%_aal2_resources_availability	PERCENT AGE	FLOAT	The transport resource request success ratio [%]. This KPI describes the average success rate of the transport resource reservation attempts for AAL2 type connections. The low success rate increases the number of unsuccessful RAB setups and requires further troubleshooting in transport layer. This KPI is based on AAL2 Resource Reservation measurement in RNC Counters - Transport and HW part in Nokia WCDMA RNC Product Documentation.	100 * ({Nokia.resource_reservation.aal2_succeeded})/({Nokia.resource_reservation.aal2_succeeded} + {Nokia.resource_reservation.aal2_rejected} + {Nokia.resource_reservation.res_ext_cap} + {Nokia.resource_reservation.res_int_cap} + {Nokia.resource_reservation.res_other})	Average, avg, nkavcacbh

The RS8234 automatically detects active CPCSPDU time out for reassembly channels. A PDU time out occurs when a partially received PDU does not complete within a set time period. When it detects this timeout condition, the RS8234 provides a status queue indication to the host. This indication allows the host to recover the buffers held by the partially completed PDU. When the serving RNC starts an immediate inter RNC (intra frequency) hard handover attempt caused by SHO incapability. An immediate HHO attempt is started if the downlink Ec/No of the neighbouring cell exceeds considerably the Ec/No of the best active cell even in one event triggered (event 1A or 1C) measurement report. The parameter HHO Margin for Peak Ec No determines the maximum allowed difference between the downlink Ec/No of the neighbouring cell and the Ec/No of the best active cell in situations when the RNC is	PMMOResult_Intra_System_Handover.M1008C5	Sum, nkcttbh, nkrttbh, tot

Table entry for that channel. This allows COM buffers to be placed on queues 16 through 31 and not be stopped by the firewall. If the RX\_COUNTER[15..0] for a channel is zero when a buffer is required, then the Rsm coprocessor declares a firewall condition. If the firewall condition occurs on a BOM or SSM, the RS8234 writes a status queue entry with the FW bit set, and a NULL in the BD\_PNTR field. If the firewall condition occurs on a COM or EOM, the Rsm coprocessor initiates EPD and writes a status queue entry with the FW and EPD bits set. It then discards cells on that channel, until the channel has recovered from the firewall condition. All AAL5 PDUs discarded under the firewall condition cause the AAL5\_DSC\_CNT counter to be incremented. Recovery occurs
