

# IBM<sup>®</sup> Rational<sup>®</sup> TestManager

### Highlights

- Manages manual testing and reporting
- Provides centralized testing control center
- Agnostic to the development platform or language
- Simplifies communication about product plans, requirements, and changes
- Flags test cases potentially impacted by change
- Handles virtually any type of test script

Test teams are expected to perform a variety of tasks that go beyond functional, performance and regression testing. From tracking requirements changes to providing up-to-date reports to giving developers the information they need to find and fix defective code – testers are asked to do more than simply test. And today testers are under pressure to finish their work in less time than ever before in order to test a greater number of projects.

IBM<sup>®</sup> Rational<sup>®</sup> TestManager V2003 helps testers do their jobs faster, and automates the communication of changes and status across the project team.

#### **Control the Testing Process**

IBM Rational TestManager is the tester's desktop. Testers and team members use it to plan, manage, organize, execute, evaluate and report on individual test cases or entire test plans. Every type of testing activity can be controlled at this one central point – from manual regression testing to defect tracking to scalingup automated stress testing. Using Rational TestManager, test cases can be logically linked to any input source. Integration with IBM Rational RequisitePro® provides automatic notification of requirements changes. This eliminates the common and error-prone process of manually correlating requirements changes to test cases – greatly improving workflow.

#### Improve Team Communication

The entire project team benefits from IBM Rational TestManager's tight integration with IBM Rational ClearQuest®, a defect management tool, and with IBM Rational RequisitePro, because the integration allows analysts and developers to query test results from their own perspectives whenever they need to.

IBM Rational TestManager improves testing productivity throughout the development lifecycle by centralizing control of testing processes and making it easy to share test results.

## Features that Benefit Testers and Development Teams

Automate Test Plans: In IBM Rational TestManager, a test plan is an easy-to-use dynamic structure that is the framework for organizing the testing process. Manage all Types of Testing: Manage functional, performance, manual, integration, regression, configuration and component testing right from the IBM Rational TestManager desktop.

Execute Multiple Test Types at Once: Execute, in the same test run, a test suite containing multiple types of scripts (manual, Java, GUI, load). Execute functional and performance tests simultaneously, on one machine or distributed across a network.

*Link Test Cases to Requirements:* As requirements change, IBM Rational TestManager automatically flags the test cases related to the change, saving testers precious time.

*Test Evaluation:* An integrated log viewer builds a full log for each test run, including pass, fail, warning and informational tags. To learn the details of a failure, just double-click on the test item.

*Meaningful Reports:* IBM Rational TestManager includes a series of predefined graphical and textual reports. Additional reports on test metrics, results, pass-fail status can be defined or extended with Crystal Reports.

#### **Manage Manual Testing**

IBM Rational TestManager V2003 automates the administrative aspects of manual testing.

With IBM Rational TestManager you can:

- Create a test plan that organizes the manual testing workflow.
- Log the steps and results of executing manual scripts as they are performed.
- Generate automated reports of manual test results and metrics.

IBM Rational TestManager V2003 contains a rich set of industry-leading features to help you manage manual testing:

- Associate a text description or a file to a test in order to better describe the expected results.
- Identify the specific verifications to perform for a test to either pass or fail.
- Run a manual script in a small, step-by-step dialog to minimize interference with the applicationunder-test.
- Capture and compile test results for one test or 1,000, and for results obtained by one individual or an entire team.

- Import and export test scripts and designs to share them with other applications.
- Export manual scripts, test case designs, and configured test case designs to a text file.
- Integrate manual test results with manual test results with automated functional and performance test results

#### Ease into Test Automation

While providing all testers with easyto-use test management capabilities, using IBM Rational TestManager to automate the management of manual testing is an intelligent first step toward automating testing itself. As later steps, IBM Rational test automation, defect tracking and requirements tracking tools can be incrementally adopted.
