

# READ ME

## Purpose

The projects contained within this folder are examples only. Each sample is a common workflow and demonstrates various best practices within the Build Forge tool. Since it is impossible to provide examples that correspond to every environment, these examples will not execute successfully without modification to match a specific environment.

## Files

For each project in the samples directory ([SOME PATH HERE/samples/projects](#)) there are two files. The first is an xml file and contains the data about each project. This is the file that needs to be imported in order to create the example project in the workspace. The second file is a PDF file containing more specific information about each project.

## Importing the Sample Projects

To import the provided sample projects log in to Build Forge and proceed to the Administrator → Import page.

Choose a sample project xml file from [SOME PATH HERE/samples/projects](#) and click on the Import button. Your project and its dependencies will be created from this file.

More detailed information regarding importing objects from xml files can be found in the help documents.
