1247I Waiting for files from the server...

Explanation: Restore request has been sent to the server. The wait time depends on how many files you are restoring.

System action: TSM waits for files to restore from the server.

User response: None.

ANS1248E An active restore for the same source file specification exists. Unable to continue with this request.

Explanation: Currently, there is an active restore for the same source file specification. Another restore of the same source file specification cannot be started.

System action: The requested restore fails.

User response: Start another restore with a different source file specification.

ANS1249W Server cannot restart the last restore request. Do you want to restore without restart or abort the request?

Explanation: The restart restore token has expired. The server cannot restart the restore from where it last ended.

System action: Processing stopped; waiting for user intervention.

User response: Retry the request without restart or abort the request.

ANS1251E File system/drive not ready

Explanation: The file system/drive was not ready for access.

System action: Processing stopped.

User response: Ensure that the drive is available to TSM, and then retry the operation.

ANS1253E File input/output error

Explanation: An error was found while reading from or writing to the file.

System action: File or file system is skipped.

User response: Check your system to ensure that it is operating properly. For OS/2, run CHKDSK /F for the failing drive which can be found in dsmerror.log.

ANS1254E File write error

Explanation: An error was found while writing to the file.

System action: File skipped.

User response: Check your system to ensure that it is operating properly.

ANS1255E File exceeds system/user file limits

Explanation: A file being restored or retrieved exceeds system set limits for this user.

System action: File skipped.

User response: Ensure that the system limits are set properly.

ANS1256E Cannot make file/directory

Explanation: The directory path for files being restored or retrieved cannot be created.

System action: File skipped.

User response: Ensure that you have the proper

authorization to create the directory for file being restored or retrieved. Make sure that you have write access.

ANS1257E An error occurred while preparing the system object for restore.

Explanation: This message is typically issued when the client is unable to delete the ADSM.SYS staging directory in preparation for restoring the system object.

System action: The system object is not restored.

User response: Check the error log for any other messages that might indicate a reason for the failure, correct any indicated problems, then try the operation again. If the problem occurs again, manually delete the ADSM.SYS directory, then try the operation again. If the problem cannot be resolved, contact IBM technical support for further assistance.

ANS1258E The image snapshot operation failed.

Explanation: TSM was not able to take a snapshot of the specified volume.

System action: Processing stopped.

User response: Check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1259E The image snapshot operation failed. Diagnostic text: .

Explanation: An error was encountered during image backup snapshot processing. The diagnostic text can vary, depending on the error.

System action: The operation ends.

User response: Examine the client error log for additional messages that might indicate the reason for the problem. Take any corrective action suggested by the messages, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1260E File is being recalled or has been recalled.

Explanation: The file is being recalled by another process or has been recalled.

System action: File skipped.

User response: None

ANS1261W The archive description you specified is the empty string. TSM will use the default description (Archive Date: current date).

Explanation: The description option on the archive command may not specify a null string.

System action: Processing continues, and the description option is ignored.

User response: None. Specify at least one character in the description

ANS1262E Password is not updated. Either an invalid current password was supplied or the new password does not fulfill the server password requirements.

Explanation: The password is not updated because of one of the following reasons:

- You entered an incorrect current password or
- You entered a new password that does not fulfill the password length requirements set on the server.

System action: The password is not updated on server.

User response: Enter another password.

ANS1263E The active policy set does not contain any backup copy groups. The backup operation can not continue.

Explanation: In order to back up files, the policy set must contain at least one backup copy group.

System action: TSM did not backup the file.

User response: The TSM administrator needs to update or define at least one management class in your policy set that contains a backup copy group, or else assign you to a different policy domain that contains at least one backup copy group. Contact your TSM administrator for further assistance.

ANS1264E The active policy set does not contain any archive copy group. The archive operation cannot continue.

Explanation: In order to archive files, the policy set must contain at least one archive copy group.

System action: TSM did not archive the file.

User response: The TSM administrator needs to update or define at least one management class in your policy set that contains an archive copy group, or else assign you to a different policy domain that contains at least one archive copy group. Contact your TSM administrator for further assistance.

ANS1265E Encountered bad mount or filesystem, processing stopped.

Explanation: The getmnt system call returned an error indication. Error was encountered trying to determine what the mounted file systems are.

System action: Processing stopped. Cannot recover.

User response: There is a bad file system or mount point on your system. Look at file systems and mounts, and correct any errors. If unsuccessful, see your system administrator for more information.

ANS1266E Encountered bad mount or filesystem, processing stopped.

Explanation: An error was encountered trying to determine what the mounted file systems are.

System action: Processing stopped. Cannot recover.

User response: Please, see your system administrator for more information.

ANS1267E The management class for file *file-name* does not allow migration. This file will not be migrated.

Explanation: The management class for this file does not allow migration

System action: File is skipped.

User response: Either have the TSM administrator change the Space Management Technique within the management class to a value other than NONE or change the include/exclude list to specify a management class with the appropriate Space Management Technique value.

ANS1268E This file has been migrated.

Explanation: File has been migrated. If files that are hard linked together are migrated then files subsequent to the first one encountered get this.

System action: File is skipped.

User response: None.

ANS1269I File is implicitly excluded.

Explanation: You tried to back up or migrate a file that is implicitly excluded.

System action: TSM will not back up or migrate an implicitly excluded file.

User response: None.

ANS1270I Forcing compression off to enable future server-free restore.

Explanation: Because ENABLESERVERFREE had been specified, and an attempted server-free data movement fell back to non-server-free, the TSM client is forcing compression off. This is to enable future server-free restore of the object backed up, when the problems preventing a server-free backup from occurring have been resolved.

System action: The operation continues without compression.

User response: Either Remove the ENABLESERVERFREE option from the system option file, or set COMPRESSION off in the option file.

ANS1271E The compressed file is corrupted and cannot be expanded correctly.

Explanation: The compressed file cannot be expanded correctly due to one of the following reasons:

There is a problem on the tape.

There is a communications problem.

The compressed file was corrupted on the TSM Server.

System action: File skipped.

User response: 1) The compressed file is corrupted because there is a problem on the tape. To know if this is the problem, please issue the following command on the TSM Server: `audit volume <volume_name> fix=no`. If there is any problem reported, you could move the data from that volume to a new one (see command MOVE DATA) and try again the restore. 2) There are communications problems between the TSM Server and the TSM Client and the results is that the file is corrupted during the transmission. If you use a gigabit Ethernet adapter on the Server please upgrade the card driver (AIX platform) or add provided by SUN suggested changes to some system network options which have resolved this problem (SUN platform). 3) Please verify with your network support if during the restore there are no any problems between the TSM Client/Server that is originating the file corruption.

ANS1272W Adaptive subfile backup has been configured on the client but the server doesn't allow this type of backup. Adaptive subfile backup will not be used for this operation.

Explanation: Adaptive subfile backup forced off by the server.

System action: Processing continues.

User response: Set up the server to allow clients to back up subfiles.

ANS1273E The image plugin was not able to acquire an exclusive lock on volume:

Explanation: To perform an off-line image backup or an image restore TSM requires exclusive use of the volume.

System action: Processing stopped.

User response: Please verify that no other application is accessing the volume. If this volume is being accessed by applications that can not be shutdown during backup then perform an online image backup (snapshot with LVSA) instead. During restore of an image TSM must have exclusive use of the volume.

ANS1274E Error Loading WINSOCK.DLL

Explanation: Error loading the Windows socket support file into memory. This error only applies when using TCP/IP communications.

System action: Connection to server fails.

User response: Because this error is caused by insufficient memory, shut down running applications and retry. If the problem persists, see your system administrator.

ANS1275E Error Loading Function(s) from WINSOCK.DLL

Explanation: Error loading one or more functions from the Windows socket support file.

System action: Connection to server fails.

User response: Since this might possibly be caused by insufficient memory, shut down running applications and retry. If the problem persists, see your system administrator.

ANS1276I \"Log on as a service\" right granted to account

Explanation: You specified a Windows user account which did not have the security right to run as a service

System action: TSM granted the "log on as a service" right to the account you specified.

User response: No action required.

ANS1277E Error occurred while granting \"log on as a service\" right to account

Explanation: You specified a Windows user account which did not have the security right to run as a service. TSM encountered a problem attempting to grant this right automatically.

System action: The "log on as a service" right is not granted to the account specified.

User response: Insure the account from which you are configuring the service has authority to grant rights and retry the request. Alternatively run the Windows policy editor from an administrative account to grant the "log on as a service" right to the account that is associated with the service you are configuring.

ANS1278W Virtual mount point '*filesystem-name*' is a file system. It will be backed up as a file system.

Explanation: A virtual mount point that is a file system is invalid and should be deleted.

System action: The virtual mount point is ignored.

User response: Delete the virtual mount point.

ANS1279W Virtual mount point '*filesystem-name*' cannot be used in a file system handled by automounter and is ignored.

Explanation: Virtual mount points cannot be used in a file system handled by automounter. If virtual mount points reside in a file system that is processed from an automounter, the backed up files underneath the virtual mount points will be expired when the file system is unmounted.

System action: The virtual mount point is ignored.

User response: Delete the virtual mount point.

ANS1286E -nasnodename option required for this operation.

Explanation: User issued a NAS related command and NASNodename option is missing.

System action: Operation aborted.

User response: Use -nasnodename option with the command or place nasnodename option in the option file.

ANS1287E Volume could not be locked.

Explanation: The system call to lock the volume failed.

System action: Processing stopped.

User response: Please verify that no other application is accessing the volume. If this volume is being accessed by applications that can not be shutdown during backup then perform an online image backup (snapshot with LVSA) instead. During restore of an image TSM must have exclusive use of the volume.

ANS1288E The (-TYPE) option is required with the SET EVENT command.

Explanation: There is no default value for the -TYPE option. It must be explicitly entered with the command.

System action: Current command ends.

User response: Enter the SET EVENT command again with the TYPE option and a value of HOLD, RELEASE, or ACTIVATERETENTION.

ANS1289W Bad areas on '*volume*' between sectors *hi:lo* and *hi:lo*

Explanation: Some bad sectors within the specified range were detected on the volume during image operation.

System action: Processing continues.

User response: Make sure the volume data is not corrupt by using system tools like chkdsk (Windows) or fsck (UNIX).

ANS1300E File "*filename*" cannot be reconstructed because a necessary component was not restored.

Explanation: The subfile backup technique was used to back up this file. During the restore, a portion of the file could not be obtained from the server.

System action: The file indicated in the message is not restored. Restore for all other files continues.

User response: Try to restore the file again by selecting the file for restore from the user interface. If this doesn't resolve the problem, check the client error log and the server activity log for any messages related to the file indicated in the message.

ANS1301E Server detected system error

Explanation: The server detected a system error and notified the clients.

System action: Processing stopped.

User response: See your system administrator for further information on server activity.

ANS1302E No objects on server match query

Explanation: No objects on the server match the query operation being performed. If this object is part of a backupset generated on a node, and the node name is changed on the server, any backup set objects that were generated prior to the name change will not match the new node name.

System action: Processing stopped.

User response: Ensure the names are properly entered. If the object is part of a backupset generated prior to a node name change, ensure that the node

name is the same as the node for which the backup set was generated.

ANS1303E Client ended transaction

Explanation: The client system ended the operation with the server and ended the current transaction.

System action: Processing stopped.

User response: Restart the session.

ANS1304W An active backup version could not be found.

Explanation: An attempt was made to expire an object, but the TSM server was unable to find an active backup version of the object. This message is preceded by message ANS1228E which specifies the object name. For instance, this message could be issued if two separate client processes are backing up the same file system at the same time. If one of the processes expires a file, then the TSM server will make that file inactive. If the second process subsequently attempts to expire that same file, the TSM server will not find an active version of the file, so the second process will issue this message for that file.

System action: The object is not expired. Processing continues with the next object.

User response:

- Review the console output, schedule log, or error log and locate the ANS1228E message that immediately precedes this message. ANS1228E will identify the object that could not be expired.
- Examine the conditions under which the problem occurred and assess whether those conditions explain the occurrence of this message. For example, this message could appear if multiple instances of the client were attempting to back up the file system concurrently.
- If the reason this message occurred can not be determined and the message occurs when the operation is tried again, then contact IBM support for further assistance. Also try searching for this message number on <http://www.ibm.com> for possible solutions.

ANS1305E The TSM server has no data for the object.

Explanation: TSM tried to do a restore or retrieve on an object that has no data associated with it. If a corrective action is possible, it is with the TSM server.

System action: TSM ends the current operation.

User response: Ask the TSM administrator to check the TSM activity log for any messages related to this error that might help identify the problem.

ANS1306E You entered an incorrect password.

Explanation: You entered an incorrect current password or you entered a new password that does not fulfill the password length requirements set on the server.

System action: Processing stops.

User response: Retry the session with the correct password. If this fails or you have forgotten your password, ask the TSM administrator to assign a new password.

ANS1307E Node in use

Explanation: The node you are running on is in use by another operation on the server. This might be from another client or from some activity on the server.

System action: Processing stopped.

User response: Retry the operation, or see your system administrator to see what other operations are running for your node.

ANS1308E Expiration date must be greater than today's date

Explanation: Archive expiration date is too low, the date must be greater than today's date.

System action: TSM canceled the current operation.

User response: Retry archiving the file with an expiration date that is higher than today's date.

ANS1309I The requested data is offline.

Explanation: For the restore or retrieve operation, one or more of the requested files must be recalled from offline storage media (generally tape). The wait time depends on your site's offline storage management policies.

System action: TSM waits for offline storage media to become available and then continues.

User response: None.

ANS1310E Object too large for server limits

Explanation: The object is too large. The configuration of the server does not have any data storage space that accepts the object.

System action: File skipped.

User response: See your system administrator to determine the maximum file (object) size for which your site's server is configured.

ANS1311E Server out of data storage space

Explanation: The server does not have any space available to store the object.

System action: TSM ended the current operation.

User response: You can take any of the following actions:

- Request the system administrator to add space to the storage pool.
- For TSM client, set COMPRESSALWAYS=NO and COMPRESSION=YES in the options file (DSM.OPT), then the file will be resent uncompressed if it grows during compression.
- For API Applications, consult the application's documentation for recommendations regarding compression.
- Turn off disk caching in the disk storage pool, and issue MOVE DATA commands to each disk pool volume to clear out the cached bitfiles.

ANS1312E Server media mount not possible

Explanation: Server media mount not possible. The server timed out waiting for a mount of an offline volume.

System action: File skipped.

User response: Retry later when server volumes can be mounted. Ensure that the MAXNUMMP (maximum number of mount points) defined on the server for this node is greater than 0.

ANS1313E Size estimate exceeded

Explanation: The total amount of data for a backup or archive operation exceeds the estimated size originally sent to the server for allocating data storage space. This happens when many files are growing by large amounts while the backup or archive operation is in session.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, check what other processes are running on the client machine that are generating large amounts of data. Disable those operations while the backup or archive operation is taking place.

ANS1314E File data currently unavailable on server

Explanation: The file data is currently unavailable on the server. A retrieve or restore operation was attempted. Possible causes are:

- Data was corrupted at the server
- Server found a read error
- File is temporarily involved in a reclaim operation at the server

- Server requested a tape volume that was marked unavailable.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, see your system administrator to determine the problem from the server console or the activity log. Check whether any requests were made for a tape volume that was unavailable. A tape volume may be marked unavailable if prior read errors were encountered or the volume is checked out of the tape library.

ANS1315W Unexpected retry request. The server found an error while writing the data.

Explanation: None.

System action: The client retries the operation.

User response: None.

ANS1316E The server does not have enough recovery log space to continue the current operation

Explanation: The server ran out of recovery log space.

System action: TSM ended the current operation.

User response: This error is a temporary problem. Retry later or see your system administrator.

ANS1317E The server does not have enough database space to continue the current operation

Explanation: The server ran out of database space.

System action: TSM ended the current operation.

User response: See your system administrator.

ANS1318E The server does not have enough memory to continue the current operation.

Explanation: The server ran out of memory.

System action: TSM ended the current operation.

User response: This is a temporary problem. Retry later or see your system administrator.

ANS1319E An error occurred on the TSM server while trying to rename file space

Explanation: None.

System action: Because the file space cannot be renamed, the operation stops.

User response: Check the client error log and the TSM server activity log for any other messages that might help identify the problem. If the problem cannot be

resolved, contact IBM technical support for additional assistance.

ANS1320E The specified file space does not exist on the server. The file space might have been deleted by another client or an administrator.

Explanation: The specified file space does not exist on the server. Your system administrator deleted the file space or another client using your client's node name deleted it.

System action: TSM canceled the current operation.

User response: Check the file space name to see if it is correct, and retry the operation.

ANS1321S Open Registration failed because the specified node name is defined in the server

Explanation: Open registration failed because a node is defined in the server with the same name.

System action: TSM canceled the current operation.

User response: Retry with another node name.

ANS1322S Open Registration failed because no default domain exists

Explanation: Open registration failed because a default policy domain does not exist for you to place your node.

System action: TSM canceled the current operation.

User response: See your system administrator.

ANS1323S Open Registration failed because an invalid node name was specified

Explanation: Open registration failed because the specified node name contains invalid characters.

System action: TSM canceled the current operation.

User response: Retry with another node name that does not have any invalid characters.

ANS1326S The TSM server does not currently have space in the storage pool for this file. This may be a temporary condition.

Explanation: This message is typically issued when the storage pool in which the data is being placed does not have sufficient space to store the data, but the space will be available soon. For example, a storage pool migration might free up sufficient space to store the data.

System action: TSM ends the current operation.

User response: Try the operation at a later time. If this

fails, contact the TSM administrator and request more storage pool space.

ANS1327W The snapshot operation for '*volname*' failed with error code: *retcode*.

Explanation: A snapshot could not be taken of the specified volume.

System action: Snapshot processing stopped.

User response: Check the client error log for any other messages that might help identify the problem. If the problem cannot be resolved, contact IBM technical support for additional assistance.

ANS1328W An error occurred generating delta file for '*file-name*'. The return code is *retcode*.

Explanation: An error occurred that prevented the creation of the delta file. Possible reasons for this error include:

- The base file cannot be opened for reading
- The file being backed up cannot be opened for reading
- The delta file cannot be opened for writing
- The file being backed up has grown to a size larger than 2 GB
- A memory file mapping of the file cannot be created

System action: A full backup of the file is made, and a new version of the reference file is stored in the subfile cache.

User response: If the message indicates return code 4504, check the delta subfile cache directory for any residual delta files. The delta subfile cache directory is specified by the client option SUBFILECACHEPATH. Search the directory for files named `\.dXXXXXXXX\` where `\XXXXXXXX\` is an eight-digit number. If there are no backup operations in progress, there should not be any files in the SUBFILECACHEPATH with this name. If there are no backup operations in progress and these files exist, they can safely be removed. If you continue to receive this message but there are no residual delta files in the subfile cache directory and the file has not grown to a size larger than 2 GB, then contact IBM technical support for further assistance.

ANS1329S Server out of data storage space

Explanation: The server does not have space available to store the object.

System action: TSM ended the current operation.

User response: Report to your system administrator that a storage pool on the server is full.

ANS1330S This node currently has a pending restartable restore session. The requested operation cannot complete until this session either completes or is canceled.

Explanation: This operation can not be completed because a restartable restore session is pending. The operation is not allowed because the restartable session and the current operation affect the same file space.

System action: TSM ended the current operation.

User response: Issue a query restore to see the conflict. Issue the cancel restore command to delete any unneeded restartable restore sessions.

ANS1331E Only a TSM authorized user can perform this Action.

Explanation: User must be a TSM authorized user to perform this action. User is not password authorized and this action requires authorization.

System action: Processing stopped.

User response: User must be root user, or user must be the owner of the executable and the set effective user id bit is set to 'on' ('s' bit).

ANS1332E Run the '... for Administrators' version of the application.

Explanation: The user must be root or a system administrator and use the provided authorization tools to start IBM Tivoli Storage Manager

System action: IBM Tivoli Storage Manager terminates.

User response: The user must login as the root user or be a system administrator and use one of the following authorization tools to start IBM Tivoli Storage Manager:

- "TSM Backup for Administrators"
- "TSM Scheduler for Administrators"
- "TSM Scheduler Daemon for Administrators"

ANS1333I Used block list used for the snapshot image backup of is different than list acquired before the start of snapshot.

Explanation: The snapshot image backup used block list is taken before and after the start of the snapshot for informational purposes.

System action: Processing continues.

User response: None.

ANS1334W Volume mount point '*filesystem namepath-namedir-name*' was not restored because the target directory is not empty.

Explanation: Volume mount points can only be restored if the target directory does not already exist, or if the target directory exists but is empty. If the target directory exists and is not empty, or already is a junction point, then the volume mount point cannot be restored. On Windows Vista, it is normal to see these warnings during system drive restore as there are many junction points that point to the '%systemroot%\Users' folder.

System action: The volume mount point is not restored. Processing continues with the next object.

User response: Correct the conflict with the non-empty directory, then try the operation again. This is especially important when this message is issued for a volume mount point that resides in the SYSVOL, since an incomplete SYSVOL restore can result in system stability problems. See the reference information for the RESTORE command in the client manual for additional information about restoring volume mount points.

ANS1335E The RSM database files could not be restored.

Explanation: None.

System action: The RSM database is not restored. Otherwise, processing continues.

User response: Check the client error log for any other messages that might help identify the problem. Reboot the system, then try the RSM restore operation again. If the problem cannot be resolved, contact IBM technical support for further assistance.

ANS1336I RSM service must be restarted for changes to become effective.

Explanation: RSM database files have been restored from the server and imported. The RSM service must be restarted for the updates to become effective.

System action: Processing continues.

User response: None.

ANS1337I Restarting the RSM service...

Explanation: RSM database files have been restored from the server and imported. TSM is about to stop then restart the RSM service.

System action: Processing continues.

User response: None.

ANS1338I Restart of the RSM service is completed.

Explanation: RSM database files have been restored from the server and imported. TSM has restarted the RSM service on the user's behalf.

System action: Processing continues.

User response: None.

**ANS1339E Restart of the RSM service failed.
Restart the RSM service manually.**

Explanation: RSM database files have been restored from the TSM server and imported. TSM has tried to restart the RSM service on the user's behalf but has run into a problem.

System action: Processing stopped.

User response: Restart the RSM service manually.

ANS1340E An error occurred while backing up the RSM database.

Explanation: An error occurred while backing up the RSM database files. The database will not be backed up.

System action: Processing stopped.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1341E An invalid character appears in the operand: *operand*.

Explanation: The *operand* contains a character that is not valid in the current locale and code page. It cannot be translated to its internal wide-character format.

System action: Processing stops.

User response: Change the locale of the workstation to match the language in which the operand is recorded, and try the command again.

ANS1342E Client cache is locked; unable to continue with operation.

Explanation: The client cache is currently locked by another process.

System action: Processing stopped.

User response: Report the program error to your service representative.

ANS1343E The option '*specified-option*' can only be entered when '*other-option*' has been entered.

Explanation: The command failed because the specified option (*specified-option*) option was entered, but the other option (*other-option*) was not.

System action: The command is terminated.

User response: Run the command without the specified option. Alternatively, run the command with the other option added.

**ANS1344E Job is running in the background.
Cannot prompt for the Key.**

Explanation: When jobs are run in the background, the client cannot prompt for the key.

System action: Processing stopped.

User response: Run the Job in the foreground.

**ANS1345E No objects on server match
'*object-name**object-name* *object-name*'**

Explanation: The specified file (*object-name*) does not have a match on the server.

System action: File skipped.

User response: Backup the file and retry the operation. If the problem continues, see your system administrator to isolate the problem through use of the server console.

**ANS1346E The image snapshot operation failed.
The SNAPSHOTCACHLocation does not contain enough space for this snapshot image backup.**

Explanation: TSM was not able to take a snapshot of the specified volume. The SNAPSHOTCACHLocation points to a location which does not contain the space necessary to manage the snapshot. This could be due to an unexpected amount of disk activity which is generating more changes than can be contained in the available space at this particular point in time, or the SNAPSHOTCACHLocation needs to be changed because the specified location is not large enough to handle the usual amount of changes to the volume. Another reason for this failure can be that the specified SNAPSHOTCACHSize is not set to a large enough value to handle the usual amount of changes to the volume during snapshot image backup.

System action: Processing stopped.

User response: If the problem persists please increase the SNAPSHOTCACHSize and/or change the value of the SNAPSHOTCACHLocation.

ANS1347E The image snapshot operation failed. The percent of space to use, specified via the SNAPSHOTCACHESize, has been exceeded.

Explanation: TSM was not able to take a snapshot of the specified volume. The percent of space allotted via the SNAPSHOTCACHESize option was not enough to perform this snapshot image backup. This could be due to an unexpected amount of disk activity which is generating more changes than can be contained in the allotted space at this particular point in time. Another reason for this failure can be that the specified SNAPSHOTCACHESize is not set to a large enough value to handle the usual amount of changes to the volume during snapshot image backup.

System action: Processing stopped.

User response: If the problem persists please increase the SNAPSHOTCACHESize or, for Windows, change the value of the SNAPSHOTCACHELocation.

ANS1348E Unable to satisfy the SNAPSHOTFSIDLEWait and SNAPSHOTFSIDLERetries options due to volume write activity.

Explanation: TSM was not able to take a snapshot of the specified volume. The Logical Volume Snapshot Agent was not able to satisfy the SNAPSHOTFSIDLEWait and SNAPSHOTFSIDLERetries options before starting the snapshot of the specified volume.

System action: Processing stopped.

User response: If the problem persists please modify the SNAPSHOTFSIDLEWait and SNAPSHOTFSIDLERetries options to better fit the normal disk write activity of the volume being backed up.

ANS1349E An error occurred during Logical Volume Snapshot Agent snapshot processing.

Explanation: An unrecoverable error occurred during snapshot processing. This can be caused by a variety of errors, so the error and system event logs should be checked for additional messages.

System action: Processing stopped.

User response: Check the client error log and the system event log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1350E The logical volume snapshot agent (LVSA) is currently busy performing a snapshot on this same volume.

Explanation: Another IBM Tivoli Storage Manager process is already performing a snapshot of this volume.

System action: The operation is stopped.

User response: Please wait until the other IBM Tivoli Storage Manager process finishes with the volume and then retry the operation.

ANS1351E Session rejected: All server sessions are currently in use

Explanation: TSM has all available sessions in use and cannot accept a new one at this time.

System action: TSM canceled the current operation.

User response: Retry the operation. If the problem continues, see your system administrator to increase the number of concurrently active sessions to the server.

ANS1352E The session is rejected. Your password has expired.

Explanation: Your TSM password has expired.

System action: TSM canceled the current operation. You are not allowed to connect to the server until the password is updated.

User response: Update your password. You may use the SET PASSWORD command, or have the TSM administrator update your node.

ANS1353E Session rejected: Unknown or incorrect ID entered

Explanation: The node name you entered is not known by the server, or you are attempting to access a file migrated to a different node.

System action: TSM canceled the current operation. You are not allowed to connect to the server until your node name is registered with the server. If attempting to access a migrated file, your node name must be the same node which migrated the file.

User response: Ensure that you entered your TSM node name correctly. If yes, see your system administrator. Verify that the server is using closed registration and that your node name is registered with the server.

ANS1354E Session rejected: Duplicate ID entered

Explanation: Another process using this node name is active with the server.

System action: TSM cannot connect to the server. TSM canceled the current operation.

User response: If you are running a UNIX-based system, ensure that another process is not active with TSM under the same name. Also, ensure that your node name is unique to the server so that it cannot be used by another person. See your system administrator to identify the owner of that node name.

ANS1355E Session rejected: Server disabled

Explanation: The server is in a disabled state and cannot be accessed for normal activity.

System action: TSM canceled the current operation.

User response: Retry the operation after the server returns to an enabled state. If the problem continues, see your system administrator.

ANS1356E The server is not configured to allow open registration

Explanation: No authorization. Registration is required by your system administrator. The server is not configured to allow open registration.

System action: Session not started.

User response: You must obtain a TSM node and password from your system administrator.

ANS1357S Session rejected: Downlevel client code version

Explanation: The server version and your client version do not match. The client code is downlevel.

System action: TSM canceled the current operation.

User response: See your system administrator to see what version of TSM to run for your location.

ANS1358S Session rejected: Downlevel server code version

Explanation: The server version and your client version do not match. The server code is downlevel.

System action: TSM canceled the current operation.

User response: See your system administrator to see what version of TSM to run for your location.

ANS1359E Session Rejected: The specified node name is currently in use

Explanation: The node name you specified is in use on the server.

System action: Session was not started.

User response: The server is probably performing a task that prevents your node from establishing a session. Retry later or check with your system administrator.

ANS1360I Compressed Data Grew

Explanation: The size of the file after compression is greater than the size of the file before compressed.

System action: Even though the size of the file increased, the file is compressed.

User response: None.

ANS1361E Session Rejected: The specified node name is currently locked

Explanation: The node name you specified is currently locked on the server.

System action: Session was not started.

User response: Check with your system administrator to find out why your node name is locked.

ANS1362S SLM LICENSE EXCEEDED: The client licenses for TSM are exceeded. See your system administrator.

Explanation: Adding a new enrollment will exceed the product license count for TSM.

System action: Execution of the client enrollment or connection request ends.

User response: See your system administrator.

ANS1363E Session Rejected: The server does not have enough memory to allow a connection to be established.

Explanation: The server does not have enough memory to allow your client to establish a connection with the server.

System action: Session was not started.

User response: Retry later or see your system administrator.

ANS1364E Session Rejected: The server does not have enough recovery log space to allow a connection to be established.

Explanation: The server ran out of recovery log space.

System action: Session was not started.

User response: This error is a temporary problem. Retry later or see your system administrator.

ANS1365E Session Rejected: The server does not have enough database space to allow a connection to be established.

Explanation: The server ran out of database space.

System action: Session was not started.

User response: See your system administrator.

ANS1366E The session is rejected. The TSM server has an internal error.

Explanation: The client cannot establish a connection to the TSM server because of an internal server error.

System action: The session was not started.

User response: Notify your TSM administrator of this error.

ANS1367E The client is unable to sign on to the TSM server because the server does not allow sign-on of Unicode clients.

Explanation: The client is not allowed to connect to the TSM server.

System action: The session does not start.

User response: Contact your TSM administrator for assistance in configuring a working TSM client for your environment.

ANS1368S Session Rejected: The server is not licensed for this platform type. See your system administrator.

Explanation: The server is not licensed for the requesting client type.

System action: Execution of the client enrollment or connection request ends.

User response: See your system administrator.

ANS1369E Session Rejected: The session was canceled by the server administrator.

Explanation: The server administrator canceled the current client session.

System action: Execution of the client connection request ends.

User response: See your system administrator.

ANS1370E The user ID entered does not have the correct level of authority to access the client machine.

Explanation: The user ID entered cannot access this TSM client.

System action: The TSM operation ends.

User response: Grant authority to this user ID on the TSM server so that it can access this TSM client.

ANS1371E File " cannot be reconstructed from subfile components.

Explanation: An error occurred while reconstructing this file from its subfile components.

System action: The file indicated in the message is not

restored. Restore for all other files continues.

User response: Try to restore the file again by selecting the file for restore from the user interface. If this doesn't resolve the problem, check the client error log and the server activity log for any messages related to the file indicated in the message.

ANS1372E An inconsistency was detected between the client node and the node that is registered to the TSM server.

Explanation: The user has probably coded the node option incorrectly. For instance, the node that is registered to the TSM server might be a type of NAS, but the node is actually a non-NAS client.

System action: The TSM operation ends.

User response: Ensure that the node name is correct in the client options file. Make sure to use a node of type NAS only with the nasnodename option.

ANS1373W The PRESNAPSHOTCMD command for volume *filespace* completed with a non-zero return code.

Explanation: The command specified by the PRESNAPSHOTCMD option must complete successfully in order to perform the snapshot backup/archive operation. If the command completed with a return code of 0 (zero), it has completed successfully. If the command completed with any other return code, it has failed. If the command failed, then the backup is still performed, but without the benefit of the snapshot technology.

System action: The client executes the backup/archive operation, but without using a snapshot.

User response: Identify and fix the problem that caused the command to fail. If a non-zero return code is normal for this command, then consider wrapping the command in a script that always exits with a return code of zero.

ANS1374W The POSTNAPSHOTCMD command for volume *filespace* completed with a non-zero return code.

Explanation: If the command specified by the POSTNAPSHOTCMD option completed with a non-zero return code, then the snapshot operation will continue, but with a warning-level result. Note that the result of the POSTNAPSHOTCMD command will not supercede a higher result from the backup/archive command. For example, if the backup command completed with a return code of 12, the backup will be considered to have completed with a return code of 12, regardless of the outcome of the POSTNAPSHOTCMD command.

System action: The backup/archive operation continues, but with a warning return code of at least 8.

User response: Identify and repair the problem that caused the command to fail. If a non-zero return code is normal for this command, then consider wrapping the command in a script that always exits with a return code of zero.

ANS1377W The client was unable to obtain a snapshot of '*volname*'. The operation will continue without snapshot support.

Explanation: TSM client was unable to create a snapshot of the volume due to some reason. Instead of failing the operation, TSM client will perform a non-snapshot based backup.

System action: Snapshot processing stops.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1378E The snapshot operation failed. The **SNAPSHOTCACHELocation** does not contain enough space for this snapshot operation.

Explanation: IBM Tivoli Storage Manager was not able to take a snapshot of the specified volume. The **SNAPSHOTCACHELocation** points to a location which does not contain the space necessary to manage the snapshot. Reasons for failure include:

- An unexpected amount of disk activity which is generating more changes than can be contained in the available space at this particular point in time.
- The **SNAPSHOTCACHELocation** is not large enough to handle the usual amount of changes to the volume.
- The specified **SNAPSHOTCACHESize** is not set to a large enough value to handle the usual amount of changes to the volume during snapshot backup or archive operation.

System action: Processing stopped.

User response: If the problem persists, increase the **SNAPSHOTCACHESize** or change the value of the **SNAPSHOTCACHELocation**.

ANS1379E The snapshot operation failed. The percent of space to use for the **SNAPSHOTCACHELocation**, specified via the **SNAPSHOTCACHESize**, has been exceeded.

Explanation: IBM Tivoli Storage Manager was not able to take a snapshot of the specified volume. The percent of space allotted via the **SNAPSHOTCACHESize** option was not enough to perform this snapshot backup/archive operation. Reasons for failure include:

- The **SNAPSHOTCACHELocation** is not large enough to handle the usual amount of changes to the volume.
- The specified **SNAPSHOTCACHESize** is not set to a large enough value to handle the usual amount of changes to the volume during snapshot backup or archive operation.

System action: Processing stopped.

User response: If the problem persists, increase the **SNAPSHOTCACHESize** or change the value of the **SNAPSHOTCACHELocation**.

ANS1380W The snapshot operation failed. The filesystem write activity prevented the Logical Volume Snapshot Agent from satisfying the **SNAPSHOTFSIDLEWait** and **SNAPSHOTFSIDLERetries** options.

Explanation: IBM Tivoli Storage Manager was not able to take a snapshot of the specified volume. The Logical Volume Snapshot Agent was not able to satisfy the **SNAPSHOTFSIDLEWait** and **SNAPSHOTFSIDLERetries** options before starting the snapshot of the specified volume.

System action: Snapshot processing stops.

User response: If the problem persists, modify the **SNAPSHOTFSIDLEWait** and **SNAPSHOTFSIDLERetries** options to better fit the normal disk write activity of the volume being backed up.

ANS1381W On volumes that are RAW or formatted FAT32 the snapshot cache location cannot be located on the same volume that is being backed up.

Explanation: When the snapshot cache location is located on the same volume that is being backed up the volume must be formatted with NTFS. The default cache location is on the same volume where the snapshot is being performed. The operation will continue without snapshot support.

System action: The client does not execute the snapshot operation.

User response: Specify a different snapshot cache location, using the **SNAPSHOTCACHELOCATION** option.

ANS1382E Server does not allow client-initiated connections for this node.

Explanation: The node is not allowed to initiate connections due to the configuration parameters for this node on the server. Server is able to initiate connections to the client scheduler running in prompted mode.

System action: The IBM Tivoli Storage Manager operation ends.

ANS1383E • ANS1391W

User response: Contact your systems administrator to enable client-initiated sessions for your node or update the SESSIONINITIATION option and run the client scheduler.

ANS1383E Wrong server port.

Explanation: You were trying to open a backup/archive client session on the server port set up for administrative sessions only.

System action: The IBM Tivoli Storage Manager operation ends.

User response: Contact your systems administrator and/or use the correct values for TCP port and TCP Admin Port.

ANS1384E An object in the transaction has been bound to an invalid management class.

Explanation: One of the objects in the transaction is bound to a management class that is not part of this node's policy, or the management class type is not supported for this client level.

System action: The current operation ends.

User response: Make sure all objects are bound to a valid management class, or upgrade the client to the proper level.

ANS1385E This server does not support backup operations.

Explanation: This server only supports archive operations, backup is not allowed.

System action: Current operation ends.

User response: Use only archive operations with this server.

ANS1386E Deleting this object: "fshlll" is not allowed.

Explanation: The object is either under a hold and cannot be deleted, or it is on a retention-protection enabled server and has not expired.

System action: The object is skipped and processing continues.

User response: Check the status of the object through a query to see if it is held, or when it expires.

ANS1387E The number of objects in this transaction exceed TXNGROUPMAX values.

Explanation: There are too many objects in this transaction.

System action: Current operation ends.

User response: Try the operation again with fewer objects in the transaction, or increase the TXNGROUPMAX value on the server.

ANS1388E fshlll is already under hold.

Explanation: The specified object is already under hold, and it cannot be placed under a new hold.

System action: This object is skipped and processing continues.

User response: Issue a query to see the status of the objects, and try the operation again, without the object that is already held.

ANS1389W Invalid option (option) for the scheduled function command

Explanation: There are two possible reasons for this message:

- The *option* option was specified for a scheduled command or subcommand (*function*) that cannot make use of that option.
- The option appears on a scheduled command but is valid only on the client scheduler initial command line, not on commands in a schedule from the server.

System action: The option is ignored.

User response: See the *Backup-Archive Client Installation and User's Guide* for correct use of the named option. The system administrator should remove the invalid option from the schedule definition on the server.

ANS1390I A TSM authorized user must configure the TSM client acceptor daemon and the TSM client scheduler.

Explanation: The installation of the TSM client acceptor daemon requires access to system locations, which require full access to the system. The TSM client acceptor daemon is installed as a startup item in /Library/StartupItems, and a link is added to /usr/bin for the dsmscad tool.

System action: The setup assistant cannot be used to configure the IBM Tivoli Storage Manager scheduler or the TSM client acceptor daemon.

User response: To acquire this access, system administrators must use the "TSM Backup for Administrators" application.

ANS1391W The TCA file permissions are not correct.

Explanation: The TCA is a tool used by TSM to provide secure access to the password file for non-administrators. If the permissions are not set correctly, and PASSWORDACCESS GENERATE is set, TSM cannot be used.

System action: Processing continues.

User response: Contact your system administrator so the permissions can be corrected. A System Administrator should use the "TSM Backup for Administrators" application to update the permissions.

ANS1392W The TCA file permissions are not correct. Would you like to update the permissions?

Explanation: The TCA is a tool used by TSM to provide secure access to the password file for non-administrators. If the permissions are not set correctly, TSM cannot be used. The dsmtca application needs to be owned by root and have 4755 permissions.

System action: If you select yes, TSM will set the owner of the TCA to root and the permissions to 4755. If you select no, the permissions will not be changed. In either case, processing continues.

User response: Select yes when you are prompted so TSM can repair the permissions of the file. If you select no, PASSWORDACCESS GENERATE will not work for non-TSM Authorized users.

ANS1393W The command line tools are not installed. The command line tools include the TSM client acceptor daemon and the TSM client scheduler.

Explanation: The command line tools are required for the IBM Tivoli Storage Manager scheduler. The 'dsmcad' application or the 'put in /Library/Startupitems' folder could not be located.

System action: The setup assistant cannot be used to configure the IBM Tivoli Storage Manager scheduler.

User response: A System Administrator must reinstall IBM Tivoli Storage Manager the command line tools.

ANS1394E The node name contains periods. Would you like to remove them? Select "no" if this is an existing node name.

Explanation: A node name with periods complicates the management of the node.

System action: IBM Tivoli Storage Manager prompts to remove the periods.

User response: Respond to the prompt. If this is a new node, select "yes", so the node is created without the periods in the name. For existing nodes, select "no", so the node name is not changed.

ANS1395E The destination filesystem or drive letter is unavailable. The following object was not processed: Filespace:'filesystem-name'

Explanation: The system is trying to restore or retrieve to a destination that cannot be reached. The specified

filesystem name or drive letter is not valid, or does not exist, or you are specifying a local share name that cannot be resolved.

System action: Objects which are part of this filesystem are not processed.

User response: Try the command again, and specify a different destination for the object that was not processed.

ANS1396E Access to the specified log or trace file (filename) is denied.

Explanation: Access to the specified file is denied. You specified a log or trace file name that cannot be written by the current user.

System action: Processing stops.

User response: Ensure that you specified the correct file or directory name, correct the permissions, or specify a new location.

ANS1397W The snapshot cannot be taken because the SNAPSHOTCACHELocation does not have enough space for this snapshot operation.

Explanation: IBM Tivoli Storage Manager was not able to take a snapshot of the specified volume. The SNAPSHOTCACHELocation points to a location which does not contain the space necessary to create the snapshot; the disk is probably full. The operation continues without snapshot support.

System action: The client does not execute the snapshot operation.

User response: Change the value of the SNAPSHOTCACHELocation, or clean the disk to which the SNAPSHOTCACHELocation points.

ANS1398E Initialization functions cannot open one of the Tivoli Storage Manager logs or a related file: log-name. errno = errno-value,

Explanation: The file "log-name" could not be opened during initialization. The system set the error code *errno-value*. If the reason given is "access denied," the current user does not have permission to write to the log in the directory specified. It is also possible that no space is available at the given log location.

On Unix systems, the log may not be placed in the root directory. Attempts to do so will result in an "access denied" error.

System action: Processing terminates.

User response: Set the DSM_LOG (or DSMI_LOG) environment variable to a directory into which the current user can write. You may also use the ERRORLOGNAME option to specify a file to which the current user has write permission.

ANS1399W The logical volume snapshot agent (LVSA) is currently busy performing a snapshot on this same volume.

Explanation: IBM Tivoli Storage Manager was not able to take a snapshot of the specified volume because another process is already performing a snapshot of this volume. The operation continues without snapshot support.

System action: Snapshot processing stops.

User response: Wait until the other IBM Tivoli Storage Manager process finishes with the volume and then try the operation again.

ANS1400W The snapshot cache location is not valid.

Explanation: The snapshot cache location must point to a local volume that is formatted with NTFS. The default cache location is on the same volume where the snapshot is being performed. The operation will continue without snapshot support.

System action: Snapshot processing stops.

User response: Specify a different snapshot cache location using the SNAPSHOTCACHELOCATION option.

ANS1401W The snapshot virtual volume is not accessible.

Explanation: The logical volume snapshot agent (LVSA) cannot access the virtual volume during OFS-enabled backup/archive operation because IBM Tivoli Storage Manager was probably started via terminal services. The operation continues without snapshot support.

System action: Snapshot processing stops.

User response: Do not use terminal services for the snapshot. Try the operation again on the local machine.

ANS1402W The snapshot is not supported on a remote, removable, or SAN drive.

Explanation: IBM Tivoli Storage Manager was not able to take a snapshot of the specified volume because open file support is only supported on local fixed volumes, including volume mountpoints. The operation continues without snapshot support.

System action: The client does not execute the snapshot operation.

User response: To take advantage of the open file support, you may try the operation again on the local machine.

ANS1403E Error loading a required *filename* DLL

Explanation: An error occurred while loading a dynamic link library. The DLL load failed.

System action: Processing stopped.

User response: Verify that your system software is up to date and that all DLLs required by the TSM client are present.

ANS1404E Error loading one or more functions from a required *filename* DLL

Explanation: An error occurred while loading a function from a dynamic link library. The DLL load failed.

System action: Processing stopped.

User response: Verify that your system software is up to date.

ANS1405I '*service-name*' service needs to be restarted.

Explanation: The service must be restarted for the restored changes to take effect.

System action: Changes are not effected.

User response: Restart the service.

ANS1406I Performing operation using point-in-time copy of the filesystem: '*volname*'.

Explanation: IBM Tivoli Storage Manager is taking a snapshot of the specified volume during the backup or archive operation. This allows the IBM Tivoli Storage Manager to access locked or in-use files.

System action: Operation proceeds.

User response: None.

ANS1407I Performing operation using point-in-time copy of the filesystem.

Explanation: IBM Tivoli Storage Manager is taking a snapshot of the specified volume during the backup or archive operation. This allows the IBM Tivoli Storage Manager to access locked or in-use files.

System action: Operation proceeds.

User response: None.

ANS1408W Previous changes have not been committed. The machine must be restarted before the snapshot can be taken

Explanation: IBM Tivoli Storage Manager was not able to take a snapshot of the specified volume because a

previous operation required the machine to be restarted for the changes to take effect, but the machine has not been restarted. The operation will continue without snapshot support.

System action: The client does not execute the snapshot operation.

User response: Restart the machine and then try the operation again.

ANS1409E The remote copy process *process ID* on server could not be canceled.

Explanation: A remote copy operation with process id *process ID*, which is in progress on server, could not be canceled. Check your error log to see cause of failure.

System action: None.

User response: Contact your TSM administrator.

ANS1410E Unable to access the network path.

Explanation: The network path cannot be accessed due to a possible network problem.

System action: The client terminates.

User response: Ensure that the network is up and the path can be accessed using a system command, and retry the operation.

ANS1411E A communication session was dropped.

Explanation: A communication session was dropped due to a possible network problem.

System action: The client terminates.

User response: Ensure that the network is up and retry the operation.

ANS1412E Directory or file has bad EA data or inconsistent data.

Explanation: Directory or file has bad EA data or inconsistent data.

System action: The client terminates.

User response: Check failing directory or file for bad EA data. Copy the directory to a new location and retry the operation.

ANS1413W File '*filesystem-namepath-namefile-name*' is not recognized by the system as a disk file and cannot be processed. The file is skipped.

Explanation: The client is unable to process file types that are not 'disk', such as 'character' and 'pipe'. This message is typically, but not always, issued for file names that are normally reserved for the operating system. In the Windows environment, reserved names

include AUX, CON, NUL, PRN, COMx or LPTx, where 'x' is any digit from 1 to 9 (for example, COM1, LPT3, etc.).

System action: The file is skipped.

User response: Either delete the file if you do not need it, or else use an EXCLUDE statement in the client options to prevent the client from trying to process the file. In the Windows environment, normal delete commands will most likely not work. You will need to prefix the file name with the characters '\\.\'. For example, "del c:\mydir\lpt4" will not work, but "del \\.\c:\mydir\lpt4" will work.

ANS1414W Don't have sufficient authority to delete open group on server.

Explanation: An open image group exists on the TSM server and cannot be deleted due to missing backup delete rights for this node.

System action: Processing continues.

User response: Ask your TSM administrator to grant backup delete rights for your node.

ANS1418W A call to TSM API *API-name* failed.

Explanation: An unexpected error occurred while performing server-free data movement.

System action: The requested operation will be retried with out server-free data movement.

User response: Contact your TSM administrator to correct problems with server-free data movement.

ANS1419W Remote copy operation for volume *filesystem-name* failed or could not be restarted, return code *retcode*.

Explanation: An error occurred on server when starting or during the remote copy operation for volume *filesystem-name*.

System action: The requested operation will be retried with out server-free data movement.

User response: Contact your TSM administrator to correct problems with server-free data movement.

ANS1421E The image object '*object-type*' was not found on server.

Explanation: The specified image object of type *object-type* could not be located on the server. The operation cannot complete without this object.

System action: The operation ends.

User response: Examine the client error log for additional messages that might indicate the reason for the problem. Take any corrective action suggested by the messages, then try the operation again. If the

ANS1422W • ANS1432E

problem persists, contact IBM technical support for further assistance.

ANS1422W The image data for volume *filespace-name* is either compressed or its compression information can not be determined.

Explanation: The image data was backed up either with compression or by an older client version. This data format cannot be restored on server-free path.

System action: The requested operation will be retried without server-free data movement.

User response: None.

ANS1424W Retrying failed image operation for volume *filespace-name*.

Explanation: The transaction for image operation for volume *filespace-name* failed due to reason described by earlier message(s).

System action: The requested image operation will be retried again.

User response: None.

ANS1425E The image operation for volume *filespace-name* cannot be retried because of a severe error.

Explanation: None.

System action: The image operation fails for the indicated volume.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1426E An error occurred creating the Registry backup directory structure

Explanation: The TSM client uses an intermediate directory structure on the client machine as part of the Windows Registry backup process. The client was unable to create this intermediate directory structure, so the Windows Registry could not be backed up. This problem can occur if you do not have sufficient privileges to perform the backup operations, if the client is unable to allocate more memory from the system, or if a component within the directory structure already exists as a file.

System action: The Windows Registry is not backed up.

User response: Check the client error log for any other messages that might have been logged when this message was written, and take the corrective action (if any) suggested by those messages. Make sure that account under which the operation runs has sufficient

privileges. Ensure that the system has sufficient memory to run TSM. Remove the ADSM.SYS directory from the root of your system drive, then try the operation again. If the problem persists, contact IBM support for further assistance.

ANS1427I Registry Backup function completed successfully.

Explanation: Registry backup was successful.

System action: None.

User response: Continue with normal operations.

ANS1428E Backup of the registry failed.

Explanation: None.

System action: The registry is not backed up.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1429I Registry Restore function completed successfully.

Explanation: Registry Restore was successful.

System action: None.

User response: Continue with normal operations.

ANS1430W The machine must be rebooted for the changes to take effect.

Explanation: The TSM restore operation made changes that will not be in effect until the machine is rebooted. It is important to note that until the reboot occurs, the system or its applications might be unstable.

System action: None

User response: Reboot the machine as soon as possible after the TSM restore operation ends.

ANS1431E Restore of the registry failed.

Explanation: None.

System action: The registry is not restored.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1432E Keyword Expected after keyword '*keyword*'.

Explanation: A registry command was incorrectly entered.

System action: Registry function is not invoked.

User response: Refer to the command reference for this command.

ANS1433E Extraneous argument *'input'* after keyword *'keyword'*

Explanation: A registry command was incorrectly entered.

System action: Registry function not invoked.

User response: Refer to the command reference for this command.

ANS1434E Invalid argument *'input'* after keyword *'keyword'*

Explanation: A registry command was incorrectly entered.

System action: Registry function not invoked.

User response: Refer to the command reference for this command.

ANS1435E An error occurred saving a registry key.

Explanation: None.

System action: The registry is not backed up.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1436E An error occurred replacing a registry key.

Explanation: None.

System action: The registry key is restored from the server, but cannot be activated in the registry. The current registry key remains active.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1437I Event Log Backup function completed successfully.

Explanation: Event Log backup was successful.

System action: None.

User response: Continue with normal operations.

ANS1438E Backup of the event logs failed.

Explanation: None.

System action: The event logs are not backed up.

User response: Check the client error log for any other

messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1439I Event Log Restore function completed successfully.

Explanation: Event Log Restore was successful.

System action: None.

User response: Continue with normal operations.

ANS1440E Restore of the event logs failed.

Explanation: None.

System action: The event logs are not restored.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1441E Keyword Expected after keyword *'keyword'*.

Explanation: A event log command was incorrectly entered.

System action: Event Log function is not invoked.

User response: Refer to the command reference for this command.

ANS1442E Extraneous argument *'input'* after keyword *'keyword'*

Explanation: A event log command was incorrectly entered.

System action: Event Log function not invoked.

User response: Refer to the command reference for this command.

ANS1443E Invalid argument *'input'* after keyword *'keyword'*

Explanation: A event log command was incorrectly entered.

System action: Event Log function not invoked.

User response: Refer to the command reference for this command.

ANS1444E An error occurred creating the Event Log backup directory structure

Explanation: The TSM client uses an intermediate directory structure on the client machine as part of the Windows Event Log backup process. The client was unable to create this intermediate directory structure, so the Windows Event Logs could not be backed up. This

ANS1445E • ANS1454W

problem can occur if you do not have sufficient privileges to perform the backup operations, if the client is unable to allocate more memory from the system, or if a component within the directory structure already exists as a file.

System action: The Windows Event Logs are not backed up.

User response: Check the client error log for any other messages that might have been logged when this message was written, and take the corrective action (if any) suggested by those messages. Make sure that account under which the operation runs has sufficient privileges. Ensure that the system has sufficient memory to run TSM. Remove the ADSM.SYS directory from the root of your system drive, then try the operation again. If the problem persists, contact IBM support for further assistance.

ANS1445E ERROR: could not create NAS image object.

Explanation: Creation of the NAS image object failed for one of following reasons:

- An unauthorized user invoked the NAS command
- NAS operations are not supported on the current platform
- Cannot find the NAS plugin library.

System action: The requested NAS operation is not performed.

User response: Retry the operation after correcting the cause for failure.

ANS1447I Current user does not need to back up the default profile.

Explanation: You are currently using the default profile, and there is no need to back it up.

System action: None.

User response: None.

ANS1448E The *command* command is not supported by the current server.

Explanation: The server to which the client is connected does not support the *command*.

1. If the command is "set event," the server does not support event-based policy. This command requires that the server support event-based policy. That support is available only at TSM Server levels 5.2.2 and above.
2. If the message displays any other command, the server is configured to support archive retention protection and cannot process operations not associated with that facility.

System action: The command is skipped and other processing continues.

User response: Log in to an appropriate server and retry the command.

ANS1449W A non-critical, unexpected error was encountered. Deletion of a snapshot(Set/Volume) failed. Probable cause, snapshot does not exist anymore. Continuing Process... TSM snapShot ID : *snapshot-id* TSM function name : *function-name* TSM function : *function-desc* TSM return code : *TSM-rc* TSM file : *file-name* (*line-number*)

Explanation: None.

System action: Processing continues.

User response: Contact the TSM administrator with the information provided in this message.

ANS1450W The -FILENAME option was specified without a file name. Output will be written to *filename*.

Explanation: The -FILENAME option was specified, but the file name was omitted.

System action: The output is written to the default file.

User response: Reissue the command and specify a valid file name, or use the information that was written to the default file.

ANS1453W The IMAGEGAPSIZE option is not supported for non-NTFS file systems. The entire volume will be backed up.

Explanation: None.

System action: The entire volume is backed up.

User response: Refer to the client manual for additional information regarding the IMAGEGAPSIZE option.

ANS1454W Used blocks information could not be obtained for *name*. The entire volume will be backed up.

Explanation: None.

System action: The entire volume is backed up.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1455I Resynching mirrors. Please wait.

Explanation: The destination volume for server-free restore has mirrored layout. The mirrors are being resynched after the data restored.

System action: Processing continues.

User response:

ANS1456I Mirror synchronization completed.

Explanation: Synchronization of the volume's mirrors completed successfully.

System action: Processing continues.

User response:

ANS1457E Mirror synchronization failed.

Explanation: Synchronization of the volume's mirrors failed.

System action: Processing stopped.

User response: Check the error log for more errors. Contact your systems administrator.

ANS1458I OBF file for volume *name* is too small for server-free data transfer.

Explanation: The OBF file for volume is very small to initiate a server-free data transfer. Hence this file will not be transferred via a server-free data path.

System action: Processing continues.

User response: None.

ANS1460W The file segment size entered is greater than the max size. Please increase the max size or decrease the file segment size.

Explanation: The user has enabled both trace wrapping and trace spanning but has entered a segment size greater than the max size.

System action: Allow the user to re-enter the max size or reduce the segment size.

User response: The user should either increase the max size or reduce the segment size.

ANS1461E Error processing '*filespace namepath-namefile-name*': unsupported encryption type.

Explanation: The files you are trying to restore or retrieve have been backed up or archived by a later version of the TSM client. The file encryption method is not supported by the current client.

System action: Object skipped.

User response: Restore or retrieve the file with the most recent version of the TSM client.

ANS1462E Unsupported encryption type

Explanation: The files you are trying to restore or retrieve have been backed up or archived by a later version of the TSM client. The file encryption method is not supported by the current client.

System action: Object skipped.

User response: Restore or retrieve the file with the most recent version of the TSM client.

ANS1463E Unexpected error in cryptography library.

Explanation: There was an unexpected error in the cryptography library. See the error log for more information.

System action: processing stops.

User response: Check the error log for ANS1467E to determine the cause of failure. Verify you TSM client is installed properly. If needed, reinstall client and/or API. If the problem still exists, contact TSM technical support.

ANS1464S Cannot load ICC encryption library.

Explanation: TSM is using cryptography library which is installed automatically with the client and is being loaded at runtime. The client cannot proceed if the library is not loaded.

System action: Client exits.

User response: Check the error log for ANS1467E to determine the cause of failure. Verify you TSM client is installed properly. If needed, reinstall client and/or API. If the problem still exists, contact TSM technical support.

ANS1465E Conflicting options ERRORLOGMAX and ERRORLOGRETENTION were specified.

Explanation: Values were specified for both the ERRORLOGMAX and the ERRORLOGRETENTION options. These options are mutually exclusive.

System action: Processing stops.

User response: Specify a nonzero value for ERRORLOGMAX if you wish to have the TSM error log wrap when it reaches the specified maximum value. Use ERRORLOGRETENTION if you wish you have the error log limited in size on a time-based schedule.

ANS1466E Conflicting options SCHEDLOGMAX and SCHEDLOGRETENTION were specified.

Explanation: Values were specified for both the SCHEDLOGMAX and the SCHEDLOGRETENTION options. These options are mutually exclusive.

System action: Processing stops.

User response: Specify a nonzero value for SCHEDLOGMAX if you wish to have the TSM scheduler log wrap when it reaches the specified maximum value. Use SCHEDLOGRETENTION if you wish you have the scheduler log limited in size on a time-based schedule.

ANS1467E ICC routine *icc-routine* returned: majRC = *majRC*, minRC = *minRC*, desc = '*desc*'.

Explanation: There was an error within an ICC cryptography library. This message reports return codes and problem description which can be used by TSM technical support personnel to determine the cause of the error.

System action: Client exits.

User response: Verify you TSM client is installed properly. If needed, reinstall client and/or API. If the problem still exists, contact TSM technical support.

ANS1468E Backing up Automated System Recovery (ASR) files failed. No files will be backed up.

Explanation: An error occurred while backing up the files needed for Automated System Recovery (ASR). No files were backed up.

System action: Processing stops.

User response: Ask your system administrator to check the error log. Verify that the Windows account from which you are running this command has administrator authority and try the command again.

ANS1469E Error processing '*filepath namepath-name file-name*'; invalid encryption key.

Explanation: The key you entered does not match the key that was used to encrypt the file during backup. The file can not be restored unless the matching key is entered.

System action: processing stops.

User response: Try the restore operation again and provide the correct key.

ANS1470E Shared library libgpfs.so is not loaded for GPFS support: skip *path_name*

Explanation: The load library that is provided to handle the GPFS™ ACL is not available on this system.

System action: Object skipped.

User response: Ensure that the GPFS software is installed on the system.

ANS1471E ASR system information file creation failed. ASR backup is unsuccessful.

Explanation: An error occurred while creating the system information file (asr.sif) needed for Automated System Recovery (ASR). The ASR backup is unsuccessful.

System action: Processing stops.

User response: Ask your system administrator to check the error log. Verify that the Windows account from which you are running this command has administrator authority and that you have access to the system object staging directory <system drive>:\adsm.sys. Try the command again.

ANS1472E Could not add entry to the ASR system information file. ASR backup is unsuccessful.

Explanation: An error occurred while adding an entry to the system information file (asr.sif) needed for Automated System Recovery (ASR). The ASR backup is unsuccessful.

System action: Processing stops.

User response: Ask your system administrator to check the error log. Verify that the Windows account from which you are running this command has administrator authority and try the command again.

ANS1473E Session rejected: TCP/IP connection failure for Shared Memory

Explanation: An attempt to connect to the local server using the Shared Memory protocol has failed during initial TCP/IP communications. This error can occur if the server is not listening on the correct port, or if the server is down.

System action: Session rejected. Processing stopped.

User response: Retry the operation, or wait until the server comes back up and retry the operation. If the problem continues, see your system administrator for further help.

ANS1474E An error occurred using the Shared Memory protocol

Explanation: An error has occurred while reading or writing data through the Shared Memory communications protocol.

System action: TSM cannot complete the requested operation.

User response: Check the trace log for additional information and retry the operation. If the problem continues, see your system administrator for further help.

ANS1475E Insufficient authority to connect to the shared memory region

Explanation: The user issuing the command does not have authority to connect to the shared memory segment. When the shared memory segment is created by the server, it will be owned by the effective uid of the server process (dsmserv). Only processes running under this uid or root will be allowed to connect to the segment (and thus to the server).

System action: The session is rejected and processing stops.

User response: Run the command under the uid of the processing running dsmserv, if possible. Otherwise contact your system administrator for further help.

ANS1476E CLUSTERNODE is set to YES but the Cluster Information Daemon is not started.

Explanation: The HACMP™ Cluster Information Daemon must be started in order to specify the CLUSTERNODE option.

System action: Processing ends.

User response: Start the HACMP Cluster Information Daemon.

ANS1477E CLUSTERNODE is set to YES but the cluster load library is not valid.

Explanation: The load library that the operating system provides to obtain the cluster name is not valid. A possible cause is an out-of-date load library which does not contain the proper routines this product expects.

System action: Processing ends.

User response: Ensure that the latest cluster software is installed on the system.

ANS1478E CLUSTERNODE is set to YES but the cluster software is not available on this system.

Explanation: The load library that the operating systems provides to obtain the cluster name is not available on this system.

System action: Processing ends.

User response: Ensure that the cluster software is installed on the system.

ANS1479E CLUSTERNODE is set to YES but this machine is not a member of a cluster.

Explanation: This machine is not a member of a cluster node. Possible causes are that the cluster service has not been configured correctly, or that the cluster is in the process of initialization.

System action: Processing ends.

User response: Ensure that the cluster software is configured properly. If the cluster is in the process of initialization, retry the operation at a later time.

ANS1480E CLUSTERNODE is set to YES but the cluster service is not enabled on this system.

Explanation: The cluster service has not been enabled on this system.

System action: Processing ends.

User response: Enable the cluster service on the system.

ANS1481E The CLUSTERNODE option is not supported on this system.

Explanation: This option is not supported on this system.

System action: Processing ends.

User response: Disable the CLUSTERNODE option in the local options file.

ANS1482E An unexpected error (*retcode*) occurred while the program was trying to obtain the cluster name from the system.

Explanation: An unknown error occurred while the program was trying to obtain the cluster name from the cluster service. The error code is the reason code provided directly from the cluster service being used in this operating system environment.

System action: Processing ends.

User response: Consult the documentation for your clustering software for an explanation of the reason code. Insure that your clustering service is operational,

ANS1483I • ANS1494S

then try the TSM operation again.

ANS1483I Schedule log pruning started.

Explanation: The schedule log pruning function has begun.

System action: The schedule log is pruned.

User response: None.

ANS1484I Schedule log pruning finished successfully.

Explanation: The schedule log pruning function completed with no errors.

System action: None.

User response: None.

ANS1486E An error occurred while restoring the WMI repository. The database will not be updated.

Explanation: The Windows event log and TSM error log might contain additional information related to this error.

System action: processing stops.

User response: Examine the Windows event log and TSM error log for messages related to Windows Management Instrumentation (WMI). Ensure that the WMI is started.

ANS1487E An error occurred while backing up the WMI repository. The database will not be backed up.

Explanation: The Windows event log and TSM error log might contain additional information related to this error.

System action: processing stops.

User response: Examine the Windows event log and TSM error log for messages related to WMI. Ensure that the Windows Management Instrumentation service is started.

ANS1489E The WMI service failed to stop. No files will be restored.

Explanation: An error occurred while stopping the Windows Management Instrumentation (WMI) service. The database will not be restored.

System action: processing stops.

User response: Examine the Windows event log and TSM error log for messages related to Windows Management Instrumentation (WMI). You might need to quiesce WMI activity or reboot the machine in order

to free resources which are preventing the WMI service from stopping.

ANS1490W File specification '*file-spec*' ignored. A file list has already been specified.

Explanation: A non-option argument (file specification) was encountered after the -FILELIST has been processed.

System action: The argument is ignored.

User response: You may have either a -FILELIST or explicit file specifications on this command, but not both.

ANS1491E Only one -FILELIST option allowed.

Explanation: The -FILELIST option may only be specified once per command

System action: The command is not executed.

User response: Enter only one -FILELIST option on the command.

ANS1492S Invalid virtual mountpoint *filespace-name*: File not found.

Explanation: The specified *VIRTUALMOUNTPOINT* in the system options file is invalid because it could not be found in the file system.

System action: TSM attempts to continue the current operation.

User response: Check the virtual mountpoint in the system options file and make sure it exists in the file system. Retry the operation.

ANS1493S Invalid virtual mountpoint *filespace-name*: Access denied.

Explanation: The specified *VIRTUALMOUNTPOINT* in the system options file is invalid because access to it is denied.

System action: TSM attempts to continue the current operation.

User response: Check the *VIRTUALMOUNTPOINT* in the system options file and make sure it is accessible. Retry the operation.

ANS1494S Invalid virtual mountpoint *filespace-name*: Symbolic link.

Explanation: The specified *VIRTUALMOUNTPOINT* in the system options file is invalid because it is a symbolic link and *FOLLOWSYMBOLIC* is not set.

System action: TSM attempts to continue the current operation.

User response: Set the option *FOLLOWSYMBOLIC* to

YES in the user options file. Retry the operation.

ANS1495S Invalid virtual mountpoint *filespace-name*: Other error, rc = *return-code*.

Explanation: The specified *VIRTUALMOUNTPOINT* in the system options file is invalid.

System action: TSM attempts to continue the current operation.

User response: Make sure the virtual mountpoint is a directory and accessible from the shell, and retry the operation.

ANS1496W Duplicate include/exclude option '*option file-name*' found while processing the client options file. This might produce unexpected results.

Explanation: TSM found a duplicate statement while processing the client options file, which might produce unexpected results.

System action: Processing continues.

User response: Verify if you obtained the desired results. If not, you need to correct the client options file by removing the duplicate option statement.

ANS1497W Duplicate include/exclude option '*option file-name*' found while processing the client options passed by the server. This might produce unexpected results.

Explanation: TSM found a duplicate statement while processing the client options by the server, which might produce unexpected results.

System action: Processing continues.

User response: Verify if you obtained the desired results. If not, you need to correct either the client options file or the client options passed by the server.

ANS1498E The IIS services failed to stop. No files will be restored.

Explanation: An error occurred while stopping the Internet Information Services (IIS) services. The metabase will not be restored.

System action: processing stops.

User response: Examine the Windows event log and TSM error log for messages related to Internet Information Services (IIS). You might need to quiesce IIS activity or reboot the machine in order to free resources which are preventing the IIS service from stopping.

ANS1499E Creation of table of contents failed.

Explanation: A failure occurred on the server during creation of the table of contents.

System action: The table of contents was not created.

User response: This abort code indicates there was a problem creating a table of contents on the server. The sysadmin will need to consult the activity log on the server to determine the cause.

ANS1500E Module *dsmtca* not found in secure directory.

Explanation: TSM cannot find the Trusted Communication Agent module (*dsmtca*) in the appropriate directory.

System action: TSM ends.

User response: Log on as root user, then create a link to *dsmtca* module in */usr/bin* with the command: `ln -s /usr/tivoli/tsm/client/ba/bin/dsmtca /usr/bin/dsmtca`

ANS1501E Trusted agent execution/owner permissions are invalid

Explanation: The Trusted Communication Agent execution/owner permissions are invalid.

System action: TSM ends.

User response: Have your system administrator check the installation instructions for the client to ensure that the Trusted Communication Agent permissions are set correctly. This error can be caused by installing TSM as a non-root user. For the UNIX platforms that have the installation program (*dsm.install*), you must run *dsm.install* while logged in as the root user.

ANS1502E Access to system function required to run has been denied

Explanation: The permissions of the Trusted Communication Agent do not allow it to be accessed by the user of the TSM client.

System action: TSM ends.

User response: See your system administrator.

ANS1503E Valid password not available for server '*server-name*'. The administrator for your system must run TSM and enter the password to store it locally.

Explanation: The file containing the stored password for the specified server *server-name* is unavailable.

System action: TSM ends.

User response: The administrator for your system must set and store a new password.

ANS1504E Error starting the Trusted Communication Agent process.

Explanation: An error has occurred starting the Trusted Communication Agent process; specifically, the fork() function has failed.

System action: TSM ends.

User response: Probable system error. If the problem persists, restart the workstation.

ANS1505W Performing image backup of the entire volume for *volume name*. The IMAGEGAPSIZE option value of *image gap size* is being ignored as this level of the operating system does not support used block image backup. Please upgrade to AIX 5.3 Maintenance Level 7 or later in order to perform used block image backup.

Explanation: AIX 5.3 Maintenance Level 7 or later has some necessary fixes that are required to support used block image backup.

System action: The entire volume is backed up.

User response: Please upgrade to AIX 5.3 Maintenance Level 7 or later in order to perform used block image backup.

ANS1506E The TSM Trusted Communication Agent received an invalid request.

Explanation: The Trusted Communication Agent is invoked by the TSM client and has received an unknown request argument in the call.

System action: TSM ends.

User response: It is possible the Trusted Communication Agent was mistakenly invoked by a process other than the TSM client. If that is not the case, then this is an internal error. If the problem recurs, contact your IBM service representative.

ANS1507E This action requires TSM administrative authority on this system.

Explanation: An activity has been attempted that must be performed by the TSM administrator (for example, open registration, filespace delete or password update).

System action: TSM ends.

User response: If the activity is required, the administrator for this system must perform it.

ANS1508E Error allocating semaphores.

Explanation: An error has occurred because the semaphores you are attempting to allocate have become insufficient.

System action: Processing ends.

User response: Ask your system administrator for assistance, and possibly increase the number of semaphores in your system.

ANS1509E Error setting semaphore value or waiting on semaphore.

Explanation: An error has occurred while attempting to set or wait on a semaphore.

System action: Processing ends.

User response: Probable system error. If the problem persists, restart the workstation.

ANS1510I The specified backupset either does not exist, or does not contain file data.

Explanation: The specified backupset either does not exist, or does not contain file data for the node name specified. The restore backupset command is limited to backupsets that contain file data. To restore an image backup from a backupset, use the restore image command.

System action: Processing stopped.

User response: If an incorrect backupset name was specified, retry the command with the correct backupset name. If you are trying to restore an image from a backupset, refer to the restore image command for the correct syntax.

ANS1511I Invalid Restore session number entered. Try again.

Explanation: You entered a number not shown in the list of restartable restores. The number you entered is either less than one or greater than the highest item number displayed.

System action: TSM waits for you to enter a valid selection.

User response: Enter a number from the list or 'Q' to quit.

ANS1512E Scheduled event '*event*' failed. Return code = *value* .

Explanation: One or more error conditions were encountered that prevented the schedule from completing successfully. This message is preceded by other messages that indicate the specific problems encountered during the operation.

System action: Scheduled event failed.

User response: Check the schedule and error log files for the messages that specify what problems were encountered during the operation. Correct the conditions that caused those messages to be issued. The specific corrective actions will depend on the specific errors encountered.

ANS1513E The object “ is skipped from rename.
Error_condition.

Explanation: TSM skips the specified object from renaming because the object with the same long name but with different attributes exists on the server.

System action: The backup operation will continue. The specified object will be expired during the next incremental backup.

User response: The object is skipped if one of the following condition takes place:

The long name object(LN) has more recent insert date than the short name object(SN).

The management classes for LN and SN don't match.

The copygroups for LN and SN don't match.

LN and SN have different owners.

The creation date for LN and SN don't match.

The short name attribute for LN doesn't match SN.

If you are unable to determine what is wrong, report the problem to your service representative.

ANS1514W Encryption key passwords are not the same.

Explanation: The key passwords are different.

System action: TSM allows you to try again.

User response: Enter the correct password.

ANS1515E Loading a table of contents failed.

Explanation: A failure occurred on the server during loading of the table of contents.

System action: The table of contents was not loaded.

User response: This abort code indicates there was a problem loading a table of contents on the server. The sysadmin will need to consult the activity log on the server to determine the cause.

ANS1519E Your node does not have permission to delete backup files

Explanation: The server does not allow your node to delete backup files.

System action: TSM did not delete the backup files.

User response: See your system administrator.

ANS1520E Failure writing to the Tivoli Storage Manager error log: errno = *errno-value*,

Explanation: A failure was encountered when writing to the dsmdir log or dsidir log. The system set the error code *errno-value*. It is possible that no space is available at the given log location.

System action: Processing terminates.

User response: Set the DSM_LOG (or DSMI_LOG) environment variable to a directory with adequate space to write the log data.

ANS1521E Failure writing to a Tivoli Storage Manager log or log-related file: *file-name*, errno = *errno-value*, *reason*

Explanation: A failure was encountered when writing to one of the log files or a related file named *file-name*. The system set the error code *errno-value*. *reason* is the system explanation of that error code. Among other things, it is possible that no space is available at the given log location.

System action: Processing terminates.

User response: Set the DSM_LOG (or DSMI_LOG) environment variable to a directory with adequate space to write the log data.

ANS1522E It is not possible to authenticate with the client node *client-node* ! The Space Management Agent version *agent-version* running on *client-node* does not match with the Space Management Console version *console-version* you are running !

Explanation: The version of the Space Management Console does not match with the version of the Space Management Agent running on the client node machine. To avoid incompatibility it is necessary to run the console and the agent with the same version.

System action: The Space Management Console exits.

User response: Use Space Management Console with the same version like the Space Management Agent running on the HSM node you want to manage.

ANS1523E An error occurred while connecting to TSA/SMDR service.

Explanation: An error was encountered during a call to the TSA/SMDR service. This message usually follows previous messages that contain more specific information about the problem.

System action: Processing stopped.

User response: Refer to previous messages in dsmdir.log for further information. If those messages are not helpful in identifying the cause of the problem, see your system administrator for further assistance.

ANS1528I TSM is converting the *log-file* from continuous (pruning) mode to wrapping mode. This process may take several minutes.

Explanation: The *log-file* was previously in continuous mode where the only size control was through the use of ERRORLOGRETENTION or SCHEDLOGRETENTION option. This is the first occasion where ERRORLOGMAX or SCHEDLOGMAX is specified for this log, so its format must be changed and old data saved.

System action: Transition processing continues.

User response: None.

ANS1529I TSM is converting the *log-file* from wrapping mode to continuous (pruning) mode. This process may take several minutes.

Explanation: The *log-file* was previously in wrapping mode where the size control was through the use of the ERRORLOGMAX or SCHEDLOGMAX option. This is the first occasion where ERRORLOGMAX or SCHEDLOGMAX is not specified for this log, so its format must be changed and old data saved.

System action: Transition processing continues.

User response: None.

ANS1530I *count* log records processed.

Explanation: This is just a progress report to let you know the process is still ongoing.

System action: Transition processing continues.

User response: None.

ANS1532E Proxy Rejected: Proxy authority has not been granted to this node.

Explanation: The node has not been granted proxy authority to access the node named by the ASNODENAME option. The TSM administrator must first grant proxy authority.

System action: The TSM operation ends.

User response: The TSM server administrator must grant proxy authority for this node. See the administrator command "Grant Proxynode".

ANS1533E Proxy Rejected: The node name you specified in the ASNODENAME option is locked.

Explanation: The TSM administrator has locked the node you specified as the ASNODENAME option.

System action: The TSM operation ends.

User response: The TSM server administrator must unlock the node before you can access it. Try the operation later, or check with your TSM administrator.

ANS1534E Proxy Rejected: The TSM server has run out of memory.

Explanation: There is not enough memory available to allow this operation to continue.

System action: TSM canceled the current operation.

User response: Try the operation again. If the problem continues, see your system administrator to increase the amount of memory of the server.

ANS1535E Proxy Rejected: ASNODENAME and NODENAME are identical.

Explanation: TSM does not allow the ASNODENAME and NODENAME option values to be the same.

System action: TSM canceled the current operation.

User response: Use the ASNODENAME option only to access another node. It is not necessary to set ASNODENAME option to access your own node. Remove ASNODENAME from your option file unless you are actually trying to access a node that you have been granted authority to access with the administrative command "Grant Proxynode".

ANS1536E Proxy Rejected: The server has an internal error.

Explanation: The client cannot proxy to the node named by the ASNODENAME option because of an internal server error.

System action: TSM canceled the current operation.

User response: See your system administrator immediately.

ANS1537E The ASNODENAME option is not valid with the FROMNODE option.

Explanation: None.

System action: Processing stops.

User response: Remove the ASNODENAME option from the options file or do not use the FROMNODE option.

ANS1538E The operation that is being attempted cannot be invoked using the ASNODENAME option.

Explanation: None.

System action: Processing stops.

User response: Remove the ASNODENAME option and retry the operation.

ANS1539E The ASNODENAME option cannot be used with the CLUSTERNODE option.

Explanation: None.

System action: Processing stops.

User response: Remove the ASNODENAME option and retry the operation.

ANS1540E Incremental backups using snapshot difference is not supported on this version of the NetApp Filer.

Explanation: Please upgrade your filer to a supported level of ONTAP in order to perform incremental backups using snapshot difference.

System action: Processing stops.

User response: Retry the operation after upgrading your Filer to a supported version of ONTAP.

ANS1541E Node entered has been federated into a Network Deployment, federated nodes cannot be backed up.

Explanation: Node entered has been federated into a Network Deployment, federated nodes cannot be backed up.

System action: None

User response: Run 'dsmc q was -wastype=local' to see the nodes that may be backed up.

ANS1542E Incorrect WAS backup type entered, no node of that name and type exists.

Explanation: There is no node with the WAS backup type that was entered.

System action: None

User response: Check the wastype that was entered. Run 'dsmc q was -wastype=local' to see the nodes that may be backed up.

ANS1543E Incorrect WAS node entered, no node exists with that name.

Explanation: There is no node with the WAS backup type that was entered.

System action: None

User response: Check the node name that was entered. Run 'dsmc q was -wastype=local' to see the nodes that may be backed up.

ANS1544E An error in WAS processing has occurred.

Explanation: None.

System action: None

User response: Run the following command to see the nodes that can be backed up: dsmc query was -wastype=local Make sure the results are correct for your environment, then try the operation again. If the problem persists, contact TSM technical support for further assistance.

ANS1546W TSM failed to lock the WebSphere configuration repository.

Explanation: None.

System action: The lock of the WebSphere configuration repository fails.

User response: Ensure that the WebSphere server is running. If the server is already running, ensure that the repository is unlocked. Ensure that you are backing up the correct node. To see a list of available nodes that can be backed up, enter: 'dsmc q was -wastype=local'.

ANS1547W TSM failed to unlock the WebSphere Configuration Repository.

Explanation: None.

System action: The unlock of the WebSphere Configuration Repository fails.

User response: Make sure that the WebSphere server is running. If the repository is locked, then unlock it and try the operation again. Ensure that the correct node is being backed up. To see a list of available nodes that can be backed up, run: 'dsmc q was -wastype=local'.

ANS1548E A supported version of WebSphere is not installed on this machine.

Explanation: A supported version of WebSphere is not installed on this machine. The only version of WebSphere that is supported is 5.0.x.

System action: None

User response: Install WebSphere 5.0 on the machine.

ANS1549E No application server instances were found. Unable to perform backup.

Explanation: The application server is not installed on this machine.

System action: Backup is not performed.

User response: Install the application server.

ANS1550E No network deployment manager instances were found to back up.

Explanation: Deployment manager is not installed on this machine.

System action: Back up is not performed.

User response: Install the network deployment manager.

ANS1551E A TSM authorized user must configure IBM Tivoli Storage Manager before individual users can use it.

Explanation: IBM Tivoli Storage Manager was not started by a TSM authorized user and the 'TSM System Preferences' file could not be located.

System action: IBM Tivoli Storage Manager exits.

User response: The initial setup and configuration of IBM Tivoli Storage Manager must be done by a TSM authorized user. To become a TSM authorized user, system administrators must use the "TSM Backup for Administrators" application. Refer to the *Backup-Archive Client Installation and User's Guide* for a complete discussion of the TSM authorized user.

ANS1552W A user name and a password have not been provided to Data Protection for WebSphere.

Explanation: The dsmd set WASPassword command has not been run to provide the user name and the password for Data Protection for WebSphere. Data Protection for WebSphere needs the user name and password to be able to run when WebSphere security is turned on.

System action: Data Protection for WebSphere cannot run.

User response: Run the dsmd set WASPassword command to set the WebSphere security user name and password.

ANS1553W The user name and password that have been provided to Data Protection for WebSphere are invalid.

Explanation: None.

System action: Data Protection for WebSphere cannot run.

User response: Run the dsmd set WASPassword command to set the WebSphere security user name and password.

ANS1554W The WASOffline option has been ignored.

Explanation: When a WebSphere server is running, Data Protection for WebSphere contacts WebSphere and locks the Configuration Repository. The WASOffline option is only valid when a WebSphere server is not running. If a WebSphere server is running, then WASOffline is ignored.

System action: The WASOffline option is ignored.

User response: Remove the WASOffline option from the options file.

ANS1555E The WebSphere Application Server (WAS) plug-in level must be at 5.2.1 or greater to set the WebSphere user and password.

Explanation: You must have the backup-archive client and the WAS plug-in at a level of 5.2.1 or higher to be able to connect to WebSphere when security is enabled.

System action: WebSphere does not set the user and password.

User response: Upgrade the WAS plug-in to 5.2.1 or greater.

ANS1556E Setting the WAS user and password failed.

Explanation: Password validation for the WAS user and password failed.

System action: WAS password validation fails.

User response: Rerun the set WASPassword command with the correct values for user and password.

ANS1557W The WAS Server was not running, and the password file was saved without validation.

Explanation: If the WAS server is down, then it is not possible to connect to the server and validate the user-entered password. The password has still been saved, but no validation has been performed.

System action: The set WAS password command did not validate the password. The password has still been saved, but no validation has been performed. The password may be incorrect.

User response: There are two options:

- Try a backup. If the backup performs a failover, and there is a incorrect password message in the error log, then the password that was entered is incorrect.
- Start the WAS server and rerun the set password command. Since the server is now up, validation will be performed as normal and the user notified if a good/bad password was entered.

ANS1558W The WebSphere backup is failing over to an offline backup.

Explanation: If there is an error locking the WebSphere configuration repository, then Data Protection for WAS will still get a backup and not lock the repository.

System action: The WebSphere backup fails over to an offline backup.

User response: Check the error log to see the nature of the lock error. The lock operation can fail because:

- The WAS server is not running
- The repository is already locked
- Security is turned on and there is no WAS user/password file
- Security is turned on and the information in the WAS user/password file is bad.

Correct the lock error.

ANS1559I Set WAS password completed successfully.

ANS1560W The WebSphere server is not running.

Explanation: The WebSphere server is not running. The WAS server is running for backup operations.

System action: The WebSphere server is not running.

User response: Start the WAS server and run the backup again.

ANS1561I Loading the Java Runtime Environment, please wait.

ANS1562E WAS Restore failed during EAR Expansion.

Explanation: EAR Expansion is performed for a WebSphere Application server after the files have been restored.

System action: WAS restore fails.

User response: Run the restore again.

ANS1563W The `itsm.was.properties` file does not exist.

Explanation: The `itsm.was.properties` file is used to store the WebSphere security user name and password.

System action: None.

User response: Run the `dsmc set waspassword` command to create this file.

ANS1564I Running the WebSphere EAR expansion, please wait.

Explanation: An APP server must have the restored EARS expanded for the server to work.

ANS1565E No WebSphere EARExpander was found. Copy the EARExpander tool from the base WebSphere bin directory to the instance bin directory, then run the restore operation again.

Explanation: The EAR files are expanded for an instance of an Application server and the EARExpander tool does not exist in the instance bin directory.

System action: No WebSphere EARExpander found.

User response: Copy the WAS EARExpander tool from the base install's bin directory to the bin directory of the instance. Then run the WAS restore operation again, after the EARExpander tool has been copied.

ANS1566E The version of WebSphere on the machine does not match the version of WebSphere that was backed up. These versions must match for a WAS restore operation.

Explanation: The version of WebSphere on the machine does not match the version of WebSphere that was backed up. These versions must match for a WAS restore operation.

System action: The WAS restore operation fails.

User response: Install the correct version of WebSphere on the machine before performing the restore operation.

ANS1567I A 5.2.2 or higher client is restoring data backed up from a 5.2.0 client. No version check can be performed before the restore.

Explanation: WebSphere's version information was not stored as part of the backup for 5.2.0. So, a 5.2.2 client cannot ensure that the version of WAS that is being restored is the same version of WAS that is on the machine. A version of WAS that is restored may be incompatible with the version of WAS on the machine and can cause errors in WAS.

System action: No version check is performed.

User response: Make sure that the version of WAS that is being restored is the same as the version of WAS that is installed on the machine.

ANS1568E The CAD attempted to register its tcpport and tcpip address without using the TCPCADADDRESS option.

Explanation: The CAD sent the port and address information to the server, however, there was a problem registering the information with the server. The problem occurred because no default value for the tcpip address was provided. The server was unable to determine a default value for the tcpip address because the communication method was not tcpip.

System action: The server cannot register the information for the CAD. CAD processing will continue, but some functions of the CAD may not be working properly.

User response: Use TCPCADADDRESS in the client option file to indicate the proper TCP/IP address for this CAD.

ANS1569E The CAD attempted to register its tcpport and tcpip address but the TCP/IP address resolved to the loopback address and was rejected by the server.

Explanation: The CAD sent the port and address information to the server, however, there was a problem registering the information with the server. The problem occurred because the server detected that the address provided resolved to the loopback address.

System action: The server did not register the information for the CAD. CAD processing will continue, but some functions of the CAD may not be working properly.

User response: Use TCPCADADDRESS in the client option file to indicate the proper TCP/IP address for this CAD. Loopback address is not valid.

ANS1570E Registering this instance of the Cad with the server failed. Cad process continues.

Explanation: The CAD failed to register address information to the server, due to an error. There should be a message immediately preceding this message that would indicate the problem more precisely.

System action: The server did not register the information for the CAD. CAD processing will continue, but some functions of the CAD may not be working properly.

User response: Look at messages immediately preceding this message to help determine what error occurred.

ANS1571E The *time-option* option cannot be used without specifying the *date-option* option

Explanation: If the to/from/pit time options is specified then the corresponding to/from/pit date MUST also be specified.

System action: Processing stopped.

User response: Either remove the to/from/pit time option or add the corresponding to/from/pit date option.

ANS1572E An unexpected error was received from the server query, RC=*re tcode*.

Explanation: An unexpected error was received by the client. This could be caused by network problems or a programming error.

System action: TSM canceled the current operation.

User response: Verify that your communication path is functioning properly and try the operation again. If the problem persists, contact your TSM administrator for further assistance.

ANS1573E FROMDATE and TODATE cannot be used with PITDATE.

Explanation: The PITDATE option specifies different and conflicting date selection criteria from the FROMDATE and TODATE options. Therefore these options cannot be combined.

System action: The restore operation is not performed.

User response: Determine whether you require the functionality of PITDATE or FROMDATE and TODATE, then try the operation again. If you want to restore files as of a certain date and time, use PITDATE and PITTIME. If you want to restore files from a given range of dates, use FROMDATE, TODATE, FROMTIME, and TOTIME. Refer to the TSM client manual for your operating system for additional information about these options.

ANS1574E Journal Query Failed.

Explanation: The journal daemon was unable to process the requested journal query.

System action: Journal backup processing is interrupted.

User response: Retry the backup, check the journal daemon errorlog for the cause of the failure. Backup of other file systems in the domain will continue.

ANS1575E Journal Daemon Communications Error.

Explanation: An error occurred communicating with the journal daemon.

System action: Journal backup processing is interrupted.

User response: Retry the backup, check the journal daemon and client errorlogs for the cause of the failure.

ANS1576W Space Management Agent version mismatch. The Space Management Agent (hsmagent) version *agent-version* running on 'client-node' client node does not match with the Space Management Console (GUI) version *console-version* you are running! To avoid compatibility problems, please use the same version for the Space Management Console and the Space Management Agent. Do you want to proceed?

Explanation: The version of the Space Management Console does not match with the version of the Space Management Agent running on the client node machine. To avoid compatibility problems, please use the same version for the Space Management Console (GUI) and the Space Management Agent (hsmagent).

System action: Prompt the user to exit or continue.

User response: Use Space Management Console (GUI) with the same version like the Space Management Agent (hsmagent) running on the HSM node you want to manage.

ANS1577I The Windows console event handler received a 'event' console event.

Explanation: A console event was received by one of the IBM Tivoli Storage Manager processes or programs. The following events can be received:

- Ctrl-C - This indicates either the user entered the ctrl-c sequence or that one of the Windows services was stopped.

System action: None.

User response: None.

ANS1578E The specified path '*path*' is not valid for backup or archive.

Explanation: The specified path is a special file system or part of a special file system. Special file systems contain dynamic information generated by the operating system and should not be backed up or archived. Refer to the TSM client manual for a complete list of special file systems for your operating system.

System action: Processing continues if there are other file systems to back up.

User response: Do not specify special file systems for backup or archive.

ANS1579E GSKit function *func-name* failed with error-code: *session*

Explanation: A GSKit function has failed with the specified error code.

System action: Processing stopped

User response: Make sure you have configured the key database for SSL communication as described in the documentation. If the problem persists, contact TSM customer support.

ANS1580W An Include.Fs statement with performance algorithm set already exists for the drive specified. Do you want to replace the statement?

Explanation: The user tried to create a duplicate Include.Fs entry on a drive that already has a performance algorithm associated with it. This is applicable to the Preference Editor on the MFC GUI

System action: The user can replace the statement with the new one or they can cancel out of this operation

User response: The user is prompted to replace the statement with the new one or they can say No to cancel out of this operation.

ANS1581W '*object-name*' was restored as '*temp-name*'. A reboot is required to complete the restore.

Explanation: This is a system file restored and could not be immediately replaced. The file will be replaced during the next reboot of the operating system. It is important to note that until the reboot occurs, the changes will not be in effect.

System action: TSM restored the file with a temporary name, and instructed the operating system to replace the original file with the restored file during the next boot of the operating system.

User response: Reboot the machine as soon as possible after the TSM restore operation ends.

ANS1583E The Hardware Utility plug-in module was not found or could not be loaded.

Explanation: Processing stops.

System action: None.

User response: Run "dsmc show plugins" at the TSM command-line client prompt to see the available plug-ins on the system and verify the path which is being used to load the plug-ins. If the plugin path is available and the Hardware Utility plug-in,

ANS1584E • ANS1595E

libPiHDW.a, is present, ensure that the LIBPATH variable is set to the Hardware product's library path, for example, LIBPTH=/usr/opt/db2_08_01/lib.

ANS1584E Error loading system library 'libdevmapper.so' required for image operations for LVM2 volumes.

Explanation: The system library libdevmapper.so required for LVM2 image operations could not be loaded. This error can occur when library does not exist on the system, or it is an earlier level than is required, or it could not be opened by the TSM client process.

System action: The image operations for LVM2 volumes will not be available.

User response: Check the installed packages and the library versions on the system. If correct versions is installed, check for access related issues. If system does not have these library installed please contact your Linux OS distributor.

ANS1587W I/O error reading file attributes for: *file-name*. **errno** = *errno-value*,

Explanation: The attributes of the file "*file-name*" could not be retrieved. The system set the error code *errno-value*. If the reason given is "access denied," the current user does not have permission to read the file attributes.

System action: Processing continues without backing up the file attributes.

User response: Correct the condition causing the physical error.

ANS1588W I/O error reading file attribute: *attr-name* for: *file-name*. **errno** = *errno-value*,

Explanation: The attribute *attr-name* of the file *file-name* could not be retrieved. The system set the error code *errno-value*. If the reason given is "access denied," the current user does not have permission to read the file attributes.

System action: Processing continues without backing up the specified file attribute.

User response: Correct the condition causing the physical error.

ANS1589W I/O error writing file attributes for: *file-name*. **errno** = *errno-value*,

Explanation: The attributes of the file *file-name* could not be set. The system set the error code *errno-value*. If the reason given is "access denied," the current user does not have permission to set the file attributes.

System action: Processing continues without restoring the file attributes.

User response: Correct the condition causing the physical error.

ANS1590W I/O error writing file attribute: *attr-name* for: *file-name*. **errno** = *errno-value*,

Explanation: The attribute *attr-name* of the file *file-name* could not be set. The system set the error code *errno-value*. If the reason given is "access denied," the current user does not have permission to set the file attributes.

System action: Processing continues without restoring the specified file attribute.

User response: Correct the condition causing the physical error.

ANS1592E Failed to initialize SSL protocol.

Explanation: TSM was unable to initialize SSL protocol.

System action: Processing stopped

User response: Check for GSKit related messages in the error log. Make sure you have configured the key database for SSL communication as described in the documentation. If the problem persists, contact TSM customer support.

ANS1593E Cannot open the key database.

Explanation: TSM was unable to open the keyfile that is expected to contain the server certificate for SSL communications.

System action: Processing stopped

User response: Make sure you have configured the key database for SSL communication as described in the documentation. If the problem persists, contact TSM customer support.

ANS1594E Wrong key database password.

Explanation: The key database that contains the server certificate has been set up with the wrong password.

System action: Processing stopped

User response: Make sure you have configured the key database for SSL communication as described in the documentation.

ANS1595E Bad server certificate.

Explanation: TSM was unable to open SSL connection to server because of a bad certificate. This error usually occurs when the server certificate cannot be verified by the client.

System action: Processing stopped

User response: Make sure you have configured the

key database for SSL communication as described in the documentation. Make sure to import the correct certificate from the TSM server you are trying to connect to.

ANS1596E SSL protocol is not supported.

Explanation: SSL protocol is not supported on this platform.

System action: Processing stopped

User response: Refer to TSM documentation for the list of supported platforms.

ANS1597E The -pick and -deltype=all options are not valid together.

Explanation: -deltype=all is used to delete an entire directory tree. You cannot use -pick to select individual objects from the tree. -pick is valid only with -deltype=active or -deltype=inactive.

System action: Processing stopped.

User response: Try the operation again with a valid combination of options. If you want to delete an entire tree, use -deltype=all, but do not use -pick. If you want to select which backup versions to delete, specify -deltype=active or -deltype=inactive, and use the -pick option. Also use -subdir=yes if you want the file selection to include files in subdirectories of the file specification. See the client manual or command line help for additional information.

ANS1598E -deltype=all is not valid for this file specification.

Explanation: -deltype=all is used to delete an entire directory tree. You must specify a fully wildcard directory when using -deltype=all.

System action: Processing stopped.

User response: Try the operation again with a valid combination of options. If you want to delete all backup versions of an entire directory tree, use -deltype=all and a fully wildcarded file specification. If you want to delete backup versions of partially qualified file names, use -deltype=inactive or -deltype=active. Also use -subdir=yes if you want to delete backup versions in subdirectories of the file specification. See the client manual or command line help for additional information.

ANS1599E Cannot load SSL runtime library.

Explanation: TSM failed to dynamically load SSL runtime library necessary for SSL protocol

System action: Processing stopped

User response: Make sure TSM client is properly installed. Try to reinstall the client software. If the

problem persists, contact TSM customer support.

ANS1600E Unable to load the Data Protection for Lotus Domino library.

Explanation: The Datt Protection for Lotus Domino library could not be loaded.

System action: Processing ends.

User response: Ensure that Domino plugin is properly configured and check the error log on the client machine for more information.

ANS1601E The Domino plugin operation failed because of an internal error.

Explanation: A Domino plugin internal error has occurred.

System action: Processing ends.

User response: Check the error log on the client machine for more information.

ANS1602E The Domino plugin operation failed because the preferences file was not found.

Explanation: The Data Protection for Lotus Domino preference file could not be found.

System action: Processing ends.

User response: The Data Protection for Lotus for Domino configuration file (default name domdsm.cfg) could not be found. Check the error log on the client machine for more information.

ANS1603E The Domino plugin operation failed because of an internal TCP/IP error.

Explanation: A TCP/IP error has occurred.

System action: Processing ends.

User response: Check the error log on the client machine for more information.

ANS1604E The Domino plugin operation failed trying to start the dsmdomp address space.

Explanation: The dsmdomp address space could not be started. This is probably an installation error.

System action: Processing ends.

User response: Ensure that the lotus/bin directory has a symbolic link to the tools directory for dsmdomp and the lotus/notes directory has a symbolic link to the dsmdomp executable. If the problem persists, contact your System Administrator for further assistance.

ANS1605E The Domino plugin operation failed while initializing communications with the dsmdomp address space.

Explanation: The Domino plugin communication initialization failed.

System action: Processing ends.

User response: The dsmdomp address space failed during its initialization. This is likely to be an installation error. Ensure that the lotus/bin directory has a symbolic link to the tools directory for dsmdomp and the lotus/notes directory has a symbolic link to the dsmdomp executable. If the problem persists, contact your System Administrator for further assistance.

ANS1606E The Domino plugin operation failed while starting up the dsmdomp address space.

Explanation: The dsmdomp address space could not be started.

System action: The TDP for Domino processing stops.

User response: The dsmdomp address space failed during its initialization. This is likely to be an installation error. Ensure that the lotus/bin directory has a symbolic link to the tools directory for dsmdomp and the lotus/notes directory has a symbolic link to the dsmdomp executable. Examine the file /tmp/dsmdomp* for more information. If the problem persists, contact your System Administrator for further assistance.

ANS1607E A plugin found in the plugins library is not supported by the current level of the TSM client.

Explanation: The plugin is not loaded, and processing continues.

System action: The plugin is not loaded, and processing continues.

User response: This probably is an installation error. Ensure that the plugins directory contains valid plugin libraries, and that the correct level of the TSM client has been installed. If the problem persists, contact your System Administrator for further assistance.

ANS1608E Domino plugin operation failed with the following message: *message*

Explanation: A Domino plugin operation error occurred.

System action: Processing ends.

User response: Correct the error that caused the operation to fail.

ANS1609E Domino plugin process failed. The following messages are associated with the error. *message*.

Explanation: A Domino plugin operation error occurred.

System action: Processing ends.

User response: Correct the error that caused the operation to fail.

ANS1610E The domnode option has not been properly specified for the node '*node_name*'.

Explanation: The domnode option has not been properly specified in the dsm.sys file for the node shown.

System action: Processing for this request stops.

User response: This is likely to be an installation error. Ensure that the domnode option has been properly specified for the node in question. If the problem persists, contact your System Administrator for further assistance.

ANS1611E A plugin operation failed because of an internal error.

Explanation: A plugin internal error has occurred.

System action: The plugin operation stops.

User response: If the error persists, run with tracing enabled and contact your System Administrator and IBM for further assistance.

ANS1612E The Domino plugin operation failed because of a TSM API error.

Explanation: An TSM API error occurred .

System action: Processing ends.

User response: Check error log on the client machine for more information.

ANS1613E >Could not load the TSM API.

Explanation: The TSM API could not be loaded.

System action: Processing ends.

User response: Check error log on the client machine for more information.

ANS1614E The Domino plugin 'Try and Buy' license has expired.

Explanation: The 'Try and Buy' license that was detected has expired.

System action: Processing ends.

User response: This product is no longer valid for use. A valid license must be obtained before running the product.

ANS1615E **The Domino plugin operation failed due to a license error.**

Explanation: Domino plugin license verification failed.

System action: Processing ends.

User response: Check the error log for further information.

ANS1616E **The Domino plugin operation failed because the Lotus Domino API could not be loaded.**

Explanation: The Lotus Domino API could not be loaded.

System action: Processing ends.

User response: Ensure the Lotus Domino Server is installed correctly.

ANS1617E **The Domino plugin operation failed because of a Data Protection for Domino API error.**

Explanation: A Data Protection for Domino API error occurred during a Domino plugin operation.

System action: Processing ends.

User response: Check error log on the client machine for more information.

ANS1618E **A Domino plugin operation is already in progress. Please wait for operation to complete.**

Explanation: A Domino plugin operation is in progress.

System action: The Domino plugin operation stops.

User response: Please wait for the Domino plugin operation to complete before starting a new Domino plugin operation.

ANS1619E **The IBM Tivoli Storage Manager application client cannot work with the version of the Domino plugin you have installed.**

Explanation: The version of the Domino plugin currently installed on the system is older than the version used to build the IBM Tivoli Storage Manager application client.

System action: Processing ends.

User response: Install a version of the Domino plugin

at or later than the level of the IBM Tivoli Storage Manager application client.

ANS1620I **Backup version for 'filespace namepath-namefile-name', object id - 'object-id':object-id' is not consistent with local repository. Its being deleted.**

Explanation: The specified backup instance of the named object is not valid with local repository contents. This could happen if local repository is modified or got corrupted on the client system. This backup can not be restored, therefore it will be deleted on the server.

System action: The specified backup object will be deleted on the server. Processing will continue.

User response: None.

ANS1621E **Failed to update backup attributes on server for local backup for 'filespace namepath-namefile-name', object id - 'object-id':object-id' return code 'return code'.**

Explanation: TSM failed to update attributes for the named backup object on the server. The server may not reflect correct state of the backup.

System action: Processing continues.

User response: Check preceding error messages in error log for more information. Retry the operation. If problem continues, contact your TSM administrator.

ANS1622I **Number of backup objects cleaned up on server: 'number' number of local snapshot resources made available: 'number'.**

Explanation: While performing consistency check for server's database and the local repository maintained on the client system, reported inconsistencies were found. Inconsistent backups cannot be restored, therefore TSM deletes all inconsistent backup objects and frees the space occupied in the local repository.

System action: Processing continues.

User response: Check error log for further details on which objects on server were deleted. If numbers look unusually high check your configuration and if it continues, contact your TSM administrator.

ANS1623W **Backup of NSF DB2 database was skipped. NSF DB2 databases not supported.**

Explanation: This version of DP for Domino plugin does not support NSF DB2 databases.

System action: Backup of NSF DB2 databases is skipped.

User response: Exclude NSF DB2 databases from backup.

ANS1624W You have chosen to proceed with the restore operation. New logical volumes added after backup will be removed during this restore process. Please restore these logical volumes manually before performing rollforward recovery.

Explanation: Database configuration has been changed since the previous backup by the addition of new logical volumes. User has requested a local restore operation which will remove these newly added logical volumes. Please restore them after the local restore command has completed, before performing rollforward recovery. You can find the list of logical volumes removed in the dserror.log file.

System action: This message is a warning to the user to perform certain action after the local restore command completes successfully.

User response: User MUST take the action specified in this warning before proceeding with rollforward recovery.

ANS1625I Number of volumes to be FlashCopied: *v1*

Explanation: Number of volumes to be flashcopied.

System action: None.

User response: None.

ANS1626E An unexpected error was encountered when processing a TSM operation using a hardware or snapshot function. TSM function name : *function-name* TSM function : *function-desc* TSM return code : *TSM-rc* TSM file : *file-name* (*line-number*)

Explanation: None.

System action: Processing stops.

User response: Contact the TSM administrator with the information provided in this message.

ANS1627E SVC virtual disk *v1* is not valid.

Explanation: The specified virtual disk is not found in the list of virtual disks provided by the connected SVC cluster.

System action: Process stops.

User response: Ensure that this virtual disk exists in the SVC.

ANS1628E The source *v1* and target *v2* virtual disks are in different SVC clusters.

Explanation: The SVC source and target virtual disks have to be assigned to the same SVC cluster.

System action: Process stops.

User response: Ensure that the source and target virtual disks are in the same SVC.

ANS1629E The source *v1* and target *v2* virtual disks are of different size.

Explanation: The SVC source and target virtual disks have to be of the same size.

System action: Process stops.

User response: Ensure that the source and target virtual disks are the same size.

ANS1630E An error was returned calling an operation of the Common Interface Model(CIM). TSM function name : *function-name* TSM function : *function-desc* TSM return code: *0xCIM-rc* TSM file : *file-name* (*line-number*)

Explanation: An error occurred when calling a CIM operation of the disk subsystem.

System action: Processing stops.

User response: Please see the section about the CIM return codes and their descriptions in the product publication.

ANS1631E A memory allocation error has occurred in file *filename*, line number *linenumber*.

Explanation: Enough memory was not available to continue processing.

System action: Processing ends.

User response: Ensure that your system has sufficient real and virtual memory. Close unnecessary applications.

ANS1632I Changing copyType to "copy" for LOCAL SAN Volume Controller incremental backup operation.

Explanation: When backup destination is LOCAL, snapshot incremental type defaults to COPY type operation. This is due to the lack of INCREMENTAL snapshot support on SAN Volume Controller.

System action: This message is informational.

User response: Do not specify "incremental" option for LOCAL backups when using SAN Volume Controller or use "any". This will allow TSM to pick the

appropriate default value of copyType.

ANS1647I **DB2 Partition Volume Information:**
Database configuration Name: *db2 cfg name* **Database Partition Number:** *db2 partition num* **DB2 Host Name:** *db2 host name* **TSM Node Name:** *tsm node name*
Volume List: *volume list*

Explanation: None.

System action: This message is informational.

User response: None.

ANS1648I **DB2 Backup Host Volume Information:**
Database configuration Name: *db2 cfg name* **Backup Host Machine Name:** *db2 partition num* **Backup TSM Node Name:** *db2 host name* **Volume List:** *volume list*

Explanation: None.

System action: This message is informational.

User response: None.

ANS1649E **The option '*specified-option*' is inconsistent with the option '*other-option*'.**

Explanation: The command failed because the specified option (*specified-option*) can not be specified in combination with the option (*other-option*), which is also specified.

System action: The command is terminated.

User response: Run the command without the specified option. Alternatively, run the command without the other option.

ANS1650I **Command:** *command-string*

Explanation: The command string listed in the message was issued by the TSM Backup-Archive client.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1651I **Backed Up:** *fshlll*

Explanation: The backup operation for the object was successful.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1652I **Archived:** *fshlll*

Explanation: The archive operation for the object was successful.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1653I **Updated:** *fshlll*

Explanation: The update operation for the object was successful.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1654E **Failed:** *fshlll*

Explanation: The backup, archive, restore or retrieve operation for the object failed.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only. For information about the failure refer to the TSM Backup-Archive Client error log.

ANS1655I **Restored:** *fshlll*

Explanation: The restore operation for the object was successful.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1656I **Retrieved:** *fshlll*

Explanation: The retrieve operation for the object was successful.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1657I **Expired:** *fshlll*

Explanation: The active version of the object was expired in the TSM database.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1658I Deleted: *fshlll*

Explanation: The object was deleted from the TSM database.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1659I Skipped: *fshlll*

Explanation: The object was skipped by the user during backup or archive processing.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1660I Excluded: *fshlll*

Explanation: The object was excluded from backup or archive processing.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1661I Unchanged: *fshlll*

Explanation: The object has not changed since the last incremental backup was performed and does not need to be resent.

System action: This message is for auditing purposes only.

User response: This message is for auditing purposes only.

ANS1662I Agent Node: *'agent_node'* **Target Node:** *'target_node'*

Explanation: Proxy nodes information.

System action: None

User response: None

ANS1663W The option fractional reserve on volume *vol_name* was reduced to less than 100 percent.

Explanation: Network Appliance strongly recommends that when the fractional reserve is set to less than 100 percent you actively monitor space consumption and the rate of change of data in the volume to ensure you do not run out of space reserved for overwrites. In that case, if you run out of overwrite reserve space, writes to the active file system fail and

the host application or operating system might crash.

System action: Process continues.

User response: Ensure that you monitor the space consumption. Consult Network Appliance for tools to monitor available space in your volumes.

ANS1664E The snap restore for volume *volname* with snapshot name *snapname* would destroy later snapshots that are required for other applications or for volume clones.

Explanation: ONTAP will delete newer snapshots of a volume when a specific snapshot is used for snap restore.

System action: Process stops.

User response: Prior to a snap restore, ensure that newer snapshots are not used in other applications or in volume clones.

ANS1665W TSM for ACS did not find any snapshots for volume *volname* on the N series filer.

Explanation: No snapshots were found for this volume on the N series filer.

System action: Process continues.

User response: None.

ANS1666W TSM for ACS did not find any information about the N series volume *volname*.

Explanation: The query for information about this volume did not return any data.

System action: Process continues.

User response: None.

ANS1667E The snapshot name *snapname* for volume *volname* was not found in the snapshot list on the N series filer.

Explanation: Snapshot identified by this name does not exist.

System action: Process stops.

User response: None.

ANS1668E The '*drive-name1*' is not a local disk.

Explanation: The specified file system is network disk or network share. Because the CLUSTERNODE option is set to YES, the file system cannot be backed up or archived.

System action: Processing stops.

User response: If the CLUSTERNODE option is incorrectly set to YES, then change the option to NO and try the operation again. Otherwise see the client manual for further information about configuring the TSM client to run in a cluster environment.

ANS1669W The *command subcommand* command can only be run in Windows WinPE mode.

Explanation: The *command subcommand* command is not supported on a currently running operating system. You must reboot to Windows WinPE mode to run this command.

User response: None.

System action: The command is not processed.

ANS1670E The specified file specification is invalid. Please specify a valid Network Appliance or N-Series NFS (AIX) or CIFS (Windows) volume.

Explanation: The file specification entered by the User is invalid. Incremental backup using snapshot difference using the -SNAPDIFF option may only be performed on Network Appliance or N-Series NFS volumes on AIX or CIFS volumes on Windows. Please make sure that you do not specify either Network Appliance or N-Series Qtrees or a path within the Network Appliance or N-Series volume. Only full volumes are supported.

System action: Processing stops.

User response: Specify a valid Network Appliance or N-Series NFS volume on AIX or CIFS volume on Windows and retry the incremental backup operation using snapshot difference.

ANS1671I The cluster database has been restored. Restarting the cluster services on all nodes. This will take a few minutes.

Explanation: After the cluster database is restored, the cluster service on the restoring node is in a paused state. The cluster service on other nodes were shutdown. All services need to be restarted. If some of the services cannot be started automatically, restart them manually.

System action: Processing continues.

User response: No action.

ANS1672I Could not take the cluster resource *resource name* offline. MS rc *retcode*. Error is ignored.

Explanation: Microsoft recommends taking the cluster resources offline during an authoritative cluster database restore. However, the restore can still be done

if the resources cannot be taken offline. The error is ignored.

System action: Processing continues.

User response: No action.

ANS1673W Cluster service on node *node name* could not be started. You must manually start the service.

Explanation: The cluster database has been restored. During the restore, the cluster service was taken offline. Tivoli Storage Manager failed to restart the cluster service.

System action: Processing continues.

User response: You can manually start the service for this node.

ANS1674I The cluster database has been restored but the cluster service on some nodes could not be started. Use the Failover Cluster Management tool to manually start the nodes.

Explanation: The cluster database has been restored. During the restore, the cluster services were taken offline except for the node being restored. Tivoli Storage Manager failed to automatically start these cluster services. You need to start them manually. The nodes whose services failed to start are logged in the client error log.

System action: Processing continues.

User response: You can manually start the cluster services.

ANS1675W Unable to obtain a list of cluster nodes to restart after the cluster database is restored. The call '*cmd*' returned with MS rc *retcode*. You must restart the cluster service on all the nodes after the restore is finished.

Explanation: Due to an error, Tivoli Storage Manager could not retrieve a list of nodes in the cluster to restart. The cluster services on these nodes need to be started manually. The client error log might contain additional information depending on where the failure occurred.

System action: Processing continues.

User response: Manually start the cluster services on all nodes.

ANS1676W You are doing an authoritative cluster database restore. The process may seem to be hang before and after the file is restored. This is because it may need to start the cluster service if it is not up and take all the resources offline. After the cluster database is restored, the cluster service will be restarted for changes to be in effect. The cluster service on all other nodes also have been shutdown. They will be restarted. This may take a few minutes.

Explanation: The restore will seem to be paused at time because before the restore, Tivoli Storage Manager ensures the cluster service is up on the restoring node and all the resources are taken offline. After the cluster database is restored, the cluster service on the restoring node is in a paused state. The cluster service on other nodes were shutdown. All services need to be retarted. If some of the services cannot be started automatically, you can try to restart them.

System action: Processing continues.

User response: No action.

ANS1677W Tivoli Storage Manager failed to set the disks for quick formatting because of an error. See the error log for more details. The disks will be slow formatted which will cause a slower restore process.

Explanation: By default, Tivoli Storage Manager tries to set the QuickFormat value of the HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\ASR\RestoreSession key to perform quick formatted on all the disks. Due to an error, a slow format will be performed on the re-creation of the disks. This process will cause a slower restore process.

System action: None

User response: None

ANS1678E ASR path '*path*': not found.

Explanation: You have specified a directory that does not exist.

System action: Processing stops.

User response: Recheck all spelling and punctuation, particularly the placement of directory delimiters (for example, "\"). Correct the syntax if it is incorrect, then retry the operation.

ANS1679W Updating the registry to identify which volumes have been restored has failed. This does not affect the volumes that have already been restored. See the error log for more details. The error is

being ignored and processing continues.

Explanation: After restoring the critical volumes, Tivoli Storage Manager tries to update the RestoredVolumes value of the HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\ASR\RestoreSession key to indicate which volumes have been restored. Due to an error accessing the registry, the error is logged but processing continues.

System action: Processing continues.

User response: None

ANS1680W Function refresh incremental FlashCopy cannot be accomplish because no consistency group found for these volumes.

Explanation: A refresh of the incremental FlashCopy® can only be done when the consistency group and the correspondent FlashCopy relation were established previously.

System action: None.

User response: None.

ANS1681E DSM_DIR was not set and the ASRFILESPATH option was not specified.

Explanation: The ASR files can be in put in the DSM_DIR path by default or overridden with the ASRFILESPATH option. Either one is being set.

System action: Processing stops.

User response: Set the DSM_DIR environment variable or specify the ASRFILESPATH option on the "RESTORE MACHINEASR" command.

ANS1682W No FlashCopy relationships found in the storage system.

Explanation: The copy services server (mostly a CIM Object Manager) does not have any FlashCopy relation objects.

System action: Process may stop.

User response: This is not necessarily a message that implies the stop of the process.

ANS1683E The state *status* of the consistency group is bad to achive a valid disk backup.

Explanation: TSM ACS function monitoring will expect that the FlashCopy are in one of the state Idle_Copied or Copying.

System action: Process will stop.

User response: Verify using the storage GUI the state of the FlashCopy. If this state was generated by an user

action, try to start the copy process through the storage GUI, then re-start the TSM ACS monitoring function.

ANS1684W Disk Full Error Accessing Subfile Cache: *exception-name*

Explanation: A disk full error occurred attempting to access or write to the specified subfile cache file during a subfile incremental backup. See the client error log for more detailed information. TSM.

System action: Processing continues without subfile.

User response: None.

ANS1685E Incremental backup operation using snapshot difference is only available for N series/NetApp filer volumes, is not a NetApp volume.

Explanation: Cannot perform NAS NFS/CIFS incremental backup operation using snapshot difference on the mounted or mapped volume because the volume is not a N series/NetApp filer volume.

System action: Processing stops.

User response: Retry the incremental backup operation by specifying an entire NAS NFS or CIFS volume.

ANS1686I Single Instance Store link '*file-name*' will be restored or retrieved as a normal file.

Explanation: TSM restores Single Instance Store (SIS) links as normal files. If the restored version is a duplicate of the copy in the SIS Common Store, then the SIS Groveler will eventually recreate the SIS link.

System action: TSM creates normal files instead of the reparse point.

User response: None

ANS1690E The list of volumes passed contain pairs which belong to different consistency groups in the scope of one single cluster.

Explanation: TSM ACS handles for each operation only one consistency group per cluster at the same time. If the set of volumes in a backup or restore operation contain pairs that belong to different consistency group inside one single cluster, then the process of the operation will be stopped.

System action: Process stopped.

User response: If you added volumes to the production database or to the target set, ensure that they are not in any FlashCopy relation.

ANS1749W Object '*filepath-name-hl-namell-name*' was backed up with invalid file system type attribute.

Explanation: File system type is used by the client to determine if an object name is case sensitive or not. Wrong file system type may result in incorrect sort order of the server tree for case sensitive file systems. Finally some unchanged files may expire and then re-backed up during full incremental backup.

System action: Processing continues.

User response: It is recommended to rename the correspondent filepath on TSM server and do the full incremental backup again.

ANS1691I The option '*option*' that was found in the options file '*file-name*' at the line number: *number* is not supported and will be ignored by TSM client.

Explanation: This message is an indication that the specified option is valid but not supported on the current platform and will be ignored by TSM.

System action: Processing continues.

User response: Either ignore the message or remove the option from the option file.

ANS1750I Volume mount point '*volumemountpoint*' is mounted to volume '*volume*'. Using snapshot volume for '*volume*' to backup.

Explanation: The volume mount point resolved to a volume that has been snapped. The same snapshot volume will be used.

System action: Processing continues.

User response: None.

ANS1751E Error processing '*filepath name*': The file system can not be accessed.

Explanation: The client is unable to access the file system. Two common reasons for this are the account under which the client is running does not have access to the root of the file system, or the file system does not exist.

System action: The inaccessible file system is skipped. Processing continues with the next file system.

User response: Check the error log for additional messages that might yield additional information about the problem that prevents access to the file system. Correct the problem, then retry the operation. If the account does not have access to the file system, then either the system administrator needs to grant access, or an account that has access to the file system must be used. If the file system does not exist, then remove or correct the file system specification.

ANS1752E The file system can not be accessed.

Explanation: The client is unable to access the file system. Two common reasons for this are the account under which the client is running does not have access to the root of the file system, or the file system does not exist.

System action: The inaccessible file system is ignored.

User response: Check the error log for additional messages that might yield additional information about the problem that prevents access to the file system. Correct the problem, then retry the operation. If the account does not have access to the file system, then either the system administrator needs to grant access, or an account that has access to the file system must be used. If the file system does not exist, then remove or correct the file system specification.

ANS1753E File space 'filespace name' was backed up by an older client version, and cannot be restored with this client version. The file space will be skipped.

Explanation: The backup set format in earlier client versions for SYSTEM STATE and SYSTEM SERVICES is incompatible with the current client version. Those file spaces will be skipped. The restore might appear to pause while the client skips past the objects in those file spaces. Other remaining file space data will be restored.

System action: Objects in this file space are skipped. Other remaining file space data will be restored.

User response: Restore this specific file space in the backupset with a prior level client.

ANS1754E File space 'filespace name' cannot be restored when ASNODENAME option is in affect. The file space will be skipped.

Explanation: System state data of another node should not be restored to a different node. Those file spaces will be skipped. The restore might appear to pause while the client skips past the objects in those file spaces. Other remaining file space data will be restored.

System action: Objects in this file space are skipped. Other remaining file space data will be restored.

User response: Remove ASNODENAME option before restoring this specific file space in the backupset or use the node name that was used to backup system state data to restore.

ANS1755W An error communicating with Active Directory has occurred. USEDIRECTORY option will be ignored and processing will continue.

Explanation: TSM attempted to query Active

Directory for TSM Server parameters but an error has occurred. This could be caused by Active Directory or the TSM Server's setup.

System action: TSM will ignore the USEDIRECTORY option and continue with client processing.

User response: Make sure your computer is properly set up to the domain with Active Directory. Also, make sure your TSM Administrator has properly configured the TSM Server for your node.

ANS1756W The Journal for 'backup-specification' has been reset: The server filespace was deleted since the last backup completed.

Explanation: The client has reset the journal because the corresponding server filespace was deleted since the last backup completed.

System action: The journal is reset, the current backup won't use the journal, and the journal won't be available for backup until a full incremental backup successfully completes.

User response: None.

ANS1757W The Journal for 'backup-specification' has been reset: The server filespace was deleted since the last backup completed.

Explanation: The client has reset the journal because the corresponding server filespace was deleted since the last backup completed.

System action: The journal is reset, the current backup won't use the journal, and the journal won't be available for backup until a full incremental backup successfully completes.

User response: None.

ANS1758W The Journal for 'backup-specification' has been reset: The server filespace was deleted since the last backup completed.

Explanation: The client has reset the journal because the corresponding server filespace was deleted since the last backup completed.

System action: The journal is reset, the current backup won't use the journal, and the journal won't be available for backup until a full incremental backup successfully completes.

User response: None.

ANS1759W The Journal for 'backup-specification' has been reset: The policy set was updated since the last backup completed.

Explanation: The client has reset the journal for the specified file system because the node policy set was updated since the last backup completed.

System action: The journal is reset, the current backup won't use the journal, and the journal won't be available for backup until a full incremental backup successfully completes.

User response: None.

ANS1760I Journal for *'backup-specification'* enabled for node *'nodename'* and server *'servername'*

Explanation: The journal for the specified file system is now valid and will be used by the next full incremental backup by the specified TSM node and server.

System action: The next full incremental backup of the file system will use the journal.

User response: None.

ANS1761I Journal for *'backup-specification'* will be enabled upon successful completion of the backup.

Explanation: An active but invalid journal is present for the file system being backed up. Once the backup successfully completes the journal will be available for use by the next full incremental backup of the file system with the same TSM node and server.

System action: None.

User response: None.

ANS1763W Unable to unmount snapshot mount point *snapshot mountpoint* during cleanup of snapshot *'snapshot'* of volume *'volume'*. Error is *'error'*. Operation will continue. Please manually unmount, remove the snapshot mount point directory and delete the snapshot after backup is completed.

Explanation: During the termination phase of TSM client operation, it was not possible to unmount the snapshot for some reason. However, TSM operation was completed successfully.

System action: Processing continues, and the unmount error is ignored.

User response: Please manually cleanup the snapshots as follows: Query the snapshot: snapshot -q -c: <source FS>. Snapshot name will be of the format: tsmxxxxxxxxxx. Check if it is mounted: df -k | grep tsmxxxxxxxxxx. Unmount the snapshot: umount -f tsmxxxxxxxxxx. Remove snapshot mount point: rmdir tsmxxxxxxxxxx. Delete the snapshot: snapshot -d /dev/tsmxxxxxxxxxx. If snapshot delete fails with "Device Busy" or some other error, unmount the snapshot source filesystem: umount -f <source FS>. Retry snapshot delete: snapshot -d /dev/tsmxxxxxxxxxx. Check if any logical volumes are

remaining: ls -l /dev/tsm*. Remove any remaining logical volumes: rmlv -f tsmxxxxxxxxxx. Remount source file system, if previously unmounted: mount <source FS>.

ANS1764W Unable to remove the snapshot mount point directory *snapshot mountpoint* during cleanup of snapshot *'snapshot'* of volume *'volume'*. Error is *'error'*. Operation will continue. Please manually remove the snapshot mount directory and delete the snapshot after backup is completed.

Explanation: During the termination phase of TSM client operation, it was not possible to remove the mount point directory for the snapshot for some reason. However, TSM operation was completed successfully.

System action: Processing continues, and the rmdir error is ignored.

User response: Please manually cleanup the snapshots as follows: Query the snapshot: snapshot -q -c: <source FS>. Snapshot name will be of the format: tsmxxxxxxxxxx. Check if it is mounted: df -k | grep tsmxxxxxxxxxx. Unmount the snapshot: umount -f tsmxxxxxxxxxx. Remove snapshot mount point: rmdir tsmxxxxxxxxxx. Delete the snapshot: snapshot -d /dev/tsmxxxxxxxxxx. If snapshot delete fails with "Device Busy" or some other error, unmount the snapshot source filesystem: umount -f <source FS>. Retry snapshot delete: snapshot -d /dev/tsmxxxxxxxxxx. Check if any logical volumes are remaining: ls -l /dev/tsm*. Remove any remaining logical volumes: rmlv -f tsmxxxxxxxxxx. Remount source file system, if previously unmounted: mount <source FS>.

ANS1765W Unable to delete the snapshot during cleanup of snapshot *'snapshot'* of volume *'volume'*. Error is *'error'*. Operation will continue. Please manually delete the snapshot after backup is completed.

Explanation: During TSM client operation, it was not possible to delete the snapshot for some reason. However, TSM operation was completed successfully. One of the reasons that the snapshot delete failed may be due to the fact that AIX JFS2 expects the snapshot delete requests for a given filesystem to be issued in the order of oldest snapshot first, next oldest snapshot second and so on. If there are other processes using older snapshots for the same filesystem, it fails the delete request. Also, TSM only deletes snapshots that was created by one of its processes. It will not delete older snapshots created by other applications or users. In this case, the user will have to manually delete all the older snapshots so that the next TSM command can complete successfully.

System action: Processing continues, and the snapshot delete error is ignored.

User response: Please manually cleanup the snapshots as follows: Query the snapshot: snapshot -q -c: <source FS>. Snapshot name will be of the format: tsmxxxxxxxxxxx. Check if it is mounted: df -k | grep tsmxxxxxxxxxxx. Unmount the snapshot: umount -f tsmxxxxxxxxxxx. Remove snapshot mount point: rmdir tsmxxxxxxxxxxx. Delete the snapshot: snapshot -d /dev/tsmxxxxxxxxxxx. If snapshot delete fails with "Device Busy" or some other error, unmount the snapshot source filesystem: umount -f <source FS>. Retry snapshot delete: snapshot -d /dev/tsmxxxxxxxxxxx. Check if any logical volumes are remaining: ls -l /dev/tsm*. Remove any remaining logical volumes: rmlv -f tsmxxxxxxxxxxx. Remount source file system, if previously unmounted: mount <source FS>.

ANS1766W Unable to remove the snapshot logical volume during cleanup of snapshot 'snapshot' of volume 'volume'.Error is 'error'.Operation will continue. Please manually remove the snapshot logical volume after backup is completed.

Explanation: During the termination phase of TSM client operation, it was not possible to remove the snapshot logical volume for some reason. However, TSM operation was completed successfully.

System action: Processing continues, and the snapshot logical volume remove error is ignored.

User response: Please manually cleanup the snapshots as follows: Query the snapshot: snapshot -q -c: <source FS>. Snapshot name will be of the format: tsmxxxxxxxxxxx. Check if it is mounted: df -k | grep tsmxxxxxxxxxxx. Unmount the snapshot: umount -f tsmxxxxxxxxxxx. Remove snapshot mount point: rmdir tsmxxxxxxxxxxx. Delete the snapshot: snapshot -d /dev/tsmxxxxxxxxxxx. If snapshot delete fails with "Device Busy" or some other error, unmount the snapshot source filesystem: umount -f <source FS>. Retry snapshot delete: snapshot -d /dev/tsmxxxxxxxxxxx. Check if any logical volumes are remaining: ls -l /dev/tsm*. Remove any remaining logical volumes: rmlv -f tsmxxxxxxxxxxx. Remount source file system, if previously unmounted: mount <source FS>.

ANS1767E Unable to create a snapshot logical volume using command: 'cmd'.Error is 'error'.Please ensure that the volume group has sufficient free partitions to fulfill the allocation request.

Explanation: During the initialization phase of TSM client operation, it was not possible to create a logical volume for the snapshot.

System action: Processing continues, and the create

snapshot logical volume error is ignored. TSM operation will be performed without the snapshot.

User response: Please ensure that the volume group has sufficient free partitions to fulfill the mklv allocation request and retry the operation.

ANS1768E TSM was unable to find space for a new snapshot. TSM function name : function-name TSM function : function-desc TSM return code : TSM-rc TSM file : file-name (line-number)

Explanation: None.

System action: Processing stops.

User response: Previous backups may still be pending. If problem persists contact the TSM administrator with the information provided in this message.

ANS1769E NetApp Filer " at ONTAP version '..' is not supported for performing incremental backups using snapshot difference.

Explanation: Please upgrade your filer to a supported level of ONTAP in order to perform incremental backups using snapshot difference.

System action: Processing stops.

User response: Retry the operation after upgrading your Filer to a supported version of ONTAP.

ANS1770E Unable to resolve address ". Error = , "

Explanation: The system was not able to get the TCP/IP v6 address.

System action: Processing stopped

User response: Verify the address shown is a TCP/IP v6 address and can be resolved with ping or ping6.

ANS1796I The short name for 'fullpath-name' could not be set to original short name 'file-name': Windows function 'func-name' failed with return code return-code

Explanation: The client cannot set the short name for the specified object. This is usually because the short name is already in use by another object located in the same directory. Another possible reason is that the account under which the client is running does not have the SE_RESTORE_NAME privilege.

System action: The short name for the specified object is not set. The object will retain the default short name. Otherwise processing continues.

User response: This message is informational and can be safely ignored. If you require that the object be restored with its original short name, you will need to

move or delete the conflicting object. From an operating system command prompt, change to the directory that contains the object you want to restore. Then use the `"dir /x\"` command to identify the conflicting object. Also make sure that you have the SE_RESTORE_NAME privilege. If you need assistance, see your system administrator. After the conflict has been resolved, try to restore the file again.

ANS1797E Function *function-name* received an unexpected error from the Microsoft API *MS-function-name*: rc=*error* while attempting to access the object '*object-name*'. Error occurred in file *file-name* (line-number).

Explanation: An error occurred while processing the '*object-name*'. The *error* code indicates the reason for the failure. This information can be used to diagnose the problem.

System action: The TSM client may or may not fail the operation, depending on the *error* code.

User response: Contact your system administrator for more information.

ANS1798W An error occurred while accessing encrypted data of the object '*object-name*', skipping object. Windows system error code *error*, reason '*error-reason*'

Explanation: An error occurred while processing encrypted data of the object. The error information captured indicates the reason for the failure. This information can be used to diagnose the problem.

System action: Object skipped.

User response: Contact your system administrator for more information.

ANS1799I The last access date for '*fullpath-name*' could not be reset because the file is read-only.

Explanation: Option PRESERVELASTACCESSDATE YES is in effect, but the TSM client was unable to reset the last access date for the specified file because the file's "read only" attribute is enabled. The client cannot reset the last access date for "read only" files.

System action: The last access date for the specified file is not reset. Otherwise processing continues.

User response: This message is informational and can be safely ignored. You might want to turn off the "read only" attribute for the file so that subsequent backups can reset the last access date. Before turning off the attribute, you should verify that doing so will not impact the integrity of the file or the applications that use the file. You should also make sure that turning off the attribute will not conflict with the file management policies of your organization.

ANS1800W The last access date for '*fullpath-name*' could not be reset: function '*func-name*' failed with return code *return-code*

Explanation: Option PRESERVELASTACCESSDATE YES is in effect, but the TSM client was unable to reset the last access date for the specified file. The message includes the name of the function that failed and the return code from that function.

System action: The last access date for the specified file is not reset. Otherwise processing continues.

User response: If the problem is reproducible, obtain a SERVICE trace that captures an instance of this problem. Run the QUERY SYSTEMINFO command and collect the dsminfo.txt file. Contact IBM support and report the exact text of this error message. Be sure to provide support with the dsminfo.txt and dsmerror.log files and (if available) the SERVICE trace.

ANS1802E Incremental backup of '*file-name*' finished with *number* failure

Explanation: This message is issued after completion of an incremental backup operation for the named file specification when one or more objects in that file specification could not be backed up.

System action: Processing continues.

User response: Examine the client error log for additional messages that indicate the reasons that each failed object could not be backed up. Take any corrective action as suggested by the messages.

ANS1803E Archive processing of '*file-space name*' finished with failures.

Explanation: This message is issued after completion of an archive operation for the named file specification when one or more objects in that file specification could not be archived.

System action: Processing continues.

User response: Examine the client error log for additional messages that indicate the reasons that each failed object could not be archived. Take corrective action as suggested by the messages.

ANS1804E Selective Backup processing of '*file-space name*' finished with failures.

Explanation: This message is issued after completion of a selective backup operation for the named file specification when one or more objects in that file specification could not be backed up.

System action: Processing continues.

User response: Examine the client error log for additional messages that indicate the reasons that each failed object could not be backed up. Take any

ANS1805E • ANS1810I

corrective action suggested by those messages.

ANS1805E Unable to restore symbolic link '*file-name*'.

Explanation: The client operating system is not able to create a symbolic link because the link points to a filename that is not given.

System action: Processing continues.

User response: Try the restore on a different operating system.

ANS1806W Size exceeded the maximum file size limit on your system for '*filepath-namefile-name*' of '*file-size*'.

Explanation: You tried to restore or retrieve a file that has exceeded the maximum file size limitation on your system.

System action: TSM cannot restore or retrieve the file.

User response: Restore or retrieve this file on a system that supports the file size. See your system administrator.

ANS1807E Unable to recall file from server due to error from recall daemon.

Explanation: Unable to recall file. The recall daemon reported an error while trying to recall a file. Look in the recall daemon's error log for more information. This can happen if the server is down, the connection is broken, or the file is missing on the server. It is also possible that the migration server in the system option file has been changed to a different server. The recall daemon does not check the system option file for changes once it has started.

System action: File skipped.

User response: See if the server is up, and retry. If the problem still exists, look in the error log. Also have the workstation administrator run `ds mreconcile` against the file system and see if the file shows up in the `.SpaceMan/orphan.stubs` file. If system option file has been changed, stop all recall daemons and restart the master recall daemon to pick up the changes.

ANS1808E The Logical Volume Snapshot Agent is not at the correct level. It is possible that the Client was upgraded to a newer level but the LVSA driver was not updated at the same time. Use the Setup Wizard to configure either Online Image or Open File support and choose Update the Logical Volume Snapshot Agent.

Explanation: The selected operation requires the current level of the Logical Volume Snapshot Agent. Use the Setup Wizard to update the LVSA.

System action: The selected operation is not performed.

User response: Retry the operation after updating the Logical Volume Snapshot Agent.

ANS1809W A session with the TSM server has been disconnected. An attempt will be made to reestablish the connection.

Explanation: This message is issued after the session with the TSM server is unexpectedly lost. Some possible reasons that this message might be issued: - There is a problem with the network. - The TSM server was shut down. - The TSM server administrator cancelled the client session.

System action: The client will try to reestablish a connection with the server. If the TSM server administrator cancelled the session, then the attempt to reestablish the connection will fail and message ANS1369E will be issued. If the attempt to reestablish the connection is successful, then processing will continue. If the attempt to reestablish the connection fails, then the client will continue to try to reestablish a connection according to the `COMMRESTARTDURATION` and `COMMRESTARTINTERVAL` client option settings.

User response: If the session was cancelled by the TSM server administrator and you do not know why, or if the client is unable to reestablish a session with the TSM server, then contact your TSM server administrator for further information. Frequent occurrences of the ANS1809W message can indicate a problem with the network. If this message is repeatedly found in the `dsmerror.log`, investigate possible networking trouble, such as a failing network interface card or router problem. One common problem is the media speed of the network adaptors: If the network adaptors are set to "auto-negotiate", try changing them to "100%% full duplex". If the problem persists, then as a temporary measure ask your TSM server administrator increase the `COMMTIMEOUT` and `IDLETIMEOUT` option settings on the TSM server. This might reduce the frequency of this message.

ANS1810I A session with the TSM server has been reestablished.

Explanation: The session with the server has been reestablished after a connection failure. This message is usually preceded by message ANS1809W.

System action: Processing will continue.

User response: None. This message is informational only.

ANS1811S TSM session could not be reestablished.

Explanation: The session with the server has been lost. Attempts to reestablish the session were unsuccessful. Possible causes include, but are not limited to the following:

- The server has been halted.
- The network connection to the server is down.
- The communication program that TSM is interacting with has encountered some problem.

System action: Processing is stopped.

User response: Check network connection to the server. Insure that the TSM server is running. Insure that the communication program underlying TSM is working properly.

ANS1813E Image Backup processing of '*filespace-name*' finished with failures.

Explanation: The image backup operation failed. This message is usually preceded by other messages indicating the nature of the failure.

System action: The failing file space is skipped and processing continues.

User response: Examine the messages preceding this message and the TSM Client error log for more specific indications about the problem. A common cause is that a tape could not be mounted on the TSM server, perhaps due to an insufficient number of mount points. If there is a problem with the server, contact your System Administrator for further assistance.

ANS1814E Unable to start the scheduled event '*event-name*'

Explanation: The scheduled *event* is no longer valid on the server. Either the window has elapsed or the schedule has been deleted.

System action: The client scheduler queries the server to obtain the next scheduled event.

User response: If the problem continues, contact your system administrator to correct the problem on the server.

ANS1815E Either the window has elapsed or the schedule has been deleted

Explanation: Scheduled event was no longer valid on the server.

System action: The client scheduler queries the server to obtain the next scheduled event.

User response: If the problem continues, see your system administrator to correct the problem on the server.

ANS1816E Invalid scheduling mode

Explanation: The mode entered for the scheduled event was not correct.

System action: Event does not occur.

User response: Enter the correct scheduling mode and retry the operation.

ANS1817E Schedule function can only be run by a TSM authorized user.

Explanation: An attempt to use the schedule function failed because of improper authority.

System action: Processing stopped.

User response: See the TSM authorized user for schedule function information.

ANS1818E The SCHEDULE command is not allowed in LOOP (interactive) mode.

Explanation: None.

System action: The client does not execute any scheduled events.

User response: Start the scheduler from the OS prompt. For example: dsmc schedule Windows clients can also use the client scheduler service. Read the client manual for information on how to use the SCHEDULE command and how to use the TSM client scheduler features.

ANS1819E The TSM server was unable to register the address for this node.

Explanation: This is a rare situation, and is usually an indication of a problem with the TSM server.

System action: Processing stopped.

User response: Check the error log for any other messages that might indicate a reason for the failure. Ask your TSM server administrator to check the TSM server activity log for any messages that might indicate a problem on the server. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1820E Command line options must be preceded by a '-'

Explanation: An option was specified without a '-' delimiter.

System action: Processing stopped.

User response: Enter the command again with a dash preceding each option.

ANS1821E Unable to start POSTSCHEDULECMD/
PRESCHEDULECMD '*command*'

Explanation: The requested action required a new process to be created. Either an option or a schedule "action" that requested an operating system command to be executed was entered.

System action: Request is ignored.

User response: Remove the request from the options file or the schedule defined on the server.

ANS1822E Too many objects were selected for restore. Please select less than *max_objects* objects

Explanation: The restore cannot be performed, because too many objects were selected.

System action: The restore is not performed.

User response: Retry the operation after reducing the number of objects selected.

ANS1823E The TESTFLAGS or TRACEFLAGS option specifies unknown flag name '*keyword*' or the value supplied is invalid for the named keyword.

Explanation: Either the testflag or traceflag name is incorrectly spelled, or the value supplied for that flag is not valid.

System action: If the TESTFLAGS or TRACEFLAGS option was specified in the client options file or on the command line during client initialization, the the client program does not start. If the option was specified from the command line client while running in LOOP (interactive) mode, then the operation does not run.

User response: Correct the TESTFLAGS or TRACEFLAGS flag name or correct the value specified for the TESTFLAG keyword shown in the message. These options are typically used at the direction of IBM technical support or as specified in the TSM Problem Determination Guide. If you are not sure which flag names to use, review the TSM Problem Determination Guide for additional information or contact IBM technical support for further assistance.

ANS1824E Invalid trace file name (name too long).

Explanation: A TRACEFILE option in the preferences files used a file name that is too long.

System action: Client program did not initialize.

User response: Change the file name used as the TRACEFILE so that it is equal to or less than 255 characters in length.

ANS1826E Unable to open trace output file *file-name*.

Explanation: A TRACEFILE option in the user configuration file or on the command line used a directory path and *file-name* combination to which you do not have write access.

System action: Client program did not initialize.

User response: Change the TRACEFILE value so that it is a location to which you have write access.

ANS1827W Directories cannot be selected with the table of contents currently loaded on the server.

Explanation: The table of contents that is currently loaded on the server for this volume does not contain objects corresponding to the one and only point-in-time backup. It contains an incomplete point in time or multiple points in time.

System action: The directory is not selected for restore.

User response: To be able to select an entire directory for restore, select "Use Latest" or "Use Point in Time" from the Point in Time dialog.

ANS1828E Screen size is too small for using the PICK option.

Explanation: You cannot use the PICK option on a workstation that has a screen smaller than 20 characters across and 10 lines down.

System action: TSM did not complete the operation.

User response: Retry the operation using a workstation that has a screen with the minimum size, or do not use the PICK option.

ANS1830E Unable to write to trace file *tracefile*. Tracing disabled.

Explanation: An error occurred when writing to the specified *tracefile*.

System action: Tracing is disabled. Processing continues.

User response: Ensure the device that the *tracefile* access is available and has sufficient space for the tracefile. Retry the command.

ANS1831E Password expired. The administrator for this system must run TSM to update the password.

Explanation: The password expired.

System action: TSM ends.

User response: The administrator for this system must update the password.

ANS1834S Unable to write to 'file-name' for storing password

Explanation: TSM cannot write to the specified *file-name*.

System action: Processing continues.

User response: Check access permissions and disk space. If unsuccessful, see your system administrator.

ANS1835E PASSWORDACCESS is GENERATE, but password needed for server 'server-name'. Either the password is not stored locally, or it was changed at the server.

Explanation: Either the password is not stored locally, or it was changed at the server.

System action: TSM prompts you for the password if TSM is running in the foreground.

User response: If TSM was running as a background process, issue any TSM command from the foreground. Enter the password in answer to the prompt. Then try your background TSM command again.

ANS1837S File space *filespace-name* is ignored. Processing continues.

Explanation: The specified *filespace-name* in the system options file is invalid.

System action: TSM attempts to continue the current operation.

User response: Check the file space in the system options file and use a valid file space. Retry the operation.

ANS1838E Error opening user specified options file '*filespace-name*' .

Explanation: The specified *options file-name* could not be located or opened.

System action: TSM attempts to open default option file.

User response: Make sure specified option file exists and is valid.

ANS1839E Cannot read password.

Explanation: An error occurred in setting up the input file (for example, the terminal) to be read.

System action: Processing stopped.

User response: Check the attributes of the terminal.

ANS1852E Server could not load the table of contents. Status: *status* reason: *reason*

Explanation: A failure occurred when the server attempted to load a file-level Table of contents for an NDMP volume. No file-level queries can be performed against the volume until the problem is solved.

System action: The table of contents is not loaded.

User response: Check the server Activity Log to determine the cause of failure. Retry the operation after correcting the problem.

ANS1853E Server could not load the Table of Contents. Status: *status*

Explanation: A failure occurred when the server attempted to load a file-level Table of contents for an NDMP volume. No file-level queries can be performed against the volume until the problem is solved.

System action: The table of contents is not loaded.

User response: Check the server Activity Log to determine the cause of failure. Retry the operation after correcting the problem.

ANS1862W No table of contents information is available on the server for this volume.

Explanation: No objects for the selected volume exist on the server that were backed up with table of contents information. Consequently no file-level queries can be performed against the volume.

System action: none

User response: If file-level information is desired, use TOC option during backup.

ANS1865E Session rejected: Named Pipes connection failure.

Explanation: An attempt to connect to the server using Named Pipes communications failed. This might have occurred if an incorrect NAMEDPIPENAME was specified in the options files or if your system administrator canceled a backup operation.

System action: Processing stopped.

User response: Retry the operation, or wait until the server comes back up and retry the operation. Ensure that the value specified on the NAMEDPIPENAME option is the same as the one used by the server. If the problem continues, contact your system administrator for further help.

ANS1867E The server generated a CRC for verb type *CRC verb* which does not match the received verb **verb received**.

Explanation: A cyclic redundancy check (CRC) failed between TSM client and server communication.

System action: The current object is skipped. Processing continues with the next object.

User response: This is an unusual condition, and could indicate a communications problem between the TSM client and server. Try the operation again. If the problem persists, contact IBM for further assistance.

ANS1869E The NDS object requires its parent, or container, to be present before this object can be restored. Try first restoring the parent of this object.

Explanation: SMS requires the parent of the object (container) to be present before the child or object can be created.

System action: Processing stops.

User response: Retry restoring, but at least one level up. For instance, restore 'dir\..o=ibm*' instead of 'dir\ou=gpl.o=ibm*'.

ANS1870E NDS transport failure FFFDFEAF has occurred. Contact Novell technical support for further assistance.

Explanation: The failure is reported from the NDS ResolveName() function. It indicates a communication failure between TSANDS and the partition on which the object resides.

System action: Object skipped.

User response: Check the TSM client README file for information on required NetWare software levels, and verify that those levels are installed. Reducing the RESOURCEUTILIZATION client setting might also help avoid this error. If the problem persists, contact Novell technical support for further assistance regarding the FFFDFEAF return code.

ANS1871W The server CRC version is *server CRC version* which does not match the client version *client CRC version*.

Explanation: This is a rare situation. The server and client are using different versions of cyclic redundancy check (CRC) algorithms.

System action: Processing continues without CRC checking.

User response: Clients can be no more than one version downlevel from the TSM server. Make sure the client and server are at compatible levels. The command line client displays both client and server

versions when the client starts and connects to the server. The QUERY SESSION command will also display the server version. From the GUI, use the \"Help/About\" menu item to identify the client version, and the \"File/Connection Information\" menu item to identify the server version. If the client and server versions are incompatible, then the TSM server administrator can turn off CRC checking for your node.

ANS1872E Unable to connect to NetWare target service '*server-name*'. Make sure the TSA NLM is loaded on the specified machine.

Explanation: TSM interacts with the Target Service Agent (TSA) and the connection cannot be made to the Netware *server-name*.

System action: Processing stopped.

User response: Ensure that the TSA is loaded and retry the TSM command.

ANS1873E An unknown error occurred while processing system object '*sys-obj-name*': utility function '*func-name*' failed with error *error*

Explanation: An unknown error occurred while processing a system object. The error information captured indicates the reason for the failure. This information can be used to diagnose the problem.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

ANS1874E Login denied to NetWare Target Service Agent '*server-name*'.

Explanation: The connection to the Target Service Agent (TSA) requires a NetWare user name and a password. The password you entered at the prompt may be incorrect.

System action: Processing stopped.

User response: Retry the TSM command, supplying the correct LAN password.

ANS1875E Unable to connect to target service. Out of memory.

Explanation: Not enough memory to connect to the Target Service Agent (TSA).

System action: Processing stopped.

User response: Either add memory to the server or free memory by unloading some programs, or by restarting the server.

ANS1876E TSM is unable to connect to the NetWare target service. NetWare SMS return code = *value*.

Explanation: The NetWare SMS return code was unexpected.

System action: Processing stopped.

User response: Messages ANS1874E, ANS1876E and ANS2025E can all be issued due to related problems. These problems might include: 1) The NetWare server has an insufficient number of NetWare user licenses. 2) The NetWare license files are corrupt. The NetWare license files can be reinstalled. 3) A NetWare typeful name is not being provided at the NetWare User prompt. 4) The TSM password file is corrupt. In this situation, quit all TSM processes, delete or move the *.PWD files that are located in the TSM installation directory, then load dsmc and run the following commands: QUERY SESSION QUERY TSA QUERY TSA NDS.

ANS1877E The parsed string is too long for TSM to process and has been truncated to prevent a buffer overflow.

Explanation: This is a rare condition. A very long string would have to be entered by the user in a command line, dsm.opt file, or filelist. This string exceeds the maximum input string size of 1024 bytes.

System action: TSM truncated the string to the maximum possible length of 1024, then continued with the operation. The operation may fail later due to this truncation.

User response: Check the client error log for other messages that might have been logged after this message was written, and take any corrective action suggested by those messages. If the problem persists, contact IBM support for further assistance.

ANS1878E An unknown error occurred while processing system object '*sys-obj-name*': Service '*service-name*' and its dependent services could not be stopped.

Explanation: An unknown error occurred while processing a system object. The service listed in the message and all of its dependent services could not be stopped. Processing cannot complete until the service is stopped.

System action: TSM ended the current operation.

User response: Manually stop the service and retry the operation.

ANS1879E A NetWare NDS error occurred during restore processing: object '*nds_objectnds_object*' TSA error '*tsa_error*', *tsa_error_text*

Explanation: TSM received an unexpected error from the Novell TSA interface. All TSA errors between 0xFFFFDFE70 and 0xFFFFDFEFF, inclusive, can generate this error message.

System action: The object is skipped. Processing continues.

User response: Check the Novell web site for any additional information about the error, as a fix might already be available. Contact Novell technical support for further assistance.

ANS1880E TSA Connect error, NWSMConnectToTargetService '*TSA_Target_Service*' password file '*password_file*'. Userid = '*NetWare_userid*' failed with cc = *TSA_ccode*

Explanation: TSM received an unexpected error from the Novell TSA interface while processing the userid and password from NWPWFILE.

System action: If the failure is a 'Login Denied' the user will be prompted for a Novell NetWare Userid and Password, and a password file will be created.

User response: The cc is returned from the TSA which belongs to Novell NetWare. If you get cc = FFFDFD7 'Login Denied', please check the following:

The user-id has been disabled.

The user-id/password is invalid or expired.

The user-id has inadequate security access.

The user-id has insufficient rights to files and directories.

The user-id specified has a login restriction based on time-of-day.

The user-id specified has a Network address restriction.

The user-id specified has a login restriction based on number of concurrent connections.

NetWare is not allowing logins (DISABLE LOGIN was issued at the console).

If you are unable to determine what is wrong, report the problem to your service representative.

ANS1881E TSM is unable to use NWPWFILE '*password_file*' to connect TSA target service '*TSA_Target_Service*', the file is corrupted.

Explanation: TSM could not use the NWPWFILE to connect to Novell TSA interface. The file was corrupted.

ANS1882E • ANS1900I

System action: User will be prompted for Novell NetWare Userid and Password, and password file will be created.

User response: The file can be corrupted via another application or hardware failures. If problem is persistent contact your service representative. A copy of the corrupted password file will be needed. This corrupted file must be preserved before you enter a new userid and password, because TSM will overwrite the corrupted file with correct information.

ANS1882E Unable to stop service 'service-name'; error error

Explanation: The service could not be stopped by the program.

System action: TSM ended the current operation.

User response: Manually stop the service and retry the operation.

ANS1891W SUBDIR is not a valid option when using FILELIST, SUBDIR will be ignored.

Explanation: When Specifying FILELIST each entry is a single object and so SUBDIR will not apply.

System action: The option SUBDIR is ignored.

User response: You may have either a -FILELIST or SUBDIR on this command, but not both.

ANS1892W Expire command is not allowed on the TSM journaled filesystem 'filesystem'.

Explanation: You cannot expire files from the server on a TSM journaled filesystem.

System action: The expire command will not work on this filesystem.

User response: If you want to expire this file remove it from the local filesystem.

ANS1895I Highest macro return code was return code value.

Explanation: This message is issued after all commands in a client macro have completed. The return code represents the highest return code that was issued during processing of the macro. In order of increasing severity, the return code meanings are:

- 0 - The command completed successfully
- 4 - One or more files were skipped
- 8 - One or more warning messages were issued
- 12 - One or more error messages (except for skipped files) were issued

System action: None.

User response: For return codes other than 0, the user may wish to verify the results of the client operation(s)

and take diagnostic and repair actions, as necessary.

ANS1896I *** Restored number objects *******

Explanation: Indicates the *number* of objects TSM has restored. During a restore session, the running total is periodically printed to the screen of a command line client.

System action: Continue with restore.

User response: None.

ANS1897I *** Retrieved number objects *******

Explanation: Indicates the *number* of objects TSM has retrieved. During a retrieve session, the running total is periodically printed to the screen of a command line client.

System action: Continue with retrieve.

User response: None.

ANS1898I *** Processed count files *******

Explanation: TSM has processed the specified number of files.

System action: Processing continues.

User response: None.

ANS1899I *** Examined count files *******

Explanation: TSM has examined the specified number of files.

System action: Processing continues.

User response: None.

ANS1900I Return code is return code value.

Explanation: The return code has been issued for the preceding client command. In order of increasing severity, the return code meanings are:

- 0 - The command completed successfully
- 4 - One or more files were skipped
- 8 - One or more warning messages were issued
- 12 - One or more error messages (except for skipped files) were issued

The return code indicates the highest severity message that was issued during execution of the client command. For a scheduled event, the event will be considered successful if the return code is 0, 4, or 8. The event will be considered to have failed if the return code is 12.

System action: None.

User response: For return codes other than 0, the user may wish to verify the results of the client operation and take diagnostic and repair actions, as necessary.

ANS1901I **Highest return code was** *return code value*.

Explanation: This message indicates the highest return code of all the client commands that were executed. In order of increasing severity, the return code meanings are:

- 0 - The command completed successfully
- 4 - One or more files were skipped
- 8 - One or more warning messages were issued
- 12 - One or more error messages (except for skipped files) were issued

System action: None.

User response: For return codes other than 0, the user may wish to verify the results of the client operation(s) and take diagnostic and repair actions, as necessary.

ANS1902E **The PRESCCHEDULECMD command failed. The scheduled event will not be executed.**

Explanation: The command specified by the PRESCCHEDULECMD option must complete successfully in order to execute the scheduled event. If the command completed with a return code of 0 (zero), it is considered to have completed successfully. If the command completed with any other return code, it is considered to have failed. If the command failed then the scheduled event is not executed.

System action: The client does not execute the scheduled event, and the result code of the scheduled event will be 12.

User response: Identify and repair the problem that caused the command to fail. If it is not necessary for the command to complete before starting the scheduled event, then consider using the PRENSCHEDULECMD option, which does not require that the command complete successfully. If a non-zero return code is normal for this command, then consider wrapping the command in a script that always exits with a return code of zero.

ANS1903W **The POSTCHEDULECMD command failed.**

Explanation: If the command specified by the POSTCHEDULECMD option completed with a non-zero return code, then the scheduled event is considered to have completed successfully, but with a warning-level result. Note that the result of the POSTCHEDULECMD command will not supercede a higher result from the scheduled client command. For example, if the scheduled client command completed with a return code of 12, the scheduled event will be considered to have completed with a return code of 12, regardless of the outcome of the POSTCHEDULECMD command.

System action: At a minimum, the result code of the scheduled event is 8.

User response: Identify and repair the problem that caused the command to fail. If it is not necessary for the command to complete before posting the result of the scheduled event, then consider using the PRENSCHEDULECMD option. If a non-zero return code is normal for this command, then consider wrapping the command in a script that always exits with a return code of zero.

ANS1904E **The archive description may not contain any wildcard characters like '?' or '*'.**

Explanation: Descriptions for archive files must not contain wildcard characters.

System action: Processing stopped.

User response: Enter an archive description that does not contain wildcard characters.

ANS1905E **There was a NetWare SMS error processing** *'filespace-name path-namefile-name'*: *error-text*

Explanation: TSM received an unexpected error from the Novell SMS interface.

System action: The object is skipped. Processing continues.

User response: Check the Novell web site for any additional information about the error, as a fix might already be available. Contact Novell technical support for further assistance.

ANS1906I **Destination must be specified for this operation when using FROMNODE.**

Explanation: The user must specify a destination with a Restore/Retrieve command when using FROMNODE processing.

System action: Processing stopped.

User response: Retry the Restore/Retrieve command with a destination specified.

ANS1907E **An error occurred while trying to perform an object merge operation on the server.**

Explanation: For NetWare clients: The TSM server is unable to perform a NetWare long name conversion. For Unix or Windows image backup: The group used to store associated image components could not be closed.

System action: The operation ends.

User response: For NetWare: It is possible that a more current level of the TSM server can perform the conversion. Contact your TSM server administrator for

ANS1908I • ANS1920E

assistance. For Unix or Windows: This error indicates an authorization problem. Contact your TSM server administrator for assistance. If the problem still cannot be resolved, contact IBM technical support for further assistance.

ANS1908I The scheduled command completed successfully.

Explanation: The scheduled command completed with return code of zero, which is interpreted as success.

System action: The scheduled event is successful. The result code for the event is 0.

User response: None.

ANS1909E The scheduled command failed.

Explanation: The scheduled command completed with a non-zero return code, which is interpreted as failure.

System action: The scheduled event is failed. The result code for the event is 12.

User response: Identify and repair the problem that caused the command to fail. If a non-zero return code is normal for this command, then consider wrapping the command in a script that always exits with a return code of zero.

ANS1912E An invalid registry hive was specified.

Explanation: The specified registry hive is invalid.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1913E An invalid registry subkey was specified.

Explanation: The specified registry subkey is invalid.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1914E The specified subkey isn't valid for the specified hive.

Explanation: The specified registry subkey is invalid for the specified registry hive.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1915E Too many arguments specified for the BACKUP REGISTRY command.

Explanation: Too many arguments were specified for the BACKUP REGISTRY command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1916E Too many arguments specified for the RESTORE REGISTRY command.

Explanation: Too many arguments were specified for the RESTORE REGISTRY command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1917E Too few arguments specified for the BACKUP REGISTRY command.

Explanation: Too few arguments were specified for the BACKUP REGISTRY command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1918E Too few arguments specified for the RESTORE REGISTRY command.

Explanation: Too few arguments were specified for the RESTORE REGISTRY command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1919E The specified eventlog is not valid.

Explanation: The specified eventlog is not valid.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1920E Too many arguments specified for the BACKUP EVENTLOG command.

Explanation: Too many arguments were specified for the BACKUP EVENTLOG command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1921E Too many arguments specified for the RESTORE EVENTLOG command.

Explanation: Too many arguments were specified for the RESTORE EVENTLOG command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1922E Too few arguments specified for the BACKUP EVENTLOG command.

Explanation: Too few arguments were specified for the BACKUP EVENTLOG command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1923E Too few arguments specified for the RESTORE EVENTLOG command.

Explanation: Too few arguments were specified for the RESTORE EVENTLOG command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1924E The specified system object is not valid.

Explanation: The specified system object is not valid.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1925E The specified system object type is not valid.

Explanation: The specified system object type is not valid.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1926E The specified system object type is only valid on Windows NT.

Explanation: The specified system object type is only valid on Windows NT.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1928E Server-initiated sessions are not available in the LAN-free mode.

Explanation: Conflicting options SESSIONINIT=serveronly and ENABLELANFREE=yes were specified. This combination is not allowed.

System action: Processing stops.

User response: Use client-initiated sessions or disable LAN-free.

ANS1929E An error occurred saving the registry key.

Explanation: The active registry key cannot be copied to the ADSM.SYS staging directory.

System action: The registry backup operation stops.

User response: Check the space available on the Windows boot partition to ensure there is room to contain a copy of the Windows registry. This might require several megabytes of free space. Also check the Windows permissions on the ADSM.SYS staging directory and ensure that the Windows user which you are using to run TSM has full access to that directory and its contents.

ANS1930W TSM Express client view not supported with a TSM Enterprise server. CLIENTVIEW option ignored.

Explanation: The TSM Express client view is only supported when going to a TSM Express server. When a TSM Express client connects to a TSM Enterprise server, the CLIENTVIEW option is ignored, and the TSM Standard client view is displayed instead.

System action: The CLIENTVIEW option is ignored and the TSM Enterprise client view is displayed.

User response: If you intend to use the TSM Enterprise server, then update your CLIENTVIEW option to a value of STANDARD. Otherwise, update your TCPSERVERADDRESS option to point to your TSM Express server.

ANS1931E An error saving one or more eventlogs.

Explanation: An error occurred saving one or more eventlogs.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1932E An error occurred replacing one or more registry keys.

Explanation: The registry key or keys being replaced are exclusively held by another process. The registry

ANS1933E • ANS1942E

keys were previously restored but the system was not restarted.

System action: processing stops.

User response: This error occurs because the registry key or keys being replaced are exclusively held by another process. This can happen if the registry keys were previously restored but the system was not rebooted. Reboot the system and attempt the restore operation again.

ANS1933E Error accessing file or device '*name*'.

Explanation: An error has occurred while accessing the file or device.

System action: Backup set operation is not completed.

User response: Verify that the file or device exists and is accessible.

ANS1934E Backup set '*name*' not found.

Explanation: The backup set name was not found on the server.

System action: The backup set operation is not processed.

User response: Verify that the backup set name is correct.

ANS1935E Too many arguments specified for the BACKUP NTDS command.

Explanation: Too many arguments were specified for the BACKUP NTDS command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1936E Not enough arguments specified for the BACKUP NTDS command.

Explanation: Not enough arguments were specified for the BACKUP NTDS command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1937E No NTDS server name specified for the BACKUP NTDS command.

Explanation: No NTDS server name was specified for the BACKUP NTDS command.

System action: Processing stopped.

User response: Specify NTDS server name at the command and retry the operation.

ANS1938E NT Active Directory is not supported in this OS level.

Explanation: NT Active Directory is not supported in this OS level.

System action: Processing stopped.

User response: Install Active Directory before performing backup operation.

ANS1939E File Replication Service backup failed.

Explanation: IBM Tivoli Storage Manager encountered an error while backing up files under control of the Windows 2000 File Replication Service

System action: Processing stopped.

User response: Examine the Windows 2000 File Replication Service Event log to insure the File Replication Service is operating properly. Restart the service and retry the backup operation.

ANS1940E File Replication Service restore failed.

Explanation: IBM Tivoli Storage Manager encountered an error while restoring files under control of the Windows 2000 File Replication Service

System action: Processing stopped.

User response: Examine the Windows 2000 File Replication Service Event log to insure the File Replication Service is operating properly. Restart the service and retry the restore operation.

ANS1941E System Volume backup failed.

Explanation: IBM Tivoli Storage Manager encountered an error while backing up files of the Windows 2000 System Volume

System action: Processing stopped.

User response: Examine the Windows 2000 File Replication Service Event log to insure the system volume was successfully initialized. Restart the service and retry the backup operation

ANS1942E System Volume restore failed.

Explanation: IBM Tivoli Storage Manager encountered an error while restoring files under control of the Windows 2000 File Replication Service

System action: Processing stopped.

User response: Examine the Windows 2000 File Replication Service Event log to insure the system volume was successfully initialized. Restart the service and retry the restore operation.

**ANS1943E The operation is not supported:
Downlevel server version.**

Explanation: The operation cannot be performed because server version is downlevel.

System action: Processing stopped.

User response: Use correct server version.

ANS1944E Error accessing file or device.

Explanation: An error has occurred while accessing the file or device.

System action: Backup set operation is not completed.

User response: Verify that the file or device exists and is accessible.

**ANS1945E The long namespace has been removed
from the local filesystem. If you wish to
proceed with the backup/archive
operation, rename your filesystem on the
server.**

Explanation: TSM has detected that the server namespace is NTW:LONG, but the local volume does not have long name support. If you would like to back up the volume using the short names, rename the filesystem on the server. If you would like to back up using long names, add the long namespace support back to the volume in question.

System action: Processing stopped.

User response: Add the long namespace support to the volume or rename(remove) the corresponding server filesystem.

ANS1946W File exists, skipping

Explanation: The client tried to restore or retrieve the specified file, but the file already existed in the target restore location and the user chose not to replace the existing file.

System action: The file is skipped, a message is logged in dsmerror.log, and restore or retrieve processing continues with the next object.

User response: The file was skipped because either REPLACE NO was in effect, causing all existing files and directories to be skipped, or REPLACE PROMPT was in effect, and when prompted, the user chose to skip this file or all existing directories and files. No additional action is necessary if the decision to skip the file was deliberate. Otherwise the operation can be retried using either REPLACE ALL (automatically replace existing directories and files) or REPLACE PROMPT (prompt the user whether to replace the file).

ANS1947W Directory exists, skipping

Explanation: The client tried to restore or retrieve the specified directory, but the directory already existed in the target restore location and the user chose not to replace the existing directory.

System action: The directory is skipped, a message is logged in dsmerror.log, and restore or retrieve processing continues with the next object.

User response: The directory was skipped because either REPLACE NO was in effect, causing all existing files and directories to be skipped, or REPLACE PROMPT was in effect, and when prompted, the user chose to skip this directory or all existing directories and files. No additional action is necessary if the decision to skip the directory was deliberate. Otherwise the operation can be retried using either REPLACE ALL (automatically replace existing directories and files) or REPLACE PROMPT (prompt the user whether to replace the directory).

**ANS1948E The Microsoft volume shadow copy
system components could not be
queried.**

Explanation: IBM Tivoli Storage Manager encountered an error while querying the system writers under control of the Windows volume shadow copy service. The TSM error log and Windows event log might contain additional information about this error.

System action: Processing stops.

User response: Try the operation again. If the error persists, review the TSM error log and Windows event log for information related to this error. You might need to restart the volume shadow copy service, then try the operation again. It might be necessary to reboot the machine to clear the volume shadow copy error state.

**ANS1949E Microsoft volume shadow copy
snapshot initialization failed.**

Explanation: IBM Tivoli Storage Manager encountered an error while initializing the Microsoft Volume Shadow Copy Service for backup or restore. The TSM error log and Windows event log can contain additional information about this error.

System action: processing stops.

User response: Try the operation again. If the error persists, review the TSM error log and Windows event log for information related to this error. Use the Windows command VSSADMIN LIST WRITERS to determine the status of the Volume Shadow Copy service. You can reboot the machine to clear the volume shadow copy error state. If the system is a Domain Controller and the Active Directory service is stopped, restarting the Active Directory service will resolve the issue.

ANS1950E Backup using Microsoft volume shadow copy failed.

Explanation: IBM Tivoli Storage Manager encountered an error while performing a backup operation using the Microsoft volume shadow copy service. The TSM error log and Windows event log might contain additional information about this error.

System action: processing stops.

User response: Review the TSM error log and Windows event log for information related to this error. Restart any failing system service indicated in the Windows event log. Restart the volume shadow copy Service. You can use the Windows command VSSADMIN LIST WRITERS to determine the status of the volume shadow copy service. It might be necessary to reboot the machine to clear the Volume Shadow Copy error state.

ANS1951E Restore using Microsoft volume shadow copy failed.

Explanation: IBM Tivoli Storage Manager encountered an error while restoring with the Microsoft Volume Shadow Copy Service.

System action: processing stops.

User response: Review the TSM error log and Windows event log for information related to this error. Restart any failing system service indicated in the Windows event log. Restart the volume shadow copy Service. You can use the Windows command VSSADMIN LIST WRITERS to determine the status of the volume shadow copy service. It might be necessary to reboot the machine to clear the Volume Shadow Copy error state.

ANS1952E Invalid symbolic link destination '*file-name*' entered

Explanation: You entered a restore/retrieve destination *file-name* specification that is a symbolic link. To restore to symbolic link, make sure you set the followsymbolic option to yes. Also, check where this symbolic link points. You can restore/retrieve to a symbolic link that points to an existing object.

System action: Processing stopped.

User response: Enter a correct file specification.

ANS1954E Backup processing of '*file-space name*' finished with failures.

Explanation: This message indicates that the file system backup has completed, but encountered errors during backup processing.

System action: Processing continues.

User response: Examine the client error log for

additional messages related to errors in backing up the file system. Take any corrective action as suggested by the messages.

ANS1956E Too few arguments specified for the BACKUP GROUP command.

Explanation: Too few arguments were specified for the BACKUP GROUP command.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1957E Showmembers and inactive are mutually exclusive parameters on a query.

Explanation: Showmembers and inactive are mutually exclusive parameters on a query.

System action: Processing terminates.

User response: Specify one of the mutually exclusive parameters on the query

ANS1958W No base group found, attempting a full backup.

Explanation: A differential backup requires a previous full backup to have been performed.

System action: Processing continues, and a full backup is attempted.

User response: None. Perform a full backup before attempting a differential backup

ANS1959W Removing previous incomplete group '*name*' Id:*hi-lo*

Explanation: A previous group backup failed without cleaning up the temporary groups correctly.

System action: The previous incomplete groups are removed and processing continues.

User response: None.

ANS1960I Contacting the WebSphere *component-name*. This step could take a few minutes...

Explanation: The application needs to contact the WebSphere component to obtain configuration information.

System action: Processing continues

User response: None.

ANS1961E Could not detect any installation of the WebSphere Deployment Manager or Application Server.

Explanation: The application could not detect a supported WebSphere component installed. At this time, only the WebSphere Deployment Manager and Application Server are supported.

System action: Processing stops

User response: Verify that the intended WebSphere component is installed on this machine, and retry the operation.

ANS1962E Operation Failed.

Explanation: The attempted operation on the WebSphere component failed.

System action: Processing stops

User response: Check the error log for more details.

ANS1963E WAS Filesweep failed for filespec '*name*'

Explanation: Could not obtain the list of files to be backed up for the indicated filespec

System action: Processing stops

User response: Verify that the process has access to the indicated filespec and retry the operation.

ANS1964E A failure occurred while contacting the WebSphere *component-name*.

Explanation: The attempted operation on the WebSphere component failed.

System action: Processing stops

User response: Check the error log for more details.

ANS1971E The remote client agent (dsmagent) could not be started.

Explanation: The remote client agent cannot be started. This error message is usually preceded or followed by other messages.

System action: Processing is stopped.

User response: Check the error log for any other messages that might indicate a reason for the failure. Verify that the web client is installed correctly. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1972E The connection to the remote client agent (dsmagent) failed. Either the port number could not be read, or the port number is invalid.

Explanation: An error occurred when trying to read the port number. A connection to the remote client agent cannot be made.

System action: Processing stopped.

User response: Check the error log for any other messages that might indicate a reason for the failure. Verify that the web client is installed correctly. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS1973I VSS writer for system object '*name*' does not exist. Restore skipped.

Explanation: Microsoft Volume Shadow Copy Service does not detect a writer for this system component. Either the component is not installed or is not running..

System action: Object skipped.

User response: Install or enable the affected system service and retry the operation.

ANS1974W Error removing previous incomplete group Id:*hi-lo*

Explanation: A previous group backup failed without cleaning up the temporary groups correctly, and the error still can not be cleaned up.

System action: The previous incomplete groups remain and processing continues.

User response: None.

ANS1975W TSM server error *reason* occurred closing and renaming the group

Explanation: An error was encountered closing and renaming the temporary group.

System action: The backup is unsuccessful.

User response: Ensure that the user has the proper authority to update the group and try the operation again.

ANS1976E The specified system service is not valid.

Explanation: The specified system service is not valid.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS1977E Dsmcad schedule invocation was unsuccessful. This command will be tried again in 10 minutes.

Explanation: Dsmcad was unable to get the valid scheduler information from the dsmc schedule process. This could be due to some problems during the scheduler initialization, such as incorrect option usage.

System action: Dsmcad will try to invoke the scheduler again in 10 minutes in order to get the valid information.

User response: Check the console and error logs to determine what kind of error occurred during the dsmc process and correct the problem.

ANS1978E The TSM server is downlevel and does not support the requested function. See error log for version information.

Explanation: The function being used requires a more current TSM Server.

System action: The operation fails.

User response: Upgrade your TSM Server to a level that supports this function. See error log for version information.

ANS1979E The TSM Storage Agent is downlevel and does not support the requested function. See error log for version information.

Explanation: The function being used requires a more current TSM Storage Agent.

System action: The operation fails.

User response: Upgrade your TSM Storage Agent to a level that supports this function. See error log for version information.

ANS1980E The TSM Server and TSM Storage agent are downlevel and do not support the requested function. See error log for version information.

Explanation: The function being used requires a more current TSM Server and TSM Storage agent

System action: The operation fails.

User response: Upgrade your TSM Server and TSM Storage agent to a level that supports this function. See error log for version information.

ANS1981E Server :Version *ver*, Release *rel*, Level *lev.subl* Storage Agent:Version *SAver*, Release *SArel*, Level *SAlev.SAsubl*

Explanation: This message supplies extra detail to downlevel messages.

System action: The operation fails.

User response: This message supplies extra detail to downlevel messages.

ANS1986E Initialization functions cannot open the trace file specified.

Explanation: The file "*tracefile-name*" could not be opened during initialization. The specified path may be incorrect. It is also possible that the current user does not have permission to write to the tracefile in the directory specified. It is also possible that no space is available at the given tracefile location.

System action: Processing terminates.

User response: Make sure the tracefile option points to a valid path and that the user has proper permissions to write to the file specified.

ANS1987E A destination file specification is not allowed with this command.

Explanation: None.

System action: Processing stopped.

User response: Re-issue the command without a destination file specification.

ANS1988W No filespaces are selected for preview.

Explanation: You requested a preview operation without selecting a client file space.

System action: TSM cannot perform a preview without a file space selected.

User response: Select the volumes you want to preview and retry the operation.

ANS1989E Initialization functions cannot open the Error Log file specified.

Explanation: The Error Log file could not be opened during initialization. The specified path may be incorrect. It is also possible that the current user does not have permission to write to the logfile in the directory specified. It is also possible that no space is available at the given logfile location.

System action: Processing terminates.

User response: Make sure the logfile option points to a valid path and that the user has proper permissions to write to the file specified.

ANS1990W The '*filesystem name*' volume mount point can not be accessed. The TSM return code is '*rc*'.

Explanation: The client is unable to access volume mount point. The common reasons for this are that the account under which the client is running does not

have access to the volume mount point, or the volume is mounted onto a cluster volume which is currently not available.

System action: The inaccessible mount point is skipped and processing continues. with the next mount point or volume.

User response: Check the error log for additional messages that might yield additional information about the problem that prevents access to the volume mount point. Ensure that the TSM client is running under an account which has access to the volume mount point. Ensure that the mount point is not accessing a clustered volume. Please refer to Microsoft KB Article 280297 for more information about how to configure volume mount points on a clustered server.

ANS1991E An error occurred processing registry key '*key-name*', data value '*value-name*'. See the client error log for additional information about this error.

Explanation: An unexpected error occurred when the client tried to read or update the Windows registry. Additional information regarding the error is usually placed in the error log.

System action: The operation might not execute correctly, depending on the error.

User response: Check the client error log for any other messages that might have been logged when this message was written, and take any corrective action suggested by those messages. If the problem persists, contact IBM support for further assistance.

ANS1995W Objects of different types cannot be deleted at the same time.

Explanation: Deleting objects of different types is not allowed. For example, deleting Backup Sets and regular file objects at the same time is not possible.

System action: No processing takes place.

User response: Select objects of the same type to perform delete operation.

ANS1999E *type of the operation* processing of '*filesystem-name*' stopped.

Explanation: The client has encountered a condition where it can not continue processing the specified file space. The TSM client error log or schedule log should contain additional messages related to this error.

System action: Processing stops.

User response: Check the TSM client error log and schedule log for any additional messages related to this error. Take any corrective action that might be suggested by the related messages, then try the operation again. If the problem persists, contact your

TSM administrator for further assistance.

ANS2000I Unable to convert file names because MEMORYEfficientbackup option is ON.

Explanation: TSM has detected that a local name space change has occurred on the volume that is currently being backed up. TSM would convert the file names to the new name space, but cannot because the option MEMORYEfficientbackup, is on.

System action: TSM continues to backup using the old name space.

User response: Edit the dsm.opt file, and set MEMORYEfficientbackup to OFF.

ANS2025E Login failed to NetWare file server '*server-name*'.

Explanation: TSM cannot establish an authorized connection to the Netware file server through NDS. Connection numbers might be exhausted.

System action: Processing stopped.

User response: Messages ANS1874E, ANS1876E and ANS2025E can all be issued due to related problems. These problems might include: 1) The NetWare server has an insufficient number of NetWare user licenses. 2) The NetWare license files are corrupt. The NetWare license files can be reinstalled. 3) A NetWare typeful name is not being provided at the NetWare User prompt. 4) The TSM password file is corrupt. In this situation, quit all TSM processes, delete or move the *.PWD files that are located in the TSM installation directory, then load dsmd and run the following commands: QUERY SESSION QUERY TSA QUERY TSA NDS.

ANS2026W Bad sectors were detected on the volume '*volname*'.

Explanation: Bad sectors are skipped during image backup/restore operations.

System action: Processing continues.

User response: Make sure the volume data is not corrupt by using system tools like chkdsk (Windows) or fsck (Unix).

ANS2036W Pruning functions cannot open one of the Tivoli Storage Manager prune files: *log-name*. **errno** = *errno-value*,

Explanation: The file "*log-name*" could not be opened during pruning. The system set the error code *errno-value*. If the reason given is "access denied," the current user does not have permission to write to the file in the directory specified. It is also possible that no space is available at the given file location or another Tivoli Storage Manager process started by different user

id is performing pruning at the same time.

System action: Pruning stops, processing continues.

User response: Set the DSM_LOG (or DSMI_LOG) environment variable to a directory into which the current user can write.

ANS2037W Schedule log pruning failed.

Explanation: The schedule log pruning function completed with errors.

System action: Processing continues.

User response: Check error log for possible reasons of failure.

ANS2038W Invalid option '*option-name*' received from the TSM server client options set.

Explanation: The client received an invalid option from the TSM server's client option set. Although most syntax checking for client option set options is done by the server, there are still errors that can only be detected by the client. These errors include:

- Option value is not correct.
- Options that have been retired by newer versions of the TSM client.
- Missing brackets or directory delimiters.
- Include and exclude patterns that are too complex.

System action: The option is ignored by the TSM client.

User response: Contact the TSM server administrator to determine if the option can be removed from the client option set.

ANS2046S Error '*errtxt*' (*errno=errno*) occurred trying to write to audit log '*file-name*'. The audit log function is disabled.

Explanation: There was an error encountered writing to the audit log (for example, there is not enough space on the disk).

System action: Audit logging is disabled for the rest of the operation. The return code for the operation is set to 12 to indicate that the contents of the audit log are incomplete.

User response: If this is an out of space condition either free up space on the volume or try to write the audit log to a volume with more space.

ANS2047E An unexpected error was encountered processing a system state/services request. TSM function name : *function-name* TSM function : *function-desc* TSM return code : *TSM-rc* TSM explanation : *TSM-msg* TSM file : *file-name* (*line-number*)

Explanation: None.

System action: Processing the system state stops.

User response: Contact the TSM administrator with the information provided in this message.

ANS2048W Named stream of object '*object-name*' *path-name* *file-name*' is corrupt.

Explanation: One or more of the file's named streams are corrupt.

System action: The named stream is not restored/retrieved.

User response: The backup copy of the named stream is damaged. The file is restored to as great an extent as possible, but the file should be examined to verify that it is usable.

ANS2049W Named stream of object '*object-name*' may be corrupt.

Explanation: One or more of the file's named streams may be corrupt.

System action: The named stream is restored/retrieved to as great an extent as possible.

User response: The backup copy of the named stream may be damaged. The file is restored to as great an extent as possible, but the file should be examined to verify that it is usable.

ANS2050E TSM needs to prompt for the password but cannot prompt because the process is running in the background.

Explanation: If PASSWORDACCESS is PROMPT or the password stored locally is incorrect, the user should be prompted for the password. But when the process is running in the background, prompting is not allowed and the process cannot proceed without authentication.

System action: Processing stopped.

User response: You may use RUNASSERVICE option with PASSWORDACCESS PROMPT. Turn off RUNASSERVICE to be able to get prompted

ANS2051W The local snapshot repository was not found on *location*.

Explanation: The specified directory for the local snapshot location does not exist.

System action: Processing continues.

User response: A new local snapshot repository will be build in the specified directory.

ANS2052E Information about the disk subsystem is missing.

Explanation: The local snapshot repository could not be initialized due to missing information about the disk subsystem.

System action: Processing stops.

User response: The application ensures that the disk subsystem is initialized properly. Check for preceding error messages.

ANS2053E A memory allocation error has occurred in file *filename*, line number *linenumber*.

Explanation: Enough memory was not available to continue processing.

System action: Processing ends.

User response: Ensure that your system has sufficient real and virtual memory. Close unnecessary applications.

ANS2054E Operating system error *errno: message*text.

Explanation: The application encountered an unexpected message error during the execution of a system function. The respective operating system error and message text will be displayed.

System action: Processing stops.

User response: Check the specific error message.

ANS2055I The local snapshot manager could not be locked.

Explanation: The local repository is locked by another application. This process will proceed when the other application unlock the local repository.

System action: Processing continues.

User response: None.

ANS2056I Waiting maximal *timeout* seconds until the lock is released by the other application.

Explanation: While the local repository is locked by another application, the program will wait a specific period of time to proceed. For example, in the mySAP environment, the wait period is 1 hour.

System action: Processing continues.

User response: None.

ANS2057E Local snapshot manager not initialized.

Explanation: The local snapshot repository was used without previous initialization.

System action: Processing ends.

User response: The system normally ensures that the local repository is initialized. Check for preceding error messages.

ANS2058E The data container with ID *dcID* could not be updated in the local repository.

Explanation: During a FlashCopy backup the target set record in the local repository is updated with the correspondent properties. A failure occurred during that process.

System action: Processing ends.

User response: Check for preceding error messages like memory allocation error or other system error.

ANS2059E Cannot find a target data container that match with the source data container.

Explanation: During a snapshot type backup or hardware function, TSM tries to find a target data container that match to the source data container to satisfy the operation. A matching target data container could not be found.

System action: Processing ends.

User response: See the rules for select one of multiple target data containers. For example, this message will be displayed if the user is trying to start a FlashCopy backup of type 'INCR' and all the target sets are being used for the FlashCopy type 'COPY'. Make sure also that the target volumes are available to the backup system and the syntax is correct for the following setup file parameters: 1. shark_target_volume 2. shark_copy_service_code 3. java_home_directory 4. primary_copyservices_servername 5. shark_username 6. shark_password

ANS2060W Cannot find a volume in the target data container *dcID* to match with the source *srcvol*.

Explanation: This warning message indicates that for the specific source not any target volume could be found in this target data container that matches for a FlashCopy operation. If multiple target data containers are being used, the processing will continue checking the volumes of the next target data container.

System action: Processing continues.

User response: None.

ANS2061W The target data container with ID *dcid* was not found in the local repository.

Explanation: An inquire of the data container with the specified ID could not be satisfied because that target set does not exist in the local repository.

System action: Processing may continue.

User response: The application that is requesting the inquire will decide whether or not the error should end the program. Check for following messages.

ANS2062W Could not find a target data container in the state *state* to fulfill the requested criteria.

Explanation: A data container in the specified state was not found in the local repository to satisfy specific criteria requested by the application.

System action: Processing may continue.

User response: Which criteria have been passed is application specific. Check for following messages. The application will decide whether or not that warning should end the program.

ANS2063W The local snapshot repository already exists on the directory *location*.

Explanation: An application tried to create the local repository in a directory that already exists.

System action: Processing may continue.

User response: The application will decide whether or not that warning should end the program. Check for following messages.

ANS2064I The local snapshot repository will be created on the directory *location*.

Explanation: The local snapshot repository containing information about the state of the data containers is being created.

System action: Processing continues.

User response: None.

ANS2065I The local snapshot repository could not be created on the directory *location*.

Explanation: A failure occurred creating the local snapshot repository.

System action: Processing ends.

User response: Look for an operating system error message.

ANS2066E Cannot read the .fct file *filename*.

Explanation: The .fct file containing the target data containers was not found or is not accessible.

System action: Processing ends.

User response: Check the name, the path and the right of the file.

ANS2067E The exception `CLsmException` was thrown. Reason: *txt*.

Explanation: An unexpected error occurred processing a function of the local snapshot repository.

System action: Processing ends.

User response: Check the specific reason.

ANS2068E No target LUNs were found for the data container *dcID* in the .fct file *filename*.

Explanation: The program will search in the .fct file for each specific data container a list of entries with the label `<PREFIX>TARGET_VOLUME` where the prefix depends on the hardware type. Either you have a wrong label for the target volumes of the specified data container or this data container in the .fct file does not have any target LUNs.

System action: Processing ends.

User response: This error can only occur if the application does not have a GUI where the user provides the input of the target data containers and the format will automatically be checked. If so, please check the format of the .fct file.

ANS2069E Cannot read the file *filename* of the local snapshot repository.

Explanation: The system keeps some information about the state of the data containers locally in a file. This file was not found or is not accessible.

System action: Processing ends.

User response: Check the name, the path and the right of the file.

ANS2070E The repository state file *filename* is empty or has a wrong format.

Explanation: The system keeps some information about the state of the data containers locally in a file. This file was found but the expected format of the data is not correct.

System action: Processing ends.

User response: Normally the system ensures that the format of this file is correct. Check for preceding error.

ANS2071E The data container *dcID* could not be inserted in the local snapshot repository.

Explanation: The system keeps some information about the state of the data containers locally in a file. Inserting an entry for a new data container occurred an error.

System action: Processing ends.

User response: This is an unexpected error. Check for preceding error. If not any other error can be seen, collect the logs and traces and contact the support.

ANS2072E An unexpected error was encountered processing a TSM operation using a hardware or snapshot function. TSM function name : *function-name* TSM function : *function-desc* TSM return code : *TSM-rc* TSM file : *file-name* (*line-number*)

Explanation: None.

System action: Processing stops.

User response: Contact the TSM administrator with the information provided in this message.

ANS2073E The file *filename* of the local snapshot repository could not be opened for writing.

Explanation: The system keeps some information about the state of the data containers in the local snapshot repository. Opening a file of this repository occurred an error.

System action: Processing ends.

User response: Check the rights permission of that file.

ANS2074E Cannot open user input FlashCopy target file '*fct_file*'.

Explanation: The FlashCopy target file that the user provided cannot be read.

System action: The operation fails.

User response: Run the client configuration utility and provide a valid FlashCopy target user input file.

ANS2075E There is no VTOC data available for the volume. The volume cannot be backed up.

Explanation: The volume disk label type is not VTOC. It is possible that your disk is formatted with an EFI label. The TSM client on Solaris currently supports only VTOC disk labels.

System action: The volume is not backed up.

User response: Do not attempt to backup volumes

formatted with a non-VTOC disk label.

ANS2076E *program-name*: Space Management can not be added for file system '*filesystem*' The length of the file system name exceeds the maximum length of '*maxlength*' which can be stored in a DMAPI attribute.

Explanation: The DMAPI has a limitation in the size of data that can be stored in a DMAPI attribute. If the length of the file system name exceeds this limit the TSM client can not add space management to the file system.

System action: Space management cannot be added to file system.

User response: Please make sure that the length of the file system name does not exceed the DMAPI limit.

ANS2093E The remote file system agent is downlevel and does not support this operation. NODENAME : *node*
MULTI-NODE NAME : *multi-node*
hostname : *host* TCP/IP address :
tcpaddr:tcpport version :
version.release.level.mod

Explanation: None.

System action: The operation fails.

User response: Upgrade the remote file system agent to a supported level.

ANS2094W Unable to assign any database partitions for back up by the Backup Worker Node '*bkupWrkr*'.

Explanation: The list of target LUNs specified by user for this backup worker node did not match in size any of the source LUNs for any of the database partitions. Hence no database partitions could be assigned for backup to this backup worker node.

System action: Processing continues.

User response: Please assign target LUNs to backup worker nodes so that they match in size with all the source LUNs of a particular database partition. Also distribute the target LUNs among all the backup worker nodes so that there is a good load balancing of the number of database partitions backed up by each backup worker node.

ANS2095E JAVA HOME value '*target*' specified in configuration is incorrect.

Explanation: The path name specified for java home is not correct.

System action: Processing ends.

ANS2096E • ANS2206W

User response: Please check the value of java home specified during configuration to make sure it is a valid path name of the directory where JRE is installed on master backup node. Use configuration wizard to update java home value for the configuration.

ANS2096E Unable to read configuration information for database name 'dbname'.

Explanation: The system was unable to read configuration information for the database name specified in the (-DATABASENAME) option.

System action: Processing ends.

User response: Check the spelling of the (-DATABASENAME) option specified and ensure the DB2 UDB configuration wizard has been used to create the configuration information for this name.

ANS2097E Unable to establish a session with the TSM server as target node 'target' using agent node 'agent'.

Explanation: None.

System action: Processing ends.

User response: Ensure that the multi-node name exists on the server and that the agent node has the proper authority to target node listed.

ANS2098E One or more of the node names in the DB2 UDB TSM configuration file are not registered correctly as proxynode agents.

Explanation: None.

System action: Processing stops.

User response: Check the TSM error log for a list of node names that have been configured incorrectly. Correct the problem by executing the DB2 UDB configuration wizard.

ANS2099W The node name 'nodename' in the DB2 UDB TSM configuration file is not registered as an agent for target node name 'targetnode'.

Explanation: None.

System action: Processing continues.

User response: None.

ANS2100E Neither source volume id nor target volume id is in the volume list.

Explanation: None.

System action: Processing ends.

User response: None.

ANS2200I *** Filling Cache count files *******

Explanation: TSM the specified number of files have been added to the disk cache.

System action: Processing continues.

User response: None.

ANS2201I *** Inspecting Cache count files *******

Explanation: TSM the specified number of files have been examined in the disk cache.

System action: Processing continues.

User response: None.

ANS2202E Disk Full Error Accessing Disk Cache.

Explanation: A disk full error occurred attempting to access or write to the specified disk cache file during a disk cache incremental backup. See the client error log for more detailed information.

System action: Processing stops.

User response: This error can be resolved by freeing up space in the file system containing the cache file, or specifying a different location for the cache file. Use the diskcachelocation option to specify the location of the cache file.

ANS2203E Error Accessing Disk Cache.

Explanation: An error occurred attempting to access the specified disk cache file during a disk cache incremental backup. See the client error log for more detailed information. TSM.

System action: Processing stops.

User response: None.

ANS2204E Disk cache restarted.

Explanation: The length of an object name exceeded the configured disk cache key length during a disk cache incremental backup. The backup must be restarted.. TSM.

System action: Backup is restarted with a larger key length to accommodate the object name.

User response: None required. The name of the object that caused the failure can be found in the dsmmerror.log file.

ANS2206W The user must have root authority to use the memory efficient backup disk cache method. The operation will continue using memory efficient backup method without disk caching.

Explanation: None.

System action: The operation continues without using disk caching.

User response: None.

ANS2213E Error while querying volume properties of volume *volserial*. Please verify that the volume specified in the target volumes file exists.

Explanation: None.

System action: Processing stops.

User response: Contact the TSM administrator with the information provided in this message.

ANS2218I The encryption key password for node *node name* and server *server name* has been migrated.

Explanation: The format of the TSM password file has recently changed. The option MIGRATEENCRYPTKEY is set and the stored encryption key password was automatically migrated to the new format. This message confirms that the migration was successful.

System action: The encryption key password has been migrated.

User response: No response.

ANS2219E Cannot backup or archive files into filesystem because it is owned by a TSM API application.

Explanation: TSM Client cannot archive or backup files into a file space that is used a TSM API application.

System action: Processing stops.

User response: Use separate node names for TSM Client and TSM API application(s).

ANS2220E The cluster disk could not be put in maintenance mode.

Explanation: The system call to put the cluster disk in maintenance mode failed.

System action: Processing stopped.

User response: Try the operation again. If the problem continues, check the client error log for any other messages that might have been logged when this message was written, and take the corrective action (if any) suggested by those messages. Examine the Windows event log which may contain additional information. See your system administrator or TSM administrator for further help.

ANS2221W Java was not able to resolve the IP address of your local machine due to network misconfiguration problems! Please verify your network and DNS configuration are setup correctly. Note that on UNIX machines the hostname must be reported correctly (the same) for IPv4 and IPv6 communication methods in the */etc/hosts* configuration file. TSM processing continues.

Explanation: Java™ was not able to get the local host address due to network misconfiguration problems.

System action: Processing continues.

User response: Please verify your network and DNS configuration are setup correctly. Note that on UNIX machines the hostname must be reported correctly (the same) for IPv4 and IPv6 communication methods in the */etc/hosts* configuration file. See your system administrator or TSM administrator for further help.

ANS2223W Rejected unauthenticated server-initiated session from *peer name*.

Explanation: For security, the client will not accept server-initiated sessions from servers that have authentication turned off.

System action: The client-server session is not opened, and the schedule is not executed. The scheduler continues to wait for contact by a server that has authentication turned on.

User response: If the client system is supposed to accept scheduled events from the prompting TSM server, either ask the TSM server administrator to turn authentication on, or do not use server-initiated sessions. If the client system is not supposed to accept scheduled events from the prompting server, ask the TSM server administrator to remove the client node name from the schedule on the prompting server.

ANS2225W User has specified 'SNAPSHOTROOT' option. *snapshot provider* snapshot backup is not valid in conjunction with this option. "SNAPSHOTROOT option will take precedence and processing will continue without the use of a snapshot taken internally by TSM.

Explanation: The (-SNAPSHOTROOT) option is incompatible with TSM snapshot providers such as Logical Volume Snapshot Agent, VSS snapshot provider, JFS2 snapshot provider etc. which provide a comprehensive snapshot solution without having to use the (-SNAPSHOTROOT) option. It is strongly recommended that the snapshot capabilities provided by the TSM snapshot providers be used instead of using the (-SNAPSHOTROOT) option. Processing will continue without the use of the TSM snapshot providers.

System action: Processing continues without the use of the TSM snapshot providers.

User response: See the appropriate *Using the Backup-Archive Client* book for your operating system for correct use of the named option.

ANS2226I Filespace *filespace-name* is renamed to *old-filespace-name*. *unicode-filespace-name* is recreated as a Unicode enabled filesystem. The current operation will continue using the Unicode enabled filesystem.

Explanation: TSM Unicode Client operates with Unicode enabled filesystem. In order to save your data there needs to be a one time automatic rename of the existing MBCS filesystem on the server. A new Unicode enabled filesystem is created on the server and backup/archive continues.

System action: Processing continues.

User response: None.

ANS2227W Server option '*option-name*' '*option-value*' has not been applied on the client due to the client option SRVOPTSETENCRYPTIONDISABLED.

Explanation: The client option SRVOPTSETENCRYPTIONDISABLED has been set to YES on the client thereby preventing the TSM administrator from setting one of the following client options - ENCRYPTKEY GENERATE, EXCLUDE.ENCRYPT, INCLUDE.ENCRYPT.

System action: The option will be ignored.

User response: None required.

ANS2600S Browser trying to establish connection to client; received socket exception: *exception-name*

Explanation: The browser received the exception *exception-name* trying to connect to the TSM client machine.

System action: The TSM operation ends.

User response: Determine what might be causing this kind of an exception. Validate that the LAN is up and that you are trying to connect to the correct port number.

ANS2601S Browser trying to establish connection to client; received unknown host exception: *exception-name*

Explanation: The browser received the exception *exception-name* trying to connect to the TSM client machine.

System action: The TSM operation ends.

User response: Retry the operation. If it persists, determine what might be causing this kind of a problem. Determine if your LAN went down. Determine if you are trying to connect to the correct TSM client machine.

ANS2602S Browser trying to establish connection to client; received IO exception: *exception-name*

Explanation: The browser received the exception *exception-name* trying to connect to the TSM client machine.

System action: The TSM operation ends.

User response: Determine what might be causing this kind of an exception. Retry the problem, and check if the LAN is down.

ANS2603S Browser trying to establish connection to client; received exception: *exception-name*

Explanation: The browser received the exception *exception-name* trying to connect to the TSM client machine.

System action: The TSM operation ends.

User response: Determine what might be causing this kind of an exception. Determine if the LAN may be down, or if the TSM Client Acceptor Daemon on the TSM machine is up and running.

ANS2604S The Web client agent was unable to authenticate with the server.

Explanation: The TSM Web client agent was unable to authenticate with the TSM server.

System action: The TSM operation ends.

User response: One possible solution is to run the command line client so that the client password can be re-entered. Another approach is to check the error log on the TSM Web client agent for any relevant messages.

ANS2605S Browser could not re-establish connection to client; received protocol error.

Explanation: The browser received a protocol error trying to re-connect to the TSM client machine.

System action: The TSM operation ends.

User response: Determine what might be causing this kind of an error. Determine if the TSM browser and the TSM client code might be out of sync.

ANS2606S An invalid password was sent to the server.

Explanation: The TSM password that was sent to the TSM server was invalid.

System action: The TSM operation ends.

User response: Make sure that you have the correct password. Also make sure that it is valid, for example it is not too short.

ANS2607S Browser could not establish connection to client.

Explanation: The TSM browser could not connect to the TSM client machine.

System action: The TSM operation ends.

User response: Determine what might be causing this kind of a problem. Determine if the LAN is down, or if the TSM Client Acceptor Daemon on the TSM machine is up and running.

ANS2608S Nothing was selected so no operation was performed.

Explanation: No object was selected in the GUI for the operation to be performed upon.

System action: The TSM operation ends.

User response: Make sure you select one or more objects (volume, directory or file) in the GUI before clicking on the operation to be performed.

ANS2609S TCP/IP communications failure between the browser and the client machine.

Explanation: This error can occur due to any of the following:

- The LAN connection to the TSM client machine went down.
- You are trying to connect to the TSM client machine using the wrong port number.
- The Client Acceptor Daemon on the TSM client machine is not up and running and accepting connections.

System action: The TSM operation ends.

User response: Retry the operation and make sure the LAN is up. Also check that the port number is correct, and that the Client Acceptor Daemon is started and running on the TSM client machine, and that it is listening on the correct port number.

ANS2610S TCP/IP communications failure between the client and the server machine.

Explanation: An attempt to connect to the server using TCP/IP communications failed. This can be a result of incorrect TCP/IP option settings in your client

options file. This error can also occur if the LAN connection went down or if your system administrator canceled a backup operation.

System action: The TSM client ends.

User response: Retry the operation and make sure the LAN is up. Make sure that both the TSM server and the TSM client are up and running.

ANS2611S An unknown error occurred in the browser.

Explanation: An unknown error occurred in the applet running in the browser.

System action: The TSM operation ends.

User response: Retry the operation. If the problem persists, turn on tracing and see if the trace to the browser console gives the reason for the error.

ANS2612S An unknown error occurred in the client
Please check the TSM Error Log for any additional information

Explanation: An unknown error occurred in the TSM client.

System action: The TSM client ends.

User response: Retry the operation. If the problem persists, check the TSM Error Log for any additional information.

ANS2613S A communications protocol error occurred between the web browser and the client.

Explanation: None.

System action: The operation ends.

User response: Try the operation again. If the problem occurs again, verify that the TSM web client is installed and configured correctly, and make sure you are using a supported browser. Flush the browser cache. Then try the operation again. If the problem persists, enable SERVICE traces on the web client on the target machine and the TSM Java applet, then reproduce the problem. Collect the traces and contact IBM for further assistance.

ANS2614S A protocol error occurred in communications between the client and the server.

Explanation: A protocol error happened between the TSM client and the TSM server.

System action: The TSM client ends.

User response: Retry the operation. If the problem persists, check the TSM Error Log for any additional information. Verify that you are running the correct

applet with the appropriate level of the client.

ANS2615S The user ID entered does not match the node name configured on the client machine.

Explanation: The user ID that was entered is not the same as the node name on this TSM client.

System action: The TSM operation ends.

User response: Verify that the node name entered is configured correctly on the TSM client.

ANS2616I The machine must be rebooted for the changes to take effect

Explanation: The machine must be started for the restored registry changes to take effect.

System action: None

User response: Reboot the machine

ANS2617S The destination directory specified is invalid.

Explanation: The user specified a destination target directory for restore or retrieve which is invalid.

System action: The TSM operation ends.

User response: Retry the operation specifying a valid directory name.

ANS2618S Browser trying to retrieve resources; received resource exception:
exception-name

Explanation: The browser received the exception *exception-name* trying to retrieve resources from the TSM client machine.

System action: The TSM operation ends.

User response: Verify that the resources are installed correctly on the TSM client machine.

ANS2619S The Client Acceptor Daemon was unable to start the Remote Client Agent.

Explanation: The TSM Client Acceptor Daemon could not start the TSM Remote Client Agent.

System action: The TSM operation ends.

User response: Check the error log on the TSM Web client agent for any relevant messages. Then correct the problem and retry.

ANS2620W The expand entire branch operation may take a long time, and cannot be canceled once it has started. Are you willing to wait for the operation to complete?

Explanation: The expand entire branch operation could take a long time and cannot be canceled once it is started.

System action: Processing stopped; waiting for user intervention.

User response: Answer 'Yes' to start the expand entire branch operation. If you answer 'No', the current operation will be canceled.

ANS2621W This function is not available on the client platform

Explanation: The browser received a request that is not available on the TSM client machine. For example, registry backup and restore are available only on the Windows platform.

System action: The TSM operation ends.

User response: Request only those functions that are valid for the platform of the TSM client machine.

ANS2622S An invalid ID or password submitted.

Explanation: Either the ID is not registered on the TSM server, or the password for the ID is incorrect.

System action: The TSM operation ends.

User response: Verify that the ID you are using exists on the TSM server to which the remote client node connects. The ID must have sufficient privileges to access the remote client node's data. Also make sure that you have the correct password for the ID. If the ID does not exist or if the password is unknown, contact your TSM administrator. If the ID does not exist, then the TSM administrator can use the REGISTER ADMIN and GRANT AUTHORITY commands to register an ID that can access the remote client node's data. If the password is unknown, the TSM administrator can use the UPDATE ADMIN command to reset the password.

ANS2623S Web Client applet level is out of sync with Web Client agent.

Explanation: The Web Client applet and Web Client agents are at incompatible levels.

System action: The TSM operation ends.

User response: Verify that you have the correct level of the applet installed with the client, and that an incorrect level of the applet was not placed in the install directory.

ANS2624E This operation requires client owner authority.

Explanation: Your user ID has insufficient authority to perform this operation.

System action: Processing continues, but the user is not allowed to do this operation.

User response: Do not perform this operation, or get a higher authority level for your user ID in order to perform this operation.

ANS2625E Node does not support this image operation.

Explanation: Node does not support or is not configured to perform this image operation.

System action: Processing continues, but the user is not allowed to do this operation.

User response: Verify whether this image related operation is supported or configured on the target platform.

ANS2626E The Include-Exclude statement: *ieStatement* contains invalid characters.

Explanation: The specified Include-Exclude statement has invalid characters.

System action: TSM will not add the specified Include-Exclude statement to the list.

User response: Retry the operation with another statement that has valid characters.

ANS2627W The NTFS security attributes for object '*full-name*' could not be set. Windows system error code: *error*; reason: '*error-reason*'. Default NTFS security attributes have been set.

Explanation: TSM was unable to set the NTFS security attributes of the file. The error information captured indicates the reason for the failure. Default NTFS security attributes have been set.

System action: Processing continues.

User response: Check the reason field for the code which explains why the NTFS security attributes have not been set. Correct the condition causing the error and try the operation again. If the problem persists, contact your system administrator or TSM administrator for further help.

ANS2628W Failed to create named stream of object '*filespace namepath-namefile-name*'.

Explanation: TSM was unable to create named stream.

System action: The named stream is not restored/retrieved.

User response: The object is restored without named stream, the object should be examined to verify that it is usable. Check the client error log for ANS5250E error message that should have been logged when this message was written, take the corrective action and try the operation again. If the problem persists, contact your system administrator or TSM administrator for further help.

ANS2699I *msg*

Explanation: This message is reserved for DB2 UDB.

System action: Reserved.

User response: This message is reserved for DB2 UDB.

ANS2700E The (-DATABASE) option must be specified with the BACKUP, RESTORE, QUERY and WITHDRAW DB2UDB commands.

Explanation: None.

System action: Processing stops.

User response: Refer to the user's guide of the corresponding platform for the correct syntax of the QUERY UDB command.

ANS2701E The attempted database operation was unsuccessful, check the TSM error log for any additional information.

Explanation: Processing stops.

System action: Reserved.

User response: Check the TSM error log for information regarding failure and take further action.

ANS2702E The DB2 UDB Utility plug-in module was not found or could not be loaded.

Explanation: Processing stops.

System action: None.

User response: Run "dsmc show plugins" at the TSM command-line client prompt to see the available plug-ins on the system and verify the path which is being used to load the plug-ins. If the plugin path is available and the DB2 UDB Utility plug-in, libPiDB2.a, is present, ensure that the LIBPATH variable is set to the DB2 UDB product's library path, for example, LIBPTH=/usr/opt/db2_08_01/lib.

ANS2703E The (-DBHOSTNAME) option must be specified when using the (-DBPARTITIONNAME) option for the RESTORE DB2UDB command.

Explanation: None.

System action: Processing stops.

ANS2704E • ANS2710W

User response: Refer to the user's guide of the corresponding platform for the correct syntax of the RESTORE DB2UDB command.

ANS2704E The (-BACKUPDESTINATION) option cannot be "BOTH" when issuing the RESTORE DB2UDB command.

Explanation: When using the RESTORE DB2UDB command, the (-BACKUPDESTINATION) option can be set to "TSM" or "LOCAL", but not "BOTH" unless using the (-PICK) option. When using the (-PICK) option the (-BACKUPDESTINATION) option can be "TSM", "LOCAL", or "BOTH".

System action: Processing stops.

User response: Refer to the user's guide of the corresponding platform for the correct syntax of the RESTORE DB2UDB command.

ANS2705S No DB2 UDB partitions are available for restore.

Explanation: No DB2 UDB partitions are available on the TSM server for restore. This is most likely due to a previous backup that was aborted before the backup completed. The DB2 UDB database and selected partitions cannot be restored.

System action: Processing stops.

User response: Issue the TSM client command QUERY DB2UDB command with the -DETAIL parameter using the same database, file, and date criteria to see if any database partitions are available for restore. Alternatively restore the DB2 UDB database from a different backup.

ANS2706E A DB2 UDB request failed. TSM function name : *function-name* TSM function : *function-desc* TSM return code : *TSM-rc* TSM reason code : *TSM-reason* DB2 return code : *DB2-rc* DB2 reason code : *DB2-reason SQL-msg*

Explanation: None.

System action: Processing stops.

User response: Contact the DB2 UDB administrator with the SQL information provided in this message.

ANS2707E A failure occurred while initializing the DB2 UDB application for db partition *part-num*. The TSM return code is *rc*.

Explanation: None.

System action: Processing stops.

User response: Check the TSM error log for failures prior to this message.

ANS2708E An unexpected error was encountered processing a DB2 UDB request. TSM function name : *function-name* TSM function : *function-desc* TSM return code : *TSM-rc* TSM file : *file-name (line-number)*

Explanation: None.

System action: Processing stops.

User response: Contact the TSM administrator with the information provided in this message.

ANS2709W A duplicate disk ID '*disk-id*' was found on the following DB2 database partitions: partition '*partition-prefix1db-num1*' hostname '*host1*' partition '*partition-prefix1db-num1*' hostname '*host2*' These DB2 partitions cannot be restored individually.

Explanation: Each DB2 database partition should have its own set of physical resources and logical volume groups. If the logical volume groups are shared by two database partitions, an artificial dependency between the two partitions is created at the logical volume group level. If one DB2 database partition is restored without restoring the other database partition, the latter database partition could have information out of synch.

System action: Processing continues. The database partition backup objects are marked so that they can not be restored individually, in other words outside the context of restoring the entire host or entire DB2 database.

User response: Contact the DB2 or storage administrator to determine if the DB2 database partitions can be segregated to their own volume groups.

ANS2710W A duplicate disk ID '*disk-id*' was found on the following DB2 database partitions: partition '*partition-prefix1db-num1*' hostname '*host1*' partition '*partition-prefix1db-num1*' hostname '*host2*' The DB2 partitions and DB2 hosts listed cannot be restored individually.

Explanation: Each DB2 database partition should have its own set of physical resources and logical volume groups. If the logical volume groups are shared by two database partitions, an artificial dependency between the two partitions is created at the logical volume group level. If one DB2 database partition is restored without restoring the other database partition, or if one DB2 database host is restored without restoring the other database host, the latter database partition or host could have information out of synch.

System action: Processing continues. The database partition and database host backup objects are marked so that they can not be restored individually, in other

words outside the context of restoring the entire DB2 database.

User response: Contact the DB2 or storage administrator to determine if the DB2 database partitions and hosts can be segregated to their own volume groups.

ANS2711W Unable to backup configuration files for DB2 database backup 'db'.

Explanation: The configuration files that are used by the TSM client for DB2 database backups could not be processed. Since these files are not critical to the database backup processing continues normally.

System action: Processing continues.

User response: Retry the operation. If the problem persists contact the TSM administrator.

ANS2712E A non-critical, unexpected error was encountered processing a DB2 UDB request. TSM function name : *function-name* TSM function : *function-desc* TSM return code : *TSM-rc* TSM file : *file-name (line-number)*

Explanation: None.

System action: Processing continues.

User response: Contact the TSM administrator with the information provided in this message.

ANS2713E An unexpected error was encountered processing a DB2 UDB request. TSM function name : *function-name* TSM function : *function-desc* TSM return code : *TSM-rc* TSM explanation : *TSM-msg* TSM file : *file-name (line-number)*

Explanation: None.

System action: Processing stops.

User response: Contact the TSM administrator with the information provided in this message.

ANS2714W The management class '*mc*' specified for the '*dest*' backup destination is invalid. The default management class will be used.

Explanation: None.

System action: Processing continues.

User response: Contact the TSM administrator to run the configuration utility for DB2 UDB and specify a valid management class.

ANS2715I The filespace '*filespace*' does not exist on the server.

Explanation: The file system may not yet have been created on the server or it might have been deleted.

System action: Processing continues.

User response: None.

ANS2716E A background copy process is still pending on local hardware. A restore operation cannot be initiated until the background copy process is completed.

Explanation: None.

System action: Processing stops.

User response: Wait until the background copy process completes and retry the restore operation.

ANS2717E The multi-node definition does not have permission to delete its own backup files from the server.

Explanation: All DB2 UDB commands require that the multi-node definition has permission to delete its own backup files from the server in order to properly reconcile the local backup repository with the server backup repository.

System action: Processing stops.

User response: Have the TSM administrator update the multi-node definition so that it has permission to delete its own backup files from the server. For example, on the TSM administrative command-line client: `dsmadm update node <multi-node name> backdelete=yes`

ANS2718E A previous incremental backup started on *datetime* is still in progress.

Explanation: A new incremental local backup can not be done until previous incremental backup completes.

System action: Processing stops.

User response: Wait until previous backup completes before starting another incremental local backup. Alternatively, use different copyType value to perform a local backup with full copy. TSM local backup policy only allows one incremental and one full background copy to be pending at any time, before local backup resources are reused for a new backup version. A new local backup would result in a backup with background copy in pending state.

ANS2719E A previous backup started on *'datetime'*, is using the resources needed for new backup is still pending.

Explanation: A new backup can not be done until previous backup completes.

System action: Processing stops.

User response: Wait until previous backup completes before starting another local backup. Alternatively, use different copyType value to perform a local backup. TSM local backup policy only allows one incremental and one full background copy to be pending at any time, before local backup resources are reused for a new backup version. A new local backup would result in a backup with background copy in pending state.

ANS2720E One or more background copies are still in progress.

Explanation: A new backup can not be done until all full background copies are completed.

System action: Processing stops.

User response: Wait until previous backups complete before starting another local backup. Alternatively, use different copyType value to perform a local backup. TSM local backup policy only allows one incremental and one full background copy to be pending at any time, before local backup resources are reused for a new backup version. A new local backup would result in a backup with background copy in pending state.

ANS2721I A previous local backup version backup date *'datetime'* copytype *'name'* has been deleted for this backup operation (object name=*'filesystem namepath-namefile-name'*, ID=*'object-id:object-id'*).

Explanation: The local resources needed for current backup operation would be made available by expiring a previous backup version referenced in the message as defined in the local backup policy. Refer to TSM documentation for additional information on local backup policy.

System action: None.

User response: None.

ANS2722E There is not enough space in the local repository to complete this backup.

Explanation: This space available in the local repository is not enough to perform snapshot for this backup operation. It could happen if there is more number of local versions kept by the management class than there is space allocated in the local repository at configuration time or application configuration has changed such that previously allocated space is not enough.

System action: None.

User response: Please validate TSM configuration by running the configuration wizard.

ANS2723I A local backup version backup date *'datetime'* is deleted because background copy operation has been cancelled (object name=*'filesystem namepath-namefile-name'*, ID = *'object-id:object-id'*).

Explanation: The specified backup instance of the named object has been deleted on the server and in local repository because the background copy operations for this backup version was cancelled. It is no longer available for restore.

System action: None.

User response: None.

ANS2724E The version of IBM Enterprise Storage Server is not supported.

Explanation: This product only supports IBM ESS microcode level 2.3 and 2.4.

System action: Process stops.

User response: Ensure that ESS microcode level 2.3 or 2.4 is installed.

ANS2725W The backup DB2 UDB preview command indicates there are not enough resources for a backup operation.

Explanation: None.

System action: check the TSM error log for additional information about the problem.

User response: Correct the problem and re-issue the BACKUP DB2UDB -PREVIEW command.

ANS2726E The putenv command failed for path = *v1*.

Explanation: There was not enough memory in the environment to successfully set the environment.

System action: Process stops.

User response: Close all unneeded applications and try the operation again. For UNIX systems that support resource limits, check to see if the memory resource limit is too low by entering the following command:

```
ulimit -a
```

Based on the resulting data, you can ask the UNIX system root user to increase resource limits so that it will override the current default. The UNIX system root user has the authority to increase resource limits.

ANS2727E ESS Lun ID *v1* is not valid.

Explanation: Length of ESS LUN id must be 8 characters.

System action: Process stops.

User response: Make sure the length of ESS Lun id is 8.

ANS2728E The ESS jar file *v1* cannot be found.

Explanation: The Enterprise Storage Sub-system Copy Services JAR file could not be located.

System action: Process stops.

User response: In order to complete Enterprise Storage Sub-system Copy Services functions the Copy Services command line functions must be available. Check the Copy Services command line is installed and your Copy Services option setting is pointing to the installation directory of the command line.

ANS2729E Operating system command '*command*' failed; rc=*rc*.

Explanation: None.

System action: Process stops.

User response: Check the return code from the operating system for more information about the failure. Issue the failing command manually to see if the same failure occurs.

ANS2730E The primary and secondary copy service servers are down.

Explanation: None.

System action: Process stops.

User response: Start at least one of the ESS copy service servers. If copy server is already running, check the value of java home specified during configuration to make sure it is a valid path name of the directory where JRE is installed on master backup node. Use configuration wizard to update java home value for the configuration.

ANS2731E Cannot open the ESS command output file *v1* for writing.

Explanation: Can't open this file for writing.

System action: Process stops.

User response: Make sure you have enough space on your system and write permission to the file.

ANS2732E The ESS LUN '*Serial number string*' are already in use.

Explanation: One or more LUNs specified in the message are in use by other flashcopy operation. Therefore this flashcopy operation can not continue.

System action: Process stops.

User response: Release ESS LUN in order to reuse them.

ANS2733I The backup DB2 UDB preview command indicates there are sufficient resources for a backup operation.

Explanation: None.

System action: None.

User response: None.

ANS2734E Withdraw command failed because a TSM backup of this database instance is in progress using the same snapshot resources.

Explanation: The snapshot established can not be withdrawn because a 'TSM' backup is in progress from the same local backup snapshot.

System action: Processing stops.

User response: You must wait until the TSM backup completes and retry the withdraw command. Alternatively, you may cancel the TSM backup and retry the withdraw command.

ANS2735E DB2 UDB is running on different operating system versions. database partition '*partition*': OS version '*os-1*' catalog partition: OS version '*os-2*'

Explanation: DB2 UDB must be running on the same operating system versions on all hosts.

System action: Processing stops.

User response: Upgrade the operating systems so that all DB2 UDB hosts are running the same version.

ANS2736E An unexpected response was received from a remote TSM file system agent. verb : *verb* remote host : *host* return code : *rc* reason code : *rs* msg. string : *msg-string*

Explanation: None.

System action: Processing stops.

User response: Contact the TSM administrator with the information provided in this message.

ANS2737E A DB2 UDB database server is not available. DB2 instance name: *instance*
DB2 database name: *db db* partition :
part

Explanation: None.

System action: Processing stops.

User response: Contact the DB2 database administrator to have the database server made available and retry the operation.

ANS2738E The DB2 UDB log retain value is not set to 'recovery'. DB2 instance name:
instance DB2 database name: *db db*
partition : *part*

Explanation: None.

System action: Processing stops.

User response: Contact the DB2 database administrator to have the log retain value set to 'recovery'.

ANS2739E The DB2 UDB user exit for archiving logs is not enabled. DB2 instance name:
instance DB2 database name: *db db*
partition : *part*

Explanation: None.

System action: Processing stops.

User response: Contact the DB2 database administrator to have the user exits for archiving logs enabled.

ANS2740E DB2 UDB is running different versions. database partition '*partition*': version '*os-1*' catalog partition: version '*os-2*'

Explanation: DB2 UDB must be running on the same version on all hosts.

System action: Processing stops.

User response: Upgrade the DB2 UDB version so that all DB2 UDB hosts are running the same version.

ANS2741I DB2 UDB configuration settings '*filename*' have either not been created using the Configuration Wizard or they are not readable. The TSM return code is *rc*.

Explanation: DB2 UDB configuration settings are required for the processing of DB2 UDB commands. They have either not been created using the Configuration Wizard or they do not have read permission.

System action: DB2 UDB operations will fail.

User response: Use the Configuration Wizard to create the DB2 UDB configuration settings.

ANS2742I Deleting local incremental backup version.

ANS2743E Unable to read configuration file information for configuration '*configname*'.

Explanation: One or more of the TSM DB2 UDB configuration files could not be read. Refer to the TSM error log for additional information.

System action: Processing stops.

User response: Review the additional messages in the TSM error log. Launch the TSM configuration wizard from the DB2 UDB production host which contains the catalog node to resolve the problem.

ANS2744I TESTFLAG DB2 enabled with the value of '*value*'.

Explanation: None.

System action: This message is informational.

User response: None.

ANS2745I Volume Group Configuration has been modified. List of logical volumes added to the Volume Group configuration of the database since the time of backup: '*value*'.

Explanation: Volume group configuration has been changed since the time of backup by the addition of new logical volumes.

System action: User will be prompted to select "Yes" to continue the restore operation, or to select "No" to stop the restore.

User response: User can select "Yes" to continue the restore operation, in which case the newly added logical volumes will be deleted. Otherwise, he can select "No" to stop the restore, backup the newly added logical volumes and then retry the restore. Thus he will be able to recover the newly added logical volumes after the restore.

ANS2746I Volume Group Configuration has been modified. List of physical volumes added to the Volume Group configuration of the database since the time of backup: '*value*'.

Explanation: Volume group configuration has been changed since the time of backup by the addition of new physical volumes.

System action: User will be prompted to select "Yes"

to continue the restore operation, or to select "No" to stop the restore.

User response: User can select "Yes" to continue the restore operation, in which case the newly added physical volumes will be removed from the volume group. User will have to add the physical volumes once the restore operation is complete. Otherwise, he can select "No" to stop the restore.

ANS2747I DB2 storage config has changed since previous backup. Retrying to find local resources for this backup.

Explanation: None.

System action: This message is informational.

User response: None.

ANS2748I Changing copyType to default "any" for no-copy snapshot for TSM backup operation.

Explanation: When backup destination is TSM, snapshot copy type defaults to no-copy operation. This is done to optimize performance of the snapshot operation required for TSM backup.

System action: This message is informational.

User response: Do not specify "copyType" option for TSM backups or use "any". This will allow TSM to pick the appropriate default value of copyType.

ANS2749E The backup host '*backup_host*' listed in the user FlashCopy target input file cannot be found in the list of configured backup hosts.

Explanation: The backup hosts specified in the user FlashCopy target input file must be configured as backup hosts.

System action: Processing stops.

User response: Check the configuration wizard to determine which backup host names have been configured. Ensure that the backup hosts specified in the user FlashCopy target input file appear in the configuration wizard. If the backup hosts do not appear in the configuration wizard, either add the backup host in the configuration wizard or specify a different backup host name in the user FlashCopy target input file.

ANS2750I *func* function invoked for DB2 configuration '*db_config*'. backup destination : *backupdest* copy type : *copytype* preview : *preview*

Explanation: None.

ANS2798E Unable to start a session from client node '*nodename*' multi-node '*multi-node*' to client at address '*ip-address:ip-port*'. The TSM return code is *rc*.

Explanation: None.

System action: This message is informational.

User response: None.

ANS2799E An error was encountered during a session with another client. check the TSM error log for any additional information

Explanation: This message is reserved for DB2 UDB.

System action: Reserved.

User response: This message is reserved for DB2 UDB.

ANS2800W No TSM processes were found.

Explanation: The QUERY PIDS command was unable to identify any known TSM processes running on the system. If the -FILTER option was used, no processes matching the filter specification were found.

System action: None.

User response: If you need to use dsmttrace to enable or disable tracing for a running client process, make

sure that the client is already running. If you used the `-FILTER` option, try the command again with a different filter specification. You can use `-FILTER=*` to display all processes running on the system.

ANS2801E The `dsmttrace` utility was unable to connect to the specified process.

Explanation: This message typically occurs when the specified process ID is not active.

System action: None.

User response: If you need to use `dsmttrace` to enable or disable tracing for a running client process, make sure that the client is already running. Use the `dsmttrace QUERY PIDS` command to identify running client processes, then try the command again.

ANS2802I Tracing has been disabled.

Explanation: None.

System action: None.

User response: None.

ANS2803E Tracing could not be disabled.

Explanation: A problem occurred while trying to disable tracing for the specified process. This message is usually accompanied by other, more specific messages immediately preceding or following this message.

System action: No changes are made to the trace status of the specified process.

User response: Review the messages that immediately precede or follow this message for further information about this error.

ANS2804W Tracing is already enabled. `-TRACEFILE`, `-TRACEMAX`, and `-TRACESEGSIZE` are ignored.

Explanation: When tracing is already enabled for a client process, only the `-TRACEFLAGS` option has any effect.

System action: The `-TRACEFLAGS` options are set on the client process. `-TRACEFILE`, `-TRACEMAX`, and `-TRACESEGSIZE` are ignored.

User response: If you need to modify the `-TRACEFILE`, `-TRACEMAX`, or `-TRACESEGSIZE` settings, you must first use the `dsmttrace DISABLE` command to disable tracing for the client process. Then run the `dsmttrace ENABLE` command to configure the desired trace settings. If it is not necessary to modify these settings, then this message may be ignored.

ANS2805I Tracing has been enabled.

Explanation: None.

System action: None.

User response: None.

ANS2806E Tracing could not be enabled.

Explanation: A problem occurred while trying to enable tracing for the specified process. This message is usually accompanied by other, more specific messages immediately preceding or following this message.

System action: No changes are made to the trace status of the specified process.

User response: Review the messages that immediately precede or follow this message for further information about this error.

ANS2807E An incorrect number of parameters was specified for the *command-name* command.

Explanation: The specified command was invoked with too few or too many parameters.

System action: The command is not processed.

User response: Try the command again with the correct number of parameters. Run `\dsmttrace help\` for additional information on `dsmttrace` command syntax.

ANS2820E An interrupt has occurred. The current operation will end and the client will shut down.

Explanation: This message is issued when the process is interrupted by a break signal such as `CTRL-BREAK` or `CTRL-C`.

System action: The TSM operation and process are ended immediately.

User response: Restart the operation if desired.

ANS2821E The function is not supported on the platform.

Explanation: The specified function isn't supported on the specified platform.

System action: Processing stops.

User response: Please retry the specified function on a supported platform.

ANS2830E An incorrect number of parameters was specified.

Explanation: The specified command was invoked with too few or too many parameters.

System action: Processing stops.

User response: Try the command again with the correct number of parameters.

ANS2831E Incremental by snapshot difference cannot be performed on " as it is not a NAS NFS or CIFS volume.

Explanation: The volume specified cannot be used for performing NAS SnapDiff Incremental operation as it does not correspond to the NFS mount point or the CIFS shared drive for a Network Appliance or N-Series NAS volume.

System action: Processing stops.

User response: Try the command again with a NAS NFS or CIFS volume.

ANS2832E Incremental by snapshot difference failed for . Please see error log for details.

Explanation: Failed to perform NAS NFS/CIFS Incremental by snapshot difference operation.

System action: Processing stops.

User response: Please take appropriate action based on the information in the error log. If the problem persists please contact your TSM administrator.

ANS2833E Incremental backup operation using snapshot difference failed as the base snapshot is the same as the latest snapshot for the NAS volume .

Explanation: User specified that the latest snapshot on the NAS Filer be used as the difference snapshot during an incremental backup operation using snapshot difference. However, the previously taken base snapshot and the latest snapshot on the filer are identical.

System action: Processing stops.

User response: Please retry the operation using the default value of "create" for the difference snapshot.

ANS2834E You have to be a root user in order to perform incremental backup using snapshot difference.

Explanation: Failed to perform NAS NFS/CIFS incremental backup operation using snapshot difference as the user was non root.

System action: Processing stops.

User response: Please retry the operation as root user.

ANS2835E Incremental backup using snapshot difference is not supported on this platform.

Explanation: NAS NFS/CIFS incremental backup operation using snapshot difference is only supported on AIX and Windows platforms.

System action: Processing stops.

User response: Please retry the incremental operation without the snapdiff option.

ANS2836E Incremental backup operation using snapshot difference is only available for full volumes. is a partial volume or qtree.

Explanation: Cannot perform NAS NFS/CIFS incremental backup operation using snapshot difference on the mounted or mapped volume due to one of the following reasons: 1) The volume is actually a qtree. 2) The volume is not a full volume, it is not mounted or mapped to the root of the volume.

System action: Processing stops.

User response: Retry the incremental backup operation by specifying an entire NAS NFS or CIFS volume.

ANS2837E Failed to perform incremental backup operation using snapshot difference as the user id and password for NAS Filer " have not been configured correctly.

Explanation: The user id and password for the specified NAS Filer have been either not configured or have been specified incorrectly.

System action: Processing stops.

User response: Use the 'set password -type=filer' command to define the user id and password for the specified NAS Filer and retry the incremental backup operation.

ANS2838E Failed with ONTAPI error " while connecting to NetApp Filer ". You may have provided incorrect hostname for this Filer.

Explanation: The hostname you have specified for the Filer you are trying to connect to is incorrect.

System action: Processing stops.

User response: Make sure that the hostname you have specified for the Filer is correct. If you are using the dsmd set password command to define the credentials for your Filer, specify the correct host name and retry the command.

ANS2839E Failed with ONTAPI error " while connecting to NetApp Filer " using user id ". You may have provided credentials incorrectly for this Filer.

Explanation: The user id and password have been configured incorrectly for the specified Filer.

System action: Processing stops.

User response: Make sure that the credentials you have specified for the Filer are the correct ones. Use the dsmc set password command to specify the correct credentials for your Filer and retry the command.

ANS2840E Incremental backup using snapshot difference is not supported for ONTAP Filer version '. Please upgrade your Filer " to ONTAP Filer version '7.3' or later in order to perform incremental backup operations using snapshot difference.

Explanation: The Filer specified is not at the ONTAP version that supports snapshot difference API.

System action: Processing stops.

User response: Upgrade the Filer specified to ONTAP version 7.3 or later and retry the operation.

ANS2841E Incremental by snapshot difference is not supported on AIX 64 bit TSM client. Please use AIX 32 bit TSM client instead.

Explanation: Network Appliance SnapDiff API is at present only supported on AIX 32 bit TSM client.

System action: Processing stops.

User response: Try the command again with a AIX 32 bit TSM client.

ANS2842E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS2843E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client

when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS3000I *communication-type* communications available on port *port-number* .

Explanation: The specified communications are available on the specified port number.

System action: None.

User response: None.

ANS3001E Error initializing HTTPS communications - Secure HTTP not available.

Explanation: An error occurred initializing HTTPS communications. Processing will continue, but secure HTTP communications will not be available.

System action: Processing continues, but secure HTTP communications will not be available.

User response: Check the console and error logs to determine why secure HTTP communications was unable to start, correct the problem, and restart the client.

ANS3002I Session started for user *userid* (*communication-method address*).

Explanation: A session was started for the specified user.

System action: None.

User response: None.

ANS3003I Session ended for user *userid*.

Explanation: A session ended for the specified user.

System action: None.

User response: None.

ANS3004E Session for user *userid* terminated - invalid password entered.

Explanation: A session was terminated for the specified user because an invalid password was entered.

System action: The session with the specified user is terminated.

User response: Re-start the remote client and enter the correct password for the specified user.

ANS3005I Session for user *userid* terminated - idle for *idle-minutes* minutes.

Explanation: A session was terminated for the specified user because there was no activity on the session for the specified number of minutes.

System action: The session with the specified user is terminated.

User response: Re-start the remote client to begin a new session.

ANS3006I Processing request for the TSM Web Client (*ip-address*).

Explanation: A request for the Web Client is being processed.

System action: None.

User response: None.

ANS3007I TSM *client-name* terminating - idle for *idle-minutes* minutes.

Explanation: The specified client is terminating because it has been idle for the specified time. It will be automatically started when it is needed.

System action: The client program stops.

User response: None.

ANS3008E Too many symbolic links were detected while resolving name '*file_name*'

Explanation: While trying to resolve the file name, too many symbolic links were found.

System action: File skipped.

User response: Ensure that you do not have a looping symbolic link for the file.

ANS3009E The Logical Volume Snapshot Agent plugin library was not found.

Explanation: The Logical Volume Snapshot Agent (LVSA) plugin library should have been installed when the client was installed, but it cannot be found.

System action: The selected operation is not performed.

User response: Try the operation again. If the problem recurs, re-install the TSM client software. If the problem persists, contact IBM technical support for further assistance.

ANS3010E The snapshot wizard operation failed.

Explanation: The snapshot wizard operation failed with a non-zero return code. Check the error log for additional information.

System action: The selected operation is not performed.

User response: Review the error log for any error messages, and then retry the operation after correcting the cause for failure.

ANS3011E Previous changes have not been committed. The machine must be rebooted before this operation can be performed

Explanation: A previous operation required the machine to be rebooted for the changes to take effect, but the machine has not been rebooted. The machine must be rebooted before this selected operation can be performed.

System action: The selected operation is not performed.

User response: Reboot the machine and then retry the operation.

ANS3012E The Logical Volume Snapshot Agent is not installed. Use the Setup Wizard to configure either Online Image or Open File support and choose the Logical Volume Snapshot Agent as the snapshot provider.

Explanation: The selected operation requires the Logical Volume Snapshot Agent, but it is not installed. Use the Setup Wizard to install the LVSA.

System action: The selected operation is not performed.

User response: Retry the operation after installing the Logical Volume Snapshot Agent.

ANS3013E The specified snapshot provider is not supported on this version of the operating system.

Explanation: The specified snapshot provider is not supported on the version of the operating system you are currently running. If another snapshot provider is available, select it and retry the operation.

System action: The selected operation is not performed.

User response: If another snapshot provider is available, select it and retry the operation.

ANS3401W The entity *name* is invalid.

Explanation: A volume with this name could not be found or is not suitable for server-free operations.

System action: Processing stopped.

User response: Specify the correct name.

ANS3402W *name*: A system call *func* failed with code *rc*.

Explanation: An error occurred while obtaining information from the operating system. The volume information could not be obtained.

System action: Processing can continue if the information being obtained is not critical for the operation or if it is expected behaviour in the context of the operation being performed.

User response: Check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS3403W Volume *name* cannot be opened for reading. System error code is *err*.

Explanation: The named volume could not be opened. Examples of why this can occur include, but are not limited to: the device is not a valid system device, the device is locked by another application, or the user does not have correct or permissions. The operating system error code shown in the message indicates the specific reason for the failure.

System action: Processing stops.

User response: Use your operating system's tools to obtain the description of the error code. Also check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS3404W An error occurred reading volume *name*.

Explanation: The named volume could not be read. Examples of why this can occur include, but are not limited to: the data being read is outside the valid range of the volume, or the device is locked by another application. The operating system error code shown in the message indicates the specific reason for the failure.

System action: If server-free data movement is used, processing continues using non-server-free data movement. Otherwise processing stops.

User response: Use your operating system's tools to obtain the description of the error code. Also check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS3405W File system *fs* on volume *name* is unknown.

Explanation: The file system on the volume is not supported for the operation being performed.

System action: If server-free data movement is used, processing continues using non-server-free data movement. Otherwise processing stops.

User response: Check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS3406W Physical mapping of the volume *name* is not supported.

Explanation: The logical volume layout is not currently supported for physical mapping.

System action:

User response: Refer to the documentation for information on what volume layouts are supported for physical mapping.

ANS3407W *name* is not local.

Explanation: The drive or filesystem is not local and is not suitable for image backup.

System action: Processing stopped.

User response: Specify a volume that is local.

ANS3408E System call 'umount' failed for volume '*volume*' with *errno*='*error*'. Please take suitable action based on *errno* and retry the operation.

Explanation: Umount failed for the specified volume

with the indicated errno. Please take suitable action based on errno and retry the operation.

System action: Processing stopped.

User response: Check errno for umount failure and take corrective action before retrying the operation.

ANS3409W An error occurred writing to volume *name*.

Explanation: TSM could not write to the named volume. Examples of why this can occur include, but are not limited to: the data being written is outside the valid range of the volume, or the device is locked by another application. The operating system error code shown in the message indicates the specific reason for the failure.

System action: Processing stops.

User response: Use your operating system's tools to obtain the description of the error code. Also check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS3410E The operating system refused a TSM request for memory allocation.

Explanation: TSM requires access to memory in order to store information as processing proceeds. In this case, more memory was requested than the operating system would allocate. Possible reasons include:

The system is low on memory.

The process in which the program runs has exceeded the maximum memory that it is allowed to allocate.

Some other error condition occurred that caused the program to think it is out of memory.

System action: TSM cannot complete the requested operation.

User response: Close all unneeded applications and try the operation again. If the operation still fails, try dividing the task into several smaller units. For example, if a file specification contains several high level directories, run the TSM task serially for each directory. If the TSM task is an incremental backup, use the option "-memoryefficientbackup=yes".

For UNIX systems that support resource limits, check to see `b` if the memory resource limit is too low by entering the following command: `ulimit -a`

Based on the resulting data, you can ask the UNIX system root user to increase resource limits so that it will override the current default. The UNIX system root user has the authority to increase resource limits.

ANS3411E Invalid arguments were passed to function *name*.

Explanation: The named function did not receive correct arguments to proceed. Please check error log for additional errors following this one for further explanation.

System action: Processing stops.

User response: Retry the operation. If problem persists contact your TSM administrator.

ANS3412I DiskMapper does not support *name* for entity *name*.

Explanation: The requested function is not implemented in DiskMapper at this time. Please report this error to your TSM administrator.

System action: Processing stops.

User response: Contact your TSM administrator.

ANS3413I DiskMapper object '*name*' type '*name*' is not valid.

Explanation: The named object is not valid on the originating client system.

System action: Processing stops.

User response: Retry the operation. If the problem persists, review the client error log for other messages that might be related to this problem. Contact your TSM administrator for additional help.

ANS3414I Disk '*name*' is not part of any container defined on the system.

Explanation: None.

System action: None. This is informational message.

User response: None.

ANS3415W At least one of the disk containing data for '*name*' has bad blocks.

Explanation: One or more physical disks containing data blocks of the above object has bad blocks and the requested operation can not continue.

System action: The system may find a work-around to complete the requested operation, please check console log and error log for additional information on corrective actions taken or suggested user action.

User response: Depending on the operation TSM may suggest an alternate way to complete the operation. Check your error log, sched log, or console log for additional information.

ANS3416E The volume '*name*' is currently in use by other process.

Explanation: The operation requires exclusive access to the volume. The most likely cause of this failure is that other process on the system has the volume opened.

System action: Processing stopped.

User response: Check applications running on your system to ensure that volume is not opened by any if the process and then retry the operation.

ANS3417W *name*: A system call *func* failed with code *rc* - *strerror*

Explanation: An error occurred while obtaining information from the operating system. The volume information could not be obtained.

System action: Processing can continue if the information being obtained is not critical for the operation or if it is expected behaviour in the context of the operation being performed.

User response: Check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS3418W Memory allocation request for image backup operation was refused by the operating system.

Explanation: TSM requires access to memory in order to store information about used blocks of a file system. In this case, more memory was requested than the operating system would allocate.

System action: If `imagegapsize` is too small for a dedicated filesystem and TSM faces out-of-memory condition then TSM automatically switches to full volume backup. Operation continues with `imagegapsize = 0`.

User response: Some recommendations to avoid the out-of-memory condition:

- check to see if the memory resource limit is too low by entering the following command: `ulimit -a`
- Then you can ask the UNIX system root user to increase memory limit.

- increase the value of the `imagegapsize` option. The bigger `imagegapsize` is used, the less memory is needed for image backup, but more unused data is sent to server. And vice versa: the smaller `imagegapsize` is used, the more memory is needed for backup, but less unused data is sent to server. The outcome also depends much on how data is spread on the volume.

ANS4000E Error processing '*filespace-name*': file space does not exist.

Explanation: The specified file space (domain) is incorrect or does not exist on the workstation. If the message results from the BACKUP IMAGE command with the `-MODE=INCREMENTAL` option, it means that you have entered the name of a raw logical volume. The `MODE=INCREMENTAL` option is not valid for raw logical volumes.

System action: Processing stops.

User response: Try the operation again, specifying an existing domain (drive letter or file system name). If the message resulted from improper use of the `MODE=INCREMENTAL` option, try the command again, omitting that option.

ANS4001E The file space for domain '*filespace-name*' could not be found on the TSM server.

Explanation: The specified file space was expected to be found on the server, but it no longer exists. It is possible that a command was issued to delete the file space from the server while the current operation was in progress.

System action: TSM processing stops.

User response: Try the operation again. If the problem recurs, check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS4002E Error processing '*filespace-name*': volume label does not exist

Explanation: The selected drive does not have a label.

System action: TSM is unable to do the requested operation without a drive or label entered.

User response: If the drive is a floppy drive, place a disk with a volume label in it and retry the operation. If the disk is a hard drive, ensure the drive has a volume label, and retry the operation.

ANS4003E Error processing '*filespace-name*': duplicate volume label encountered

Explanation: The selected drive has a duplicate volume label. Because TSM uses the volume label to keep track of backup/archive information, it cannot back up or archive files from a drive with a duplicate volume label.

System action: TSM cannot select the drive.

User response: If the volume needs to be available to the system, exit TSM, and assign a volume label to the drive. Restart TSM and retry the operation.

ANS4004E Error processing '*filesystem namepath-name file-name*': destination file or directory is write locked

Explanation: The file or directory being restored or retrieved from the server cannot be written to because the destination is write locked. Another operation might have the file open and will not allow it to be updated.

System action: File skipped.

User response: Either determine which operation has the file write locked, or restore the file to another name or location.

ANS4005E Error processing '*filesystem namepath-name file-name*': file not found

Explanation: The file being processed for backup, archive or migrate no longer exists on the client. Another process deletes the file before it can be backed up, archived or migrated by TSM.

System action: File skipped.

User response: None.

ANS4006E Error processing '*filesystem namepath-name file-name*': directory path not found

Explanation: The operating system returned a "path not found" status when IBM Tivoli Storage Manager attempted to access the directory. You either have specified a directory that does not exist, as shown in the message (*path-name*), or the directory being processed no longer exists on the client because another process deleted it before it could be backed up or archived by IBM Tivoli Storage Manager.

System action: The directory is skipped, processing continues

User response: Recheck all spelling and punctuation, particularly the placement of directory delimiters (for example, "\"). Correct the syntax if it is incorrect, then retry the operation. Ensure that the path is specified correctly and that the directory actually exists. Retry the command with the corrected path and directory name. If you cannot correct the directory name, use the Exclude option to exclude the directory from the operation.

ANS4007E Error processing '*filesystem namepath-name file-name*': access to the object is denied

Explanation: Access to the specified file or directory is denied. You tried to read from or write to a file and you do not have access permission for either the file or the directory.

System action: Processing stopped.

User response: Ensure that you specified the correct

file or directory name, correct the permissions, or specify a new location.

ANS4008E Error processing '*filesystem namepath-name file-name*': file is temporarily unavailable

Explanation: File is temporarily unavailable.

System action: File skipped.

User response: Check and see if file is locked by other process. If not, retry the command.

ANS4009E Error processing '*filesystem namepath-name file-name*': disk full condition

Explanation: No more files can be restored or retrieved because the destination disk is full.

System action: The client prompts you for action:

- Retry this object
- Skip this object
- Abort the action

User response: Select the appropriate action for this object. Create some free space on the destination disk before you retry the operation. Another option is to restore or retrieve the file to another disk.

ANS4010E Error processing '*filesystem namepath-name file-name*': stale NFS handle

Explanation: An NFS file system becomes stale.

System action: File system skipped.

User response: Check the NFS mounted filesystem.

ANS4011E Error processing '*filesystem namepath-name file-name*': no file handles available

Explanation: All file handles for your system are currently in use. No more are available.

System action: Processing stopped.

User response: Either free some file handles by ending other processes, or modify your system setup to allow for more files to be open at the same time.

ANS4012E '*filesystem namepath-name file-name*' already exists. It will be skipped.

Explanation: The client tried to restore or retrieve the specified file, but the file already existed in the target restore location and the user chose not to replace the existing file.

System action: The file is skipped, a message is logged in dsmerror.log, and restore or retrieve processing continues with the next object.

User response: The file was skipped because either REPLACE NO was in effect, causing all existing files

ANS4013E • ANS4021E

and directories to be skipped, or REPLACE PROMPT was in effect, and when prompted, the user chose to skip this file or all existing directories and files. No additional action is necessary if the decision to skip the file was deliberate. Otherwise the operation can be retried using either REPLACE ALL REPLACE PROMPT.

ANS4013E Error processing '*filesystem namepath-name file-name*': **invalid file handle**

Explanation: An internal system error occurred. A file operation failed because an invalid file handle was passed.

System action: Processing stopped.

User response: Report the problem to your system administrator, and then retry the operation.

ANS4014E Error processing '*filesystem namepath-name file-name*': **unknown system error (error-code) encountered. Program ending.**

Explanation: An unrecognized and unexpected *error-code* occurred within the client program. This is a programming failure and the client program ends.

System action: processing stops.

User response: Try the operation again. If the problem continues, report the error to your TSM administrator.

ANS4015E Error processing '*filesystem namepath-name file-name*': **unexpected TSM error (error-code) encountered**

Explanation: An unexpected error occurred. This might be a low-level system or communication error that TSM cannot handle or recover from.

System action: processing stops.

User response: Try the operation again. If the problem continues, look for other indications of system problems to determine where the problem exists. Most systems have error or event logs which may contain additional information. See your system administrator or TSM administrator for further help.

ANS4016E Error processing '*filesystem namepath-name file-name*': **file is being executed; write permission denied**

Explanation: The current file cannot be opened to write to because it is currently being run by another operation.

System action: File skipped.

User response: Stop the operation that is running the file and retry the operation, or restore or retrieve the file to a different name or directory.

ANS4017E Error processing '*filesystem namepath-name file-name*': **too many symbolic links were detected while resolving name**

Explanation: While trying to resolve the file name, too many symbolic links were found.

System action: File skipped.

User response: Ensure that you do not have a looping symbolic link for the file.

ANS4018E Error processing '*filesystem namepath-name file-name*': **file name too long**

Explanation: The file name specified is too long to be handled by TSM.

System action: File is skipped.

User response: See the appropriate *Using the Backup-Archive Client* book for the particular operating system, for the file names that are handled by TSM.

ANS4019E Error processing '*filesystem namepath-name file-name*': **file system is locked by system**

Explanation: File system cannot be accessed because it is locked by the system.

System action: TSM cannot complete the operation.

User response: See your system administrator.

ANS4020E The data format for object '*filesystem namepath-name file-name*' is **unknown. This usually occurs when the file was backed up or archived by a later version of TSM.**

Explanation: When a file is backed up or archived, TSM includes some additional information about the file. This message is issued if TSM cannot recognize the information during a restore or retrieve operation. The most likely cause is that the file was backed up or archived with a version of TSM that is newer than the version used to perform the restore or retrieve.

System action: The file is not restored or retrieved. Processing continues with the next file.

User response: Try the restore or retrieve operation again with a current version of the TSM client software. If the problem persists, contact IBM technical support for further assistance.

ANS4021E Error processing '*filesystem namepath-name file-name*': **file system not ready**

Explanation: The file system/drive was not ready for access.

System action: Processing stopped.

User response: Ensure that the drive is available to TSM, and then retry the operation.

ANS4022E Error processing '*filesystem namepath-name file-name*': file system is invalid.

Explanation: The drive was not available for access.

System action: processing stops.

User response: Ensure that the drive is operational, and then try the operation again. If this is unsuccessful, check the error log.

ANS4023E Error processing '*filesystem namepath-name file-name*': file input/output error

Explanation: An error was found while reading from or writing to the file.

System action: File skipped.

User response: Check your system to ensure that it is operating properly. For OS/2, run CHKDSK /F for the failing drive which can be found in dsmerror.log.

ANS4024E Error processing '*filesystem namepath-name file-name*': file write error

Explanation: An error was found while writing to the file.

System action: File skipped.

User response: Check your system to ensure that it is operating properly.

ANS4025E Error processing '*filesystem namepath-name file-name*': file exceeds user or system file limit

Explanation: A file being backed up/restored or archived/retrieved exceeds system set limits for this user. Shown below are the filesize limits corresponding to various platforms.

AIX 68,589,453,312 (64GB)

HP-UX 1,099,511,627,775 (1TB-1)

Linux 2,147,483,647 (2GB)

Mac pre-OS9
2,147,482,624 (2GB-1K)

Mac OS9
18,446,744,073,709,551,616 (16EB)

NetWare
4,294,963,200 (4GB -4KB)

NUMA-Q® DYNIX/ptx®
4.5 1,095,216,660,480 (1TB-4GB)

OS/390 4,294,967,295 (4GB)

SGI 18,446,744,073,709,551,615 (16EB-1)

Solaris 2.6 or higher
1,099,511,627,775 (1TB-1)

Tru64 UNIX
1,099,511,627,776 (1TB)

UnixWare
2,147,483,647 (2GB)

Windows ME (FAT32)
4,294,967,295 (4GB)

Windows NT/2000 (NTFS)
17,592,185,978,880 (16TB-64K)

System action: File skipped.

User response: Ensure that the system limits are set properly.

ANS4026W Error processing '*filesystem namepath-name file-name*': size of '*file-size*' exceeded the maximum file size limit on your system

Explanation: You tried to restore or retrieve a file that has exceeded the maximum file size limitation on your system.

System action: TSM cannot restore or retrieve the file.

User response: Restore or retrieve this file on a system that supports the file size. See your system administrator.

ANS4027S Error processing '*filesystem namepath-name file-name*': internal program message '*value*' encountered

Explanation: An unexpected catastrophic program failure occurred, indicated by *value*.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, see your system administrator or service representative.

ANS4028E Error processing '*filesystem namepath-name file-name*': cannot create file/directory entry

Explanation: The directory path for files being restored or retrieved cannot be created.

System action: File skipped.

User response: Ensure that you have the proper authorization to create the directory for file being restored or retrieved.

ANS4029E Error processing '*filesystem namepath-name file-name*': unable to build a directory path; a file exists with the same name as a directory

Explanation: TSM tried to create a directory path, but

is unable to because a file exists that has the same name as a directory.

System action: Processing stopped.

User response: Remove the file that has the same name as the directory. Refer to the last restore/retrieve operation and check all directories along the path.

ANS4030E Error processing 'filespace namepath-name file-name': disk space limit for this process reached

Explanation: The disk space allocated for the client owner is full.

System action: Processing stopped.

User response: Free up disk space and retry the restore or retrieve operation.

ANS4031E Error processing 'file_space_namepath_name file_name'. Name exceeds an internal TSM limit.

Explanation: During a file operation, TSM encountered a filename where at least one component of the file name (file_space_name, path_name or directory_name or file_name) exceeded an internal TSM maximum. The internal TSM limits should not be confused with the operating system limits for file_space_name, path_name or directory_name, file_name.

Shown below are the TSM internal file name limits for various platforms.

AIX HP-UX Solaris:	
File_space_name	1024
Path_name or directory_name	1023
File_name	256
Linux	
File_space_name	1024
Path_name or directory_name	768
File_name	256
Windows XP/2000/2003	
File_space_name	1024
Path_name or directory_name	248
File_name	248

System action: The file is skipped.

User response: Reduce the size of the filename so that it is smaller than the TSM internal limits.

ANS4032E Error processing 'filespace namepath-name file-name': file is not compressed.

Explanation: A file that was flagged as compressed was not compressed, and the system failed.

System action: Processing stopped.

User response: See your system administrator to report this problem. This error is a system failure.

ANS4033E Error processing 'filespace namepath-name file-name': file compressed on a different client machine that has more memory

Explanation: You are trying to restore a file that was backed up and compressed on another client workstation that had more memory than your client workstation. You cannot restore this file. When the file is restored, it is expanded and your workstation does not have enough memory.

System action: TSM canceled the operation.

User response: Obtain a machine with more memory and retry the operation.

ANS4034E Error processing 'filespace namepath-name file-name': unknown system error

Explanation: An unknown error occurred. This might be a low-level system or communication error that TSM cannot handle or recover from.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, determine where the problem exists. See your system administrator for further help.

ANS4035W File 'filespace namepath-namefile-name' currently unavailable on server.

Explanation: You tried to restore or retrieve a file that is currently not available from the TSM server.

System action: TSM Cannot restore or retrieve the file.

User response: Try to restore or retrieve after the file was made available on the server. See your system administrator.

ANS4036E An error occurred saving the registry key.

Explanation: The active registry key cannot be copied to the ADSM.SYS staging directory.

System action: Registry backup operation terminates.

User response: Check the space available on the Windows boot partition to ensure there enough space to contain a copy of the Windows registry. This might require several megabytes of free space. Also check the Windows permissions on the ADSM.SYS staging directory and ensure that the Windows user under which you are running TSM has full access to that directory and its contents.

ANS4037E Object 'file-namefile-namefile-name' changed during processing. Object skipped.

Explanation: The specified file-name was skipped during backup, archive, or migrate because it was

changing during the attempt to process it.

System action: TSM skipped the object.

User response: If you want the file backed up, archived, or migrated, retry the operation. If it fails, determine why the object is being changed. For more information on backing up, archiving, or migrating changing objects, see your system administrator.

ANS4038E An error occurred processing file system '*filesystem name*'.

Explanation: File system '*filesystem name*' is corrupted or contains one or more corrupted directories and cannot be processed.

System action: File system is skipped.

User response: Check your system to ensure that it is operating properly. For the Windows environment, run CHKDSK utility for the failing drive. More information about corrupted directories can be found in dsmerror.log.

ANS4039E Error processing '*filesystem namepath-name file-name*': **compressed file is corrupted and cannot be expanded.**

Explanation: The compressed file cannot be expanded correctly due to one of the following reasons:

There is a problem on the tape.

There is a communications problem.

The compressed file was corrupted on the TSM Server.

System action: File skipped.

User response: 1) The compressed file is corrupted because there is a problem on the tape. To know if this is the problem, please issue the following command on the TSM Server: `audit volume <volume_name> fix=no`. If there is any problem reported, you could move the data from that volume to a new one (see command MOVE DATA) and try again the restore. 2) There are communications problems between the TSM Server and the TSM Client and the results is that the file is corrupted during the transmission. If you use a gigabit ethernet adapter on the Server please upgrade the card driver (AIX platform) or add provided by SUN suggested changes to some system network options which have resolved this problem (SUN platform). 3) Please verify with your network support if during the restore there are no any problems between the TSM Client/Server that is originating the file corruption.

ANS4040E Error processing '*filesystem namepath-name file-name*': **file system *filesystem name* has exceeded its space management quota.**

Explanation: TSM detects that the file system has exceeded its quota. No more data can be migrated out of this file system.

System action: TSM will not migrate files from this file system.

User response: Recall some files, or ask the system administrator to increase the quota for this file system.

ANS4041W Error processing '*filesystem namepath-name file-name*': **Out of free space or inodes in file system to migrate or recall.**

Explanation: The file system is full. No more free space or free inodes are available to be allocated for the transaction file that is needed when a file is being migrated or recalled.

System action: TSM terminates the current operation for this file system.

User response: Remove some files in the file system, and then run reconciliation. Retry the operation.

ANS4042E Object name '*filesystem namepath-name file-name*' **contains one or more unrecognised characters and is not valid.**

Explanation: The filename, directory name, or volume label syntax is incorrect.

System action: File skipped.

User response: You need to check the disk for errors.

ANS4044E Error processing '*filesystem-namepath-name file-name*': **Case-sensitive name conflict exists.**

Explanation: While processing the specified file on the workstation, another file name was encountered with a similar name which only differed in case. The Backup-Archive client does not allow names which differ only in case on this platform and cannot guarantee the integrity of the file, so the file is skipped.

System action: This object will be skipped.

User response: Rename the file in question to a unique name.

ANS4045E Error processing '*filesystem-namepath-name file-name*': **Case-sensitive name conflict exists. The directory tree will be skipped.**

Explanation: While processing the specified file on the workstation, another object name was encountered with a similar name which only differed in case. The Backup-Archive client does not allow names which differ only in case on this platform and cannot guarantee the integrity of the file, so the directory and all of the objects contained within it are skipped.

System action: This object will be skipped.

User response: Rename the file in question to a unique name.

ANS4046E There is an error processing '*filesystem-namepath-name file-name*': the object is corrupted and unreadable.

Explanation: You tried to read from or write to a file or directory that is corrupted. The corrupted file is skipped. If this is a directory, the objects contained in the directory and its subdirectories are skipped.

System action: This object will be skipped.

User response: Check your system to ensure that the filesystem is not corrupted by using system tools like chkdsk (Windows) or fsck (UNIX).

ANS4047E There is a read error on '*file-namefile-namefile-name*'. The file is skipped.

Explanation: The specified *file-name* was skipped during backup archive because the file could not be read.

If you are performing a JFS2 snapshot based operation, it is possible that the snapshot was not large enough to contain all the changes made to the filesystem after the snapshot was created. This could cause the snapshot to become invalid thereby preventing TSM client from reading the snapshot.

System action: TSM skipped the file.

User response: Check your system to ensure that it is operating properly.

If you are performing a JFS2 snapshot based operation, please use the default snapshotcachesize of 100% and ensure that the volume group has sufficient disk space to allocate snapshots at least as large as the file system and retry the operation.

ANS4048W LAN-Free connection failed.

Explanation: ENABLELANFREE option is set to YES for this session, but an attempt to establish LAN-Free connection failed.

System action: The TSM client will failover to non LAN-Free support.

User response: Review the TSM error.log for LAN-Free failures. Check your LAN-Free setup and verify that all components are working properly.

ANS4049I Established LAN-Free connection.

Explanation: ENABLELANFREE option is set to YES for this session and the TSM client successfully established LAN-Free connection with server, after the LAN-Free connection was broken.

System action: The TSM client will communicate with the server via LAN-Free.

User response: Review the TSM error.log for

LAN-Free errors. Check your LAN-Free setup and verify that all components are working properly.

ANS4050W Scheduled action '*schedule-action*' did not execute for schedule '*schedule-name*' as the TSM administrator has been disabled from executing the scheduled action on the client.

Explanation: One or more of the client options - schedcmddisabled, srvprepostscheddisabled, srvprepostsnapdisabled, restretscheddisabled, have been set to YES on the client thereby preventing the TSM administrator from executing one of the following scheduled actions on the client - preschedule, postschedule, presnapshot, postsnapshot or scheduled operating system commands, restore or retrieve operations.

System action: The scheduled operation will not be executed and a message will be logged to TSM Server indicating this.

User response: None required.

ANS4051E Error processing '*filesystem namepath-name file-name*': The decryption option is in effect, but the user ID under which back-up or archive is being run is not authorized to decrypt this encrypted-file-system (EFS) file.

Explanation: The file being processed is encrypted by an encrypted file system (EFS). The option is specified to back-up or archive the file in decrypted form. The user ID under which the back-up or archive is being run does not have decryption rights for this file.

System action: The file is skipped.

User response: There are three possible ways to make decryption work:

- Re-encrypt the file under the encryption key of a group to which both the owner and the back-up/archive user IDs belong
- Add the back-up/archive user ID to the list of users authorized to decrypt this file
- Run the back-up or archive under the owner's user ID, if possible

ANS4052E Error processing '*filesystem namepath-name file-name*': Encrypted-file-system (EFS) file cannot be restored, because file system does not support restore from the raw-EFS back-up data, or possibly because the restore function does not have write access to the directory.

Explanation: The file being processed is encrypted by an encrypted file system (EFS). The file was backed up in the raw encrypted format. Either the target filesystem does not support the encrypted format, or

restore does not have write access to the directory to which the file is to be restored.

System action: The restore is terminated.

User response:

- The file cannot be restored to this location if the file system is not the AIX Enhanced Journaled File System (JFS2)
- If the file is JFS2 but EFS is not enabled, then EFS must be enabled before the file can be restored
- If the user ID under which restore is being run does not have write permission for the directory, the permissions must be changed or the restore must be run under a different user ID

ANS4053E Error processing 'filespace namepath-name file-name': The file cannot be restored because the file system or operating system does not support the Encrypted File System data

Explanation: The specified object was backed-up as raw Encrypted File System data. The client is trying to restore or retrieve the object to a destination that does not support the encrypted file system data. The location may not support the encrypted file system data for one of the following reasons:

- The operating system does not provide the support, or is a release that does not include the support
- Encrypted File System support has not been activated on the operating system
- The target file system is of a type that does not support the Encrypted File System data

System action: The object is not restored or retrieved. Processing continues with the next object.

User response: If this file must be restored, restore it to an AIX operating system environment supporting Encrypted File System data.

ANS4054E Error processing 'filespace namepath-name file-name': The encryption key is not loaded.

Explanation: The file being processed is encrypted by an encrypted file system (EFS). The option is specified to backup or archive the file in decrypted form. The encryption key, required to decrypt the file, is not loaded in the kernel keyring.

System action: The file is skipped.

User response: There are three situations in which this problem can occur:

- You just performed initial activation of EFS on the AIX system, and have not logged out. AIX does load the keys for the session running at the time of initial activation. Solution: Logout and login again.

- The login password has been changed recently, and you normally run with the EFS password the same as the login password. AIX does not automatically change the EFS password when you change the login password. Solution: Issue 'efskeymgr -n' to set the EFS password to be the same as the login password.
- You need to run the decrypting backup when the EFS password is different from the login password. Solution: Issue 'efskeymgr -o ksh' to launch a new shell with the keys loaded. AIX will prompt you for the EFS password as you launch the shell. Run the backup from the new shell.

ANS4055E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4060E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4061E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4062E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4063E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4064E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4065E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4066E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4067E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4068E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4069E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4070E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4071E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4072E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4073E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4074E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4075E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4076E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4077E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4078E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4079E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4080E This message is reserved for use by FS snapshot WI 1859 and 1864..

Explanation: Please explain the situation that can cause this error to occur.

System action: State what will happen in the BA client when this error occurs. Ex: Processing stopped, processing continues.

User response: What should user do to proceed after this error. List any corrective actions, Ex: retry, see your TSM administrator

ANS4081E Error processing '*filesystem-name*': file space type is not supported.

Explanation: The specified file space type is not currently supported by TSM on this platform.

System action: The unsupported file system is skipped. Processing continues with the next file system.

User response: Refer to the documentation for information on what file space types are supported.

ANS4082I Node password has been reset to the administrative id password.

Explanation: The client logged in using administrative id rather than node name. The node password has been reset to be in sync with the administrative password.

System action: Processing continues.

User response: None.

ANS4083I New node password has been generated.

Explanation: The client logged in using administrative id rather than node name. New random node password has been generated and recorded.

System action: Processing continues.

User response: None.

ANS4900W Schedule '*schedule-name*' has opened a new session with the server.

Explanation: A scheduled event ends because of a connection failure. The scheduled event had to be restarted outside its normal startup window to continue the operation.

System action: The scheduled event is completed using more than one session.

User response: None required. If this is a recurrent condition, you may want to check for network problems.

ANS4942E The file specification '*string*' is invalid.

Explanation: The operating system indicated that the file specification is invalid. One possible reason is that the file specification contains unrecognized characters. Another possible cause is incorrect use of quotation marks in the file specification.

System action: Processing stopped.

User response: Enter a correct file specification as described in the *Using the Backup-Archive Client* book for the particular operating system. Ensure that the file specification contains valid characters. Verify correct use of quotation marks for specifications that contain blank spaces. If multiple file specifications are used,

make sure that any use of quotation marks does not cause the file specifications to be treated as a single file specification.

ANS4973E An error occurred accessing NTFS security information for file '*filesystemnamepath-namefile-name*'

Explanation: An access denied error occurred while attempting to access NTFS security information.

System action: The object is skipped.

User response: See your system administrator or bypass the failing check by using SkipNTSecurity option.

ANS4974E Error processing '*filesystemnamepath-namefile-name*': a required NT privilege is not held.

Explanation: The user account running TSM does not possess a required NT user right/privilege for performing the current operation.

System action: The object is skipped.

User response: Your system administrator has the authority to grant the needed privilege.

ANS4987E Error processing '*filesystemnamepath-namefile-name*': the object is in use by another process

Explanation: The specified file is being used by another process. You tried to read from or write to a file that is currently being used by another process.

System action: File skipped.

User response: Ensure that the file is not locked by another process. If the file is not locked, retry the command.

ANS4988W File '*filesystemnamepath-namefile-name*' is currently unavailable on server and has been skipped.

Explanation: You tried to restore or retrieve a file that is currently not available from the TSM server. This is most likely a temporary condition.

System action: TSM cannot restore or retrieve the file.

User response: Try to restore or retrieve the file again after the file becomes available on the server. If the problem persists, see your TSM administrator for assistance.

ANS4989E Error processing '*filesystemnamepath-namefile-name*': the directory is in use by another process. All objects in the directory and any of its subdirectories are skipped.

Explanation: The specified directory is being used by another process. You tried to read from or write to a directory that is currently being used by another process. The objects contained in the directory and its subdirectories are not backed up.

System action: Processing stopped for that directory. If other files and directories were also specified in this backup, they are processed

User response: Ensure that you specified the correct directory name, correct the permissions, or specify a new location. If the directory name is correct, retry the backup when no process has exclusive use of the directory.

ANS4991I Application Type Application Message Id Application Message

Explanation: This is a message sent by the application you are currently running with TSM.

System action: TSM logs the application message.

User response: Refer to the documentation for the application that you are using.

ANS4992W Application Type Application Message Id Application Message

Explanation: This is a message sent by the application you are currently running with TSM.

System action: TSM logs the application message.

User response: Refer to the documentation for the application that you are using.

ANS4993E Application Type Application Message Id Application Message

Explanation: This is a message sent by the application you are currently running with TSM.

System action: TSM logs the application message.

User response: Refer to the documentation for the application that you are using.

ANS4994S Application Type Application Message Id Application Message

Explanation: This is a message sent by the application you are currently running with TSM.

System action: TSM logs the application message.

User response: Refer to the documentation for the application that you are using.

ANS4997E Error processing '*filespace namepath-name file-name*': file system quota reached condition - no space left.

Explanation: No more files can be restored or retrieved because the quota of the destination file system has been reached.

System action: The client prompts you for action:

- Retry this object
- Skip this object
- Abort the action

User response: Select the appropriate action for this object. Create some free space or increase the quota on the destination file system before you retry the operation. Another option is to restore or retrieve the file to another file system.

ANS4999I The following message was too long to log to the server: '*shortened message with message number*' @msgnl;

Explanation: The message text and inserts are too large to send to the server in the available internal buffer.

System action: The *message number* message is written to the local client error log, then shortened and sent to the server as a part of this message. The message is reduced in length by substituting '*...*' in the middle of the original message.

User response: The message referred to has been shortened, but describes the error that occurred. Refer to the documentation for that message for more information.

ANS5000W Unable to update password

Explanation: Intended new password cannot be registered.

System action: The server did not replace the old password with the new password.

User response: Update the password again. If unsuccessful, see your system administrator.

ANS5001E Open registration required. Root user must run TSM to register with server

Explanation: This client must be registered with this server.

System action: TSM ends.

User response: The root user must register the client with the server.

ANS5002E Open registration failed

Explanation: During the change password, update password, or open register dialog, the open registration failed.

System action: TSM did not register this system.

User response: Reenter the password, or see your system administrator to register this system.

ANS5003S The management class assigned to directories does not exist.

Explanation: The management class named on the DIRMC option does not exist in your assigned policy set on the server. The error log contains an entry showing the invalid management class name.

System action: processing stops.

User response: Remove the current DIRMC option from the client options file, then run DSMC QUERY MGMTCLASS -DETAIL to view information about available management classes. Make sure the management class you select has a backup copy group. If you have more than one TSM server, make sure you are connecting to the correct server. If you are unable to find a suitable management class, contact your TSM administrator for further assistance.

ANS5004S There is no backup copy group in the management class used for directories. See the error log.

Explanation: The DIRMC option names a management class that contains no backup copy group.

System action: processing stops.

User response: Remove the current DIRMC option from the client options file, then run DSMC QUERY MGMTCLASS -DETAIL to view information about available management classes. Make sure the management class you select has a backup copy group. If you have more than one TSM server, make sure you are connecting to the correct server. If you are unable to find a suitable management class, contact your TSM administrator for further assistance.

ANS5005E Table of contents information is not available for the selected images.

Explanation: An error occurred when the server tried to load a table of contents. Requested image or table of contents may have expired or been deleted on the server.

System action: Processing stopped.

User response: Start a new restore window to get current information.

ANS5006W The policy set does not contain any backup copy groups. TSM is unable to continue the backup.

Explanation: You tried to back up the files using a policy set that contained no backup management information.

System action: TSM did not back up the files.

User response: See your TSM administrator for assistance in associating your node with a policy set containing a management class that has a backup copy group. Then try the operation again.

ANS5007W The policy set does not contain any archive copy groups. TSM is unable to continue the archive.

Explanation: You tried to archive the files using a policy set that contains no archive management information.

System action: TSM did not archive the files.

User response: See your TSM administrator for assistance in associating your node with a policy set containing a management class that has an archive copy group. Then try the operation again.

ANS5008W Incorrect password entered

Explanation: You entered a password that was incorrect.

System action: TSM cannot connect to the server without the correct password.

User response: Reenter the password, or ask your system administrator for the current password.

ANS5009W New password entries are not the same

Explanation: During the change password, update password, or open registration dialog, the two entries for the new password were not the same.

System action: The password was not changed on the server.

User response: Backspace over both of the new passwords and reenter them, ensuring that they match.

ANS5011I Backup stopped by user

Explanation: You requested to stop the backup operation.

System action: Backup stopped.

User response: Continue with normal operations.

ANS5012E Server out of backup data storage space

Explanation: The server ran out of space in its backup data storage.

System action: TSM cannot complete the requested backup operation. Any files displayed on the lower half of the backup activity panel were successfully backed up.

User response: See your system administrator.

ANS5013E Not enough memory for backup operation

Explanation: TSM cannot allocate memory for the specified backup operation.

System action: TSM cannot complete the requested operation.

User response: Close all unneeded applications and retry the operation. Reducing the scope of queries and the amount of data returned might also help, or see your system administrator.

ANS5014I Backup completed

Explanation: The backup was completed.

System action: TSM backed up the files.

User response: Continue with normal operations.

ANS5015I Restore stopped by user

Explanation: You requested to stop the restore operation.

Attention: If you were restoring files with "overwrite" option specified, the file you restored last can be damaged (partially overwritten).

System action: Restore stopped.

User response: Continue with normal operations.

ANS5016E Not enough memory for restore operation

Explanation: TSM cannot allocate memory for the requested restore operation.

System action: TSM cannot complete the requested restore operation.

User response: Close all unneeded applications and retry the operation. Reducing the scope of queries and the amount of data returned can also help, or see your system administrator.

ANS5017I Restore completed

Explanation: A restore was completed.

System action: TSM restored the files.

User response: Continue with normal operations.

ANS5018E Not enough memory for archive operation

Explanation: TSM cannot allocate memory for the requested archive operation.

System action: TSM cannot complete the archive operation.

User response: Close all unneeded applications and retry the operation. Reducing the scope of queries and the amount of data returned might also help, or see your system administrator.

ANS5019I Archive stopped by user

Explanation: You requested to stop the archive operation.

System action: Archive stopped.

User response: Continue with normal operations.

ANS5020E The TSM server is out of archive data storage space.

Explanation: The server ran out of space in its archive data storage.

System action: TSM cannot complete the requested archive operation.

User response: Report the problem to your TSM system administrator, who can allocate more resources to archive storage.

ANS5021I Archive completed

Explanation: An archive was completed.

System action: TSM archived the files.

User response: Continue with normal operations.

ANS5022I Retrieve stopped by user

Explanation: You requested to stop the retrieve operation.

Attention: If you were retrieving files with "overwrite" option specified, the file you retrieved last can be damaged (partially overwritten).

System action: Retrieve stopped.

User response: Continue with normal operations.

ANS5023E Not enough memory for retrieve operation

Explanation: TSM cannot allocate memory for the specified retrieve operation.

System action: TSM cannot complete the requested retrieve operation.

User response: Close all unneeded applications and retry the operation. Reducing the scope of queries and the amount of data returned might also help, or see your system administrator.

ANS5024I Retrieve completed

Explanation: A retrieve was completed.

System action: TSM retrieved the files.

User response: Continue with normal operations.

ANS5025E The node name contains invalid characters.

Explanation: The specified node name has invalid characters.

System action: TSM canceled the current operation.

User response: Retry with another node name that has valid characters.

ANS5026W MatchAllChar and MatchOneChar options MUST precede Include/Exclude options

Explanation: The MatchAllChar and MatchOneChar options must precede any include-exclude options.

System action: The TSM client ends the current application.

User response: Move the MatchAllChar and MatchOneChar options before any include-exclude options.

ANS5062E Disk full

Explanation: Operation has stopped because the destination disk is full.

System action: Processing stopped.

User response: Free up disk space and retry the operation

ANS5083E Drive specification contains wildcard character.

Explanation: Drive name shouldn't contain wildcard character.

System action: Wildcarded objects skipped.

User response: Use valid drive specification.

ANS5091S The TSM server does not currently have space in the storage pool for this file. This might be a temporary condition.

Explanation: This message is typically issued when the storage pool in which the data is being placed does not have sufficient to store the data, but that the space will be available soon. For example, a storage pool migration may free up sufficient space to store the data.

System action: TSM ends the current operation.

User response: This is possibly a temporary condition. Try the operation again at a later time. If the error persists, contact your TSM administrator, who can examine server console and error logs to locate the cause of the problem.

ANS5092S Server out of data storage space.

Explanation: The server does not have any more space available to store the object.

System action: TSM ended the current operation.

User response: Report to your system administrator that a storage pool on the server is full.

ANS5093S SLM_LICENSE_EXCEEDED: The client licenses for TSM are exceeded. See your TSM administrator.

Explanation: Adding a new enrollment will exceed the product license count for this TSM server.

System action: The client enrollment or connection request ends.

User response: See your TSM administrator to delete unused enrollments or negotiate an increase in the number of allowed licenses for your server.

ANS5094E Session Rejected. Sufficient server memory is not available.

Explanation: The server does not have enough memory to allow your client to establish a connection with the server.

System action: Session was not started.

User response: Retry later or see your system administrator.

ANS5122E The specified filespace does not exist on the server. The filespace might have been deleted by another client or an administrator.

Explanation: The specified filespace does not exist on the server. Your administrator might have already deleted the filespace or another client using your client's node name might have deleted it.

System action: TSM ends the current operation.

User response: The filespace you selected does not exist any more. See your TSM administrator for help in finding how the filespace was deleted.

ANS5123S Open registration failed because the specified node name is already defined in the server.

Explanation: Open registration failed because a node is defined on the server with the same name.

System action: TSM canceled the current operation.

User response: Retry with another node name.

ANS5124S Open registration failed because there is no default domain.

Explanation: Open registration failed because a default policy domain does not exist in which to place your node. A default policy domain is required to fully support open node registration.

System action: TSM cancels the current operation.

User response: See your TSM administrator for assistance in registering your node.

ANS5125S Open registration failed because an invalid node name was specified.

Explanation: Open registration failed because the specified node name has invalid characters.

System action: TSM canceled the current operation.

User response: Retry with another node name that does not have any invalid characters.

ANS5126S Filespaces with duplicate names are not supported. Please unmount the duplicate filespace.

Explanation: The selected filespace has a duplicate volume label. Because TSM uses the volume label to keep track of backup/archive information, it cannot back up or archive files from a filespace with a duplicate volume label.

System action: TSM cannot select the volume.

User response: If the filespace needs to be available to the system, exit TSM, and assign a volume label to the filespace. Restart TSM and retry the operation. Otherwise, unmount the duplicate filespace.

ANS5127I TSM has detected an incomplete setup! The system options file 'dsm.sys' was not found, while the client options file 'file-path' exists! The wizard will guide you through the configuration process of the initial basic TSM client options files replacing your current option file. Would you like to continue?

Explanation: TSM has detected an incomplete setup. The system options file, `dsm.sys`, was not found. Additionally, a user options file, `dsm.opt`, was found. To complete the configuration the configuration wizard will create `dsm.sys` and replace `dsm.opt` with minimal settings.

System action: TSM may stop

User response: If the current version of `dsm.opt` is needed, rename the file and restart TSM. If the current version is not needed, select yes and allow TSM to replace the file.

ANS5128E The management class for this file did not have a backup copy group.

Explanation: For backup operations, a file may only be bound to a management class that has a backup copy group.

System action: TSM did not back up the file.

User response: See your TSM system administrator for assistance in finding a management class with the required copy group. The administrator may also define such a management class for you.

ANS5129E The management class for this file did not have an archive copy group specified.

Explanation: For archive operations, a file may only be bound to a management class that has an archive copy group.

System action: TSM did not archive the file.

User response: See your TSM system administrator for assistance in finding a management class with the required copy group. The administrator may also define such a management class for you.

ANS5130W No filespaces selected for deletion

Explanation: You requested a deletion operation without selecting a client domain.

System action: TSM cannot perform a deletion without a domain selected.

User response: Select the volumes you want to delete and retry the operation.

ANS5132I Filespace deletion canceled by user

Explanation: You requested to cancel the filespace deletion operation.

System action: The filespace deletion operation stopped.

User response: Continue with normal operations.

ANS5133I Filespace 'filespace' was deleted

Explanation: The specified *filespace* was successfully deleted.

System action: TSM deleted the filespace.

User response: Continue with normal operations.

ANS5134E Unable to delete the filespace because this node does not have permission to delete archived data and/or backed up data.

Explanation: You tried to delete a filespace that you do not have permission to access.

System action: TSM canceled the operation.

User response: Ensure that you specify the correct filespace, or specify a filespace you have access to.

ANS5135I Archive delete stopped by user

Explanation: You requested to stop the archive delete operation.

System action: Archive delete stopped.

User response: Continue with normal operations.

ANS5136E Not enough memory for archive delete operation

Explanation: TSM cannot allocate memory for the specified archive delete operation.

System action: TSM cannot continue with the requested archive delete operation.

User response: Close all unneeded applications and retry the operation. Reducing the scope of queries and the amount of data returned might also help, or see your system administrator.

ANS5138I Archive delete completed

Explanation: An archive delete was completed.

System action: TSM deleted the archived files.

User response: Continue with normal operations.

ANS5139E Your node does not have permission to delete archived files.

Explanation: Your node is registered at the server with the ARCHDELETE option set to 'no'. Therefore your node is not allowed by the server to delete archived files.

System action: TSM did not delete the archived files.

User response: See your TSM system administrator. The administrator has authority to delete archived files, and can also grant that authority to your node.

ANS5145W Server cannot restart the last restore request. Do you want to restore without restart?

Explanation: The restart restore token has expired. The server cannot restart the restore from where it last ended.

System action: Processing stopped; waiting for user intervention.

User response: Retry the request without restart or abort the request.

ANS5146W You cannot perform this operation while accessing data for another node. Do you wish to switch back to accessing your own node?

Explanation: The user cannot perform the selected operation while accessing another users data.

System action: Processing stopped; waiting for user intervention.

User response: Answer "Yes" to switch back to accessing the server as the original node.

ANS5148W The server needs to do a one-time conversion of your archive data before you can continue. This operation may take a long time, and cannot be canceled once it has started. Are you willing to wait for the conversion to complete?

Explanation: The server must do a conversion of the archive data before continuing. The conversion could take a long time, and cannot be canceled once it is started.

System action: Processing stopped; waiting for user intervention.

User response: Answer "Yes" to start the archive data conversion. If you answer "No", the current operation will be canceled.

ANS5150E An active restore for the same source file specification exists. Unable to continue with this request.

Explanation: Currently, there is an active restore for the same source file specification. Another restore of the same source file specification cannot be started.

System action: The requested restore fails.

User response: Start another restore with a different source file specification.

ANS5151S This node currently has a pending restartable restore session. The requested operation cannot complete until this session either completes or is canceled.

Explanation: This operation can not be completed because a restartable restore session is pending. The operation is not allowed because the restartable session and the current operation affect the same file space.

System action: TSM ended the current operation.

User response: Issue a query restart to see the conflict. Issue the cancel restore command to delete any unneeded restartable restore sessions.

ANS5152S Session Rejected: The server is not licensed for this platform type. See your TSM administrator.

Explanation: The server license governs the types of client that can connect to it. The license for this server does not include the requesting client type.

System action: The client enrollment or connection request ends.

User response: See your TSM administrator who must upgrade the server license to accept your client type.

ANS5153E Session Rejected: The server does not allow a signon as a Unicode enabled client.

Explanation: The client cannot establish a connection to the server because of a unicode enabling mismatch between server and client.

System action: Session was not started.

User response: See your system administrator immediately.

ANS5154I File is implicitly excluded

Explanation: You tried to back up or migrate a file that is implicitly excluded.

System action: TSM will not back up or migrate an implicitly excluded file.

User response: None.

ANS5155E Valid password not available. The TSM administrator for your system must run TSM and enter the password to store it locally.

Explanation: The file containing the stored password for the specified server *server-name* is unavailable.

System action: TSM ends.

User response: The TSM administrator for your

ANS5157E • ANS5179E

system must set and store a new password.

ANS5157E This action requires TSM administrative authority on this system.

Explanation: An activity has been attempted that must be performed by the TSM administrator (for example, open registration, filespace delete or password update).

System action: TSM canceled the operation.

User response: If the activity is required, the TSM administrator for this system must perform it.

ANS5158S Filespace deletion is in progress. Try again later.

Explanation: The filespace is in the process of being deleted.

System action: TSM cannot complete the requested operation.

User response: Try the operation again later. If the filespace was being deleted, it could take awhile for it to complete. If the problem continues, report the problem to your system administrator.

ANS5164E Backup or archive of drives with duplicate volume labels is not allowed.

Explanation: You tried to back up or archive a drive that has a duplicate volume label. Because TSM uses the volume label to keep track of backup or archive information, it cannot back up or archive files from a drive with a duplicate volume label.

System action: TSM cannot select the drive for backup or archive operations.

User response: If the volume needs to be available to the system, exit TSM and assign a unique volume label to the drive. Restart TSM and try the operation again.

ANS5165E Drive has no volume label. Backup/Archive not allowed.

Explanation: You tried to backup or archive a drive that has no volume label.

System action: TSM rejected the selected drive.

User response: If the drive is a floppy drive, place a disk with a volume label in it and retry the operation. If the disk is a hard drive, ensure the drive has a volume label, and retry the operation.

ANS5166E An error occurred while removing include-exclude statement 'statement'. Please try again.

Explanation: There was a problem with removing the include-exclude statement. Make sure that your include-exclude statement is valid.

System action: No include-exclude statement was removed. Waiting for user action.

User response: Retry your operation. If you see this error message again, contact your system administrator

ANS5169E The destination path must contain a drive letter

Explanation: The entered path must begin with a drive letter, colon, and root slash.

System action: TSM did not continue with the requested operation.

User response: Enter the destination path in the correct format.

ANS5173E An error occurred accessing NTFS security information.

Explanation: An error occurred while attempting to access NTFS security information.

System action: Object will not be processed.

User response: See your system administrator or bypass by using SkipNTSecurity option.

ANS5174E A required NT privilege is not held.

Explanation: The user account running TSM does not possess a required NT user right/privilege for performing the current operation.

System action: Object will not be processed.

User response: See your system administrator.

ANS5178E Restart of the RSM service failed. Restart the RSM service manually.

Explanation: RSM database files have been restored from the TSM server and imported. TSM has tried to restart the RSM service on the user's behalf but has run into a problem.

System action: Processing stopped.

User response: Restart the RSM service manually.

ANS5179E TSM is unable to continue. Exiting program.

Explanation: TSM ran into a problem and is unable to continue. This error message is usually preceded by other error messages. Resolve those errors and try again.

System action: Program terminates.

User response: Fix the problem(s) that preceded this message and then restart TSM.

ANS5181E Invalid selection; A specific backup set must be selected.

Explanation: A selection was made that might result in multiple backup sets being restored at the same time, but restoring multiple backup sets at the same time is not supported.

System action: The backup set restore was not performed.

User response: Select a specific backup set to be restored.

ANS5182E Multiple backup sets can not be restored at the same time.

Explanation: Multiple backup sets were selected to be restored, but restoring multiple backup sets at the same time is not supported.

System action: The backup set restore was not performed.

User response: Select a specific backup set to be restored.

ANS5183W Objects of different types cannot be restored at the same time.

Explanation: Restoring objects of different types is not allowed. For example, restoring Backup Sets and regular file objects at the same time is not possible.

System action: No processing takes place.

User response: Select objects of the same type to perform restore operation.

ANS5184E Illegal Operation On Following Object:
object

Explanation: Requested operation cannot be performed on this object.

System action: This object will be skipped.

User response: Try another operation on this object, or try the same operation on another object.

ANS5186E Server is downlevel, System Services and System State backup disabled for this session.

Explanation: The operation cannot be performed because server version is downlevel.

System action: System Service and System State backup is disabled for this session.

User response: Must use level 5.2.0 or higher server.

ANS5187E Unable to set SHAREAS extended attribute for file: 'pathname' Return code: 'returncode' 'sterror' Reason code: 'reasoncode'

Explanation: You must be the file owner or have superuser authority.

System action: File processed without setting attribute.

User response: The attribute must be set manually.

ANS5188E Unable to clear SHAREAS extended attribute for file: 'pathname' Return code: 'returncode' 'sterror' Reason code: 'reasoncode'

Explanation: You must be the file owner or have superuser authority.

System action: File processed without setting attribute.

User response: The attribute must be set manually.

ANS5189E Unable to set APF extended attribute for file: 'pathname' Return code: 'returncode' 'sterror' Reason code: 'reasoncode'

Explanation: You must have at least READ access to the BPX.FILEATTR.APF facility class profile and you must be the file owner or have superuser authority.

System action: File processed without setting attribute.

User response: The attribute must be set manually.

ANS5190E Unable to set PROGCTL extended attribute for file: 'pathname' Return code: 'returncode' 'sterror' Reason code: 'reasoncode'

Explanation: You must have at least READ access to the BPX.FILEATTR.PROGCTL facility class profile and you must be the file owner or have superuser authority.

System action: File processed without setting attribute.

User response: The attribute must be set manually.

ANS5191E NT Active Directory is not online. Offline backup is not supported.

Explanation: NT Active Directory is not online when performing a backup operation. Offline backup is not supported.

System action: Processing stopped.

User response: Reboot computer and turn on Active Directory, and try the operation again.

ANS5192E NT Active Directory is online. Online restore is not supported.

Explanation: NT Active Directory is online when performing a restore operation. Online restore is not supported.

System action: Processing stopped.

User response: Reboot computer and enter Active Directory repair mode, then try the operation again.

ANS5193E Certificate Services is not online. Offline backup is not supported.

Explanation: Certificate Services is not online when performing a backup operation. Offline backup is not supported.

System action: Processing stopped.

User response: Start Certificate Services and try the operation again.

ANS5194E Certificate Services is online. Online restore is not supported.

Explanation: Certificate Services is online when performing a restore operation. Online restore is not supported.

System action: Processing stopped.

User response: Stop Certificate Services and try the operation again.

ANS5196W Invalid encryption key password entered.

Explanation: The encryption key password supplied does not meet the TSM requirements. This key can be up to 63 bytes in length and include the following characters: A-Z Any letter, A through Z, uppercase or lowercase 0-9 Any number, 0 through 9 + Plus . Period _ Underscore - Hyphen & Ampersand

System action: TSM allows you to try again.

User response: Enter the correct encryption key password.

ANS5197E File Replication Service backup failed.

Explanation: IBM Tivoli Storage Manager encountered an error while backing up files under control of the Windows 2000 File Replication Service

System action: Processing stopped.

User response: Examine the Windows 2000 File Replication Service Event log to insure the File Replication Service is operating properly. Restart the service and retry the backup operation.

ANS5198E File Replication Service restore failed.

Explanation: IBM Tivoli Storage Manager encountered an error while restoring files under control of the Windows 2000 File Replication Service

System action: Processing stopped.

User response: Examine the Windows 2000 File Replication Service Event log to insure the File Replication Service is operating properly. Restart the service and retry the restore operation.

ANS5199I The machine must be rebooted for the changes to take effect. Would you like to reboot the machine now?

Explanation: The machine must be rebooted for the changes to take effect. The user can select to have the program reboot the machine now or can perform this action manually at a later time.

System action: TSM None.

User response: Select 'YES' to reboot the machine immediately.

ANS5200I *'service-name'* service needs to be restarted.

Explanation: The service must be restarted for the restored changes to take effect.

System action: Changes are not effected.

User response: Restart the service.

ANS5201E The specified function is not implemented

Explanation: The specified function is not implemented.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS5202I One or more system objects were excluded from processing by entries in the include-exclude list.

Explanation: One or more system objects were excluded from processing by entries in the include-exclude list and the client did not process them.

System action: Excluded objects skipped.

User response: None.

ANS5203E An error occurred saving one or more registry keys

Explanation: None.

System action: Processing stopped.

User response: Check the client error log for any other messages that might help identify the problem. Try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS5204W Only one backup set may be selected for restore.

Explanation: Restoring multiple backup sets is not allowed. Only one backup set may be selected and restored.

System action: No processing takes place.

User response: Only one backup set may be selected for restore.

ANS5205E An error saving one or more eventlogs

Explanation: An error occurred saving one or more eventlogs.

System action: Processing stopped.

User response: Correct the command and retry the operation.

ANS5206E An error occurred replacing one or more registry keys.

Explanation: The registry key or keys being replaced are exclusively held by another process. This can happen if the registry keys were previously restored but the system was not restarted.

System action: Processing stops.

User response: Restart the system and try the restore operation again.

ANS5207I The machine must be rebooted for the changes to take effect

Explanation: The machine must be started for the changes to take effect.

System action: TSM backed up the files.

User response: Reboot the machine

ANS5208E An invalid date or time was entered.

Explanation: An invalid date or time value was entered. Either the syntax of the value was not correct, or an actual value (for example, "45" for month) was invalid.

System action: Processing stops.

User response: Identify and correct the invalid date or time value. Refer to the user's guide of the corresponding platform for the correct date syntax.

ANS5209E System Volume backup failed.

Explanation: IBM Tivoli Storage Manager encountered an error while backing up files of the Windows 2000 System Volume

System action: Processing stopped.

User response: Examine the Windows 2000 File Replication Service Event log to insure the system volume was successfully initialized. Restart the service and retry the backup operation

ANS5210E System Volume restore failed.

Explanation: IBM Tivoli Storage Manager encountered an error while restoring files of the Windows 2000 System Volume

System action: Processing stopped.

User response: Examine the Windows 2000 File Replication Service Event log to insure the system volume was successfully initialized. Restart the service and retry the restore operation.

ANS5211E The cluster service is offline. The cluster service must be online to perform an authoritative cluster database restore operation.

Explanation: The cluster service must be online to restore the cluster database. Tivoli Storage Manager tried to start the service and failed. It is possible that an authoritative restore cannot be done.

System action: Processing stops.

User response: Start the cluster service and retry the operation.

ANS5212E An error occurred while trying to rename file space.

Explanation: This operation can not be completed because the file space could not be renamed.

System action: TSM ended the current operation.

User response: Contact system administrator for more information.

ANS5213W NAS objects cannot be selected with other objects for backup.

Explanation: Backing up NAS objects with other types of objects is not allowed.

System action: No processing takes place.

User response: Select NAS objects without other

objects to perform backup NAS operation.

ANS5214W NAS objects cannot be selected with other objects for restore.

Explanation: Restoring NAS objects with other types of objects is not allowed.

System action: No processing takes place.

User response: Select NAS objects without other objects to perform restore NAS operation.

ANS5215E *function-type* is not allowed on object '*object*'. Object is not sent to the server.

Explanation: The requested operation cannot be performed on this object. The object is not sent to the server.

System action: This object is skipped.

User response: Try another operation on this object, or try the same operation on another object.

ANS5216E Could not establish a TCP/IP connection with address '*tcp-addr:tcp-port*'. The TCP/IP error is '*tcp-err-string*' (**errno** = *errno*).

Explanation: A TCP/IP connection was attempted with a server or agent program and failed.

System action: Processing stops.

User response: Ensure that the target TCP/IP address and port number is correct. Check to ensure that a TSM server or agent has been started at the target TCP/IP address and is configured to listen at the port listed in the message.

ANS5217E Your node does not have permission to delete backed up files.

Explanation: You cannot delete backed up files unless your TSM administrator has authorized your node to do so.

System action: TSM does not delete the backed up files.

User response: Use the DSMC QUERY SESSION command to verify your authorization. Ask your TSM administrator to provide the necessary authorization.

ANS5219W Objects of different groups cannot be restored at the same time.

Explanation: Restoring objects of different groups is not allowed.

System action: No processing takes place.

User response: Select objects of the same group to perform restore operation.

ANS5222E The archive description exceeds 254 characters.

Explanation: TSM places a maximum length of 254 characters on the archive description.

System action: processing stops.

User response: Issue the command again and specify a shorter valid archive description.

ANS5250E An unexpected error was encountered.
TSM function name : *function-name* TSM function : *function-desc* TSM return code : *TSM-rc* TSM file : *file-name (line-number)*

Explanation: None.

System action: Processing stops.

User response: Contact the TSM administrator with the information provided in this message.

ANS5251E The snapshot provider is not available for this operation.

Explanation: TSM was not able to take a snapshot because the snapshot provider is not available.

System action: Processing stopped.

User response: If you are attempting an operation using the Microsoft Volume Shadow Copy service make sure that Volume Shadow Copy service is installed on the system and also ensure that the TSM snapshot plugin "pivss.dll" is present.

ANS5252E TSM attempted to execute a system command which failed. command : *command* rc : *rc*

Explanation: TSM needed to execute a system command in conjunction with a snapshot operation.

System action: Processing stops.

User response: See your system administrator.

ANS5253W The system could not create Volume Shadow Copy Services staging directory '*dir*'.

Explanation: The system was unable to create a user-specified location for the Volume Shadow Copy Services staging area. The default staging area on the system drive will be used instead.

System action: Processing continues.

User response: Check the option to specify the staging area for Volume Shadow Copy Services operations and specify a valid location.

ANS5254E The Volume Shadow Copy Services snapshot plugin 'pivss.dll' was not found.

Explanation: The system cannot find the VSS snapshot plugin 'pivss.dll' in any of the plugin locations.

System action: Processing stops.

User response: Check the TSM installation to ensure the plugin was installed correctly.

ANS5255E Unable to copy local file 'local-file' to remote location 'remote-file'.

Explanation: An attempt to transfer a file to a remote system failed..

System action: Processing stops.

User response: Ensure that the directory path on the remote system exists and that the TSM application has the proper authority to write to that location.

ANS5256E Unable to copy remote file 'remote-file' to local location 'local-file'.

Explanation: An attempt to transfer a file from a remote system failed..

System action: Processing stops.

User response: Ensure that the directory path on the remote system exists and that the TSM application has the proper authority to read from that location.

ANS5257E The volume 'volume' does not support the requested VSS operation.

Explanation: The volume does not support the requested VSS operation. Some reasons for this error include:

- For off-load backup requests, a hardware provider cannot be found
- For off-load backup requests, the provider does not support transportable media
- For local backup requests, the provider does not support persistent snapshots

System action: Processing stops.

User response: Retry the request using a supported backup destination.

ANS5258E Microsoft volume shadow copy snapshot initialization failed.

Explanation: IBM Tivoli Storage Manager encountered an error while initializing the Microsoft Volume Shadow Copy Service for backup or restore. The IBM Tivoli Storage Manager error log and Windows event log can contain additional information about this error.

System action: IBM Tivoli Storage Manager stops the operation.

User response: Try the operation again. If the error persists, review the IBM Tivoli Storage Manager error log and Windows event log for information related to this error. Use the Windows command VSSADMIN LIST WRITERS to determine the status of the Volume Shadow Copy service. Reboot the machine to clear the volume shadow copy error state. If the system is a Domain Controller and the Active Directory service is stopped, restart the Active Directory service.

ANS5259W Failed to update volume 'volume' for read-write access used for 'volume'.

Explanation: Changing the volume to read-write access requires exclusive access to the volume. If the volume is opened by any application, this operation will fail.

System action: Processing continues.

User response: Close all the applications using the volumes and use operating system's interface to mount failed volume for read-write access.

ANS5260W Restore object 'volume' has volume either source 'volume' or target 'volume' volume that has already been selected for restore from a different snapshot volumes. It will be restore using file-level copy.

Explanation: This error can occur when multiple objects are selected for snapshot restore and have data overlapping on the volumes and were selected for restore from different backup versions. Snapshot restore can only be performed from one local backup.

System action: The restore object identified in the message will be restored using the file-level copy after snapshot restore is completed.

User response: Retry the restore of identified object separately for faster restore using snapshot.

ANS5261W An attempt to create a snapshot has failed. Another attempt will be made to create the snapshot in *time* seconds.

Explanation: An attempt to create a snapshot has failed with a retryable error. The program will wait for a short time and retry the operation.

System action: None.

User response: None.

ANS5262I Snapshot restore will failover to file-level copy from snapshot volume.

Explanation: Snapshot restore is not possible due to an error at this time. TSM will automatically fail over to other restore method to complete the restore operation.

System action: Processing continues.

User response: Check TSM error log for more information from messages preceding this one to identify the error condition.

ANS5263E Snapshot module for '*snapshot provider*' failed with error '*error msg*'.

Explanation: The snapshot module for identified snapshot provider failed to perform the operation and returned with the identified error.

System action: Restore may automatically failover to alternate restore method 'file-level copy from snapshot volume' if possible. Otherwise, processing stops.

User response: Check TSM error log for more information from messages preceding this one. Use snapshot provider interface to identify and correct the problem.

ANS5264W No snapshot plugin found for '*snapshot provider*' snapshot provider.

Explanation: The snapshot restore requires a plugin for the specified snapshot provider type. The plugin must be installed under TSM directory.

System action: Restore will failover to alternate restore method of 'file-level copy from snapshot volume'.

User response: Contact your TSM administrator to obtain and install the required plugin module.

ANS5265W Snapshot restore has already been initialized using '*snapshot provider*' provider module. Another module for '*snapshot provider*' provider can not be loaded at the same time for restore of '*object name*'.

Explanation: This error occurs when restoring multiple LOCAL backup objects that were created using different snapshot providers. Snapshot restore can only be done using one snapshot interface.

System action: Restore will failover to file-level copy restore from snapshot volume.

User response: If snapshot restore is desired for the object identified in the message, restore it using a separate command.

ANS5266E File-level copy restore of '*object name*' failed.

Explanation: Data files could not be copied from the local backup to their destination, causing restore to fail.

System action: Processing continues to another object, if multiple objects are selected for restore.

User response: Check TSM error log for more information from messages preceding this one.

ANS5267E Disk Mapper module failed for the operation.

Explanation: An underlying TSM operation has failed to perform the operation due to system error.

System action: Processing stops.

User response: Check TSM error log for more information from messages preceding this one to identify cause of the failure. Contact TSM administrator for more information.

ANS5268W The Microsoft Volume Shadow Copy Services writer '*name*' current state (*state*) is not valid for the current operation.

Explanation: None.

System action: The system will retry the operation automatically after thirty seconds up to three times to allow the writer to return to the proper state. If after three attempts the writer is still in the incorrect state, the operation will fail.

User response: Determine if there are other Volume Shadow Copy Services operations that are occurring concurrently with the current operation.

ANS5269E The Microsoft Volume Shadow Copy Services writer '*name*' current state (*state*) is not valid for the current operation or cannot be determined. The last error reported is '*error*'.

Explanation: None.

System action: Processing stops.

User response: Check the Microsoft event log to determine if there are any problems with the writer.

ANS5270E A VSS restore request with timestamp '*time1*' conflicts with a restore request with timestamp '*time2*'

Explanation: A VSS restore request was issued which requires restoring multiple components which reside in VSS backup documents with different backup timestamps. For example, a user backs up Exchange storage group STG1 on Monday and Exchange storage

group STG2 on Tuesday. On Wednesday, the user tries to restore STG1 and STG2.

System action: Processing stops.

User response: Resubmit the restore request as separate requests for each component. For example, if you receive this error trying to restore Exchange storage groups STG1 and STG2, resubmit a restore request for storage group STG1 and a separate restore request for storage group STG2.

ANS5271E A Microsoft Volume Shadow Copy Services writer is in an invalid state before snapshot initialization.

Explanation: None.

System action: Processing stops.

User response: See the TSM error log for additional information.

ANS5272E A Microsoft Volume Shadow Copy Services writer is in an invalid state after snapshot initialization.

Explanation: None.

System action: Processing stops.

User response: See the TSM error log for additional information.

ANS5273E A Microsoft Volume Shadow Copy Services writer is in an invalid state after taking a snapshot.

Explanation: None.

System action: Processing stops.

User response: See the TSM error log for additional information.

ANS5274E A Microsoft Volume Shadow Copy Services writer is in an invalid state after backup completion.

Explanation: None.

System action: Processing stops.

User response: See the TSM error log for additional information.

ANS5275E A Microsoft Volume Shadow Copy Services writer is in an invalid state before restore initialization.

Explanation: None.

System action: Processing stops.

User response: See the TSM error log for additional information.

ANS5276E A Microsoft Volume Shadow Copy Services writer is in an invalid state after preparing for a restore operation.

Explanation: None.

System action: Processing stops.

User response: See the TSM error log for additional information.

ANS5277E A Microsoft Volume Shadow Copy Services writer is in an invalid state after restore termination.

Explanation: None.

System action: Processing stops.

User response: See the TSM error log for additional information.

ANS5278W Error processing '*filename*': file not found.

Explanation: The file being processed for backup, archive or migrate, no longer exists on the client. Another process deleted the file before it could be backed up, archived or migrated by TSM.

System action: File skipped.

User response: None.

ANS5279E Error processing '*filename*': file not found.

Explanation: The file being processed for backup, archive or migrate, no longer exists on the client. Another process deleted the file before it could be backed up, archived or migrated by TSM.

System action: Processing stops.

User response: None.

ANS5280E Object enumeration from a file set or file list failed.

Explanation: For more information, see the IBM Tivoli Storage Manager client error log.

System action: Processing stopped.

User response: See the user response based on other messages in the client error log.

ANS5281E A remote backup failure has occurred.
remote node name : *node* remote address : *address* multi-node name : *multi-node*
error message : *msg* return code : *rc*

Explanation: For more information, see the IBM Tivoli Storage Manager client error log on the remote system.

System action: Processing stopped.

ANS5282E • ANS5303I

User response: See the user response based on other messages in the client error log.

ANS5282E A remote backup failure has occurred.

Explanation: For more information, see the IBM Tivoli Storage Manager client error log.

System action: Processing stopped.

User response: See the user response based on other messages in the client error log.

ANS5283E The operation was unsuccessful.

Explanation: None.

System action: Processing stopped.

User response: See the user response based on other messages in the client error log.

ANS5284I TSM has detected an incomplete setup! The client options file 'dsm.opt' was not found, while the system options file 'file-path' exists! The wizard will guide you through the configuration process of the initial basic TSM client options files replacing your current option file. Would you like to continue?

Explanation: TSM has detected an incomplete setup. The user options file, dsm.opt, was not found. Additionally, a system options file, dsm.sys, was found. To complete the configuration the configuration wizard will create dsm.opt and replace dsm.sys with minimal settings.

System action: TSM may stop

User response: If the current version of dsm.sys is needed, rename the file and restart TSM. If the current version is not needed, select yes and allow TSM to replace the file.

ANS5298E A Flashcopy background copy is in progress between source volume: and target volume: .

Explanation: A Flashcopy background copy from a previous operation is not complete for the given source and target volumes.

System action: Command will fail.

User response: Please wait until the background copy is complete and retry the command.

ANS5299E A Flashcopy association exists between source volume: and a different target volume: .

Explanation: A Flashcopy association exists between

the source volume and a target other than the designated target volume.

System action: Restore command will fail.

User response: Please withdraw the Flashcopy association between the source volume and the target volume and retry the restore command.

ANS5300E Error detected in specified file list 'file list name' during processing of line line number: found an invalid external object ID / inode number / inode generation number / restore order number / alias entry: 'invalid entry'. Invalid line: 'invalid entry'

Explanation: File list parsing failed because of an invalid entry.

System action: The operation aborted because of an file list error.

User response: Correct the invalid file list entry and restart the operation.

ANS5301E Error detected in specified file list 'file list name' during processing of line line number: found an invalid ordering of external object IDs. ext. object ID of previous file: previous external object ID ext. object ID of current file: current external object ID

Explanation: File list parsing failed because of an invalid ordering of the external object IDs.

System action: The operation aborted because of an file list error.

User response: Correct the invalid file list ordering and restart the operation.

ANS5302E File list stream error to file 'file list name' detected during processing of line line number.

Explanation: File list processing failed because of an stream error.

System action: The operation aborted because of an file list stream error.

User response: Check the specified file list and restart the operation.

ANS5303I *** Processed count TSM server and count file list objects *******

Explanation: TSM has processed the specified number of TSM server and file list objects.

System action: Processing continues.

User response: None.

ANS5304E *program-name:* **synchronous file deletion failed for external object ID: *external object ID*.**

Explanation: The HSM client could not delete an object on the TSM Server.

System action: Current file is skipped for synchronous file deletion and the process will continue.

User response: Check the TSM server log file.

ANS5307E **The session is rejected. The server does not allow a signon of a client that is not space management-retention protection enabled.**

Explanation: The client cannot establish a connection to the server because the server is space management-retention protection enabled and the client is not.

System action: The session is not started.

User response: See your system administrator.

ANS5821E **Cannot connect to Active Directory.**

Explanation: TSM could not connect to Active Directory. The Active Directory is either not running or you don't have enough permissions to use it.

System action: Processing stops.

User response: Make sure your system is set up as Active Directory controller and the the service is active. Make sure you are logged in as a user with sufficient rights to administer the Active Directory.

ANS5822E **No Active Directory objects match query.**

Explanation: A search has been performed in Active Directory; however, no objects matching the query were found.

System action: Processing stops.

User response: Make sure you specify a valid distinguished name of Active Directory object or a container, or a valid wildcarded name, and that you have sufficient rights to administer the Active Directory.

ANS5823W **Object exists, skipping**

Explanation: The client tried to restore the specified object, but the object already existed in the target restore location and the user chose not to replace the existing object.

System action: The object is skipped, a message is logged in dsmerror.log, and restore processing continues with the next object.

User response: The object was skipped because either

REPLACE NO was in effect, causing all existing objects to be skipped, or REPLACE PROMPT was in effect, and when prompted, the user chose to skip this object. No additional action is necessary if the decision to skip the object was deliberate. Otherwise the operation can be retried using either REPLACE ALL (automatically replace existing object) or REPLACE PROMPT (prompt the user whether to replace the object).

ANS5824E **Invalid Active Directory search specification.**

Explanation: The search specification for Active Directory objects is not valid.

System action: Processing stops.

User response: Refer to the documentation for supported Active Directory syntax.

ANS5825E **Reanimate '*tombstone-name*' to '*distinguished-name*' failed. See the error log for more details.**

Explanation: An attempt to reanimate Active Directory tombstone object has been performed, but an error occurred.

System action: Processing continues to process all other tombstone objects per user's request.

User response: None.

ANS5826E **Restoring to a read-only domain controller is not allowed.**

Explanation: An attempt to restore to a read-only domain controller.

System action: Processing stops.

User response: None.

ANS5827E **A backup copy of the Active Directory database was not found.**

Explanation: An attempt to restore Active Directory objects from a database that was not backed up.

System action: Processing stops.

User response: Verify the Active Directory was backed up with system state.

ANS5828E **A system state file space was not found on the server. Active Directory functions can not be executed.**

Explanation: An attempt to restore the Active Directory database from a system state backup that does not exist.

System action: Processing stops.

User response: Verify that system state was backed up

or back up the system state then retry the command.

ANS5829E A system state backup on the specified date was not found. Active Directory functions can not be executed.

Explanation: An attempt to restore the Active Directory database from a system state backup that does not exist.

System action: Processing stops.

User response: Verify that system state was backed up on the specified date or specify a new date.

ANS5830E Restore of object 'tombstone-name' is not allowed by Active Directory.

Explanation: Object of certain types cannot be restored. This is a system limitation.

System action: Processing continues to process all other objects per user's request.

User response: None.

ANS5831E Restore for this object is not allowed by Active Directory.

Explanation: Object of certain types cannot be restored. This is a system limitation.

System action: Processing continues to process all other objects per user's request.

User response: None.

ANS5832E Reanimate tombstone object failed. See the error log for more details.

Explanation: An attempt to reanimate Active Directory tombstone object has been performed, but an error occurred.

System action: Processing continues to process all other tombstone objects per user's request.

User response: None.

ANS5833E This system is a Domain Controller but the Active Directory service is stopped. You can not perform the operation unless the Active Directory service is running.

Explanation: The Active Directory service must be running when you back up or restore the system state or operate on Active Directory objects. When the Active Directory service is running, it can be in online state or in offline state. When you query or restore Active Directory objects, or back up the system state, the Active Directory service must be online. When you restore the system state, the Active Directory service must be offline (but not stopped).

System action: Processing stopped.

User response: If you are querying or a restoring the Active Directory objects or backing up the system state, put the Active Directory service in online state by starting the Active Directory service. If you are restoring the system state, put the Active Directory service in offline state by rebooting to the Active Directory Restore Mode. When the Active Directory service is in the appropriate state, retry the operation.

ANS5834E Unexpected LDAP error occurred. See the error log for more details.

Explanation: An unexpected error occurred during Active Directory tombstone reanimation.

System action: Processing continues to process all other tombstone objects per user's request.

User response: Check the error log for detailed information on the LDAP error.

ANS5835E An LDAP operation returned *return code: 'error string'*

Explanation: An unexpected error occurred during Active Directory tombstone reanimation.

System action: Processing continues to process all other tombstone objects per user's request.

User response: None.

ANS5836W One or more attributes were not restored. See the error log.

Explanation: During processing of an Active Directory object, one or more object attributes could not be restored.

System action: Processing continues to process all other Active Directory objects per user's request.

User response: Check the error log for detailed information on which attribute(s) could not be restored.

ANS5837W *'object name': attribute 'attribute name' could not be restored.*

Explanation: The listed attribute could not be restored during processing on the Active Directory object.

System action: Processing continues to process all other Active Directory objects per user's request.

User response: None.

ANS5838E The utility dsamain.exe does not exist on the system. You cannot perform the operation unless Tivoli Storage Manager can launch this utility.

Explanation: You attempted to launch dsamain.exe, but the utility does not exist.

System action: Processing stopped.

User response: Verify that the dsamain.exe utility exists in the Windows system32 directory. When you can run the utility independently of Tivoli Storage Manager, retry the operation.

ANS5839E The Active Directory object specification is not allowed.

Explanation: You attempted to restore the domain object (starting with "DC="), or you attempted to restore all objects ("name=*"), or you did not specify anything.

System action: Processing stops.

User response: Modify the specification then retry the operation.

ANS5840E The current user is not a member of the Administrators group, and cannot perform this function.

Explanation: You must be a member of the Administrators group to perform the Active Directory objects function.

System action: Processing stops.

User response: Log on with a user who is a member of the Administrators group or add this user to the Administrators group then retry the operation.

ANS5841E Active Directory database could not be opened.

Explanation: An error occurred while opening the restored Active Directory database.

System action: Processing stopped.

User response: Make sure ntdsutil.exe utility is located in the same directory with TSM client executables. If it doesn't exist, reinstall the client. Verify that the dsamain.exe utility exists in the Windows system32 directory. When you can run the utility independently of Tivoli Storage Manager, retry the operation. If the problem persists, contact the support.

ANS5842E 'tombstone-name': object class violation.

Explanation: Object class error violation occurred during tombstone reanimation. This can happen if the Active Directory schema was modified and is no longer compatible with the tombstone.

System action: Processing continues to process all other objects per user's request.

User response: Recreate the failing object manually or restore it from a backup.

ANS5843E Object class violation.

Explanation: Object class error violation occurred during tombstone reanimation. This can happen if the Active Directory schema was modified and is no longer compatible with the tombstone.

System action: Processing continues to process all other objects per user's request.

User response: Recreate the failing object manually or restore it from a backup.

ANS5876I SET EVENT Activate Retention completed

Explanation: The Data Retention ACTIVATE transaction has completed.

System action: TSM activated the objects that were selected.

User response: Continue with normal operations.

ANS5877I SET EVENT Hold completed

Explanation: The Data Retention HOLD transaction has completed.

System action: TSM held the objects that were selected.

User response: Continue with normal operations.

ANS5878I SET EVENT Release completed

Explanation: The Data Retention RELEASE transaction has completed.

System action: TSM released the objects that were selected.

User response: Continue with normal operations.

ANS6001S NULL character found in the name of folder/file *filename* .

Explanation: A NULL character was found in the name of a file or folder. Some products place a NULL character in a file name so that the file is sorted alphabetically to the top of a list. TSM cannot backup/restore such files.

System action: TSM cannot complete the requested operation.

User response: Remove the NULL character by renaming the file or folder.

ANS7421W The archive attribute for file *filename* cannot be reset. The return code from Windows API function SetFileAttributes() is *rc*.

Explanation: The client was unable to reset the

ANS7500W • ANS7508W

archive attribute for the file indicated in the message. This error is due to an error received from the Windows API function SetFileAttributes().

System action: processing stops.

User response: Try the operation again. If the problem persists, it may be indicative of a problem with the file. Contact your system administrator or TSM administrator for further assistance.

ANS7500W Object 'object-name' could not be bound to management class 'mgmt-specified' specified in an 'option' statement.

Explanation: The management class specified in an include statement was not valid. If the include statement is an "INCLUDE.SIZE" statement the warning message will be issued if an appropriate copygroup is defined for the management class. For example, this warning will be issued on a backup operation if no backup copygroup is defined for the management class or this message will be issued on an archive operation if no archive copygroup is defined for the management class.

System action: The management class on the include statement is ignored and processing continues.

User response: Contact the TSM administrator to correct the appropriate copygroup definition on the TSM Server.

ANS7501E An invalid host address was received. Host address is too long.

Explanation: An invalid host parameter was found in the HTTP Request. The parameter is too long. The maximum length for a host address is 64 characters.

System action: TSM returns HTTP error code 400 Bad Request.

User response: Use a host machine with a valid/shorter host address.

ANS7502E An invalid filename was received. Filename is too long.

Explanation: A filename passed to the dsmcad service is too long and thus invalid.

System action: TSM returns HTTP error code 400 Bad Request.

User response: Retry connecting to dsmcad but use a valid/shorter filename.

ANS7503W Invalid drive entry

Explanation: An invalid entry is entered on the Drive field.

System action: TSM prompts you to enter a valid drive letter.

User response: Enter a valid drive letter or see your system administrator for the correct syntax.

ANS7504W Invalid directory entry

Explanation: An invalid entry is entered on the Directory field.

System action: TSM prompts you to enter a valid directory.

User response: Enter a valid directory or see your system administrator for the correct syntax.

ANS7505W Invalid filename entry

Explanation: An invalid entry is entered on the Filename field.

System action: TSM prompts you to enter a valid file name.

User response: Enter a valid file name or see your system administrator for the correct syntax.

ANS7506W Invalid label entry

Explanation: An invalid entry is entered on the Label field.

System action: TSM prompts you to enter a valid volume label.

User response: Enter a valid volume label or see your system administrator for correct syntax.

ANS7507W The node name entry is invalid. Please try again.

Explanation: An invalid entry is entered on the Node Name field.

System action: TSM prompts you to enter a valid node name.

User response: Enter a valid node name or see your system administrator for the correct syntax.

ANS7508W Duplicate authorization

Explanation: The authorization rule entered by the user is already defined. Duplicate rules are not allowed.

System action: TSM allows you to enter a different rule.

User response: Enter an authorization rule that has not been defined yet or cancel defining authorization rules.

ANS7509W Drive and/or volume label do not exist

Explanation: Either the drive or the volume label or both do not match the existing ones. Rules must be defined on existing drives and volumes.

System action: TSM prompts you to reenter drives and/or volumes or cancel defining authorization rules.

User response: Enter an existing drive and volume to define the desired rule.

ANS7510E A NAS node cannot be used for this operation.

Explanation: NAS nodes cannot be used for operations like Access Another Node.

System action: TSM prompts you to enter a valid node name.

User response: Enter a valid, non-NAS, TSM node name.

ANS7522E Environment variable *name* is not set.

Explanation: Required environment variable as indicated in the message is not set for TSM processes.

System action: Processing stops.

User response: Set the environment variable and restart TSM processes then retry the operation.

ANS7523E The hardware type *number* is not known to TSM.

Explanation: Due to a configuration or internal error, underlying snapshot hardware type is not set correctly.

System action: Processing stops.

User response: Check your configuration and error log file for more information. If unresolved, contact your TSM administrator for help.

ANS7526E The (-SNAPSHOTROOT) option is not valid in conjunction with any of the following options: -FILELIST, -GROUPNAME, and -VIRTUALFSNAME.

Explanation: The (-SNAPSHOTROOT) option is incompatible with the -FILELIST, -GROUPNAME, and -VIRTUALFSNAME options and cannot be used in conjunction with any one of those options.

System action: Processing stopped.

User response: See the appropriate *Using the Backup-Archive Client* book for your operating system for correct use of the named option.

ANS7527E The (-SNAPSHOTROOT) option is not valid in conjunction with *num-specs* file specifications.

Explanation: The (-SNAPSHOTROOT) option must be used in conjunction with only one file specification. It cannot be used with zero file specification (e.g., an INCREMENTAL command with no file specifications) or with more than one file specification.

System action: Processing stopped.

User response: See the appropriate *Using the Backup-Archive Client* book for your operating system for correct use of the named option.

ANS7528W The (-SNAPSHOTROOT) option is not valid in conjunction with the Logical Volume Snapshot Agent. Processing will continue without the use of the Logical Volume Snapshot Agent.

Explanation: The (-SNAPSHOTROOT) option is incompatible with the Logical Volume Snapshot Agent. The Logical Volume Snapshot Agent provides a comprehensive snapshot solution without having to use the (-SNAPSHOTROOT) option. It is strongly recommended that the snapshot capabilities provided by the Logical Volume Snapshot Agent be used instead of using the (-SNAPSHOTROOT) option. Processing continues without the use of the Logical Volume Snapshot Agent.

System action: Processing continues without the use of the Logical Volume Snapshot Agent.

User response: See the appropriate *Using the Backup-Archive Client* book for your operating system for correct use of the named option.

ANS7529E The specified SNAPSHOTROOT '*obj-name*' is not valid for the BACKUP IMAGE command.

Explanation: When you use the (-SNAPSHOTROOT) option with the BACKUP IMAGE command, SNAPSHOTROOT must specify the device name of the logical volume containing the snapshot for the backup. An example is /dev/fslv01 (on Unix) or \\?\GLOBALROOT\Device\HarddiskVolumeShadowCopy1 (on Windows).

With BACKUP IMAGE, SNAPSHOTROOT cannot be used unless SNAPSHOTPROVIDERIMAGE has one of the following values in effect:

- VSS
- JFS2

System action: Processing is stopped.

User response: For the correct use of the (-SNAPSHOTROOT) option, see the appropriate *Backup-Archive Client Installation and User's Guide* book for your operating system.

ANS7530E The `snapshot_volume_name` cannot end with a directory delimiter.

Explanation: The `snapshot_volume_name` cannot end with a directory delimiter. This name should specify the root of a logical volume, e.g., `/snapshot, x;`, `\\machine\x$, SNAP_VOL;`, etc.

System action: Processing stopped.

User response: See the appropriate *Using the Backup-Archive Client* book for your operating system for correct use of the named option.

ANS7531E The `(-SNAPSHOTROOT)` option is invalid when processing the NetWare NDS or Server Specific Information.

Explanation: The `(-SNAPSHOTROOT)` option is only intended with NetWare file server volumes and is not compatible with processing the NDS or Server Specific Information on NetWare.

System action: Processing stopped.

User response: See the appropriate *Using the Backup-Archive Client* book for your operating system for correct use of the named option.

ANS7532E The logical file system specified with the `(-SNAPSHOTROOT)` option cannot be a remote NetWare file system.

Explanation: The `(-SNAPSHOTROOT)` option is only intended with local NetWare file server volumes and is not compatible with remote NetWare volumes.

System action: Processing stopped.

User response: See the appropriate *Using the Backup-Archive Client* book for your operating system for correct use of the named option.

ANS7533E The specified file system '*obj-name*' does not exist or is not local.

Explanation: When you use the `(-SNAPSHOTROOT)` option, the target and source file systems must be valid, local file systems. The file systems cannot be non-local, such as a remote NetWare drive, a remote Windows drive, or an NFS mount. The `(-SNAPSHOTROOT)` option is valid for local operations only.

System action: Processing is stopped.

User response: For the correct use of the `(-SNAPSHOTROOT)` option, see the appropriate *Backup-Archive Client Installation and User's Guide* book for your operating system.

ANS7534W Initialization functions cannot open `/dev/tty` special file. `errno = errno-value`,

Explanation: Special file `/dev/tty`, required by command line internal editor could not be opened during initialization. The system set the error code `errno-value`.

System action: Processing continues as if EDITOR option was set to NO

User response: Check your terminal settings.

ANS7535W Command line internal editor can not be initialized.

Explanation: EDITOR option is set to YES in the options file, but command line internal editor can not be started.

System action: Processing continues as if EDITOR option was set to NO

User response: Check previous messages to determine the reason why the internal editor could not be started.

ANS7543E Error: Scout is not available for object query. Please restart the scout daemon.

Explanation: The reconcile process needs the scout daemon to do a query for all migrated files. If the scout daemon is not running it is not possible to run the reconcile tool in the orphan check mode.

System action: Processing stop.

User response: Ensure that the scout daemon is running. If the scout daemon is not running, restart is and retry the command.

ANS7551E The source path cannot contain a drive letter

Explanation: The entered path cannot contain a drive letter.

System action: TSM did not continue with the requested operation.

User response: Enter the source path in the correct format.

ANS7555E The destination path must contain a drive letter

Explanation: The entered path must begin with a drive letter, colon, and root slash.

System action: TSM did not continue with the requested operation.

User response: Enter the destination path in the correct format.

ANS7556E An invalid drive letter was entered

Explanation: You entered an invalid drive letter.

System action: TSM prompts you for the correct drive ID.

User response: Reenter the drive ID in the correct format.

ANS7560E Drive *drive-name* has no volume label. Backup/Archive not allowed.

Explanation: The specified *drive-name* selected cannot be backed up.

System action: TSM rejected the selected drive.

User response: If the drive is a floppy drive, place a disk with a volume label in it and retry the operation. If the disk is a hard drive, ensure the drive has a volume label, and retry the operation.

ANS7561E Drive *drive-name* is unavailable

Explanation: In an attempt to process a file, the specified *drive-name* was found unavailable.

System action: TSM did not process the file.

User response: Determine why the drive was not available, make it ready, and retry the operation.

ANS7564E Backup or archive of drives with duplicate volume labels is not allowed.

Explanation: You tried to back up or archive a drive that has a duplicate volume label. Because TSM uses the volume label to keep track of backup or archive information, it cannot back up or archive files from a drive with a duplicate volume label.

System action: TSM cannot select the drive for backup or archive operations.

User response: If the volume needs to be available to the system, exit TSM and assign a unique volume label to the drive. Restart TSM and try the operation again.

ANS7642E An error occurred creating the registry directory structure.

Explanation: An error occurred while creating the directory structure to save or replace a registry key.

System action: Registry function fails.

User response: Ensure that the user account that is running the backup of the registry has the proper authority. If the user account has the proper authority, you might need to restart the machine. There might be operations that are pending which have a file or files in the registry directory structure locked.

ANS7650E The user does not have sufficient privileges to execute IBM Tivoli Storage Manager.

Explanation: The user account used to execute IBM Tivoli Storage Manager must have the "Back up files and directories" and the "Restore files and directories" security settings assigned.

System action: Processing stops.

User response: Assign the "Back up files and directories" and the "Restore files and directories" security settings to the account using the Windows Local Security Settings tool or use a different user-id to execute IBM Tivoli Storage Manager.

ANS7660E An error occurred replacing one or more registry keys.

Explanation: The registry key or keys being replaced are exclusively held by another process. The registry keys were previously restored but the system was not restarted.

System action: processing stops.

User response: Restart the system and try the restore operation again.

ANS7701E The specified directory cannot be created.

Explanation: The directory contains invalid characters, or you are not authorized to create the directory.

System action: The directory selection dialog remains open so that you can specify another directory name.

User response: Specify another directory name. Ensure that the directory contains valid characters and that you have proper authorization to create the directory.

ANS7709E Restore operation failed. Not all files were restored.

Explanation: Restore operation failed due to an error.

System action: Operation completed.

User response: Check the error log for more details.

ANS8000I Server command: '*command*'

Explanation: The specified command is being sent to the server. This message is displayed when the command is generated from a macro or when the client is running in batch mode.

System action: The command is sent to the server for processing.

User response: None.

ANS8001I • ANS8015E

ANS8001I **Return code** *return code value*.

Explanation: The error code shown has been returned from the preceding server command. This message is preceded by a server message explaining the reason for the error code.

System action: None.

User response: None.

ANS8002I **Highest return code was** *return code value*.

Explanation: At exit from the client, the highest return code encountered during the session is displayed.

System action: This value is used as the program exit code.

User response: None.

ANS8003I **Process number** *process ID* **started.**

Explanation: As a result of the preceding server command, the process whose ID is shown starts to execute the command. The process can be monitored using the QUERY PROCESS command.

System action: None.

User response: None.

ANS8008W **Redirection inside macro whose output is redirected is ignored.**

Explanation: An output redirection symbol has been encountered inside a macro. However, the output of the macro itself (or a higher level macro) is already being redirected.

System action: The redirection request is ignored.

User response: None.

ANS8009E **Exiting due to command or option errors.**

Explanation: Because of errors in command line or option file parameters displayed earlier, the administrative client session is ending.

System action: The client exits.

User response: Fix the option file parameter in error and restart the client, or restart the client with proper command line parameters.

ANS8010E **An attempt to backup or archive a file has exceed the maximum number of retries.**

Explanation: After five unsuccessful attempts to backup or archive a file, the client will no longer attempt to send the file to the server.

System action: File skipped.

User response: Check the console or schedule log for additional information. Retry the operation at a later time.

ANS8012E **Option processing storage exhausted.**

Explanation: During processing of the client options file, the client runs out of memory.

System action: The client session is ended.

User response: Make more memory available and restart the administrative client.

ANS8013I **Invalid encryption key password**

Explanation: The key you entered does not match the key that was used to encrypt the file during backup. The file can not be restored unless the matching key is entered.

System action: User is prompted for encryption key password.

User response: Enter the correct encryption key password.

ANS8014E **Insufficient information to connect to host.**

Explanation: The client options file or command line, or both, do not contain enough communications information to successfully connect to the server system. For example, with TCP/IP both the TCP Port number and TCP Server address are required to make a connection.

System action: The administrative client session is ended.

User response: Determine what information is needed to establish a connection for your communications method and then specify all that information in your client options file or on the administrative client command line.

ANS8015E **File '*file spec*', error code *error code* from options processing.**

Explanation: An unknown error code is returned from the routine that processes the client options file.

System action: The administrative client session is ended.

User response: Attempt to determine the error and correct it. If the problem persists, contact your service representative.

ANS8016E **Command line parameter** *parameter number: 'parameter' is too long.*

Explanation: The specified command line parameter exceeds the maximum length for a command line parameter.

System action: The administrative client session is ended.

User response: Reissue the command with a shorter parameter.

ANS8017E **Command line parameter** *parameter number: 'parameter' is not valid.*

Explanation: The command line parameter shown is not a valid administrative client parameter.

System action: The administrative client session is ended.

User response: Reissue the command with valid parameters.

ANS8018E **Administrative command not valid in Console mode.**

Explanation: The Console Mode option has been specified but the client encounters what appears to be a server command on the command line.

System action: The administrative client session is ended.

User response: Reissue the command with no server command.

ANS8019E **Id and password must be supplied in Batch mode.**

Explanation: A server command has been encountered on the command line, but no administrator ID or password, or both, are specified.

System action: The administrative client session is ended.

User response: Reissue the command and include the -ID and -PASSWORD parameters on the command line.

ANS8020E **Unable to open file** *'file spec'* **for output.**

Explanation: The file name specified in the -OUTFILE option cannot be opened.

System action: The -OUTFILE parameter is ignored.

User response: Allow processing to continue or exit the session and correct the file name.

ANS8021E **Exiting Batch mode session due to output file error.**

Explanation: The file specified in the -OUTFILE parameter cannot be opened for a session running in Batch mode.

System action: The administrative client session is ended.

User response: Reissue the command with a valid output file name or make space available for the output file.

ANS8022E **Output will be written only to stdout.**

Explanation: The file specified in the -OUTFILE parameter cannot be opened, so output is written only to the standard output stream.

System action: Output that would have been written to the output file is written to the standard output stream.

User response: Allow processing to continue or exit the session and correct the file name.

ANS8023E **Unable to establish session with server.**

Explanation: The administrative client cannot start a session with the requested server. This message is preceded by another message that explains the reason for the error.

System action: The administrative client session is ended.

User response: Attempt to correct the error. If the problem persists, contact your service representative.

ANS8024E **End of macro after continued command line.**

Explanation: A macro containing a continuation line has been executed, but no more lines are found in the macro file.

System action: The continued command is ignored, and an error return code is set for the macro.

User response: Correct the macro in error.

ANS8025E **I/O Error reading command input.**

Explanation: The client is unable to read an input command from the terminal.

System action: The administrative client session is ended.

User response: Correct the problem on the terminal and retry the administrative session.

ANS8026E Input line longer than maximum of *max length* characters. Use continuation.

Explanation: An input command line is longer than the maximum input line length allowed.

System action: The input command is ignored.

User response: Reissue the command with several lines using continuation characters.

ANS8027E Unterminated comment in command.

Explanation: An input command contains an opening comment mark but no closing comment mark.

System action: The input command is ignored.

User response: Reissue the command with matching comment marks.

ANS8028E Command longer than maximum of *max length* characters.

Explanation: An input command longer than the maximum command length allowed has been entered.

System action: The input command is ignored.

User response: Reissue the command with fewer characters. This could mean replacing series of repeating blanks with a single blank.

ANS8029E Macro processing terminated.

Explanation: An error occurs during processing of a macro because the -ITEMCOMMIT option is not specified on the command line. Processing of this macro and any higher level macro is terminated.

System action: All current macro processing ends.

User response: Specify the -ITEMCOMMIT option on the command line to ensure that the server commits each command in the macro individually.

ANS8030E Substituted command longer than maximum of *max length* characters.

Explanation: After variable substitution, an input command is longer than the maximum command length allowed.

System action: The input command is ignored.

User response: Reissue the command with fewer characters. This may require replacing a series of repeating blanks with a single blank.

ANS8031E Missing name of macro to execute.

Explanation: A macro command is encountered that does not contain a macro name.

System action: The command is ignored.

User response: Reissue the macro command with a macro file name.

ANS8032E Could not allocate storage to process macro '*file spec*'.

Explanation: The client cannot allocate enough memory to process the macro shown.

System action: The macro is ignored and an error is returned.

User response: Make more memory available to the client and retry the macro command.

ANS8034E Your administrator ID is not recognized by this server.

Explanation: The administrator ID entered is not known to the requested server.

System action: The administrative session terminates.

User response: Ensure that you are using a registered administrative ID for the server to which you are connecting.

ANS8035E Interrupted by user.

Explanation: During an administrative session, a keyboard interrupt or break sequence is entered.

System action: The administrative session is terminated.

User response: Restart the administrative client session.

ANS8036E Administrative command not valid in Mount mode.

Explanation: The Mount Mode option has been specified but the client encounters what appears to be a server command on the command line.

System action: The administrative client session is ended.

User response: Reissue the command with no server command.

ANS8037E Missing name for redirection file.

Explanation: A command is entered that contains an output redirection symbol but no output file name.

System action: The command is ignored and an error is returned.

User response: Reissue the command with an output file name.

ANS8038E Unable to open file *'file spec'* for redirection.

Explanation: A command has been entered that specifies an output redirection file, but the file cannot be opened.

System action: The command is ignored and an error is returned.

User response: Reissue the command with a valid output file name or make space available for the output file.

ANS8041E The server connection has been lost and cannot be re-established.

Explanation: During an administrative session, the client discovers that the connection with the server has been severed; an attempt to reestablish the connection fails.

System action: The client session is ended.

User response: Determine the cause of the failure; then try to restart the session at a later time. If the problem persists, contact your service representative.

ANS8045E Communications error.

Explanation: An unexpected communications error occurs during an administrative session.

System action: The client session is ended.

User response: Verify that communications are active between the client and server machines. Server outages, processor outages, and communication controller outages can cause this error.

ANS8046E The client connection with the server has ended due to an unexpected error.

Explanation: The TSM error log might contain other messages related to this error.

System action: The client session ends.

User response: Check the communication link between the client and server to ensure that it is operational. Examine the client error log for additional messages related to this error.

ANS8047E The client connection with the server has ended due to a communications buffer overflow.

Explanation: The TSM error log might contain other messages related to this error.

System action: The client session ends.

User response: Try the operation again. Check the communication link between the client and server to ensure that it is operational. Examine the client error

log for additional messages related to this error.

ANS8049E A connection with the server cannot be established due to a communications time-out.

Explanation: The TSM error log might contain other messages related to this error.

System action: The client session ends.

User response: Check the communication link between the client and server to ensure that it is operational. Examine the client error log for additional messages related to this error.

ANS8050E The TSM server is not accepting administrative sessions on the client port. You must use the port number designated for administrative sessions.

Explanation: The TSM server is configured to not allow administrative sessions on the client TCP/IP port. A different port number has been designated for use by administrative sessions.

System action: The administrative session is not established.

User response: Use the TCPADMINPORT client option to specify the TCP/IP port number that the TSM server uses for administrative sessions. See your TSM server administrator if you do not know the correct port number.

ANS8051E User is not authorized to get prompted for encryption key

Explanation: The current passwordaccess option setting and user authority do not allow encryption.

System action: You are not prompted to set the encryption key password.

User response: Request the TSM authorized user to set passwordaccess=GENERATE in dsm.sys and set the encryption key password. (The encryption key password is set the first time that the TSM authorized user backs up a file).

ANS8052E Unable to decrypt file *'filespace namepath-name file-name'*Please try to restore this file individually

Explanation: File could not be decrypted and restored.

System action: File is not restored.

User response: Restore the file separately.

ANS8053E The network cannot be accessed.

Explanation: The TSM error log might contain other messages related to this error.

System action: The client session ends.

User response: Check the communication link between the client and server to ensure it is operational. Examine the client error log for additional messages related to this error. Try the operation again.

ANS8054E No memory available to service request.

Explanation: Sufficient server memory is not available.

System action: The client session is ended.

User response: Retry the administrative session. If the problem persists, contact your service representative.

ANS8055E The server has insufficient resources to perform the operation.

Explanation: The server ran out of resources. A lack of storage or other problem condition does not allow any new activity. The server activity log might contain additional information about this problem.

System action: The client session ends.

User response: The TSM administrator should examine the TSM server activity log to determine the source of the resource constraints. Try the operation again when the server is under less load.

ANS8056E Your administrator ID is locked.

Explanation: The administrative ID entered has been locked by a system administrator and cannot be used.

System action: The client session is ended.

User response: Contact your system administrator to unlock your ID.

ANS8057E The requested language files are not available.

Explanation: The NLS repository for the language specified is not available.

System action: The client session is ended.

User response: Use a different language or obtain a copy of the NLS repository for the language desired.

ANS8059E The TCP/IP functions have not been linked into this module.

Explanation: The ADSM TSO administrative client cannot find the TCP/IP functions required to support TCP/IP communications.

System action: The connection to the server fails.

User response: The TCP/IP functions must be included in the DSMADMC/ANSADM module. Refer to the Program Directory for this product for instructions on how to include the TCP/IP functions in the DSMADMC/ANSADM module.

ANS8060W A previously established incremental flashcopy relationship for local backup version with backup date 'datetime' for database configuration 'dbconfig' has been withdrawn for this backup operation. The reason for this is that the local backup policy defined for this database specifies a single backup version. This backup operation is requesting a copytype of NOINCR forcing the reuse of the single set of target volumes.

Explanation: The local backup policy defined for this database specifies a single backup version. The target volume set defined for this backup version is currently engaged in an incremental flashcopy relationship. This backup operation is requesting a copytype of NOINCR forcing the withdraw of the incremental flashcopy relationship. Refer to TSM documentation for additional information on local backup policy.

System action: None.

User response: None.

ANS8061E Session Rejected: The server does not allow a signon as a Unicode enabled administrative client

Explanation: The administrative client is unable to establish a connection to the server because of a unicode enabling mismatch between server and client.

System action: The client session is ended.

User response: Register a new administrator from a different administrative client or the server console, and signon with the new administrator ID.

ANS8062E C2C is not allowed to take place when server authentication is turned off.

Explanation: C2C is not allowed to take place when server authentication is turned off.

System action: Processing stops.

User response: Turn server authentication on.

ANS8064E Communication timeout. Reissue the command.

Explanation: The connection to the server is ended because of a communication timeout from the server.

System action: The server does not process the command.

User response: Reissue the command. If necessary, increase the values of IDLETIMEOUT and COMMTIMEOUT options in the server options file.

ANS8104W Cannot determine EFS status of the file system '*file-system name*', *errno*='error number', processing data normally.

Explanation: IBM Tivoli Storage Manager cannot determine EFS status on the specified filesystem. No EFS specific processing will take place for files on this filesystem. If EFS is indeed enabled on the filesystem, all accessible files will be backedup in cleartext.

System action: The filesystem will be processed as a regular filesystem.

User response: Contact your system administrator to determine the cause of the error reported in the message.

ANS8500I *User action cannot be completed due to the following error:*

Explanation: An error has occurred while processing your requested action, *user action*. The message displaying with this message identifies the error.

System action: The system does not process your requested action.

User response: See Explanation for the message displaying with ANS8000I.

ANS8501E Internal error in this graphical user interface. Try one of the following in the order listed: 1) close this window and reopen it 2) close this object and reopen it 3) shut down this graphical user interface and restart it 4) save dsmerror.log residing in the directory specified by DSMG_LOG and contact your service representative for assistance. | Graphical User Interface - Internal error

Explanation: An internal processing error has occurred in the TSM Administrator's graphical user interface while processing your requested action. Message ANS8000I, which displays with this message, identifies your requested action.

System action: The system does not process your requested action.

User response:

- Close the window in which your failed request was made and reopen it.
- If this problem persists, close all windows associated with the object toward which your failed request was directed and reopen them.

- If this problem persists, shut down the TSM Administrator's graphical user interface and restart it.
- If this problem persists, save the dsmerror.log file residing in the directory specified by the environment variable DSMG_LOG or in the current directory if DSMG_LOG is not specified, and contact your service representative for assistance.

ANS8502S Due to this error, processing cannot continue. This graphical user interface will shut down.

Explanation: A severe error has occurred. The message displaying with this message identifies the actual error.

System action: The TSM Administrator's graphical user interface closes.

User response:

- Restart the TSM Administrator's graphical user interface.
- If this problem persists, save the dsmerror.log file residing in the directory specified by the environment variable DSMG_LOG or in the current directory if DSMG_LOG is not specified, and contact your service representative for assistance.

ANS8503I No matching option found for pattern: '*pattern*'.

Explanation: You specified a pattern which does not match the name of any supported option.

System action: This message is the only response to your query.

User response: Specify a different pattern or omit the pattern to display all options.

ANS8504E A message related to this window or your requested action cannot be displayed due to an internal error in this graphical user interface. Refresh this window or request the action again.

Explanation: An internal processing error has occurred in the TSM Administrator's graphical user interface while attempting to display an informational, warning, or error message related to the current window or your requested action.

System action: The system may or may not process your requested action.

User response: View the Activity Log window in the Server object to find out if your requested action has completed. If it has completed successfully, refresh the current window to show its results. If it has not completed successfully, make your request again.

ANS8505I *program: node hostname with id node-id was added to the Responsiveness Service.*

Explanation: The remote node is running and has failover enabled. The node is now marked as offline until it has successfully joined the Service.

System action: The watch daemon will now check the node.

User response: None.

ANS8506I *program: node hostname with id node-id was removed from the Responsiveness Service.*

Explanation: The remote node has shut down and was removed from the Responsiveness Service after some time.

System action: The watch daemon will not look for this node until it is up again.

User response: None.

ANS8507I *program: node hostname with id node-id is now online.*

Explanation: The remote node has successfully joined our Responsiveness Service and its availability is now checked.

System action: The watch daemon will now check the availability of the node.

User response: None.

ANS8508I *program: node hostname with id node-id is now offline.*

Explanation: The node has successfully left the Responsiveness Service because it was shut down normally.

System action: The watch daemon will not check the node again.

User response: None.

ANS8509I *program: node hostname with id node-id is now recovered.*

Explanation: The node has recovered from a previous failure situation and a rollback can now be initiated.

System action: The watch daemon will now check the node for availability.

User response: None.

ANS8510W *program: node hostname with id node-id has failed, checking if failover is required.*

Explanation: The node is not responding to the Responsiveness Service anymore, a failover will be initiated if the remote and current node have failover enabled and if the remote watch daemon's filesystem timestamp is too old.

System action: The watch daemon will check if a failover for any of the node's filesystems is required.

User response: None.

ANS8511W *program: failover for node hostname with id node-id aborted, failover thread could not be started.*

Explanation: The internal service thread to perform the failover operation could not be started.

System action: The failover on this machine is aborted. Another machine with failover enabled will perform the failover.

User response: Please check if the machine has too much load to start new threads.

ANS8512W *program: this node is failing on purpose because of a local problem.*

Explanation: The node is failing voluntarily because of a local problem.

System action: Other nodes will be informed to take over its filesystems.

User response: Examine the log files for possible reasons and do a filesystem rollback once the machine is back online.

ANS8513I *program: this node is leaving the Responsiveness Service voluntarily.*

Explanation: The node is shut down regularly and will leave the Responsiveness Service without initiating a failure notice to other nodes.

System action: The watch daemon will not check for the node.

User response: None.

ANS8514E *program: the Responsiveness Service on this node could not be initialized. Failover will not be possible.*

Explanation: It was not possible to initialize and start the internal thread for the Responsiveness Service.

System action: The watch daemon is exiting and will be restarted to retry the operation.

User response: Verify that virtual memory (swap

space) has sufficient space. Verify that the system process thread limit is reasonable and has not been met or exceeded. If the thread limit is reasonable, but has been exceeded, or the problem otherwise persists, reboot the GPFS cluster

ANS8515E *program: it was not possible to join the Responsiveness Service. Failover will not work for this node.*

Explanation: The watch daemon could not join the Responsiveness Service and will not be able to do failover.

System action: The watch daemon is exiting and will be restarted to retry the operation.

User response: None.

ANS8516E *The values entered for the New Password and Reenter New Password fields do not match. Type the same value into both fields.*

Explanation: You have entered different values into the New Password and Reenter New Password fields.

System action: The system does not process your requested action.

User response: Enter the same value into the New Password and Reenter New Password fields.

ANS8517W *program: not trying to take over filesystems for node `hostname` with id `node-id` since it has failover disabled.*

Explanation: The node was detected as failing but no failover will be initialized since the node is not configured for failover.

System action: No filesystem of the failing node will be taken over.

User response: Manually take over the filesystem if required.

ANS8518W *program: Could not resolve cluster node id by hostname `hostname`.*

Explanation: The hostname provided by the Responsiveness Service could not be resolved to a cluster node id.

System action: The current operation aborts.

User response: Make sure the cluster is functional and the machine hostnames are properly set and resolvable.

ANS8566E *You have not entered or selected a value for this required field. Enter or select a value for this field.*

Explanation: You have not entered or selected a value for a required field.

System action: The system does not process your requested action.

User response: Enter or select a valid value for this required field.

ANS8776E *The IBM Tivoli Enterprise Space Management Console cannot be started. Java Runtime Environment version `version by company` has been detected on machine. A Java Runtime Environment version or higher is required to run this program. If you have already installed Java version on this machine, please ensure that the correct Java executable is on your PATH, otherwise you can download it from '`webAddress`' and start the program again.*

Explanation: IBM Tivoli Enterprise Space Management Console cannot be started because the Java runtime environment does not meet the requirements.

System action: A confirmation dialog is displayed for you to close the application, or to open a browser with a link to the Web site where you can download the correct version of Java.

User response: Verify that the correct java executable is on your PATH or install the required version of Java runtime environment and start the program again.

ANS8777E *The IBM Tivoli Enterprise Space Management Console cannot be started. An error occurred trying to load Tivoli look and feel. Verify that the product is correctly installed.*

Explanation: IBM Tivoli Enterprise Space Management Console cannot be started because the library that defines the Tivoli look and feel cannot be found.

System action: The IBM Tivoli Enterprise Space Management Console shuts down.

User response: Verify that the product is correctly installed. If IBM Tivoli Enterprise Space Management Console still cannot be started, contact your system administrator for further assistance.

ANS8778E *A browser program cannot be found or cannot be started. An error occurred executing the command `command`. Verify that a browser is installed and works correctly on your local machine.*

Explanation: A browser program cannot be found, so

ANS8779E • ANS8783E

it is not possible to access the IBM Tivoli Web site and online documentation.

System action: TSM continues to process user requests.

User response: For the Windows platform, the default system browser is used. Verify that a browser is installed on your machine.

ANS8779E A browser program cannot be found or cannot be started. One of the following browsers is required: *browser-list* Verify that one of these browsers is installed and works correctly on your local machine.

Explanation: A browser program cannot be found, so it is not possible to access the IBM Tivoli Web site and online documentation.

System action: TSM continues to process user requests.

User response: For UNIX platforms, a list of supported browsers is provided in the README. Install the required browser to access the IBM Tivoli Web sites and online documentation.

ANS8780E A browser program cannot be found or cannot be started. Check the *'file-name'* file on your local machine for more information.

Explanation: A browser program cannot be found, so it is not possible to access the Web site or online documentation.

System action: TSM continues to process user requests.

User response: Install a browser to access the Web site or online documentation.

ANS8781E The system could not log on to TSM client node *node-name* on *machine-name*. Make sure your data and password are correct and that caps lock key is not on. The Space Management Agent must be running at the specified port on the machine to which you are attempting to log on to.

Explanation: The system was not able to connect to the specified client node.

System action: TSM continues to process user requests.

User response: Verify that:

- the information provided to connect is correct
- the machine is reachable in the network

- HSM is installed on the specified machine and a Space Management Agent is running at the specified port.

ANS8782E An error occurred while loading file system information on *'fs-name'*. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on *machine* if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred while loading file system information on the selected client node

System action: Disconnects the client node.

User response: Verify that the Space Management agent is running on the client node machine. Check also the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8783E An error occurred loading file system properties of *fsName* required to show space usage graphical information. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on *machine* if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred while loading file system properties on the selected client node.

System action: Continue to process other file system properties.

User response: Verify that the Space Management agent is running on the client node machine. Check also the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine. If this does not identify the cause of the problem, then see your system administrator for further assistance.

ANS8784E An error occurred initializing the client nodes table. Your local configuration file '*config-file*' might be corrupted. Remove it from your installation directory and start the program again. Check also the *log-file* file on your local machine for more information.

Explanation: The client nodes table cannot be initialized.

System action: The IBM Tivoli Enterprise Space Management Console shuts down.

User response: It is possible that your local settings file '*dsmsm.cfg*' is corrupted. Try to remove it from your installation directory and start the program again. Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8785E An error occurred disconnecting the system from the client node '*node-name*'. The Client node is being disconnected without deleting internal HsmSystem objects. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred disconnecting the system from the client node. It was not possible to delete internal HsmSystem objects.

System action: The client node disconnected without deleting HsmSystem objects.

User response: Verify that the Space Management agent is running on the client node machine. Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8786E An error occurred loading file system information from the selected client node. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file in the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred loading file system information from the selected client node.

System action: File System information is not loaded

User response: Verify that the Space Management agent is running on the client node machine. Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8787E An error occurred loading file system information from *nodename* client node. The client node is being disconnected. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred loading file system information from the selected client node.

System action: The client node is disconnected

User response: Verify that the Space Management agent is running on the client node machine. Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8788E An error occurred starting manually threshold migration on *file-system*. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on *machine* if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred starting the manually threshold migration on the selected client node.

System action: Threshold migration is not started manually.

User response: Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8789E An error occurred trying to deactivate all managed file systems of *client-node*. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on *machine* if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred trying to deactivate all managed file systems of the selected client node.

System action: File systems are not deactivated.

User response: Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8790E An error occurred trying to reactivate all managed file systems of *client-node*. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on *machine* if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred trying to reactivate all managed file systems of the selected client node.

System action: File systems are not reactivated.

User response: Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8791E An error occurred trying to add space management to *fs-name* file system. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on *machine* if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred trying to add space management to the selected file system.

System action: Space management is not added to the selected file system.

User response: Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8792E An error occurred trying to remove space management from *file-system* file system. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on *machine* if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred trying to remove space management from the selected file system.

System action: Space management is not removed from the selected file system.

User response: Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8793E An error occurred trying to deactivate *file-system* file system. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred trying to deactivate the selected file system.

System action: The selected file system is not deactivated.

User response: Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8794E An error occurred trying to reactivate *file-system* file system. Verify that the Space Management agent is running on the client node machine. Check also the *local-log-file* file in the installation directory of your local machine and the *\$DSM_DIR/error-file* file on machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

Explanation: An error occurred trying to reactivate the selected file system.

System action: The selected file system is not reactivated.

User response: Check the *dsmsm.log* file in the installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8795E An error occurred trying to save your settings to *config-file* configuration file on your local machine. Check the *log-file* file in the installation directory of your local machine for more information.

Explanation: An error occurred trying to save your settings to *dsmsm.cfg* configuration file on your local machine.

System action: Customized GUI settings are not saved to the local machine

User response: Check the *dsmsm.log* file in the

installation directory of your local machine and the *\$DSM_DIR/dsmerror.log* file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS8818E An error occurred trying to apply your changes. Your changes have not been applied to the system. Contact your system administrator.

Explanation: An error occurred trying to apply your changes.

System action: User changes are not applied.

User response: Contact your system administrator.

ANS8819E The following trace flag(s) are not valid: *trace-flag-list*. Correct them before continuing.

Explanation: One or more of the trace flags are not valid.

System action: Prompts the user to correct the trace flags.

User response: Correct the wrong trace flags.

ANS8820E The HSM System Object was not found on the Space Management agent. The error occurred when calling function: *function-name*. The last operation was not processed correctly.

Explanation: The Space Management agent was unable to process a HSM System function, because the HSM System object was not found.

System action: The last operation is skipped.

User response: Reconnect to the Space Management agent. If this does not solve the problem restart the Space Management agent.

ANS8821E Unable to create requested HSM object on Space Management agent. The last operation was not processed correctly. The problem is caused from a memory problem. Try to free memory on the system where the Space Management agent is running. Or restart the Space Management agent.

Explanation: Space Management agent was not able to create a requested HSM object because not enough free space was found on the system.

System action: Last operation is skipped.

User response: Try to free more memory on the system where the Space Management agent is running, or restart the Space Management agent.

ANS8822E HSM File System Object was not found on Space Management agent. The error occurred when calling function: *function-name* The last operation was not processed correctly.

Explanation: Space Management agent was not able to process a HSM File System function, because no HSM File System object was found.

System action: Last operation is skipped.

User response: Reconnect to the Space Management agent. If this does not solve the problem restart the Space Management agent.

ANS8823E A Protocol error occurred in communication with the Space Management agent This error occurs when a session with the Space Management agent was lost, or network error caused synchronization problem between the Space Management console and the agent.

Explanation: Space Management console and Space Management agent has different session and transaction key in the communication header.

System action: Last operation is skipped.

User response: Restart Space Management console and Space Management agent.

ANS8824E A internal error occurred in the Space Management agent. The error occurred in function : *function-name*

Explanation: Not defined exception caused a internal error in the Space Management agent.

System action: Last operation is skipped.

User response: Restart Space Management agent. If this does not solve the problem contact TSM technical support.

ANS8825E The Space Management API was unable to locate option object The error occurred in function : *function-name*

Explanation: Not defined exception caused this internal error in the Space Management API.

System action: Last operation is skipped.

User response: Contact TSM technical support.

ANS8826E The Space Management API was unable to query a HSM device. This error occurs because the HSM kernel extension was not loaded correctly

Explanation: Because of a wrong configuration HSM

was not able the load the kernel extension. This causes to fail the query for global activation of the HSM system.

System action: Query for global HSM activation is skipped.

User response: Check the configuration of the HSM system. If you can not find any problem in the configuration contact TSM technical support.

ANS8827E The Space Management API was unable to locate global control block. The error occurred in function : *function-name*

Explanation: Not defined exception caused this internal error in the Space Management API.

System action: Load connection settings function is skipped.

User response: Contact TSM technical support.

ANS8828E The Space Management API lost the session with the server. This problem is caused by a connection failure with the server. Check to see if your Space Management Client machine has a network connection to the TSM server.

Explanation: This error occurs when the Space Management API has connection problems with the TSM server.

System action: Session with server gets lost and server operation is skipped.

User response: Check the network connection with TSM server machine. See the error log file for additional information why the session gets lost. Restart the Space Management Agent if the connection re-established automatically.

ANS8829E The Space Management API was unable to initialize the HSM system. The error is caused from a problem to initialize a DMAPI session.

Explanation: This error is caused from a problem to initialize a DMAPI session.

System action: The HSM system cannot be initialized and the Space Management Console is ended.

User response: Try to restart Space Management Agent. If this does not solve the problem, see the error log for additional information and contact TSM technical support.

ANS8830W Different server name stanzas (*HSM-stanza* and *BA-stanza*) for *file-system-name* file system for space management and backup-archive.

Explanation: The server name stanzas you specified for the space management (HSM) client and the backup-archive (BA) client are different. The inline backup and stub restore features will be unavailable for the file system.

System action: Processing continues.

User response: If you want to allow inline backup and stub restore for the file system, the MIGRATESERVER and DEFAULTSERVER options must specify the same SERVERNAME stanza in dsm.sys. You may also choose to supply a server stanza name using the SERVERNAME option in dsm.opt or on the command line. In either case the stanza name must match the stanza specified in the MIGRATESERVER option.

ANS8831E The Space Management API could not find file system : *function-name* An incorrect file system name was passed to the Space Management API. Ensure that the file system that was selected in the file system list is still valid. Refresh the file system view in the Space Management Console by pressing F5 on your keyboard or select 'Refresh' under the View menu.

Explanation: The Space Management API could not find the file system that was specified in the Space Management Console. A reason could be that the file system was unmounted and is not longer existing on the system.

System action: Getting file system information for the specified file system name is skipped.

User response: Update the file system list in the Space Management Console by pressing F5 on your keyboard or selecting 'Refresh' in the View menu.

ANS8832E The Space Management API could not retrieve TSM policy settings from the server.

Explanation: The Space Management API tried to get TSM policy settings from the server and failed for a unknown reason.

System action: Getting TSM policy settings fails and policy information fields are not filled up in the Space Management Console.

User response: See the error log file for additional information.

ANS8833E The Space Management API could not retrieve TSM policy settings from the already loaded list.

Explanation: The Space Management API tried to get TSM policy settings from the management list and failed for a unknown reason.

System action: Getting TSM policy settings fails and policy information fields are not filled up in the Space Management Console.

User response: See the error log file for additional information.

ANS8834E The Space Management API was unable to get file system information for file system : *filesystem-name*.

Explanation: The Space Management API could not retrieve the file system information for a selected file system.

System action: Getting file system information fails and information are not displayed in the Space Management Console.

User response: See the error log file for additional information.

ANS8835E The Space Management API was unable to get file system status for file system : *filesystem-name*. System call to get file system status returned with error.

Explanation: The Space Management API could not retrieve the file system status for a selected file system. The error is caused from a failed system call on the file system.

System action: Getting file system status fails and information are not displayed in the Space Management Console.

User response: See the error log file for additional information.

ANS8836E An object creation error occurred in the Space Management API The error occurred in function : *function-name*. The problem is caused from a memory problem. Try to free memory on the system where the Space Management agent is running. Or restart the Space Management agent.

Explanation: Caused from a out of memory problem the Space Management API could not create a requested object.

System action: The requested function fails and cannot retrieve information to the Space Management Console.

ANS8837E • ANS8843E

User response: Free more memory on the system where the Space Management agent is running, or restart the Space Management agent.

ANS8837E The Space Management API was unable to get configuration data from managed file system : *filesystem-name*. The problem is caused from a error when reading dsmmigfs table entry.

Explanation: The Space Management API reads information from dsmmigfs table to get HSM managed files system configuration. This error occurs when the API is unable to read an entry from this table.

System action: Getting HSM managed file system configuration fails and information is not displayed in the Space Management Console.

User response: See the error log for additional information on errors occurring when reading entries from the dsmmigfs table.

ANS8838E The Space Management API can not set HSM managed file system configuration for file system : *filesystem-name*. The configuration cannot be set because this file system is NOT HSM managed. Check to see if the managed file system that was selected in the file system list is still HSM managed. Refresh the file system view in the Space Management Console by pressing F5 on your keyboard or select 'Refresh' under the View menu.

Explanation: The file system that you selected from the file system list in the Space Management console is not longer HSM managed and no configuration can bet set for it. A reason could be that the file system was unmanaged from a other user.

System action: Setting HSM managed file system configuration fails.

User response: Update the file system list in the Space Management Console by pressing F5 on your keyboard or selecting 'Refresh' in the View menu.

ANS8839E A wrong stub file size was passed to the Space Management API for file system : *filesystem-name*. The stub file size that was entered in the file system properties dialog is not supported by this file system. Correct the stub file size value in the file system properties dialog of the Space Management Console.

Explanation: The Stub file size that you has specified is not supported by this file system.

System action: Wrong stub file size is not applied to the file system.

User response: Correct the stub file size in the file system properties dialog of the Space Management Console.

ANS8840E The maximum number of candidates that was specified for file system : *filesystem-name* is out of range. The maximum number of candidates value that was entered in the file system properties dialog is out of range. Correct the maximum number of candidates value in the file system properties dialog of the Space Management Console.

Explanation: The maximum number of candidates value that was specified is out of range for this file system.

System action: Wrong maximum number of candidates value is not applied to the file system.

User response: Correct the maximum number of candidates value in the file system properties dialog of the Space Management Console.

ANS8841E The server name that was specified for the file system : *optfile-name* is not valid. Correct the server name value in the client node properties dialog of the Space Management Console.

Explanation: The server name that was specified is not valid.

System action: Wrong server name value is not applied to the system options file.

User response: Correct the server name value in the client node properties dialog of the Space Management Console.

ANS8842E The Space Management API was not able to modify system options file : *optfile-name* because of insufficient privilege. Use root user to change HSM managed file system configuration.

Explanation: User has no rights to modify system options file.

System action: Changes are not applied to the system options file.

User response: Run as root user to change HSM managed file system configuration.

ANS8843E No correct include/exclude settings are found in system options file : *optfile-name*. Correct the include/exclude list in the system options file.

Explanation: The include/exclude settings in the

system options file are not correct.

System action: Changes are not applied to the system options file.

User response: Correct the include/exclude list in the system options file.

ANS8844E A incorrect preferred node or server name was specified in the HSM configuration for *filesystem-name*. Correct the preferred node and server name value in the HSM configuration.

Explanation: The Space Management API could not change preferred node settings because a wrong value was specified

System action: Changes are not applied to the system options file.

User response: Correct the preferred node and server settings in Space Management Configuration.

ANS8845E A incorrect owner node or server name was specified in the HSM configuration for *filesystem-name*. Correct the owner node and server name value in the HSM configuration.

Explanation: The Space Management API could not change owner node settings because a wrong value was specified

System action: Changes are not applied to the system options file.

User response: Correct the owner node and server settings in Space Management Configuration.

ANS8846E The Space Management API was not able to update the HSM managed file system : *filesystem-name*.

Explanation: The Space Management API could not apply configuration changes to the HSM managed file system.

System action: Changes are not applied to HSM managed file system.

User response: See error log file for additional information why the update of the file system fails.

ANS8847E The Space Management API was not able to obtain a lock on SDR file for file system : *filesystem-name*.

Explanation: The Space Management API could not lock the SDR file for the file system.

System action: Changes are not applied to HSM managed file system.

User response: See the error log file for additional

information on why the lock on the SDR file fails.

ANS8848E The Space Management API could not open file system status file to retrieve managed file system statistics for : *filesystem-name*. Reason could be insufficient permissions or that the file does not exist. The managed file system statistics are not retrieved from the HSM system.

Explanation: The Space Management API could not retrieve managed file system information from file system status file. The error occurred when the API tries to open the file for reading.

System action: Managed file system statistics are not retrieved and information is not displayed in the Space Management Console.

User response: See the error log file for additional information on why opening the file system status file fails.

ANS8849E The Space Management API was not able to load HSM managed file system statistics for : *filesystem-name*. Check to see if the managed file system that was selected in the file system list is still HSM managed. Refresh the file system view in the Space Management Console by pressing F5 on your keyboard or select 'Refresh' under the View menu.

Explanation: The Space Management API could not load managed file system statistics from selected file system. The reason could be that the file system is not longer HSM managed.

System action: Managed file system statistics are not retrieved and information is not displayed in the Space Management Console.

User response: Update the file system list in the Space Management Console by pressing F5 on your keyboard or selecting 'Refresh' in the View menu.

ANS8850E The Space Management API was not able to add HSM to file system : *filesystem-name*. This error occurs because selected file system is not mounted. You must mount the file system before you can add HSM.

Explanation: The Space Management API could not add HSM to a file system, because it is not mounted.

System action: The add HSM operation fails and HSM is not added to the selected file system.

User response: Mount the selected file system before adding HSM.

ANS8851E The Space Management API was not able to add HSM to file system : *filesystem-name*. This error occurs because selected file system is not supported to add HSM.

Explanation: The Space Management API could not add HSM to a unsupported file system.

System action: The add HSM operation fails and HSM is not added to the selected file system.

User response: Select a supported file system to add HSM.

ANS8852E The Space Management API was not able to add HSM to file system : *filesystem-name*. This error occurs because selected file system is already HSM managed.

Explanation: The Space Management API attempt to manage a already HSM managed file system.

System action: The add HSM operation fails and the selected file system stays HSM managed.

User response: Select a not managed file system to add HSM.

ANS8853E The Space Management API was not able to add HSM to file system : *filesystem-name*.

Explanation: The Space Management API attempt to manage file system and fails for a unknown reason.

System action: The add HSM operation fails and HSM is not added to the selected file system.

User response: Retry the add HSM operation. If this does not solve the problem, see the error log file for additional information and contact TSM technical support.

ANS8854E The Space Management API was not able to remove HSM from file system : *filesystem-name*. The error occurs when the Space Management API tries to lock the SDR file and fails.

Explanation: The Space Management API attempt to unmanage (remove) file system and fails for a unknown reason.

System action: The remove HSM operation fails and HSM is not removed from the selected file system.

User response: Try the remove HSM operation again. If this does not solve the problem, see the error log file for additional information and contact TSM technical support.

ANS8855E The Space Management API was not able to start automatic migration on the file system : *filesystem-name*.

Explanation: The Space Management API tries to start automatic migration on a file system and fails for a unknown reason.

System action: The automatic migration is not started for the file system.

User response: See the error log file for additional information and contact TSM technical support.

ANS8856E The Space Management API was not able to start reconciliation process on the file system : *filesystem-name*.

Explanation: The Space Management API tries to start reconciliation process on a file system and fails for a unknown reason.

System action: The reconciliation process is not started for the file system.

User response: See the error log file for additional information, and contact TSM technical support.

ANS8857E The Space Management API was not able to start scout process on the file system : *filesystem-name*.

Explanation: The Space Management API tries to start scout process on a file system and fails for a unknown reason.

System action: The scout process is not started for the file system.

User response: See the error log file for additional information, and contact TSM technical support.

ANS8858E The Space Management API was not able to migrate the file : *file-name*. The error occurred in function : *function-name*.

Explanation: The Space Management API tries to migrate a file and fails in the displayed API function.

System action: The selected file is not migrated to the server.

User response: See the error log file for additional information.

ANS8859E The Space Management API was not able to recall the file : *file-name*. The error occurred in function : *function-name*.

Explanation: The Space Management API tries to recall a file and fails in the displayed API function.

System action: The selected file is not recalled from the server.

User response: See the error log file for additional information.

ANS8939E **An unexpected error occurred trying to filter the directory tree. rc=return-code**

Explanation: The filter was not applied to the directory tree.

System action: The directory tree is not filtered.

User response: Contact your system administrator for further assistance.

ANS8945E **An unexpected error occurred analyzing the directory tree. The list of files matching your search criteria is not completed. rc=return-code**

Explanation: It was not possible to search all items matching the search criteria on the directory tree due to an unexpected error.

System action: The search results table shows only the items found until the error is occurred.

User response: Contact your system administrator for further assistance.

ANS8946E **RPC call failed.**

Explanation: Unable to connect receiver recall daemon.

System action: Processing stopped.

User response: System is not operating correctly or recall daemons are not started.

ANS9005W *program name: invalid 'parameter name' value: value (must be in [minimum value..maximum value]).*

Explanation: The program found an invalid parameter in the space management configuration of a filesystem.

System action: The paramter value was rejected.

User response: In case you tried to set the specified value manually, choose a value from the specified range instead. If the value is read from a file system's space management configuration file (located at [fs]/.SpaceMan/hsmfsconfig.xml), edit the file accordingly. The name of the filesystem can be determined from a subsequent error message.

ANS9007W *program name: invalid 'parameter name' value: value (must be in [minimum value..maximum value]).*

Explanation: The program found an invalid parameter in the space management configuration of a filesystem.

System action: The paramter value was rejected.

User response: In case you tried to set the specified value manually, choose a value from the specified range instead. If the value is read from a file system's space management configuration file (located at [fs]/.SpaceMan/hsmfsconfig.xml), edit the file accordingly. The name of the filesystem can be determined from a subsequent error message.

ANS9009E *program name: found invalid space management configuration for 'filesystem'.*

Explanation: The program found an invalid space management configuration for the given filesystem.

System action: The space management configuration was rejected for the given filesystem . When updating an existing configuration, invalid configurations to set are ignored. When a persistent configuration file is invalid, the filesystem will appear to not have space management enabled.

User response: In case you tried to update space management for this filesystem manually, enter a valid configuration instead. In case the persistent configuration file is invalid, edit the file accordingly; alternatively, you can add space management explicitly (which will remove / overwrite the existing configuration). The reason for the configuration can be determined from a preceding error message. The filesystem's space management configuration file is located at 'filesystem'/.SpaceMan/hsmfsconfig.xml.

ANS9010E *program name: could not parse space management configuration file 'configuration file' for filesystem.*

Explanation: The space management configuration file for the given filesystem is present but its content appears to have invalid format.

System action: The configuration was rejected. The filesystem will appear to not have space management enabled.

User response: Check the given space management configuration file; it is supposed to contain a well-formed XML document with a root element named 'HsmFsConfig'. To create a new configuration file, you can simply add space management to this filesystem.

ANS9011E *program name: could not write space management configuration file 'configuration file' for filesystem.*

Explanation: IBM Tivoli Storage Manager could not write and save the space management configuration file for the given filesystem.

System action: IBM Tivoli Storage Manager did not save the space management configuration information.

ANS9012E • ANS9024E

If you tried to add space management for this filesystem, it was not added. If you tried to update the space management configuration, it was probably not updated. If an existing configuration file in old format was read successfully, but could not be converted to XML format, space management will be active for this filesystem with the configuration from the old file.

User response: Determine if there is any reason why the given file cannot be written.

ANS9012E *error-program:* **Command must be run by root user.**

Explanation: TSM requires that a root user perform this operation.

System action: TSM terminates the operation.

User response: Change to root user, and then retry the operation.

ANS9016E **Cannot get space management migration status for path.**

Explanation: An error occurred while trying to get the space management migration status. Either the permissions for the status file are not set correctly, or the status file is damaged.

System action: TSM terminates the operation.

User response: The root user should check the permissions of the status file, or contact the service representative.

ANS9017W *error-program:* **Minimum number of recall daemons *min-dsmrecalld* cannot be greater than maximum number of recall daemons *max-dsmrecalld*; defaulting to minimum *min-dsmrecalld* and maximum *max-dsmrecalld* .**

Explanation: A minimum number of recall daemons has been entered that is greater than the maximum number of recall daemons.

System action: TSM uses defaults instead of the values specified in the client system options file (dsm.sys).

User response: Correct the MINRECALLDAEMONS and MAXRECALLDAEMONS options in the client system options file and retry the operation.

ANS9018W *program-name: option* **option value value invalid, range *min-value* to *max-value*.**

Explanation: An invalid value has been entered. Value should be in the range specified by the message.

System action: TSM uses defaults instead of the value specified by the user.

User response: Correct the invalid input value.

ANS9019W *program-name:* **unable to parse option value 'argument'**

Explanation: Input is incorrect or is not in correct format.

System action: TSM continues.

User response: Retry operation with correct usage syntax.

ANS9020E **Could not establish a session with a TSM server or client agent. The TSM return code is *tsm-error*.**

Explanation: None.

System action: Processing stops.

User response: Check the TSM error log for communications failures such as TCP/IP, shared memory, or named pipe errors.

ANS9021E *error-program* **Unknown recall daemon (pid *process-ID*) terminated abnormally, status: *status*.**

Explanation: A recall daemon stops abnormally.

System action: TSM terminates the operation.

User response: Try the operation again. If the problem persists, send the core file to IBM technical support for analysis.

ANS9022E *error-program* **Recall daemon (pid *process-ID*) ended abnormally, status: *status*.**

Explanation: A recall daemon stopped abnormally.

System action: The operation does not complete.

User response: Try the operation again. If the problem persists, send the core file to IBM technical support for analysis.

ANS9023I *error-program:* **Subsidiary recall daemon process exiting.**

Explanation: The process is interrupted and exiting. The user has terminated the process.

System action: TSM detected an interrupt. The recall daemon is terminated and exiting.

User response: None.

ANS9024E **Starting with this release all candidate processing is done internally by the TSM monitor daemon. Thus -c is no longer a valid option for dsmreconcile.**

Explanation: The command line options -c and -Candidates are no longer valid for dsmreconcile as all

candidates processing is now performed by dsmmonitorord.

System action: TSM detected an invalid option. dsmreconcile is exiting.

User response: Don't use options -c and -Candidates with dsmreconcile anymore.

ANS9025E The Data Protection for WebSphere plug-in version and the backup-archive client version do not match. Please upgrade your Data Protection for WebSphere plug-in.

Explanation: The release and version of the Data Protection for WebSphere plug-in is downlevel from the release and version of the Backup-Archive Client.

System action: None

User response: Upgrade Data Protection for WebSphere to the proper release and version.

ANS9028E *program name:* could not acquire lock for *filesystem*.

Explanation: Prior to modifying a space management configuration file, it is required to lock the file in order to avoid concurrent access. If acquiring the lock fails, there was a concurrent access.

System action: The action was cancelled.

User response: Retry the same request or determine the process holding the lock.

ANS9029E The WebSphere server is running, but the server must be shut down for a restore operation. Shut down the WebSphere server and try the restore operation again.

Explanation: The WebSphere server must be brought down to perform a restore.

System action: The restore operation fails.

User response: Shut down the WebSphere server and try the restore operation again.

ANS9030W Cannot set conflicting attributes to file *file-name*.

Explanation: TSM cannot set the file attributes because the requested attributes are in conflict with one another.

System action: TSM does not set the file attributes.

User response: Retry this operation with attributes that do not conflict with each other.

ANS9031W File *file-name* is not a migrated file.

Explanation: TSM can only set file attributes to a migrated file. This file has not been migrated.

System action: TSM does not set the file attributes.

User response: Migrate this file, and then retry the operation.

ANS9032W File *file-name* is not in an HSM managed file system.

Explanation: TSM detects that the file is not in an HSM managed file system, and therefore, it cannot perform the operation requested.

System action: TSM does not set the file attributes.

User response: Add space management to the file system, migrate the file, and then retry the operation.

ANS9034E The restore operation did not complete, due to a change in the original WebSphere environment.

Explanation: The data must be restored to the same environment that it was backed up from. This includes items such as cell name, node name, and the location where WebSphere is installed.

System action: The restore operation does not complete.

User response: Perform the restore procedure in the *DP for WebSphere* book.

ANS9036W *program-name:* migrated file(s) are missing on server for *number stub file(s)*. Look in '*file-spec*' for file names.

Explanation: TSM cannot find the migrated file(s) on the server.

System action: TSM continues.

User response: Look in the path mentioned in the message for the file name. Also ensure that you are working with the correct server for this file.

ANS9054E The plug-in was not found.

Explanation: None.

System action: None

User response: Run "dsmc show plugins" at the command prompt to see the available plug-ins on the system.

ANS9057W *error-program: cannot get space information for file-system : error.*

Explanation: TSM cannot get the space information for the file system.

System action: TSM continues.

User response: Verify that space management has been added to the file system.

ANS9058E *error-program: cannot close file-spec: error .*

Explanation: TSM cannot close the file. This problem occurs while the dsmonitor daemon examines available space on the file system.

System action: TSM terminates the current operation.

User response: Confirm that file system is still mounted and managed by HSM. If the problem persists, reboot the system. If that does not resolve the problem, contact IBM technical support for further assistance. Provide the operating system error code and the output of the df, dsmdf, and mount Unix shell commands.

ANS9059E *error-program: process cannot detach to become a daemon.*

Explanation: TSM process cannot detach itself to become a daemon.

System action: TSM cannot start the daemon as requested. TSM stops.

User response: Retry the operation.

ANS9060W *error-program: cannot get and increase limit of open files.*

Explanation: TSM either cannot get the limit of the number of open files, or cannot increase the limit of the number of open files.

System action: TSM cannot increase the number of open files, and was not able to complete the operation.

User response: Free some file space by ending some processes or removing some files, and retry the operation.

ANS9062E *File 'filename' has changed during the backup.*

Explanation: A file changed during the backup. Check the dserror.log file for a list of files that have changed.

System action: The backup fails.

User response: Try the backup again.

ANS9063E *error-program: file system file-system is out of inodes.*

Explanation: TSM cannot get space for the file system because the file system is out of inodes.

System action: TSM cannot get space via migration.

User response: Remove some files to make more inodes available and retry.

ANS9064E *error-program: Cannot fork a new process: error .*

Explanation: TSM cannot fork a new process that is needed. If the operating system errno is EAGAIN, then the limit on the total number of processes running on the system or by a single user has been exceeded, or the system does not have the resources necessary to create another process. If the errno is ENOMEM, then there is not enough memory to create the process.

System action: TSM cannot complete the requested operation.

User response: Depending on the error code (errno), either allocate additional virtual memory (swap space) or increase the operating system process limit. Then restart the HSM daemons or reboot the system.

ANS9065E *File 'filename' or file 'filename2' has been added or removed during the backup.*

Explanation: A file was added or removed during the backup.

System action: The backup fails.

User response: Try the backup again.

ANS9067W *error-program: error updating dsmmigfstab file for file-system .*

Explanation: TSM found an error in updating the dsmmigfstab file for this file system.

System action: TSM does not update the dsmmigfstab file.

User response: See the preceding error message and correct the error if possible. Then, retry the operation. If problem persists, contact your system administrator.

ANS9068I *program-name: dsmmigfstab file updated for file system file-system .*

Explanation: TSM successfully updated the dsmmigfstab file for the file system.

System action: TSM continues.

User response: Continue with normal operation.

ANS9069I *program-name: all file systems are reactivated to previous states.*

Explanation: TSM has reactivated all file systems managed by HSM to their previous states before the global deactivation.

System action: TSM continues.

User response: Continue with normal operation.

ANS9070I *program-name: space management is now deactivated for all HSM file systems.*

Explanation: TSM has deactivated space management for all file systems listed in the dsmmigfstab file.

System action: TSM continues.

User response: Continue with normal operation.

ANS9071W *program-name: error reactivating space management for all HSM file systems.*

Explanation: TSM found an error in trying to reactivate space management.

System action: TSM does not reactivate space management for HSM file systems.

User response: Make sure space management is installed correctly and retry the operation.

ANS9072W *error-program: error deactivating space management for all FSM file systems.*

Explanation: TSM found an error in trying to deactivate space management.

System action: TSM does not deactivate space management for FSM file systems.

User response: Make sure space management is installed correctly and retry the operation.

ANS9073W *program-name: error deactivating space management for file system file-system.*

Explanation: TSM found an error in trying to deactivate the file system.

System action: TSM does not deactivate space management for the file system.

User response: Make sure space management is installed correctly and retry the operation.

ANS9074I *program-name: Space management for file system file-system is now deactivated.*

Explanation: TSM has deactivated space management for the file system.

System action: TSM continues.

User response: Continue with normal operation.

ANS9075W *program-name: error reactivating space management for file system file-system.*

Explanation: TSM found an error in trying to reactivate space management for the file system.

System action: TSM does not reactivate space management for the file system.

User response: Verify that the specified file system is mounted and that HSM is enabled for this file system. Then try the operation again. If the problem persists, contact IBM technical support for additional assistance. Provide the /etc/filesystems (or equivalent file) and the output from the mount and dsmdf commands.

ANS9076I *program-name: space management is now active for file system file-system.*

Explanation: TSM has reactivated space management for the file system.

System action: TSM continues.

User response: Continue with normal operation.

ANS9077I *program-name: removed space management from file system file-system*

Explanation: TSM removed space management. The file system is now a native file system.

System action: TSM continues.

User response: Continue with normal operation.

ANS9078W *Space management is not removed from file system file-system .*

Explanation: TSM was not able to remove space management from this file system. Possible causes:
Kernel extension is downlevel.
Program is downlevel.
Insufficient disk space.

System action: TSM is unable to complete the requested operation.

User response: Refer to the immediately preceding error message and retry the operation.

ANS9079W *program-name: no migrated files matching search criteria found.*

Explanation: TSM did not find any migrated files matching the search criteria.

System action: TSM cannot complete the requested operation.

User response: Retry the operation with a different search criteria.

ANS9080E *program-name:* **not enough space in file system or storage pool to recall all migrated files.**

Explanation: TSM detects there is not enough space in the file system to hold all the migrated files if all are recalled. If you are using GPFS storage pools, each pool needs to have enough space to recall its files.

System action: TSM does not attempt to recall all the migrated files.

User response: Make room in the file system by increasing the file system size or removing some files. Retry the operation.

ANS9081W *program-name:* **orphaned stub file(s) detected in file system** *file-system.*

Explanation: TSM detected one or more orphaned stub files. Either the migration server was changed in the client system options file after the file was migrated, or the migration server database is damaged.

System action: TSM does not attempt to remove space management from the file system.

User response: Determine the cause of orphaned stub files. Switch to the correct migration server and recall the migrated files. Retry the operation.

ANS9082W *program-name:* **error encountered while reconciling file system** *file-system.*

Explanation: TSM encountered an error performing reconciliation on the file system.

System action: TSM continues.

User response: Refer to other messages displayed or messages in the log to correct the problem. Then retry the operation.

ANS9083W *program-name:* **cannot deactivate space management on file system** *file-system.*

Explanation: TSM cannot deactivate space management on the file system.

System action: TSM continues.

User response: Correct the error if possible and retry the operation.

ANS9084E *program-name:* **file-system is not managed or not locally managed by space management.**

Explanation: There is no entry for the file system in the dsmmigfstab file or the file system is managed by another node.

System action: TSM will not perform space management functions on this file system.

User response: Add space management to the file system, if appropriate, and then retry the operation. If the file system is not locally managed, retry the operation on the node managing the file system.

ANS9085E *program-name:* **file system** *file-system* **is not managed by space management.**

Explanation: There is no entry for the file system in the dsmmigfstab file.

System action: TSM will not perform space management functions on this file system.

User response: Add space management to the file system, if appropriate, and then retry the operation.

ANS9086E *program-name:* **A DMAPI error occurred adding space management to file system** *file-system* **, It is possible DMAPI is disabled on this file system. The system set the error code: errno = errno-value**

Explanation: TSM encountered an error and cannot add space management to the file system.

System action: TSM Space management cannot be added to file system.

User response: Verify that DMAPI is enabled for this file system and retry the operation.

ANS9087I **Space management is successfully added to file system** *file-system* .

Explanation: TSM has added space management to the file system, and will now monitor its space usage. You can also perform other space management operations on this file system.

System action: TSM continues.

User response: Continue with normal operation.

ANS9088W *program-name:* **space management is already active for file system** *filesystem.*

Explanation: This message is issued when trying to add space management to a filesystem with space management already activated. It is not possible to add space management for a filesystem that already has space management activated.

System action: The action was cancelled.

User response: In case you wanted to update the filesystem's space management configuration instead, use the appropriate update command.

ANS9089E **The group backup validation failed. One or more files were added, removed, or changed during the backup.**

Explanation: One or more files have been added, removed, or changed from the time WebSphere was queried to the time that all the data was sent to the TSM server. Check the dsmdir.log file for a list of files that were added, removed, or changed.

System action: The backup fails.

User response: Try the backup again.

ANS9090E *program-name: file-system* **is not a valid file system name.**

Explanation: TSM received an invalid file system name. The file system is not mounted, or is not mounted correctly.

System action: TSM continues.

User response: Correct the file system name, and retry the operation.

ANS9091E **The WebSphere backup validation failed. One or more files were added, removed, or changed during the backup.**

Explanation: One or more files have been added, removed, or changed from the time WebSphere was queried to the time that all the data was sent to the TSM server. Check the dsmdir.log file for a list of files that were added, removed, or changed.

System action: The backup fails.

User response: Try the backup again. Do not install new WebSphere applications or change the WebSphere configuration while in the backup window.

ANS9092W **AES 128-bit Encryption is not being used.**

Explanation: AES 128-bit encryption is not being used. DES 56-bit encryption is being used instead.

System action: DES 56-bit Encryption is used instead of AES 128-bit encryption.

User response: If the user wants to use AES encryption, then the user must install the IBM JRE in order to enable AES encryption for the web client.

ANS9093W *program-name: cannot update migration candidates list file-name* .

Explanation: TSM cannot update the migration candidates list because not enough memory is available to create a temporary file.

System action: Processing stops.

User response: Make some memory available by

ending some processes, and then retry the operation.

ANS9094W *program-name: no candidates found in file system file-system* .

Explanation: TSM found no files eligible for migration in the file system after running dsmdirconcile.

System action: TSM continues.

User response: Continue with normal operation.

ANS9096E **User is not the owner of file filesystem-namedirectory-name file-name so file is skipped.**

Explanation: The user does not own this file and cannot perform this operation.

System action: TSM skips the file.

User response: None, or if you have root-user authority, switch to root user and retry the operation.

ANS9098E *program-name: space management does not support file system file-system*.

Explanation: TSM space management does not support this type of file system. Space management supports only true local file systems (e.g. JFS on AIX). Space management does not support other types of file systems (AFS®, NFS, etc).

System action: Processing of the file system stopped.

User response: None.

ANS9099E *program-name: space management is not active for file system file-system*.

Explanation: TSM found the file system did not have space management activated.

System action: Processing of that file system stopped.

User response: Reactivate space management for the file system.

ANS9100E **Unable to open file 'filename' for output.**

Explanation: The file name specified cannot be opened.

System action: Make sure that user has access to write to specified file, or use different file name.

User response: Output will not be saved. Please specify different file or check permissions on chose file.

ANS9101I **No migrated files matching 'file-name' were found.**

Explanation: You entered a search pattern or file name that cannot be found in the server database as a migrated file.

ANS9121I • ANS9134E

System action: Processing stopped.

User response: Ensure that your search pattern is correct, or specify a new search string.

ANS9121I Activate completed.

Explanation: A Domino activate databases operation was completed.

System action: TSM activated the databases.

User response: Continue with normal operations.

ANS9126E *program-name: cannot determine whether space management is active or inactive for file-system due to error: error.*

Explanation: The program 'program-name' indicated in the message text was unable to obtain statistics for file system 'file-system'. Therefore the program cannot determine whether space management is activated, deactivated, or globally deactivated on that file system. The message text includes a description of the Unix errno error that occurred while trying to get the state of space management.

System action: TSM stops the operation.

User response: Verify that the file system is mounted and accessible. Using the appropriate tools for that file system, check whether there are any I/O or other integrity errors on that file system. Then try the operation again. If the operation fails, then a system reboot might clear the error condition. If, after taking these actions the problem persists, contact IBM technical support for assistance.

ANS9128I Inactivate logs completed.

Explanation: A Domino inactivate log operation was completed.

System action: TSM inactivated the log.

User response: Continue with normal operations.

ANS9130W *program name: could not convert the space management configuration for filesystem from file old configuration file to XML configuration file.*

Explanation: Starting from TSM version 6.1, space management configuration is stored in XML format. In case the systems finds a configuration file in former, proprietary format only, it is read and converted to XML format. This message indicates that the old format file was read successfully but could not be written to an XML configuration file.

System action: Space management configuration is taken from the old format file.

User response: Determine the reason why the XML file could not be written.

ANS9131E *program name: old space management configuration file does not match filesystem: file content.*

Explanation: Starting from TSM version 6.1, space management configuration is stored in XML format. In case the systems finds a configuration file in former, proprietary format only, this file is processed. The content of the file starts with the filesystem; this message is issued when the filesystem name does not match.

System action: Space management configuration was rejected. The filesystem is considered to not have space management activated.

User response: Check the old configuration file and correct the filename manually in case the rest of the file content is valid. Alternatively, you can explicitly add space management for the filesystem to create a new space management configuration file.

ANS9132E *program name: old space management configuration file is corrupted for filesystem: file content.*

Explanation: Starting from TSM version 6.1, space management configuration is stored in XML format. In case the systems finds a configuration file in former, proprietary format only, this file is processed. This message is issued when parsing its content failed.

System action: Space management configuration was rejected. The filesystem is considered to not have space management activated.

User response: Check the old configuration file and consider correct its content manually. Alternatively, you can explicitly add space management for the filesystem to create a new space management configuration file.

ANS9133E *program name: space management already active for filesystem.*

Explanation: This message is issued when trying to add space management to a filesystem with space management already activated.

System action: The action was cancelled.

User response: Check the filesystem's space management configuration and consider updating it in case it does not match your needs. It is not possible to add space management for a filesystem that already has space management activated.

ANS9134E *program name: space management not active for filesystem.*

Explanation: The program requested the space management configuration for a file system where space management is not active.

System action: The action was cancelled.

User response: In case you entered the filesystem specification, check for correct spelling. It is not possible to perform space management actions on a filesystem with space management not activated.

ANS9135E *program name: space management for filesystem not controlled by the local node.*

Explanation: The program requested the space management configuration for a file system where space management is active, but not controlled by the local node. In cluster environments, some space management actions are allowed from the owner node only.

System action: The action was cancelled.

User response: Determine the controller node for this filesystem and retry.

ANS9136E *program name: could not remove configuration file for filesystem.*

Explanation: During removal of space management for the given filesystem, this configuration file could not be removed.

System action: Space management could not be deactivated for this filesystem.

User response: Determine the reason why the file could not be removed and retry.

ANS9147E *program-name: cannot read file-spec: error .*

Explanation: TSM cannot read this file.

System action: TSM cannot fully complete the requested operation.

User response: An error occurred reading an HSM managed file system status file. Verify that the file system is mounted and enabled for HSM and is actually managed by HSM and then try the operation again. If the problem persists, contact IBM technical support for further assistance. Provide the output from the mount, dsmdf and ls -l [file system name] commands.

ANS9148E *program-name: cannot find mount point for file system file-system .*

Explanation: TSM cannot find file system mount point.

System action: TSM cannot complete the requested operation.

User response: The specified file system is not currently mounted. Mount the file system and try the operation again.

ANS9150I **Archive log completed.**

Explanation: A Domino archive log operation was completed.

System action: TSM archived the log.

User response: Continue with normal operations.

ANS9151E **An unexpected program error was encountered . TSM function name :**
function-name **TSM function :**
function-desc **TSM return code :** *TSM-rc*
TSM file : *file-name (line-number)*

Explanation: None.

System action: Processing stops.

User response: Check error log for more information. Contact the TSM administrator with the information provided in this message.

ANS9152E *program-name: cannot deactivate space management for whole system: error.*

Explanation: Space management cannot be deactivated for the whole machine.

System action: TSM cannot deactivate space management support.

User response: The HSM global status is inaccessible, possibly due to concurrent access. Try the operation again. If the problem continues, examine the output of the shell command ps -aef as well as the contents of /etc/adsm/SpaceMan/config/dmiFSGlobalState.pid. If a pid is stored in this file and it does correspond to a running process, remove the dmiFSGlobalState.pid file and retry the operation. If the problem persists, reboot the system and repeat the appropriate analysis for your file system type.

ANS9153E *program-name: cannot reactivate space management for whole system: error.*

Explanation: Space management cannot be reactivated for the whole machine.

System action: TSM cannot reactivate space management support.

User response: The HSM global status is inaccessible, possibly due to concurrent access. Try the operation again. If the problem continues, examine the output of the shell command ps -aef as well as the contents of /etc/adsm/SpaceMan/config/dmiFSGlobalState.pid. If a pid is stored in this file and it does correspond to a running process, remove the dmiFSGlobalState.pid file and retry the operation. If the problem persists, reboot the system and repeat the appropriate analysis for your file system type.

ANS9154E *program-name: cannot deactivate space management for file system file-system: error.*

Explanation: Space management cannot be deactivated for the file system.

System action: TSM unable to deactivate space management support for the file system.

User response: The HSM file system status is inaccessible, possibly due to concurrent access. Try the operation again. If the problem continues verify that the file system is mounted and that HSM is enabled on the file system with the Unix shell commands mount and dsmdf. If the problem persists, reboot the system and try the operation again.

ANS9155E *program-name: cannot reactivate space management for file system file-system: error.*

Explanation: Space management cannot be reactivated for the file system.

System action: TSM cannot reactivate space management support to the file system.

User response: The HSM file system status is inaccessible, possibly due to concurrent access. Try the operation again. If the problem continues, verify that the file system is mounted and that HSM is enabled on the file system with the Unix shell commands mount and dsmdf. If the problem persists, reboot the system and try the operation again.

ANS9156I **Rollforward completed.**

Explanation: A Domino DB2 rollforward operation was completed.

System action: TSM rollforward the Domino DB2 database log.

User response: Continue with normal operations.

ANS9157W **Please enter a valid filespace location**

Explanation: This message will be seen when you run the Pref editor from MFC GUI. This means that user has not entered a required field which is filespace location path.

System action: TSM Enter required field

User response: Operation will not proceed till user enters required field

ANS9158W *program-name: cannot turn on ENOSPC checking in kernel: error .*

Explanation: TSM cannot turn on ENOSPC checking.

System action: TSM cannot turn on ENOSPC checking. Processing continues.

User response: Verify that the AIX JFS HSM fsm kernel extension is loaded, then try the operation again. If the problem persists, reboot the system and try the operation again.

ANS9159E *program-name: unable to create temporary file.*

Explanation: TSM cannot create a temporary file.

System action: TSM cannot complete its operation.

User response: Check with the Unix mount shell command that /tmp and /etc exist as separate file systems on your system. Use the df command to check whether they are full. Create additional space by deleting files or increasing the file system size.

ANS9160E *program-name: cannot write to temporary file or status filefile-spec : error.*

Explanation: TSM cannot complete writing to the temporary file.

System action: TSM cannot complete the requested operation.

User response: The Unix error code may provide guidance as to why the write failed. Use the Unix mount and df shell commands to verify that the associated file system is mounted and has space available. If this message resulted from a shell command, mount the file system and create additional space if necessary, then retry the operation. If the message did not result from a shell command, restart the daemons. If the problem persists, reboot the system.

ANS9161E **Invalid backupset file or device name entered.**

Explanation: The backupset file or device name specified does not contain a valid backupset.

System action: Processing stopped.

User response: Specify a file name or device that contains a valid backupset and retry the operation.

ANS9163W *program-name: Could not acquire the recall daemon session id.*

Explanation: Could not set up the event disposition for the file system, because the recall daemon session could not be acquired. It seems the recall daemon is not running. Recall requests will not be handled, which means the TSM client for space management can't react to recall requests for this file system.

System action: TSM could not set up the recall event handling. The recall event handling is not enabled for this filesystem.

User response: Start or restart the recall daemon.

ANS9164W *program-name*: **Could not acquire the monitor daemon session id.**

Explanation: Could not set up the event disposition for the file system, because the monitor daemon session could not be acquired. It seems the monitor daemon is not running. Thus the thresholds for file system usage will not be monitored and the NOSPSPACE event will not be handled, which means the file system may run out of space.

System action: TSM could not set up the NOSPSPACE event handling. The NOSPSPACE event handling is not enabled for this filesystem.

User response: Start or restart the monitor daemon.

ANS9165E *program-name* **cannot open directory** *directory-spec* **due to the following error:** *error*.

Explanation: The directory indicated in the message text cannot be opened. The message text includes a description of the error that occurred.

System action: The requested operation is not completed.

User response: Try to correct the error condition that is indicated in the message text, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS9166I A '*backup type*' backup version backup date '*datetime*' is not consistent with local repository and has been deleted from the server (object name='*filespace namepath-namefile-name*', ID = '*object-id:object-id*').

Explanation: The specified backup instance of the named object is not valid with local repository contents. This could happen if local repository is modified or got corrupted on the client system. This backup can not be restored, therefore it will be deleted on the server.

System action: The specified backup object will be deleted on the server. Processing will continue.

User response: None.

ANS9167W **The client cache for adaptive subfile backup is corrupt and cannot be used.**

Explanation: The adaptive subfile cache has become corrupt. While the backup client can detect the corruption, the reason for the corruption cannot be determined.

System action: The TSM client will proceed with standard selective or incremental backup. The cache will be rebuilt so that subsequent backups will use the adaptive subfile technique.

User response: If the problem persists, contact IBM technical support for assistance. Be prepared to provide the client error log, which will contain additional messages that might be useful for support to help identify the problem.

ANS9168E *program-name* **cannot open database** *file-spec* **due to the following error:** *error*.

Explanation: The database specified in the message text could not be opened. The reason for the error is included in the message text.

System action: The requested operation does not complete.

User response: Make sure that the file system has sufficient available space, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

ANS9169E *program-name*: **cannot create directory** *directory-spec* , *reason*.

Explanation: TSM cannot create this directory.

System action: TSM does not create this directory.

User response: Verify that this directory does not already exist, and that its parent directory has proper permissions.

ANS9170E *program-name*: **file-system is not a mounted local file system.**

Explanation: TSM did not find that this file system is properly mounted.

System action: TSM ignores the file system.

User response: Verify that this file system is local and mounted and activated properly.

ANS9171E **An error internal to TSM has occurred.** **The following string is too long:** *error*.

Explanation: None.

System action: The requested operation does not complete.

User response: A system reboot might clear up the problem, after which the operation should be tried again. If the problem persists, contact IBM technical support for further assistance.

ANS9172I **Backup system component "** *is excluded from processing*.

Explanation: You tried to back up the system component that was specified to be excluded from backup.

System action: IBM Tivoli Storage Manager did not back up the system component.

ANS9173I • ANS9182W

User response: Verify the input keyword or the writer name via the command line client and the Exclude lists.

ANS9173I Backup system component " doesn't exist.

Explanation: You tried to back up the system component that is not installed or is not started.

System action: IBM Tivoli Storage Manager did not back up the system component.

User response: Verify the input keyword or the writer name by using the GUI interface to expand the "System State" or "System Services" node.

ANS9174I A backup delete completed.

Explanation: A Backup delete was completed.

System action: TSM deleted backup files.

ANS9175E There is not enough memory for the backup delete operation

Explanation: TSM cannot allocate memory for the specified backup delete operation.

System action: TSM cannot continue with the requested backup delete operation.

User response: Close all unneeded applications and try the operation again. Reducing the scope of queries and the amount of data returned might also help, or see your system administrator.

ANS9176I Backup delete is stopped by the user.

Explanation: You requested the backup delete operation be stopped.

System action: Archive delete stopped.

User response: Continue with normal operations.

ANS9177T Reconciling local snapshot repository with TSM server....

Explanation: None.

System action: This message is informational.

User response: None.

ANS9178E *program-name* cannot open file *file-spec* due to the following error: *error*.

Explanation: The program indicated in the message text was unable to open the specified file. The message text also includes a description of the error that occurred when it tried to open the file.

System action: The requested operation does not complete.

User response: Verify that the file system on which

the file resides is mounted, then try the operation again. A system reboot might clear up the problem. If the problem persists, contact IBM technical support for further assistance.

ANS9179W Database log path is overlapping with the path for *data.value*.

Explanation: When log path overlaps database data path, the logs will be overwritten upon local restore causing rollforward recovery to fail.

System action: User will be prompted to select "Yes" to continue the restore operation, or to select "No" to stop the restore.

User response: User should select "No" to stop the restore operation and backup the logs to an alternate location. The restore operation can then be retried. Now the User can select "Yes" to continue the restore operation, in which case the logs will be overwritten. User will have to copy the logs back to the original location once the restore operation is complete. The rollforward operation can then be performed successfully.

ANS9180W An entry in the password file could not be decrypted.

Explanation: The password failed decryption validation.

System action: The password in the password file will be ignored. You will be prompted for the password, unless the process is running in the background, such as in scheduling mode.

User response: Enter the password when prompted.

ANS9181I Current statistics for DB2 restore host '*host*': Total number of volumes in request: *volumes* Total number of volumes completed: *complet* Total number of volumes in progress: *inprogr* Total number of volumes remaining: *remaing* Currently processing volumes: *process* Total number of bytes in request: *totalda* Total number of bytes transferred: *totaltr*

Explanation: None.

System action: This message is informational.

User response: None.

ANS9182W Your customized client nodes list already contains this node. Would you like to update it?

Explanation: The list of client nodes contains already the specified client node. You cannot have two client

nodes with the same client node name in the same machine.

System action: Updates or does not update the client node, depending on the user response.

User response: Select "yes" to update the client node. Select "no" to cancel this operation.

ANS9183W Removing Space Management from 'file-system' file system means that all migrated data will be recalled from TSM Server 'server-name' Make sure that enough free space is present on this file system for the recalled data. Do you want to remove Space Management from 'client-node' now?

Explanation: Removing Space Management from the selected file system means that all migrated data will be recalled from the server.

System action: Prompts the user to confirm when removing Space Management from the selected file system.

User response: Make sure that enough free space is present on this file system for the recalled data.

ANS9184E *program-name* cannot allocate memory due to the following error: *error*.

Explanation: A memory allocation error occurred. The message text includes a description of the error that occurred.

System action: The requested operation does not complete.

User response: Try the operation again. If the problem occurs in an HSM daemon, restart the daemon, then try the operation again. If the problem continues to occur, use your operating system's administrative tools to check virtual memory (swap space) on your system, and increase it if necessary. Check whether an application is consuming available virtual memory. A system reboot might also clear up the problem. If the problem persists, contact IBM technical support for further assistance.

ANS9185W Master scout daemon is not running!

Explanation: A list of candidates files eligible for migration cannot be built because the master scout daemon is not running on the selected client node.

System action: Files are not automatically migrated to the TSM server.

User response: Restart the master scout daemon manually using the "dsmscoutd" command from a command shell on the machine where Space Management Agent is running.

ANS9186E *program-name*: cannot open mounted file system *file-system* : *error*.

Explanation: TSM cannot open mounted file system.

System action: TSM ignores the file system.

User response: Verify that this file system is mounted and activated properly.

ANS9187W Monitor daemon is not running!

Explanation: Files cannot be automatically migrated to the TSM server or recalled from TSM server because the monitor daemon is not running on the selected client node.

System action: Files are not automatically migrated or recalled from the TSM server.

User response: Restart the monitor daemon manually using the "dsmmonitord" command from a command shell on the machine where Space Management Agent is running.

ANS9188E Not enough memory for recall operation

Explanation: TSM cannot allocate storage for the requested recall operation.

System action: TSM cannot complete the requested operation.

User response: Retry the recall operation. If the problem continues, check with your system administrator.

ANS9189I Recall stopped by user

Explanation: You requested that TSM stop the recall operation.

System action: Recall stopped.

User response: Continue with normal operations.

ANS9191E Error checking file system state

Explanation: The system cannot open /dev/dsm or cannot open the file system.

System action: Transaction stopped.

User response: Retry the operation. If the problem continues, check with your system administrator.

ANS9192I Cannot disable *file-system*.

Explanation: TSM cannot disable the file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM ignores the request.

User response: Use the dsm Unix shell commands.

ANS9193I Cannot open *file-system*.

Explanation: TSM cannot open the file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM ignores the request.

User response: Use the dsm Unix shell commands.

ANS9194W A selective migration is in progress. Wait until it completes and retry the recall.

Explanation: You tried a recall operation while a selective migration is in progress.

System action: TSM ignores the request.

User response: Wait until the selective migration is complete and retry the recall operation.

ANS9195W A selective recall is in progress. Wait until it completes and retry the migration.

Explanation: You initiated a migration operation while a selective recall is in progress.

System action: TSM ignores the request.

User response: Wait until the selective recall is complete and retry the migration operation.

ANS9196W The PASSWORDACCESS option in your dsm.sys file is not set to GENERATE. Reset it to GENERATE and restart the HSM client.

Explanation: The PASSWORDACCESS option in your dsm.sys file is set to PROMPT. It must be set to GENERATE in order for automatic space management services to work.

System action: TSM terminates the client.

User response: The root user must set the PASSWORDACCESS option to GENERATE in the dsm.sys file.

ANS9197E File: *file-name* has already been recalled.

Explanation: You tried to recall the a file that has already been recalled.

System action: TSM does not highlight the file.

User response: None.

ANS9198E File: *file-name* is a resident file.

Explanation: You tried to recall a file that is resident.

System action: TSM will not highlight the file.

User response: None.

ANS9199S Cannot open /dev/fsm

Explanation: TSM cannot open the space management device file, /dev/fsm.

System action: TSM cannot complete the operation.

User response: Check to see whether TSM is installed correctly and that the /dev/fsm file exists. Correct the problem and retry the operation.

ANS9201W LAN-free path failed.

Explanation: A LAN-free connection could not be made.

System action: The system will connect to the server without using the LAN-free path.

User response: Verify your LAN-free setup.

ANS9203E ENABLELANFREE can not be used when HSM is installed.

Explanation: The TSM Client has detected that HSM is installed on the system. LAN-free is not a valid option when HSM is installed.

- This error occurs on AIX when this file is found: /usr/tivoli/tsm/client/hsm/bin/dsmrecalld
- This error occurs on Solaris when this file is found: /opt/tivoli/tsm/client/hsm/bin/dsmrecalld

System action: An invalid option is detected and processing stops.

User response: Remove the ENABLELANFREE option from the system option file. ENABLELANFREE can only be used when HSM is not installed.

ANS9206W User quota is reached!

Explanation: The maximum amount of data that can be migrated and premigrated from this file system to the TSM Server is reached.

System action: Files cannot be migrated to TSM server.

User response: Use the File System Properties dialog to specify a different quota value.

ANS9220W Recall daemon is not running!

Explanation: Files cannot be recalled from TSM server because the recall daemon is not running on the selected client node.

System action: Files are not recalled from the TSM server.

User response: Restart the recall daemon manually using the "dsmrecalld" command by a command shell on the machine where Space Management Agent is running.

ANS9227E Internal error loading the status:
error-message

Explanation: An exception has been detected loading the status of space management activities.

System action: The status of the related activity is not loaded. The process continues to load the status at the next refresh interval.

User response: Check the dsmsm.log file in the installation directory of your local machine and the \$DSM_DIR/dsmerror.log file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS9230E Communication error detected in the migration phase of this process!

Explanation: An unexpected error is occurred due to server communication error in migration phase.

System action: TSM will not migrate files from this file system.

User response: Check the dsmsm.log file in the installation directory of your local machine and the \$DSM_DIR/dsmerror.log file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS9231E Processing error detected in the migration phase of this process!

Explanation: An unexpected error is occurred due to some processing communication error.

System action: TSM will not migrate or premigrate files from this file system.

User response: Check the dsmsm.log file in the installation directory of your local machine and the \$DSM_DIR/dsmerror.log file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS9233E Processing error detected in the premigration phase of this process!

Explanation: An unexpected error is occurred due to some processing communication error in the premigration phase.

System action: TSM will not premigrate files from this file system.

User response: Check the dsmsm.log file in the installation directory of your local machine and the \$DSM_DIR/dsmerror.log file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or

TSM technical support for further assistance.

ANS9236E Error detected performing reconciliation on this file system!

Explanation: An error is occurred performing reconciliation on the selected file system.

System action: TSM will not reconcile this file system with TSM server.

User response: Check the dsmsm.log file in the installation directory of your local machine and the \$DSM_DIR/dsmerror.log file on the client node machine if present. If this does not identify the cause of the problem, contact your system administrator and/or TSM technical support for further assistance.

ANS9240W Could not acquire the serial number of disk 'disk-name' at LUN LUN-id.

Explanation: TSM was not able to determine the serial number of the specified disk. The disk may not support SCSI inquiries of the Vital Product Data on page 0x80.

System action: Server-free data movement will not be possible for data residing on the specified disk.

User response: None.

ANS9249E File 'file-namefile-namefile-name' accessed during migration. File skipped.

Explanation: The specified *file-name* was not migrated because the file was accessed by another process during the attempt to migrate it.

System action: TSM left the file resident.

User response: If you want the file migrated, stop the process which is accessing the file and retry the migration.

ANS9250I File system 'file-system' reconciliation completed.

Explanation: TSM has finished reconciling the file system.

System action: TSM continues.

User response: Continue with normal operations.

ANS9251E ProgramName: Cannot parse command-line options correctly.

Explanation: An internal program error occurred trying to parse the command-line arguments.

System action: The program is not able to process the request.

User response: Use the -h or -help option to see what options are allowed on the command-line, then retry the request.

ANS9252I Value of environment variable: *envVar*.

Explanation: None.

System action: This message is informational.

User response: None.

ANS9254E An error was encountered while adding implicit excludes to the include-exclude list.

Explanation: None.

System action: TSM cannot proceed.

User response: If HSM control file exclusion conflicted with other include/exclude directives, correct the explicit include/exclude directives to allow for exclusion of HSM control files and directories. Ensure that all HSM file systems are mounted.

ANS9256E File '*file-namefile-namefile-name*' is currently opened by another process. File skipped.

Explanation: The specified *file-name* was not migrated because the file was open by one or more other processes.

System action: TSM left the file resident.

User response: If you want the file migrated, stop the processes which currently have the file open and retry the migration.

ANS9257E Server '*server-name*' does not support space management.

Explanation: The specified *server-name* does not support space management. It is a downlevel server, or a platform that does not support space management.

System action: TSM failed the operation.

User response: If you want to use the space management function, make sure you connect to a server that supports space management.

ANS9263W You cannot restore both active and inactive versions of System State.

Explanation: Restoring an active copy and inactive copy of System State is not allowed.

System action: No processing takes place.

User response: Select either the active copy or the inactive copy to perform restore operation.

ANS9264E Incremental backup of Virtual Machine '*vmname*' failed with RC *rc*

Explanation: The incremental backup of virtual machine volumes failed.

System action: The backup of the virtual machine finished with failures. The next virtual machine in the *vm*list will be processed. The reason for the failure is written to the local client error log.

User response: Check the local client error log for reason for the failure.

ANS9265E Failure mounting Virtual Machine '*vmname*' with *vcbMounter* command. RC=*rc*

Explanation: The VMware *vcbmount* command failed to mount virtual machine disk.

System action: The backup of the virtual machine can not continue. The next virtual machine in the *vm*list will be processed. The output of the *vcbMounter* command will show the reason for the failure.

User response: Issue a *vcbMounter* command for the virtual machine to determine the reason for the failure. Refer to the documentation for that message for more information.

ANS9266E Failure initializing virtual machine environment. Can not find *vcbMounter.exe* command. RC=*rc*

Explanation: Failure initializing virtual machine environment. Can not find *vcbMounter.exe* command. The VMware Consolidated Backup Framework not installed or *vcbMounter.exe* command is not located in current *PATH* environment variable.

System action: The backup can not continue. The output of the *vcbMounter* command will show the reason for the failure.

User response: Issue a *vcbMounter* command for the virtual machine to determine the reason for the failure. Refer to the documentation for that message for more information. The VMware Consolidated Backup Framework must be installed on the Backup Proxy machine. The installed location and the *vcbMounter.exe* must be located in the *PATH* environment variable. The default location is C:\Program Files\VMware\VMware Consolidated Backup Framework.

ANS9267E *program-name*: File system *file-system* has exceeded its quota.

Explanation: TSM detects that the file system has exceeded its quota. No more data can be migrated out of this file system.

System action: TSM will not migrate files from this file system.

User response: Recall some files, or ask the system administrator to increase the quota for this file system.

ANS9278E Failure processing vmList option. RC=*rc*

Explanation: Failure processing vmList option.

System action: The backup can not continue.

User response: Check for errors in the vmList option value. Refer to the documentation for the vmList option for more information.

ANS9279E Failure locating Virtual Machine '*vmname*' volumes. Failed with RC=*rc*

Explanation: Virtual machine volumes can not found. Volume mount points are not available on Backup Proxy machine.

System action: The backup of the virtual machine can not continue. The next virtual machine in the vmlist will be processed. The output of the vcbMounter command will show the reason for the failure.

User response: Issue a vcbMounter command for the virtual machine to determine the reason for the failure. Refer to the documentation for that message for more information.

ANS9280E '*vmname*' option must be set when running this operation.

Explanation: A required option for the command is missing.

System action: The operation can not continue.

User response: Set the missing option using the Preference Editor or the command line.

ANS9283K Tivoli Space Manager is recalling a migrated file.

Explanation: The space management kernel extension is attempting to access a file that is not stored locally. If the file is migrated, TSM is attempting to access it from an TSM space management server.

System action: TSM waits for the kernel to access the file.

User response: None.

ANS9284K File access waiting for migration to complete.

Explanation: The file being accessed is currently being migrated. Access to this file must wait until the migration process is finished.

System action: TSM waits until the file migration is completed.

User response: None.

ANS9285K Cannot complete remote file access.

Explanation: The space management kernel extension cannot complete the remote file access. The file may be migrated to an TSM migration server. The file cannot be recalled to the local machine. The server could be temporarily disabled.

System action: TSM terminates the current operation.

User response: Check to see whether the server has been disabled by the system administrator, then retry the operation.

ANS9286K File migration has been discontinued.

Explanation: Migration stops because the file is being migrated by another process.

System action: TSM terminates the current operation.

User response: None.

ANS9287E Invalid or unsupported device.

Explanation: The logical volume device is either invalid or unsupported. Refer to the documentation for device type support for image backup.

System action: The logical volume operation is not performed.

User response: For image backup source or image restore destination, specify a device of one of the supported types.

ANS9288I File *file-name* of size *file-size* is too small to qualify for migration.

Explanation: The file is smaller than the minimum size required for migration. A file is considered for migration only if its size is greater than both the stub file size specified for the file system plus 1 byte and the block size defined for the file system.

System action: TSM does not migrate this file because it will not free additional space.

User response: None.

ANS9289I Object '*dir-name*' is a directory. It is skipped for migration.

Explanation: The object is a directory. It is not migrated. Space management does not migrate directories.

System action: TSM does not migrate this object because it is a directory.

User response: None.

ANS9290I Error processing file *file-name*. It is skipped for migration.

Explanation: The file either cannot be read, is not a regular file, or its type is unknown to space management. Space management only migrates regular files and does not migrate directories, symbolic links, special files.

System action: TSM does not migrate this file.

User response: None.

ANS9291E *program-name*: A conflicting space management program is already running in the *file-system* file system. Re-run this program later in this file system.

Explanation: TSM detected another program running in the file system that cannot run at the same time as the program you tried to initiate. The following programs cannot run at the same time for a file system:

- dsmreconcile
- dsmautomig
- dsmmigfs remove.

Also, dsmmigfs remove cannot run while a migration process is running in the file system.

System action: TSM will not run the program at this time.

User response: Try running the program later.

ANS9292E *program-name*: Cannot access lock file *lock-file* *lock-file*:error

Explanation: TSM cannot access a lock file due to an error. The lock file provides serialization of certain programs to prevent conflicting processes from running at the same time.

System action: TSM will not run the program at this time.

User response: Check the permissions on the directories leading up to the lock file and also the permissions on the program executable.

ANS9293E TSM space management cannot access ERRORPROG *error-program*:error

Explanation: TSM encountered an error trying to access the program specified with the ERRORPROG option in your client system options file (dsm.sys). This message will appear only the first time this error occurs.

System action: TSM cannot send a severe error message to the specified error message program.

User response: Check to make sure the program exists and that it accepts standard input when run. It is usually best if ERRORPROG specifies the fully qualified file name of the program.

ANS9294I No files matching '*file-name*' were found.

Explanation: You entered a search pattern or file name that cannot be found in the local file system.

System action: Processing stopped.

User response: Ensure that your search pattern is correct, or specify a new search string.

ANS9296W Performing image backup of the entire volume for *volume name*. The IMAGEGAPSIZE option and used block image backup is not supported for non-JFS2 file systems on AIX.

Explanation: None.

System action: The entire volume is backed up.

User response: Refer to the client manual for additional information regarding the IMAGEGAPSIZE option and used block image backup.

ANS9297I File *file-name* is skipped for migration: No backup copy found.

Explanation: A management class is assigned to the file with the attribute MIGREQUIRESBKUP set to YES. This requires a current backup copy of the file before migration. However, there is no backup copy found on the migration server. This file will not be migrated. Note: TSM checks only the migration server for a backup copy. If the migration server and backup server are different servers, TSM does not find a backup copy of the file.

System action: TSM does not migrate this file.

User response: Back up this file on the migration server, or assign a management class to this file that does not require a current backup copy. Retry the operation.

ANS9298I File *file-name* is skipped for migration: Backup copy found is not current.

Explanation: A management class is assigned to the file with the attribute MIGREQUIRESBKUP set to YES. This requires a current backup copy of the file before migration. However, the backup copy found on the migration server is an old version. This file will not be migrated. Note: TSM checks only the migration server for a backup copy. If the migration server and backup server are different servers, there must be a valid backup copy of the file on the migration server.

System action: TSM does not migrate this file.

User response: Back up the current file on the migration server, or assign a management class to this file that does not require a current backup copy. Retry the operation.

ANS9299I Cannot get the number of migrated files for file system *file-system* .

Explanation: Failed to get the number of migrated files on the file system. The number is stored in the status file for the file system.

System action: If you are removing space management from the file system, processing stops. Space management is not removed.

User response: Run reconciliation to reconcile the file system. Retry operation.

ANS9300I Migrated files found in file system *file-system*. Check for any error encountered during recall.

Explanation: Remove space management failed because there are migrated files in the file system. TSM was unable to recall any files, or some of the migrated files may have failed during a recall operation.

System action: TSM remove processing stops.

User response: Check for error messages that occurred during the recall process, correct any problems, and retry the remove process.

ANS9301E Full VM backup of Virtual Machine *'vmname'* failed with RC *rc*

Explanation: The Full VM backup of virtual machine failed.

System action: The full backup of the virtual machine finished with failures. The next virtual machine in the vmlist will be processed. The reason for the failure is written to the local client error log.

User response: Check the local client error log for reason for the failure.

ANS9302E The Restore VM command does not support VMBACKUPTYPE=FILE data. VM File level restore must be run from inside the virtual machine or with the *'asnodename'* option.

Explanation: The Restore VM function not supported for file level data.

System action: The system does not process your requested action.

User response: Virtual machine File level restore must be run from inside the virtual machine or with the asnodename option. To process a full virtual machine restore, issue the command with VMBACKUPTYPE=FULLVM.

ANS9303E Full VM restore of Virtual Machine *'vmname'* failed with RC *rc*

Explanation: The Full VM restore of virtual machine failed.

System action: The full restore of the virtual machine finished with failures. The next virtual machine in the vmlist will be processed. The reason for the failure is written to the local client error log.

User response: Check the local client error log for reason for the failure.

ANS9304E VMware Converter tool not installed on system.

Explanation: VMware Converter tool install could not be detected on system.

System action: The full virtual machine image files have been restored successfully at the specified location.

User response: No further action is necessary. The full virtual machine images files can be used by various tools. VMware Converter tool can be installed on system.

ANS9312S *program-name*: Cannot change owner/group on file: *file-name* : error

Explanation: TSM cannot change the ownership or group, or both for the specified file. This change is necessary for space management to run properly.

System action: TSM cannot continue processing.

User response: Ensure that directory permissions allow the file owner or group to be changed. Reissue the command.

ANS9313E *program-name*: The TMP directory is full.

Explanation: The TMP directory from the operating system is full.

System action: TSM stops.

User response: Delete some files in the TMP directory and retry the operation.

ANS9316T File system *'file-system'* undelete completed.

Explanation: TSM has finished undeleting the file system.

System action: TSM continues.

User response: Continue with normal operations.

ANS9318W *program-name: error encountered while undeleting file system file-system.*

Explanation: TSM encountered an error performing undelete on the file system.

System action: TSM continues.

User response: Continue with normal operation.

ANS9349I **Selective Recall completed**

Explanation: The selective recall was completed.

System action: TSM recalled the files.

User response: Continue with normal operations.

ANS9353I **Selective Recall stopped by user.**

Explanation: You requested to stop the selective recall operation.

System action: Selective recall stopped.

User response: Continue with normal operations.

ANS9357E **The dsmscout executable cannot be used on the user level.**

Explanation: The dsmscout process is exclusively started by the dsmonitord.

System action: TSM aborts the operation.

User response: None.

ANS9399W *program-name: lock file access error for operation value on path value value with errno text value.*

Explanation: A lock file operation has failed.

System action: TSM logs the condition and continues processing, or exits if directory not found.

User response: Correct the configuration.

ANS9400W *program-name: Recovered program-name. The daemon was either not started or in corrupted state.*

Explanation: TSM HSM daemon breakdown with automatic recovery by the dsmswatchd.

System action: Restarting the daemon.

User response: Continue with normal operation.

ANS9401E *program-name: Cannot kill recall daemon.*

Explanation: TSM A request for killing the recall daemon failed. This may occur during node failover.

System action: none.

User response: Continue with normal operation unless further errors occur.

ANS9402E *program-name: Cannot notify to recover HSM operations on a failure node.*

Explanation: In order to assume the functionality of a failing partner node, the dsmswatchd must notify the local daemons.

System action: none.

User response: Communication cannot be established with the HSM daemon specified in this message. Check whether the target daemon is running. Start or restart the target daemon as appropriate. If the problem persists, reboot the GPFS cluster.

ANS9403E *program-name: The local HSM functionality cannot be recovered. Trying to initiate failover to another node.*

Explanation: TSM If the GPFS daemon crashes or the local HSM daemons cannot perform their function for whatever reason the dsmswatchd will try to migrate the functionality to another node.

System action: Migrate HSM functionality to another node.

User response: Check failure node. It may be necessary to recover the local GPFS daemon.

ANS9405W *program-name: The takeover of filesystem file system started.*

Explanation: The local activation of the specified file system started successfully.

System action: TSM on the local node will try to activate the file system that is space managed on another node.

User response: None.

ANS9412E *program-name: Failover is disabled on the local machine. Aborting failover ...*

Explanation: TSM Failover operations were disabled either by the system or the user.

System action: None.

User response: Check failover policy if necessary.

ANS9413W *program-name: The remote node was able to recover from failure situation. Aborting takeover ...*

Explanation: The remote dsmswatchd was able to recover from the failure situation during the local takeover operation.

System action: None.

User response: Check failure node for consistency.

ANS9414E *program-name: Unable to create file-name in the SDR. Aborting ...*

Explanation: An update of an SDR object failed.

System action: Aborting operation.

User response: Check SDR consistency.

ANS9418W *program-name: File file-name could not be acquired at the moment. It may be locked, or the var filesystem may be full. Will try to acquire the SDR lock again in a few seconds.*

Explanation: SP-wide files are stored in the SDR. These files can be accessed as soon as it is possible to set a certain SDR lock. If a 2nd process holds this lock, access to the file is denied till the lock is released.

System action: TSM None.

User response: Wait. If the situation does not get resolved within a reasonable amount of time (about 1 min.), examine the var file system. If it is full, free up some space. Otherwise execute dsmmigfs SDRreset. This will reset all activated locks in the SDR for the local GPFS node set.

ANS9419E *program-name: The filesystem filesystem-name is either already managed locally or under the control of a remote HSM instance.*

Explanation: A GPFS filesystem can be managed just once.

System action: Aborting operation.

User response: Execute dsmmigfs query -detail to have a look at the current HSM configuration within the local GPFS node set.

ANS9420E *program-name: An update of the configuration files in the SDR is not allowed as long as failover is disabled on the local machine.*

Explanation: You cannot update configuration files in the SDR when failover is disabled on the local machine.

System action: TSM Aborting operation.

User response: Do nothing, or activate failover by using dsmmigfs enableFailover before running dsmmigfs SDRupdate.

ANS9421W *program-name: Recovered from Lock on SDR File file-name*

Explanation: This output relates to ANS9418W. A previously blocked SDR file got unlocked.

System action: TSM continues.

User response: None.

ANS9422W *program-name: The rollback of filesystem file system started.*

Explanation: The local activation of the specified file system started successfully.

System action: TSM on the local node will try to activate the file system that is space managed on another node.

User response: None.

ANS9423E *program-name: Setting the default partition name failed! Aborting operation ...*

Explanation: The application needs to have access to the SP™ Group Services. In this context it tries to extract the default partition name for the local system as provided by spget_syspar. The data extraction failed.

System action: Aborting operation.

User response: Check node consistency.

ANS9424E *program-name: It was not possible to send a message to the SP Group Services. This is a severe error.*

Explanation: The Failover environment requires proper access to the SP Group Services. The distribution of a message failed.

System action: Aborting operation.

User response: If the problem persists, verify SP Group Service is accessible and is not overwhelmed. If the problem persists, reboot the GPFS cluster.

ANS9425E *program-name: It was not possible to notify the dsmswatchd in order to distribute a message within the failover group. The data of the current operation may get lost.*

Explanation: Some HSM commands need to inform the dsmswatchd about the current operation. This notification failed.

System action: Aborting operation.

User response: Restart the GPFS daemon and check that the DMApi support is active by executing /usr/lpp/mmfs/bin/mmlsfs deviceName.

ANS9428E *program-name: The takeover of filesystem file system failed to start.*

Explanation: The local activation of the specified file system failed to start. Please, note that only file systems which are space managed on another node within the same cluster can be taken over. Additionally, the file system must be mounted locally.

System action: TSM will not take over the file system.

User response: Make sure the file system is mounted locally and managed with the TSM client for space management on another node within the same cluster and retry the operation.

ANS9433E *program-name: dm_send_msg failed with errno Errno.*

Explanation: Unable to execute DMApi call.

System action: Aborting operation.

User response: Check consistency of the GPFS daemon.

ANS9442E *program-name: It appears that another dsmmigfs add/rem/update command is in process within the local GPFS nodeset. Please wait a few moments, then repeat the operation. If a previous dsmmigfs command was aborted, there could be a stale lock in the SDR. If so, run dsmmigfs SDRreset to fix the problem.*

Explanation: There can only be one instance of dsmmigfs add/rem/update running within a GPFS nodeset at the same time.

System action: Aborting operation.

User response: Wait for a bit and try again. If no other instance of dsmmigfs is running within the local GPFS nodeset run dsmmigfs SDRreset.

ANS9443E *program-name: The operation cannot be executed in a deactivated failover environment.*

Explanation: The operation relies on an active failover environment.

System action: Aborting operation.

User response: Run dsmmigfs enableFailover on the local node and repeat the operation.

ANS9449W *program-name: Forced deactivation of the local failover environment!*

Explanation: TSM Failover was initiated or a problem with the group services occurred.

System action: Continuing failover or aborting operation.

User response: Check HSM and SP Group Services environments. Execute dsmmigfs enableFailover after resolving the problem.

ANS9450W *program-name: No eligible filesystem for takeover.*

Explanation: None of the locally mounted GPFS filesystems matches with the remotely managed filesystems of the failure node.

System action: Aborting takeover operation.

User response: Check that the filesystems of the remote failure node get managed elsewhere within the node set.

ANS9451E *program-name: GPFS or the SP switch is down locally. Aborting takeover activities ...*

Explanation: TSM GPFS is not functional locally.

System action: Aborting takeover operation.

User response: Check switch and VSD status. The local system must be unfenced.

ANS9452E *program-name: The DMApi is not functional locally. Aborting takeover activities ...*

Explanation: The operation stopped because the DMApi interface is not accessible.

System action: Aborting takeover operation.

User response: Check GPFS status.

ANS9453E *program-name: Could not determine the GPFS storage pool id for file 'file-path'. Reason: reason*

Explanation: The processed file does not exist or is located on a file system without storage pool support.

System action: The requested operation stops.

User response: Please check the input parameters and if DMAPI is enabled on the file system.

ANS9454W *program-name: Performing synchronization between the local and global file event handling.*

Explanation: The local node received a request from a remote node to synchronize with the global file event handling (DMApi event disposition).

System action: Synchronization proceeds.

User response: None.

ANS9455E *program-name:* **Unable to join the local failover group with rc=return-code!**

Explanation: SP Group services reported a problem accessing/creating an HSM group.

System action: Aborting operation.

User response: Check PSSP environment on the local node.

ANS9457E *program-name:* **Could not determine the storage pools of file system 'file-system'.**
Reason: *reason*

Explanation: The specified file system is not a GPFS file system or has an old GPFS version.

System action: The requested operation stops.

User response: Please update to a supported version of GPFS.

ANS9458I *program-name:* **Responsiveness Service successfully started.**

Explanation: Starting and joining the Responsiveness Service to monitor other nodes for failover was successful. The node will now try to establish a connection to the service of other nodes.

System action: Processing continues.

User response: None.

ANS9459E **Using the specified MAXCANDIDATES parameter would produce an out-of-space condition in the parent filesystem of /etc/adsm/SpaceMan/candidatesPool. Based on the current free space situation the maximum value for the MAXCANDIDATES parameter is value.**

Explanation: TSM The automigration candidate pools for the selected filesystem require MAXCANDIDATES/10 KB plus a safety buffer of 5 MB of memory under /etc/adsm/SpaceMan/candidatesPool, which exceeds the available space.

System action: TSM Abort operation.

User response: Increase the filesystem size or choose a smaller value for the MAXCANDIDATES parameter. You may also create a dedicated filesystem with sufficient space for the migration pools under /etc/adsm/SpaceMan/candidatesPool. Kill the dsmscout processes after performing this option.

ANS9462E **Failover functionality is not supported with this HSM release.**

Explanation: The TSM user ran dsmmigfs with the failover flag on an unsupported platform.

System action: TSM ends the operation.

User response: None.

ANS9469E **Warning! Unable to write a complete migration candidate list due to low space in the parent filesystem of name.**

Explanation: TSM Low space in filesystem which stores the migration candidates files.

System action: TSM The executable writes a partial migration candidates list.

User response: Increase the filesystem size or create a dedicated filesystem with sufficient size under the given path.

ANS9472I *program-name:* **Updating failover information for Node ID: node**

Explanation: Failover status information for remote node was updated.

ANS9474E *program-name:* **Lost my session with errno: errno . Trying to recover.**

Explanation: The DMAPI session is not valid.

System action: Trying to recover session.

User response: Check the failure node. You might have to recover the local GPFS daemon.

ANS9476I *program-name:* **Recovered my DM session sid.**

Explanation: DMAPI session is recovered.

ANS9480E *program-name:* **The rollback of filesystem file system failed to start.**

Explanation: The local activation of the specified file system failed to start. Please, note that a rollback can only be performed after the space management of the file system was moved from the local node to another node during failover. Additionally, the file system must be mounted locally.

System action: TSM will not roll back the file system.

User response: Make sure the file system is mounted locally and managed with the TSM client for space management on another node within the same cluster and retry the operation.

ANS9500W *program-name: cannot disposition the mount event. Reason: error*

Explanation: The system wide mount event could not be dispositioned. Mount events will not be received by this daemon.

System action: TSM continues.

User response: Try to resolve the problem and restart the recall daemon. If the problem cannot be resolved immediately, kill and restart the recall daemon after an TSM space management supported file system has been added using dsmmigfs or after a file system has been mounted using the mount command.

ANS9501W *program-name: cannot set event disposition on session session for file system mountdir token = token . Reason : error*

Explanation: Events could not be dispositioned on the file system. No events will be received for this filesystem. HSM is not enabled for this file system.

System action: TSM continues.

User response: The file system must be one of the supported native file systems in order for the TSM space management to support it. Verify that the mount options the file system are correct. Correct the problem and remount the file system.

ANS9502W *program-name: cannot remove event disposition on session session for file system mountdir token = token . Reason : error*

Explanation: Event dispositions could not be removed from the file system.

System action: TSM continues.

User response: Verify that the file system is mounted and that dmapi is enabled on that file system. If the problem persists, unmount and remount the file system, then try the operation again. If the problem still persists, reboot the system.

ANS9503I *program-name: events have been set and dispositioned on session session for file system filesystem-name*

Explanation: Setting events and dispositioning these on a DM session enables the file system for TSM space management support.

System action: TSM continues.

User response: Continue with normal operation.

ANS9504W *program-name: The file system filesystem-name is not mounted or is mounted with wrong options.*

Explanation: Either the file system is not mounted or it has been mounted with incorrect options.

System action: TSM continues.

User response: Mount the file system or remount it with corrected mount options.

ANS9505E *program-name: cannot initialize the DMAPI interface. Reason: error*

Explanation: TSM client failed to perform implementation-defined initialization of the DMAPI interface.

System action: The dm_init_service() function failed.

User response: If you are running TSM as a non-root user and you have TSM space management client installed, please, make sure that the dsrootd daemon is up and running, then retry the operation. If you don't have TSM space management client installed, retry the operation under the root user authority.

ANS9506E *program-name: The provided filepath argument 'argument' has an invalid format.*

Explanation: Occurs if you are on a GPFS file system and the file system parameter was not in the correct format.

System action: The requested operation stops.

User response: See the dsmautomig documentation for the correct syntax.

ANS9507E *program-name: cannot request the right on session session for file handle filehandle token = token . Reason : error*

Explanation: TSM space management cannot request the required right on a file.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9508W *program-name: cannot release the right on session session for file handle = filehandle token = token . Reason : error*

Explanation: TSM space management cannot release the right on a file.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9509W *program-name: received an unexpected event of type event-type on session session.*

Explanation: TSM space management daemon received an unexpected event. This event has not been dispositioned.

System action: TSM ignores event and continues.

User response: Continue with normal operation.

ANS9510E *program-name: cannot get event messages from session session , expected max message-length = msglen, returned message-length = return-length. Reason : error*

Explanation: TSM space management encountered an error while trying to receive a message on a DM session.

System action: TSM continues.

User response: Continue with normal operation.

ANS9511E *program-name: cannot read DM attributes on session session for file: name = name handle = handle token = token. Reason : error*

Explanation: TSM space management cannot read the DM attributes of a DM object, usually a file. If the file name is not available, it will be displayed as an empty string or as <NA>.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9512E *program-name: cannot set DM attributes on session session for file handle = filehandle token = token . Reason : error*

Explanation: TSM space management cannot set DM attributes for a DM object, usually a file.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9513E *program-name: cannot remove DM attributes on session session for file handle = filehandle token = token . Reason : error*

Explanation: TSM space management cannot remove DM attributes for a DM object, usually a file.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9514E *program-name: cannot create a file handle from path . Reason: error*

Explanation: TSM space management cannot create a file handle from the given file.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9515E *program-name: cannot set the migration information. Reason: error*

Explanation: TSM space management cannot set the migration information of a file, because space management cannot create a file handle from the file and/or from the file system.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9516E *program-name: cannot create an user event message on session session. Reason: error*

Explanation: TSM space management cannot create an user event message, needed to reference rights on a file to be processed.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9517I *program-name: cleared event messages from session session. Reason: error*

Explanation: TSM space management is in the process of destroying a DM session. There are still unexpected event messages on this session that were responded to.

System action: TSM DM session is not destroyed.

User response: This message is informational. If the session could not be destroyed, try the operation again. If the problem persists, reboot the system.

ANS9518E *program-name: cannot respond to an event message on session session using token token Reason : error*

Explanation: An event message could not be responded to (returned to the system).

System action: TSM space management continues.

User response: If a user process is unexpectedly blocked and cannot be killed, see your system administrator.

ANS9519W *program-name: cannot set eventlist for a file system on session session token = token fs-handle = fs-handle. Reason : error*

Explanation: An eventlist could not be set on a file system. None of the events will be generated by the system on this file system.

System action: TSM space management continues.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, reboot the system.

ANS9520E *program-name: cannot set a managed region on session session for file handle = filehandle token = token . Reason : error*

Explanation: A managed region could not be set on a file. No events will be generated for this file.

System action: Processing of the file is interrupted.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, reboot the system.

ANS9521E *program-name: cannot get the file attributes on session session for file handle = handle token = token . Reason : error*

Explanation: TSM space management cannot read the attributes of a file.

System action: Processing of the file is interrupted.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, reboot the system.

ANS9522E *program-name: can not create a file system handle from path . Reason: error*

Explanation: TSM can not create a file system handle from the file system name. If Reason is Operation not permitted, the dmapi functionality may be disabled for the file system.

System action: Processing of the file system is interrupted.

User response: If Reason is Operation not permitted, enable dmapi functionality for the file system and retry.

ANS9523E *program-name: is unable to verify the stub size for the file on session session file handle = filehandle token = token. Reason : error*

Explanation: A correct stub size could not be determined by the system.

System action: TSM stops migration of the file.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9524W *program-name: adjusted stubsize to an allowed value on session session file handle = filehandle token = token old stubsize = old-size new stubsize = new-size*

Explanation: The predefined stubsize for the file was not valid. The system corrected the stubsize.

System action: TSM space management continues.

User response: Continue with normal operation.

ANS9525E *program-name: is unable to create a stub file on session session for file handle = handle token = token. Reason : error*

Explanation: An error occurred while creating a stub file.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9526E *program-name: cannot open the state file filename for writing. Reason: error*

Explanation: The global or file system state file could not be opened.

System action: TSM stops processing.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9527E *program-name: cannot write to the state file filename . Reason: error*

Explanation: TSM space management could not write to the state file.

System action: TSM stops processing.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9528W *program-name: cannot read from the state file filename. . The file is corrupted and will be recreated.*

Explanation: TSM space management could not read from the state file.

System action: TSM stops processing.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9529W *program-name: cannot obtain the handle of a file system state file*

Explanation: TSM space management could not find the handle of a file system state file that is stored in the global state file. This can occur if either space management is querying a file system that has no HSM support added, or the file system state file is corrupted, or the global state file is corrupted.

System action: TSM continues or stops processing, depending on the situation.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9530W *program-name: cannot remove an entry for file-system from the global state file.*

Explanation: The entry for the file system in the dmiFSGlobalState file cannot be removed. Possible reasons:

- There is not enough memory to create temporary file name for temporary file system table.
- There is not enough free space or inodes to create temporary file system table
- The real or temporary file system table files cannot be opened.

System action: TSM does not remove the entry from the global state file.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9531E *program-name: cannot create a DM session: old session = oldsession session info = session-info . Reason : error*

Explanation: TSM space management could not create a DM session.

System action: TSM stops processing.

User response: Try the operation again. If the problem persists restart the system.

ANS9532W *program-name: cannot destroy the session session . Reason: error*

Explanation: TSM space management could not destroy a DM session.

System action: TSM continues.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9533W *program-name: failed getting all sessions. Reason: error*

Explanation: TSM space management could not get all DM sessions on the system.

System action: TSM stops processing.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9534W *program-name: cannot query a session. Reason: error*

Explanation: TSM space management could not query a DM session on the system.

System action: TSM continues.

User response: Continue with normal operation.

ANS9535E *program-name: a file handle could not be created from the file descriptor file-descriptor. Reason: error*

Explanation: TSM space management could not create a file handle.

System action: Processing of the file is interrupted.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9536E *program-name: cannot query an event message on session session. Reason: error*

Explanation: TSM space management cannot query an event message, needed to determine whether nfs call.

System action: Processing of the file is interrupted.

User response: Continue with normal operation.

ANS9537E *program-name: Invalid storage pool 'storagepool' for file system 'filesystem'.*

Explanation: No storage pool with that name exists on the specified file system.

System action: The requested operation stops.

User response: Please make sure the storage pool exists on the specified file system.

ANS9538W *program-name: request request for DM file attributes not recognized*

Explanation: An unknown request type has been encountered that cannot be handled.

System action: TSM continues.

User response: Continue with normal operation.

ANS9539E *program-name: cannot create a file system handle from the file handle = filehandle. Reason : error*

Explanation: A file system handle could not be created from a file handle.

System action: TSM continues.

User response: Continue with normal operation.

ANS9542E *program-name: the file attributes could not be set on session session for file handle = filehandle token = token flag = flag Reason : error*

Explanation: TSM space management could not update file attributes.

System action: Processing of the file is interrupted.

User response: Try the operation again. If the problem persists, verify that the file system is mounted with dmapi enabled. If the problem still persists, restart the system.

ANS9543W *program-name: cannot reserve (blocks-num1) blocks for nospace condition on file system filesystem-name, errno: error-num, reason: error-str. Currently, (blocks-num2) blocks are available.*

Explanation: Either the TSM client is not able to get status information for the file system or there is insufficient space in the file system. The message reports zero blocks if the file system status information is not available.

System action: TSM continues.

User response: If there is insufficient space in the file system, free the required space or increase the file system capacity. If this is due to an input output error,

perform an appropriate file system check. Then, retry the operation.

ANS9545E *program-name: cannot get a lock for lockdir lockfile to continue processing.*

Explanation: TSM space management could not obtain a lock for a file.

System action: processing stops.

User response: Try the operation again. If problem persists, restart HSM. If problem still persists, restart the system.

ANS9548W **Cannot complete remote file access.**

Explanation: TSM space management cannot complete the remote file access. The file may be migrated to an TSM migration server. The file cannot be recalled to the local machine. The server could be temporarily disabled.

System action: TSM terminates the current operation.

User response: Check to see whether the server has been disabled by the system administrator, then retry the operation.

ANS9550W **File recall has been discontinued.**

Explanation: Recall stops because the file being recalled would cause the file system to run out of space.

System action: TSM terminates the current operation.

User response: Increase the file system space, or remove unneeded files, or wait until space management has migrated files off the file system by demand or threshold migration, or manually migrate files. Then retry the operation.

ANS9552E *program-name: cannot add space management to file-system ; path includes non-local file system.*

Explanation: An attempt was made to add space management to a file system whose path contains non-local elements.

System action: Processing stopped.

User response: File system must be entirely local.

ANS9553I **Wrote temporary candidates list to file-name.**

Explanation: Due to out of space condition, the candidates list was written to the named temporary file.

System action: Temporary file created.

User response: Temporary file can be copied to the

appropriate .SpaceMan directory when space is made available.

ANS9554E *program-name: command for file system mountdir* **Reason :** *error*

Explanation: An attempt to enable or disable xdsms api functionality on the file system failed. If the attempt was to enable HSM, then HSM is not enabled for this file system.

System action: TSM continues.

User response: The file system must be of type JFS2 in order for the TSM Space Management to successfully set the managed attribute. Verify that the file system is of the correct type.

ANS9576E **Not enough space in filesystem to create meta data file!At least *space* space required!**

Explanation: A disk full error occurred attempting to create the metadata file. Please migrate some files in filesystem to free at least *space* kb.

System action: Processing stops.

User response: None.

ANS9577E **An exception "*msg*"!Unable to use meta file!**

Explanation: An internal error occurred. The dsmscout is unable to use the meta data file!

System action: Processing stops.

User response: None.

ANS9578E **An unknown error occurred!**

Explanation: An internal error has occurred. The dsmscout is unable to use the meta data file! The file has been deleted. A new meta data file will be created.

System action: Processing stops.

User response: None.

ANS9590E **The SOAP error information: *message* failed, reason: *message***

Explanation: The detailed SOAP error message is created from gSOAP communication module and does not exist in the chosen language!

System action: TSM continues.

User response: Verify your system and retry the operation.

ANS9591E **A SOAP UDP connection error has happened!**

Explanation: The SOAP communication system had an UDP error. Please see errorlog file for more detailed information!

System action: TSM aborts the operation.

User response: None.

ANS9592E **A SOAP TCP connection error has happened!**

Explanation: The SOAP communication system had an TCP error. Please see errorlog file for more detailed information!

System action: TSM aborts the operation.

User response: None.

ANS9593E **A SOAP HTTP communication error has happened!**

Explanation: The SOAP communication system had an HTTP error. Please see errorlog file for more detailed information!

System action: TSM aborts the operation.

User response: None.

ANS9594E **An internal SOAP error has happend!**

Explanation: The SOAP communication system had an internal error. Please see errorlog file for more detailed information!

System action: TSM aborts the operation.

User response: None.

ANS9595E **The SOAP communication system is out of memory!**

Explanation: The SOAP communication system had an memory error. Please see errorlog file for more detailed information!

System action: TSM aborts the operation.

User response: None.

ANS9596E **The SOAP communication ended unexpected!**

Explanation: The SOAP communication system had an EOF error. Please see errorlog file for more detailed information!

System action: TSM aborts the operation.

User response: None.

ANS9613E *program-name*: **Stub size of *stubsizesize* bytes is not supported on *filesystem* .**

Explanation: The given stub size value not a multiple of the file system block size and cannot be supported.

System action: The program aborts the operation.

User response: Use a correct stub size.

ANS9641S **Invalid option '*option*' found in options file '*file-name*' at line number : *number***
Invalid entry : '*entry*'

Explanation: The specified *option* in the TSM options file (*file-name*) is in error.

System action: Processing stopped.

User response: Correct the options file entry.

ANS9732E **No Backup Copy Group for Management Class: *management-class***

Explanation: The *management class* for this file does not have a backup copy group specified. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: processing stops.

User response: Use the HSM Unix shell commands instead.

ANS9733E **File: *File-name* excluded by the Include/Exclude list**

Explanation: You tried to back up the named *file-name* that was specified to be excluded from backup.

System action: TSM did not back up the file.

User response: Specify the file using the Include option and retry the operation.

ANS9734E **There are *number* file(s) not selected. Click on file to find out reason.**

Explanation: There are files that cannot be selected.

System action: These files will not be selected for migrate or recall.

User response: Click on the files to find out the reason these files are not selected, for example, *includel* list.

ANS9735E **Error doing realtime initialization**

Explanation: TSM ran out of resource (either processes or shared storage) that prevents it from starting a migrate or recall operation. Your file selections remain intact. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot start the migrate or recall operation.

User response: Use the HSM Unix shell commands instead.

ANS9736E **Not enough memory for authorization list table**

Explanation: TSM cannot allocate enough storage for the authorization list. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot complete the requested operation.

User response: Use the HSM Unix shell commands instead.

ANS9737E **Authentication failed -- Exit TSM to retry**

Explanation: You typed an incorrect password four times in a row. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot connect to the server without a correct password.

User response: Use the HSM Unix shell commands instead.

ANS9738S **Out of memory**

Explanation: TSM found an error allocating storage at initialization. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot continue.

User response: Use the HSM Unix shell commands instead.

ANS9739E **Cannot get shared memory**

Explanation: The system ran out of shared storage resources.

System action: TSM cannot continue without a shared storage segment.

User response: Check the output of the "ipcs" program to see if there are many new shared storage segments. Use "ipcrm" to remove them. If this problem continues, configure UNIX to allow more shared storage segments.

ANS9740S **This program is not installed correctly. Place the application defaults file (*file-name*) into the application default directory (usually *directory-name*), or set the XAPPLRESDIR environment variable to the directory containing the *file-name* defaults file.**

Explanation: TSM cannot find its resource file (*Sm*) in the default directory (*directory-name*). A problem may

have occurred during installation. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot start.

User response: Use the HSM Unix shell commands instead.

ANS9741E Not enough memory to hold directory structure

Explanation: TSM cannot allocate storage for the requested directory structure. This error can happen under migrate or recall operations. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot complete the requested operation.

User response: Use the HSM Unix shell commands instead.

ANS9742E Error reading directory structure

Explanation: TSM cannot load the requested directory structure. This error is due to a corrupted file system or a storage shortage. This can happen under selective migrate or selective recall. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot complete the requested operation.

User response: Use the HSM Unix shell commands instead.

ANS9743W No files selected in directory tree

Explanation: You did not select any files to list for migrate or recall.

System action: TSM cannot complete the requested operation.

User response: Select files and retry the operation.

ANS9744W Size exceeds limit

Explanation: You tried to recall a file that has exceeded the maximum file size limitation on your system.

System action: TSM cannot recall the file.

User response: Recall this file on a system that supports the file size. See your system administrator.

ANS9778E Error(s) were detected in options file: "Do you want TSM to comment out the line with errors and continue?"

Explanation: Invalid options or option values were encountered while reading the options file.

System action: This message is displayed. Further action depends on your response.

User response: Click "Yes" to allow TSM to turn the invalid line into comments. If you click "No", you will exit immediately.

ANS9779E Unable to open options file " for writing.

Explanation: An error occurred while TSM tried to open options file for writing to update it.

System action: Program exits.

User response: Check file and directory access permissions or correct invalid entries in your options file manually.

ANS9780E Unable to update options file ".

Explanation: TSM was unable to update your options file, possibly because of disk full condition.

System action: Program exits.

User response: Check if you have enough disk space or correct invalid entries in your options file manually.

ANS9781E After completing repair TSM found an invalid option, keyword or parameter in your options file.

Explanation: A final check of your options file found that an invalid option, keyword, or parameter still remains. It is possible your options file was modified by another application.

System action: Program exits.

User response: Make sure no other application modified your options file and restart TSM. You may also use a text editor to correct invalid entries in your options file.

ANS9782S The selected backupset was generated by a newer version of the backup server, and the new backupset version is not supported by this client; The backupset data cannot be restored by this version of the client.

Explanation: The backupset you are attempting to restore was generated by a newer server that has a different level of functionality. The client you are using does not recognize this newer format so it cannot restore the data from the backupset.

System action: Processing stopped.

User response: Restore the backupset with a client that is at the same or higher level as the server that was used to generate the backupset.

ANS9790I File is skipped for migration: No backup copy found.

Explanation: A management class is assigned to the file with the attribute MIGREQUIRESBKUP set to YES. This requires a current backup copy of the file before migration. However, there is no backup copy found on the migration server. This file will not be migrated.

Note: TSM checks only the migration server for a backup copy. If the migration server and backup server are different servers, TSM does not find a backup copy of the file.

System action: TSM does not migrate this file.

User response: Back up this file on the migration server, or assign a management class to this file that does not require a current backup copy. Retry the operation.

ANS9791I File is skipped for migration: Backup copy found is not current.

Explanation: A management class is assigned to the file with the attribute MIGREQUIRESBKUP set to YES. This requires a current backup copy of the file before migration. However, the backup copy found on the migration server is an old version. This file will not be migrated. Note: TSM checks only the migration server for a backup copy. If the migration server and backup server are different servers, there must be a valid backup copy of the file on the migration server.

System action: TSM does not migrate this file.

User response: Back up the current file on the migration server, or assign a management class to this file that does not require a current backup copy. Retry the operation.

ANS9792W A tree view of a file system is being built. Please wait until it completes, and then retry the operation.

Explanation: You tried to choose Selective Migration or Selective Recall when a tree view of a file system is being built.

System action: TSM ignores the request.

User response: Wait until the tree view build completes, and then retry the operation.

ANS9796E Cannot access lock file for *file-system* file system.

Explanation: TSM cannot access a lock file due to an error. The lock file provides serialization of certain programs to prevent conflicting processes from running at the same time.

System action: TSM will not run the program at this time.

User response: Check the permissions on the directories leading up to the lock file and also the permissions on the program executable.

ANS9797E A conflicting space management process is already running in the *file-system* file system. Rerun this process at a later time.

Explanation: TSM detects that another process that conflicts with the process you are trying to run is running in the file system. The following processes cannot be run at the same time for a file system:

dsmreconcile
dsmautomig
dsmmigfs remove.

Also dsmmigfs remove cannot run while a migration process is running in the file system.

System action: TSM will not run the process at this time.

User response: Try running the process again later.

ANS9799W Cannot open temp file for mount command.

Explanation: TSM cannot open a temporary file to process the mount command for this file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot add space management to the file system.

User response: Use the HSM Unix shell commands instead.

ANS9800W Cannot create temp file for mount command.

Explanation: TSM cannot create a temporary file to process the mount command for this file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot add space management to the file system.

User response: Use the HSM Unix shell commands instead.

ANS9801W Cannot create transaction file.

Explanation: Cannot create transaction file for this file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot add space management to the file system.

User response: Use the HSM Unix shell commands instead.

ANS9802W Cannot create status file.

Explanation: Cannot create status file for this file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot add space management to the file system.

User response: Use the HSM Unix shell commands instead.

ANS9803W Cannot create premigration database.

Explanation: Cannot create a premigration database for this file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot add space management to the file system.

User response: Use the HSM Unix shell commands instead.

ANS9804W Cannot create migration candidates list.

Explanation: Cannot create a migration candidates list for this file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot add space management to the file system.

User response: Use the HSM Unix shell commands instead.

ANS9805W Cannot create .SpaceMan directory.

Explanation: Cannot create .SpaceMan directory for this file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot add space management to the file system.

User response: Use the HSM Unix shell commands instead.

ANS9806W The file system type is not supported.

Explanation: The file system is not a type supported by space management.

System action: TSM cannot add space management to the file system.

User response: There is a mismatch between the HSM client and the file system type specified. If the file system type is consistent with the intent, install an HSM client that supports it, then try the operation again. Only one HSM client can be installed at a time.

ANS9807I The specified backupset file does not contain a backupset of type "file" for the specified nodename.

Explanation: Local backupset support is limited to backupsets that contain file data; Image backupsets are not supported locally. The specified backupset does not contain a backupset with file data for the node name specified.

System action: Processing stopped.

User response: Specify a different backupset file to restore file data from a backupset. To restore an image from a backupset, access the backupset from a TSM server.

ANS9808W Invalid field in the dsmmigfstab file.

Explanation: There is an invalid field in the dsmmigfstab file entry for the file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot add space management to the file system.

User response: Use the HSM Unix shell commands instead.

ANS9809W Cannot open the dsmmigfstab file.

Explanation: TSM cannot open the dsmmigfstab file. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot add space management to the file system.

User response: Use the HSM Unix shell commands instead.

ANS9811W Server did not respond. Check the server connection. Select OK to exit.

Explanation: Server did not respond.

System action: TSM stops processing.

User response: Exit dsmlhsm. Check the server connection and try again later.

ANS9812I Files not found in current directory.
Refresh file systems.

Explanation: Some files are not found in the local file system.

System action: The transaction will show incorrect results.

User response: Refresh the file systems to reflect local file systems.

ANS9813W Incorrect data shown. Run reconcile.

Explanation: Information in the space management status file is not synchronized with the file system.

System action: TSM continues processing.

User response: To correct the information, run reconcile, and then refresh the current window.

ANS9814W Cannot create migration object ID.

Explanation: The file system is full. No more free space can be allocated for the migration object ID when a file is being migrated or recalled.

System action: TSM terminates the current operation for this file system.

User response: Remove some files in the file system, and then run reconciliation. Retry the operation.

ANS9815W Out of free space or inodes in file system to migrate or recall.

Explanation: The file system is full. No more free space or free inodes are available to be allocated for the transaction file that is needed when a file is being migrated or recalled.

System action: TSM terminates the current operation for this file system.

User response: Remove some files in the file system, and then run reconciliation. Retry the operation.

ANS9816W File system has exceeded its quota.

Explanation: TSM detects that the file system has exceeded its quota. No more files can be migrated to TSM storage for this file system.

System action: TSM will not migrate files from this file system.

User response: Either recall some files to the local file system, or ask the system administrator to increase the quota for this file system.

ANS9817W *file-system* is globally deactivated. Please wait until the file system is globally reactivated.

Explanation: The file system is in a global inactive state.

System action: TSM cannot continue the process.

User response: Wait until the system administrator globally reactivates the file system.

ANS9818W A selective recall is in progress. Stop the recall, and then close the window.

Explanation: You tried to close the Selective Recall Status window while a selective recall was in progress.

System action: TSM ignores the request.

User response: Stop the selective recall process, and then close the window.

ANS9819W A selective migration is in progress. Stop the process, and then close the window.

Explanation: You tried to close the Selective Migration Status window while a selective migration was in progress.

System action: TSM ignores the request.

User response: Stop the selective migration process, and then close the window.

ANS9820W A selective recall or a selective migration is in progress. Wait until it completes, and then retry the operation.

Explanation: You tried to perform one of the following while a selective recall or selective migration process was in progress:

- Add space management
- Deactivate or reactivate space management
- Global deactivate or reactivate space management
- Display policy information
- Change password

System action: TSM ignores the request.

User response: Wait until the selective recall or selective migration process is complete, and then retry the operation.

ANS9821W New password is not re-entered.

Explanation: You did not re-enter the new password.

System action: The Change password dialog will display again.

User response: Re-enter the new password.

ANS9822W New password is not entered.

Explanation: You did not enter the new password.

System action: The Change password dialog will display again.

User response: Enter the new password.

ANS9823W Current password is not entered.

Explanation: You did not enter the current password.

System action: The Change password dialog will display again.

User response: Enter the current password.

ANS9824W Cannot update space management settings for *file-system*

Explanation: You tried to update space management settings for a file system, and the update failed. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM continues with normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9825W Total migrated space is greater than quota for *file system* .

Explanation: TSM total migrated space is greater than quota.

System action: TSM continues.

User response: You can remove this warning message by increasing the quota for the file system.

ANS9827W Error accessing the Recall daemon lock file: *file name* .

Explanation: There is a problem accessing the recall daemon lock file.

System action: TSM cannot determine whether the recall daemon is running. Because the recall daemon is needed to perform file recalls, the recall fails.

User response: Check with the system administrator. The recall process needs read access to the `/etc/adsm/SpaceMan/dsmrecalld.pid` file.

ANS9828W Error processing the space monitor daemon: *reason* .

Explanation: There is a problem accessing the space monitor daemon.

System action: TSM cannot perform automatic space management functions.

User response: Check with the system administrator.

The space monitor daemon is normally installed as `/usr/lpp/adsm/bin/dsmmonitord`.

ANS9829W Recall daemon is not running.

Explanation: An TSM recall daemon is not running.

System action: TSM recall fails.

User response: Ask the system administrator to start a recall daemon by issuing the `dsmrecalld` command.

ANS9830W Space monitor daemon is not running.

Explanation: The space monitor daemon is not running.

System action: TSM is unable to perform space management functions.

User response: Ask the system administrator to start the space monitor daemon by issuing the `dsmmonitord` command.

ANS9840I This command is not currently supported for local backupsets.

Explanation: Local backupset support is limited to only a few commands and the command you specified is not one of the supported commands.

System action: Processing stopped.

User response: To perform this command on a backupset, access the backupset from a TSM server.

ANS9841E Cannot get user name for the user ID.

Explanation: TSM cannot get the user name for the user ID. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM terminates the requested process and returns to normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9842E The watch daemon is not running properly.

Explanation: An TSM watch daemon is either not running, has no dmapi session, or is not connected to group services.

System action: The TSM action fails.

User response: Ask the system administrator to check GPFS and the group services and to restart a watch daemon by issuing the `dsmwatchd` command.

ANS9843E Cannot connect to migration server.

Explanation: TSM cannot connect to the migration server specified in your client system options file. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM terminates the requested process and returns to normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9844E Cannot close the premigrated files database.

Explanation: TSM cannot close the premigrated files database for the file system. The premigrated files database resides in the .SpaceMan subdirectory of the file system's root directory. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM terminates the requested process, and returns to normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9845E Space management action ends.

Explanation: TSM The requested space management operation is ended because the watch daemon is not working properly.

System action: TSM is unable to complete the operation.

User response: Look for previous messages.

ANS9846W Cannot add space management to *file system*.

Explanation: TSM cannot add space management to the file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM continues with normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9848W Cannot activate file system *file system*.

Explanation: TSM cannot activate space management for the specified file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM file system state is not changed.

User response: Use the HSM Unix shell commands instead.

ANS9849I Local backupset cannot be expanded; Only full backupset restore is supported locally.

Explanation: Local backupsets cannot be expanded to show volumes, directories, and files. Only full backupset restore is supported from local backupsets.

System action: Processing stopped.

User response: To restore specific volumes, directories, and files from a backupset, restore the backupset from the TSM server.

ANS9850E Tape read error; Max Blocksize is *blocksize*. Attempted to read *blocksize* *blocksize*. Run *dsmmxsg* to update scsi driver max blocksize allowed and retry operation.

Explanation: An attempt to read from tape at the specified blocksize failed; The maximum blocksize allowed for the scsi driver is shown.

System action: Processing stopped.

User response: If the maximum blocksize is less than the blocksize used by the operation, run the *dsmmxsg* utility to update the maximum blocksize allowed for the scsi driver, and then retry the operation. If the maximum blocksize is greater than or equal to the blocksize used, then verify that the tape installed and operating correctly and retry the operation.

ANS9852E Cannot query the level of client and kernel.

Explanation: The space management GUI client fails to query the level of kernel and client code. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM continues with normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9853W The space management client program is downlevel.

Explanation: The space management client is downlevel compared to the kernel level. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM continues with normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9854W The space management kernel is downlevel.

Explanation: The space management kernel is downlevel compared to the client level. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM continues with normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9855W File is accessed during migration. File skipped.

Explanation: The specified *file-name* was not migrated because the file was accessed by another process during the attempt to migrate it.

System action: TSM left the file resident.

User response: If you want the file migrated, stop the process which is accessing the file and retry the migration operation.

ANS9856E File is currently opened by another process. File skipped. File has already been migrated or is currently being migrated by another process.

Explanation: The specified file was not migrated because the file was opened by one or more other processes.

System action: TSM left the file resident.

User response: If you want the file migrated, stop the processes which currently have the file open, and retry the migration operation.

ANS9857W The restored HSM for Windows stub file may be an orphan: *stub file name*

Explanation: The restored stub file may not be accessible in the HSM client archive and thus it possibly cannot be recalled.

System action: Stub file is restored.

User response: Check if the stub file can be accessed.

ANS9858E Bit file for image on push button cannot be found. Please check to make sure the *pixmap file* exists in your TSM installed directory.

Explanation: TSM failed to find the pixmap file defined for the push button.

System action: TSM continues with normal operation.

User response: Check to see whether the pixmap file exists in the TSM installation directory.

ANS9860W Some selected files are hidden. Change View option to see all.

Explanation: You have selected all files in a directory or in all subdirectories. Due to the current View option, only certain types of files are shown (either migrated, resident, or premigrated files).

System action: TSM proceeds normally.

User response: If you want to see all selected files, change the View option from the View menu bar option.

ANS9862W Do you want to exit TSM space management?

Explanation: You have selected Exit from the File menu bar option.

System action: TSM waits for your response.

User response: If you want to exit the program, select OK. Otherwise, select Cancel.

ANS9871W Specified column width is smaller than the largest attribute value. Data will be truncated.

Explanation: You have entered a column width that is too small to display all digits of the largest attribute.

System action: TSM accepts your request.

User response: To see all attributes in full length, increase the column width.

ANS9873W This function should not be used on large file systems. Continue anyway ?

Explanation: You have decided to open selective recall or selective migration window, but these functions may take too long for large file systems.

System action: TSM waits for your response.

User response: If you want to continue, select OK. Otherwise, select Cancel.

ANS9875W Refresh time must be numeric value and within 0 - 14400 minutes or 0 - 240 hours (10 days).

Explanation: You have entered an invalid value for Refresh time. It must be a positive number between 0 and 14400.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 14400.

ANS9876W Refresh time must be a positive number.

Explanation: You have entered an invalid value for Refresh time. It must be a positive number between 0 and 14400.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 14400.

ANS9877W Size Factor must be a numeric value between 0 - 999999999.

Explanation: You have entered an invalid value for Size Factor. It must be a positive number between 0 and 999999999.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 999999999.

ANS9878W Size Factor must be a positive number.

Explanation: You have entered an invalid value for Size Factor. It must be a positive number between 0 and 999999999.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 999999999.

ANS9879W Age Factor must be a numeric value between 0 - 999999999.

Explanation: You have entered an invalid value for Age Factor. It must be a positive number between 0 and 999999999.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 999999999.

ANS9880W Age Factor must be a positive number.

Explanation: You have entered an invalid value for Age Factor. It must be a positive number between 0 and 999999999.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 999999999.

ANS9881W Premigration Percent must be a numeric value between 0 - 100.

Explanation: You have entered an invalid value for Premigration Percentage. It must be a positive number between 0 and 100.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 100.

ANS9882W Premigration Percent must be a positive number.

Explanation: You have entered an invalid value for Premigration Percentage. It must be a positive number between 0 and 100.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 100.

ANS9883W Quota must be a numeric value between 0 - 999999999.

Explanation: You have entered an invalid value for Quota. It must be a positive number between 0 and 999999999.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 999999999.

ANS9884W Quota must be a positive number.

Explanation: You have entered an invalid value for Quota. It must be a positive number between 0 and 999999999.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 999999999.

ANS9885I The premigration percentage will not be updated until you select the Update push button on the Update window or the Add push button on the Add window.

Explanation: While you have just selected 'OK' in the Advanced Feature dialog, the premigration percentage is not activated until you select 'Add' or 'Update' in the 'Add space management', or the 'Update space management' dialog.

System action: TSM waits until you select 'Add' or 'Update' to apply your premigration percentage to the system.

User response: When you have changed the space management attribute, select 'Add' or 'Update', and then the system will apply your new premigration percentage.

ANS9886W Enter a positive number for Column Width.

Explanation: You have entered an invalid value for Column Width. It must be a positive number between 0 and 18.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 18.

ANS9887W Enter a positive number for Space Between Column.

Explanation: You have entered an invalid value for Space Between Column. It must be a positive number between 0 and 18.

System action: TSM continues with normal operation.

User response: Enter a positive number between 0 and 18.

ANS9889W Space management has not been added to *file-system* file system. Do you want to build the directory tree anyway?

Explanation: You selected a file system that is not managed by HSM.

System action: TSM builds the directory tree if you select the OK button. Otherwise, it will not.

User response: You can add space management to the file system by selecting the Space Manager push button in the TSM main window, and then selecting Add under the Selected menu option.

ANS9891W Please mark either or both check boxes before proceeding.

Explanation: You have not marked either of the check boxes.

System action: TSM does not proceed with reconcile processing.

User response: Mark either or both check boxes.

ANS9895W Space management in file system *file system* is not active.

Explanation: You tried to select a file in a file system for which space management is inactive.

System action: TSM continues with normal operation.

User response: Reactivate space management for the file system, and then proceed with selecting files.

ANS9901E Cannot migrate TSM system internal file.

Explanation: You tried to select files that are used internally by the HSM client. You cannot migrate TSM internal files.

System action: TSM ignores your request.

User response: None.

ANS9903E Space management is deactivated for this file system.

Explanation: You tried to migrate a file in a file system for which space management is inactive.

System action: TSM continues to migrate files only in active file systems.

User response: Reactivate space management for the file system, and retry the migration operation.

ANS9904E Transaction failed, migration aborted.

Explanation: The specified *file-name* was not migrated because the file was accessed by another process during the attempt to migrate it.

System action: TSM migration is aborted.

User response: If you want the file migrated, stop the process that is accessing the file, and then retry the migration.

ANS9908E System Error.

Explanation: TSM detects an error in reading the state of the file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM proceeds with normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9909I Error in accessing migration candidates list file.

Explanation: TSM detects an error in reading the migration candidates list file. This file resides in the *.SpaceMan* directory of the file system. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM proceeds with normal operation.

User response: Use the HSM Unix shell commands instead.

ANS9914I Space management settings have been modified successfully on *file-system* file system.

Explanation: Space management settings have been updated successfully.

System action: TSM updated space management settings for the file system.

User response: Continue with normal operation.

ANS9915I Space management has been added successfully to *file-system* file system.

Explanation: Space management has been added successfully.

System action: TSM added and activated space management for the file system.

User response: Continue with normal operation.

ANS9918E Cannot open migration candidates list for *file-system*.

Explanation: TSM cannot access the migration candidates list for the specified file system.

System action: TSM continues normal operation.

User response: Select OK to return.

ANS9928I Space management has been deactivated successfully on *file-system* file system.

Explanation: Space management is deactivated successfully.

System action: TSM deactivated space management for the file system.

User response: Select OK to return.

ANS9929I Space management has been reactivated successfully on *file-system* file system.

Explanation: Space management is reactivated successfully.

System action: TSM reactivated space management for the file system.

User response: Select OK to return.

ANS9933I Migration candidates list only exists in an 'Active' file system. If you want to make *file-system* file system 'Active', select 'Add Space Management'.

Explanation: You tried to display the migration candidates list for a "Native" file system (a file system to which space management has not been added).

System action: Processing stopped.

User response: Select OK to return. Select "Add Space Management" if you want to add space management to the file system.

ANS9934I Reconcile only works on an 'Active' file system. If you want to make *file-system* file system 'Active', select 'Add Space Management'.

Explanation: You tried to start reconciliation on a "Native" file system (a file system to which space management has not been added). You must add space management to a file system before starting reconcile.

System action: Processing stopped.

User response: Select OK to return. Select "Add" if you want to add space management to the file system.

ANS9935I Start Threshold Migration only works on an 'Active' file system. If you want to make *file-system* file system 'Active', select 'Add Space Management'.

Explanation: You tried to start Threshold Migration on a "Native" file system (a file system to which space management has not been added). You must add space management to the file system first.

System action: Processing stopped.

User response: Select OK to return. Select "Add" if you want to add space management to the file system.

ANS9936I Start Threshold Migration only works on an 'Active' file system. If you want to make *file-system* file system 'Active', select 'Reactivate'.

Explanation: You tried to start Threshold Migration on an "Inactive" file system (a file system for which space management has been deactivated). You must reactivate space management for your file system first.

System action: Processing stopped.

User response: Select OK to return. Select 'Reactivate' to reactivate space management for the file system.

ANS9938I Space management has not been added to *file-system* file system. You do not need to deactivate space management.

Explanation: You tried to deactivate space management on a file system to which space management has not been added.

System action: Processing stopped.

User response: Select OK to return.

ANS9941I Space management has not been added to *file-system*. If you want to add space management, select 'Add space management' option. The file system will automatically be activated when you add space management.

Explanation: You tried to activate space management on a file system to which space management has not been added. You must first add space management. The file system will automatically be activated when the add process is complete.

System action: Processing stopped.

User response: Select OK to return. Select "Add" if you want to add space management to the file system.

ANS9942S Space management has not been added to *file-system* file system. Do you want to add space management now?

Explanation: You tried to update space management settings for a file system to which space management has not been added.

System action: Processing stopped.

User response: Select OK to add space management to the file system. Select Cancel to return.

ANS9943I Space management has already been added to *file-system* file system.

Explanation: You tried to add space management to a file system to which space management has already been added.

System action: Processing stopped.

User response: Select OK to return.

ANS9944I Space management has been deactivated on *file-system* file system. You must reactivate space management before you can remove it.

Explanation: You tried to remove space management from a file system for which space management has been deactivated. You must reactivate space management for the file system before you can remove it.

System action: Processing stopped.

User response: Select OK to return. Select "Reactivate", and then select "Remove " to remove space management.

ANS9945I Space management has not been added to *file-system* file system. You do not need to remove space management.

Explanation: You tried to remove space management from a file system to which space management has not been added.

System action: Processing stopped.

User response: Select OK to return.

ANS9947E File: *file-spec* is in a file system to which space management has not been added.

Explanation: You tried to migrate a file that resides in a file system to which space management has not been added.

System action: TSM will not highlight/process the file.

User response: Switch over to the Space Manager window, and add space management to the file system.

ANS9948E File: *file-spec* size is less than the minimum size required for migration.

Explanation: You tried to migrate a file that is smaller than the minimum size required for migration. To be eligible for migration, a file must be larger than both the stub file size specified for the file system plus one byte and the block size defined for the file system.

System action: TSM will not highlight the file.

User response: None.

ANS9949E File: *file-spec* is not a regular file and therefore not qualified for migration.

Explanation: You tried to migrate a file that is not a regular file. It might be a FIFO file, a special file, a directory or a symbolic link.

System action: TSM will not highlight the file.

User response: None.

ANS9950E File: *file-spec* is not qualified for migration because the Space Management Technique attribute is set to None.

Explanation: The Space Management Technique attribute in the management class is set to None, which does not allow a file to be migrated.

System action: TSM will not highlight the file.

User response: Assign a management class to the file that specifies "Automatic" or "Selective" for the Space Management Technique attribute.

ANS9951E File: *file-name* file has already been migrated.

Explanation: You tried to migrate a file that is already migrated.

System action: TSM will not highlight the file.

User response: None.

ANS9953E The management class assigned to this file does not allow migration.

Explanation: The management class assigned to this file does not allow migration.

System action: TSM does not migrate the file.

User response: None.

ANS9954E This file has already been migrated.

Explanation: The file has been previously migrated.

System action: File is skipped.

User response: None.

ANS9958E File '*file-namefile-namefile-name* has not yet reached the age for migration. File skipped.

Explanation: This file cannot be migrated because it has not yet reached the age for migration.

System action: TSM will not highlight the file.

User response: None.

ANS9960W No files selected for migrate or recall.

Explanation: You requested a migrate or recall operation without selecting files from the presented directory tree.

System action: TSM cannot do the migration or recall without selected files.

User response: Select the files that you want to migrate or recall, and retry the operation.

ANS9961E Server out of migrate data storage space.

Explanation: The server ran out of space in its migrate data storage. This message is issued only from the Motif HSM GUI, which is no longer supported.

System action: TSM cannot complete the migrate operation. Any files displayed in the Successful list of the Migrate Status window were successfully migrated.

User response: Use the HSM Unix shell commands instead.

ANS9962I Migration stopped by user.

Explanation: You requested that TSM stop the migrate operation.

System action: Migration stopped.

User response: Continue with normal operations.

ANS9963I Selective Recall completed. Check failure list for possible errors.

Explanation: The recall was completed.

System action: TSM recalled the files.

User response: Continue with normal operations.

ANS9964I Selective Migration completed. Check failure list for possible errors.

Explanation: The migration was completed.

System action: TSM migrated the files.

User response: Continue with normal operations.

ANS9965S Please select a file system first.

Explanation: You did not select any file system for the Migrate window.

System action: TSM ignores this request and continues.

User response: Select a file system, a directory, and all files you want to migrate, and then select the Migrate button to start the process.

ANS9966S No file system has been selected.

Explanation: You did not select a file system.

System action: TSM ignores the request and continues.

User response: Select at least one file system and retry the operation

ANS9984W PFR plugin library was not found.

Explanation: PFR plugin library should have been installed when the client was installed, but it cannot be found.

System action: The selected operation is not performed.

User response: None.

ANS9988S As part of the remove process, all migrated files in *file-system* will be recalled from TSM server. Do you want to continue with the remove process now?

Explanation: When you remove space management from a file system, TSM recalls all migrated files.

System action: TSM waits for your response before proceeding with the remove process.

User response: Select Yes to remove space management from the selected file system, or select Cancel to skip the remove.

ANS9989W Management class *mcName* specified on the INCLUDE statement in *file-name* at line *line-number* does not exist.

Explanation: Management class named on the INCLUDE statement in the *file-name* file does not exist in your assigned policy set on the server.

System action: The object is bound to the default management class.

User response:

- Update the INCLUDE statement so that it specifies a valid management class.
- Define the management class named on the INCLUDE statement (if it is intended to have a management class with that name).
- Verify that the node is in the correct policy domain (perhaps the node was accidentally put in the wrong policy domain, and the correct domain has the management class).
- Remove the INCLUDE statement if it is no longer necessary to bind the files to the management class.

ANS9990W Management class *mcName* specified on INCLUDE statement in client option set does not exist.

Explanation: Management class named on the INCLUDE statement in client option file does not exist in your assigned policy set on the server.

System action: The object is bound to the default management class.

User response:

- Update the INCLUDE statement so that it specifies a valid management class.
- Define the management class named on the INCLUDE statement (if it is intended to have a management class with that name).
- Verify that the node is in the correct policy domain (perhaps the node was accidentally put in the wrong policy domain, and the correct domain has the management class).
- Remove the INCLUDE statement if it is no longer necessary to bind the files to the management class.

ANS9997W The selective migration, selective recall, or policy information window is displayed. Stop any operations, close the window, and then retry the operation.

Explanation: When a node is contacting more than one server for space management services, the selective migration, selective recall, and policy information windows may not be displayed at the same time.

System action: TSM ignores the request.

User response: Close the selective migration, selective recall, or policy information window, and then retry the operation.

ANS9998E The migration server changed after the selective migration or selective recall window was displayed. Close the window, and then retry the operation.

Explanation: A migrate or recall operation will not be allowed to proceed if the user changed the migration server after the selective migration or selective recall window was displayed.

System action: No files will be migrated or recalled.

User response: Close the selective migration or selective recall window, and then retry the operation.

ANS9999E (0):

Explanation: This message carries diagnostic text relating to a client process or algorithm. This information is intended for reporting processing exceptions and other non-standard situations that occur on the TSM client. The (component), (code), and (text) will vary depending upon the cause of the message and the client process or algorithm that issues the message.

System action: Client processing may or may not continue depending upon the cause of this message.

User response: Examine error messages that may have been displayed before and/or after this message and correct any problems, if possible. If the cause of this message can not be determined or resolved, contact your support representative. If you contact your support representative, the entire text of this message should be reported.

Chapter 4. Data Protection products messages

With the exception of those Data Protection clients listed in the client messages reference section of this publication, Data Protection products messages are listed in two locations.

- Each Data Protection product user's guide contains an appendix that lists the messages for that product. The Data Protection products user's guides are available at the Tivoli Storage Manager information center, in the Reference section, in the Data Protection reference subsection.
- The Tivoli Storage Manager information center Troubleshooting section contains a Messages subsection. The Messages subsection contains a plugin for each TSM product and component, including those listed in this publication.

Appendix A. API return codes with explanations

This appendix describes the return codes. The return codes are listed in numeric order. For each return code, the following information is provided:

- The return code number. This number corresponds to the number in the **dsmrc.h** header file.
- The severity code. This letter is an indication of the severity that generated the return code. The possible severity codes and their meanings include:

S	Severe error	Processing cannot continue.
E	Error	Processing cannot continue.
W	Warning	Processing can continue, but problems might develop later. You should be cautious.
I	Information	Processing continues. User response is not necessary.

- The symbolic name. This name corresponds to the definition in the header file, **dsmrc.h**. *Always use the symbolic name for a return code in your application rather than the return code number.*
- The explanation. This field explains the circumstances under which this return code might be generated.
- The system action. This field describes what action Tivoli Storage Manager is going to take in response to the return code.
- The user response. This field explains how you should respond to the system action.

Many of the return codes describe errors that cause processing to stop. You can send a message to the end user that describes the problem and suggest a course of action. To identify different messages, use these return code values or develop your own numbering system.

-452 E
DSM_RC_SHM_NOTAUTH

Insufficient authority to connect to the shared memory region

Explanation: The user issuing the command does not have authority to connect to the shared memory segment. When the shared memory segment is created by the server, it will be owned by the effective uid of the server process (dsmserv). Only processes running under this uid or root will be allowed to connect to the segment (and thus to the server).

System action: The session is rejected and processing stops.

User response: Run the command under the uid of the processing running dsmserv, if possible. Otherwise contact your system administrator for further help.

-451 E
DSM_RC_SHM_FAILURE

An error occurred using the Shared Memory protocol

Explanation: An error has occurred while reading or writing data through the Shared Memory communications protocol.

System action: TSM cannot complete the requested operation.

User response: Check the trace log for additional information and retry the operation. If the problem continues, see your system administrator for further help.

-450 E
DSM_RC_SHM_TCPIP_FAILURE

Session rejected: TCP/IP connection failure for Shared Memory

Explanation: An attempt to connect to the local server using the Shared Memory protocol has failed during initial TCP/IP communications. This error can occur if the server is not listening on the correct port, or if the server is down.

System action: Session rejected. Processing stopped.

User response: Retry the operation, or wait until the server comes back up and retry the operation. If the problem continues, see your system administrator for further help.

-190 E
DSM_RC_NP_ERROR

Session rejected: Named Pipes connection failure.

Explanation: An attempt to connect to the server using Named Pipes communications failed. This might have occurred if an incorrect NAMEDPIPENAME was specified in the options files or if your system administrator canceled a backup operation.

System action: Processing stopped.

User response: Retry the operation, or wait until the server comes back up and retry the operation. Ensure that the value specified on the NAMEDPIPENAME option is the same as the one used by the server. If the problem continues, contact your system administrator for further help.

-124 E
DSM_RC_3270COMM_MISSING_DLL

The TSM DLL dsm3270.dll cannot be found in the user's path.

Explanation: The TSM DLL dsm3270.dll cannot be found in the user's path.

System action: Communications link is not established.

User response: Make sure that the TSM DLL dsm3270.dll is in a directory that is included in the user's path.

-057 E
DSM_RC_TCPIP_LOADFAILURE

The TCP/IP load function failed.

Explanation: An error occurred while locating a function. The TCP/IP load function failed.

System action: Processing stopped.

User response: Verify your TCP/IP installation.

-056 E
DSM_RC_TCPIP_DLL_LOADFAILURE

An error occurred while loading a library.

Explanation: An error occurred while loading a library. The TCP/IP DLL load failed.

System action: Processing stopped.

User response: Verify your TCP/IP installation.

-055 E
DSM_RC_WINSOCK_MISSING

The TCP/IP WINSOCK.DLL file cannot be found.

Explanation: The TCP/IP WINSOCK.DLL file cannot be found.

System action: Processing stopped.

User response: Verify your TCP/IP installation.

-054 E
DSM_RC_NETWORK_UNREACHABLE

The specified TCP/IP host name is unreachable

Explanation: The TCP/IP host name specified in the TCPSEVERADDRESS statement cannot be reached.

System action: Processing stopped.

User response: Check your options file for the correct TCPSEVERADDRESS statement. See your administrator for the correct name of the server.

-053 E
DSM_RC_BAD_HOST_NAME

An invalid TCP/IP address was specified.

Explanation: The TCP/IP address specified by the TSM client's TCPSEVERADDRESS setting could not be found on the network. Common reasons for this error include:

- The TCPSEVERADDRESS client option specifies the wrong TCP/IP address for the TSM server".
- The machine that hosts the TSM server is not on the network.
- A network problem is preventing the TSM client from reaching the machine that hosts the TSM server.

System action: processing stops.

User response: Verify that the TCPSEVERADDRESS and TCPSPORT settings have the correct values for your TSM server. Use your operating system's "ping" (or similar) utility to ensure that your machine can locate the machine that hosts the TSM server across the network. Try the operating again. If the problem persists, ask your TSM administrator for further assistance.

-052 E
DSM_RC_CONN_REFUSED

An attempt to establish a TCP/IP connection was rejected by the host

Explanation: An attempt to establish a TCP/IP connection was rejected by the server.

System action: Processing stopped.

User response: The server was not fully initialized, is not currently running, was not enabled for TCP/IP communications, or an incorrect TCP/IP port number was specified. If the problem continues, see your system administrator.

-051 E
DSM_RC_CONN_TIMEDOUT

The attempt to establish a TCP/IP connection timed out before the connection was made.

Explanation: None.

System action: processing stops.

User response:

- Restart the TSM client and retry the operation.
 - Check the client options file and verify that TCPSEVERADDRESS and TCPSPORT specify the correct TCP/IP address and port number for your TSM server.
 - Verify that network connectivity exists between the TSM client machine and the TSM server machine.
 - If the problem persists, see your TSM administrator for further assistance.
-

-050 E
DSM_RC_TCPIP_FAILURE

Session rejected: TCP/IP connection failure

Explanation: An attempt to connect to the server using TCP/IP communications failed. This can be a result of incorrect TCP/IP option settings in your client options file. This error can also occur if the LAN connection went down or if your system administrator canceled a backup operation.

System action: Session rejected. Processing stopped.

User response: Retry the operation, or wait until the server comes back up and retry the operation. If the problem continues, see your system administrator for further help.

0000 I
DSM_RC_OK

Successfully done.

Explanation: The operation successfully completed.

System action: None.

User response: None.

0001 E
DSM_RC_ABORT_SYSTEM_ERROR

Server detected system error

Explanation: The server detected a system error and notified the clients.

System action: Processing stopped.

User response: See your system administrator for further information on server activity.

0002 E
DSM_RC_ABORT_NO_MATCH

No objects on server match query

Explanation: No objects on the server match the query operation being performed. If this object is part of a backupset generated on a node, and the node name is changed on the server, any backup set objects that were generated prior to the name change will not match the new node name.

System action: Processing stopped.

User response: Ensure the names are properly entered. If the object is part of a backupset generated prior to a node name change, ensure that the node name is the same as the node for which the backup set was generated.

0003 E
DSM_RC_ABORT_BY_CLIENT

Client ended transaction

Explanation: The client system ended the operation with the server and ended the current transaction.

System action: Processing stopped.

User response: Restart the session.

0004 W
DSM_RC_ABORT_ACTIVE_NOT_FOUND

An active backup version could not be found.

Explanation: An attempt was made to expire an object, but the TSM server was unable to find an active backup version of the object. This message is preceded by message ANS1228E which specifies the object name. For instance, this message could be issued if two separate client processes are backing up the same file system at the same time. If one of the processes expires a file, then the TSM server will make that file inactive. If the second process subsequently attempts to expire that same file, the TSM server will not find an active

version of the file, so the second process will issue this message for that file.

System action: The object is not expired. Processing continues with the next object.

User response:

- Review the console output, schedule log, or error log and locate the ANS1228E message that immediately precedes this message. ANS1228E will identify the object that could not be expired.
 - Examine the conditions under which the problem occurred and assess whether those conditions explain the occurrence of this message. For example, this message could appear if multiple instances of the client were attempting to back up the file system concurrently.
 - If the reason this message occurred can not be determined and the message occurs when the operation is tried again, then contact IBM support for further assistance. Also try searching for this message number on <http://www.ibm.com> for possible solutions.
-

0005 E
DSM_RC_ABORT_NO_DATA

The TSM server has no data for the object.

Explanation: TSM tried to do a restore or retrieve on an object that has no data associated with it. If a corrective action is possible, it is with the TSM server.

System action: TSM ends the current operation.

User response: Ask the TSM administrator to check the TSM activity log for any messages related to this error that might help identify the problem.

0006 E
DSM_RC_ABORT_BAD_VERIFIER

You entered an incorrect password.

Explanation: You entered an incorrect current password or you entered a new password that does not fulfill the password length requirements set on the server.

System action: Processing stops.

User response: Retry the session with the correct password. If this fails or you have forgotten your password, ask the TSM administrator to assign a new password.

0007 E
DSM_RC_ABORT_NODE_IN_USE

Node in use

Explanation: The node you are running on is in use by another operation on the server. This might be from another client or from some activity on the server.

System action: Processing stopped.

User response: Retry the operation, or see your system administrator to see what other operations are running for your node.

0008 E
DSM_RC_ABORT_EXPDATE_TOO_LOW

Expiration date must be greater than today's date

Explanation: Archive expiration date is too low, the date must be greater than today's date.

System action: TSM canceled the current operation.

User response: Retry archiving the file with an expiration date that is higher than today's date.

0009 W
DSM_RC_ABORT_DATA_OFFLINE

The requested data is offline.

Explanation: For the restore or retrieve operation, one or more of the requested files must be recalled from offline storage media (generally tape). The wait time depends on your site's offline storage management policies.

System action: TSM waits for offline storage media to become available and then continues.

User response: None.

0010 E
DSM_RC_ABORT_EXCLUDED_BY_SIZE

Object too large for server limits

Explanation: The object is too large. The configuration of the server does not have any data storage space that accepts the object.

System action: File skipped.

User response: See your system administrator to determine the maximum file (object) size for which your site's server is configured.

0011 E
DSM_RC_ABORT_NO_REPOSIT_SPACE

Server out of data storage space

Explanation: The server does not have any space available to store the object.

System action: TSM ended the current operation.

User response: You can take any of the following actions:

- Request the system administrator to add space to the storage pool.
 - For TSM client, set COMPRESSALWAYS=NO and COMPRESSION=YES in the options file (DSM.OPT), then the file will be resent uncompressed if it grows during compression.
 - For API Applications, consult the application's documentation for recommendations regarding compression.
 - Turn off disk caching in the disk storage pool, and issue MOVE DATA commands to each disk pool volume to clear out the cached bitfiles.
-

0012 E
DSM_RC_ABORT_MOUNT_NOT_POSSIBLE

Server media mount not possible

Explanation: Server media mount not possible. The server timed out waiting for a mount of an offline volume.

System action: File skipped.

User response: Retry later when server volumes can be mounted. Ensure that the MAXNUMMP (maximum number of mount points) defined on the server for this node is greater than 0.

0013 E
DSM_RC_ABORT_SIZEESTIMATE_EXCEED

Size estimate exceeded

Explanation: The total amount of data for a backup or archive operation exceeds the estimated size originally sent to the server for allocating data storage space. This happens when many files are growing by large amounts while the backup or archive operation is in session.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, check what other processes are running on the client machine that are generating large amounts of data. Disable those operations while the backup or archive operation is taking place.

0014 E
DSM_RC_ABORT_DATA_UNAVAILABLE

File data currently unavailable on server

Explanation: The file data is currently unavailable on the server. A retrieve or restore operation was attempted. Possible causes are:

- Data was corrupted at the server
- Server found a read error
- File is temporarily involved in a reclaim operation at the server
- Server requested a tape volume that was marked unavailable.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, see your system administrator to determine the problem from the server console or the activity log. Check whether any requests were made for a tape volume that was unavailable. A tape volume may be marked unavailable if prior read errors were encountered or the volume is checked out of the tape library.

0015 E
DSM_RC_ABORT_RETRY

Unexpected retry request. The server found an error while writing the data.

Explanation: None.

System action: The client retries the operation.

User response: None.

0016 E
DSM_RC_ABORT_NO_LOG_SPACE

The server does not have enough recovery log space to continue the current operation

Explanation: The server ran out of recovery log space.

System action: TSM ended the current operation.

User response: This error is a temporary problem. Retry later or see your system administrator.

0017 E
DSM_RC_ABORT_NO_DB_SPACE

The server does not have enough database space to continue the current operation

Explanation: The server ran out of database space.

System action: TSM ended the current operation.

User response: See your system administrator.

0018 E
DSM_RC_ABORT_NO_MEMORY

The server does not have enough memory to continue the current operation.

Explanation: The server ran out of memory.

System action: TSM ended the current operation.

User response: This is a temporary problem. Retry later or see your system administrator.

0020 E
DSM_RC_ABORT_FS_NOT_DEFINED

The specified file space does not exist on the server. The file space might have been deleted by another client or an administrator.

Explanation: The specified file space does not exist on the server. Your system administrator deleted the file space or another client using your client's node name deleted it.

System action: TSM canceled the current operation.

User response: Check the file space name to see if it is correct, and retry the operation.

0021 S
DSM_RC_ABORT_NODE_ALREADY_DEFED

Open Registration failed because the specified node name is defined in the server

Explanation: Open registration failed because a node is defined in the server with the same name.

System action: TSM canceled the current operation.

User response: Retry with another node name.

0022 S
DSM_RC_ABORT_NO_DEFAULT_DOMAIN

Open Registration failed because no default domain exists

Explanation: Open registration failed because a default policy domain does not exist for you to place your node.

System action: TSM canceled the current operation.

User response: See your system administrator.

0023 S
DSM_RC_ABORT_INVALID_NODENAME

Open Registration failed because an invalid node name was specified

Explanation: Open registration failed because the specified node name contains invalid characters.

System action: TSM canceled the current operation.

User response: Retry with another node name that does not have any invalid characters.

0024 E
DSM_RC_ABORT_NO_INVALID_POL_BIND

An object in the transaction has been bound to an invalid management class.

Explanation: One of the objects in the transaction is bound to a management class that is not part of this node's policy, or the management class type is not supported for this client level.

System action: The current operation ends.

User response: Make sure all objects are bound to a valid management class, or upgrade the client to the proper level.

0024 S
DSM_RC_ABORT_INVALID_POL_BIND

A policy management problem has occurred on the TSM server.

Explanation: The TSM client error log and TSM server activity log may contain additional information about this error.

System action: Processing is stops.

User response: Try the operation again. If the problem persists, examine the TSM client error log and TSM server activity log for additional information about this error. If the problem cannot be resolved, then obtain a SERVICE trace that captures the problem and contact IBM technical support for additional assistance. Your TSM administrator can help you configure the trace.

0025 E
DSM_RC_ABORT_DEST_NOT_DEFINED

Server problem: Destination not defined.

Explanation: Server problem: Destination not defined.

System action: Processing stopped.

User response: Have your service representative check the error log.

0026 S
DSM_RC_ABORT_WAIT_FOR_SPACE

The TSM server does not currently have space in the storage pool for this file. This may be a temporary condition.

Explanation: This message is typically issued when the storage pool in which the data is being placed does not have sufficient space to store the data, but the space will be available soon. For example, a storage pool migration might free up sufficient space to store the data.

System action: TSM ends the current operation.

User response: Try the operation at a later time. If this fails, contact the TSM administrator and request more storage pool space.

0027 E
DSM_RC_ABORT_NOT_AUTHORIZED

The file space cannot be deleted because this node does not have permission to delete archived or backed up data.

Explanation: You cannot delete the file space data unless your TSM administrator has authorized your node to do so. Authorization permits you to delete backup data, archive data, or both.

System action: Delete processing fails.

User response: Use the DSMC QUERY SESSION command to verify your authorization. Ask your TSM administrator to provide the necessary authorization or to delete the file space for you.

0028 E
DSM_RS_ABORT_RULE_ALREADY_DEFED

'Access rule' Access Rule already defined for node 'node '. Old rule must be deleted before new one can be defined.

Explanation: You are trying to define authorization for the specified node, which already has authorization defined.

System action: TSM did not redefine authorization for the specified node.

User response: Update the authorization, or delete the old rule and define a new one, or use the current authorization.

0029 S
DSM_RC_ABORT_NO_STOR_SPACE_STOP

Server out of data storage space

Explanation: The server does not have space available to store the object.

System action: TSM ended the current operation.

User response: Report to your system administrator that a storage pool on the server is full.

0030 E
DSM_RC_ABORT_LICENSE_VIOLATION

The operation is not permitted due to server licenses values.

Explanation: The node or user is trying to perform an operation that either exceeds license values, or is not licensed.

System action: The session is rejected or the transaction is cancelled, ending the current operation.

User response: See your system administrator.

0032 E
DSM_RC_ABORT_DUPLICATE_OBJECT

A duplicate object was found, operation cannot complete.

Explanation: A duplicate object was found, operation cannot complete.

System action: The requested operation failed.

User response: Try the operation with a different file specification.

0033 E
DSM_RC_ABORT_INVALID_OFFSET

partialObjOffset value for partial object retrieve is invalid.

Explanation: The partialObjOffset value for partial object retrieve is invalid.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

0034 E
DSM_RC_ABORT_INVALID_LENGTH

partialObjLength value for partial object retrieve is invalid.

Explanation: partialObjLength value for partial object retrieve is invalid.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

0036 E
DSM_RC_END_NODE_NOT_AUTHORIZED

The node or user does not have proper authority to perform this operation

Explanation: The node or user does not have proper authority to perform this operation.

System action: The transaction is ended.

User response: Check the authority for the specified object.

0041 E
DSM_RC_ABORT_EXCEED_MAX_MP

This node has exceeded its maximum number of mount points.

Explanation: Either no tape or sequential disk mount points are permitted for this operation, or the maximum number of mount points allowed are already in use. The operation can not be completed. The TSM administrator defines the maximum number of mount points with the MAXNUMMP property of your node definition.

System action: The object is skipped

User response: If you are performing any other TSM operations that might be using mount points, wait until those operations are complete, then try the failed operation again. Otherwise contact your TSM administrator for further assistance

0045 E
DSM_RC_ABORT_MERGE_ERROR

The specified objects failed the merge test.

Explanation: The specified objects failed the merge test, operation cannot complete.

System action: The requested operation failed.

User response: See documentation for the merge test parameters.

0047 E
DSM_RC_ABORT_INVALID_OPERATION

An invalid operation was attempted on a node

Explanation: The operation is not valid.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

0048 E
DSM_RC_ABORT_STGPOOL_UNDEFINED

The specified target storage pool is not defined.

Explanation: The storage pool is not defined.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

0049 E
DSM_RC_ABORT_INVALID_DATA_FORMAT

A target storage pool does not have the correct data format for the given node type.

Explanation: none

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

0050 E
DSM_RC_ABORT_DATAMOVER_UNDEFINED

No associated data mover is defined for the given node.

Explanation: none

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

0051 E
DSM_RC_REJECT_NO_RESOURCES

Session rejected: All server sessions are currently in use

Explanation: TSM has all available sessions in use and

cannot accept a new one at this time.

System action: TSM canceled the current operation.

User response: Retry the operation. If the problem continues, see your system administrator to increase the number of concurrently active sessions to the server.

0052 E
DSM_RC_REJECT_VERIFIER_EXPIRED

The session is rejected. Your password has expired.

Explanation: Your TSM password has expired.

System action: TSM canceled the current operation. You are not allowed to connect to the server until the password is updated.

User response: Update your password. You may use the SET PASSWORD command, or have the TSM administrator update your node.

0053 E
DSM_RC_REJECT_ID_UNKNOWN

Session rejected: Unknown or incorrect ID entered

Explanation: The node name you entered is not known by the server, or you are attempting to access a file migrated to a different node.

System action: TSM canceled the current operation. You are not allowed to connect to the server until your node name is registered with the server. If attempting to access a migrated file, your node name must be the same node which migrated the file.

User response: Ensure that you entered your TSM node name correctly. If yes, see your system administrator. Verify that the server is using closed registration and that your node name is registered with the server.

0054 E
DSM_RC_REJECT_DUPLICATE_ID

Session rejected: Duplicate ID entered

Explanation: Another process using this node name is active with the server.

System action: TSM cannot connect to the server. TSM canceled the current operation.

User response: If you are running a UNIX-based system, ensure that another process is not active with TSM under the same name. Also, ensure that your node name is unique to the server so that it cannot be used by another person. See your system administrator to identify the owner of that node name.

0055 E
DSM_RC_REJECT_SERVER_DISABLED

Session rejected: Server disabled

Explanation: The server is in a disabled state and cannot be accessed for normal activity.

System action: TSM canceled the current operation.

User response: Retry the operation after the server returns to an enabled state. If the problem continues, see your system administrator.

0056 E
DSM_RC_REJECT_CLOSED_REGISTER

The server is not configured to allow open registration

Explanation: No authorization. Registration is required by your system administrator. The server is not configured to allow open registration.

System action: Session not started.

User response: You must obtain a TSM node and password from your system administrator.

0057 S
DSM_RC_REJECT_CLIENT_DOWNLEVEL

Session rejected: Downlevel client code version

Explanation: The server version and your client version do not match. The client code is downlevel.

System action: TSM canceled the current operation.

User response: See your system administrator to see what version of TSM to run for your location.

0058 S
DSM_RC_REJECT_SERVER_DOWNLEVEL

Session rejected: Downlevel server code version

Explanation: The server version and your client version do not match. The server code is downlevel.

System action: TSM canceled the current operation.

User response: See your system administrator to see what version of TSM to run for your location.

0059 E
DSM_RC_REJECT_ID_IN_USE

Session Rejected: The specified node name is currently in use

Explanation: The node name you specified is in use on the server.

System action: Session was not started.

User response: The server is probably performing a task that prevents your node from establishing a session. Retry later or check with your system administrator.

0061 E
DSM_RC_REJECT_ID_LOCKED

Session Rejected: The specified node name is currently locked

Explanation: The node name you specified is currently locked on the server.

System action: Session was not started.

User response: Check with your system administrator to find out why your node name is locked.

0062 S
DSM_RC_SIGNONREJECT_LICENSE_MAX

SLM LICENSE EXCEEDED: The client licenses for TSM are exceeded. See your system administrator.

Explanation: Adding a new enrollment will exceed the product license count for TSM.

System action: Execution of the client enrollment or connection request ends.

User response: See your system administrator.

0063 E
DSM_RC_REJECT_NO_MEMORY

Session Rejected: The server does not have enough memory to allow a connection to be established.

Explanation: The server does not have enough memory to allow your client to establish a connection with the server.

System action: Session was not started.

User response: Retry later or see your system administrator.

0064 E
DSM_RC_REJECT_NO_DB_SPACE

Session Rejected: The server does not have enough database space to allow a connection to be established.

Explanation: The server ran out of database space.

System action: Session was not started.

User response: See your system administrator.

0065 E
DSM_RC_REJECT_NO_LOG_SPACE

Session Rejected: The server does not have enough recovery log space to allow a connection to be established.

Explanation: The server ran out of recovery log space.

System action: Session was not started.

User response: This error is a temporary problem. Retry later or see your system administrator.

0066 E
DSM_RC_REJECT_INTERNAL_ERROR

The session is rejected. The TSM server has an internal error.

Explanation: The client cannot establish a connection to the TSM server because of an internal server error.

System action: The session was not started.

User response: Notify your TSM administrator of this error.

0067 S
DSM_RC_SIGNONREJECT_INVALID_CLI

Session Rejected: The server is not licensed for this platform type. See your system administrator.

Explanation: The server is not licensed for the requesting client type.

System action: Execution of the client enrollment or connection request ends.

User response: See your system administrator.

0068 E
DSM_RC_CLIENT_NOT_ARCHRETPROT

The session is rejected. The server does not allow a signon of a client that is not archive-retention protection enabled.

Explanation: The client cannot establish a connection to the server because the server is archive-retention

protection enabled and the client is not.

System action: The session is not started.

User response: See your system administrator.

0068 E
DSM_RC_SESSION_CANCELED

Session Rejected: The session was canceled by the server administrator.

Explanation: The server administrator canceled the current client session.

System action: Execution of the client connection request ends.

User response: See your system administrator.

0073 E
DSM_RC_REJECT_INVALID_NODE_TYPE

An inconsistency was detected between the client node and the node that is registered to the TSM server.

Explanation: The user has probably coded the node option incorrectly. For instance, the node that is registered to the TSM server might be a type of NAS, but the node is actually a non-NAS client.

System action: The TSM operation ends.

User response: Ensure that the node name is correct in the client options file. Make sure to use a node of type NAS only with the nasnodename option.

0074 E
DSM_RC_REJECT_INVALID_SESSIONINIT

Server does not allow client-initiated connections for this node.

Explanation: The node is not allowed to initiate connections due to the configuration parameters for this node on the server. Server is able to initiate connections to the client scheduler running in prompted mode.

System action: The IBM Tivoli Storage Manager operation ends.

User response: Contact your systems administrator to enable client-initiated sessions for your node or update the SESSIONINITIATION option and run the client scheduler.

0075 E
DSM_RC_REJECT_WRONG_PORT

Wrong server port.

Explanation: You were trying to open a backup/archive client session on the server port set up for administrative sessions only.

System action: The IBM Tivoli Storage Manager operation ends.

User response: Contact your systems administrator and/or use the correct values for TCP port and TCP Admin Port.

0079 E
DSM_RC_CLIENT_NOT_SPMRETPROT

The session is rejected. The server does not allow a signon of a client that is not space management-retention protection enabled.

Explanation: The client cannot establish a connection to the server because the server is space management-retention protection enabled and the client is not.

System action: The session is not started.

User response: See your system administrator.

0101 W
DSM_RC_USER_ABORT

The operation was stopped by the user.

Explanation: The operation was stopped at the request of the user. This usually occurs when the 'Q' key is pressed two times.

System action: Processing stopped.

User response: None.

0102 E
DSM_RC_NO_MEMORY

The operating system refused a TSM request for memory allocation.

Explanation: TSM requires access to memory in order to store information as processing proceeds. In this case, more memory was requested than the operating system would allocate. Possible reasons include:

The system is low on memory.

The process in which the program runs has exceeded the maximum memory that it is allowed to allocate.

Some other error condition occurred that caused the program to think it is out of memory.

System action: TSM cannot complete the requested operation.

User response: Close all unneeded applications and try the operation again. If the operation still fails, try dividing the task into several smaller units. For example, if a file specification contains several high level directories, run the TSM task serially for each directory. If the TSM task is an incremental backup, use the option "-memoryefficientbackup=yes".

For UNIX systems that support resource limits, you can check if the memory resource limit is too low by entering the following command: `ulimit -a`

Based on the resulting data, you can ask the UNIX system root user to increase resource limits so that it will override the current default. The UNIX system root user has the authority to increase resource limits.

0104 E
DSM_RC_FILE_NOT_FOUND

File not found during Backup, Archive or Migrate processing

Explanation: The file being processed for backup, archive or migrate no longer exists on the client. Another process deleted the file before it could be backed up, archived or migrated by TSM.

System action: File skipped.

User response: None.

0105 E
DSM_RC_PATH_NOT_FOUND

The specified directory path could not be found.

Explanation: An invalid or unreachable directory path was specified.

System action: Processing stopped.

User response: Try the operation again using a valid directory path.

0106 E
DSM_RC_ACCESS_DENIED

Access to the specified file or directory is denied

Explanation: Access to the specified file or directory is denied. You tried to read from or write to a file and you do not have access permission for either the file or the directory.

System action: Processing stopped.

User response: Ensure that you specified the correct file or directory name, correct the permissions, or specify a new location.

0106 E
DSM_RC_ACCESS_DENIED

The specified file is being used by another process

Explanation: The specified file is being used by another process. You tried to read from or write to a file that is currently being used by another process.

System action: Processing stopped.

User response: Ensure that you specified the correct file or directory name, correct the permissions, or specify a new location.

0107 E
DSM_RC_NO_HANDLES

No file handles available

Explanation: All file handles for your system are currently in use. No more are available.

System action: Processing stopped.

User response: Either free some file handles by ending other processes, or modify your system setup to allow for more files to be open at the same time.

0108 E
DSM_RC_FILE_EXISTS

The file exists and cannot be overwritten.

Explanation: The file being restored or retrieved exists and cannot be overwritten due to lack of authority or access permissions.

System action: The file is skipped.

User response: Verify that you have sufficient access permissions to overwrite the file, then try the operation again. If the problem persists, contact your system administrator or TSM administrator for further assistance.

0109 E
DSM_RC_INVALID_PARM

Invalid parameter was found.

Explanation: The system encountered an internal program error due to an invalid parameter.

System action: The system returns to the calling procedure.

User response: Ask your service representative to check the error log.

0110 E
DSM_RC_INVALID_HANDLE

An invalid file handle was passed; system error.

Explanation: An internal system error occurred: A file operation failed because of an invalid file handle.

System action: processing stops.

User response: Try the operation again. If the failure persists, obtain a service trace that captures the problem and contact IBM technical support for additional assistance. Your TSM administrator can help you configure the trace.

0111 E
DSM_RC_DISK_FULL

Processing stopped; Disk full condition

Explanation: No more files can be restored or retrieved because the destination disk is full.

System action: Processing stopped.

User response: Free up disk space, or restore or retrieve the file to another disk.

0113 E
DSM_RC_PROTOCOL_VIOLATION

Protocol violation

Explanation: A communications protocol error occurred. The communication subsystem is not properly defined or is itself in error.

System action: TSM ended the current operation.

User response: Verify that the communication processes are operating properly, and then retry the operation.

0114 E
DSM_RC_UNKNOWN_ERROR

An unknown system error has occurred from which TSM cannot recover.

Explanation: An unknown error occurred. This might be a low-level system or communication error from which TSM cannot recover.

System action: Processing stops.

User response: Try the operation again. If the problem persists, review the TSM error log for any related

messages. Obtain a service trace that captures the problem and contact IBM technical support for additional assistance. Your TSM administrator can help you configure the trace.

0115 E
DSM_RC_UNEXPECTED_ERROR

An unexpected error occurred.

Explanation: This is usually caused by a low-level system error or communication error from which TSM cannot recover.

System action: Processing stopped.

User response: Examine the client error log for any additional messages that might be related to this problem. Try the operation again. If the problem persists, contact TSM technical support for further assistance.

0116 E
DSM_RC_FILE_BEING_EXECUTED

File is in use; Write permission denied.

Explanation: The current file cannot be opened to write to because it is currently being run by another operation.

System action: File skipped.

User response: Stop the operation that is running the file and retry the operation, or restore or retrieve the file to a different name or directory.

0117 E
DSM_RC_DIR_NO_SPACE

No more files can be restored or retrieved since the destination directory is full.

Explanation: No more files can be restored or retrieved since the destination directory is full.

System action: Processing stopped.

User response: Free up disk space, or restore or retrieve the file to another disk.

0118 E
DSM_RC_LOOPED_SYM_LINK

Too many symbolic links were detected while resolving name

Explanation: While trying to resolve the file name, too many symbolic links were found.

System action: File skipped.

User response: Ensure that you do not have a looping symbolic link for the file.

0119 E
DSM_RC_FILE_NAME_TOO_LONG

The file name is too long and can not be processed by TSM

Explanation: None.

System action: The file is skipped.

User response: See the client manual for the operating system on which you are receiving this error. The "File specification syntax" section of the manual explains file name lengths supported by TSM.

0120 E
DSM_RC_FILE_SPACE_LOCKED

File system is locked by system

Explanation: File system cannot be accessed because it is locked by the system.

System action: TSM cannot complete the operation.

User response: See your system administrator.

0121 I
DSM_RC_FINISHED

The operation is finished.

Explanation: The operation is finished.

System action: The system returns to the calling procedure.

User response: Proceed with next function call.

0122 E
DSM_RC_UNKNOWN_FORMAT

The file has an unknown format.

Explanation: TSM tried to restore or retrieve a file, but it had an unknown format.

System action: The file is skipped.

User response: The file was either backed up by another application, or the data is invalid. If the file belongs to this system, try the operation again. If the problem persists, contact IBM technical support for further assistance.

0123 E
DSM_RC_NO_AUTHORIZATION

Not authorized to restore the other node's data.

Explanation: The client is not authorized to restore the other node's data.

System action: The system returns to the calling procedure.

User response: Get authorization from the other node.

0124 E
DSM_RC_FILE_SPACE_NOT_FOUND

File space 'filespace-name' does not exist

Explanation: The specified file space (domain) is incorrect or does not exist on the machine.

System action: Processing stopped.

User response: Retry the operation specifying an existing domain (drive letter or file system name).

0125 E
DSM_RC_TXN_ABORTED

Transaction aborted

Explanation: The current transaction between the server and the client stopped. A server, client, or communication failure cannot be recovered.

System action: TSM canceled the current operation.

User response: Retry the operation. If the problem continues, see your system administrator to isolate the problem.

0126 E
DSM_RC_SUBDIR_AS_FILE

TSM cannot build a directory path because a file exists with the same name as the directory.

Explanation: None

System action: Processing stopped.

User response: Remove or rename the file that has the same name as the directory. Alternatively, you can restore the directory to a different location.

0127 E
DSM_RC_PROCESS_NO_SPACE

Disk space limit for this process reached

Explanation: The disk space allocated for the client owner is full.

System action: Processing stopped.

User response: Free up disk space and retry the restore or retrieve operation.

0128 E
DSM_RC_PATH_TOO_LONG

Destination directory path length exceeds system maximum

Explanation: The path name specified plus the path name in the restored file name combine to create a name whose length exceeds the system maximum.

System action: Processing stopped.

User response: Specify a destination path that, when combined, is less than the system maximum.

0129 E
DSM_RC_NOT_COMPRESSED

File is not compressed; System failure.

Explanation: A file that was flagged as compressed was not compressed, and the system failed.

System action: Processing stopped.

User response: See your system administrator to report this problem. This error is a system failure.

0130 E
DSM_RC_TOO_MANY_BITS

File compressed on a different client machine that has more memory

Explanation: You are trying to restore a file that was backed up and compressed on another client workstation that had more memory than your client workstation. You cannot restore this file. When the file is restored, it is expanded and your workstation does not have enough memory.

System action: TSM canceled the operation.

User response: Obtain a machine with more memory and retry the operation.

0131 S
DSM_RC_SYSTEM_ERROR

An internal program error occurred.

Explanation: TSM encountered an unexpected condition and can not continue the operation. This

might be a programming error.

System action: processing stops.

User response: Try the operation again. If the problem persists, contact your TSM administrator or IBM technical support for further assistance.

0131 E
DSM_RC_COMPRESSED_DATA_CORRUPTED

The compressed file is corrupted and cannot be expanded correctly.

Explanation: The compressed file cannot be expanded correctly due to one of the following reasons:

There is a problem on the tape.

There is a communications problem.

The compressed file was corrupted on the TSM Server.

System action: File skipped.

User response: 1) The compressed file is corrupted because there is a problem on the tape. To know if this is the problem, please issue the following command on the TSM Server: audit volume <volume_name> fix=no If there is any problem reported, you could move the data from that volume to a new one (see command MOVE DATA) and try again the restore. 2) There are communications problems between the TSM Server and the TSM Client and the results is that the file is corrupted during the transmission. If you use a gigabit Ethernet adapter on the Server please upgrade the card driver (AIX platform) or add provided by SUN suggested changes to some system network options which have resolved this problem (SUN platform). 3) Please verify with your network support if during the restore there are no any problems between the TSM Client/Server that is originating the file corruption.

0132 E
DSM_RC_NO_SERVER_RESOURCES

The TSM server is out of resources.

Explanation: A lack of a storage resource or a maximum value condition does not allow any new activity.

System action: TSM canceled the current operation.

User response: Try the operation again at a later time. If the problem continues, contact your TSM administrator to isolate what resource is unavailable. The TSM administrator can check the TSM server activity log for messages that might explain the problem.

0133 E
DSM_RC_FS_NOT_KNOWN

The file space for domain 'domain-name' could not be found on the TSM server.

Explanation: The specified file space was expected to be found on the server, but it no longer exists. It is possible that a command was issued to delete the file space from the server while the current operation was in progress.

System action: TSM processing stops.

User response: Try the operation again. If the problem recurs, check the error log for any other messages that might indicate a reason for the failure. Try to correct any indicated problems, then try the operation again. If the problem persists, contact IBM technical support for further assistance.

0134 E
DSM_RC_NO_LEADING_DIRSEP

The objName field has no leading directory separator.

Explanation: The objName field does not have a leading directory separator.

System action: The system returns to the calling procedure.

User response: Correct the value for the objName.

0135 E
DSM_RC_WILDCARD_DIR

Wildcards are not allowed in the objName directory path.

Explanation: Wildcards are not allowed in the objName directory path.

System action: The system returns to the calling procedure.

User response: Correct the value for the objName.

0136 E
DSM_RC_COMM_PROTOCOL_ERROR

The session is rejected: There was a communications protocol error.

Explanation: An unexpected network message was received by the client. This could be caused by network problems or a programming error.

System action: TSM canceled the current operation.

User response: Verify that your communication path

is functioning properly and try the operation again. If the problem persists, contact your TSM administrator for further assistance.

0137 E
DSM_RC_AUTH_FAILURE

Session rejected: Authentication failure

Explanation: Authentication failure. You entered an incorrect password.

System action: TSM canceled the current operation.

User response: Enter your correct password. If you cannot remember the correct password, see your system administrator to have a new one assigned for your node name.

0138 E
DSM_RC_TA_NOT_VALID

The trusted agent execution/owner permissions are invalid.

Explanation: The trusted agent execution/owner permissions are invalid.

System action: Processing stopped.

User response: Have your system administrator check the installation instructions for the client to ensure that the trusted agent permissions are set correctly.

0139 S
DSM_RC_KILLED

Process killed.

Explanation: Processing stopped. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

0145 S
DSM_RC_WOULD_BLOCK

Trusted agent would block the operation.

Explanation: The trusted agent blocks the operation. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

0146 S
DSM_RC_TOO_SMALL

The area for the include/exclude pattern is too small.

Explanation: The area for the include/exclude pattern is too small. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

0147 S
DSM_RC_UNCLOSED

There is no closing bracket in the pattern.

Explanation: There is no closing bracket in the pattern. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

0148 S
DSM_RC_NO_STARTING_DELIMITER

Include/Exclude pattern must start with a directory delimiter

Explanation: The include or exclude pattern must start with a directory delimiter.

System action: Processing stopped.

User response: Correct the syntax for the pattern.

0149 S
DSM_RC_NEEDED_DIR_DELIMITER

Include/Exclude pattern has a '...' without beginning/ending directory delimiter

Explanation: The include/exclude pattern has a '...' without a beginning or ending directory delimiter.

System action: Processing stopped.

User response: Correct the syntax for the pattern.

0150 S
DSM_RC_UNKNOWN_FILE_DATA_TYPE

The structured file data type is unknown.

Explanation: An unknown and unexpected error code

occurred within the client program. The structured file data type is unknown. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

0151 S
DSM_RC_BUFFER_OVERFLOW

The data buffer overflowed.

Explanation: The data buffer overflowed. This is a programming failure and the client program ends.

System action: Processing stopped.

User response: Retry the operation. If the problem continues, contact your system administrator.

0154 E
DSM_RC_NO_COMPRESS_MEMORY

Insufficient memory for file compression/expansion

Explanation: Not enough memory is available to do data compression or expansion. For a restore or retrieve, the file cannot be recalled from the server until more storage is made available. For a backup or archive, try running without compression if storage cannot be made available.

System action: Processing stopped.

User response: Free up extra storage for the operation to continue, or run the backup or archive process without compression enabled.

0155 T
DSM_RC_COMPRESS_GREW

Compressed Data Grew

Explanation: The size of the file after compression is greater than the size of the file before compressed.

System action: Even though the size of the file increased, the file is compressed.

User response: None.

0156 E
DSM_RC_INV_COMM_METHOD

An unsupported communications method was specified.

Explanation: None.

System action: processing stops.

User response: Specify a communications interface that is supported by the TSM client on your operating system. See the TSM client manual for your operating system for further information on configuring TSM client communications.

0157 S
DSM_RC_WILL_ABORT

The transaction will be aborted.

Explanation: The server encountered an error and will abort the transaction.

System action: The transaction will be aborted. The reason code is passed on the dsmEndTxn call.

User response: Issue the dsmEndTxn with a vote of DSM_VOTE_COMMIT and examine the reason code.

0158 E
DSM_RC_FS_WRITE_LOCKED

Destination file or directory is write locked

Explanation: The file or directory being restored or retrieved from the server cannot be written to because the destination is write locked. Another operation might have the file open and will not allow it to be updated.

System action: File skipped.

User response: Either determine which operation has the file write locked, or restore the file to another name or location.

0159 I
DSM_RC_SKIPPED_BY_USER

A file was skipped during a restore operation because the file is off line and the application has chosen not to wait for a tape mount.

Explanation: A file was skipped during a restore operation because the file is off line and the application has chosen not to wait for a tape mount.

System action: File skipped.

User response: Verify the application sets the mountWait value correctly on dsmBeginGetData.

0160 E
DSM_RC_TA_NOT_FOUND

Unable to find Trusted Agent module.

Explanation: TSM was unable to find the TSM Trusted Agent module in the specified directory. The name of the TSM Trusted Agent module is dsmtca.

System action: TSM ends.

User response: Make sure the Trusted Agent module is in the directory specified by DSMI_DIR.

0161 E
DSM_RC_TA_ACCESS_DENIED

Access denied for dsmapi

Explanation: An attempt to access a system function has been denied.

System action: Processing stopped.

User response: Contact your system administrator.

0162 E
DSM_RC_FS_NOT_READY

File system/drive not ready

Explanation: The file system/drive was not ready for access.

System action: Processing stopped.

User response: Ensure that the drive is available to TSM, and then retry the operation.

0164 E
DSM_RC_FIO_ERROR

File input/output error

Explanation: An error was found while reading from or writing to the file.

System action: File or file system is skipped.

User response: Check your system to ensure that it is operating properly. For OS/2, run CHKDSK /F for the failing drive which can be found in dsmerror.log.

0165 E
DSM_RC_WRITE_FAILURE

File write error

Explanation: An error was found while writing to the file.

System action: File skipped.

User response: Check your system to ensure that it is operating properly.

0166 E
DSM_RC_OVER_FILE_SIZE_LIMIT

File exceeds system/user file limits

Explanation: A file being restored or retrieved exceeds system set limits for this user.

System action: File skipped.

User response: Ensure that the system limits are set properly.

0167 E
DSM_RC_CANNOT_MAKE

Cannot make file/directory

Explanation: The directory path for files being restored or retrieved cannot be created.

System action: File skipped.

User response: Ensure that you have the proper authorization to create the directory for file being restored or retrieved. Make sure that you have write access.

0168 E
DSM_RC_NO_PASS_FILE

Password file is not available.

Explanation: The file containing the stored password for the specified *server-name* is unavailable.

System action: TSM ends.

User response: The root user must set and store a new password.

0169 E
DSM_RC_VERFILE_OLD

PASSWORDACCESS is GENERATE, but password needed for server 'server-name'. Either the password is not stored locally, or it was changed at the server.

Explanation: Either the password is not stored locally, or it was changed at the server.

System action: TSM prompts you for the password if TSM is running in the foreground.

User response: If TSM was running as a background process, issue any TSM command from the foreground. Enter the password in answer to the prompt. Then try your background TSM command again.

0173 E
DSM_RC_INPUT_ERROR

The process is running in a non-interactive mode, but requires user input.

Explanation: This process requires keyboard input, but non-interactive processes are unable to read input from keyboard.

System action: processing stops.

User response: Perform the following actions to resolve this error:

- Run the product in interactive mode.
 - Ensure your password is set correctly.
-

0174 E
DSM_RC_REJECT_PLATFORM_MISMATCH

Session rejected: Node type mismatch

Explanation: Your node name is associated with a different type of operating system (such as OS/2 or AIX) and cannot be used on this system.

System action: TSM canceled the current operation.

User response: If you need a new node name, see your system administrator to assign a new one to you. Generally, you have a unique node name for each machine and operating system pair that requires access to the server.

0175 E
DSM_RC_TL_NOT_FILE_OWNER

Not file owner

Explanation: The file cannot be backed up because the client is not the file owner.

System action: TSM skips the file.

User response: None.

0177 S
DSM_RC_UNMATCHED_QUOTE

Quotes are not matched

Explanation: The quotes specified in the pattern are not the same and do not make a set.

System action: Processing stopped.

User response: Correct the pattern by using matching quotes in the syntax.

0184 E
DSM_RC_TL_NOBCG

The management class for this file does not have a valid backup copy group. This file will not be backed up.

Explanation: The management class for this file does not have a backup copy group specified. This file will not be backed up.

System action: Processing stopped.

User response: Add a valid backup copy group to the management class, and then retry the operation.

0185 W
DSM_RC_TL_EXCLUDED

File '*file-name file-namefile-name*' excluded by Include/Exclude list

Explanation: You can not back up, archive, or migrate files that are excluded.

System action: TSM does not process the file.

User response: If the file is intentionally excluded, then this message can be ignored. Otherwise modify the include/exclude list, restart the client, and try the operation again. Contact your TSM administrator for further assistance.

0186 E
DSM_RC_TL_NOACG

The management class for this file does not have a valid archive copy group. This file will not be archived.

Explanation: The management class for this file does not have an archive copy group specified. This file will not be archived.

System action: Processing stopped.

User response: Add a valid archive copy group to the management class, and then retry the operation.

0187 E
DSM_RC_PS_INVALID_ARCHMC

Invalid management class entered

Explanation: You entered an invalid management class.

System action: TSM is unable to do the requested operation.

User response: Retry the operation using a valid management class.

0188 S
DSM_RC_NO_PS_DATA

Either the node does not exist on the server or there is no active policy set for the node.

Explanation: This error occurs when you try to access another node's data. Either the node is not registered with the TSM server, or there is no active policy set for the node.

System action: Processing stops.

User response: Verify that the node whose data you are trying to access is registered with the TSM server. If you have more than one TSM server, make sure you are connecting to the correct server, then try the operation again. If the problem persists, contact your TSM administrator for further assistance.

0189 S
DSM_RC_PS_INVALID_DIRMC

The management class assigned to directories does not exist.

Explanation: The management class named on the DIRMC option does not exist in your assigned policy set on the server. The error log contains an entry showing the invalid management class name.

System action: processing stops.

User response: Remove the current DIRMC option from the client options file, then run DSMC QUERY MGMTCLASS -DETAIL to view information about available management classes. Make sure the management class you select has a backup copy group. If you have more than one TSM server, make sure you are connecting to the correct server. If you are unable to find a suitable management class, contact your TSM administrator for further assistance.

0190 S
DSM_RC_PS_NO_CG_IN_DIR_MC

There is no backup copy group in the management class used for directories.

Explanation: The DIRMC option names a management class that contains no backup copy group.

System action: processing stops.

User response: Remove the current DIRMC option from the client options file, then run DSMC QUERY MGMTCLASS -DETAIL to view information about available management classes. Make sure the

management class you select has a backup copy group. If you have more than one TSM server, make sure you are connecting to the correct server. If you are unable to find a suitable management class, contact your TSM administrator for further assistance.

0231 E
DSM_RC_ABORT_MOVER_TYPE

Unknown Remote Mover type

Explanation: The specified Remote Mover type is unknown.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

0232 E
DSM_RC_ABORT_ITEM_IN_USE

An Operation for the requested node and filesystem is already in progress.

Explanation: A request has been made to use a data mover to perform an operation for the indicated node and filesystem. Since an operation for this node and filesystem is already in progress, the new operation cannot be performed.

System action: TSM ended the current operation.

User response: Retry the operation at a later time.

0233 E
DSM_RC_ABORT_LOCK_CONFLICT

System resource in use

Explanation: A required resource is in use by another command or process.

System action: TSM ended the current operation.

User response: Retry the operation at a later time.

0234 E
DSM_RC_ABORT_SRV_PLUGIN_COMM_ERROR

Server plugin communication error

Explanation: Communication between a server plugin module and a NAS filer failed.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

0235 E
DSM_RC_ABORT_SRV_PLUGIN_OS_ERROR

Server plugin detected unsupported NAS filer operating system.

Explanation: A plugin module detected that a NAS filer is running an unsupported operating system or operating system level.

System action: TSM ended the current operation.

User response: Contact your system administrator for more information.

0236E
DSM_RC_ABORT_CRC_FAILED

The CRC received from the Server does not match the CRC calculated by the client.

Explanation: The server sent a CRC for a buffer. The client calculated a CRC for the same buffer. These did not match. The mismatch indicates a communication failure.

System action: In some cases, the client can indicate the failure to the server and retry the operation.

User response: Check the trace log for additional information and retry the operation. If the problem persists, contact your system administrator.

0237E
DSM_RC_ABORT_INVALID_GROUP_ACTION

An invalid operation was attempted on a group leader or group member.

Explanation: An invalid operation was attempted on a logical group.

System action: The current operation stops.

User response: Retry a valid operation.

0238E
DSM_RC_ABORT_DISK_UNDEFINED

Remote disk not defined.

Explanation: An operation was attempted on a remote disk that is not defined.

System action: The current operation stops.

User response: Define the proper remote disk.

0239E
DSM_RC_ABORT_BAD_DESTINATION

Input destination does not match expected destination.

Explanation: Input destination does not match expected destination.

System action: The current operation stops.

User response: Retry operation with proper destination.

0240E
DSM_RC_ABORT_DATAMOVER_NOT_AVAILABLE

Data mover is not available.

Explanation: Data mover is not available.

System action: The current operation stops.

User response: Retry operation with a proper Data mover.

0241E
DSM_RC_ABORT_STGPOOL_COPY_CONT_NO

Operation failed because the copy continue option was set to NO.

Explanation: Operation failed because the copy continue option was set to NO.

System action: The current operation stops.

User response: This abort code indicates that a store operation, like backup or archive failed because the copy continue option was set to NO. The sysadmin will need to resolve the problem on the server end.

0242E
DSM_RC_ABORT_RETRY_SINGLE_TXN

Transaction failed because of a problem during a store operation.

Explanation: Transaction failed because of a problem during a store operation. This error is typical when the next storage pool has a different copy storage pool list and we switch to this pool in the middle of a transaction.

System action: Transaction is aborted.

User response: Resend objects in separate transactions.

0245 E
DSM_RC_ABORT_PATH_RESTRICTED

The current client configuration does not comply with the value of the DATAWRITEPATH or DATAREADPATH server option for this node.

Explanation: The values of the DATAWRITEPATH and DATAREADPATH server options specify where the client is allowed to send data, and where data is read from. The values for the specified node name should correspond with the client configuration. For example, you will get this error message if DATAWRITEPATH contains a LAN value and the client is configured to use LAN-free protocol, or vice versa.

System action: Processing stopped.

User response: Check the client, server, and storage agent logs to determine why the client was not able to send data LAN-free. Make sure the client configuration and server options are compatible.

0247 E
DSM_RC_ABORT_INSERT_NOT_ALLOWED

This server does not support backup operations.

Explanation: This server only supports archive operations, backup is not allowed.

System action: Current operation ends.

User response: Use only archive operations with this server.

0248 E
DSM_RC_ABORT_DELETE_NOT_ALLOWED

Deleting this object: "fshlll" is not allowed.

Explanation: The object is either under a hold and cannot be deleted, or it is on a retention-protection enabled server and has not expired.

System action: The object is skipped and processing continues.

User response: Check the status of the object through a query to see if it is held, or when it expires.

0249 E
DSM_RC_ABORT_TXN_LIMIT_EXCEEDED

The number of objects in this transaction exceed TXNGROUPMAX values.

Explanation: There are too many objects in this transaction.

System action: Current operation ends.

User response: Try the operation again with fewer objects in the transaction, or increase the TXNGROUPMAX value on the server.

0250 E
DSM_RC_ABORT_OBJECT_ALREADY_HELD

fshlll is already under hold.

Explanation: One of the objects in the transaction The specified object is already under hold, and it cannot be placed under a new hold.

System action: Current operation ends. This object is skipped and processing continues.

User response: Issue a query to see the status of the objects, and try the operation again, without the object that is already held.

0292 E
DSM_RC_TCA_FORK_FAILED

Error starting the Trusted Communication Agent process.

Explanation: An error has occurred starting the Trusted Communication Agent process; specifically, the fork() function has failed.

System action: TSM ends.

User response: Probable system error. If the problem persists, restart the workstation.

0295 E
DSM_RC_TCA_INVALID_REQUEST

The TSM Trusted Communication Agent received an invalid request.

Explanation: The Trusted Communication Agent is invoked by the TSM client and has received an unknown request argument in the call.

System action: TSM ends.

User response: It is possible the Trusted Communication Agent was mistakenly invoked by a process other than the TSM client. If that is not the case, then this is an internal error. If the problem recurs, contact your IBM service representative.

0296 E
DSM_RC_TCA_NOT_ROOT

This action requires TSM administrative authority on this system.

Explanation: An activity has been attempted that must be performed by the TSM administrator (for example, open registration, filespace delete or password update).

System action: TSM ends.

User response: If the activity is required, the administrator for this system must perform it.

0297 E

DSM_RC_TCA_SEMGET_ERROR

Error allocating semaphores.

Explanation: An error has occurred because the semaphores you are attempting to allocate have become insufficient.

System action: Processing ends.

User response: Ask your system administrator for assistance, and possibly increase the number of semaphores in your system.

0298 E

DSM_RC_TCA_SEM_OP_ERROR

Error setting semaphore value or waiting on semaphore.

Explanation: An error has occurred while attempting to set or wait on a semaphore.

System action: Processing ends.

User response: Probable system error. If the problem persists, restart the workstation.

0400 E

DSM_RC_INVALID_OPT

An invalid option was found during option parsing.

Explanation: An invalid option was found.

System action: The system returns to the calling procedure.

User response: Verify the options in dsm.opt, dsm.sys, and the options string. Check the error log for more details about the error. on the AS/400 platform, verify the options in *LIB/QOPTTSM(APIOPT).

0405 E

DSM_RC_NO_HOST_ADDR

TCPSERVERADDRESS not defined for this server in the System Options File

Explanation: The TCPSERVERADDRESS for this

server is not defined in the server name stanza in the system options file.

System action: TSM initialization fails and the program ends.

User response: See the TSM administrator for your system, and make sure that the server to which you are trying to connect, has a valid TCPSERVERADDRESS defined in the system options file.

0406 S

DSM_RC_NO_OPT_FILE

Options file '*file-name*' could not be found.

Explanation: Common reasons for this error include:

- The default options file does not exist.
- You specified the -OPTFILE option when starting the TSM client, but the options file you provided does not exist.
- The DSM_CONFIG (or DSMI_CONFIG if you are using the TSM API) environment variable specifies an options file that does not exist.

System action: TSM client processing stops.

User response: Make sure that the options file you want to use exists. Review the information on configuring TSM in the TSM client manual specific to your operating system. If the problem persists, ask your TSM administrator for further assistance.

0408 E

DSM_RC_MACHINE_SAME

A virtual node name must not equal either a node name or the system host name.

Explanation: A VIRTUALNODENAME option was entered with a name the same as either a NODENAME option or the system host name.

System action: Initialization fails and the program ends.

User response: If the virtual node name entered was the same as the host name, remove the virtual node name option. If it was the same as the node name option, you can remove either one, depending upon the intended usage. Node name is used to assign an alternate name to your system. Virtual node name is used to access another system's server data.

0409 E

DSM_RC_INVALID_SERVER

Server name not found in System Options File

Explanation: The system options file does not contain the SERVERNAME option.

System action: TSM initialization fails and the program ends.

User response: See the TSM administrator for your system, and make sure that the system options file contains the server name.

**0410 E
DSM_RC_INVALID_KEYWORD**

An invalid option keyword was found during option parsing.

Explanation: An invalid option keyword was found in the dsmlnit configuration file, the option string, dsm.sys, or dsm.opt.

System action: The system returns to the calling procedure.

User response: Correct the spelling of the option keywords. Verify that the dsmlnit configuration file only has a subset of the dsm.sys options. Check the error log for more details about the error.

**0411 S
DSM_RC_PATTERN_TOO_COMPLEX**

The include or exclude pattern cannot be parsed.

Explanation: The pattern is formatted incorrectly or is too complex for TSM to interpret.

System action: Processing stopped.

User response: Verify that the include or exclude pattern is specified correctly. If the pattern is correct, then contact IBM technical support for further assistance.

**0412 S
DSM_RC_NO_CLOSING_BRACKET**

Include/Exclude pattern is missing a closing bracket

Explanation: The include or exclude pattern is incorrectly constructed. The closing bracket is missing.

System action: Processing stopped.

User response: Correct the syntax for the pattern.

**0426 E
DSM_RC_CANNOT_OPEN_TRACEFILE**

Initialization functions cannot open the trace file specified.

Explanation: The file "*tracefile-name*" could not be opened during initialization. The specified path may be incorrect. It is also possible that the current user does not have permission to write to the tracefile in the directory specified. It is also possible that no space is available at the given tracefile location.

System action: Processing terminates.

User response: Make sure the tracefile option points to a valid path and that the user has proper permissions to write to the file specified.

**0427 E
DSM_RC_CANNOT_OPEN_LOGFILE**

Initialization functions cannot open the Error Log file specified.

Explanation: The Error Log file could not be opened during initialization. The specified path may be incorrect. It is also possible that the current user does not have permission to write to the logfile in the directory specified. It is also possible that no space is available at the given logfile location.

System action: Processing terminates.

User response: Make sure the logfile option points to a valid path and that the user has proper permissions to write to the file specified.

**0600 E
DSM_RC_DUP_LABEL**

A duplicate volume label exists. The operation cannot continue.

Explanation: For removable media, TSM uses the volume label as the file space name. To prevent data from different volumes being stored in the same file space on the TSM server, backup or archive of removable media volumes having duplicate volume labels is not allowed.

System action: The requested operation does not run.

User response: Change the volume labels on the removable media volumes so that there are no duplicate labels. Then restart TSM and try the operation again.

**0601 E
DSM_RC_NO_LABEL**

The drive has no label. The operation cannot continue.

Explanation: Backup or archive of removable media requires that the media have a volume label. An attempt was made to back up or archive data on a

removable volume that has no label.

System action: The requested operation does not run.

User response: Create a volume label on the removable media, then try the operation again.

0610 E
DSM_RC-NLS_CANT_OPEN_TXT

Unable to open message text file.

Explanation: The system is unable to open the message txt file (dscenu.txt or dsmclientV3.cat for AIX). On the AS/400 platform this file is QANSAPI/QAANSENU(TXT).

System action: The system returns to the calling procedure.

User response: Verify that the dscenu.txt file is in the directory pointed to by DSMI_DIR. For AIX, verify that the dsmclientV3.cat file has a symbolic link to /usr/lib/nls/msg/<locale>/dsmclientV3.cat .

0611 E
DSM_RC-NLS_CANT_READ_HDR

Unable to use message text file.

Explanation: The system is unable to use the message text file (dscenu.txt or dsmclientV3.cat for AIX) because of an invalid header. On the AS/400 platform this file is QANSAPI/QAANSENU(TXT).

System action: The system returns to the calling procedure.

User response: Install the message text file again.

0612 E
DSM_RC-NLS_INVALID_CNTL_REC

Unable to use message text file.

Explanation: The system is unable to use the message txt file (dscenu.txt or dsmclientV3.cat for AIX) because of an invalid control record. On the AS/400 platform this file is QANSAPI/QAANSENU(TXT).

System action: The system returns to the calling procedure.

User response: Install the message text file again.

0613 E
DSM_RC-NLS_INVALID_DATE_FMT

Invalid value for DATEFORMAT specified.

Explanation: An invalid value is specified for DATEFORMAT.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

0614 E
DSM_RC-NLS_INVALID_TIME_FMT

Invalid value for TIMEFORMAT specified.

Explanation: An invalid value is specified for TIMEFORMAT.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

0615 E
DSM_RC-NLS_INVALID_NUM_FMT

Invalid value for NUMBERFORMAT specified.

Explanation: An invalid value is specified for NUMBERFORMAT.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

0620 E
DSM_RC_LOG_CANT_BE_OPENED

Unable to open error log file.

Explanation: The system is unable to open the error log file.

System action: The system returns to the calling procedure.

User response: Verify the DSMI_LOG value and access permission. On the AS/400 platform, verify the value specified for ERRORLOGNAME in the API options file.

0621 E
DSM_RC_LOG_ERROR_WRITING_TO_LOG

The log file cannot be written to.

Explanation: There was an error writing to the log file.

System action: The system returns to the calling procedure.

User response: Verify the DSMI_LOG value and

access permission. on the AS/400 platform, verify the value specified for ERRORLOGNAME in the API options file.

0622 E
DSM_RC_LOG_NOT_SPECIFIED

The log file name was not specified.

Explanation: The system is unable to open the error log file.

System action: The system returns to the calling procedure.

User response: Verify the DSMI_LOG value and access permission. On the AS/400 platform, verify the value specified for ERRORLOGNAME in the API options file.

0927 E
DSM_RC_NOT_ADSM_AUTHORIZED

Only a TSM authorized user can perform this Action.

Explanation: User must be a TSM authorized user to perform this action. User is not password authorized and this action requires authorization.

System action: Processing stopped.

User response: User must be root user, or user must be the owner of the executable and the set effective user id bit is set to 'on' ('s' bit).

961 E
DSM_RC_DIRECT_STORAGE_AGENT_
UNSUPPORTED

Direct connection to the Storage Agent is not allowed.

Explanation: You cannot connect directly to the Storage Agent.

System action: Processing stopped.

User response: To perform Lanfree operations using the Storage Agent, specify the ENABLELANFREE option in your options file, and restart the process.

963 E
DSM_RC_FS_NAMESPACE_DOWNLEVEL

The long namespace has been removed from the local filesystem. If you wish to proceed with the backup/archive operation, rename your filesystem on the server.

Explanation: TSM has detected that the server namespace is NTW:LONG, but the local volume does

not have long name support. If you would like to back up the volume using the short names, rename the filesystem on the server. If you would like to back up using long names, add the long namespace support back to the volume in question.

System action: Processing stopped.

User response: Add the long namespace support to the volume or rename(remove) the corresponding server filesystem.

0996 E
DSM_RC_SERVER_DOWNLEVEL_FUNC

The TSM server is downlevel and does not support the requested function. See error log for version information.

Explanation: The function being used requires a more current TSM Server.

System action: The operation fails.

User response: Upgrade your TSM Server to a level that supports this function. See error log for version information.

0997 E
DSM_RC_STORAGEAGENT_DOWNLEVEL

The TSM Storage Agent is downlevel and does not support the requested function. See error log for version information.

Explanation: The function being used requires a more current TSM Storage Agent.

System action: The operation fails.

User response: Upgrade your TSM Storage Agent to a level that supports this function. See error log for version information.

0998 E
DSM_RC_SERVER_AND_SA_DOWNLEVEL

The TSM Server and TSM Storage agent are downlevel and do not support the requested function. See error log for version information.

Explanation: The function being used requires a more current TSM Server and TSM Storage agent

System action: The operation fails.

User response: Upgrade your TSM Server and TSM Storage agent to a level that supports this function. See error log for version information.

2000 E
DSM_RC_NULL_OBJNAME

The object name pointer is NULL.

Explanation: There is no value provided for the object name pointer.

System action: The system returns to the calling procedure.

User response: Provide an address for the dsmObjName structure.

2001 E
DSM_RC_NULL_DATA_BLKPTR

The data block pointer is NULL.

Explanation: There is no value provided for the data block pointer.

System action: The system returns to the calling procedure.

User response: Provide an address for the DataBlk structure.

2002 E
DSM_RC_NULL_MSG

msg parameter for dsmRCMsg is a NULL pointer.

Explanation: The message parameter for dsmRCMsg is a NULL pointer.

System action: The system returns to the calling procedure.

User response: Allocate enough space for the message parameter.

2004 E
DSM_RC_NULL_OBJATTRPTR

The object attribute pointer is NULL.

Explanation: There is no value provided for the object attribute pointer.

System action: The system returns to the calling procedure.

User response: Provide an address for the ObjAttr structure.

2006 E
DSM_RC_NO_SESS_BLK

There is no server session information.

Explanation: The server did not respond with the session information.

System action: The system returns to the calling procedure.

User response: Verify the server status.

2007 E
DSM_RC_NO_POLICY_BLK

There is no server policy information.

Explanation: The server did not respond with the policy information.

System action: The system returns to the calling procedure.

User response: Verify the server policy definitions.

2008 E
DSM_RC_ZERO_BUFLLEN

The dataBlk bufferLen value is zero.

Explanation: The value for the dataBlk bufferLen is zero.

System action: The system returns to the calling procedure.

User response: Provide a non-zero value for the bufferLen.

2009 E
DSM_RC_NULL_BUFPTR

The dataBlk bufferPtr is NULL.

Explanation: There is no value provided for the dataBlk bufferPtr.

System action: The system returns to the calling procedure.

User response: Provide an address for the bufferPtr.

2010 E
DSM_RC_INVALID_OBJTYPE

The objType is invalid.

Explanation: The value for the objType is invalid.

System action: The system returns to the calling procedure.

User response: The value for dsmObjName.objType must be:

DSM_OBJ_FILE or DSM_OBJ_DIRECTORY for Backup, or
DSM_OBJ_FILE for Archive.

**2011 E
DSM_RC_INVALID_VOTE**

The dsmEndTxn vote is invalid.

Explanation: The dsmEndTxn vote is invalid.

System action: The system returns to the calling procedure.

User response: The vote must be DSM_VOTE_COMMIT or DSM_VOTE_ABORT.

**2012 E
DSM_RC_INVALID_ACTION**

The update action is invalid.

Explanation: The dsmUpdateFS or dsmUpdateObj action is invalid.

System action: The system returns to the calling procedure.

User response: Correct the action value. Valid values are defined in dsmapi.h and documented in our Using the API book.

**2014 E
DSM_RC_INVALID_DS_HANDLE**

There was an error in the TSM API internals.

Explanation: The system encountered an error in the API internals.

System action: The system returns to the calling procedure.

User response: Shut down the process and retry the operation. Verify that any previous dsmInit calls were cleaned up and terminated by a dsmTerminate call. If the problem continues, contact your system administrator or service representative.

**2015 E
DSM_RC_INVALID_REPOS**

The repository type is invalid.

Explanation: The repository type is invalid.

System action: The system returns to the calling procedure.

User response: For dsmDeleteFS the repository must be one of the following:

- DSM_ARCHIVE_REP
 - DSM_BACKUP_REP
 - DSM_REPOS_ALL.
-

**2016 E
DSM_RC_INVALID_FSNAME**

Filespace name should start with the directory delimiter.

Explanation: The filesystem name is invalid.

System action: The system returns to the calling procedure.

User response: Filespace name should start with the directory delimiter.

**2017 E
DSM_RC_INVALID_OBJNAME**

The object name is either an empty string or has no leading delimiter.

Explanation: The object name is invalid because of an empty string or there is no leading delimiter.

System action: The system returns to the calling procedure.

User response: Verify the format of the dsmObjName full path.

**2018 E
DSM_RC_INVALID_LLNAME**

Low level qualifier of the object name should start with the directory delimiter.

Explanation: The low level qualifier for the object name is invalid.

System action: The system returns to the calling procedure.

User response: Start the low level qualifier of the object name with the directory delimiter.

**2019 E
DSM_RC_INVALID_OBJOWNER**

The object owner is invalid.

Explanation: The object owner must be either the root

user, or the object owner must be the same as the session owner.

System action: The system returns to the calling procedure.

User response: Verify the session owner and object owner.

2020 E
DSM_RC_INVALID_ACTYPE

The dsmBindMC sendType is invalid.

Explanation: The dsmBindMC sendType is invalid.

System action: The system returns to the calling procedure.

User response: The sendType must be one of the following:

- stBackup
- stArchive
- stBackupMountWait
- stArchiveMountWait

2021 E
DSM_RC_INVALID_RETCODE

no text available for this return code.

Explanation: The dsmRC parameter for dsmRCMsg is an unsupported return code.

System action: The system returns to the calling procedure.

User response: Specify a valid value.

2022 E
DSM_RC_INVALID_SENDTYPE

The dsmSendObj sendType is invalid.

Explanation: The dsmSendObj sendType is invalid.

System action: The system returns to the calling procedure.

User response: The sendType must be one of the following:

- stBackup
- stArchive
- stBackupMountWait
- stArchiveMountWait

2023 E
DSM_RC_INVALID_PARAMETER

The dsmDeleteObj delType is invalid.

Explanation: The dsmDeleteObj delType is invalid.

System action: The system returns to the calling procedure.

User response: The delType must be dtBackup or dtArchive.

2024 E
DSM_RC_INVALID_OBJSTATE

The query Backup objState is invalid.

Explanation: The query Backup objState is invalid.

System action: The system returns to the calling procedure.

User response: The qryBackupData.objState must be one of the following:

- DSM_ACTIVE
- DSM_INACTIVE
- DSM_ANY_MATCH

2025 E
DSM_RC_INVALID_MCNAME

The management class name was not found.

Explanation: A query or send operation is unable to find the management class name.

System action: The system returns to the calling procedure.

User response: Verify the management class name.

2026 E
DSM_RC_INVALID_DRIVE_CHAR

The drive letter is not an alphabetic character.

Explanation: The drive letter is not an alphabetic character. This return code is valid on Microsoft Windows only.

System action: The system returns to the calling procedure.

User response: Verify that the drive designation is an alphabetic character. The referenced field is dsmDosFSAttrib.driveLetter.

2027 E
DSM_RC_NULL_FSNAME

The Register Filespace name is NULL.

Explanation: There is no value provided for the Register Filespace name.

System action: The system returns to the calling procedure.

User response: Provide a filespace name on dsmRegisterFS.

2028 E
DSM_RC_INVALID_HLNAME

High level qualifier of the object name should start with the directory delimiter.

Explanation: The high level qualifier for the object name is invalid.

System action: The system returns to the calling procedure.

User response: High level qualifier of the object name should start with the directory delimiter.

2029 E
DSM_RC_NUMOBJ_EXCEED

The number of objects on dsmBeginGetData exceeds DSM_MAX_GET_OBJ | DSM_MAX_PARTIAL_GET_OBJ.

Explanation: The number of objects (numObjId) specified on the dsmBeginGetData call exceeds DSM_MAX_GET_OBJ | DSM_MAX_PARTIAL_GET_OBJ.

System action: The system returns to the calling procedure.

User response: Check the number of objects before calling dsmBeginGetData. If it is greater than DSM_MAX_GET_OBJ | DSM_MAX_PARTIAL_GET_OBJ, then issue multiple Get call sequences.

2030 E
DSM_RC_NEWPW_REQD

The new password value is NULL or blank.

Explanation: There is no value provided for new password.

System action: The system returns to the calling procedure.

User response: Provide a new password on dsmChangePW.

2031 E
DSM_RC_OLDPW_REQD

The old password value is NULL or blank.

Explanation: There is no value provided for old password.

System action: The system returns to the calling procedure.

User response: Provide an old password on dsmChangePW.

2032 E
DSM_RC_NO_OWNER_REQD

On dsmInit, the owner is not allowed to establish a session when PASSWORDACCESS=generate.

Explanation: PASSWORDACCESS=GENERATE establishes a session with the current login user as the owner. The application should set clientOwnerNameP to NULL when PASSWORDACCESS=GENERATE is in effect.

System action: The system returns to the calling procedure. Whether the application can continue processing depends on how the application handles the error.

User response: This message applies to applications that utilize the TSM API, and is intended primarily for the vendor of the application for which the message is issued. Depending on the application, this could be a configuration issue.

Consult the documentation for the application and verify that the application is configured correctly. If the problem persists, contact the application vendor for further assistance.

2033 E
DSM_RC_NO_NODE_REQD

On dsmInit, the node is not allowed when PASSWORDACCESS=generate.

Explanation: PASSWORDACCESS=generate establishes a session with the current hostname as the node.

System action: The system returns to the calling procedure.

User response: When using PASSWORDACCESS=generate, set clientNodeNameP to NULL.

2034 E
DSM_RC_KEY_MISSING

The key file is missing.

Explanation: The key file for Tivoli Data Protection application client for Oracle cannot be found.

System action: The system returns to the calling procedure.

User response: Ensure that you have ordered the Tivoli Data Protection application client which contains TDP for Oracle, and install the key file.

2035 E
DSM_RC_KEY_BAD

The key file content is invalid.

Explanation: The key file content for Tivoli Data Protection application client for Oracle is invalid.

System action: The system returns to the calling procedure.

User response: Ensure that you have ordered the Tivoli Data Protection application client which contains the TDP for Oracle, and install the key file.

2041 E
DSM_RC_BAD_CALL_SEQUENCE

The sequence of calls is invalid.

Explanation: The sequence of calls is invalid.

System action: The system returns to the calling procedure.

User response: Verify the transaction call sequence.

2042 E
DSM_RC_INVALID_TSMBUFFER

The tsmBuffHandle is invalid, or the value of dataPtr is invalid.

Explanation: An invalid value for a handle or dataPtr has been passed into the API.

System action: The system returns to the calling procedure.

User response: There is a problem with the calling application. Verify the values of the tsmBuffHandle and dataptr passed to the API.

2043 E
DSM_RC_TOO_MANY_BYTES

The number of bytes copied into the tsmBuffer is larger than the allowed value.

Explanation: An invalid number of bytes was copied to a tsmBuffer.

System action: The system returns to the calling procedure.

User response: There is a problem with the calling application. Verify the number of bytes copied into the tsmBuffer.

2044 E
DSM_RC_MUST_RELEASE_BUFFER

dsmTerminate cannot finish because the application is holding on to 1 or more tsmBuffers.

Explanation: An application is trying to terminate a session, but is still holding some tsmBuffers.

System action: The system returns to the calling procedure.

User response: The application must return all buffers for this session by calling tsmReleaseBuffer, and then issue dsmTerminate.

2045 E
DSM_RC_BUFF_ARRAY_ERROR

An internal error occurred in the tsmBuffer array.

Explanation: An internal API buffer array error occurred.

System action: The system returns to the calling procedure.

User response: Try the operation again. If the problem continues, contact your system administrator or service representative.

2046 E
DSM_RC_INVALID_DATA_BLK

When using useTsmBuffers, dataBlk must be NULL in calls to dsmSendObj and dsmGetObj.

Explanation: The value for dataBlk must be NULL when using useTsmBuffers.

System action: The system returns to the calling procedure.

User response: There is a problem with the calling application. Contact your application provider

2047 E
DSM_RC_ENCR_NOT_ALLOWED

Encryption is not allowed when using useTsmBuffers.

Explanation: useTsmBuffers does not support encryption.

System action: The system returns to the calling procedure.

User response: Try the operation again, without using useTsmBuffers, or disable encryption for this operation.

2048 E
DSM_RC_OBJ_COMPRESSED

This object cannot be restored/retrieved using useTsmBuffers, because it is compressed.

Explanation: useTsmBuffers does not support compression.

System action: The system returns to the calling procedure.

User response: Try the operation again, without using useTsmBuffers.

2049 E
DSM_RC_OBJ_ENCRYPTED

This object cannot be restored/retrieved using useTsmBuffers, because it is encrypted.

Explanation: useTsmBuffers does not support encryption.

System action: The system returns to the calling procedure.

User response: Try the operation again, without using useTsmBuffers.

2050 E
DSM_RC_WILDCHAR_NOTALLOWED

On dsmSendObj, wildcards are not allowed for the objName.

Explanation: On dsmSendObj, wildcards are not allowed for the objName.

System action: The system returns to the calling procedure.

User response: Provide a fs, hl, and ll on the dsmObjName.

2051 E
DSM_RC_POR_NOT_ALLOWED

When using useTsmBuffers, a restore/retrieve with partial object restore is not allowed.

Explanation: useTsmBuffers does not support partial object restore.

System action: The system returns to the calling procedure.

User response: Make sure the calling application is either using Partial object restore or useTsmBuffers.

2052 E
DSM_RC_NO_ENCRYPTION_KEY

No encryption key was found. If you are using -encryptkey=prompt make sure there is a value in the encryptionPasswordP field and that bEncryptKeyEnabled is set to true.

Explanation: There was no encryption key found in the password file, or no key was provided by the application.

System action: The system returns to the calling procedure.

User response: If you are using -encryptkey=prompt, make sure there is a value in encryptionPasswordP and that bEncryptKeyEnabled is set to true.

2053 E
DSM_RC_ENCR_CONFLICT

Conflicting encryption key options have been specified.

Explanation: When using the ENABLEENCRYPTKEY option, the parameter bEncryptKeyEnabled for the TSM API dsmInitExIn_t and tsmlInitExIn_t structures cannot be set to bTrue.

System action: The system returns to the calling procedure.

User response: Either remove the ENABLEENCRYPTKEY option from the options file, or set the parameter bEncryptKeyEnabled to bFalse in the program using the TSM API.

2060 E
DSM_RC_FSNAME_NOTFOUND

The filespace to delete/set access cannot be found.

Explanation: The filespace to delete cannot be found.

System action: The system returns to the calling procedure.

User response: Verify the filespace name.

2061 E
DSM_RC_FS_NOT_REGISTERED

On dsmSendObj, dsmDeleteObj, or dsmUpdateFS the filespace is not registered.

Explanation: On dsmSendObj, dsmDeleteObj, or dsmUpdateFS, the filespace is not registered.

System action: The system returns to the calling procedure.

User response: Verify the filespace name.

2062 W
DSM_RC_FS_ALREADY_REGED

On dsmRegisterFS the filespace is already registered.

Explanation: On dsmRegisterFS the filespace is already registered.

System action: The system returns to the calling procedure.

User response: Verify the filespace name.

2063 E
DSM_RC_OBJID_NOTFOUND

On dsmBeginGetData the objID is NULL.

Explanation: On dsmBeginGetData, the objID is NULL.

System action: The system returns to the calling procedure.

User response: Verify the following:

The dsmGetList is not NULL.

Each objID is not NULL.

The dsmGetList numObjId is not zero.

2064 E
DSM_RC_WRONG_VERSION

On dsmInit the caller's API version is different than the TSM library version.

Explanation: On dsmInit the caller's API version has a higher value than the TSM library version.

System action: The system returns to the calling procedure.

User response: Install the latest TSM API library and trusted agent module.

2065 E
DSM_RC_WRONG_VERSION_PARM

The caller's structure version is different than the TSM library version.

Explanation: The caller's structure version is different than the TSM library version.

System action: The system returns to the calling procedure.

User response: Ensure that the stVersion field is set with the value in the header file. Recompile the application with the latest header files.

2070 E
DSM_RC_NEEDTO_ENDTXN

Issue dsmEndTxn and then begin a new transaction session.

Explanation: This transaction must be ended and a new one must be started due to one of the following reasons:

The destination changed.

The byte limit is exceeded

The maximum number of objects is exceeded.

System action: The system returns to the calling procedure.

User response: Issue dsmEndTxn and start a new transaction session.

2080 E
DSM_RC_OBJ_EXCLUDED

The backup or archive object is excluded from processing.

Explanation: The backup or archive object is excluded from processing.

System action: The system returns to the calling procedure.

User response: Verify the objName and Exclude lists.

2081 E
DSM_RC_OBJ_NOBCG

The backup object does not have a copy group.

Explanation: The backup object does not have a copy group.

System action: The system returns to the calling procedure.

User response: Verify server policy definitions.

2082 E
DSM_RC_OBJ_NOACG

The archive object does not have a copy group.

Explanation: The archive object does not have a copy group.

System action: The system returns to the calling procedure.

User response: Verify server policy definitions.

2090 E
DSM_RC_APISYSTEM_ERROR

Memory used by the TSM API has been corrupted.

Explanation: Memory used by the TSM API has been corrupted.

System action: The system returns to the calling procedure.

User response: Retry the operation. If the problem continues, contact your system administrator or service representative.

2100 E
DSM_RC_DESC_TOOLONG

The sendObj Archive description is too long.

Explanation: The sendObj Archive description is too long.

System action: The system returns to the calling procedure.

User response: The sndArchiveData.descr string must be less than or equal to DSM_MAX_DESCR_LENGTH.

2101 E
DSM_RC_OBJINFO_TOOLONG

The sendObj ObjAttr.objInfo is too long.

Explanation: The sendObj ObjAttr.objInfo is too long.

System action: The system returns to the calling procedure.

User response: The objInfo field must be less than or equal to DSM_MAX_OBJINFO_LENGTH.

2102 E
DSM_RC_HL_TOOLONG

The sendObj dsmObjName.hl is too long.

Explanation: The sendObj dsmObjName.hl is too long.

System action: The system returns to the calling procedure.

User response: The hl field must be less than or equal to DSM_MAX_HL_LENGTH.

2103 E
DSM_RC_PASSWD_TOOLONG

The password, or encryptionPassword string provided is too long.

Explanation: The value provided for password or encryptionPassword is too long.

System action: The system returns to the calling procedure.

User response: The password or encryptionPassword field must be less than DSM_MAX_VERIFIER_LENGTH.

2104 E
DSM_RC_FILESPACE_TOOLONG

The sendObj dsmObjName.fs is too long.

Explanation: The sendObj dsmObjName.fs is too long.

System action: The system returns to the calling procedure.

User response: The fs field must be less than or equal to DSM_MAX_FS_LENGTH.

2105 E
DSM_RC_LL_TOOLONG

The sendObj dsmObjName.ll is too long.

Explanation: The sendObj dsmObjName.ll is too long.

System action: The system returns to the calling procedure.

User response: The ll field must be less than or equal to DSM_MAX_LL_LENGTH.

2106 E
DSM_RC_FSINFO_TOOLONG

On RegisterFS or UpdateFS the fsAttr's fsInfo is too long.

Explanation: On RegisterFS or UpdateFS the fsAttr's fsInfo is too long.

System action: The system returns to the calling procedure.

User response: The fsInfo field must be less than or equal to DSM_MAX_FSINFO_LENGTH.

2107 E
DSM_RC_SENDDATA_WITH_ZERO_SIZE

Cannot Send data with a zero byte sizeEstimate.

Explanation: You cannot send data for an object with size estimate = 0.

System action: The system returns to the calling procedure.

User response: Set size estimate greater than 0 in dsmSendObj.

2110 E
DSM_RC_INVALID_ACCESS_TYPE

The dsmSetAccess access Type is invalid.

Explanation: The dsmSetAccess accessType is invalid.

System action: The system returns to the calling procedure.

User response: The accessType must be one of the following:

- atBackup
- atArchive

2111 E
DSM_RC_QUERY_COMM_FAILURE

Communications error with server during object query

Explanation: An unexpected communications error occurred during an object query to the server.

System action: Processing stopped.

User response: Verify that communications are active between the client and server machines. Server outages, processor outages, and communication controller outages can cause this error.

2112 E
DSM_RC_NO_FILES_BACKUP

No files have been previously backed up for this filename/filespace.

Explanation: You tried to set access to files when no files for the specified filename, drive or file system were previously backed up.

System action: Processing stopped.

User response: Ensure that the correct drive or file system was specified and that files are backed up for you to set access.

2113 E
DSM_RC_NO_FILES_ARCHIVE

No files have been previously archived for this filename/filespace.

Explanation: You tried to set access to files when no files for the specified filename, drive or file system were previously archived.

System action: Processing stopped.

User response: Ensure that the correct drive or file system was specified and that files are archived for you to set access.

2114 E
DSM_RC_INVALID_SETACCESS

Invalid format for Set Access command.

Explanation: None.

System action: Processing stopped.

User response: Enter the SET ACCESS command using the correct syntax.

2120 E
DSM_RC_STRING_TOO_LONG

The following message was too long to log to the server: 'shortened message with message number' @msgnl;

Explanation: The message text and inserts are too large to send to the server in the available internal buffer.

System action: The *message number* message is written to the local client error log, then shortened and sent to the server as a part of this message. The message is reduced in length by substituting '...' in the middle of the original message.

User response: The message referred to has been

shortened, but describes the error that occurred. Refer to the documentation for that message for more information.

2200 I
DSM_RC_MORE_DATA

On dsmGetNextQObj or dsmGetData there is more available data.

Explanation: On dsmGetNextQObj or dsmGetData there is more available data.

System action: The system returns to the calling procedure.

User response: Call the function again.

2210 E
DSM_RC_BUFF_TOO_SMALL

The dataBlk buffer is too small for the query response.

Explanation: The dataBlk buffer is too small for the query response.

System action: The system returns to the calling procedure.

User response: On dsmGetNextQObj ensure that the dataBlk buffer is at least as big as the query response structure.

2228 E
DSM_RC_NO_API_CONFIGFILE

The configuration file specified on dsmInit cannot be opened.

Explanation: The configuration file specified on dsmInit cannot be opened.

System action: The system returns to the calling procedure.

User response: Verify the file name.

2229 E
DSM_RC_NO_INCLEXCL_FILE

The Include/Exclude definition file was not found.

Explanation: The Include/Exclude definition file was not found.

System action: The system returns to the calling procedure.

User response: Verify the file name on the Inclexcl option.

2230 E
DSM_RC_NO_SYS_OR_INCLEXCL

Either the dsm.sys file was not found, or the Inclexcl file specified in dsm.sys was not found.

Explanation: Either the dsm.sys file was not found, or the Inclexcl file specified in dsm.sys was not found.

System action: The system returns to the calling procedure.

User response: The dsm.sys file must be in the directory referenced by the environment variable DSMI_DIR. Verify the file name on the Inclexcl option in the dsm.sys file.

2231 E
DSM_RC_REJECT_NO_POR_SUPPORT

Partial Object Retrieve is not supported on this server.

Explanation: The TSM server specified by the user does not support partial object retrieve.

System action: The system returns to the calling procedure.

User response: Specify a TSM server which supports the partial object retrieve function.

2300 E
DSM_RC_NEED_ROOT

Only a UNIX root user can execute dsmChangePW or dsmDeleteFS.

Explanation: Only a UNIX root user can execute dsmChangePW or dsmDeleteFS.

System action: The system returns to the calling procedure.

User response: Run this program as a root user.

2301 E
DSM_RC_NEEDTO_CALL_BINDMC

You must issue dsmBindMC before dsmSendObj.

Explanation: You must issue dsmBindMC before dsmSendObj.

System action: The system returns to the calling procedure.

User response: Modify your program.

2302 I
DSM_RC_CHECK_REASON_CODE

The dsmEndTxn vote is ABORT, so check the reason field.

Explanation: After a dsmEndTxn call, the transaction is aborted by either the server or client with a DSM_VOTE_ABORT and the reason is returned.

System action: The system returns to the calling procedure.

User response: Check the reason field for the code which explains why the transaction has been aborted.

2400 E
DSM_RC_ALMGR_OPEN_FAIL

License file could not be opened.

Explanation: The license file was not found, or could not be opened because of permissions or the file is corrupted.

System action: The system returns to the calling procedure.

User response: Check permissions on file. See if the license file is in the correct place.

2401 E
DSM_RC_ALMGR_READ_FAIL

Read failure on the license file.

Explanation: The license file was not found, or could not be opened because of permissions, or the file is corrupted.

System action: The system returns to the calling procedure.

User response: Check permissions on file. See if the license file is in the correct place.

2402 E
DSM_RC_ALMGR_WRITE_FAIL

Write failure on the license file.

Explanation: The license file was not found, or could not be opened because of permissions or the file is corrupted.

System action: The system returns to the calling procedure.

User response: Check permissions on file. See if license file is in the correct place.

2403 E
DSM_RC__ALMGR_DATA_FMT

Data in the license file is not in a valid format.

Explanation: The license file is not valid.

System action: The system returns to the calling procedure.

User response: User needs to obtain a new license.

2404 E
DSM_RC_ALMGR_CKSUM_BAD

The checksum in the license file does not match the licenseregistration string.

Explanation: The registration string is not valid.

System action: The system returns to the calling procedure.

User response: User needs to obtain a new license.

2405 E
DSM_RC_ALMGR_TRIAL_EXPRD

This is an expired try and buy license.

Explanation: The registration string is not valid.

System action: The system returns to the calling procedure.

User response: User needs to obtain a new license.

2410 E
DSM_RC_ORC_INVALID_MODE

Oracle passed invalid mode

Explanation: Invalid mode passed by Oracle.

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

2411 E
DSM_RC_ORC_NULL_FILENAME

Oracle passed null file name

Explanation: Null filename passed by Oracle.

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

2412 E
DSM_RC_ORC_WRONG_BLKSIZE

Wrong data block size

Explanation: Wrong Block Size

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

2413 E
DSM_RC_ORC_OBJ_EXISTS

Object exists

Explanation: Backup or Restore Object already exists.

System action: The system returns to the calling procedure.

User response: If backing up an object, be sure to generate a unique object name.

2414 E
DSM_RC_ORC_NOTSAME_HANDLE

Not same Oracle handle

Explanation: The handle passed from Oracle is not the same handle that TSM passed back.

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

2415 E
DSM_RC_ORC_END_OF_FILE

End of file reached

Explanation: End of file reached.

System action: The system returns to the calling procedure.

User response: None

2416 E
DSM_RC_ORC_WRONG_RDSTATE

Wrong Read State

Explanation: The operation must be in READ state.

System action: The system returns to the calling procedure.

User response: Contact your service representative.

2417 E
DSM_RC_ORC_LOWER_APIVER

Runtime API version is outdated

Explanation: Runtime API is lower than compile time API.

System action: The system returns to the calling procedure.

User response: Use the WHAT command to find out the compile time API level. Obtain the same or higher level of API library.

2418 E
DSM_RC_ORC_WRONG_WRTSTATE

Wrong write state

Explanation: The operation must be in WRITE state.

System action: The system returns to the calling procedure.

User response: Contact your service representative.

2419 E
DSM_RC_ORC_INVALID_FLAG

Invalid flag passed

Explanation: Invalid flag passed from Oracle.

System action: The system returns to the calling procedure.

User response: Contact your system administrator.

4580 E
DSM_RC_ENC_WRONG_KEY

**Error processing 'filespace namepath-name file-name';
invalid encryption key.**

Explanation: The key you entered does not match the key that was used to encrypt the file during backup. The file can not be restored unless the matching key is entered.

System action: processing stops.

User response: Try the restore operation again and provide the correct key.

4582 E
DSM_RC_ENC_NOT_AUTHORIZED

User is not authorized to encrypt filename.

Explanation: The user is not authorized to encrypt the file. Normally, only a TSM authorized user or a root user can use TSM encryption. However, a certain combination of PASSWORDACCESS and ENCRYPTKEY options may allow encryption operations by a non-authorized user.

System action: The file is not backed up or restored.

User response: Log in as a root or TSM authorized user and retry the operation. Refer to *Backup-Archive Client Installation and User's Guide* for the correct usage of the ENCRYPTKEY option.

4584 E
DSM_RC_ENC_TYPE_UNKOWN

Error processing 'filespace namepath-namefile-name': unsupported encryption type.

Explanation: The files you are trying to restore or retrieve have been backed up or archived by a later version of the TSM client. The file encryption method is not supported by the current client.

System action: Object skipped.

User response: Restore or retrieve the file with the most recent version of the TSM client.

4600 E
DSM_RC_CLUSTER_INFO_LIBRARY_NOT_LOADED

CLUSTERNODE is set to YES but the Cluster Information Daemon is not started.

Explanation: The HACMP Cluster Information Daemon must be started in order to specify the CLUSTERNODE option.

System action: Processing ends.

User response: Start the HACMP Cluster Information Daeon.

4601 E
DSM_RC_CLUSTER_LIBRARY_INVALID

CLUSTERNODE is set to YES but the cluster load library is not valid.

Explanation: The load library that the operating system provides to obtain the cluster name is not valid. A possible cause is an out-of-date load library which does not contain the proper routines this product expects.

System action: Processing ends.

User response: Ensure that the latest cluster software is installed on the system.

4602 E
DSM_RC_CLUSTER_LIBRARY_NOT_LOADED

CLUSTERNODE is set to YES but the cluster software is not available on this system.

Explanation: The load library that the operating systems provides to obtain the cluster name is not available on this system.

System action: Processing ends.

User response: Ensure that the cluster software is installed on the system.

4603 E
DSM_RC_CLUSTER_NOT_MEMBER_OF_CLUSTER

CLUSTERNODE is set to YES but this machine is not a member of a cluster.

Explanation: This machine is not a member of a cluster node. Possible causes are that the cluster service has not been configured correctly, or that the cluster is in the process of initialization.

System action: Processing ends.

User response: Ensure that the cluster software is configured properly. If the cluster is in the process of initialization, retry the operation at a later time.

4604 E
DSM_RC_CLUSTER_NOT_ENABLED

CLUSTERNODE is set to YES but the cluster service is not enabled on this system.

Explanation: The cluster service has not been enabled on this system.

System action: Processing ends.

User response: Enable the cluster service on the system.

4605 E
DSM_RC_CLUSTER_NOT_SUPPORTED

The CLUSTERNODE option is not supported on this system.

Explanation: This option is not supported on this system.

System action: Processing ends.

User response: Disable the CLUSTERNODE option in the local options file.

4606 E
DSM_RC_CLUSTER_UNKNOWN_ERROR

An unexpected error (*retcode*) occurred while the program was trying to obtain the cluster name from the system.

Explanation: An unknown error occurred while the program was trying to obtain the cluster name from the cluster service. The error code is the reason code provided directly from the cluster service being used in this operating system environment.

System action: Processing ends.

User response: Consult the documentation for your clustering software for an explanation of the reason code. Insure that your clustering service is operational, then try the TSM operation again.

5702 E
DSM_RC_PROXY_REJECT_NO_RESOURCES

Proxy Rejected: The TSM server has run out of memory.

Explanation: There is not enough memory available to allow this operation to continue.

System action: TSM canceled the current operation.

User response: Try the operation again. If the problem continues, see your system administrator to increase the amount of memory of the server.

5705 E
DSM_RC_PROXY_REJECT_DUPLICATE_ID

Proxy Rejected: ASNODENAME and NODENAME are identical.

Explanation: TSM does not allow the ASNODENAME and NODENAME option values to be the same.

System action: TSM canceled the current operation.

User response: Use the ASNODENAME option only to access another node. It is not necessary to set ASNODENAME option to access your own node. Remove ASNODENAME from your option file unless you are actually trying to access a node that you have been granted authority to access with the administrative command "Grant Proxynode".

5710 E
DSM_RC_PROXY_REJECT_ID_IN_USE

Proxy Rejected: The node name you specified in the ASNODENAME option is locked.

Explanation: The TSM administrator has locked the node you specified as the ASNODENAME option.

System action: The TSM operation ends.

User response: The TSM server administrator must unlock the node before you can access it. Try the operation later, or check with your TSM administrator.

5717 E
DSM_RC_PROXY_REJECT_INTERNAL_ERROR

Proxy Rejected: The server has an internal error.

Explanation: The client cannot proxy to the node named by the ASNODENAME option because of an internal server error.

System action: TSM canceled the current operation.

User response: See your system administrator immediately.

5722 E
DSM_RC_PROXY_REJECT_NOT_AUTHORIZED

Proxy Rejected: Proxy authority has not been granted to this node.

Explanation: The node has not been granted proxy authority to access the node named by the ASNODENAME option. The TSM administrator must first grant proxy authority.

System action: The TSM operation ends.

User response: The TSM server administrator must grant proxy authority for this node. See the administrator command "Grant Proxynode".

5746 E
DSM_RC_PROXY_INVALID_FROMNODE

The ASNODENAME option is not valid with the FROMNODE option.

Explanation: None.

System action: Processing stops.

User response: Remove the ASNODENAME option from the options file or do not use the FROMNODE option.

5748 E
DSM_RC_PROXY_INVALID_FUNCTION

The operation that is being attempted cannot be invoked using the ASNODENAME option.

Explanation: None.

System action: Processing stops.

User response: Remove the ASNODENAME option and retry the operation.

5748 E
DSM_RC_PROXY_INVALID_CLUSTER

The ASNODENAME option cannot be used with the CLUSTERNODE option.

Explanation: None.

System action: Processing stops.

User response: Remove the ASNODENAME option and retry the operation.

5801 E
DSM_RC_CRYPTO_ICC_ERROR

Unexpected error in cryptography library.

Explanation: There was an unexpected error in the cryptography library. See the error log for more information.

System action: processing stops.

User response: Check the error log for ANS1467E to determine the cause of failure. Verify you TSM client is installed properly. If needed, reinstall client and/or API. If the problem still exists, contact TSM technical support.

Appendix B. Allocating additional server memory

If the server is low on memory, the following actions can be taken to allocate additional storage resource for the server:

- For AIX, ensure that there is sufficient paging space. You can also use SMIT to determine if the number of applications is causing a memory shortage.
- For OS/390 and z/OS, increase the size of the REGION parameter on the JOB or EXEC statement of the JCL used to start the server.

A minimum size of 128MB is recommended for Tivoli Storage Manager, but larger servers will require a larger region size.

- For Windows, the preferred method of solving a low memory condition is to add physical memory to the system. Otherwise, increase the amount of the system's virtual memory. This can be done from the control panel by running the system applet and increasing the total paging file size.
- For HP-UX, ensure that there is sufficient paging space and that a sufficient amount of shared memory is available. For information on shared memory, refer to the Tivoli Storage Manager installation guide.
- For Sun Solaris, ensure that there is sufficient paging space. Consult your Sun Solaris system documentation for details.

Reduce the maximum number of client sessions permitted. To do this, update the value of the MAXSESSIONS parameter in the server options file and restart the server.

Appendix C. I/O error code descriptions for server messages

This section contains code descriptions for possible I/O error messages from the Tivoli Storage Manager server for the AIX, HP-UX, Solaris, Linux, and Windows operating systems.

Code Description

- OP** I/O operation that failed. Some possible values displayed are:
- READ
 - WRITE
 - FSR (forward space record)
 - FSF (forward space file)
 - WEOF (write end of file mark)
 - A string of hex digits
- See "Operation code values for tape library devices" on page 939 for a list of operation codes.
- CC** I/O completion code. This value is returned by the device driver to the server when an error occurs. See "Completion code and operation code values" on page 936 for a list of completion codes. Refer to the *IBM TotalStorage Tape Device Drivers Installation and User's Guide* for information on tape library system calls and error description for the library I/O control requests.
- KEY** Byte 2 of the sense bytes from the error. The following lists some definitions:
- 0 = no additional sense bytes available
 - 1 = recovered error
 - 2 = not ready
 - 3 = medium error
 - 4 = hardware error
 - 5 = illegal request
 - 6 = unit attention (for example, a SCSI bus reset)
 - 7 = data protect
 - 8 = blank check
 - 9 = vendor specific
 - A = copy aborted
 - B = aborted command
 - C = equal compare on SEARCH DATA command
 - D = volume overflow
 - E = miscompare
 - F = reserved

ASC/ASCQ

Additional sense codes (ASC) and additional sense code qualifiers (ASCQ) are bytes 12 and 13 of the sense bytes. You should refer to the sense byte number along with the value for a complete description of the common values of the ASC and ASCQ codes. The drive or library reference manual provided with the device usually contain tables explaining the values of the KEY, ASC, and ASCQ fields. "Common values for ASC and ASCQ codes" on page 940 also provides additional information on the common values of ASC and ASCQ.

Completion code and operation code values

This section lists the completion code values for the following:

- All device classes
- Media changers
- Tape and optical drives

This section lists the operation code values for tape library devices. See “Operation code values for tape library devices” on page 939 for a description of the operation codes.

Completion code values common to all device classes

The following table shows the completion code values, in decimal and hexadecimal numbers, common to all device classes. It provides a description for the I/O error message and the recommended action. After performing the recommended action, retry the failing operation. If the failing operation is not successful, contact Tivoli Storage Manager support.

Table 6. Completion code values common to all device classes

Decimal	Hexadecimal	Description	Recommended Action
200	X'C8'	The device indicated a failure condition, but sense data was unavailable	Retry the failing operation.
201	X'C9'	Device driver failure	Contact Tivoli Storage Manager support.
202	X'CA'	The device EEPROM failed	The device should be tested or serviced.
203	X'CB'	Manual intervention required	Correct the problem on the device. This may be a stuck tape, dirty heads or a jammed library arm.
204	X'CC'	Recovered from an I/O error; for your information only	No action necessary.
205	X'CD'	SCSI adapter failure	Check for loose cables, bent pins, bad cables, bad SCSI adaptors, improper termination or bad terminators.
206	X'CE'	General SCSI failure	Check for loose cables, bent pins, bad cables, bad SCSI adaptors, improper termination or bad terminators.
207	X'CF'	Device is not in a state capable of performing request	Ensure the device is on and ready. Ensure the DEFINE DRIVE and DEFINE DEVCLASS have been issued properly.
208	X'D0'	Command aborted	Contact Tivoli Storage Manager support.
209	X'D1'	Device microcode failure detected	Check the microcode level of the drive. Call the drives manufacturer and request latest level.
210	X'D2'	The device was reset due to device power-up, SCSI bus reset, or manual tape load/eject	Retry the failing operation.
211	X'D3'	The SCSI bus was busy	Ensure the SCSI ids are correctly assigned to the correct device, and the device is not being accessed by another process.

Completion code values for media changers

The following table shows the completion code values, in decimal and hexadecimal numbers, for the media changers. It provides a description for the I/O error message and the recommended action. After performing the recommended action, retry the failing operation. If the failing operation is not successful, contact Tivoli Storage Manager support.

Table 7. Completion code values for media changers

Decimal	Hexadecimal	Description	Recommended Action
300	X'12C'	Cartridge entry/exit error	Check the entry/exit ports for a jammed volume.
301	X'12D'	Cartridge load failure	Check the drive for jammed volumes. On AIX, display the errpt to check for hardware errors.
302	X'12E'	Cartridge in failed drive	Check the drive for jammed volumes. On AIX, display the errpt to check for hardware errors.
303	X'12F'	Carousel not loaded	Ensure the carousel is correctly in place and the door is shut.
304	X'130'	Changer failure	On AIX, display the errpt to check for hardware errors.
305	X'131'	Drive failure	Ensure the heads have been cleaned. On AIX, display the errpt to check for hardware errors.
306	X'132'	Drive or media failure	Ensure the heads have been cleaned. On AIX, display the errpt to check for hardware errors.
307	X'133'	Entry/exit failure	Contact Tivoli Storage Manager support.
308	X'134'	Entry/exit port not present	Contact Tivoli Storage Manager support.
309	X'135'	Library audit error	Ensure that there are no jammed volumes. It is possible that the library audit is failing due to hardware errors. On AIX, display the errpt to check for hardware errors.
310	X'136'	Library full	Check for jammed volumes. Ensure the volumes have not been rearranged. If the library is not actually full, perform an AUDIT LIBRARY.
311	X'137'	Media export	Contact Tivoli Storage Manager support.
312	X'138'	Slot failure	Ensure that nothing is jammed in the slot.
313	X'139'	Slot or media failure	Ensure the volume is not jammed in the slot and that the volumes have not been rearranged. If problem persists, perform an AUDIT LIBRARY.
314	X'13A'	The source slot or drive was empty in an attempt to move a volume	Ensure the volumes have not been rearranged. If problem persists, perform an AUDIT LIBRARY.

Table 7. Completion code values for media changers (continued)

Decimal	Hexadecimal	Description	Recommended Action
315	X'13B'	The destination slot or drive was full in an attempt to move a volume	Ensure the volumes have not been rearranged, or that a volume is not stuck in the drive. If problem persists, perform AUDIT LIBRARY.
316	X'13C'	Cleaner cartridge installed	Contact Tivoli Storage Manager support.
317	X'13D'	Media not ejected	Ensure the volumes have not been rearranged, or that a volume is not stuck in the drive. If problem persists, perform AUDIT LIBRARY.
318	X'13E'	I/O port not configured	Contact Tivoli Storage Manager support.
319	X'13F'	First destination empty	Ensure the volumes have not been rearranged. If problem persists, perform AUDIT LIBRARY.
320	X'140'	No inventory information	Perform AUDIT LIBRARY.
321	X'141'	Read element status mismatch	Contact Tivoli Storage Manager support.
322	X'142'	Initialize range failed	Contact Tivoli Storage Manager support.

Completion code values for tape and optical drives

The following table shows the completion code values, in decimal and hexadecimal numbers, for tape and optical drives. It provides a description for the I/O error message and the recommended action. After performing the recommended action, retry the failing operation. If the failing operation is not successful, contact Tivoli Storage Manager support.

Table 8. Completion code values for tape and optical drives

Decimal	Hexadecimal	Description	Recommended Action
400 [®]	X'190'	Physical end of media encountered	Ensure the heads are clean on the drive.
401	X'191'	End of data detected	Contact Tivoli Storage Manager support.
402	X'192'	Media corrupted	Ensure the heads are clean and the media is not physically damaged or too old.
403	X'193'	Media failure	Ensure the heads are clean and the media is not physically damaged or too old.
404	X'194'	Media incompatibility	Ensure the correct length and type of media is being used.
406	X'196'	Sector requested is invalid.	Internal server error. Contact Tivoli Storage Manager support.
407	X'197'	Write protect	Ensure the volume is not write protected.
408	X'198'	Clean the media and the drive.	Clean the drive heads with a cleaning cartridge that is not too old.

Table 8. Completion code values for tape and optical drives (continued)

Decimal	Hexadecimal	Description	Recommended Action
409	X'199'	Media fault	Clean the heads and ensure the media is not physically damaged or too old.
410	X'19A'	Cleaning complete	Retry the failing operation.
411	X'19B'	Logical end of media encountered	Contact Tivoli Storage Manager support.
412	X'19C'	Media not present in drive	Ensure the media is correctly positioned in the drive. If problem persists, perform an AUDIT LIBRARY.
413	X'19D'	Beginning of media encountered	Contact Tivoli Storage Manager support.
414	X'19E'	Erase failure	Clean the drive heads.
415	X'19F'	Attempted to overwrite written WORM media	Internal server error. Contact Tivoli Storage Manager support.
416	X'1A0'	An incorrect length block was read.	Ensure the heads are clean. On AIX, display the errpt to check for hardware errors.
417	X'1A1'	Open read only	Contact Tivoli Storage Manager support.
418	X'1A2'	Open write only	Contact Tivoli Storage Manager support.
419	X'1A2'	Media scan failed	Clean the drive and media.
420	X'1A4'	Logical write protect	Ensure the heads have been cleaned. Check operating system error logs for hardware errors.
422	X'1A6'	Cleaning required	Clean the tape drive.
423	X'1A7'	Optical media error	Check operating system error logs for hardware errors. Possible bad media.
424	X'1A8'	Encryption related error has occurred	Check your encryption setting on your device class and Tape Drive.
425	X'1A9'	Decryption related error has occurred	Check your encryption setting on your device class and Tape Drive.

Operation code values for tape library devices

The following table shows the operation code values for tape library devices. The table provides the two least significant bytes of the operation code. Refer to the Tape Library System Calls chapter in the *IBM TotalStorage Tape Device Drivers Installation and User's Guide* for detailed information on operation codes.

Table 9. Operation code values for tape library devices

Hexadecimal	Name	Description
X'6D31'	MTIOCLM	Mount a volume on a specified drive.
X'6D32'	MTIOCLDM	Demount a volume on a specified drive.
X'6D34'	MTIOCLSVC	Change the category of a specified volume.
X'6D37'	MTIOCLQ	Return information about the tape library and its contents.

Table 9. Operation code values for tape library devices (continued)

Hexadecimal	Name	Description
X'6D38'	MTIOCLQMID	Query the status of the operation for a given message ID.
X'6D38'	MTIOCLQMID	Query the status of the operation for a given message ID.
X'6D39'	MTIOCLSDC	Assign a category to the automatic cartridge loader for a specified device.

Common values for ASC and ASCQ codes

This section provides descriptions for common values of the ASC and ASCQ codes, which are bytes 12 and 13 for SCSI-2 devices. For Windows, these codes also appear in the Event Log. See “Windows Event Log entries” on page 943.

See server message **ANR8300E** or **ANR8302E** for the recommended action.

The following table provides descriptions for common values of the ASC and ASCQ codes. Each value has a prefix of 0x, which indicates that it is a hexadecimal constant.

Table 10. Common values for ASC and ASCQ codes

ASC	ASCQ	Description
0x00	0x00	No additional sense
0x00	0x01	Filemark detected
0x00	0x02	End-of-medium detected
0x00	0x03	Setmark detected
0x00	0x04	Beginning of medium
0x00	0x05	End of data
0x00	0x06	I/O process terminated
0x02	0x00	No seek complete
0x03	0x00	Device write fault
0x03	0x01	No write current
0x03	0x02	Excessive write errors
0x04	0x00	Logical unit not ready
0x04	0x01	Becoming ready
0x04	0x02	Not ready, initializing command required
0x04	0x03	Not ready, manual intervention required
0x04	0x04	Not ready, formatting
0x05	0x00	No response to select
0x06	0x00	No reference position found
0x07	0x00	Multiple devices selected
0x08	0x00	Communication failure
0x08	0x01	Communication timeout
0x08	0x02	Communication parity error
0x09	0x00	Track following error

Table 10. Common values for ASC and ASCQ codes (continued)

ASC	ASCQ	Description
0x0A	0x00	Error log overflow
0x0C	0x00	Write error
0x11	0x00	Unrecovered read error
0x11	0x01	Read retries exhausted
0x11	0x02	Error too long to correct
0x11	0x03	Multiple read errors
0x11	0x08	Incomplete block read
0x11	0x09	No gap found
0x11	0x0A	Miscorrected error
0x14	0x00	Recorded entity not found
0x14	0x01	Record not found
0x14	0x02	Filemark/setmark not found
0x14	0x03	End-of-data not found
0x14	0x04	Block sequence error
0x15	0x00	Random positioning error
0x15	0x01	Mechanical positioning error
0x15	0x02	Read positioning error
0x17	0x00	No error correction applied
0x17	0x01	Recovered with retries
0x17	0x02	Recovered with positive head offset
0x17	0x03	Recovered with negative head offset
0x18	0x00	ECC applied
0x1A	0x00	Parameter list length error
0x1B	0x00	Synchronous data transfer error
0x20	0x00	Invalid operation code
0x21	0x00	Block out of range
0x21	0x01	Invalid element address
0x24	0x00	Invalid field in CDB
0x25	0x00	LUN not supported
0x26	00	Invalid field in parameter list
0x26	0x01	Parameter not supported
0x26	0x02	Parameter value invalid
0x26	0x03	Threshold parameters not supported
0x27	0x00	Write protected
0x28	0x00	Not-ready to ready
0x28	0x01	Import/export element accessed
0x29	0x00	Power-on, reset, bus reset
0x2A	0x00	Parameters changed
0x2A	0x01	Mode parameters changed
0x2A	0x02	Log parameters changed

Table 10. Common values for ASC and ASCQ codes (continued)

ASC	ASCQ	Description
0x2B	0x00	Copy cannot execute
0x2C	0x00	Command sequence error
0x2D	0x00	Overwrite error on update
0x2F	0x00	Command cleared by initiator
0x30	0x00	Incompatible media
0x30	0x01	Media unknown format
0x30	0x02	Media incompatible format
0x30	0x03	Cleaning cartridge installed
0x31	0x00	Media format corrupted
0x33	0x00	Tape length error
0x37	0x00	Rounded parameter
0x39	0x00	Saving parameters not supported
0x3A	0x00	Medium not present
0x3B	0x00	Sequential positioning error
0x3B	0x01	Positioning error at BOT
0x3B	0x02	Positioning error at EOT
0x3B	0x08	Reposition error
0x3B	0x0D	Medium destination element full
0x3B	0x0E	Medium source element empty
0x3D	0x00	Invalid bits in message
0x3E	0x00	LUN not self-configured
0x3F	0x00	Operating conditions changed
0x3F	0x01	Microcode has been changed
0x3F	0x02	Changed operating definition
0x3F	0x03	Inquiry data has changed
0x3F	0x0E	Reported LUNs data has changed
0x43	0x00	Message error
0x44	0x00	Internal target failure
0x45	0x00	Select/reselect failure
0x46	0x00	Unsuccessful soft reset
0x47	0x00	SCSI parity error
0x48	0x00	Initiator detected message received
0x49	0x00	Invalid message error
0x4A	0x00	Command phase error
0x4B	0x00	Data phase error
0x4C	0x00	LUN failed self-configuration
0x4E	0x00	Overlapped commands attempt
0x50	0x00	Write append error
0x50	0x01	Write append position error
0x50	0x02	Position error (timing)

Table 10. Common values for ASC and ASCQ codes (continued)

ASC	ASCQ	Description
0x51	0x00	Erase failure
0x52	0x00	Cartridge fault
0x53	0x00	Load/media eject failed
0x53	0x01	Unload tape failure
0x53	0x02	Media removal prevented
0x5A	0x00	Operator state changed
0x5A	0x01	Operator media removal
0x5A	0x02	Operator write protect
0x5A	0x03	Operator write permit
0x5B	0x00	Log exception
0x5B	0x01	Threshold condition met
0x5B	0x02	Log counter at maximum
0x5B	0x03	Log list codes exhausted

Windows Event Log entries

The code values will appear as hexadecimal values in the Data area of the Windows Event Log. The Event Log omits the 0x prefix for the displayed information.

In the Windows Event Log, the entries with source AdsmScsi are produced by the AdsmScsi device driver. In these entries, byte 3E is the sense key, byte 3D is the ASC, and byte 3C is the ASCQ. (This is also true of entries logged by any of the Windows tape device drivers.) If byte 44 is 'ef', the error logged is not a check condition error. Examples of such errors are command timeouts or device selection errors.

Appendix D. Device errors in AIX system error log

Tivoli Storage Manager logs certain device errors in the AIX system error log. This section provides a brief description of the device error. It also provides the detail data and a description of the data. For a detailed description of the AIX error logging facility and of the information contained within an error report, refer to *AIX Problem Solving Guide and Reference*.

DEVICE ERROR and ERROR DESCRIPTION

ADSM_DD_LOG1 (0xAC3AB953)

DEVICE DRIVER SOFTWARE ERROR

This error is logged by the Tivoli Storage Manager device driver when a problem is suspected in the Tivoli Storage Manager device driver software. For example, if the Tivoli Storage Manager device driver issues a SCSI I/O command with an illegal operation code the command fails and the error is logged with this identifier. Report this error immediately to Tivoli Storage Manager support personnel.

Detail Data: Sense Data

The sense data consists of information that can determine the cause of the error. All data in the error entry should be reported to Tivoli Storage Manager support personnel.

ADSM_DD_LOG2 (0x5680E405)

HARDWARE/COMMAND-ABORTED ERROR

This error is logged by the Tivoli Storage Manager device driver when the device reports a particular hardware error or command-aborted error in response to a SCSI I/O command.

Detail Data: Sense Data

The sense data consists of information that can determine the exact cause of the error; in this case, which hardware component failed and why. To interpret the sense data for a particular device, refer to the device's SCSI specification manual.

ADSM_DD_LOG3 (0x461B41DE)

MEDIA ERROR

This error is logged by the Tivoli Storage Manager device driver when a SCSI I/O command fails because of corrupted or incompatible media, or because a drive requires cleaning.

Detail Data: Sense Data

The sense data consists of information that can determine the exact cause of the error. To interpret the sense data for a particular device, refer to the device's SCSI specification manual.

ADSM_DD_LOG4 (0x4225DB66)

TARGET DEVICE GOT UNIT ATTENTION

This error is logged by the Tivoli Storage Manager device driver after receiving certain UNIT ATTENTION notifications from a device. UNIT ATTENTIONs are informational and usually indicate that some state of the device has changed. For example, this error would be logged if the door of

a library device was opened and then closed again. Logging this event indicates that the activity occurred and that the library inventory may have been changed.

Detail Data: Sense Data

The sense data consists of information that describes the reason for the UNIT ATTENTION. To interpret the sense data for a particular device, refer to the device's SCSI specification manual.

ADSM_DD_LOG5 (0xDAC55CE5)

PERMANENT UNKNOWN ERROR

This error is logged by the Tivoli Storage Manager device driver after receiving an unknown error from a device in response to a SCSI I/O command. If the error persists, report it to Tivoli Storage Manager support personnel.

Detail Data: Sense Data

The sense data consists of information that can determine the cause of the error. All data in the error entry should be reported to Tivoli Storage Manager support personnel.

ADSM_DD_LOG6 (0xBC539B26)

WARNING OR INFORMATIONAL MESSAGE FOR TARGET DEVICE

This error is logged by the Tivoli Storage Manager device driver after receiving a warning or informational message from a device in response to a SCSI I/O command. These are informational messages and may not be an indication of a problem. If the message persists, report it to Tivoli Storage Manager support personnel.

Detail Data: Sense Data

The sense data consists of information that can determine the reason for the message. All data in the message entry should be reported to Tivoli Storage Manager support personnel.

Appendix E. Accessibility features for Tivoli Storage Manager

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully. The major accessibility features of Tivoli Storage Manager are described in this topic.

Accessibility features

The following list includes the major accessibility features in Tivoli Storage Manager:

- Keyboard-only operation
- Interfaces that are commonly used by screen readers
- Keys that are discernible by touch but do not activate just by touching them
- Industry-standard devices for ports and connectors
- The attachment of alternative input and output devices
- User documentation provided in HTML and PDF format. Descriptive text is provided for all documentation images.

The Tivoli Storage Manager Information Center, and its related publications, are accessibility-enabled.

Keyboard navigation

The Tivoli Storage Manager for Windows Console follows Microsoft conventions for all keyboard navigation and access. Drag and Drop support is managed using the Microsoft Windows Accessibility option known as MouseKeys. For more information about MouseKeys and other Windows accessibility options, please refer to the Windows Online Help (keyword: MouseKeys).

Tivoli Storage Manager follows AIX operating system conventions for keyboard navigation and access.

Tivoli Storage Manager follows HP-UX operating-system conventions for keyboard navigation and access.

Tivoli Storage Manager follows Linux operating-system conventions for keyboard navigation and access.

Tivoli Storage Manager follows Macintosh operating-system conventions for keyboard navigation and access.

Tivoli Storage Manager follows Sun Solaris operating-system conventions for keyboard navigation and access.

Tivoli Storage Manager follows z/OS operating-system conventions for keyboard navigation and access.

Vendor software

Tivoli Storage Manager includes certain vendor software that is not covered under the IBM license agreement. IBM makes no representation about the accessibility

features of these products. Contact the vendor for the accessibility information about its products.

Related accessibility information

You can view the publications for Tivoli Storage Manager in Adobe® Portable Document Format (PDF) using the Adobe Acrobat Reader. You can access these or any of the other documentation PDFs at the IBM Publications Center at <http://www.ibm.com/shop/publications/order/>.

IBM and accessibility

For more information about the commitment that IBM has to accessibility, see the IBM Human Ability and Accessibility Center at <http://www.ibm.com/able>.

Notices

This information was developed for products and services offered in the U.S.A.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not grant you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

IBM World Trade Asia Corporation
Licensing
2-31 Roppongi 3-chome, Minato-ku
Tokyo 106-0032, Japan

The following paragraph does not apply to the United Kingdom or any other country where such provisions are inconsistent with local law:

INTERNATIONAL BUSINESS MACHINES CORPORATION PROVIDES THIS PUBLICATION "AS IS" WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESS OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE. Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore, this statement may not apply to you.

This information could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Any references in this information to non-IBM Web sites are provided for convenience only and do not in any manner serve as an endorsement of those Web sites. The materials at those Web sites are not part of the materials for this IBM product and use of those Web sites is at your own risk.

IBM may use or distribute any of the information you supply in any way it believes appropriate without incurring any obligation to you.

Licensees of this program who wish to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact:

IBM Corporation
2Z4A/101
11400 Burnet Road
Austin, TX 78758
U.S.A.

Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this information and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Program License Agreement, or any equivalent agreement between us.

Any performance data contained herein was determined in a controlled environment. Therefore, the results obtained in other operating environments may vary significantly. Some measurements may have been made on development-level systems and there is no guarantee that these measurements will be the same on generally available systems. Furthermore, some measurements may have been estimated through extrapolation. Actual results may vary. Users of this document should verify the applicable data for their specific environment.

Information concerning non-IBM products was obtained from the suppliers of those products, their published announcements or other publicly available sources. IBM has not tested those products and cannot confirm the accuracy of performance, compatibility or any other claims related to non-IBM products. Questions on the capabilities of non-IBM products should be addressed to the suppliers of those products.

This information contains examples of data and reports used in daily business operations. To illustrate them as completely as possible, the examples include the names of individuals, companies, brands, and products. All of these names are fictitious and any similarity to the names and addresses used by an actual business enterprise is entirely coincidental.
