THE INFORMATION PROVIDED IN THIS DOCUMENT IS DISTRIBUTED "AS IS" WITHOUT ANY WARRANTY, EITHER EXPRESS OR IMPLIED. IBM EXPRESSLY DISCLAIMS ANY WARRANTIES IF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE OR NON-INFRINGEMENT.
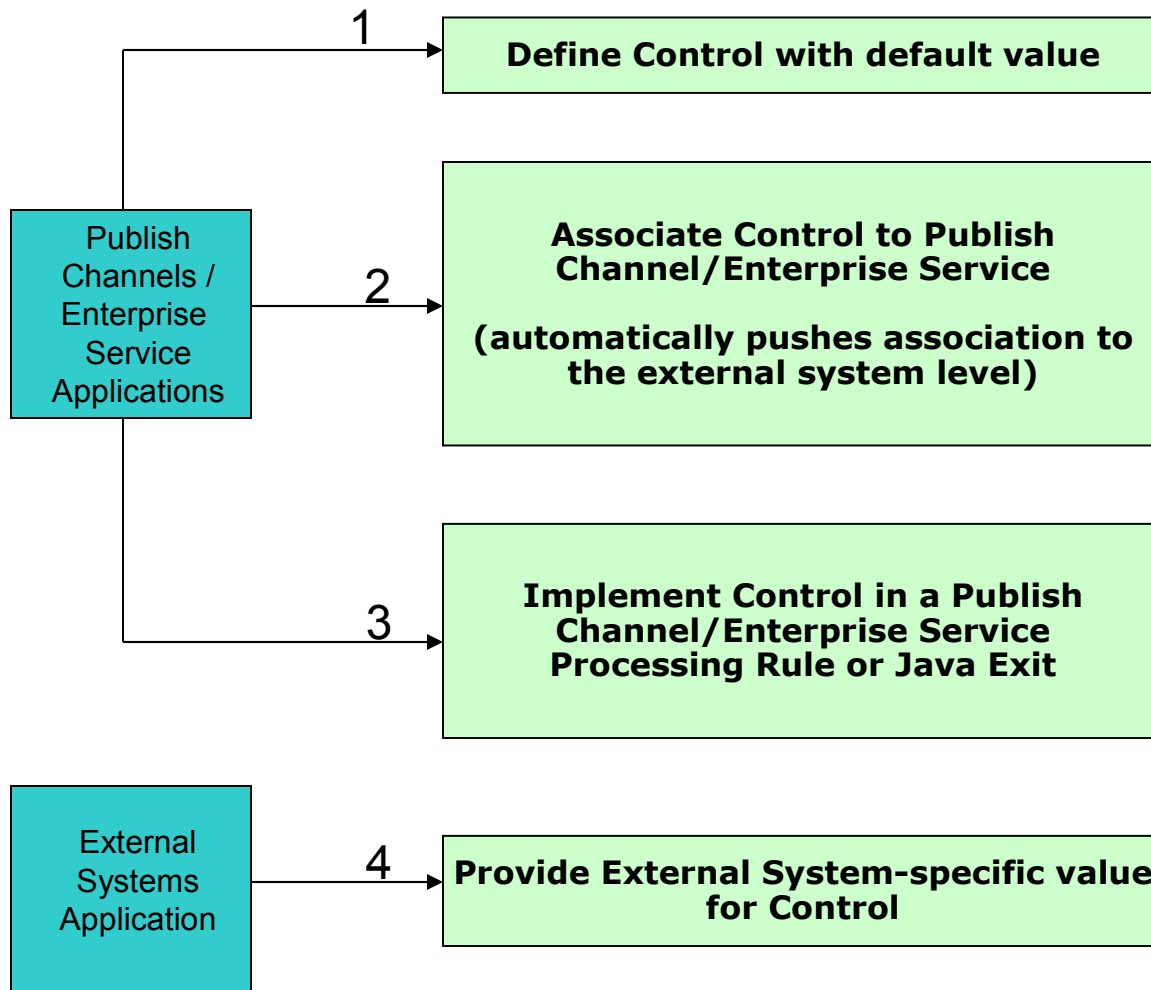

Agenda

1. Integration Controls

2. Collaboration Controls

3. XSL

Integration Controls – Drive integration processing behaviour through the setting of configurable values (not hard-coded). Can be used for filtering integration messages or conditionally setting values in an integration message

1

Define Control with default value

Publish Channels / Enterprise Service Applications

2

Associate Control to Publish Channel/Enterprise Service

(automatically pushes association to the external system level)

3

Implement Control in a Publish Channel/Enterprise Service Processing Rule or Java Exit

External Systems Application

4

Provide External System-specific value for Control

Collaboration Switches

MXCOLLAB table – Thru configuration, allows the **bypass** of some normal processing based on object and/or transaction ownership

IVMATCH - Invoice Match

RC   - Allow Receipts

PCID	OWNER1SYSID	OWNER2SYSID	PCVALUE
IVMATCH	EXT	EXT	1
IVMATCH	EXT	THISMX	0
IVMATCH	THISMX	EXT	1
RC	EXT	EXT	0
RC	EXT	THISMX	0
RC	THISMX	EXT	1

3 Rows per Control ID (PCID)

- Control Values:

1=Yes, bypass processing logic

0= No, do not bypass processing logic

- For some controls not all rows apply
- No Row created for THISMX – THISMX

default processing, behaves as if control value is 0

Collaboration Switches

IVMATCH – Invoice Match – controls whether invoice matching is validated and variance transactions are created.

<u>No Variance</u>
PO Receipt of 1 @ $12
      Receipt GL (Matrectrans) for $12
Invoice of 1 @$12
      Invoice GL (Invoicetrans) for $12

<u>Variance</u>
PO Receipt of 1 @ $12
      Receipt GL (Matrectrans) for $12
Invoice of 1 **@$13**
      Invoice GL (Invoicetrans) for $12
      Invoice Variance GL (Matrectrans) for $1

IVMATCH controls creation of the variance transaction

SAP adapter – Invoicing done in SAP and all variance transactions generated there. When invoice sent to Maximo to update WO, <u>no variance calculated</u>. SAP will send variance transactions to Maximo separately.

Collaboration Switches

IVMATCH – Invoice Match – controls whether invoice matching is validated and variance transactions are created.
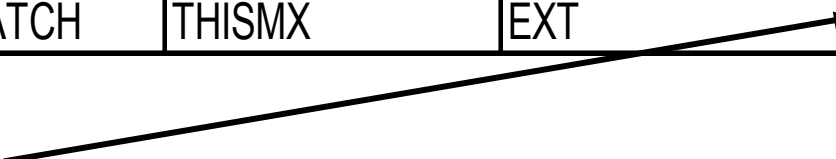

Invoice processing will determine the value of OWNER1SYSID/OWNER2SYSID and find the Control Value (PCVALUE) and use that during processing of invoice to determine if invoice variance transactions are created or not.

PCID - IVMATCH
OWNER1SYSID - hardcoded to THISMX
OWNER2SYSID - from Invoice OWNERSYSID column

PCID	OWNER1SYSID	OWNER2SYSID	PCVALUE
IVMATCH	EXT	EXT	1
IVMATCH	EXT	THISMX	0
IVMATCH	THISMX	EXT	1

Value of 1 means 'bypass' normal processing – no variance transaction created

Collaboration Switches

OWNERSYSID column – defined in Maximo base tables and included in integration message schemas

Maximo – defined through MAXVAR: MXSYSID with default value of MX

THISMX = MX, null, THISMX
EXT = EXT or any value other than MX, null, THISMX

You can add additional rows for your individual external systems as needed
(restart of server is need when mxcollab values are updated):

| PCID	OWNER1SYSID	OWNER2SYSID	PCVALUE
IVMATCH	EXT	EXT	1
IVMATCH	EXT	THISMX	0
IVMATCH	THISMX	EXT	1
IVMATCH	THISMX	ORA	0
IVMATCH	THISMX	SAP	1

XSL

eXtensible Stylesheet Language

XSL is a language for expressing stylesheets.

**XSL is a family of recommendations for defining XML document transformation and presentation.**

Integration Framework

Business Objects (WO, PO, Item etc)

Object Structure

Channels

XSL

XML Transformation

JMS Queue

JMS Queue

Enterprise Service

XSL

External System

XSL file can be part of the Application EAR file or a file path accessible by the Maximo server

XSL Transformation

XML

XSLT Processor

XSL Stylesheet

Transformation rules

Different XML
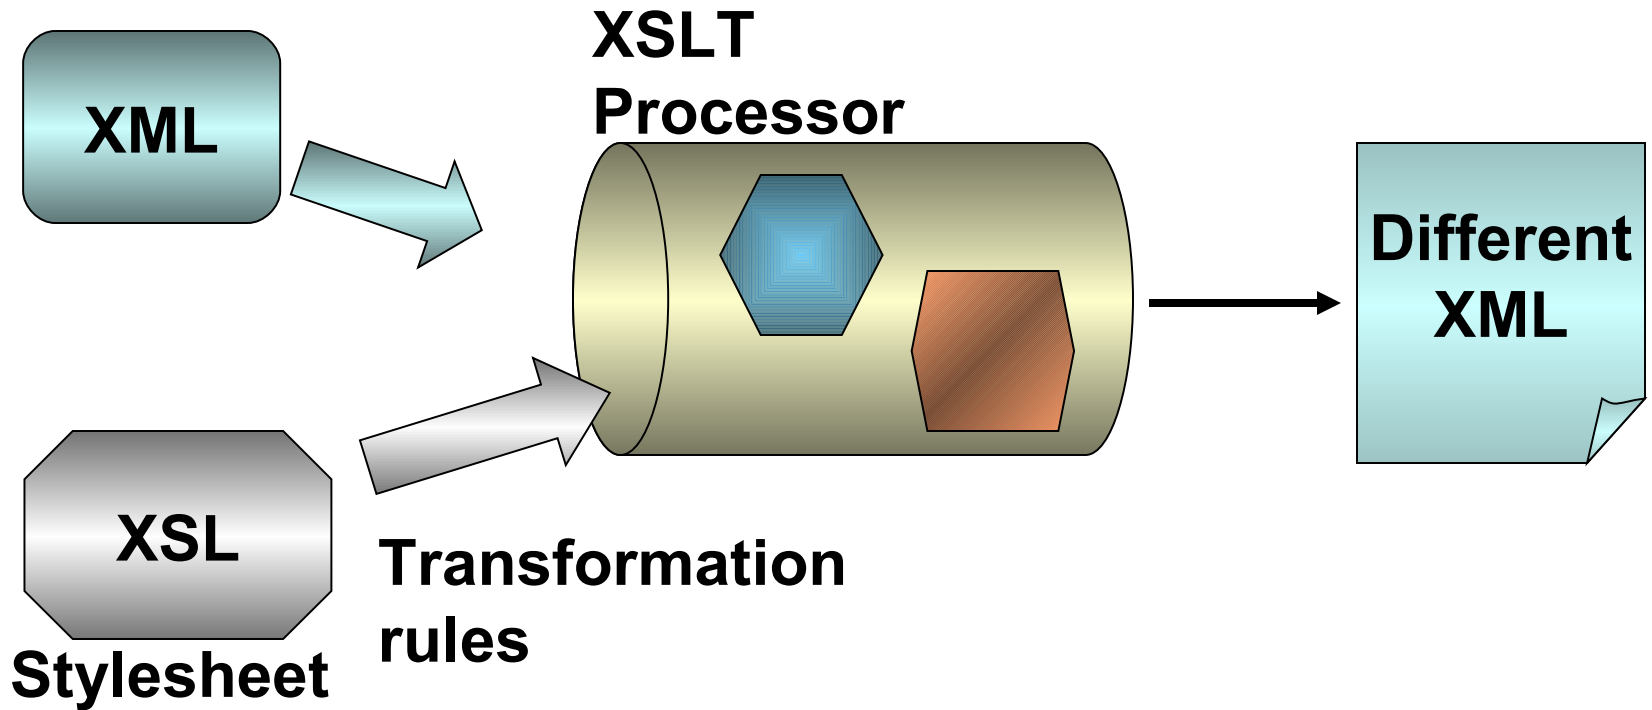

XSLT is interpreted by the processor that performs the formatting task
