# 1 Installation and Configuration

The following sections provide details regarding the installation and configuration of IBM UnifiedPOS system management support on the following environments

- Windows
- SUSE Linux Enterprise 11-SP1 (SLED, SLES, SLEPOS)

Notes:

1. The system management support is provided for all JavaPOS/OPOS supported devices.

## 1.1 Installation on Windows

During IBM UnifiedPOS installation, a check box option is provided for selecting system management support. When this option is selected, the installation automatically installs and configures necessary system management components. By default, this option is enabled. However, the system management has dependencies on the existence of Windows core components that support system management.

### Windows WMI Component

The Microsoft WMI components are required to run the IBM UnifiedPOS Management Services on Windows. The WMI component is typically a part of Windows OS, and IBM installation does not install Microsoft WMI components during installation. In case it is missing, it can be downloaded from:

<http://www.microsoft.com/downloads/details.aspx?familyid=013BB284-3946-44A9-AC3C-BF2A569EAA72&displaylang=en>

Optionally, the WMI components can be obtained by installing the Microsoft .NET component.

## Validating System management:

To view the systems management properties for a device, the device must be opened and claimed.

- **open/claim/enable a device in JavaPOS:**

Start POS Control Center utility:

- Start → IBM UnifiedPOS for Windows → IBM JavaPOS → POS Control Center
- To configure devices, Click on AutoDetect and save jpos.xml to default location.
- Select a device that is online, and click on “System Management” tab, click on “Start Statistics Test”. This will display the system management properties of the device, and it will also keep the device in open/claim/enable state.

- **open/claim/enable a device in OPOS:**

Use the application or an OPOS utility to open/claim/enable a device(s).

- **Use wbemtest utility to view properties:**

1. Start wbemtest tool
  - Click on Start → Run, then enter wbemtest
2. Connect to root\cimv2 name space
  - Click on Connect
  - Enter root\cimv2, click on Connect again
3. Enumerate UPOS Device Instances
  - Click on Enum Instances
  - Enter UPOS\_LogicalDevice
  - Select Recursive
  - Click on OK
4. To view detailed properties, select a device in Query Results windows and double click on it.

## 1.2 Uninstallation on Windows

When the IBM UnifiedPOS software is uninstalled, it will automatically remove the system management components on Windows XP.

### 1.3 Installation on SLE 11-SP1

The IBM UnifiedPOS support for System Management is supported through the Small Footprint CIM Broker. This is rpm is available on SLE11-SP1 DVD.

#### Installation and Configuration:

You must be root user to install and configure the system management components.

- Install posIBM\_XML4C-5.7.1-1.i586.rpm.

```
•rpm -ivh posIBM_XML4C-5.7.1-1.i586.rpm
```

- Install SFCB rpm from SLE-11-SP1 DVD.

```
•rpm -ivh sblim-sfcb-1.3.7-0.9.4.i586.rpm
```

- Edit /etc/sfcb/sfcb.cfg to allow http communication and authentication.

For example edit the following two properties to:

```
enableHttp: true
doBasicAuth: false
```

Refer to <http://sblim.wiki.sourceforge.net/sfcb> for more details.

- Start SFCB with /etc/init.d/sfcb start

Known issue:

Lifecycle indications do not work with sfcb 1.3.7-0.9.4 version because of a problem at the sfcb server. This problem may be addressed in future versions of sfcb.

- Install “posIBM\_sblim-cmpi-upos-server-sled-<version>.i586.rpm”.

```
•rpm -ivh posIBM_sblim-cmpi-upos-server-sled-<version>.i586.rpm
```

- Install wbemcli utility from SLE-11-SP1 DVD.

```
•rpm -ivh sblim-wbemcli-1.6.1-1.1.84.i586.rpm
```

The utility also can be downloaded from <http://sblim.wiki.sourceforge.net/wbemcli>

## Validating System management:

To view the systems management properties for a device, the device must be opened and claimed.

- **open/claim/enable a device in JavaPOS:**

Start POS Control Center utility:

- Start → IBM UnifiedPOS for Windows → IBM JavaPOS → POS Control Center
  - To configure devices, Click on AutoDetect and save jpos.xml to default location.
  - Select a device that is online, and click on “System Management” tab, click on “Start Statistics Test”. This will display the system management properties of the device, and it will also keep the device in open/claim/enable state.
- Get System Management properties for a given device by issuing the wbemcli command, for example for POSPrinter device:

```
•wbemcli ei http://localhost:5988/root/cimv2:UPOS_POSPrinter
```

## 1.4 Uninstallation UPOS Systems Management

- Remove “posIBM\_sblim-cmpi-upos-server-sled-<version>.i586.rpm” .

```
•rpm -e posIBM_sblim-cmpi-upos-server-sled-<version>
```

- Remove SFCB rpm.

```
•rpm -e sblim-sfcb-1.3.7-0.9.4
```

- Remove posIBM\_XML4C-5.7.1-1.i586.rpm.

```
•rpm -e posIBM_XML4C-5.7.1-1.i586
```

## 1.5 System Management Configuration File

To customize some of the system management functions, several properties are defined in sysmgmt.properties file. The details are described below.

File Name: systemgmt.properties

Location : <install directory>\sysmgmt directory (Windows).  
/opt/ibm/javapos/etc (Linux)

**Property:** provider.eventSocket.Port

**Default value:** 42114

**Description:** Port number used by Windows Event CIM Provider (JavaPOS).

**Description:** Port number used by Windows CIM Provider for events and requests (OPOS).

**Property:** provider.response.timeout

**Default value:** 30000

**Description:** Timeout value from CIM Provider to JavaPOS Management Services..

**Property:** upos.requestSocket.Port

**Default value:** 42115

**Description:** Port number used by JavaPOS Management Services.

**Property:** provider.eventSocket.IP

**Default value:** 127.0.0.1

**Description:** Destination IP address for event UDP datagrams. Typically this would be the local machine,

**Property:** provider.maxQueryThreads

**Default value:** 10

**Description:** Maximum number of threads that are allowed to connect to the Java drivers at the same time.

**Property:** provider.dataUpdate.frequency (OPOS)

**Default value:** 1

**Description:** Defines the value of the frequency in which the driver should try to update the data of the device, it will depend if the device is use or not, the driver will decide if it is possible to update the data at that moment, if not, it should ignore the request or enqueue it until it can be executed. This value is configured inminutes.

---

## 2 Problem Determination

The IBM UPOS provides facility to gather trace information for JavaPOS/OPOS and Provider components. You can selectively enable/disable traces as follows.

### Enabling Trace in Linux

1. Edit the file `/opt/ibm/javapos/etc/jutil.properties`
2. Turn on the "com.ibm.jutil.tracing.TurnOnAllNamedTracers=ON" trace.
3. The location for the trace file is "<HOME>/.ibmjpos" where <HOME> is the absolute path to the user's home directory.

To enable the provider tracing:

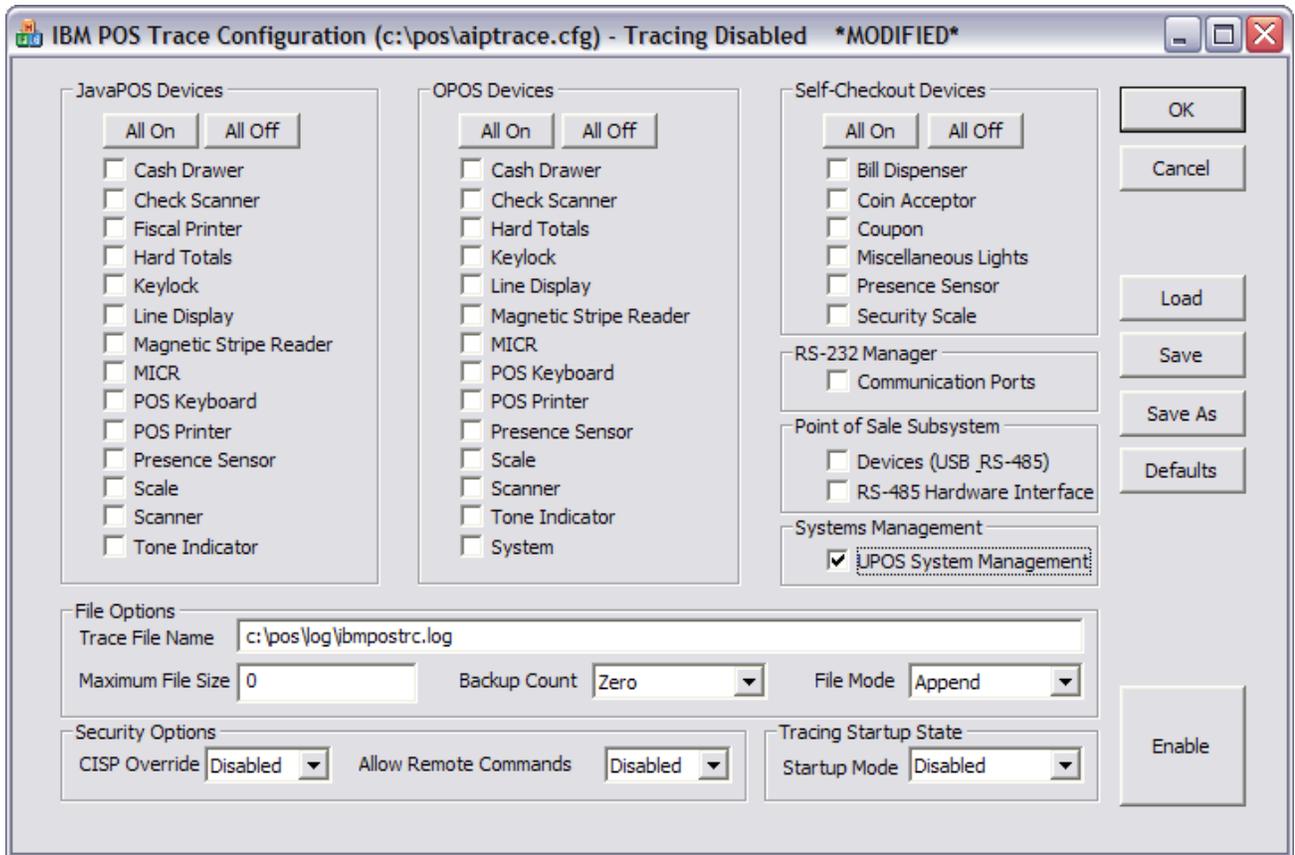

1. Edit/Create the file `/var/pos/aiptrace.cfg`.
2. Enable trace with the option "SystemManagement: ON". Also configure the following settings to a correct value:  
BackupCount: <Number from 0 to 4>  
FileSize: <Maximum Length of file>  
A value of 0 on FileSize will not have a limit on the file to be created.
3. Restart the CIM Server for changes to take effect:  
`/etc/init.d/sfcb restart`
4. The location for the trace file is `"/var/log/UPOS_SysMgmt.log"`.

**Note:** If no configuration file is found, trace will be disabled.

### Enabling Trace in Windows

For IBM UPOS Systems Management, the following steps are used to gather trace information.

1. Using a command line prompt, type in AIPTRCCFG. The application will appear

- 2 Choose item UPOS Systems Management for tracing.
- 3 When trace configuration is complete, click Save and then click Enable.

**Notes:**

2 different trace files are created:

- The first file is indicated in the option Trace File Name. The file will be created based on the settings selected in the IBM POS Trace Configuration window.
- The second one is the UPOS system management provider trace and is created in the directory <INSTALL\_DIR>\log\UPOS\_SysMgmt.log.

This trace file will be created based on the settings for Maximum File Size and Backup Count only; the other options will not take effect for this trace.

---

## **3 IBM Defined Management Services**

### **3.1 Introduction**

This document explains the high level design of the UnifiedPOS Management Services Subsystem and related components. This strategy conforms to the Common Information Model (CIM) from the Distributed Management Task Force (DMTF). The CIM model for Retail devices has been included as part of UnifiedPOS Specification starting in version 1.12. The IBM management service for Retail devices is based off the CIM schema for Retail devices.

### 3.2 CIM ClassNames for UnifiedPOS Device Category Names

The correlations of UnifiedPOS programmatic names and CIM class names are defined in the following table

UnifiedPOS Device Programmatic Names	CIM Class Name	OPOS Supported since	JPOS Supported since
<b>Belt</b>	<b>UPOS_Belt</b>		
<b>BillAcceptor</b>	<b>UPOS_BillAcceptor</b>		
<b>BillDispenser</b>	<b>UPOS_BillDispenser</b>		
<b>Biometrics</b>	<b>UPOS_Biometrics</b>		
<b>BumpBar</b>	<b>UPOS_BumpBar</b>		
<b>CashChanger</b>	<b>UPOS_CashChanger</b>		
<b>CashDrawer</b>	<b>UPOS_CashDrawer</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>CAT</b>	<b>UPOS_CAT</b>		
<b>CheckScanner</b>	<b>UPOS_CheckScanner</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>CoinAcceptor</b>	<b>UPOS_CoinAcceptor</b>		
<b>CoinDispenser</b>	<b>UPOS_CoinDispenser</b>		
<b>ElectronicJournal</b>	<b>UPOS_ElectronicJournal</b>		
<b>ElectronicValueRW</b>	<b>UPOS_ElectronicValueRW</b>		
<b>FiscalPrinter</b>	<b>UPOS_FiscalPrinter</b>	<b>1.13.0</b>	
<b>Gate</b>	<b>UPOS_Gate</b>		
<b>HardTotals</b>	<b>UPOS_HardTotals</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>ImageScanner</b>	<b>UPOS_ImageScanner</b>		
<b>ItemDispenser</b>	<b>UPOS_ItemDispenser</b>		
<b>Keylock</b>	<b>UPOS_Keylock</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>Lights</b>	<b>UPOS_Lights</b>		
<b>LineDisplay</b>	<b>UPOS_LineDisplay</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>MICR</b>	<b>UPOS_MICR</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>MotionSensor</b>	<b>UPOS_MotionSensor</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>MSR</b>	<b>UPOS_MSR</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>PINPad</b>	<b>UPOS_PINPad</b>		
<b>PointCardRW</b>	<b>UPOS_PointCardRW</b>		
<b>POSKeyboard</b>	<b>UPOS_POSKeyboard</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>POSPower</b>	<b>UPOS_POSPower</b>		
<b>POSPrinter</b>	<b>UPOS_POSPrinter</b>	<b>1.13.0</b>	<b>1.9.1</b>

<b>UnifiedPOS Device Programmatic Names</b>	<b>CIM Class Name</b>	<b>OPOS Supported since</b>	<b>JPOS Supported since</b>
<b>RemoteOrderDisplay</b>	<b>UPOS_RemoteOrderDisplay</b>		
<b>RFIDScanner</b>	<b>UPOS_RFIDScanner</b>		
<b>Scale</b>	<b>UPOS_Scale</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>Scanner</b>	<b>UPOS_Scanner</b>	<b>1.13.0</b>	<b>1.9.1</b>
<b>SignatureCapture</b>	<b>UPOS_SignatureCapture</b>		
<b>SmartCardRW</b>	<b>UPOS_SmartCardRW</b>		
<b>ToneIndicator</b>	<b>UPOS_ToneIndicator</b>	<b>1.13.0</b>	<b>1.9.1</b>

**Note:** There are some differences between the UPOS Specification 1.12 definition and the class names listed in this table. For a complete class definitions refer to:

In Windows: File located in “<installdir>\sysmgmt\UPOSMgmtSrv.mof”

In Linux using Pegasus: File located in /usr/share/Pegasus/mof/Pegasus

In SLED using SFCB: File located in /usr/share/sfcb

### 3.3 JavaPOS Changes

To seamlessly support the integration of UnifiedPOS management services, some changes are required to the UnifiedPOS specification, as well as the device controls provided by members of the committee.

Each component, the control and the service will have the capability to expose the device to UnifiedPOS Management Services. A read/write Boolean property, **AllowManagement** at control, will allow the application to determine if the device should participate in systems management. The default value is true for **AllowManagement** property. Also, each Service should implement the **UPOSManagementService** interface. The interface, from UPOS Management Services, it is what the component passes to Management Services when it registers with it. This interface serves as the connection point to Management Services and eventually the CIMOM. Registration occurs when the device is opened, and un-register when closed.

When the device is open, it should check with its corresponding control and service to determine if it will handle systems management, checking the **CapServiceAllowManagement** capability and **AllowManagement** property. If **CapServiceAllowManagement** is true, the Service will accept the responsibility to interact with systems management, notify StatusUpdateEvents and register its own **UPOSManagementService** with UPOS Management Services and handle the systems management interface on behalf of the named device.

During open time when **CapStatisticsReporting** is true the **UPOSManagementService** will try to claim and enable the device to call the retrieveStatistics method and gather the device information statistics like SerialNumber. Once the retrieveStatistics method is complete the device will be released and the control returned to the application.

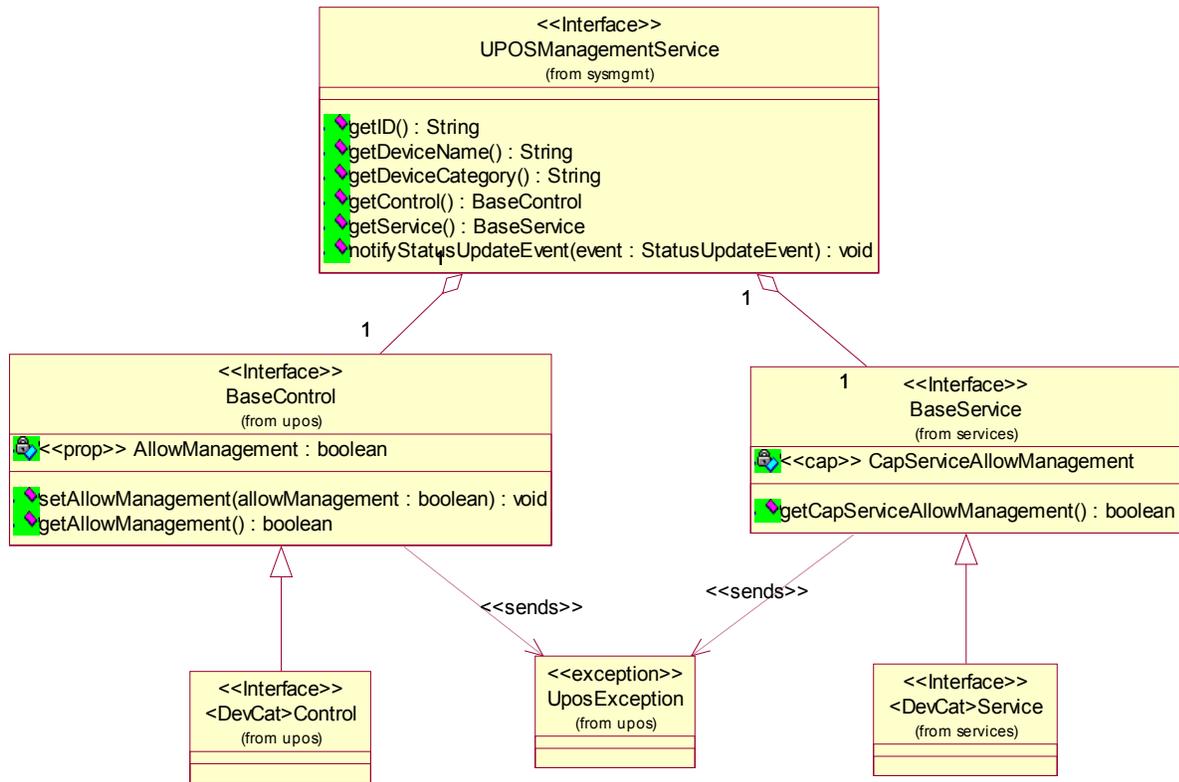

When **CapServiceAllowManagement** is false and the **AllowManagement** is true the control of the device will register the **UPOSManagementService** with UPOS Management Services. Finally when both are false the device will not participate in systems management.

The **UPOSManagementService** is unregistered when the device is closed.

**CapServiceAllowManagement** capability has as default value false

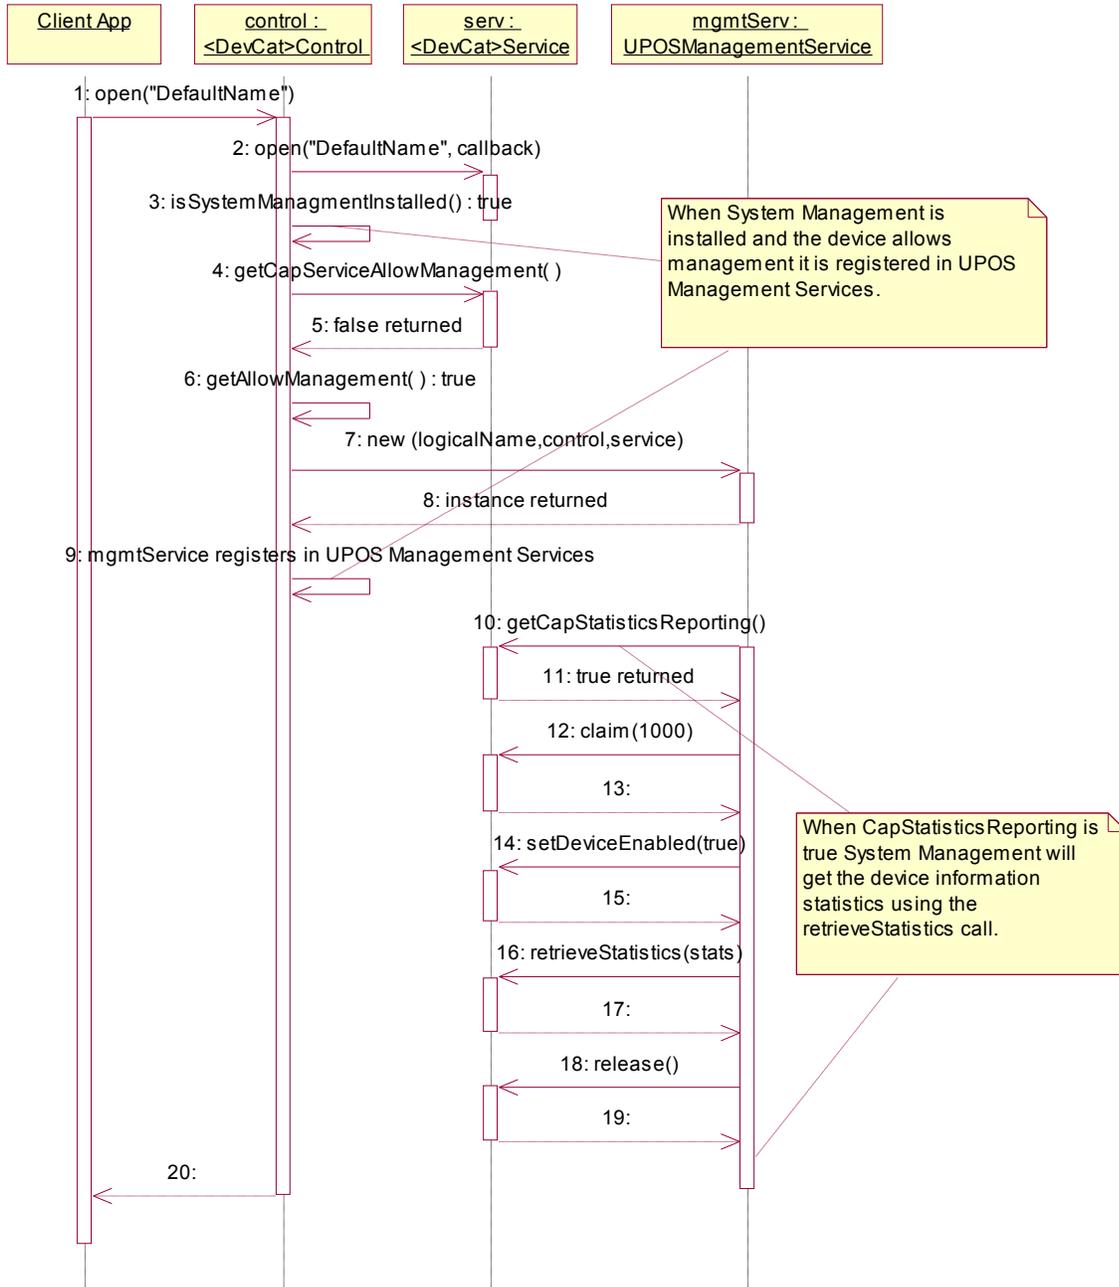

The following sections describe the class diagrams and sequence diagrams created in IBM UnifiedPOS 1.9.1 release.

### 3.2.1 JavaPOS Controls Class Diagram for Management Service

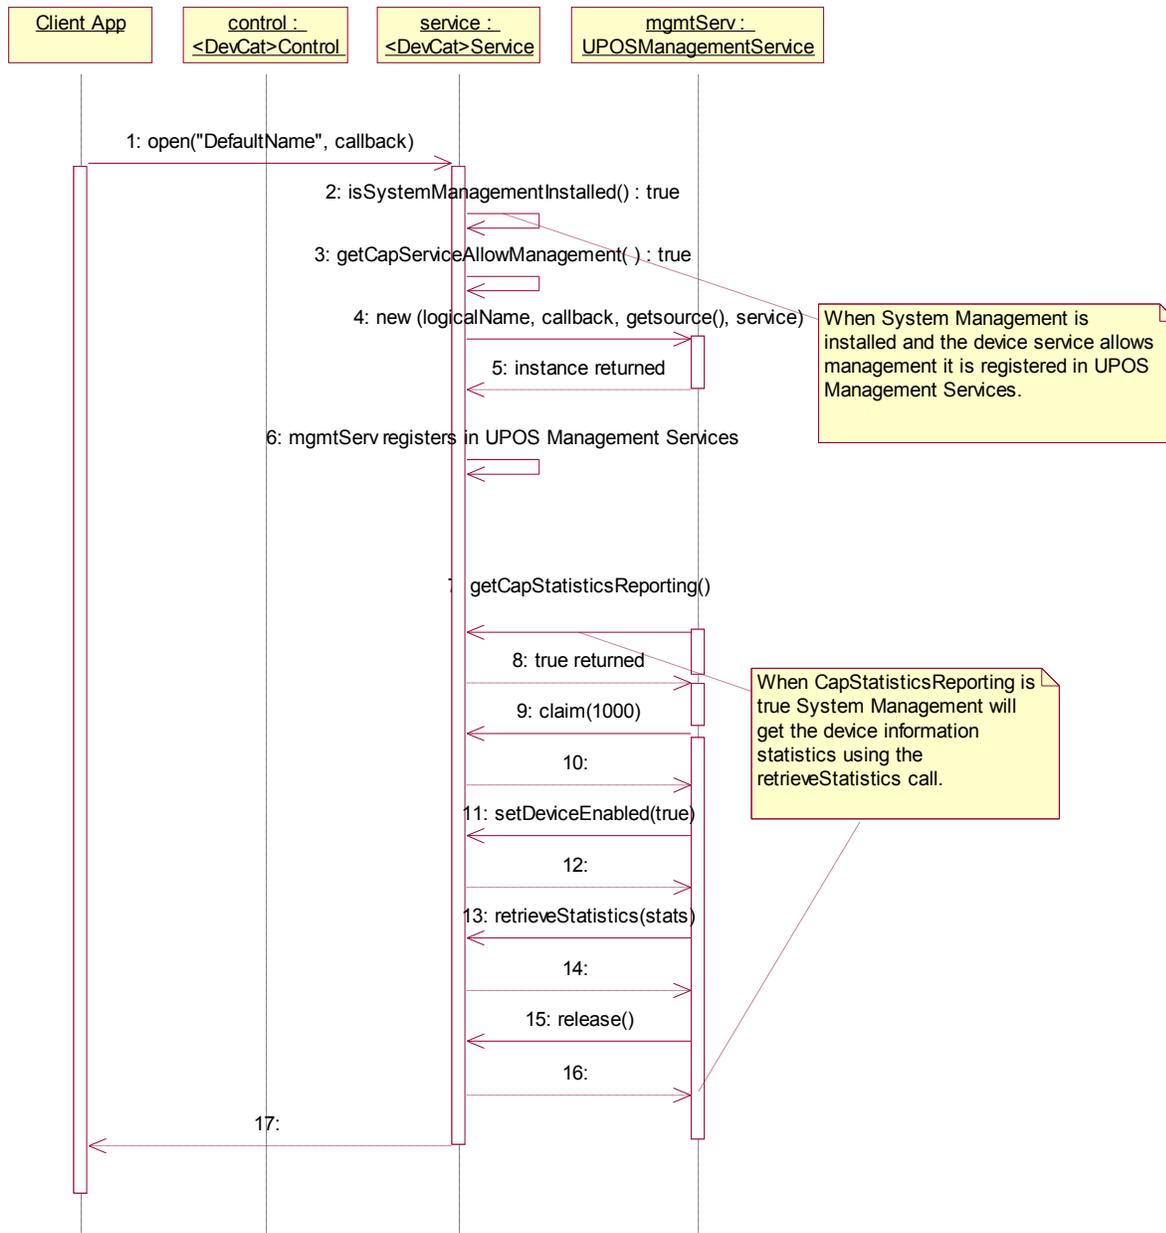

### 3.2.2 JavaPOS Device Registration Sequence Diagram (CapServiceAllowManagement = false)

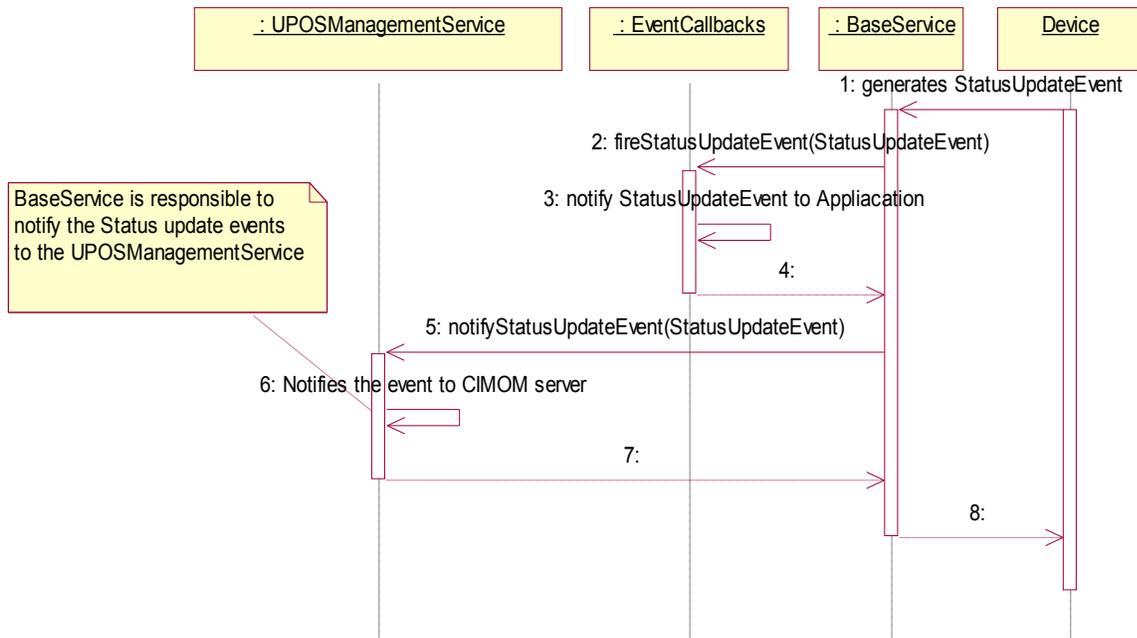

The following sequence diagram show the new sequences added to the Device Control to register the device with IBM Management Services at open() time.

### 3.2.3 JavaPOS Device Registration sequence diagram (CapServiceAllowManagement = true)

### 3.2.4 JavaPOS Events notification sequence diagram (CapServiceAllowManagement = true)

### 3.4 IBM UnifiedPOS Provider for System Management

The IBM Provider acts as driver and interface between the abstract world of the Common Information Model (CIM) and the UnifiedPOS device characteristics of Retail Hardware.

Following describes the providers supported by IBM:

#### 3.4.1 Instance Provider

An instance provider supplies instances of one or more given classes. For example, an instance provider can supply information regarding a POSPrinter device.

The information provided at CIM getInstance call will depend on the current state of the Device, when the **DeviceEnabled** property is false the Provider will generate an instance with all the properties available at open time plus all properties defined by UPOS statistics (device information and device specific properties).

Note: When device is not enabled the initial statistic properties detected during open time are used.

When the **DeviceEnabled** property is true the Provider will generate an instance with all the properties defined at the UPOS CIM Class.

CIM Method	WMI Equivalent	Supported by		
		Windows	IRES 2	SLED 11
GetInstance	GetObjectAsync	Yes	Yes	Yes
ModifyInstance	PutInstanceAsync	No	No	No
DeleteInstance	DeleteInstanceAsync	No	No	No
EnumerateInstances	CreateInstanceEnumAsync	Yes	Yes	Yes
EnumerateInstanceNames		No	Yes	Yes
ExecQuery	ExecQueryAsync	No	No	No

#### 3.4.2 Method Provider

A method provider allows CIMOM access to the methods of a class.

CIM Method	WMI Equivalent	Supported by		
		Windows	IRES 2	SLED 11
InvokeMethod	ExecMethodAsyn c	No	No	No

### 3.4.3 UPOS System Management Events in Windows

```
class UPOS_SysMgmtEvent : __ExtrinsicEvent
{
    String eventtype;
    String classname;
    String deviceid;
    String codename;
};
```

### 3.4.4 UPOS System Management Events in Linux

```
class UPOS_SysMgmtEvent: CIM_ProcessIndication
{
    string eventtype;
    string classname;
    string deviceid;
    string codename;
};
```

### 3.4.5 Description of Event fields

#### eventtype property

The type of event generated

<b>Values</b>	<b>Meaning</b>
addInstance	An UPOS device has registered with UPOS System Management
modifyInstance	The UPOS device has generated an Status Update Event
dellInstance	An UPOS device has unregistered with UPOS System Management

#### classname property

The CIM class name. Refer to section 1.5 in "CIM Class name" column for values.

#### deviceid property

The ID whom generates the event, currently this ID is created in base of the logicalName and CIM class name.

For example:

"POSPrinter1UPOS\_POSPrinter"

#### codename property

Property used when the event type is "modifyInstance". The value describes the type of device category-specific status change. Below the details for supported categories.

**UPOS Device Category                      Status Update Events (SUE) reported to System Management**

### 3.4.6 Windows Event Provider (WMI)

An event provider is a COM object that supplies WMI notifications of intrinsic and extrinsic events. An intrinsic event reports an internal data change to WMI, while an extrinsic event reports a user-defined event not described by an intrinsic event.

For example, an event in response to changes, creation, or deletion of the UnifiedPOS\_POSPrinter class would classify as an intrinsic event. An event that is generated on the basis of something other than the modification, creation or deletion of an existing WMI object is an extrinsic event.

IBM UnifiedPOS provider provides events for creation, deletion and modification of instances (all the supported UnifiedPOS Status Update Events(SUE) are reported as instance modification events). Even though these events could be classified as intrinsic events, they are implemented as extrinsic events, since they are instances of UPOS\_SysMgmtEvent, which is subclass of \_\_ExtrinsicEvent (See figure below). Intrinsic events are generated by the WMI, rather than by the provider. Intrinsic events that concern to UPOS System Management are \_\_InstanceOperationEvent and its subclasses. In order to receive intrinsic events, as a client application, it is necessary to subscribe a consumer with WMI for the intrinsic events specific to the CIM classes that are intended to monitor.

*Detail of class hierarchy around \_\_Event system class.*

*(This class hierarchy is shown using CIM Studio from the WMI Tools, see reference ahead)*

### 3.4.7 Linux Indication Provider

An indication is the representation of the occurrence of an event. The indication provider identifies when a specific type of event happens in the system. Then it converts the event into a CIM\_ProcessIndication and sends it to the CIM Server.

In order to be ready to receive those events the provider should be registered (this step is performed at installation time) and a client application should be developed to subscribe for specific indications. The following steps are required in the client application:

- Define an indication filter condition, to describe the event that should be monitored, for example, when an instance is created.
- Define an indication listener to specify how to handle the indication.
- Activate the subscription by associating a filter and a listener.
- Consume the indication when it arrives based on the configured filter and it will be handled in the registered listener.

The API JSR48 Java™ WBEM Services is a set of APIs for Web-Based Enterprise Management. It has implemented several functions that are useful to code a client application.
