Preface

Installing Rational Suite DevelopmentStudio provides you with the information that you need to install this Rational Suite edition. Additional information about the point-products in Rational Suite is available in the individual product documentation, including database and Web server configurations and product customizations.

Rational Suite DevelopmentStudio delivers a comprehensive set of integrated tools that embody software engineering best practices and span the entire software development life cycle. Rational Suite DevelopmentStudio has an unparalleled level of integration improves communication both within teams and across team boundaries, reducing development time and improving software quality.

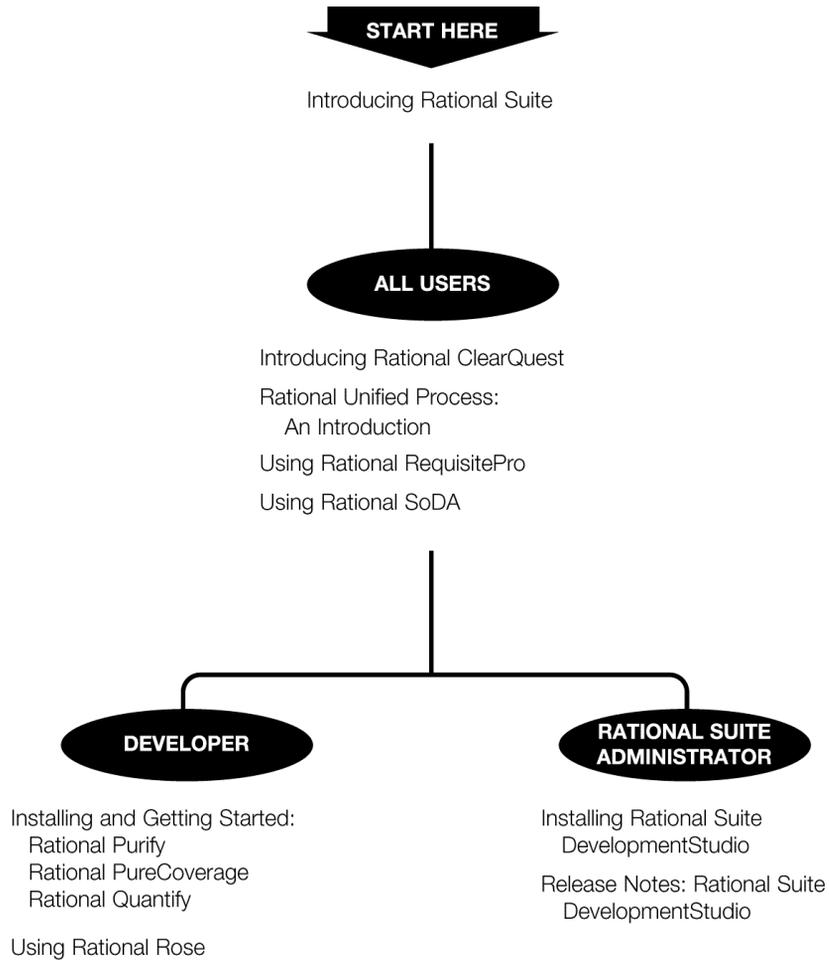

Audience

This guide is intended for developers, system administrators, and quality engineers, who use Rational Suite DevelopmentStudio.

Other Resources

- All manuals are available online, either in HTML or PDF format. The online manuals are on the Rational Suite DevelopmentStudio CD.
- To send feedback about documentation for Rational products, please send e-mail to techpubs@rational.com.
- For more information about Rational Software technical publications, see: <http://www.rational.com/documentation>.
- For more information on training opportunities, see the Rational University Web site: <http://www.rational.com/university>.

Rational Suite Documentation Roadmap– UNIX

Contacting Rational Technical Support

When you contact Rational Technical Support, please be prepared to supply the following information:

- Your name, company name, telephone number, and e-mail address
- Your operating system, version number, and any service packs or patches you have applied
- Product name and release number
- Your case ID number (if you are following up on a previously reported problem)
- The Rational Account number listed on your Rational License Key Certificate (Rational Licensing Technical Support only)

Contacting Rational Technical Support

If you have questions about installing, using, or maintaining this product, contact Rational Technical Support as follows:

Your Location	Telephone	Facsimile	E-mail
North America	(800) 433-5444 (toll free) (408) 863-4000 Cupertino, CA	(781) 676-2460 Lexington, MA	support@rational.com
Europe, Middle East, Africa	+31 (0) 20-4546-200 Netherlands	+31 (0) 20-4545-201 Netherlands	support@europe.rational.com
Asia Pacific	+61-2-9419-0111 Australia	+61-2-9419-0123 Australia	support@apac.rational.com

Contacting Rational Licensing Technical Support

If you have questions about acquiring license keys for your Rational Software products, contact Rational Licensing Support as follows:

Your Location	Telephone	Facsimile	E-mail
Asia Pacific	+61-2-9419-0111	+61-2-9419-0123	license@apac.rational.com
Asia Pacific (Japan)	+61-2-9419-0111	+61-2-9419-0123	license@japan.rational.com

Your Location	Telephone	Facsimile	E-mail
Asia Pacific (Korea)	+82-2-556-9420	+82-2-556-9426	license@apac.rational.com
Asia Pacific (Mainland China, Hong Kong, and Taiwan)	+61-2-9419-0111	+61-2-9419-0123	license@china.rational.com
Europe Middle East Africa	+31 20 4546 200	+31 20 4546 202	license@europe.rational.com
North American (East Coast) South America	800-433-5444 (toll free)	781-676-2460	license@rational.com
North America (West Coast) Central America	800-433-5444 (toll free)	408-863-4001	license@rational.com

Requesting Licenses

To request or return permanent (or Term License Agreement) license keys, access AccountLink: <http://www.rational.com/accountlink>.

Rational Suite DevelopmentStudio is a member of the Rational Suite family. Rational Suite comes in several Windows-based editions in addition to the Rational Suite DevelopmentStudio for UNIX.

Each edition of the Suite targets a particular practitioner: AnalystStudio, DevelopmentStudio, and TestStudio. DevelopmentStudio for UNIX can be used either in conjunction with the other Suite editions, or by itself in UNIX-only application development.

DevelopmentStudio for UNIX is an integrated set of software development tools, combined with the Rational Unified Process. The following products are included in DevelopmentStudio for UNIX:

- Rational Unified Process
- Rational Rose
- Rational SoDA for Frame
- Rational Purify
- Rational Quantify
- Rational PureCoverage
- Rational ClearQuest
- Rational RequisiteWeb*

* This product is installed and run on a Windows server. RequisiteWeb provides a web interface that allows UNIX users to access Rational RequisitePro on Windows through their web browser.

Note: This version of Rational Suite DevelopmentStudio includes a new version of the licensing server software (FLEXlm 7.0f). It is highly recommended that you take advantage of the new features provided in this release to help optimize your license server's performance.

Rational ClearCase LT

Rational ClearCase LT is included with this release of Rational Suite DevelopmentStudio on a separate CD as an optional product for you to install. Your Suite license key can be used to install ClearCase LT.

Rational ClearCase LT provides software configuration management and a built-in process to track changes to all software project assets, including requirements, visual models, and code. Rational ClearCase LT supports Unified Change Management, Rational's best practices process for managing change and controlling workflow.

To install this product, see the *Rational ClearCase LT Installation Notes* and *Release Notes*.

Installation Manual Roadmap

Table 1 helps you to navigate through this manual.

Table 1 **Installation Roadmap**

Chapter	Description
Before You Install	Provides information about the tasks you need to perform before you install the software. Topics include hardware and software requirements and planning your installation.
Understanding Rational Suite Licensing	Provides information about license types and how to request a license using AccountLink or using the fax request form.
Installing Rational Suite DevelopmentStudio	Provides instructions about using <code>rs_install</code> to install the Rational Suite software.
Installing the FLEXlm License Server on Windows	Provides instructions about how to set up a Windows server for the Rational Suite DevelopmentStudio (Windows Components).
Administering Licenses	Provides information about managing licenses.
After You Install	Provides information about configuring Rational Purify, Rational PureCoverage, Rational Quantify, Rational Rose, and Rational SoDA.
Troubleshooting	Provides information about troubleshooting your installation.

Online Documentation

Online documentation is available in either PDF or HTML formats. Adobe Acrobat® Reader is required to view PDF files; a Web browser is required for HTML documents. When you install Rational Suite DevelopmentStudio, Adobe Acrobat Reader and Netscape Navigator are automatically installed for you unless you choose not to install these products.

A copy of Adobe Acrobat Reader is available on the *Rational Suite DevelopmentStudio for UNIX* CD in the extras/acrobat directory. A copy of Netscape Navigator is available on the *Rational Suite DevelopmentStudio for UNIX* CD in the extras/netscape directory.

The documentation browser can be used to browse all of the documentation, both directly from the CD and from the installed product area. To view documents directly from the CD, run the command **rs_help** from the CD-ROM root directory. To view documents from the installed product area, run the command **rsdsu_help** (assuming you have set up your Suite environment using the **rs_setup.csh** or **rs_setup.ksh** script).

Typical Installation

The following list gives an outline of what takes place during a “typical” installation. Detailed instructions are provided in subsequent chapters.

- Install the FLEXlm licensing and UNIX components.
- Test the licensing of the UNIX components.
- Configure the UNIX components
- Check that the Windows host is correctly networked to the UNIX license server.
- Install RequisiteWeb and ClearQuest Web on the Windows server.
- Configure licensing on the Windows server to use the UNIX license server.
- Test the licensing of RequisiteWeb and ClearQuest Web.
- Configure the RequisiteWeb and ClearQuest Web interfaces on the Windows system, and test with a browser from UNIX.

To take full advantage of the Rational approach to software development, we recommend that at least one person on your team (generally the analyst or product manager) use a Windows system to author requirements with RequisitePro. These requirements can be accessed on your UNIX workstation through the RequisiteWeb interface.

The following topics are covered in this chapter;

- *UNIX Installation Requirements* on page 23
 - *UNIX Hardware Requirements* on page 23
 - *UNIX Software Requirements* on page 24
 - *Installation Requirements for Rational Rose* on page 25
 - *Installation Requirements for Rational SoDA* on page 34
- *Windows Installation Requirements* on page 35
 - *Installation Requirements for RequisitePro* on page 35
 - *Hardware Requirements* on page 35
 - *Licensing Requirements* on page 35
 - *RequisiteWeb* on page 36
- *Planning Your Installation* on page 38

Ensure that you meet the requirements listed in this chapter before proceeding with the installation.

Before You Install Quick Reference

Table 2 provides a quick reference for tasks that need to be performed *before* you install Rational Suite DevelopmentStudio. Use this table as a convenient checklist as you run through steps to upgrade your Suite software or perform a new installation.

Table 2 Before You Install Quick Reference

Step	Action
1 Verify that you meet the hardware and software requirements for this release of Rational Suite DevelopmentStudio.	See the following sections: <ul style="list-style-type: none"> ▪ <i>UNIX Installation Requirements</i> on page 23 ▪ <i>Windows Installation Requirements</i> on page 35
2 Determine how you want to set up your server configuration based on the products you are planning to use.	See <i>Planning Your Installation</i> on page 38
3 Backup your data. Backing up your data prior to installing any new software should be a regular practice. This is especially important for database products such as Rational ClearQuest and Rational Requisite Pro.	For ClearQuest, see the <i>Installing Rational ClearQuest</i> manual. For Requisite Pro, see the <i>Installing Rational Requisite Pro</i> manual. You can find this manual on the <i>Rational Solutions for Windows Online Documentation CD</i> .
4 Do you plan to install Rational ClearCase? Do you plan to install Rational ClearCase LT?	If yes, install Rational ClearCase before you install Rational Suite DevelopmentStudio. Refer to the ClearCase product documentation for instructions on how to install. If yes, you should install Rational Suite DevelopmentStudio first and ClearCase LT second. See also <i>Installation Requirements for Rational ClearCase LT</i> on page 34.
5 Do you plan to use Rational SoDA?	If yes, see <i>Installation Requirements for Rational SoDA</i> on page 34.
6 Do you plan to use Rational Apex with Rational Rose or with Rational SoDA?	If yes, you may want to install Apex before you install Rational Suite DevelopmentStudio. Make a note of the Apex installation directory as you need to provide this during the installation. Alternatively, you can go ahead and install Rational Suite DevelopmentStudio and install Apex later. See <i>Integrating Products That Are Not Part of the Suite</i> on page 62 for information about how to integrate Apex with Rose, Rose RT, or SoDA after you have installed the Suite.

Table 2 Before You Install Quick Reference (continued)

Step	Action
7 Obtain a valid license key.	You need either a temporary license, an existing license, or a permanent license <i>before</i> you install the product. If you are using an existing license, go to Step 8. If you are using a temporary license, locate your license key certificate and go to Step 8. If you want to install the product using a permanent license, see <i>Requesting License Keys</i> on page 47.
8 You are ready to install Rational Suite DevelopmentStudio.	See <i>Installing Rational Suite DevelopmentStudio</i> on page 51.

UNIX Installation Requirements

UNIX Hardware Requirements

Table 3 summarizes the hardware requirements for the installation and use of DevelopmentStudio for UNIX. Note that the recommended amount of memory is only the suggested minimum amount. Additional memory may improve performance. Your memory requirements will also be larger depending on the tasks you are attempting and what else is resident (running concurrently on the system). For example, the construction of larger Rose models requires more memory.

Table 3 UNIX Hardware Requirements

Product	Swap Space	Memory	Disk Space	
			Solaris	HP-UX
Rational Unified Process	NA	16 MB minimum	52 MB	52 MB
Rose	150 MB + 50 MB/user	64 MB + 32 MB/simultaneous user	335 MB + 1 to 3 MB for each model	360 MB (10.20) 353 MB (11.00) + 1 to 3 MB for each model
SoDA with Frame	64 MB	32 MB minimum	221 MB	271 MB
Purify	*	2–5 times application size	16 MB	11 MB (32-bit) 12 MB (64 bit)

Table 3 UNIX Hardware Requirements (continued)

Product	Swap Space	Memory	Disk Space	
			Solaris	HP-UX
Quantify	*	2-5 times application size	15 MB	10 MB (32-bit) 12 MB (64 bit)
PureCoverage	*	2-5 times application size	9 MB	12 MB
ClearQuest	NA	48 MB	65 MB	143 MB
RequisitePro Web Interface	NA	NA	NA	NA
Totals	214 MB + 50 MB /user	160 MB + 32 MB/user + Purify, Quantify, and PureCoverage requirements	720 MB	860-885 MB
Recommended Suite Requirements	500 MB + 50 MB/user	256 MB + 32 MB/user	0.9 GB	1 GB

* Highly dependent on the application that's instrumented

UNIX Software Requirements

Rational Suite DevelopmentStudio is supported on the following operating systems:

- Solaris 2.5.1, 2.6, 2.7 (Solaris 7), and 2. 8 (Solaris 8)
- HP-UX 10.20*, 11.00 and 11.11 (11.i)

* Rational Unified Process is not supported on HP-UX 10.20. Supported HP-UX platforms for this product include HP-UX 11.00 and 11.11.

Each point product within the DevelopmentStudio for UNIX has its own range of OS version compatibility as summarized in Table 4. Customers should pick the OS version that intersects the product mix they intend to use.

Table 4 Individual Product OS Version Compatibility

Product	Solaris	HP-UX
Rose	2.5.1, 2.6, 2.7 (Solaris 7), and 2.8 (Solaris 8)	10.20, 11.0, and 11.11
SoDA with Frame	2.5.1, 2.6, 2.7 (Solaris 7), and 2.8 (Solaris 8)	10.20, 11.0, and 11.11
Purify	2.5.1, 2.6, 2.7 (Solaris 7), and 2.8 (Solaris 8) (32 and 64 bit)	10.x through 11.0, and 11.11 32 and 64 bit (narrow and wide mode)
Quantify	2.5.1, 2.6, 2.7 (Solaris 7), and 2.8 (Solaris 8) (32 and 64 bit)	10.x through 11.0, and 11.11 32 and 64 bit (narrow and wide mode)
Pure Coverage	2.5.1, 2.6, 2.7 (Solaris 7), and 2.8 (Solaris 8) (32 bit only)	10.x through 11.0, and 11.11 32 bit only
ClearQuest	2.5.1, 2.6, 2.7 (Solaris 7), and 2.8 (Solaris 8)	10.20, 11.0, and 11.11
Rational Unified Process +	2.5.1, 2.6, 2.7 (Solaris 7), and 2.8 (Solaris 8)	11.0 and 11.11 Note that Rational Unified Process is not supported on HP-UX 10.20.

+ Requires an HTML browser. Netscape Navigator 4.6 or later is recommended.

Installation Requirements for Rational Rose

This section lists requirements that must be met to successfully use Rational Rose. Table 5 summarizes the software requirements for Rational Rose.

Table 5 Rose Software Requirements

Software Item	Requirement	For
Operating system	Solaris 2.5.1, 2.6, 7, and 8 (kernel revision January 2000 and later) HP-UX 10.20 (ACE release ^a), 11.00, and 11.11	Use
C++ Compiler #include files	Solaris SC 5.0 HP-UX 10.20: HP aC++ B3910B A.01.21 HP aC++ B3910B A.01.19.02 Language Support Library HP-UX 11.00: HP aC++B3910B A.03.13 HP aC++B3910B X.03.11.10 Language Support Library	Analyzer
JDK	JDK 1.1.6 JFC 1.1 (swing classes for 1.1) JDK 1.2 (based on 1.2.1) J2SE 1.2 (based on 1.2.2) J2SE 1.3 J2EE 1.2 or any of the major Java IDEs	
Port map daemon	Must be running	Installation, Use
TCP/IP	Must be running	Installation, Use
Host names	Must be configured	Installation, Use
Page/Swap space	150 + (50 * N) MB	Use
X Window System	Native X11R5 or X11R6 (except HP 10.20) X news on Sun with OpenWindows 3. PC X server eXceed version 6.1 or higher	Use

Table 5 Rose Software Requirements (continued)

Software Item	Requirement	For
Window Manager	<p>MWM (Motif Window Manager) version 1.2 vuewm on HP-UX 4dwm on SGI IRIX dtwm (CDE (Desk Top) version 1.0) olwm (Open Look Window Manager) on Sun is supported, but icons of Rose may not integrate well with other icons on the screen</p> <p>The following Window Managers are not supported:</p> <p>olvwm (olwm with virtual screens) Rose will not remain on original virtual desktop, but rather will follow when other desktops selected. twm (shipped with X11) tvtwm (twm with virtual screens) fwm gwm fvwm</p>	Use

a. Rose requires that an ACE release be installed to run properly on HP-UX 10.20. To determine if an ACE release is installed, run `/usr/sbin/swlist | grep ACE`.

Rational Rose - Operating System Run Time and/or Patch Requirements

The requirements below are in relation to the following platforms (operating system versions):

- HP-UX (10.20 (ACE) and 11.00)
- Sun Solaris (2.5.1, 2.6, 7)

Note: If you are currently using Rose and your installed operating system patches are currently meeting your needs, we strongly recommend that you not change your installed patches. The following patches are recommended for new customers and customers experiencing problems. If you upgrade your patches, we recommend that you use the following patch versions. While we encourage you to contact the appropriate vendor to determine if a patch has been superseded, we cannot guarantee release compatibility with a patch version we have not yet tested. For information regarding the latest patch versions tested or required with this release, visit the Rational web site at <http://www.rational.com/support>.

Contact Rational Technical Support if you encounter any compatibility difficulties after installing a patch which supersedes the following patches.

HP-UX 10.20 and 11.00 Patch Requirements and Descriptions

Table 6 summarizes the patch requirements for HP-UX 10.20 and 11.00.

Table 6 HP-UX 10.20 and 11.00 Patch Requirements

Run-Time Patches	Description	Reason for Patch	Operating System Versions and Notes
PHCO_19434	S700_800 10.20 csh(1) cumulative patch	Fixes crash of csh exit of MainWin	HP-UX 10.20 (ACE)
PHSS_21461	S700_800 10.20 Xserver cumulative patch	Fixes Xserver crash with multiple rectangle	HP-UX 10.20 (ACE)
PHSS_17872	HP aC++ run-time libraries (aCC A.01.21)	Run time for compiler A.01.21	HP-UX 10.20 (ACE)
PHSS_19739	S700_800 10.20 HP DCE 9000 1.5 cumulative patch	Problem with threads	HP-UX 10.20 (ACE)
PHSS_17225	S700-800 10X dld.sl(5) cumulative patch	Run-time requirement	HP-UX 10.20 (ACE)
PHSS_17327 ^a	X/Motif 2.1 Dev Kit Mar99 Periodic Patch	Run-time requirement	HP-UX 11.00
PHSS_19866	ld(1) and linker tools cumulative patch	Resolve dld.sl error when using CORBA & Java Operation Specification Window: /usr/lib/dld.sl: Unresolved symbol: (libot.sl (unknown))	HP-UX 11.00
PHSS_16587	s700_800 11.X HP aC++ (aCC A.03.13) run-time libraries	Run-time requirement	HP-UX 11.00

a. See the following Note

Note: Rose requires HP-UX OS Patch PHSS_17327 (X/Motif 2.1 Dev Kit Mar99 Periodic Patch). This Patch requires PHSS_17326 (X/Motif 2.1 Run time Mar99 Periodic Patch). PHSS_17326 has been superseded by HP-UX OS Patch PHSS_23823

The HP-UX patches are available at:

- <http://us-support.external.hp.com> (US, Canada, Asia-Pacific and Latin-America)
- <http://europe-support.external.hp.com> (Europe)
- <ftp://us-ffs.external.hp.com> (“anonymous” FTP)

Solaris Patch Requirements and Descriptions

Note: Some patches are required on the *server* (the computer which users login to, to run Rose) and the *client* (the computer which is used to display Rose), and some are required only on the client. In some cases, the server and client are the same computer, but often several users login to one server (to run the application) and have their own displays which serve as their client. The following Sun Solaris patch recommendations are specific to Sun Solaris servers and clients. Table 7 summarizes the server and client patches. Table 8 summarizes the client patches.

Table 7 Solaris Server and Client Patches

Server and Client Run-Time Patches	Description	Reason for Patch	Operating System Version
103566-46	Xsun patch	To fix defects in XinitThreads and _XflushInt, i.e., defect fixes for multi-threaded applications under X.	Solaris 2.5.1
103627-11	Linker patch	Fixes problems in dlclose()	Solaris 2.5.1
103640-29	Kernel nisopaccess & libthread patch	Kernel fix for dlclose()	Solaris 2.5.1
106529-04	Shared library patch for C++	Shared library fix	Solaris 2.5.1
105181-16	Kernel update patch	Fixes kernel thread problems	Solaris 2.6
105591-06	Shared library patch for C++	Shared library fix	Solaris 2.6
105633-32	Xsun patch	See “Reason for Patch” under patch 103566-46	Solaris 2.6
106040-12	X input and output method patch	Fixes input/output problem	Solaris 2.6

Table 7 Solaris Server and Client Patches (continued)

Server and Client Run-Time Patches	Description	Reason for Patch	Operating System Version
106327-05	Shared library patch for C++	Shared library fix	Solaris 7
108376-03	Xsun patch	See “Reason for Patch” under patch 103566-46	Solaris 7
108434-01	Shared library patch for C++	Shared library fix	Solaris 8

Table 8 Solaris Client Patches

Client (Display) Patches	Description	Reason for Patch	Operating System Version & Graphic Card (see information describing how to detect graphics cards in the following Notes section)
105789-07	VIS/XIL Graphics Patch	Provides the imaging and video foundation for Solaris	Supplemental for Creator or Elite graphics card on Solaris 2.5.1
105361-10	VIS/XIL Graphics Patch	Provides the imaging and video foundation for Solaris	Supplemental for Creator or Elite graphics card on Solaris 2.6
106147-03	VIS/XIL Graphics Patch	Provides the imaging and video foundation for Solaris	For Creator or Elite graphics card on Solaris 7

Table 8 Solaris Client Patches (continued)

Client (Display) Patches	Description	Reason for Patch	Operating System Version & Graphic Card <i>(see information describing how to detect graphics cards in the following Notes section)</i>
103792-25	M64 Graphics Patch	Required for PGX (M64 Graphics card) PCI-based Ultra 5, 10, and 60: <ul style="list-style-type: none"> ▪ To fix gui hanging problems ▪ To fix paint problems (black/white regions appear in menus, dialog boxes, toolbars, and so on) 	For PGX (M64 Graphics card) on Solaris 2.5.1
105362-20	M64 Graphics Patch	See “Reason for Patch” under patch 103792-25	For PGX (M64 Graphics card) on Solaris 2.6
106146-10	M64 Graphics Patch	See “Reason for Patch” under patch 103792-25	For PGX (M64 Graphics card) on Solaris 7
105790-19	FFB Graphics Patch	Supplemental patch for VIS/XIL graphics patch: <ul style="list-style-type: none"> ▪ To fix gui hanging problems ▪ To fix paint problems (black/white regions appear in menus, dialog boxes, toolbars, and so on) 	For Creator Graphics Card on Solaris 2.5.1
105360-28	FFB Graphics Patch	See “Reason for Patch” under patch 105790-19	For Creator Graphics Card on Solaris 2.6
106145-12	FFB Graphics Patch	See “Reason for Patch” under patch 105790-19	For Creator Graphics Card on Solaris 7
105791-25	AFB Graphics Patch	Supplemental patch for VIS/XIL graphics patch for Elite 3D frame buffer: <ul style="list-style-type: none"> ▪ To fix gui hanging problems ▪ To fix paint problems (black/white regions appear in menus, dialog boxes, toolbars, and so on) 	For Elite3D Graphics Card on Solaris 2.5.1

Table 8 Solaris Client Patches (continued)

Client (Display) Patches	Description	Reason for Patch	Operating System Version & Graphic Card <i>(see information describing how to detect graphics cards in the following Notes section)</i>
105363-24	AFB Graphics Patch	See “Reason for Patch” under patch 105791-25	For Elite3D Graphics Card Solaris 2.6
106144-12	AFB Graphics Patch	See “Reason for Patch” under patch 105791-25	For Elite3D Graphics Card Solaris 7
103793-01	TCX Graphics Patch	To fix GUI hanging, and to fix paint problems (black/white regions appear in menus, dialog boxes, toolbars, and so on)	For TCX Graphics Card on Solaris 2.5.1
106391-01	TCX Graphics Patch	To fix GUI hanging, and to fix paint problems (black/white regions appear in menus, dialog boxes, toolbars, and so on)	For TCX Graphics Card on Solaris 2.6
107851-01	PGX32 2.1 Graphics Patch	Recommended for GFX graphics card	For GFX Graphics Card on Solaris 2.5.1, 2.6, and 7 if “VERSION” line from pkginfo -l TSIGfxOW indicates 2.1, otherwise refer to following patches
107714-01	PGX32 Graphics Patch	Recommended for GFX graphics card	For GFX Graphics card on Solaris 2.5.1 if 107851-01 does not apply
107715-04	PGX32 Graphics Patch	Recommended for GFX graphics card	For GFX Graphics card on Solaris 2.6 if 107851-01 does not apply

Table 8 Solaris Client Patches (continued)

Client (Display) Patches	Description	Reason for Patch	Operating System Version & Graphic Card (see information describing how to detect graphics cards in the following Notes section)
107716-04	PGX32 Graphics Patch	Recommended for GFX graphics card	For GFX Graphics card on Solaris 7 if 107851-03 does not apply
105492-02	cgsix driver patch	For issue related to GX frame buffer	For cgsix Graphics Card on Solaris 2.6

The Solaris patches are available at:

- <http://sunsolve.sun.com/private-cgi/show.pl?target=patches/patch-access>

The Sun Solaris patches may not be available publicly.

The following may be necessary to obtain some of the Solaris patches listed above:

- Must be under maintenance support with Sun; or
- System must be under warranty; or
- You must be willing to pay for patch to receive it.

Notes

How to detect a graphics card on a Sun Solaris computer:

```
% ls /dev/fbs/*  
/dev/fbs/m640 – PGX graphics card  
/dev/fbs/afb* – Elite3D graphics card  
/dev/fbs/ffb* – Creator/Creator3D graphics card  
/dev/fbs/cgsix* – GX graphics card  
/dev/fbs/leo* – ZX graphics card  
/dev/fbs/sx* – SX graphics card
```

/dev/fbs/tcx* - TCX graphics card

/dev/fbs/gfx* - GFX graphics card

Installation Requirements for Rational SoDA

Note: FrameMaker + SGML is no longer shipped with SoDA. It must now be licensed and installed independently. Rational SoDA 2001A.04.00 supports FrameMaker+SGML 5.5 and 6.0.

You may want to install FrameMaker + SGML 5.5 or 6.0 before you install Rational Suite DevelopmentStudio. Make a note of the FrameMaker + SGML installation directory as you need to provide this during the installation.

Alternatively, you can go ahead and install Rational Suite DevelopmentStudio and install FrameMaker + SGML later. See *Integrating Products That Are Not Part of the Suite* on page 62 for information about how to integrate FrameMaker + SGML with SoDA after you have installed the Suite.

If you have previously installed version 3.0.1, 3.0.3, or 3.1.0 of Rational SoDA, you may choose to use the installation of FrameMaker+SGML bundled with that release. To do this, copy the entire SoDA directory to a new location and uninstall the previous version of Rational Suite DevelopmentStudio. This way, you do not accidentally remove the previous version of Rational SoDA when you uninstall the Suite.

Installation Requirements for Rational ClearCase LT

Rational ClearCase LT is included with this release of Rational Suite DevelopmentStudio on a separate CD as an optional product for you to install. Your Suite license key can be used to install ClearCase LT

You must install Rational Suite DevelopmentStudio *before* you install Rational ClearCase LT. When you install Rational ClearCase LT you are prompted to provide the host name of the Rational Suite DevelopmentStudio license server. By doing the installation in this sequence, ClearCase LT will be able to use the Rational Suite DevelopmentStudio license key.

For more information about the requirements for installing Rational ClearCase LT, see the *Rational ClearCase LT Installation Notes*.

Windows Installation Requirements

Installation Requirements for RequisitePro

RequisitePro is available on the Windows platform and is accessed on UNIX through a web interface. Installation requirements for RequisitePro are listed in this section.

Complete installation instructions can be found on the *Rational Solutions for Windows Online Documentation* CD. You can also view the instructions online by typing `rsdsu_help`.

Note: It is recommended that for best web server performance a dedicated Windows Server system be configured.

Hardware Requirements

To run RequisitePro you need:

- Pentium 300 MHz or faster processor recommended
- 128 MB or more of memory
- 250 MB or more of disk space
- 800 x 600 x 256 color video resolution, or higher
- Microsoft Mouse or compatible pointing device
- CD-ROM drive

Licensing Requirements

To install and use RequisiteWeb you will need the following license:

- One floating license for Rational Suite DevelopmentStudio web components. This provides a license for RequisitePro.

This license can be served from either a UNIX license server or a Windows license server.

Note: If you are configuring your Windows system to get licenses from a UNIX system, you will need to have DNS configured on your Windows system.

To check, try to ping the UNIX license server by name and by IP address. If networking is okay, you should be able to ping the system by IP address. If DNS is configured, you will be able to ping by name.

RequisiteWeb

RequisiteWeb provides a Web interface for accessing RequisitePro project data through a Web browser.

Installation and configuration instructions can be found in *rational_dir/docs/html/reqweb_install/RequisiteWebInstall.html*. This document is available through the documentation browser accessed through the **rsdsu_help** command.

Oracle and SQL Server Databases

To create and access RequisitePro projects in Oracle or Microsoft SQL Server databases, you must configure an Oracle or SQL Server schema on your database server, and install RequisitePro and RequisiteEnterprise on your client system.

Note: RequisiteEnterprise is available separately for Rational Suite users who require access to these database servers.

RequisiteWeb Interface

The RequisiteWeb interface requires the installation of Web components on a Microsoft Windows server and a Web browser on the client system.

Web Server

RequisiteWeb requires that it be installed on an Internet Information Server (IIS). If you prefer to use the Personal Web Server (PWS), you can do so by performing a “Custom Installation” and checking the box for Internet Service Manager.

IIS is the web server for Microsoft NT Server; PWS is the web server for Microsoft NT Workstation. Since NT Workstation and Personal Web Server have a limited number of connections, they are often not suitable for production use. However, you may find it convenient to use Personal Web Server for evaluation or demonstration purposes.

The following table summarizes the requirements for the RequisiteWeb server.

RequisiteWeb Component	Disk Space
Operating System	NT Server 4.0, Service Pack 6A or later NT 4.0 Option Pack which includes: Microsoft Internet Information Server (IIS) 4.0 and Microsoft Transaction Server (MTS) 2.0 or Microsoft Windows 2000 Advanced Server, which includes: Internet Information Services (IIS) 5.0

RequisiteWeb Component	Disk Space
Processor	400 MHz or greater
Memory	128 MB. For projects with more than 10,000 requirements or Web sites with more than 10 concurrent users, 256 MB or more is recommended.
Disk space	RequisiteWeb (includes system DLLs) – 40 MB
Other products	<p>Microsoft Word 2000</p> <p>Oracle, version 7.3 or later, client software (for accessing projects in an Oracle database)</p> <p>Microsoft Internet Explorer 5, 6 or Internet Explorer 4 with the XML parser available at http://msdn.microsoft.com/downloads/tools/xmlparser/xmldl.asp</p>

Web Interface Client

To use the RequisiteWeb interface requires that a web browser be available. **rs_install** will install a version of Netscape that is compatible with RequisiteWeb. No additional client installation is required for use of the RequisiteWeb interface. If you choose not to use the supplied version of Netscape, the following web browsers should be compatible:

- Microsoft Internet Explorer 4.x or later
- Netscape Communicator 4.x or later
- Netscape Navigator 4.x for UNIX or later

Installation Requirements for Rational ClearQuest Web

Rational ClearQuest is provided on UNIX; however, you may use your Rational Suite DevelopmentStudio (Windows components) license key to install Rational ClearQuest Web on Windows. Installing ClearQuest Web allows UNIX users to access ClearQuest on Windows through their web browser.

This manual assumes that an existing Rational ClearQuest for Windows installation is being used and that only the web component is being installed. For installation requirements for ClearQuest Web, refer to the *Installing Rational ClearQuest Installation* manual. If you are performing a full installation of ClearQuest, refer to the ClearQuest documentation provided on the *Rational Solutions for Windows Online Documentation* CD in addition to the *Installing Rational ClearQuest Installation* manual.

Planning Your Installation

Rational Suite DevelopmentStudio is designed to work in a distributed environment. Both Solaris and HP-UX versions are available, and both may be installed on the same network.

For the purposes of installation, your computers assume roles as depicted in Figure 1. Note that these roles are generalized; in practice, any particular computer can serve more than one role. In fact, this is typically the case. In many installations, the roles of the storage host, license server, install client, and exec client are provided by a single UNIX server. A separate Windows server is still required to act as the RequisitePro server.

Storage Host

This is the computer that hosts the physical disks on which the product will be installed. All computers with UNIX roles must have access to the installation directory on this disk, presumably through NFS. (Operating System: Solaris or HP-UX).

X-server

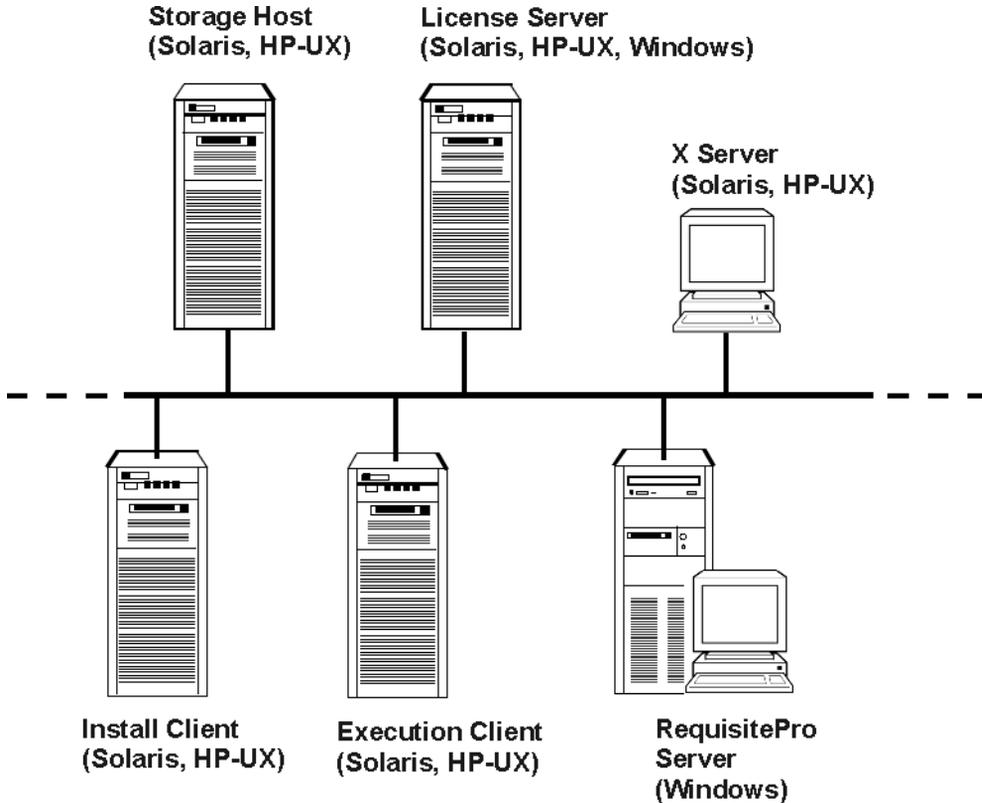

This is any computer, typically an engineering workstation, which provides an X-Windows display to the end user. This role is shown for completeness; its operation is transparent to the installation.

RequisitePro Server

This Windows computer hosts the RequisitePro component. This server is only needed if you are going to use RequisitePro. See the RequisitePro document for more information. Access to RequisitePro is provided through a web interface.

Note: You cannot have two different versions of Rational Suite installed on the same Windows server.

Figure 1 Installation Computer Roles

License Servers

These computers provide licensing for Rational Suite DevelopmentStudio. License server configurations are described in more detail in *License Server Configurations* on page 40.

Note: In most cases, it is possible to use the same license server to manage Suite licenses and individual point-product licenses; however, some exceptions apply. For example, ClearDDTS and Rational Suite DevelopmentStudio licenses cannot be served by the same license server. This configuration requires that two separate license servers be set up on two different UNIX systems.

Install Client

This is simply the computer on which you run the installation utility. Typically, this is the same computer as the storage host. (Operating System: Solaris or HP-UX)

Execution Client

This is any computer which will execute the component products. There may be any number of execution clients on your network. (Operating System: Solaris or HP-UX)

Note that you only need to install the UNIX components once, on the install client and storage server. Individual workstations (execution clients) may simply run the installed software from the single installation area.

License Server Configurations

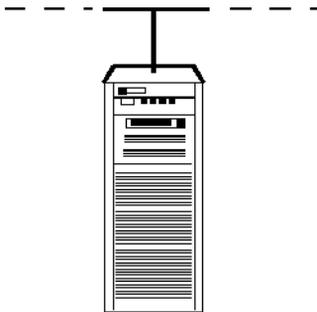

Rational Suite DevelopmentStudio supports three license server configurations:

- Single server configuration
- Two server configuration
- Redundant server configuration

Single server configuration

As shown in Figure 2, the single server configuration uses a single UNIX server to manage licenses for both UNIX components and Windows components. This is the recommended configuration because it is the simplest to manage.

Figure 2 Single server configuration

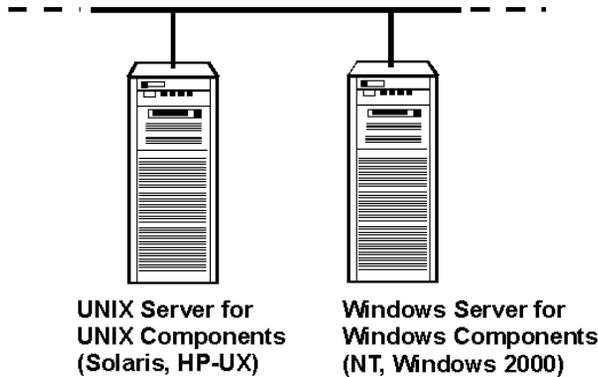

**UNIX Server for
UNIX Components and
Windows Components
(Solaris, HP-UX)**

Two server configuration

As shown in Figure 3, a two-server configuration uses a UNIX server to manage licenses for UNIX components and a Windows server to manage licenses for the Windows components (Rational Requisite Pro and Rational ClearQuest Web). Information on installing the Windows license server is provided in *Installing the FLEXlm License Server on Windows* on page 79.

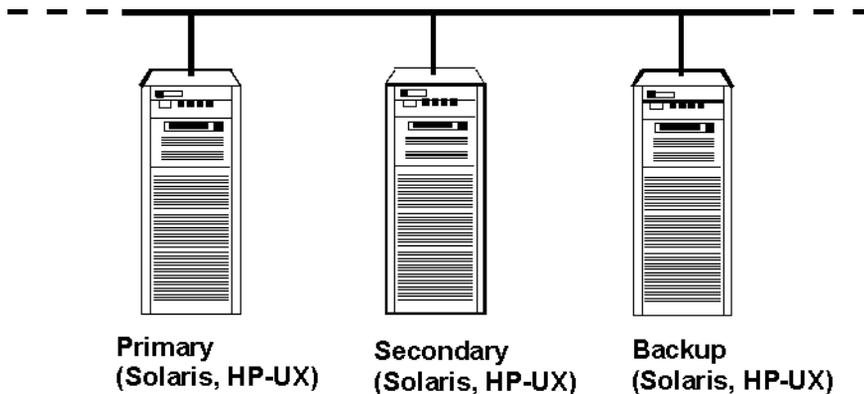

Figure 3 Two server configuration

Redundant server configuration

As shown in Figure 4, a redundant server configuration uses three UNIX servers to manage licenses in a fault-tolerant configuration known as redundancy. The redundant server configuration is described in more detail in *Setting up Redundant Servers on UNIX* on page 69.

Figure 4 Redundant server configuration

Installation Worksheet

The following worksheet is provided for convenience in planning the installation.
Note that some parts may not be known until you begin the installation.

Table 9 Installation Worksheet

Storage Host		
Host name		_____
Installation directory (<i>rational_dir</i> location)		_____
Installation user name (not root)		_____
Install Client		
Host name		_____
Install user name (not root)		_____
License Server		
Host name for UNIX licenses		_____
License port (default=27000)		_____
License file		_____
Host name for Windows licenses		_____
License port		_____
RequisitePro Server		
Host name		_____
URL for RequisiteWeb		_____

Host name		_____

Understanding Rational Suite Licensing

3

This chapter describes the following topics related to Rational software licensing services:

- *The Rational Common Licensing Model* on page 43
- *Types of Licenses* on page 44
 - *Node-Locked Licenses* on page 44
 - *Permanent Licenses and Temporary License Keys* on page 45
 - *Emergency and Evaluation Keys* on page 45
- *Requesting License Keys* on page 47
- *Requesting License Keys by Fax* on page 49
- *Converting a Temporary License to a Permanent License* on page 50

The Rational Common Licensing Model

Rational Software uses a software-based license management tool from GLOBEtrouter Inc. called FLEXIm. FLEXIm provides users with a powerful and flexible mechanism for managing licensing. This allows vendors such as Rational Software to build a customized licensing model by implementing the FLEXIm features that best meets their business needs.

Products Included in Rational Common Licensing

The following list of Rational software products use Rational Common Licensing:

- Rational Rose products
- Rational ClearQuest products
- Rational Requisite products
- Rational ClearCase LT
- Rational SoDA products

- Rational Testing products
- Rational RealTime products
- Rational Developer Tools on Windows
- Rational Developer Tools on UNIX
- Rational Suite DevelopmentStudio on UNIX
- Rational ClearCase LT

Products Not Included in Rational Common Licensing

- Rational ClearCase
- Rational Developer Tools on UNIX (before the August 2000 release)
- Rational Apex
- Rational ClearDDTS
- Rational VADS

Types of Licenses

Node-Locked Licenses

Node-locked licenses are created only for a specific system. A node-locked license can be a permanent license, a temporary license agreement (TLA), or it can be an evaluation license.

Note: Because node-locked licenses are uncounted licenses, there is no need to have a license server process running to manage their use.

Floating Licenses

Floating licenses are licenses that can be shared by multiple users on multiple systems. A Rational license server controls use of the floating licenses.

Note: Users need floating license keys from a Web server to run Rational ClearQuest Web and Rational RequisiteWeb on Web clients.

Floating licenses allow anyone on your network to use Rational Suite DevelopmentStudio as long as a license is available. Thus, the number of licenses that you purchase determines the maximum number of users who can use Rational Suite DevelopmentStudio concurrently.

Permanent Licenses and Temporary License Keys

When you register Rational products to specific systems (license server or client) in AccountLink, Rational generates license keys and sends you an e-mail message with these permanent license keys in a license file. The permanent keys let you use the Rational products for an indefinite period of time. However, Rational assigns an expiration date to the license keys if your company has negotiated a Term License Agreement (TLA). Technically, TLA keys are not permanent, but the process of ordering and installing TLA licenses is the same as a permanent license.

To use Rational products for an evaluation period or if you expect a delay in receiving your permanent keys, you can install the temporary license key provided in your Rational License Key Certificate. Because Rational has not generated the temporary key for a specific system, you can use it on any system until the specified expiration date.

Permanent and temporary license keys can be floating or node-locked. The difference is that a temporary key is not generated for a specific system and a permanent key is generated for a specific system.

Emergency and Evaluation Keys

Emergency and evaluation license keys are temporary license keys. They can be floating or node-locked. They are short-term licenses that are not generated for a specific system.

Suite Licenses and Point Product Licenses

A Rational license key indicates whether it is a Rational Suite license, such as Rational Suite DevelopmentStudio, or a point-product license, such as Rational Purify. A Rational license file can contain multiple floating or node-locked Suite and point-product license keys.

Returning License Keys

You may need to replace an old system or decide another system should act as the new Rational license server. Because permanent license keys are tied to a system's host ID, Rational products will not work on another system until you import new license keys that are tied to the new system's host ID.

To get your new license key, you need to "return" the existing license key back to your Rational account and then "get" or order a license key for the other system. You could also call this task moving the license key from one system to another or removing the license key from the old system.

When you return a license key, you do not physically give the license key back to Rational. Instead, the return transaction updates Rational's records to indicate that you are no longer using the software on that system. This adjusts the count of registered products in your account and allows you to get the license key for the other system.

In accordance with the Legal Agreement provided on AccountLink, you have 30 days to shut down the license server that corresponds to the server identified in the returned license file. If you have a license file that contains more than one license and you are returning only one of those licenses, remove the entry for the license that you are returning. When you have finished editing the file, use the **Imreread** command to reread the license file and restart the vendor daemon. For more information about licensing commands, see *License Manager Commands* on page 87.

Upgrading Licenses

If you are upgrading from an earlier version of a Rational Suite or point-product, you can reuse your current Rational Suite and point-product license keys.

Adding Point Products to Licenses

If you are adding a new product to your system, you have to request a new license file that includes the new point-product license key. You cannot use the Suite license for individual point product installations.

Using Your Rational License Key Certificate

To get your permanent or TLA license keys, you need to supply information from your Rational License Key Certificate. This certificate is enclosed in a large green envelope in your shipment. The information, especially the Rational Account Number, on this certificate verifies that your company has purchased licenses to run Rational products.

License Usage Order

A Rational product, whether it is installed as part of a Rational Suite or installed individually, requests licenses in this order, by default:

- 1 Node-locked before floating license
- 2 Suite license before point-product license

A Rational product requests a node-locked license before a floating license, regardless of whether it is a Suite or point-product license. Then, among a group of floating or node-locked licenses, a product requests a Suite license before a point-product license. For example, Rational Purify is sold as part of a Rational Suite and as a stand-alone product. It will request the Rational Suite license before it requests a Rational Purify license.

If you would like to change how your Rational products use Suite and point-product licenses, see *Customizing License Usage Order* on page 88.

Rational RequisiteWeb and ClearQuest Web

Rational RequisiteWeb and ClearQuest Web require floating licenses. Unlike other Rational products, they request the point-product license before the Suite license.

Rational ClearCase LT

Rational ClearCase LT can use either a ClearCase LT (floating) license or a Rational Suite DevelopmentStudio (node-locked or floating) license. The license usage order for this product cannot be customized. When Rational ClearCase LT is started, a Rational ClearCase LT license is claimed first. If there are no Rational ClearCase LT licenses available, a Suite license is claimed if one is available.

Note: Rational ClearCase LT licenses are managed differently from other point products. Rational ClearCase LT uses a linger feature that requires a user to claim a license for a minimum period of 30 minutes. After 30 minutes has elapsed, the license is returned and made available to other users.

Requesting License Keys

AccountLink (<http://www.rational.com/accountlink>) is a Web tool that you can use to manage your permanent (or Term License Agreement) license keys. To use AccountLink, you need the License Key Certificate to order and install your license keys. AccountLink's interface offers three license transactions:

- Get License Key(s)
- Return License Key(s)
- Request a Copy of a License File

With these three transactions, you can order and return permanent license keys for Windows and UNIX products from single or multiple Rational accounts.

Note: AccountLink does not support temporary license key transactions.

AccountLink requires you to register your Rational software to specific systems using the system's host ID or ethernet address. You can register:

- Rational Windows or UNIX products that will be served from a Rational license server.
- Single or redundant Rational license servers on Windows or UNIX systems.
- Remote Windows or UNIX systems; you do not need to sit at the system for which you are requesting license keys.

If you are not at the computer for which you are requesting license keys, you must have the following information available: Hostname and Host ID. You can download a tool from AccountLink that provides this information automatically for you.

Alternatively, you can run `rs_hostinfo` directly from the CD to get the host information. This applies to UNIX host information only. To obtain information about a Windows host, you need to use the download tool.

The following license key types are supported in Rational Suite DevelopmentStudio:

Component type	License type
UNIX components (for example, Rose)	Node-locked and floating
Windows components (Rational Requisite Web, ClearQuest Web)	Floating

Note: You must request license keys twice if you plan to use Rational Requisite Web or ClearQuest Web. You must request a license for the Rational Suite DevelopmentStudio (UNIX components) and you must request a license for the Rational Suite DevelopmentStudio (Windows components).

Receiving and Importing License Keys

After you register your Rational products to a specific system with AccountLink, Rational generates a license key file that contains the license key. The file is sent in an e-mail message to the contact e-mail address that you designate in AccountLink's License Contact page.

You need to save the file to a known directory location as you will need to provide this information when you install the Rational software.

Note: If AccountLink is unavailable, see *Requesting License Keys by Fax* on page 49 or call Rational Licensing Support. See *Contacting Rational Licensing Technical Support* on page xv for Support phone numbers.

Requesting License Keys by Fax

This section summarizes the steps for getting a node-locked or floating permanent license key when you do not have an internet connection or when Rational AccountLink is unavailable.

Although this section gives customers instructions for obtaining license keys by fax, Rational recommends that you use Rational AccountLink (www.rational.com/accountlink) to request permanent license keys.

- 1 Find your License Key Certificate in your Rational product shipment.
- 2 Print the license request form.

The documentation browser can be used directly from the CD-ROM and from the installed product area. To view the form directly from the CD-ROM, run the command **rs_help** from the CD-ROM root directory. The form, is located in the HTML Tool Documentation/Rational Suite DevelopmentStudio/FAX License Request Form.

- 3 Use the License Key Certificate to fill out the form. Make sure that the contact, Rational account number, product, licensing, and host information are correct. Any errors will cause delays in receiving your license keys.

Note: If you are requesting a node-locked license, be sure to select **NodeLocked** and not **NodeLocked UNIX**.

- 4 Fax the request to Rational. See *Contacting Rational Licensing Technical Support* on page xv for fax and phone numbers.

Call Rational Licensing Support if you cannot use Rational AccountLink or the fax form to order your permanent license keys. See *Contacting Rational Licensing Technical Support* on page xv for phone numbers.

Receiving Permanent License Keys

If you request a new license using AccountLink, Rational will send you a license key file through e-mail. If you request a permanent license key by fax and you have specified an e-mail address in your contact information, you will receive a license key file through e-mail. You can copy the permanent license file from the e-mail enabled system and install it on the system that is not e-mail enabled.

If you cannot provide an e-mail address, contact Rational Licensing Support. See *Contacting Rational Licensing Technical Support* on page xv for the phone numbers.

Converting a Temporary License to a Permanent License

If you initially used a temporary license (evaluation or startup) to install Rational Suite DevelopmentStudio, you can convert your license to a permanent license by using the **license_setup** command. The **license_setup** command allows you to run a subset of the install script, **rs_install**. The **license_setup** command allows you to set up license options and run the license check sequence.

You may also do this by running **rs_install**; however, using **license_setup** will save you time as there is no need to run through a full product installation or any of the post product installation setup.

You need to have a permanent or TLA license before you start. See *Requesting License Keys* on page 47.

Installing Rational Suite DevelopmentStudio

4

This chapter details how to install the Rational Suite DevelopmentStudio and includes the following topics:

- *Installing Rational Suite DevelopmentStudio (UNIX Components)* on page 53
- *Running Rational Suite DevelopmentStudio for UNIX: User Setup Script* on page 61
- *Installing Rational Suite DevelopmentStudio (Windows Components)* on page 63
- *Removing the Rational Suite DevelopmentStudio Software* on page 66
- *Next Steps* on page 67

Note: If you have not reviewed *Before You Install* on page 21, you should do so *before* proceeding.

Upgrading Rational Suite DevelopmentStudio

Upgrading from the Beta Version 2001A.04.00

If you installed the beta software for version 2001A.04.00, you must remove the software *before* installing the final version.

Upgrading from Version 2000.02.10

If you are upgrading from version 2000.02.10, you may use your existing license.

- 1 Install the product by running **rs_install**. For complete instructions, see *Installing Rational Suite DevelopmentStudio (UNIX Components)* on page 53.
- 2 Choose option 1, use an existing FLEXlm license file, from the **Licensing Options Menu**.

- 3 After you have completed the upgrade, you may wish to remove the previous version to recover disk space. See *Removing the Rational Suite DevelopmentStudio Software* on page 66.

Note: If you have previously installed version 3.0.1, 3.0.3, or 3.1.0 of Rational SoDA, you may choose to use the installation of FrameMaker+SGML bundled with that release. To do this, copy the entire SoDA directory to a new location and uninstall the previous version of Rational Suite DevelopmentStudio. This way, you do not accidentally remove the previous version of Rational SoDA when you uninstall the Suite.

Upgrading from a Release Prior to Version 2000.02.10

As of version 2000.02.10, all license management is done through Rational AccountLink, a new online licensing web tool. You need to return your old license keys and request new license keys before you can install Rational Suite DevelopmentStudio. For information, see *Requesting License Keys* on page 47.

- 1 Install the product by running `rs_install`. For complete instructions, see *Installing Rational Suite DevelopmentStudio (UNIX Components)* on page 53.
- 2 Choose option **2**, setup a permanent or term-license-agreement, from the **Licensing Options Menu**.
- 3 After you have completed the upgrade, you may wish to remove the previous version to recover disk space. See *Removing the Rational Suite DevelopmentStudio Software* on page 66.

Note: If you have previously installed version 3.0.1, 3.0.3, or 3.1.0 of Rational SoDA, you may choose to use the installation of FrameMaker+SGML bundled with that release. To do this, copy the entire SoDA directory to a new location and uninstall the previous version of Rational Suite DevelopmentStudio. This way, you do not accidentally remove the previous version of Rational SoDA when you uninstall the Suite.

Installing Rational Suite DevelopmentStudio (UNIX Components)

This section provides instructions about how to install Rational Suite DevelopmentStudio. The `rs_install` command is a complete installer that includes licensing setup, license checking, product installation, and product setup. Rational recommends that you follow the menus and prompts and allow `rs_install` to guide you through the installation.

Default values, where provided, are enclosed in square brackets. To accept the default value, simply press the Enter key.

Installing in Secure Environments

Problems may occur when trying to perform a remote installation of Rational Suite DevelopmentStudio in a secure environment (for example, remote access to other machines is through `ssh`) if the environment does not have access to `rsh` or `remsh`. To install Rational Suite DevelopmentStudio in this situation, perform a local installation of the software rather than a remote installation. If you experience further problems, contact Rational Technical Support.

Installing Multiple OS Versions of Rational Suite DevelopmentStudio

If you wish to install different OS versions of Rational Suite DevelopmentStudio (for example, Solaris and HP-UX) on the same file server, it is recommended that you install them in different rational directories (referred to as *rational_dir*). If you install them into the same Rational directory, you will not be able to uninstall a single OS version later, if necessary. The uninstall script will remove all OS versions that reside in the same Rational directory.

Stopping and Restarting an Installation

You can stop an installation by entering `q` to quit the installation. If you choose `q`, most of your input is saved in a user defaults file that is located in *rational_dir/config/defaults*. The file name itself is in the following format: `rs_install.release_name.user_name`.

The user defaults file contains general purpose defaults that relate to you and the license server that you configure. It also keeps track of the product-specific information for the installation of this specific Suite and version.

Note: If you enter `q!`, your entries are not saved to the user defaults file.

You can restart the installation by running `rs_install` again. You should notice that many of your entries appear as the default value. Simply press the Enter key to continue with the installation. After you get to the **Enter Install Mode** screen you can choose one of three options:

- Ask – if you want to reinstall the product
- Skip – if you want `rs_install` to automatically skip any product that has already been installed
- Reinstall – if you want `rs_install` to automatically uninstall and reinstall the product.

Note: Rational Rose and Rational SoDA are always automatically installed regardless of the setting. This will not affect any user areas for Rational Rose or Rational SoDA that were set up in an earlier installation.

To install Rational Suite DevelopmentStudio (UNIX Components):

- 1 Log on to the install client. This may be any UNIX computer that:
 - Gives you access to a CD-ROM drive
 - Mounts the file system into which you will load the Rational Suite DevelopmentStudio release
 - Runs the operating system specified on the *Rational Suite DevelopmentStudio* CD (Solaris 2.5.1, 2.6, Solaris 7 or Solaris 8; or HP-UX 10.20, 11.0 or 11.11)

Note: You do not need to be root to install the product.

- 2 Place the *Rational Suite DevelopmentStudio* CD in the CD-ROM drive.

If the CD-ROM drive is not mounted, supplemental instructions can be found in the appendix, *Accessing the CD-ROM Drive* on page 113.

- 3 Run the installation script, `rs_install`, which is located at the root level of the CD.

```
./rs_install
```

`rs_install` can be invoked with a number of options. For example, the `-no_log` (`-nl`) option can be used to stop `rs_install` from creating a log file. To see a listing of all available options, run `rs_install -help`.

- 4 Enter the directory where you will install Rational Suite DevelopmentStudio.

Note: For the Rational directory, supply a pathname such as: `/vendor/rational`. The directory needs to be visible on all computers from which you want to run this product, and must be writable by the installer's user name. Also, the NFS name for the directory must be the same on all computers.

- 5 Read through the license agreement and answer yes (**y**) to accept the terms.

- 6 Choose your license configuration option from the **Product and License Configuration Selection Menu**. Options 1 applies to the Rational Suite DevelopmentStudio installation.

Option	Description
1	Choose this option to install Rational Suite DevelopmentStudio.
2-7	Choose one of these options to install an individual point product. Note: You need to have an individual product license for the product specified. These options are not intended to be used for the Suite installation but rather to provide a means of using the Rational Suite DevelopmentStudio CD to install individual point products that you may have purchased separately.

- 7 Choose your license option from the **Licensing Options Menu**.

Option	Description
1	Choose this option if you already have an existing license file for version 2000.02.10 or later of Rational Suite DevelopmentStudio. Note: Rational has changed the way licenses are handled in version 2000.02.10. If you are upgrading from a release prior to version 2000.02.10, you should select option 2. Before you do so, you will need to return your old license key and request a new license key through AccountLink. For more information see <i>Requesting License Keys</i> on page 47. Caution: Selecting this option will not upgrade the license server software automatically. It is highly recommended that you upgrade the license server software from FLEXlm 6.0i to FLEXlm 7.0f if you have not already done so. This will allow you to take advantage of the new features and help optimize your license server's performance. If you choose not to upgrade and experience frequent problems such as internal errors or vendor daemon errors, you should upgrade the license server software as a first step to addressing these issues. To do this, run <code>rs_install</code> again, select option 2, and enter the license key manually (see step 11).
2	Choose this option if you have a permanent license key or a Term License Agreement (TLA). This is a full installation that upgrades both the Rational Suite products and the license server software (FLEXlm 7.0f). Note: You need to have either the license file (<i>filename.upd</i>) stored in a known location on the license server or you need a printout of the contents of the license file available to proceed with the install. <code>rs_install</code> prompts you to provide the location of the license file or gives you the option to enter the license key information manually. If you do not have a license file containing your license keys, see <i>Requesting License Keys</i> on page 47.

3	<p>Choose this option if you do not have a permanent license yet and you want to install the product immediately, or if you want to install the product for evaluation purposes.</p> <p>Because the license keys are uncounted, option 3 does not start the license server as part of the license check. A license server process is started if you are serving both UNIX and Windows evaluation licenses on a UNIX license server. This is because the Windows License Key Administrator (LKAD) requires the port and host information (port@host) when configuring access to a UNIX license server.</p> <p>This is a full installation that upgrades both the Rational Suite products and the license server software (FLEXlm 7.0f).</p> <p>Note: You need to have your license key certificate available as rs_install prompts you for information contained in the certificate.</p>
---	---

8 Do one of the following:

- If you chose to use an existing license in Step 7, go to Step 9.
- If you chose to set up a temporary license in Step 7, go to Step 10.
- If you chose to set up a permanent license in Step 7, go to Step 11.

9 Enter the path to the license file or enter the port information.

Note: If the license server is running, it is preferable to specify the port. Enter **port@host**, where port is the TCP/IP port number used by the license server and the host is the hostname of the license server.

Go to Step 13.

10 Enter the temporary license key information from your license key certificate.

- Expiration date
- License key.

Go to Step 13.

11 Provide your license file information by doing one of the following:

- Import the information from the license file automatically by giving the path to the .upd file. This is the file that AccountLink sends to an e-mail account when you request a license. It has the filename format similar to *license_for_server.upd*.
- Enter **none** to provide the license key information manually. You will need a printout of the content of the .upd file. Follow the prompts.

12 Define the location for the *license.dat* file that will be created from the information supplied by the *license_for_server.upd* file. By default, **rs_install** creates the *license.dat* file and stores it in the *rational_dir/config* directory.

Choose either the default path (option 1) that **rs_install** has selected or choose option 2 to specify an alternate path.

Note: If you are prompted for *port@host* information, simply press the Enter key.

13 Proceed with the **License Check Menu**. Do one of the following:

- If you chose to set up an existing license in Step 7, run through options 1 and 3. Note that these options are the default settings provided by **rs_install**. There is no need to restart the license server (option 2) if it is already running.
- If you chose to set up a permanent floating license in Step 7, run through options 1–3 sequentially and forward to the next menu. If you chose to set up a permanent node-locked license in Step 7, run through option 1 only. Note that these options are the default settings provided by **rs_install**.
- If you chose to set up a temporary license in Step 7, run through option 1 and forward to the next menu. Note that these options are the default settings provided by **rs_install**.

14 The **Product Customization Menu** allows you to refine your Suite product installation. The default settings are shown in Figure 5. To toggle the installation setting between yes and no, enter the product number. Once you have the settings you desire, enter **f** to forward to the next menu.

Note: To accommodate heterogeneous environments, the Product Customization Menu gives you the ability to install Rational Unified Process (RUP) for IBM and Microsoft environments on a UNIX server. The default installation settings install the UNIX version of RUP (generic) but you may install any or all variants to support existing clients running in IBM or Microsoft environments. To install other versions of RUP, enter the corresponding number for the variant that you want to install. To deselect the generic version of RUP, enter its number to change the selection to **no**.

Figure 5 Product Customization Menu

```

Install?Size (KB) DevelopmentStudio for UNIX 2001a.04.00
-----
1) yes    15893    + Purify 2001a.04.00
2) yes    14545    + Quantify 2001a.04.00
3) yes    8508     + PureCoverage 2001a.04.00
4) yes    322239   + Rational Rose 2001a for UNIX 2001a.04.00
5) yes    56625    + Rational Unified Process (Generic)2001a.04.00
6) no     --        + Rational Unified Process (IBM)2001a.04.00
7) no     --        + Rational Unified Process (Microsoft)2001a.04.00

custom 750271    Total

f) Forward to the next menu to continue...
q) Quit rs_install. Enter q! to quit without saving your inputs.
?) Help

```

Enter a product number (1-12) or range to (de)select.

15 The Rational Rose Product Component Customization Menu allows you to customize your Rose installation. To toggle the installation setting between yes and no, enter the product number. Once you have the settings you want, enter **f** to forward to the next menu.

Warning: Some components have dependencies and deselecting one may affect the performance of another. Contact Rational Technical Support for more information about component dependencies.

16 If you chose to install SoDA in Step 14, the **SoDA Product Configuration Menu** is displayed. All options install SoDA demos and training files.

Option	Description
1	Choose this option to install the domains for Rational Suite DevelopmentStudio (Rose and ClearQuest). Note: In earlier releases, option 1 installed all domains. Be sure to choose option 4 if you wish to install all the SoDA domains.
2	Choose this option to install the Rose domain for SoDA.
3	Choose this option to install the Rose RealTime domain for SoDA.
4	Choose this option to install <i>all</i> SoDA domains (Apex, Rose, Summit, TestMate, ClearCase, ClearQuest, and Rose RT).

- 17 The **SoDA Product Component Customization Menu** allows you to customize your SoDA installation. To toggle the installation setting between yes and no, enter the product number. After you have the settings you want, enter **f** to forward to the next menu.
- 18 The **Install Documentation Menu** allows you to customize your online documentation installation.
- 19 The **Install Mode Menu** allows you to decide whether you want **rs_install** to prompt you before it reinstalls a product, skip a product if it is already installed on your system, or reinstall the product without confirmation.

The installation process starts.

- 20 You are prompted to configure the cache directory for Rational Purify, Rational PureCoverage, and Rational Quantify. Do one of the following:

- Enter **no** to accept the default directory.
- Enter **yes** to specify an alternate location and follow the prompts.

- 21 Are you configuring Rose to work with Apex? Enter a value **Yes** or **No**.

If you chose **Yes**, you will need to provide the path to the Apex directory.

- 22 Define the read/write privileges: **Owner writable**, **Owner and group writable**, or **Writable by all**.

- 23 Are you configuring SoDA to work with Apex? Enter a value **Yes** or **No**.

If you chose **Yes**, you will need to provide the path to the Apex directory.

- 24 Enter the FrameMaker + SGML directory. Do one of the following:

- If you do not have FrameMaker + SGML installed on your system, enter **none**. Continue with the installation and see *Integrating Products That Are Not Part of the Suite* on page 62 after you have finished installing.
- If you have FrameMaker + SGML installed, enter the path.

Note: This release of SoDA does not include FrameMaker + SGML. You need to have either version 5.5 or 6.0 installed to use SoDA.

- 25 Use ClearQuest with SoDA? Enter a value **Yes** or **No**.

If you choose **Yes**, you will be prompted to provide the path to the ClearQuest installation. If you chose to install ClearQuest in Step 14, the default path is *rational_dir/releases/ClearQuestClient.2001a.04.00*. You can accept the default or specify another path.

- 26** If you answered **Yes** to install the Rose RT domain in Step 17, you are prompted whether or not you want to use RoseRT with SoDA? Enter a value **Yes** or **No**.
- 27** The **Web Setup Menu** allows you to enter the URLs for a Requisite Web server or a ClearQuest Web server. These applications run on a Windows server and can be accessed by UNIX developers through a web browser. Do one of the following:
- If you do not plan to use these web interfaces, enter **none**.
 - If you do not know the URL for these servers, enter **none** and run the **web_setup** command after you have the URLs.
 - If you know the URLs, enter them now.
- 28** If you chose to install more than one Rational Unified Process variant in Step 14, you are prompted to select which variant you wish to use as the primary. Enter an option (1–3) to select the primary variant. The default setting is the UNIX (**Generic**) version of RUP.

Note: You may change the primary RUP variant at any time by running the **post_install** command. For more information see *Changing the Primary RUP Variant* on page 63.

The installation of the Rational Suite DevelopmentStudio is now complete.

Verify Your Installation

It is recommended that you verify that your installation is working properly. This test ensures that both the installation and licensing are working. If you experience any problems, refer to the *Administering Licenses* chapter on page 85, and the *Troubleshooting* chapter on page 107.

Note that Rational Rose, SoDA, and ClearQuest require configuration before actual use. For configuration information, please see the *Configuring Rational Rose for UNIX* on page 98, and the *Configuring Rational SoDA* on page 101 of this document. For ClearQuest configuration, please see the *ClearQuest Release Notes* (HTML) and *Installing Rational ClearQuest* (PDF) documents.

To verify your installation:

- 1** Test the UNIX installation and licensing by running Rose and SoDA.

For csh, tcsh, or compatible shells, do the following:

```
% source rational_dir/rs_setup.csh
% rose
% soda
```

For ksh, bash, or other Korn-compatible shells, do the following:

```
$ . rational_dir/rs_setup.ksh
$ rose
$ soda
```

Note: `rs_setup.csh` and `rs_setup.ksh` are setup scripts. For additional information on the setup script see “Running Rational Suite DevelopmentStudio for UNIX: User Setup Script” on page 61.

Running Rational Suite DevelopmentStudio for UNIX: User Setup Script

Installation creates two setup scripts which set up the environment to run all the components of DevelopmentStudio for UNIX. These can be used as a common logon for users, and as a convenient point for additional customization.

For csh, tcsh, or compatible shells, source the following from the `.cshrc` file:

```
source rational_dir/rs_setup.csh
```

For sh, ksh, bash, and other Bourne-compatible shells, source the following from the `.profile` file:

```
. rational_dir/rs_setup.ksh
```

Use the following aliases to start a Suite product:

Product	Start command
Rational Rose	% rose (to start Rose) % modelint (to start Rose Model Integrator) % analyzer (to start Rose C++ Analyzer)
Rational SoDA for FrameMaker	% soda
Rational Purify Rational PureCoverage Rational Quantify	% purify % purecov % quantify <i>See the Installing and Getting Started Rational Purify Rational PureCoverage Rational Quantify manual for a full description of start command options.</i>
Rational ClearQuest	% clearquest
Rational Unified Process	% viewrup_gen (for UNIX RUP) % viewrup_ibm (for IBM RUP) % viewrup_msft (for Microsoft RUP) % viewrup (starts the primary RUP) Note: If you only chose to install one variant of RUP then you may use the viewrup command to start it. You only need to use the environment-specific commands if you have more than one variant installed and that variant has not been defined as the primary.

Integrating Products That Are Not Part of the Suite

You may choose to add products that are not part of the Suite after you have installed Rational Suite DevelopmentStudio. The following products are examples:

- Adobe FrameMaker + SGML 5.5 or 6.0 (required to use SoDA)
- Rational Apex
- Requisite Web (Windows)
- Rational ClearQuest (Windows)

If you answered **no** to adding any of these products when you ran **rs_install**, you may install them later and simply run **post_install**. The **post_install** command allows you to run a subset of **rs_install** that includes prompts for integrating other products with Rational Suite DevelopmentStudio.

Rational Requisite Web and Rational ClearQuest Web

Rational Suite DevelopmentStudio includes Rational ClearQuest; however, you may want to give UNIX developers access to ClearQuest running on a Windows server. This is done by providing the URL to the Windows ClearQuest Web server.

For these two products, you may use the **web_setup** command to define the URLs for the Requisite Web and ClearQuest Web servers. The **web_setup** command allows you to run a subset of **rs_install** and includes the prompts for defining the location of these servers. The server information is recorded in the **rpweb** and **cqweb** scripts.

Changing the Primary RUP Variant

After you have installed Rational Suite DevelopmentStudio using **rs_install**, you can change the primary RUP variant at any time by running the **post_install** command. This only applies if you have installed more than one RUP variant.

Installing Rational Suite DevelopmentStudio (Windows Components)

This section describes how to install the Windows components of Rational Suite DevelopmentStudio for UNIX.

Step	Action
1 Are you using a single UNIX server to manage licenses for both the UNIX and Windows components?	Continue with Installing Rational Suite DevelopmentStudio (Windows Components).
2 Are you using a Windows server to manage licenses for the Windows components?	You must install the license server software on the Windows server before you install the Windows components. See <i>Installing the FLEXlm License Server on Windows</i> chapter on page 79.

To install Rational Suite DevelopmentStudio (Windows Components):

- 1 Install RequisitePro on the Windows application server(s).
 - a Insert the *Rational Solutions for Windows* CD into the system's CD-ROM drive.

The setup program should start automatically. If autorun is disabled on the system, click Start > Run, then using the drive letter of the CD-ROM drive, enter *drive:\SETUP.EXE*.
 - b On the Choose Product screen, the default selection *must* be changed to **Rational Suite DevelopmentStudio for UNIX (Windows Components)**. To make the change, click the drop-down list, and then pick the **Rational Suite DevelopmentStudio for UNIX (Windows Components)** selection.

Warning: Failure to select **Rational Suite DevelopmentStudio for UNIX (Windows Components)** will cause the licensing to fail and the Windows products will be unusable. You cannot have Rational Suite DevelopmentStudio for UNIX (Windows Components) installed on the same computer as other Rational Suites for Windows products.

Note: If you wish to install the Windows version of ClearQuest, you will need to install it separately. (Earlier versions of DevelopmentStudio for UNIX installed the Windows version of ClearQuest by default. Now that ClearQuest for UNIX is available, the Windows version is no longer the default.) The Windows license key provided with this version of the Suite will work for both RequisitePro and ClearQuest on the Windows platform.
 - c At the Setup Configuration screen, select **Custom**.
 - d At the Choose Features screen, click the **Web Server Components** item. Leave the other selections they are.
 - e Continue through the installation wizard until complete.
- 2 Set the license server through the Windows License Key Administrator.

- a Launch the License Key Administrator from the Installation Wizard, or from the Start > Programs > Rational Suite DevelopmentStudio for UNIX > License Key Administrator menu item.
- b Select the Settings tab, and then click the Search Server box. Do one of the following:
 - If you are using a single UNIX server to manage licenses for both the UNIX and Windows components, enter the UNIX license Server IP address or hostname in the License Server Name field.
 - If you are using a Windows server to manage licenses for the Windows components, enter the Windows license server IP address here.
- 3 Check that RequisitePro is licensed correctly by starting RequisitePro from Start > Program Files > Rational Suite DevelopmentStudio for UNIX.

If this step fails, then licensing has not been set up correctly. Additional licensing information can be found in *Administering Licenses* on page 85.

Configuring and Testing Requisite Web

If any RequisiteWeb users will access RequisiteWeb through the UNIX version of Netscape Navigator, you will have to do the steps outlined in the *Configuring for UNIX Navigator Access* topic. After installation, that topic and other configuration information can be found on your RequisitePro server at:

```
c:\Program Files\Rational\RequisitePro\reqweb\reqwebsetup.html
```

If the HTML documentation files were installed on the UNIX server, the same information can be found at *rational_dir/docs/html/reqweb_install/RequisiteWebInstall.html*

To test Requisite Web:

- 1 Enter the **rpweb** command on the UNIX host.

```
% rpweb
```

rpweb will launch Netscape Navigator, and display the RequisiteWeb URL. If the **rpweb** command fails, then try sourcing *rational_dir/rs_setup.csh*.

For csh, tcsh, or compatible shells:

```
% source rs_setup.csh
```

```
% rpweb
```

For sh, ksh, bash, and other Bourne-compatible shells:

```
$ . rs_setup.ksh
```

```
$ rpweb
```

Another method of testing RequisiteWeb is to invoke Netscape Navigator and point it at the RequisiteWeb URL with the following command.

```
% netscape -install http://requisiteweb_url
```

Removing the Rational Suite DevelopmentStudio Software

After you have installed the latest version of DevelopmentStudio for UNIX, and after all users have switched to using it, you can remove the old release to reclaim disk space.

Running the Uninstall Program

Rational includes an **uninstall** script in its **config** directory. You can uninstall an earlier release of a product or Suite by running this script in the *rational_dir* directory.

Before you run **uninstall**, you must verify that your system startup file has a valid path to the Rational license daemon. See *The License Manager* on page 86. Open this file and search for the string *lmgrd*.

If the file contains the following pathname, it is correct:

```
rational_dir/base/cots/flexlm.version/platform
```

If the pathname does not look like this, you must change the path.

If you have set up the Rose/ClearCase integration on the server running **uninstall**, you will see a message regarding “rose” and “rose_unit” merge and compare operations. The type manager (or managers) which manage these operations for “rose” and “rose_units” will include links to this release in relation to the merge and compare operations. The messages will include instructions describing how to correct the merge and compare links that become obsolete after uninstalling this release.

With the valid path to the DevelopmentStudio for UNIX license daemon established, you are ready to run **uninstall**. Running the script with no command line arguments causes it to display the list of products in the *releases* directory. You will be prompted for the product or Suite to uninstall. If there is only one product, you will be asked for confirmation before the **uninstall** takes place. You must be the installer of the product to uninstall it. If you select a Suite, you will be given a chance to review the products in the Suite that would be uninstalled as part of the Suite **uninstall**. The default action will be to remove all of the point-products and the Suite directory.

Example:

```
% cd rational_dir
% config/uninstall
```

If you have installed more than one version of Rational Suite DevelopmentStudio in the same *rational_dir* directory, the **uninstall** program will only uninstall the products for a particular Suite if that same product is not a member of another Suite. For example, if Suite 1.0 contains SoDA 3.0.0c and Purify 4.4 and Suite 2.0 contains SoDA 3.0.1 and Purify 4.4, Purify 4.4 is common to both, so it will not be uninstalled until both Suites have been uninstalled. The license software will only be removed when the last Suite using it is removed. In all cases, you can select one or more products in the Suite to be spared from the uninstall operation.

Note: Manually removing the Suite directory *does not* remove the Suite. The only things in the Suite directory are the Suite documentation, Suite installation tools and Suite data.

Next Steps

- If you plan to set up a Windows license server to administer licenses for Requisite Web, see *Installing the FLEXlm License Server on Windows* chapter on page 79.
- If you have ClearCase installed and plan on using it with the DevelopmentStudio for UNIX, then set up the Rose/ClearCase integration by following the directions in the Rose on-line help topic “Configuring the Rose for UNIX/ClearCase Integration”.
- If you plan to set up your UNIX license server in a redundant configuration, see *Setting up Redundant Servers on UNIX* on page 69.
- You must configure the following applications before you can use them:

Point Product	Action
Rational Rose	See <i>After You Install</i> chapter on page 95

Setting up Redundant Servers on UNIX

5

This chapter describes how to set up UNIX license servers in a fault-tolerant configuration known as redundant servers. It includes the following topics:

- *Redundant Server Configuration* on page 69
- *Installing the License Server software* on page 70
- *Setting Up the Redundant Server License Files* on page 72
- *Restarting FLEXlm When A Server Reboots* on page 76
- *Setting up Applications to Use Redundant Servers* on page 77

Redundant Server Configuration

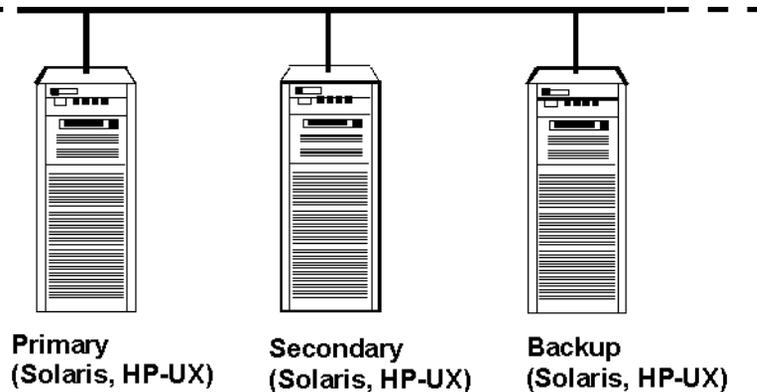

Redundant servers are a system of three servers that work as a team to manage a single pool of floating license keys. If one of the server systems goes down, the other two license servers automatically continue to manage the license pool. This type of redundant configuration requires that a minimum of two license servers be running at all times. If two servers go down, licenses will be unavailable until one of the servers is restarted.

Warning: It is a common misconception that separating redundant servers across multiple sites (for example, one in the U.S., one in Europe, and one in Asia) provides maximum fault tolerance. This is not the case. Redundant server partners should always be at the same site and on the same subnet.

Figure 6 shows the redundant server configuration.

A homogeneous redundant server setup is recommended (i.e., all servers are running the same operating system); however, heterogeneous environments are supported. For example, you could have two license servers, one running Solaris, and one running HP-UX.

Figure 6 Redundant Server Configuration

Note: A Windows license server is not a supported platform in a UNIX redundant server setup.

Each license server must have its own copy of the license file and the license software must be installed locally (NFS is not supported). Each server runs a FLEXlm `lmgrd` process and a **rational** vendor daemon process to manage licenses.

HTML versions of the *FLEXlm User Guide* and *FLEXlm Frequently Asked Questions* are provided online in the `/docs` directory. To access these guides type `rsdsu_help`. The *FLEXlm Frequently Asked Questions* includes important information about setting up redundant servers.

Installing the License Server software

You can install the FLEXlm license server software on all three servers without installing the product using `rs_install`. In fact, if this is a first-time installation, this is probably the best method. `rs_install` cannot import a redundant server license file directly, so it is necessary to set up the license file as described in *Setting Up the Redundant Server License Files* on page 72. The section *Setting up Applications to Use Redundant Servers* on page 77 provides tips for running `rs_install` after you have set up your redundant license servers.

If this is an existing installation and the license server software is already installed on one system, go ahead and follow this procedure to install the license server software on the secondary and backup machines. Complete all the tasks in this chapter and refer to the section *Setting up Applications to Use Redundant Servers* on page 77 for instructions on what to do next.

To install the license server software:

- 1 Obtain copies of the FLEXlm license server software by doing one following:
 - a Locate the FLEXlm license server software on the Rational Suite DevelopmentStudio for UNIX CD. The files are in the following location: extras/flexlm/\$SYS/7.0f.
 - b If you cannot find the FLEXlm tar file for the platform you need, you can go to the following FTP site <ftp://ftp.rational.com/public/tools/flexlm> and download it. Occasionally, downloading the file causes the periods in the filename to be replaced with underscores. If this happens, simply rename the file replacing the underscores with periods.

Compressed tar file	UNIX Vendor	Operating System	Version
flexlm.7.0f.aix.tar.Z	IBM	AIX	4.x
flexlm.7.0f.hp.tar.Z	HP	HP-UX	B.10.20, B.11.00
flexlm.7.0f.sg32.tar.Z	SGI	IRIX	6.x
flexlm.7.0f.sol.tar.Z	Sun	Solaris	2.x

Note: SunOS 4.x and IRIX 5.x are no longer supported by version 7.0f of FLEXlm. As a result, these systems cannot be used as license servers.

- 2 Copy the FLEXlm files to the \$FLEXROOT directory on all three servers. The term \$FLEXROOT is used herein to represent the location from which you plan to run FLEXlm.

Note: If you downloaded the software from the FTP site, you will have to unpack the files as shown in the example below.

Example using the HP-UX tar file:

```
cd $ROOT
dd if=flexlm.7.0f.hp.tar.Z | uncompress | tar -xvf -
ls -l flexlm.7.0f/hppa_hpx (to verify that it got installed)
```

If you get an error like this:

```
flexlm.7.0f.hp.tar.Z: No such file or directory
stdin: not in compressed format
tar: No input
```

Make sure the input file (if=) flexlm.7.0f.hp.tar.Z is in the local directory (\$FLEXROOT).

Warning: Be sure to copy the appropriate tar file for the platform on which you are installing.

Setting Up the Redundant Server License Files

The following is a high-level summary of the steps you need to perform to set up the redundant server license files.

- 1 You need to get a license key for redundant UNIX servers. For more information, see *Licensing Requirements for Redundant Servers* on page 72.
- 2 Place copies of the same license file on each of the three license servers and ensure that the order of the SERVER lines is the same in each file. For more information, see *Renaming the license file for each server* on page 73.
- 3 Assign a TCP/IP port to each server. For more information see, *Assigning the TCP/IP ports* on page 73.

Licensing Requirements for Redundant Servers

You need to have a license file for a redundant server setup before you can proceed. You can verify this by opening the license file and checking for three server lines. If you do not have a three-server license file, you will need to return your single server license file and request a new redundant server license file.

- 1 Determine the host names for the machines that you plan to use as your primary, secondary and backup servers.

- 2 Go to AccountLink (<http://www.rational.com/accountlink>) and request a license for redundant servers. Be sure to specify the redundant servers in the correct order:
 - Host ID is the primary server
 - Host Name #2 is the secondary server
 - Host Name #3 is the backup server

Note: If you do not have an internet connection, see *Requesting License Keys by Fax* on page 49.

Renaming the license file for each server

The license file (*license_for_primary.upd*) needs to be copied to the \$FLEXROOT directory. You need to maintain this file on all three servers.

Copy and rename the file to **rational.dat** as shown below:

```
cp license_for_primary.upd $FLEXROOT/rational.dat
```

Assigning the TCP/IP ports

You must assign a TCP/IP port number to each server by modifying the port assignment in each SERVER line.

Warning: There is a known problem in FLEXIm that prevents redundant servers from communicating with each other if you use the default port numbers: 27000 to 27009. Use a port number between 1501 and 26999. Ensure that the port number you use is not in conflict with any other TCP/IP services.

To specify the TCP/IP port number:

- 1 Choose three port numbers between 1501 and 26999 to use for each server. Note that the same port number can be used for each server, or the port numbers can be unique.
- 2 Check that the port is not already in use. (Port 1706 is used in the sample commands below.)

- Check the **etc/services** file

```
grep "[ 1706/" /etc/services
```

- Check the NIS services by using the **yppcat** services command.

```
yppcat services | grep "[ 1706/"
```

Note: There is a tab and a space character between the [].

3 Edit the license file to use the new port numbers.

```
cd $FLEXROOT
vi rational.dat
```

Your license file should look similar to the example below.

```
SERVER primary 8001d410 1706
SERVER secondary 8001d625 1706
SERVER backup 8001d873 1706
```

Configuring and Starting the License Servers

You must do the following to start the license servers:

- You must configure the start script for each server. This is best done by copying a template file and modifying it.
- You must start each license server manually by using the `start_lmgrd` script.

Configuring the start script

Working from the `$FLEXROOT` directory, you need to create a start script for each server. A template start script can be obtained at the following FTP site:

ftp://ftp.rational.com/public/tools/flexlm/start_lmgrd

- 1 Copy the template file to the `$FLEXROOT` directory on all three license servers.
- 2 You need to set the following four variables in the `start_lmgrd` script.

Solaris Example:

```
FLEXROOT=/usr/rational/flexlm.7.0f
LICENSE_DIR=$FLEXROOT/sun4_solaris2
LICENSE_DAT=$FLEXROOT/rational.dat
LICENSE_USER=joe
```

HP-UX Example:

```
FLEXROOT=/usr/rational/flexlm.7.0f
LICENSE_DIR=$FLEXROOT/hppa_hpux
LICENSE_DAT=$FLEXROOT/rational.dat
LICENSE_USER=joe
```

The above examples show FLEXlm being installed in the same location, using the same license file name, and the same user. This helps simplify the setup and makes it easier to maintain.

Starting the license servers

After you have completed the following, you are ready to start all three license servers:

- You have installed the FLEXlm license server software on all three servers.
- You have copied the redundant server license file to the \$FLEXROOT directory on all servers.
- You have configured the start scripts for all servers.

The servers must be started in the correct order: primary, secondary and backup.

To start the license servers:

- 1 Start the primary server by entering the following commands:

```
cd /usr/rational/flexlm
./start_lmgrd
```

- 2 Repeat Step 1 for the secondary and backup servers.

- 3 Check the status of each server:

```
./start_lmgrd lmstat -a
```

To stop the license servers:

- 1 Stop each license server by entering the following command:

```
./start_lmgrd stop
```

To verify the license file:

- 1 Check the Rational INCREMENT line by running the exinstal command:

```
./start_lmgrd ex
```

This command will generate a report if the license file is not properly encrypted.

Problems starting the license server

If the license server will not start, check the corresponding **lmgrd** log file (specified by **LICENSE_LOG** in **start_lmgrd**).

- 1 **Error message: ulimit: bad ulimit**

If you see this message when you run **start_lmgrd**, remove the **ulimit** command from the script.

- 2 If there are any other problems, check that the start scripts reference the correct license file (LICENSE_DAT), the license directory (LICENSE_DIR), and the license log file (LICENSE_LOG). Mail the start scripts, the license files, and the log files to support@rational.com. For more information about contacting Rational Licensing Support see *Contacting Rational Licensing Technical Support* on page xv.

Restarting FLEXlm When A Server Reboots

All three license servers should be set up to be restarted at boot time. This is accomplished by copying the start script to the appropriate system directory.

Note: For security reasons, it is recommended that you do not run `lmgrd` as `root`. It is recommended that you run `lmgrd` as a user by setting the `LICENSE_USER` variable. The user id that you specify, must exist on the system that runs the start script. In the example below, the user is set to “joe”.

```
FLEXROOT=/usr/rational/flexlm.7.0f
LICENSE_DIR=$FLEXROOT/hppa_hpux
LICENSE_DAT=$FLEXROOT/rational.dat
LICENSE_USER=joe
```

In previous releases, Rational used the filename `SlmRational.sh` in the system start directories. If there is an `SlmRational.sh` file under any of the `/etc/` or `/sbin` directories they should be removed and replaced with `S98Rational`.

The following sections provide the start script commands for each operating system.

Note: You must be `root` to perform these steps.

Sun Solaris

```
cd /usr/rational/flexlm
cp start_lmgrd /etc/rc2.d/S98Rational
```

If you need to remove a reference to the `SlmRational.sh` file, use the following command to do so:

```
/bin/rm -f /etc/rc2.d/SlmRational.sh
```

HP-UX

```
cd /usr/rational/flexlm
cp start_lmgrd /sbin/init.d/S98Rational
ln -s /sbin/init.d/S98Rational /sbin/rc2.d/S98Rational
```

If you need to remove a reference to the **SlmRational.sh** file, use the following command to do so:

```
/bin/rm -f /sbin/*.d/SlmRational.sh
```

SGI IRIX

```
cd /usr/rational/flexlm  
cp start_lmgrd /etc/init.d/S98Rational  
ln -s /etc/init.d/S98Rational /etc/rc2.d/S98Rational
```

If you need to remove a reference to the **SlmRational.sh** file, use the following command to do so:

```
/bin/rm -f /etc/*.d/SlmRational.sh
```

IBM AIX

Edit `/etc/inittab` and add a line to run the start script using `/bin/sh`:

```
lmgr:234:once:/bin/sh /usr/rational/flexlm/start_lmgrd
```

Setting up Applications to Use Redundant Servers

This section explains how to set up your applications to use the new redundant licenser server file.

Product is not installed

- 1 Install the product by running **rs_install**. For complete instructions, see *Installing Rational Suite DevelopmentStudio* on page 51.
- 2 Choose option 1, use an existing FLEXlm license file, from the **Licensing Options Menu**.
- 3 Enter the location of the license file (port@host) for the primary license server (for example, 1706@primary).
- 4 After you have finished the installation, edit the **rs_setup.csh** and **rs_setup.ksh** setup files as described below.
 - a In **rs_setup.csh**, change the following line from:

```
set rdsu_license=port@host  
to  
set rdsu_license=port@primary:port@secondary:port@backup
```

For example,

```
set rsdsu_license=1706@primary:1706@secondary:1706@backup
```

b In `rs_setup.ksh`, change the following line from:

```
rsdsu_license=port@host  
to  
rsdsu_license=port@primary:port@secondary:port@backup
```

For example,

```
rsdsu_license=1706@primary:1706@secondary:1706@backup
```

Product has been installed

1 Run the command `license_setup`.

The `license_setup` command allows you to run a subset of `rs_install` that includes setting up license options and running the license check sequence.

2 Choose option 1, use an existing FLEXlm license file, from the **Licensing Options Menu**.

3 Enter the location of the license file (`port@host`) for the primary license server (for example, `1706@primary`).

4 Proceed with the **License Check Menu**. Choose options **1**, **3** and **4**. You do not need to run option 2 because you have already done this when you started the license servers.

5 After you have finished running `license_setup`, edit the `rs_setup.csh` and `rs_setup.ksh` setup files as described below.

a In `rs_setup.csh`, change the following line from:

```
set rsdsu_license=port@host  
to  
set rsdsu_license=port@primary:port@secondary:port@backup
```

For example,

```
set rsdsu_license=1706@primary:1706@secondary:1706@backup
```

b In `rs_setup.ksh`, change the following line from:

```
rsdsu_license=port@host  
to  
rsdsu_license=port@primary:port@secondary:port@backup
```

For example,

```
rsdsu_license=1706@primary:1706@secondary:1706@backup
```

Installing the FLEXlm License Server on Windows

6

This chapter provides detailed information for those users who want to use a Windows computer as the license server for RequisitePro and includes the following topics:

- *Before You Start the FLEXlm License Server Installation* on page 79
- *Installing FLEXlm License Server* on page 80
- *Configuring the License Server Software* on page 82
- *Removing FLEXlm License Server* on page 83

You will need to copy your license file for Rational Suite DevelopmentStudio for UNIX (Windows components) to the license server. If you do not have a license, see *Requesting License Keys* chapter on page 47.

This section describes how to use the Rational Software Setup wizard to install the FLEXlm License Server Version 7.0f on a Windows server. FLEXlm is a software-based license server that:

- Provides flexible installation and maintenance of license keys
- Supports standard networking protocols

Before You Start the FLEXlm License Server Installation

The following sections list the steps you must take and information you must prepare before installing FLEXlm License Server on a Windows computer.

Installation Requirements

Make sure that you have a current backup of your Registry and system directories before running the Rational Software Setup program.

Table 10, FLEXlm License Server Requirements, lists the system and software requirements for installing FLEXlm License Server.

Table 10 FLEXIm License Server Requirements

Item	Requirement
Operating System	Microsoft Windows NT 4.0, SP3 Windows 2000
Processor	133 MHz or greater
Memory	64 MB
Disk space	75 MB
Privileges	To use the Rational Software Setup program on a Windows system, you must have Windows administrator privileges on the local system.

Verifying Network Communication

- 1 Verify that the Windows application server is correctly networked to the license server.

- a Open a command prompt window on the Windows application server, and then **ping** both the license server IP address and the license server host name.

```
c:\>ping hostname
```

```
c:\>ping IP_address
```

Note: The license server may be either a UNIX or Windows computer depending on the licensing option you selected earlier.

If either ping fails, then the networking between the license server and the application server must be corrected. It is beyond the scope of this manual to describe configuration of the Windows network. If necessary, consult your system administrator.

- b From the exec client computer, **ping** the Windows application server.

```
% ping server_name
```

Installing FLEXIm License Server

The Rational Software Installation procedure uses C:\Program Files\Rational as the default installation path. You can specify another drive during the installation procedure.

If your C:\ drive lacks sufficient free disk space, you may either specify another drive or make space available on the default drive.

Warning: Interrupting an installation that is in progress may leave your system in an indeterminate state. If you try to close the Rational Software Setup window while the installation is in progress, you are asked to confirm that you want to exit from the incomplete installation.

Typical Installation

This section describes a Typical installation of FLEXlm License Server.

- 1 Insert the *Rational Solutions for Windows* CD into your system's CD-ROM drive.

The setup program starts automatically.

If autorun is disabled on your system, use Windows Explorer to locate and run the SETUP.EXE file on the *Rational Solutions for Windows* CD.

- 2 The Rational Software Setup wizard guides you through the software installation. On each page, click **Next** to proceed to the next page.

The Rational Software Setup page provides general information about the software installation. Click **Browse** to review Rational product information.

The **Save** button lets you copy the contents of the setup wizard message window to a file. The **Copy** button copies the contents of the message window in the setup wizard to the Windows clipboard. The **Copy** and **Save** buttons are enabled on wizard pages that display the license agreement or installation messages.

The **Help** button is enabled on the Setup Configuration, Shared Components, and Software Use pages, providing you with additional information regarding setup options.

- 3 The Choose Product page provides a list of products for you to install. Click **GLOBEtrouter FLEXlm License Server** from the list of products. Click **Next** to continue.
- 4 Click **Finish** to exit from the Rational Software Setup wizard. If the **Launch License Key Administrator** check box is selected, the License Key Administrator will start after you click **Finish**.

The Rational Software Setup program writes a log of the installation activities. The log file is located in *Install Path*\Rational\RSSetup\RSsetup.log.

Possible Reboot Required

If files required for the installation are in use during the installation procedure, the Rational Software Setup program may need to reboot your system to complete the installation.

- 1 After rebooting, log on as the same user to complete the installation procedure.
Part 2 of the installation automatically starts on your system.
- 2 Click **Finish** to exit from the Rational Software Setup program. If the **Launch License Key Administrator** check box is selected, the Rational License Key Administrator will start after you click **Finish**.
- 3 Click **Finish** to exit from the Rational Software Setup wizard.

Configuration instructions are included in the following section.

Configuring the License Server Software

After installing the FLEXlm License Server software, you must provide the following additional information about your configuration. You can use the FLEXlm License Manager to configure:

- Location of the license key file. (Rational recommends that you keep a copy of the license in the location where the application expects it.)
- Location of licensing executables.
- Location of log files. The debug log files can be used to diagnose configuration problems and daemon software errors.
- TCP/IP port number used by the license manager process, **lmgrd**.

Configuration

Use the following steps to configure your FLEXlm License Server software:

- 1 Click **Start** and click **Settings > Control Panel**.
- 2 Open the FLEXlm License Manager control panel.
- 3 Click the **Setup** tab. Enter the location of the **lmgrd.exe** file. The default location is *Install Path*\Program Files\Rational\Common\
- 4 Enter the location of the license key file on your license server computer. Specify either *server-name.dat* the permanent license key file, or *Temporary.dat*, the startup license key file. The default location is *Install Path*\Program Files\Rational\Common\

- 5 Enter the location of the license debug log file. The default location is *Install Path*\Program Files\Rational\Common\
6 Click **Use NT Services** check box if you want to start the FLEXlm License Server software as a Windows NT service.

If you click **Use NT Services** check box, you may also click **Start Server at Power Up** check box. If you do not click **Start Server at Power Up** check box, you must start the FLEXlm License Server manually each time you start your computer.

We recommend that you click both check boxes to start your license server as a Windows NT service automatically each time you boot your system.

To start the FLEXlm License Server manually, on the **Control** tab of the FLEXlm License Manager control panel, click the **Start** button.

- 7 Click **OK** to save this information and exit.

Starting the FLEXlm License Server Software

We recommend that you reboot your system before starting the FLEXlm License Server software for the first time.

- 1 Open the FLEXlm License Manager control panel.
- 2 On the **Control** tab, click the **Start** button to start the license server.
- 3 Click the **Status** button to confirm that the license server started.

Removing FLEXlm License Server

This section describes how to remove FLEXlm License Server from your system.

Preparing to Remove FLEXlm License Server

Make sure that no one is using the FLEXlm License Server or any associated files. You cannot remove files that are in use.

To remove FLEXlm from a Windows system, you must have Windows administrator privileges on the local computer.

Removing FLEXlm License Server

Use the Windows **Add/Remove Programs** control panel to select and remove FLEXlm License Server. The Rational Software Setup program removes FLEXlm License Server from your system. It does not remove directories that contain files that you have created using Rational Suite products.

This chapter describes the following topics related to Rational software licensing services:

- *How Licenses Work* on page 85
- *The License Manager* on page 86
- *License Manager Commands* on page 87
- *The License File* on page 88
- *Customizing License Usage Order* on page 88
- *Licensing Diagnostic Messages* on page 93
- *Frequently Asked Questions* on page 93
- *FLEXlm User Guide and FAQ* on page 94

How Licenses Work

Licenses are managed by a *license manager* (FLEXlm™ software delivered as part of DevelopmentStudio for UNIX) that runs on a *license server*. The license manager monitors license access, simultaneous usage, idle time, and so on.

When you start any product in the Rational Suite DevelopmentStudio, you are initially unlicensed. If a license is available, the license manager gives you a license for the Suite, which allows you to run any of the products included in the Suite. You retain the license as long as you keep using any of the products in the Suite. When you exit the last program in the Suite, your license is returned to the license manager and is made available for another user.

If a Suite license is unavailable, you are unable to use any of the products in the Suite until a license is returned by another user.

Note: Rational ClearCase LT licenses are managed differently than other point products. Rational ClearCase LT uses a linger feature that requires a user to claim a license for a minimum period of 30 minutes. After 30 minutes has elapsed, the license is returned and made available to other users.

The License Manager

DevelopmentStudio for UNIX uses the Flexible License Manager, FLEXlm™, from Globetrotter Software, Inc. The DevelopmentStudio requires FLEXlm 7.0f. The license manager includes the following components:

- A *vendor daemon* named **rational** that dispenses DevelopmentStudio licenses.

The **rational** daemon is used for all of Rational's licensed products. If you have other products from other vendors that also use FLEXlm, they will include their own vendor daemons.

- A *license daemon* named **lmgrd**.

The same license daemon is used by all licensed products from all vendors that use FLEXlm. The **lmgrd** daemon does not process requests on its own, but forwards requests to the appropriate vendor daemon.

- A *license file* that you maintain.

It specifies your license servers, vendor daemons, and product licenses.

Note: Rational recommends that you use a single combined license file for all of our products.

After the license file is in place and the license daemons are running, the server system needs to be set up to automatically restart the license server when it reboots. You will be instructed by **rs_install** or **license_setup** how to do this. These commands cannot do this because this step requires root permissions. The commands to do this are as follows:

On HP-UX:

```
% su
# cp rational_dir/config/start_lmgrd_on_server-name \
  /sbin/init.d/S98Rational
# ln -s /sbin/init.d/S98Rational/sbin/rc2.d/S98Rational
```

On Solaris:

```
$ su
# cp rational_dir/config/start_lmgrd_on_server-name \
  /etc/rc2.d/S98Rational
```

License Manager Commands

To verify that your license manager is operational, you can enter these commands on your license server to see if its daemons are running:

```
% ps axw | grep -v grep | egrep "lmgrd|rational"
```

or

```
% ps -e | grep -v grep | egrep "lmgrd|rational"
```

Their output should include lines similar to the following (your path names may vary):

```
538 ?? S 0:03.50 /rational/base/cots/flexlm.7.0f/platform/lmgrd
      -c /rational/config/servername.dat
      -l /rational/config/servername.log
539 ?? I 0:00.90 rational -T brazil 6.0 3 -c ...
```

The license manager supports several system-administration commands.

Command	Description
lmdiag	Allows you to diagnose problems when you cannot checkout a license.
lmdown	Shuts down license and vendor daemons
lmhostid	Reports license manager host ID of workstation
lmreread	Rereads license file, starts new vendor daemons
lmstat	Reports status on daemons and feature usage
exinstal	Reports on licenses in license file you specify on the command line.

For more information on these commands, you can view the FLEXlm online documentation in the `rational_dir/docs/html/FLEXlm_End-User_Manual` directory. This documentation is provided in HTML. These commands are documented in the *License Administration Tools* chapter.

Additional Licensing Commands

license_check — This command allows you to run a subset of **rs_install**. In addition to using the commands above, you can also use the **license_check** command to run the FLEXlm **lmstat** command for counted licenses and the **exinstal** command for any license file (not port@host). The **lmstat** command queries the license server for a list of licenses that are in the license pool. The **exinstal** command checks the license file format and license codes to see if everything is consistent.

The License File

The default Rational license file is either:

rational_dir/config/server-name.dat

or

rational_dir/config/Temporary.dat

The **Temporary.dat** file is used for both startup and evaluation licenses while the **server-name.dat** file is used for permanent and TLA licenses.

When users start DevelopmentStudio for UNIX, the environment variable `LM_LICENSE_FILE` is automatically defined for them. FLEXlm uses this variable to locate the license file. The `LM_LICENSE_FILE` environment variable can contain other non-Rational products, but Rational recommends that you keep the licenses in separate files.

Format

The license file is a text file that is set up by the **rs_install** or **license_setup** programs. Your license file will contain a `SERVER` line, a `VENDOR` line and one or more `INCREMENT` or `FEATURE` lines.

Detailed information about the license file and licensing can be found in the FLEXlm End User Manual. To access this guide type **rsdsu_help**.

Customizing License Usage Order

It is possible to set up a mixed environment where the same license server manages licenses for both a Suite product and individual point products. In this situation, license usage order can be customized by modifying the settings in the **License_Map** file on a per-component-product basis. For example, when a user starts an application, such as Rational Rose, you can define whether that user claims a Rational Rose license or a Rational Suite DevelopmentStudio license.

Note: Rational ClearCase LT does not use the **License_Map** file; therefore, the license usage order for this product cannot be customized. When Rational ClearCase LT is started, a Rational ClearCase LT license is claimed first. If there are no Rational ClearCase LT licenses available, then a Suite license will be claimed if one is available.

The License Map File

When you install Rational Suite DevelopmentStudio, a default file called **License_Map** is created and stored in the `config/` subdirectory. The default **License_Map** file, its contents shown in Figure 7, is set to claim a Suite license for all products first.

Figure 7 License_Map default file

```
purecov:5.0 DevelopmentStudioUNIX:1.0, standalone
purify:5.0 DevelopmentStudioUNIX:1.0, standalone
quantify:5.0 DevelopmentStudioUNIX:1.0, standalone
Rose98_Unix:6.0 DevelopmentStudioUNIX:1.0, standalone
ClearQuest:1.1 DevelopmentStudioUNIX:1.0, standalone
soda:3.0 DevelopmentStudioUNIX:1.0, standalone
RationalUnifiedProcess:1.0 DevelopmentStudioUNIX:1.0, standalone
```

The **License_Map** file “maps” a component product feature and version to a list of features and versions to try in the order given. It contains lines of the following format:

```
component_designator product_designator {, product_designator}
```

The `component_designator` is followed by a comma-separated list of `product_designators`.

A `component_designator` specifies the FLEXlm feature and version number associated with a given Suite component product and has the following syntax:

```
feature_name:version_number (for example, purecov:5.0)
```

A `product_designator` specifies a FLEXlm feature and version number that the license client subsystem will try to claim on behalf of the component product when that product requests a license for the feature and version specified by the `component_designator`. A `product_designator` has the following syntax:

```
feature_name:version_number (for example, DevelopmentStudioUNIX:1.0)
```

In addition, the keyword “standalone” in place of a `product_designator` denotes a stand-alone license; it is equivalent to specifying a `product_designator` that is identical to the `component_designator`.

Comments introduced by ‘#’ are allowed anywhere in the map file.

Note: If a component product is not named in the license map file, then it defaults to claiming a stand-alone license.

The following are some examples of license map settings and a description of how they are handled.

Example 1

```
soda:3.0 DevelopmentStudioUNIX:1.0, standalone # (suite first)
```

This line tells SoDA's license client subsystem to first attempt to check out a Rational Suite DevelopmentStudio license. If that fails, it will attempt to check out a stand-alone license (that is a license with feature name **soda** and version **3.0** or greater).

Example 2

```
soda:3.0 standalone # (standalone only)
```

This line tells SoDA's license client subsystem to check out a standalone license only (that is a license with feature name **soda** and version **3.0** or greater).

Example 3

```
soda:3.0 DevelopmentStudioUNIX:1.0 # (suite only)
```

This line tells SoDA's license client subsystem to check out a Rational Suite DevelopmentStudio license only.

Note: You must have a license map file somewhere for Suite licenses to take effect. If a Suite component product cannot find any license map file containing its component name, it assumes that it is a stand-alone installation, that is, it will only try to check out stand-alone licenses (and will fail if none are available). The only way for a product to know that it is supposed to try a Suite license is if it finds that Suite license feature name and version in a component mapping specified in a license map file.

RSU_LICENSE_MAP

When you run the user setup script (**rs_setup.csh** or **rs_setup.ksh**), the setup script checks to see if the environment **RSU_LICENSE_MAP** variable is set. If the variable is not set, the setup script sets the pathname to the default license map file (for example, `config/License_Map`).

Customizing License Usage for All Users

You can create a global license map file that applies to all users by copying the default license map file and modifying it to suit your purposes.

To create a global `License_Map` file:

- 1 Copy the `config/License_Map` to another location.
- 2 Modify the file by doing the following:

- To change the file to use a stand-alone license for the product first and a Suite license second, edit the component as shown in the following example:

```
Rose98_Unix:6.0 standalone, DevelopmentStudioUNIX:1.0
```

- To change the file to use a Suite license for the product first and a stand-alone license second, edit the component as shown in the following example:

```
Rose98_Unix:6.0 DevelopmentStudioUNIX:1.0, standalone
```

- To change the file to use only a Suite license for the product, edit the component as shown in the following example:

```
Rose98_Unix:6.0 DevelopmentStudioUNIX:1.0
```

- 3 Instruct users to set the `RSU_LICENSE_MAP` variable to the pathname of your customized license map file.

Customizing License Usage for Individual Users

You can customize license usage for an individual user by creating a license map file for that particular user. The contents of the user license map file will override the contents of the default or global license map file.

To create a customized `License_Map` file for individual users:

- 1 If the directory does not already exist, create a `~/Rational` directory.
- 2 Copy the **License_Map** to the `~/Rational` directory. If you are using a customized global license map file, be sure to copy that version to the user's directory and not the default license map file in the config directory.
- 3 Only add the component lines for mappings that you want to override:

- To change the file to use a stand-alone license for the product first and a Suite license second, edit the component as shown in the following example:

```
Rose98_Unix:6.0 standalone, DevelopmentStudioUNIX:1.0
```

- To change the file to use a Suite license for the product first and a stand-alone license second, edit the component as shown in the following example:

```
Rose98_Unix:6.0 DevelopmentStudioUNIX:1.0, standalone
```

- To change the file to use only a Suite license for the product, edit the component as shown in the following example:

```
Rose98_Unix:6.0 DevelopmentStudioUNIX:1.0
```

- To change the file to use only a stand-alone license for the product, edit the component as shown in the following example:

```
Rose98_Unix:6.0 standalone
```

License Server Process

When you run a Rational product, the following occurs:

- 1 When a Rational product is launched, the product checks to see if the environment variable `RSU_LICENSE_MAP` is set. If it is set, it reads the license map file to which it points.
- 2 Next, the product checks to see if a **License_Map** file exists in the user's home directory (`~/Rational/License_Map`). If this file exists, it is read in, and its contents override those of the license map read from `$RSU_LICENSE_MAP` (if any) as follows:
 - If a `component_designator` appears only in the `$RSU_LICENSE_MAP` file, then it remains in force
 - If a `component_designator` appears in both `$RSU_LICENSE_MAP` and `~/Rational/License_Map`, then the mapping specified in `$RSU_LICENSE_MAP` is replaced by the mapping specified in `~/Rational/License_Map`.

Considerations for Customizing License Usage

Because there is no “one size fits all” solution, it is worthwhile to consider the following scenarios when defining your license map settings, especially settings that affect all users.

Scenario 1: Rose set to claim a Suite license first

```
Rose98_Unix:6.0 DevelopmentStudioUNIX:1.0, standalone
```

In this scenario, starting Rose will consume a Suite license making it unavailable to other users. If the user is unlikely to use other Suite products, you may want to make a standalone license the default.

Scenario 2: Rose set to claim a stand-alone license first

```
Rose98_Unix:6.0 standalone, DevelopmentStudioUNIX:1.0
```

If Rose always tries to check out a stand-alone Rose license before attempting to check out a Suite license, another problem is introduced. Now, when the user starts Rose, a Rose license is consumed, if one is available. Later, if the user starts another Suite product such as SoDA while their Rose session is still active, SoDA will check out a Suite license (assuming there are no stand-alone SoDA licenses). At this point, the user is holding two licenses, a Rose stand-alone license and a Suite license, where the Suite license alone would have sufficed to run both Rose and SoDA.

It is important to take the time to think about usage profiles. For example, you need to take into account what products users need and how frequently they use them. Modify your license map files accordingly.

Licensing Diagnostic Messages

Setting the environment variable `RSU_LICENSE_DIAG` causes the licensing client subsystem to generate diagnostic messages which show you what it's doing when it searches for license map files, reads them in, and performs licensing operations. Since license maps can be found in various places that depend on the user's environment, licensing operations can have unexpected results if you are not careful. In these cases, it is very helpful to set `RSU_LICENSE_DIAG` and examine the resulting messages, because you can see exactly what is going on.

The default for Rational products is to print licensing diagnostic messages on standard error. Note that Rational SoDA does not do this.

Frequently Asked Questions

1 Can I use the FLEXlm licensing software I already have installed?

Yes. Install our license code in the default location (in *rational_dir/base/cots*) and use it to serve the Rational licenses.

2 I already have FLEXlm installed and managing non-Rational licenses, and now I want to install DevelopmentStudio for UNIX. Can I do this?

Yes. You can have more than one `lmgrd` on a system, but they must use different ports. You can only have one rational daemon on the system.

a What do I do if my existing FLEXlm installation uses port 27000?

27000 is the default port, so you need to specify a different port number for DevelopmentStudio. Do this by editing the license import file (.upd file) and modifying the `SERVER` line. Change the port number to something other than 27000 (for example, 2001). Note that the port number follows the host ID.

b What do I do if my existing FLEXlm installation uses a port other than 27000?

You don't have to do anything since `rs_install` will default to port 27000. If you are using the same server for other Rational products, you must specify the port number you are using.

- 3 I already have Apex installed, with FLEXlm serving Apex licenses. What do I need to do to install DevelopmentStudio?

For Rational Suite DevelopmentStudio Version 2001A.04.00, you need to use a different system as the license server. Do not use **rs_install** or **license_setup**. After the licenses are received, append the Rational Suite DevelopmentStudio license to the existing license file. Reread the license file on the server by using the **lmreread** command.

As an alternative, you could use **rs_install** to setup Suite licenses and then manually merge the Apex licenses into this file. If you point **rs_install** at an existing license file with Apex licenses, the file will get saved to **license_file.priorN**, where **N** starts at 1 and counts up to the next available prior file. The installer can then take the licenses in that file and merge them back in. Releases after and including Rational Suite DevelopmentStudio, version 1.1 perform this merge automatically.

- 4 Can I use the FLEXlm redundant license server feature?

Yes. For more information, see *Setting up Redundant Servers on UNIX* on page 69.

FLEXlm User Guide and FAQ

HTML versions of the *FLEXlm User Guide* and *FLEXlm Frequently Asked Questions* are provided online. To access these guides type **rsdsu_help**.

For technical support regarding licensing issues, please use the contact information provided in *Contacting Rational Licensing Technical Support* on page xv as your first point of contact.

This chapter provides an overview of tasks that you must perform after you have installed Rational Suite DevelopmentStudio. The following topics are included:

- *Configuring Rational Purify, PureCoverage, and Quantify* on page 95
- *Configuring Rational Rose for UNIX* on page 98
- *Configuring Rational SoDA* on page 101

Configuring Rational Purify, PureCoverage, and Quantify

This section explains how to configure Rational Purify, PureCoverage, and Quantify after you have installed the three products.

The configuration tasks include:

- *Installing on a Read-Only File System* on page 95
- *Making the Manual Pages Available* on page 96
- *Making the Product Available to All Users* on page 96, including:
 - *Making Rational Quantify Scripts Available* on page 97
 - *Making Rational PureCoverage Scripts Available* on page 97
 - *Making Debugger Scripts Available on HP-UX* on page 97

Installing on a Read-Only File System

If you install Rational Purify, PureCoverage, or Quantify on a file system that is mounted read-only by client systems, you must create symbolic links to a writable file system. The `rs_install` program guides you through the process of selecting a shared directory that is mounted read-write on client systems and linking the cache directory to this publicly writable directory.

If There Is No Writable File System

If there is no writable shared directory mounted on client systems, have all users make a cache subdirectory in their home directory and set the product's **-cache-dir** option to this directory. For example

```
% mkdir $HOME/cache
% echo $PUREOPTIONS
```

If the PUREOPTIONS environment variable is already set, specify the **-cache-dir** option by typing:

```
csh % setenv PUREOPTIONS "-cache-dir=$HOME/cache:$PUREOPTIONS"
sh, ksh $ PUREOPTIONS="-cache-dir=$HOME/cache $PUREOPTIONS"; \ export
PUREOPTIONS
```

If the PUREOPTIONS environment variable is *not* set, type:

```
csh % setenv PUREOPTIONS "-cache-dir=$HOME/cache"
sh, ksh $ PUREOPTIONS="-cache-dir=$HOME/cache"; export PUREOPTIONS
```

Add this same specification to your local or central **.cshrc** file, or its equivalent.

Making the Manual Pages Available

The **rs_install** program installs the product manual pages in **producthome/man**. To make them available, do one of the following:

- Set your MANPATH environment variable to include **producthome/man**.
- Copy the manual pages for the product into your **man** directory. If necessary, log in as *root* to do this.
- Running **rs_setup.csh** or **rs_setup.ksh** adds the locations of these product's manual pages to the MANPATH environment variable automatically.

Making the Product Available to All Users

To make Rational Purify, PureCoverage, and Quantify available to all users, create a symbolic link to **producthome/product** from a directory such as **/usr/local/bin**. Make sure this is a symbolic link, not a copy or a hard link.

For example:

```
% rm /usr/local/bin/purify
% ln -s producthome/purify /usr/local/bin
```

Repeat this procedure for each product you install.

Note: As an alternative, you can add the **producthome/product** pathname to each user's PATH environment variable, or reference the full path name in your makefile (**rs_setup.csh** and **rs_setup.ksh** will do this for you).

Making Rational Quantify Scripts Available

To make Rational Quantify scripts available, you need to create symbolic links to **qv** and to the **qx** script files:

```
% rm /usr/local/bin/qv
% rm -i /usr/local/bin/qx*
% ln -s quantifyhome/qv /usr/local/bin
% ln -s quantifyhome/qx* /usr/local/bin
```

For more information on the **qx** scripts, see the *Quantify online help*.

Making Rational PureCoverage Scripts Available

To make Rational PureCoverage scripts available, you need to create symbolic links to the **pc_*** script files:

```
% rm -i /usr/local/bin/pc_*
% ln -s purecovhome/scripts/pc_* /usr/local/bin
```

For more information on the **pc_*** scripts, see the *PureCoverage online help*.

Making Debugger Scripts Available on HP-UX

On HP-UX, Rational Purify, PureCoverage, and Quantify include three scripts that enable you to start instrumented programs under a debugger. You need to create symbolic links to these scripts. For example, for Purify:

```
% rm /usr/local/bin/purify_dde
% rm /usr/local/bin/purify_xdb
% rm /usr/local/bin/purify_softdebug
% ln -s <purifyhome>/purify_dde /usr/local/bin
% ln -s <purifyhome>/purify_xdb /usr/local/bin
% ln -s <purifyhome>/purify_softdebug /usr/local/bin
```

For Rational PureCoverage and Quantify, create the same symbolic links, substituting **purecov** or **quantify** for **purify**.

The installation is now complete.

Configuring Rational Rose for UNIX

This section details Rose for UNIX configuration, performed after installation. You must complete these steps before using Rational Rose.

The following topics are covered in this section:

- *Rose for UNIX Configuration Files* on page 98
- *Configuring Your Printer* on page 98
- *Using Rose for UNIX* on page 100
- *Initial Run-time Instructions When Upgrading* on page 100
- *Installing and Using Converted Fonts Provided in this Release* on page 100
- *Configuring the Rose/ClearCase Integration* on page 100

Rose for UNIX Configuration Files

Executing `$RSU_HOME/releases/DevelopmentStudioUNIX.2001a.04.00/bin/rose` will run the Rose configuration file **config.sh** before bringing up Rose. The configuration file sets environment information such as the ROSE home directory and location of the license file.

Configuring Your Printer

Perform the following steps to configure your printer for use with Rose.

- You may print to your default `$PRINTER` by selecting the appropriate print options within Rose. Rose will print to the printer defined in the `PRINTER` environment variable.
- You may install a default printer, or redefine or add ports by editing your `$HOME/windows/win.ini` file as described. Any changes made to your `$HOME/windows/win.ini` will apply to your personal configuration.

You may also edit the release win.ini file (\$RSU_HOME/releases/rose.2001a.04.00/mw/win.ini). In this case, the same change will apply to any new user who runs the release.

- Specify the default printer under the “[windows]” section, using the following syntax:

```
device=outputdevicename, PSCRIPT, portconnection:
```

The keyword “PSCRIPT” (PostScript) is used in place of the ‘devicedriver’.

Rose for UNIX supports PostScript printing only.

- Specify the UNIX command in the “[ports]” section. The “[ports]” section lists available communication and printer ports. The “LPTn” keywords are mapped to UNIX commands. In the following example, LPT1 and LPT2 are mapped to the print command “lp”. The print job output is sent to a file. The output file is then sent to the printer. The term “%s” tells the system to substitute the name of the PostScript intermediate output file. The term “-dps1700” in the example directs the print job to a UNIX printer named “ps1700”.

```
[ports]
LPT1:=lp -c "%s"
LPT2:=lp -c -dps1700 "%s"
LPT3:=
```

Note: When using **lp**, the **-c** option should always be used.

- Rose does not use the “[PrinterPorts]” section. Modifying this section will have no effect.
- The “[devices]” section lists the active and inactive output devices that can be accessed by device driver “PSCRIPT” and specifies ‘ports’ to which these devices are connected. In the following example, “Default Postscript Printer=PSCRIPT,LPT1:” specifies that the printer is connected to the PSCRIPT queue that is connected to LPT1:

```
[devices]
Default Postscript Printer=PSCRIPT,LPT1:
Postscript Printer QMS=PSCRIPT,LPT2:
```

The devices listed in this section appear in the **File > Print ...** dialog, under “Name”. In this dialog you may select the printer you wish to use.

Using Rose for UNIX

Use the following commands to start Rational Rose products:

Product	Command
Rose for UNIX	rose
Analyzer	analyzer
Rose Model Integrator	modelint

These commands are shell scripts contained in the `$_RSU_HOME/releases/DevelopmentStudioUNIX.2001a.04.00/bin` directory.

Initial Run-time Instructions When Upgrading

Any user running an earlier version of Rose, should do the following before running Rose.

- Run `$_RSU_HOME/releases/DevelopmentStudioUNIX.2001a.04.00/bin/rose_cleanup`

It is only necessary to perform this step once - before running Rose.

Upon running this release, a new `.rose.ini` file will be created. Customizations may then be added to this file, as required.

To run Rose, see *Using Rose for UNIX* on page 100.

Installing and Using Converted Fonts Provided in this Release

Rose includes fonts that are compatible and may be used on both personal computers and UNIX displays. For more information on using these fonts, please see the *Rose Release Notes*.

Configuring the Rose/ClearCase Integration

It may be necessary to reconfigure an earlier Rose/ClearCase integration set up. Before using the Rose/ClearCase integration with this release, review the following file (located in this release):

`$_RSU_HOME/releases/rose.2001a.04.00/addins/clearcase/README`

Configuring Rational SoDA

This section describes Rational SoDA configuration options available during installation, and for reconfiguration purposes after installation.

Note: If you are using an earlier release of SoDA, read about upgrading from previous releases in the *Rational SoDA Release Notes* before installation.

Installation Requirements for Rational SoDA

Note: FrameMaker + SGML is no longer shipped with SoDA. It must now be licensed and installed independently. Rational SoDA 2001A.04.00 supports FrameMaker+SGML 5.5 and 6.0.

If you have previously installed version 3.0.1, 3.0.3, or 3.1.0 of Rational SoDA, you can choose to use the installation of FrameMaker+SGML bundled with that release. To do this, copy the entire SoDA directory to a new location and uninstall the previous version of Rational Suite DevelopmentStudio. This way, you do not accidentally remove the previous version of Rational SoDA when you uninstall the Suite.

SoDA Components

During installation, you will have the option of choosing which SoDA components to load. The following describes these components.

Required Components

You must load the two components that are required for all installations:

- **SoDA Common Component**, containing document templates, X resources, **apiclients** file updates, and so on
- **SoDA Components for *platform***, the platform-specific executables

The SoDA installation process is not optimized for heterogeneous networks (more than one UNIX platform). If you need to install more than one version of SoDA, contact Rational Technical Support.

Optional Components

There are additional components that you may need to load, depending on the needs of your project:

- **Apex Domain for *platform***, containing source-domain definitions, executables, and so on for integrating SoDA and Rational Apex. You must load it to use SoDA with Apex.

- **TestMate Domain for *platform***, containing source-domain definitions, executables, and so on for integrating SoDA and TestMate. You must load it to use SoDA with TestMate.
- **Rose Domain for *platform***, containing source-domain definitions, executables, and so on for integrating SoDA and Rational Rose. You must load it to use SoDA with Rose.
- **RoseRT Domain for *platform***, containing source-domain definitions, executables, and so on for integrating SoDA and Rational RoseRT. You must load it to use SoDA with Rose RealTime.
- **Ghostscript postscript interpreter for *platform***, this is public domain software for processing PostScript images. You may install this component for improving the appearance of diagrams generated by the Rose domain. Ghostscript is provided without warranty or support. Use of Ghostscript is subject to the GNU General Public License. See the *Rational SoDA Release Notes* for more information.
- **ClearCase Domain for *platform***, containing source-domain definitions, executables, and so on for integrating SoDA and Rational ClearCase. You must load it to use SoDA with ClearCase.
- **ClearQuest Domain for *platform***, containing source-domain definitions, executables, and so on for integrating SoDA and Rational ClearQuest. You must load it to use SoDA with ClearQuest.
- **SoDA Training**, a platform-independent tar file. Load it only if you have SoDA users who are planning to attend Rational's SoDA training class. (Further instructions on completing the installation of the **SoDA Training** component are provided with the training material.)
- **SoDA Demo**, a platform-independent component for demonstrating SoDA features. It is intended primarily for use by Rational personnel. Unless requested by your Rational representative, you do not need to load this component.

SoDA Control Options

If you have Rational Apex installed, you will be prompted during installation to provide a control type for use during checkin of a FrameMaker+SGML file. These options are only applicable if you are loading the **Apex Domain** component. Here are the two options for SoDA control:

- Storage in binary format or MIF (Frame's Maker Interchange Format) upon checkin

- Document locking (Frame's View Only format) upon checkin and document unlocking upon checkout

Storage Formats

You can specify the way in which versions of controlled documents are stored in the CMVC database. The two choices are:

- Binary format, which is the normal format of FrameMaker+SGML documents. This format is more compact and requires less time for FrameMaker+SGML to save and open.
- However, CMVC does not store versions of binary files efficiently. Each version is stored as a full copy of the current binary file. Over time, as many new versions are checked in, the CMVC database will grow very large even if each version contains only minor changes.
- MIF, which is an ASCII representation that fully describes the contents of FrameMaker+SGML documents. MIF can be several times larger than the equivalent binary format and requires more time for FrameMaker+SGML to save and open (because FrameMaker+SGML must convert the MIF from/to binary).

However, CMVC stores versions of ASCII text files efficiently. Only one version is stored as a full copy of the original file. All other versions are stored as differentials. Over time, as many new versions are checked in, the CMVC database does not grow too large if most versions contain only minor changes.

Because MIF files are often quite large, calculating the differences between versions can take some time, thereby slowing the checkin.

A Binary Example

For example, a 10 KB document is controlled in binary format, and its initial version takes up 10 KB in the CMVC database.

The document is checked out, additions are made to it, and its size is now 15 KB. The document is checked in, and its two versions use 25 KB (10 KB + 15 KB) in the CMVC database.

The document is checked out again, minor changes are made to it, and its size remains 15 KB. It is checked in again, and its three versions use 40 KB (25 KB + 15 KB) in the CMVC database.

A MIF Example

The same 10 KB document is controlled in MIF, and its initial version uses 30 KB in the CMVC database. (For this document, the MIF was three times larger than the equivalent binary format.)

The document is checked out, additions are made to it, and its size (in binary format) is now 15 KB. The document is checked in, and its two versions use 36 KB (30 KB + 6 KB in differences) in the CMVC database.

The document is checked out again, minor changes are made to it, and its size (in binary format) remains 15 KB. It is checked in again, and its three versions use 37 KB (36 KB + 1 KB in differences) in the CMVC database.

Document Locking

When documents are controlled and checked in, their UNIX file permissions are set to be read-only (`r--r--r--`). However, there is no easy way to tell if a document is read-only from within FrameMaker+SGML.

You can tell SoDA to lock documents when they are checked in and unlock them when they are checked out. When a document is locked (in FrameMaker+SGML View Only format), it is apparent in FrameMaker+SGML that the document is not editable—you cannot select text or type in the document until it is checked out and unlocked.

Using SoDA With Rational Rose

During installation you may be asked if you want to use SoDA with Rational Rose. If you answer **yes**, you must also provide the location of your Rose installation. The install process will automatically configure SoDA to use the version of Rational Rose you have specified.

See the release notes for further information about using SoDA with Rational Rose.

Installing SoDA With Rational Rose RealTime

During installation you may be asked if you want to use SoDA with Rational RoseRT. If you answer **yes**, you must also provide the location of your RoseRT installation. The install process will automatically configure SoDA to use your RoseRT installation.

See the release notes for further information about using SoDA with RoseRT.

Installing SoDA With Rational Apex

If you are installing SoDA for use with Rational Apex, and if you would like **apexinit** to automatically start SoDA for all Apex users, use your preferred text editor to adjust the **soda.start** script in the *rational_dir/releases/soda.I.J.K/share/bin* directory. Uncomment the appropriate line as indicated by the instructions in the file.

Normally, it is better *not* to make this adjustment unless all Apex users will also be regular SoDA users. Usually, only some Apex users are regular SoDA users.

See the release notes for further information about using SoDA with Apex.

Using SoDA With Rational ClearQuest

During installation you may be asked if you want to use SoDA with Rational ClearQuest for UNIX. If you answer **yes**, you must also provide the location of your ClearQuest installation. The install process will automatically configure SoDA to use the version of Rational ClearQuest you have specified.

See the release notes for further information about using SoDA with ClearQuest.

Reconfiguring SoDA

Sometimes it is necessary to reconfigure SoDA after installation, for example to specify a new Rose installation, or if the SoDA installation is moved. Configuration of the SoDA is performed during the **post_install** phase of **rs_install**. You may run **rs_install** using the **post_install** alias to reconfigure SoDA.

Licensing may also be reconfigured after install by using the **license_setup** and **license_check** tools, described earlier in this manual.

Using SoDA

After you have completed the SoDA installation, you may start SoDA by running the **soda** command. For further information, see the instructions for SoDA users in Chapter 1, “Getting Started,” of *Using SoDA*.

Use the information in this chapter if you run into problems installing Rational Suite DevelopmentStudio. The following areas are covered in this chapter:

- *Troubleshooting the Installation of Rational Suite DevelopmentStudio* on page 107
- *Troubleshooting the Installation of the Windows Components* on page 112
- *Contacting Rational Technical Support* on page 112

Note: Error messages are shown in bold italics in the following sections.

Troubleshooting the Installation of Rational Suite DevelopmentStudio

General Problems

Display problems

If you are having problems with the display showing strange characters on your screen and your screen does not clear for each new menu, you may have your TERM environment variable set incorrectly. Try setting it to something else like xterm, vt100 or ansi. To prevent the program from using escape sequences to do underlining, run the programs with the **-no_underlining** (alias **-nu**) option. This will prevent the commands from using escape sequences.

If uninstalling something fails, it may be that you are not the original installer. Log in as the person who installed the product and rerun the uninstall script as that person.

Cannot create directories

If you have problems creating directories, it may be that you do not have the correct permissions. Check your login name and the groups you belong to using the UNIX **id** command. Check the directory permissions of the directory where you are trying to create a directory. You must have read (r), write (w), and execute (x) permissions for you or the groups you are in.

Permission problems

If you have permission problems with the tar command, it may be that you are trying to install on top of an already existing product. In most cases, this type of error can be ignored.

Disk space unavailable

If you run out of disk space while installing products, you cannot ignore this problem. The best thing to do is uninstall the Suite and reinstall it in a place where you have sufficient space to do the installation. Disk space requirements are summarized in *UNIX Installation Requirements* on page 23. The approximate amount of disk space you need to install the Suite is also provided in the **Customization Menu** when you run the `rs_install` command.

Could not find rs_install data.

Check that you have correctly mounted the CD-ROM. Refer to *Mounting the CD-ROM Drive* on page 113. Make sure that you are running the installation commands from the CD-ROM directory. There must be an **extras** directory in the same location. The command looks for the installation data in there. If you have mounted the `/cdrom` directory from another system, make sure the directory has been properly exported – it needs to be listed in the filesystem table for exported file systems. This file is operating-system dependent.

FAIL: Could not install file0:

This means that the installation was trying to untar this file. In doing so, it expected it to create a directory structure that looks something like **releases/product.ver/install**. It could be that the tar command failed due to lack of disk space, or you do not have permissions to read the file. Check to see if you can untar the file that is shown by doing a `tar -tf <file0>` where `<file0>` is the full path to file0.

FAIL: Could not find a file to install from here:

This means that the install could not find a tar file in the listed directory. It could be that you are trying to install a Solaris CD-ROM on a non-Solaris system or an HP-UX CD-ROM on a non-HP-UX system.

Licensing Problems

There is a problem with one license key.

or

There are problems with <N> license keys.

This means that the license keys in the license file do not match and are inconsistent with the text of the license. The licenses consist of several parameters and a 12-digit hexadecimal key that was created using these parameters. The parameters are in ASCII text but they cannot be changed or it will invalidate the license. The parameters used to create the license are the server host ID, license name, vendor daemon name, expiration date, number of users (quantity), `VENDOR_STRING`, `OVERDRAFT`, `SUPERSEDE`, `DUP_GROUP`, and `NOTICE`.

It appears that DevelopmentStudio for UNIX <version_number> is not licensed.

This means that there is a problem with the license server. It could be that:

- 1 The license server was never started.
- 2 The license server failed to start. This happens when the license keys are inconsistent.
- 3 There is already a license server running but it is not using the Rational Suite DevelopmentStudio license file.

Check the license server log file which is kept in `/rational_dir/config/server-name.log`.

Users of DevelopmentStudioUNIX: Cannot get users of DevelopmentStudioUNIX: No such feature exists (-5,222)

This could mean that multiple Rational servers are running, or a stale lock file was not cleaned up. This error could result from either:

- 1 Another copy of `lmgrd` is running.
- 2 A prior `lmgrd` was killed with `kill -9` which would leave the vendor daemon running.

To correct this, kill the `lmgrd` and `rational` processes and remove the Rational lock file:

- a Use the `ps` command or equivalent to find the process IDs:

```
ps -ax | egrep "lmgrd|rational"
```

- b Kill those processes:

```
kill Process-ID-of-lmgrd Process-ID-of-rational
```

- c Remove the **lockrational** file which can be found at either:

```
/usr/tmp/lockrational
```

or

```
/tmp/lockrational
```

```
Run /rational_dir/config/start_lmgrd_on_machine
```

You do not have remote access to <license-server-name> from <local-host-name>, so it cannot be set up as a license server...

It may be that the license server is not the same system on which you are installing. You must have remote shell access (**rsh** or **remsh**) to the license server system.

Host <license-server-name> is running Solaris.

Host <local-host-name> is running HP-UX.

They do not match so <license-server-name> cannot be used as a license server.

It may be that the license server is not the same system on which you are installing. If so, it must run the same operating system that the product you are installing requires.

Host, <license-server-name> does not have access.

If the license server is not the same system on which you are installing, it must have access to the **rational_dir** directory where Rational products have been installed.

Cannot set <license-server-name's> host ID with this command:

```
rational_dir/base/cots/flexlm.7.0f/lmhostid
```

The **lmhostid** command failed. Check to see if the **lmhostid** command shown will run on your local host. If so, enter the host id number in the **License Server Host ID Menu** (choice number 2).

Cannot access rational_dir/base/cots/flexlm.7.0f/lmhostid on <license-server-name>.

There was a problem accessing the **rational_dir** directory or the **lmhostid** command was not installed from the CD-ROM.

Host ID <nnn> not valid. Less than 4 digits.

This means that the host ID number will not work. Check again using the `lmhostid` to see what the host ID is. It should be at least four or more hexadecimal digits.

Port number <pn> is in use in /etc/services.

or

Port number <pn> is in use under NIS services.

If you entered a port number and it appears that the number is in use in your `/etc/services` file or under NIS services, you may have a problem with licensing. Rational products use FLEXlm which uses TCP/IP sockets to communicate with a license server using a specific port number. This port number is specified in the license file on the `SERVER` line. The license server will not be able to open a socket on a port that is already in use. Rational recommends that you use the default port number, 27000.

Checked the import file and could not find an INCREMENT line for:

<u>License Feature</u>	<u>Description</u>
<i>DevelopmentStudioUNIX</i>	<i>Suite DevelopmentStudio for UNIX (UNIX Components)</i>
<i>DevelopmentStudioUNIXWeb</i>	<i>Rational Suite DevelopmentStudio for UNIX (Windows Components)</i>

There does not appear to be any license information to import for Rational DevelopmentStudio for UNIX.

This means that the import file you specified contains INCREMENT lines but none of them match the two that are expected. Make sure that the file you import contains one or both of these licenses.

Users of DevelopmentStudioUNIX: (Total of 1 license available)

Users of DevelopmentStudioUNIXWeb: NOT LICENSED

1 of the 2 license components is not being served.

This may be okay, since 1 license is being served.

This means that you only have a license to use Rational Suite DevelopmentStudio (UNIX components). If you are not using the unlicensed product, no action is necessary. If you plan to use the Windows components, request a Rational Suite DevelopmentStudio for UNIX (Windows components) license from AccountLink.

Error message: ulimit: bad ulimit

If you see this message when you run `start_lmgrd`, remove the `ulimit` command from the script.

Troubleshooting the Installation of the Windows Components

If you have problems installing the Web Interface components of Rational Suite DevelopmentStudio, try the following suggestions before you call Rational Technical Support:

- Be sure to stop all applications before you begin the installation.
- Turn off all virus protection software. These programs often run in the background and interfere with the installation and file decompression process.
- Turn off any user interface managers or desktop environments that run on top of Microsoft Windows.
- Disable video features such as virtual screens or screen switching.
- Change to a standard mouse driver, or disable special mouse features that perform tasks such as leaving pointer trails or Support Information

Troubleshooting Windows Licensing

The `lmtools` application is available on Windows and is designed to help diagnose licensing issues. Rational installs this application with all products in the `<rational>\common` directory. If the license server is installed, you can use the License Tools **Start** menu shortcut to the `lmtools` GUI. For more information about using this diagnostic tool, see the *FLEXlm User Guide*. You can access this guide online by typing `rsdsu_help`.

Contacting Rational Technical Support

Contact Rational Technical Support if you are unable to resolve your problems or if you have questions regarding the installation, use, or maintenance of this Rational Software product

For contact information, see *Contacting Rational Technical Support* on page xv.

Accessing the CD-ROM Drive

A

This section provides instructions for mounting and unmounting a CD-ROM drive in the UNIX environment.

Mounting the CD-ROM Drive

As root, make a directory (if one does not already exist) to be the mount point for the CD-ROM drive. The following examples for each platform use the directory `/cdrom`. Make sure you know the device name of the CD-ROM drive. If you do not know the device name for the CD-ROM drive, consult your system administrator. Mounting commands for different operating systems are as follows:

Sparc/Solaris with Volume Management

Solaris 2.x with volume management mounts to the `/cdrom` directory. This happens automatically when you load the CD-ROM drive. You have volume management if the `vold` daemon is running on the system.

Sparc/Solaris (Solaris 2.x) Without Volume Management

```
# mkdir /cdrom
# mount -r -F hfs /dev/dsk/c0t6d0s0 /cdrom
```

HP (HP-UX 10.x, 11.0)

```
# mkdir /cdrom
# mount -r -F cdfs /dev/dsk/c0t2d0 /cdrom
```

Unmounting the CD-ROM Drive

For CD-ROM installs, unmount the CD-ROM drive with the following commands.

For Solaris with volume management (`vold` is running):

```
% eject cd
```

All others must unmount the CD as *root*.

```
% su
# umount /cdrom
```

Note: You cannot eject the CD if you are at the directory `/cdrom` or `/cdrom/cdrom0`. If you get a “Device busy” error, change your directory location to a location other than the CD-ROM and repeat the above commands.

Glossary

AccountLink. Rational's Web-based license management tool. Customers can use this tool to request and return licenses to their Rational accounts.

ANY-HOST. A license key issued for ANY-HOST will run on any system, and is not tied to the customer's system ID.

Emergency Key. A temporary key that lets a customer use Rational software for a fixed period of time if they cannot use their own license for some reason. The duration of the Emergency Key is five days. Emergency Keys can be node-locked or floating. Emergency Keys are distributed by the Licensing Support Group and run on any host.

Evaluation Key. A temporary key that lets a customer use and evaluate Rational software for a fixed period of time. Rational Software determines the duration of the Evaluation Key. Evaluation Keys can be node-locked or floating. Evaluation Keys are distributed by the Sales team and run on any host.

Floating License. A license type that links products to a license server system. Client systems obtain licenses from the license server when they need to run a copy of Rational software. Multiple clients can share the pool of floating licenses; one license is granted per client per product. Floating licenses on license servers are typically administered by system administrators.

GLOBEtrotter FLEXlm Server. Software license manager for Windows, UNIX, Java, and VMS.

Key Type. Node-locked and floating licenses can be enforced by different types of license keys. The types of license keys are Startup and Permanent. Evaluation and Emergency keys are variations of Startup keys, and Term License Agreements (TLAs) are a variation of Permanent keys. Each type of key has different business rules and policies.

License. A legal right to use a product. A customer receives a license when they purchase the product. However, they need a license key to actually associate the product and the system on which it is running with a license.

License Key. Generic term used in this document to describe keys that enable licenses on a customer system. The types of license keys are: permanent, temporary, evaluation, emergency, and Term License Agreement (TLA).

License Key Administrator. A Windows program written by Rational Software, which provides a customer interface to Rational's Licensing system. Similar functionality exists with a subset of the `rs_install` command, called `license_setup`. Starting with the release of Rational Suite 1.0 and associated point products, the License Key Administrator or `license_setup` command is installed whenever a Rational software product is installed. For hosting floating licenses on Windows, the License Key Administrator is installed when the Globetrotter FLEXlm server is installed on a Windows License Server system.

License Key Code. An encrypted code used to enforce a license agreement.

License Type. The valid types of licenses are node-locked licenses and floating licenses. See also **Key Type**.

Node-Locked License. A type of license that links a product to a system. Typically, one node-locked license is issued per software copy.

Permanent Key. A license that lets customers run Rational products indefinitely. Permanent Keys can be node-locked or floating. Node-locked Permanent Keys are installed on a client system. Floating Permanent Keys are installed on a license server.

Note: A Term License Agreement, a variation of a permanent key, does have an expiration date. See *Term License Agreement*.

Permanent Key Code. The encrypted code that lets a customer run a particular Rational product using a Permanent Key.

Temporary Key. A short-term license key that lets a customer run Rational software products. Temporary licenses are not keyed to a specific system. Temporary Keys can be node-locked or floating. Node-locked Temporary Keys are installed on a client system. Floating Temporary Keys are installed on a license server.

Temporary Key Code. The encrypted code that lets a customer run a particular Rational product using a Temporary Key.

Temporary License Key Certificate. A piece of paper or an electronic file that contains information a customer needs to begin using Rational software with a license. The temporary License Key Certificate is shipped to the customer with the software installation media.

Term License Agreements (TLAs). Variation of a Permanent Key. TLAs are issued to a site to let their employees use Rational software for a negotiated period of time. TLAs are issued by Rational Sales and have an expiration date.
