**Innovate2013**

The IBM Technical Summit

# Agenda

# A lack of continuous delivery impacts the entire business

## CHALLENGES

**Costly, error prone** manual processes and efforts to deliver software across an enterprise

**Slow** deployment to development and test environments leave teams **waiting and unproductive**

**Upgrade risk** due to managing multiple application configurations and versions across servers

Customers

**41%**

Experience development delays

Business Owners

**34%**

Experience deployment delays

Development/  
Test

**45%**

Experience production delays

Operations/  
Production

**4-6 weeks**

To deliver code changes

# Agenda

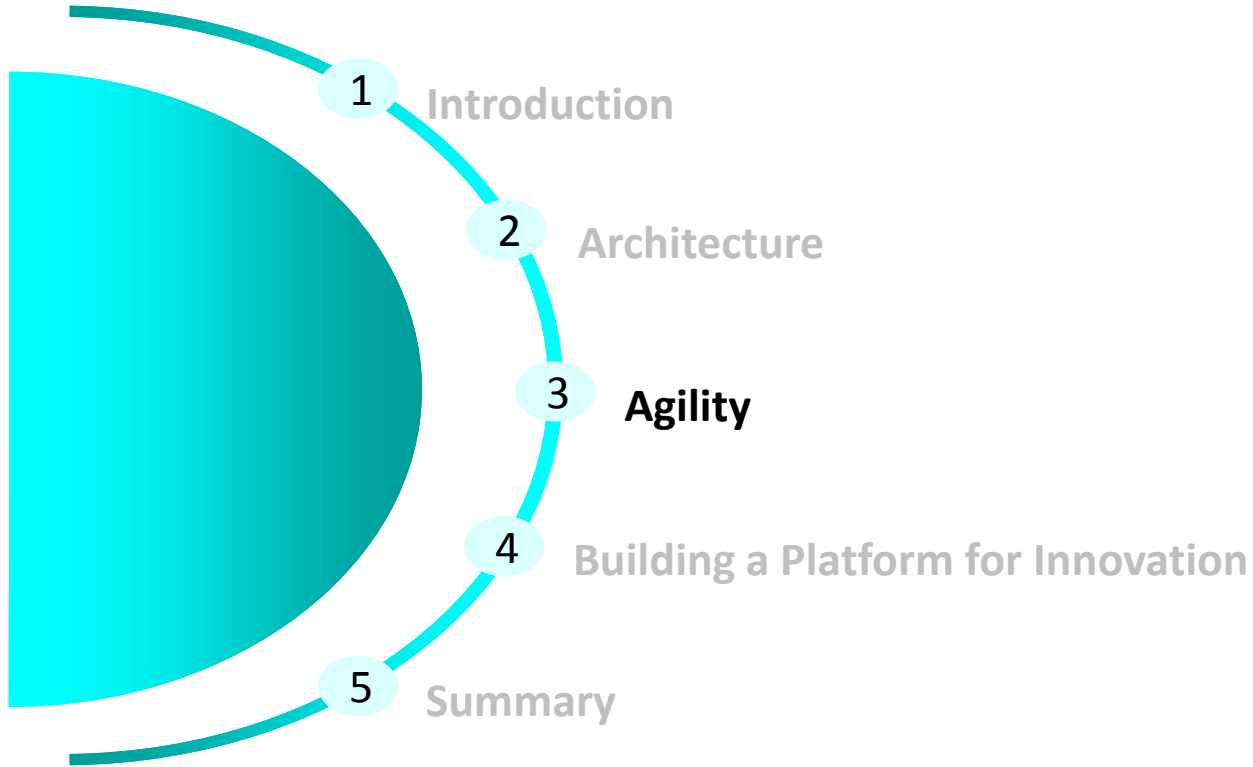

# Can you spot the innovation enablers?

# Proven architecture practices

# Agenda

# Iterative development practices

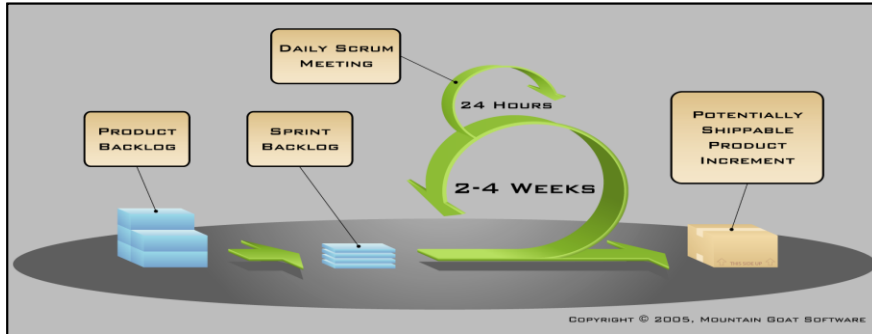

- Iterative development
  - Incremental releases provide improvements in capability until the final system is complete
- Risk-value lifecycle
  - Phases represents the strategic plan for the project and drives the goals and objectives of each iteration
- Shared Vision
  - Ensures that all stakeholders share a common view of the problems being solved
- Use Case-Driven Development
  - Use cases make natural units of implementation in an iterative development approach
- Release Planning
  - Focused on the just-in-time project planning needed to scope the release of executable software within an iteration

# Agile practices

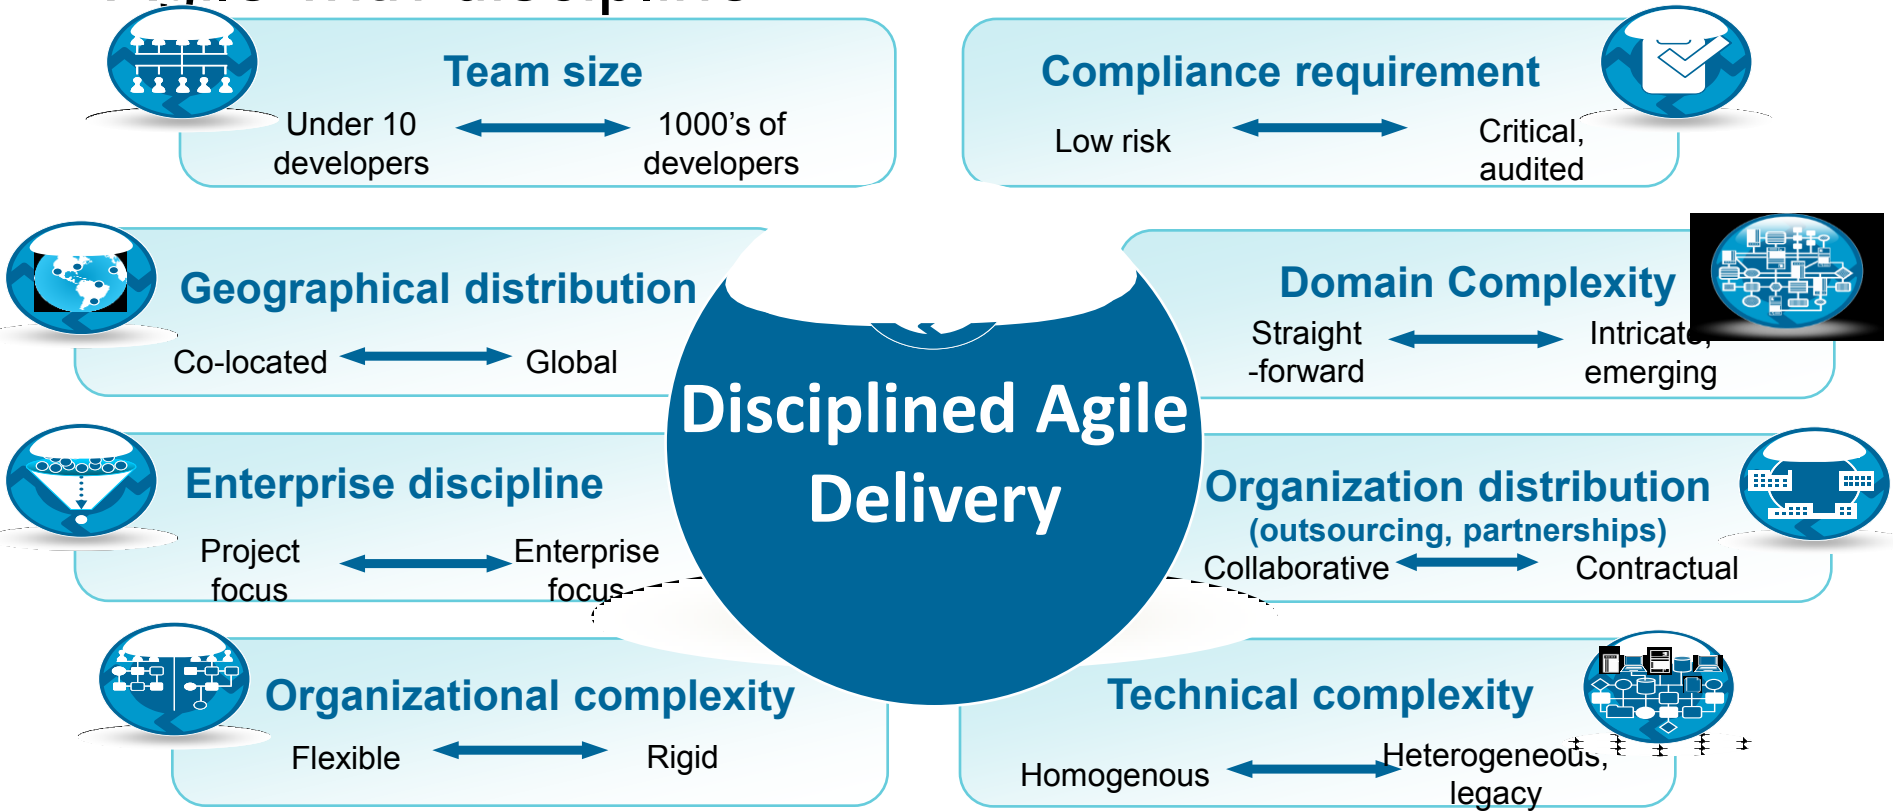

- Test-Driven Development (TDD)
  - Creating tests that are a specification of what the code should do first
- Continuous Integration
  - Encourages frequent the integration and testing of programming changes
- Refactoring
  - Changing an existing body of code in order to improve its internal structure

- Whole Team
  - A focus on the value of highly-collaborative teams as exemplified by Scrum's daily standup meeting. Instills of sense of collective ownership and responsibility
- User Story-Driven Development
  - Capture requirements in a lightweight manner. Encourages collaboration with the relevant stakeholders throughout a project
- Team Change Management
  - Supports the logging of defects or new requirements, by any member of the team, that are within the scope of the current iteration

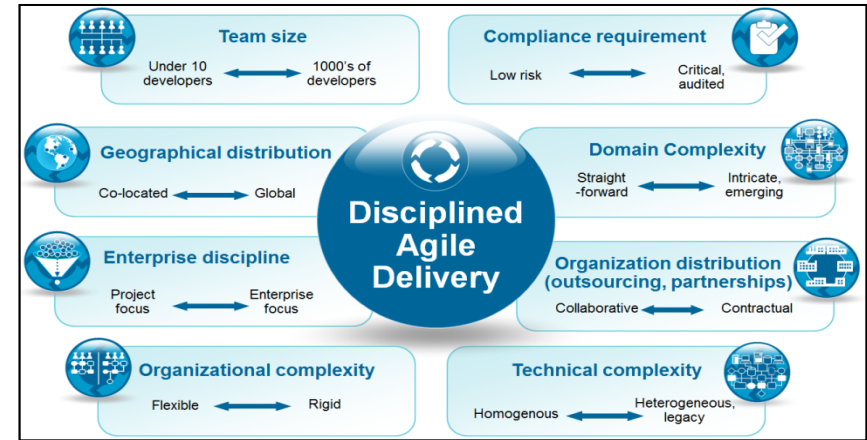

# Agile with discipline

# “Disciplined Agile Delivery” practices (examples)

- Measured Performance
  - This practice allows project and portfolio-level measurements to inform key business decisions
- Formal Change Management
  - Applied when change approval is required from stakeholders outside of the project team, or when a deliverable has been baselined as part of a contract and the deliverable needs to be modified
- Concurrent Testing
  - Often an independent test team is present (especially in larger organizations) that typically provide a level of user acceptance testing before the solution is put into production

# Practice summary

## Traditional

## Iterative

## Agile

## Disciplined Agile

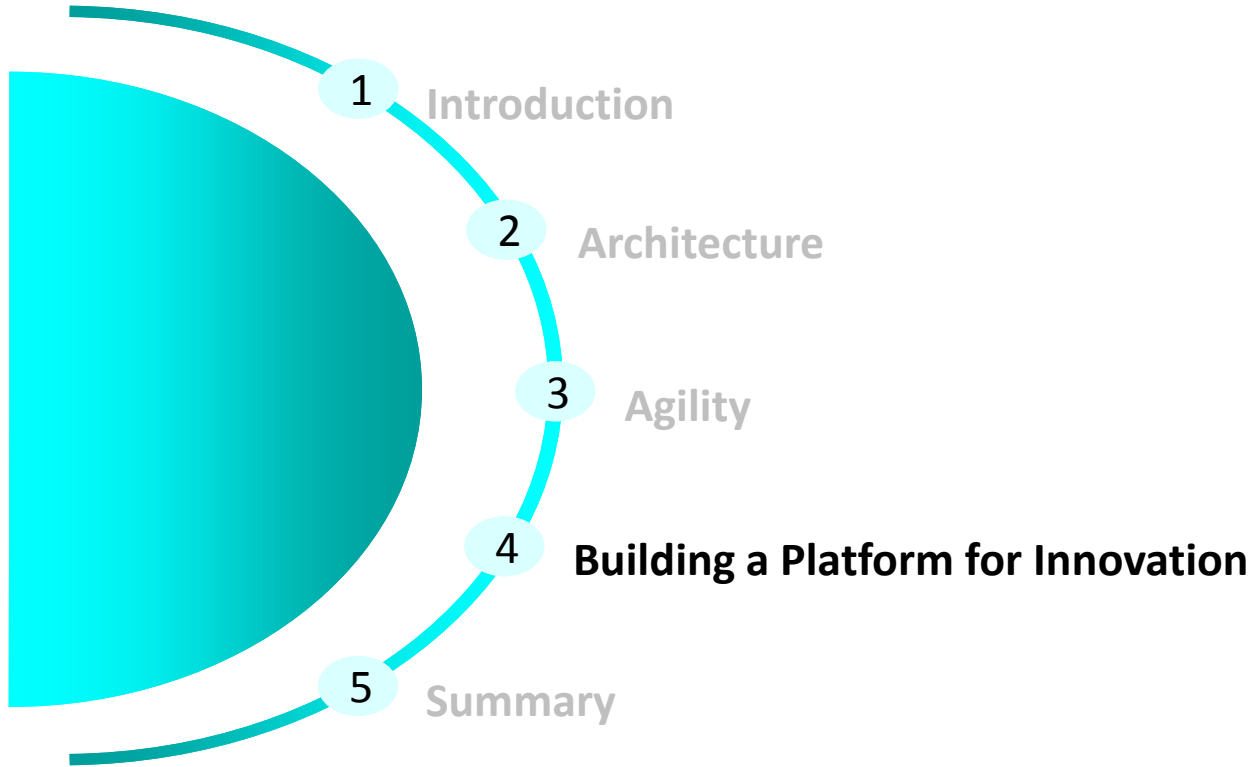

- Multiple Views
- Quality Attribute-Driven Development
- Component-Based Development
- Asset Reuse
- Decision Capture
- Architecture Proving

- Iterative Development
- Risk-Value Lifecycle
- Shared Vision
- Use Case-Driven Development
- Release Planning

- Test-Driven Development
- Continuous Integration
- Refactoring
- Whole Team
- User Story-Driven Development
- Team Change Management

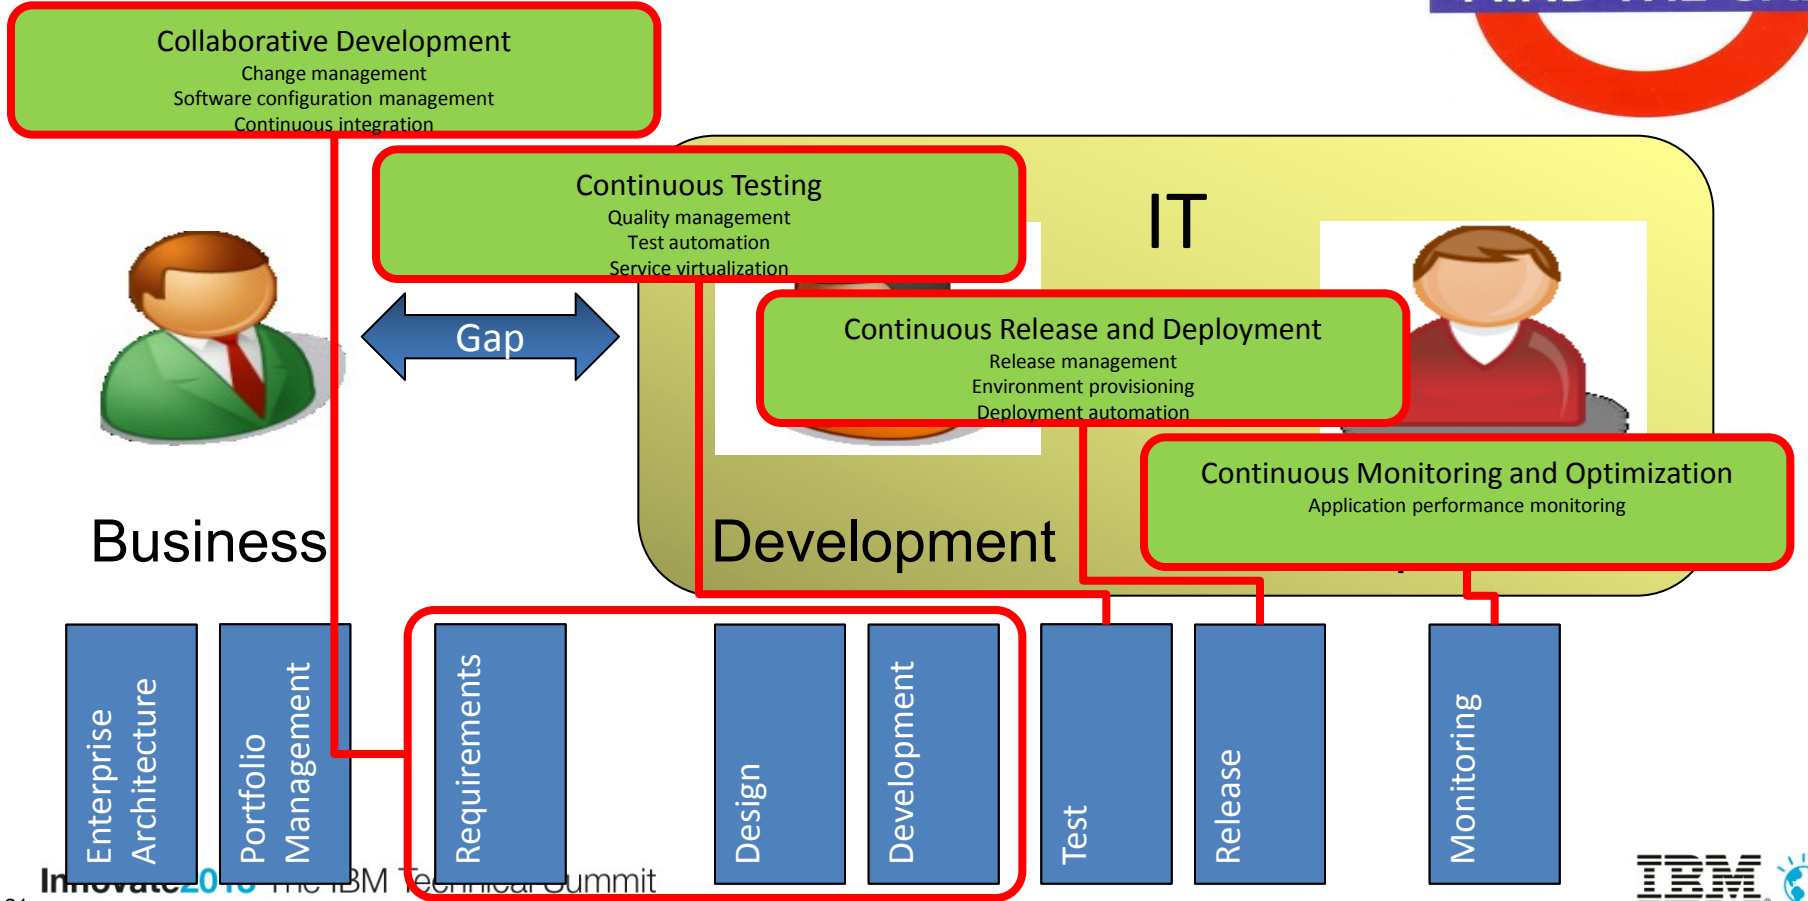

- Measured Performance
- Formal Change Management
- Concurrent Testing

# Agenda

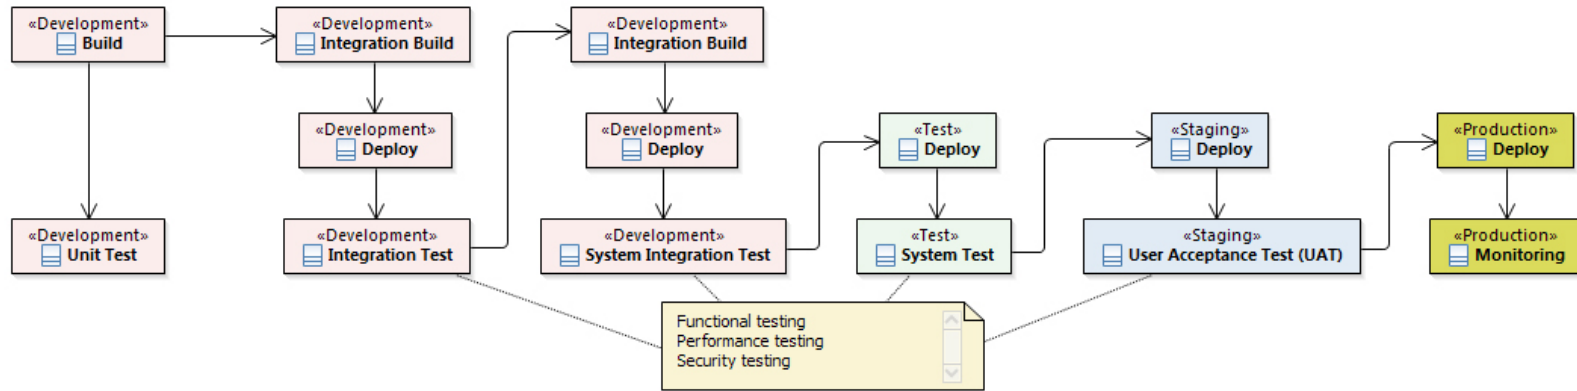

# Technology imperatives

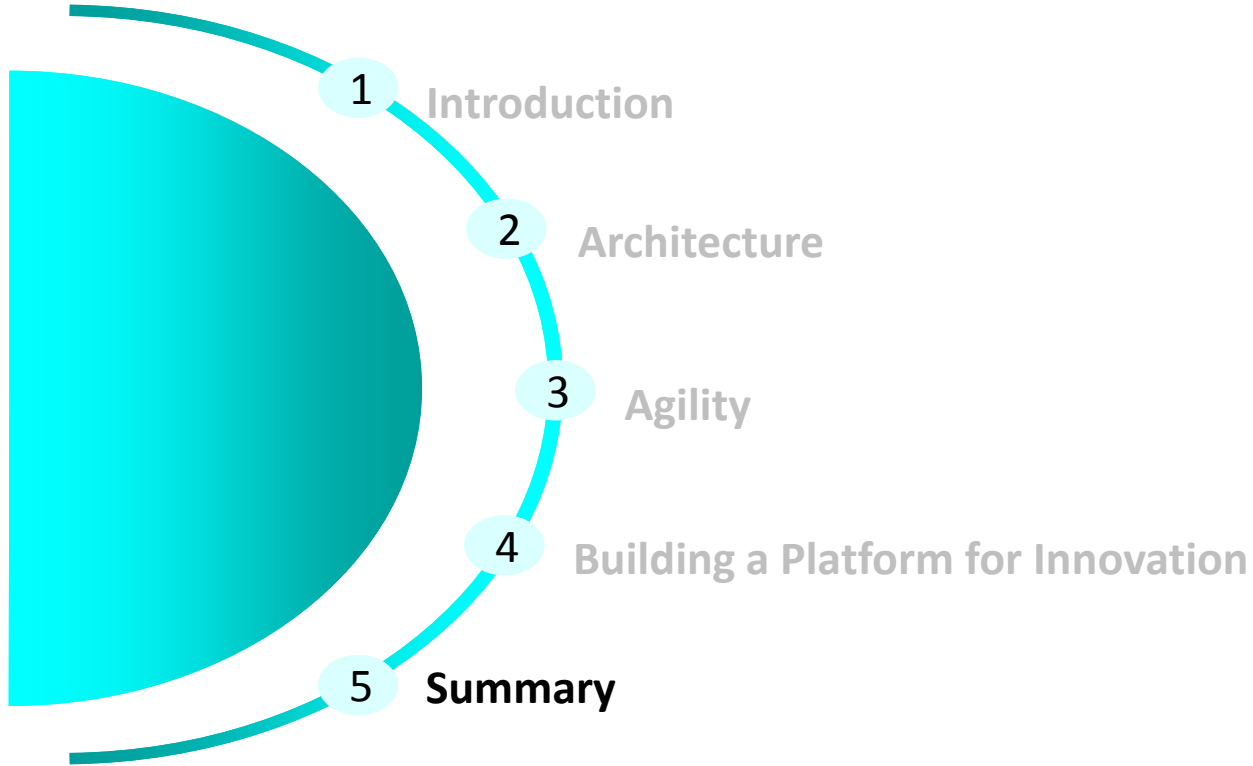

MIND THE GAP

# DevOps practices

# Agenda

# Summary

- A poor foundation can stifle innovation
- Architecture and agility are complementary innovation enablers
- With the right foundation, IT enables the enterprise
- The “next big thing” after agile is ... DevOps!

THANK YOU
