

Modern Application Architectures for COBOL Developers -Continuing the drilldown

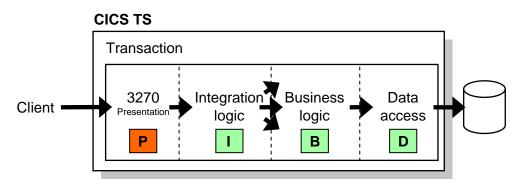

Agenda

- Introduction
- Middle Tier
 - WebSphere Application Server
 - J2EE
 - Servlets, JSP's and JSF
 - EGL
- Client
 - HTML
- Connectivity
 - Web Services, XML, SOAP, WSDL
- Business Tier
 - CICS
 - COBOL

Modern "CICS" architecture

 Best practice in CICS application design is to separate key elements of the application, in particular:

—	Presentation logic	3270, HTML, XML
_	Integration or aggregation logic	Menu, router, tooling
_	Business logic	COBOL, PL/I, Reusable component
_	Data access logic	VSAM, DB2, IMS,
_		

 Provides a framework for reuse and facilitates separation of concerns, clear interfaces, ownership, and optimisation

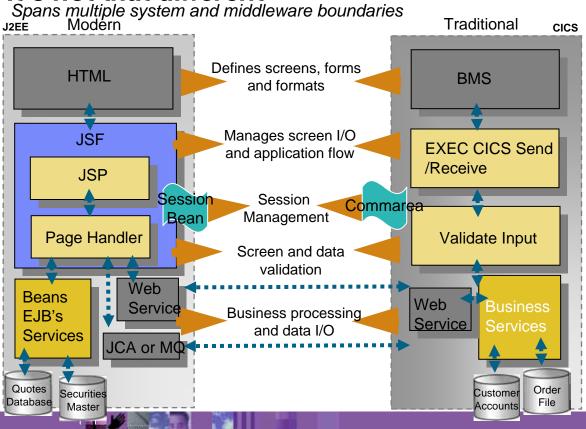

"Modern" Multitier Architecture

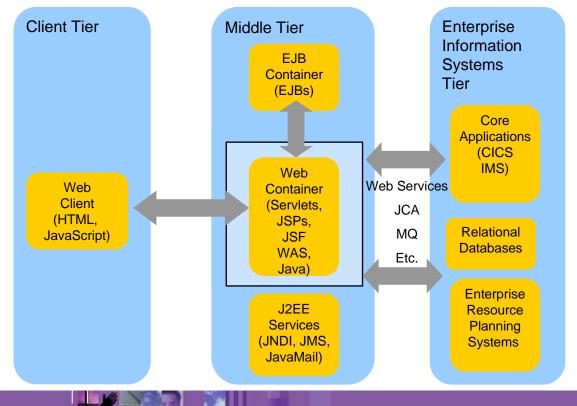

It's not that different Spans multiple system and middleware bound

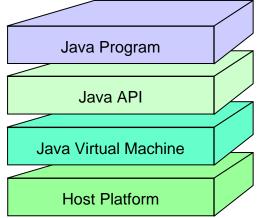

The Middle Tier

The Java platform

- Java is an object-oriented programming language developed by Sun Microsystems
- Java has a set of standardized class libraries that support predefined reusable functionality
- Java has a runtime environment that can be embedded in Web browsers and operating systems
- Many popular UI / Session frameworks are built on Java processing

Procedural and object oriented approaches – example

- System requirement
 - Banking system model withdrawing money from a savings account
- Procedural approach
 - Identify where the data is stored
 - List the algorithmic steps necessary to perform the action
- Object approach
 - Identify what objects are involved; these objects will directly relate to real life objects (Bank, SavingsAccount, Teller and Transaction)
 - Show how these objects interact:
 - To enforce business rules for withdrawals
 - To modify the balance

Both have advantages in SOA – in the right place

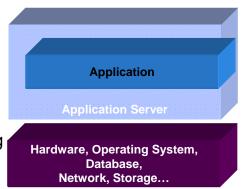

What is an Application Server?

- Provides the infrastructure for running applications that run your business
 - Insulates applications from hardware, operating system, network...
 - Provides a common environment and programming model for applications
 - Write once, run anywhere (J2EE)
 - Platform for developing and deploying Web Services
 - Provides a scalable, reliable transaction engine for your enterprise

What is WebSphere Application Server?

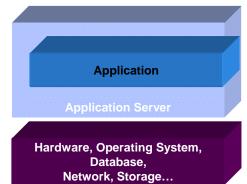

- WebSphere Application Server is a platform on which you can run Javabased business applications
- It is an implementation of the Java 2 Enterprise Edition (J2EE) specification
- It provides services (database connectivity, threading, workload management, and so forth) that can be used by the business applications

What is J2EE?

- J2EE Java 2 Enterprise Edition
 - A run-time platform used for developing, deploying, and managing multitier server-centric applications on an enterprise-wide scale

Applets

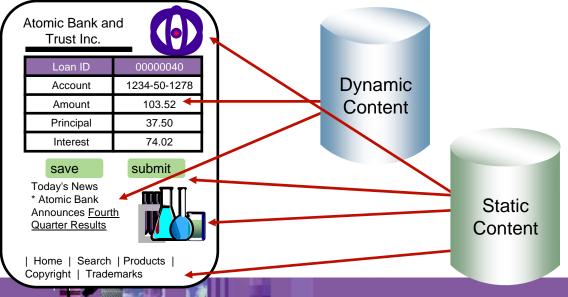

- · Graphical Java components which typically execute within a browser
- Can provide a powerful user interface for other J2EE components
- Application client components
 - Java programs which execute on a client machine and access other J2EE components
- Web components
 - Servlets and JavaServer Pages
 - These provide the controller and view functionality in J2EE
- Enterprise JavaBeans
 - Distributed, transactional components for business logic and database access

11

Web page content

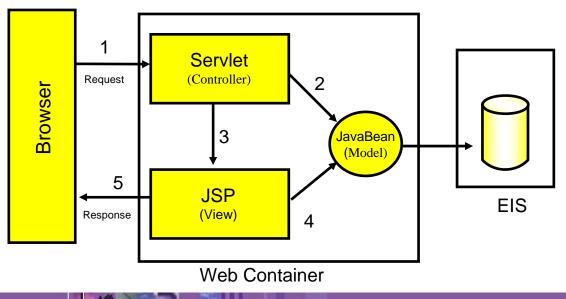

- Content delivered to a client is composed from:
 - Static or non-customized content
 - Customized content
- Page layout and style are managed through HTML, XSL

Typical J2EE Web Application Model

 A request is sent to a servlet that generates dynamic content and calls a JSP page to send the content to the browser, as shown:

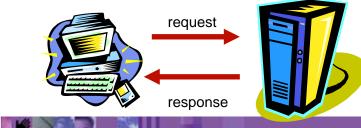

MVC Design Pattern

What Is a Servlet?

- A servlet is a standard, server-side component of a J2EE application which executes business logic on behalf of an HTTP request
 - Runs in the server tier (and not in the client)
 - A pure Java alternative to other technologies, such as CGI scripts
 - Managed by the Web container
- Servlets form the foundation for Web-based applications in J2EE

A Simple Java Servlet Example

```
package com.ibm.example.servlet;
import javax.servlet.http.HttpServlet;
import javax.servlet.http.HttpServletReguest;
import javax.servlet.http.HttpServletResponse;
import javax.servlet.ServletException;
import java.io.IOException;
import java.io.PrintWriter;
public class VerySimpleServlet extends HttpServlet {
 public void doGet(HttpServletRequest request,
                    HttpServletResponse response)
                         throws ServletException, IOException {
        String browser = request.getHeader("User-Agent");
        response.setStatus(HttpServletResponse.SC_OK); // default
        response.setContentType("text/html"); // default
        PrintWriter out = response.getWriter();
        out.println("<HTML><HEAD><TITLE>Simple servlet");
        out.println("</TITLE></HEAD><BODY>");
        out.println ("Browser details: " + browser);
        out.println("</BODY></HTML>");
```

What is JSP (JavaServer Pages)?

- JavaServer Pages is a technology that lets you mix static HTML with dynamically generated HTML
- JSP technology allows server-side scripting
- A JSP file (has an extension of .jsp) contains any combination of:
 - JSP syntax
 - Markup tags such as HTML or XML

JSP or Servlet?

- Writing HTML code in a servlet is tedious and difficult to maintain
- Java code embedded in a JSP is difficult to reuse and maintain
- Use servlets to:
 - Determine what processing is needed to satisfy the request
 - Validate input
 - Work with business objects to access the data and perform the processing needed to satisfy the request
 - Control the flow through a Web application
- Use JSP pages to format and displaying the content generated by your servlets

What is JavaServer Faces?

- JavaServer Faces (JSF) is a *framework* for developing Webbased applications.
 - A framework is a skeleton or foundation of an application
 - Provides code, resources, concepts and best practices upon which applications are constructed
- The main components of JavaServer Faces are:
 - An API and reference implementation for:
 - representing UI components and managing their state
 - handling events, server side validation, and data conversion
 - defining page navigation
 - supporting internationalization and accessibility
 - providing extensibility for all of these features
 - A JavaServer Pages (JSP) custom tag library for expressing UI components within a JSP page
 - EGL, IBM's enterprise generation or *business* language supports JSF_____

What is EGL?

Enterprise Generation Language (EGL)

- Is a development environment and programming language that lets users write full-function applications quickly
- Can be used to create text-based user interfaces for migration of existing applications
- Focus is on the business problem rather than on software technologies
- Is written independently of the target platform
- Can be generated into Java or COBOL programs
- Is well-suited to procedural programmers
- Is a high-level language which promotes iterative development and testing early in the development cycle

EGL - generation

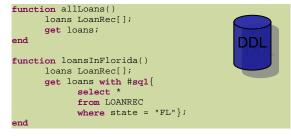

- Runtime code generated for appropriate platform
 - Java for Windows, Linux, and so forth
 - COBOL for z/OS
 - Uses SQL transparently
- EGL can be used to create "full" Web-based application including Web UI's
 - JavaServer Faces application generated for runtime code
 - Runs on WebSphere Application Server

WebSphere Application Server

EGL – key high level language abstractions

- Data Access:
 - -Common Verbs for data access (Get, Add, Replace, Delete)
 - -Abstracts access to SQL, Indexed, Relative, Serial, DL/I, MQ, Services
 - -Allows complete access to SQL statement if needed
 - -Common Error Handling

- Validation/Editing Rules
 - -Define formatting & validation rules once in common place
 - -Reuse data items for Records, screens, reports

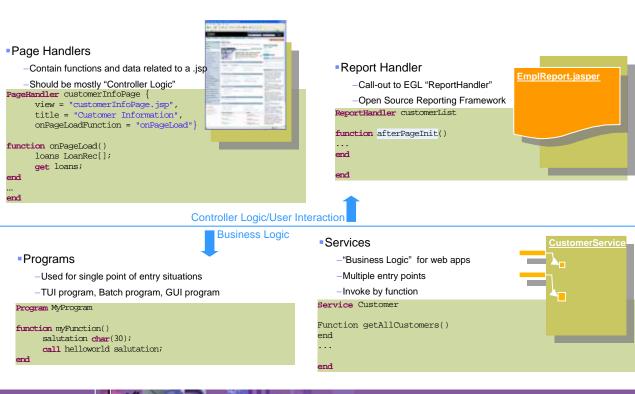

```
    Remote Invocation
    - Call COBOL, RPG, C, Java
    - Linkage information separated from code...simplifies development
    - JDBC, CICS, IMS
    function loansInFlorida()
        startTransaction(myLoanTransaction);
        ...
        rollback();
    end
```

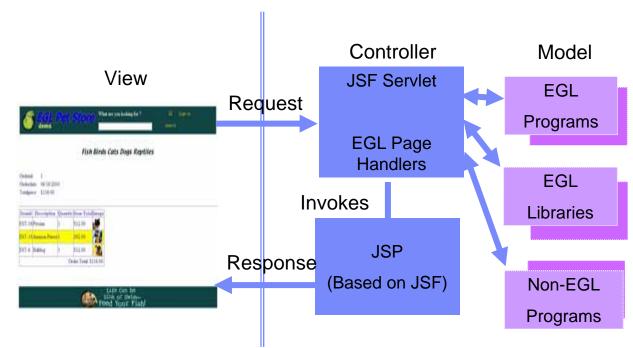

IBM

EGL – simple programming model

EGL and JSF

JSP's / JSF / EGL and COBOL

- JSP's are synonymous with EXEC CICS Send Map and Receive Map processing
 - If a CICS program only processed screens to request business processing – or work – it would need to either Link, XCTL or Calls in COBOL.
 - JSP is a similar concept.
- Java Server Faces provides a framework to build UI oriented forms linked with processes such as Web Services.
 - Performs similar function as existing CICS programs which perform send/receive processing and input validation.
- Java server faces consist of Java Server pages which handle the build and catching of forms and user information – and page handlers which validate information and provide control calls into back end services.

IBM Software Group | WebSphere software

EGL Web – C.I.C.S. Programming Similarities

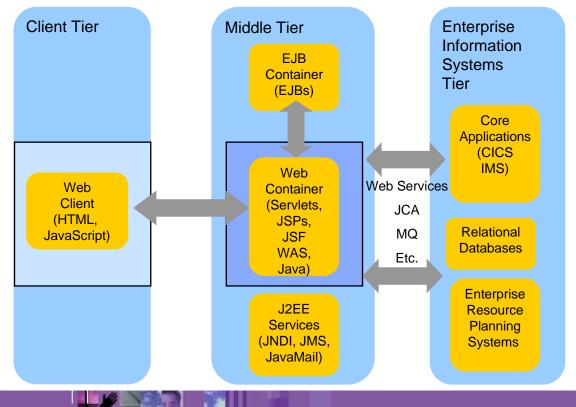

package pagehandlers; import data.*;

PageHandler ordersbycustomer (view="ordersbycustomer.jsp", onPageLoad=onPageLoad)

```
//Page data - equivalent to I/O area for screen values
                                                     customer Customer:
                                                     dt char(33);
                                                     orders order[];
                          Page Data
                                                     sel int[] {selectFromList=Orders}; //Integer array - bind to Row Selection
                                                     OrderRec Order: //Single Order record - for update of checked rows
                  BMS Map Fields
                                                     //vars for combo-box
                                                     comboBoxSel char(12) {selectFromList=valueListArray,selectType=value}; //Display
                                                                                    //Temp holding array for state values
                                                     valueListArray char(12)[];
                                                     int :
                                                                        //Loop ctr - max number of rows in Customers dynamic array
                                                     i int :
                                                     s int:
                                                     Function onPageLoad(cid int) //Receives control upon entry
                                                     dt=sysvar.currentFormattedDate;
I oad values from the database
                                                     customer.CUSTOMER ID=cid;
                                                     CustomerLib.getCustomer(Customer); //Load customer data from the database
                                                     s = sqlcode;
                         "Send map"
                                                     OrderLib.ordersByCustomer(cid, Orders); //Load order data from the database
                                                    end
                                                     Function updateOrders() //Receives control upon button-clicked event
                                                         arrayMax int; //sel (array) is created to the size of # of checked rows
                     "Receive map"
                                                         arravMax = size(sel); //Get this size (= # of checked rows)
                                                         i int; //Array loop ctr
                                                         i = 1; //Initialize loop ctr
                                                         j int; //Declare temp variable to hold indexed value in sel
      Process user-input values
                                                         while (i <= arrayMax) //Loop through all checked rows in Sel array
                                                             i = sel[i];
                                                                            //assign each sel[i] value to temp var.
                                                             move Orders[j] to OrderRec byname; //Move the fields
                                                             orderrec.ORDER STATUS = comboBoxSel;
                 Update Database
                                                             OrderLib.updateOrder(OrderRec); //Update the DB
                                                             i = i + 1;
                                                                            //Don't forget to increment the array loop ctr
                                                         end
```

IBM

The Client

HTML

- HTML performs similar processing as BMS or MFS maps. It defines the screens and fields, colors, and interactions, although the technologies and implementations of course are different.
- Hypertext Markup Language consists of:
 - Hypertext. The way of creating web documents and of linking multiple documents together. HTML offers support for both document as well as multimedia links.
 - Tags or controls: Pieces of code that are used to create links. All browsers let you know when you've selected an active area of the screen.
 - For example <head> marks where a heading starts and </head> marks where it ends.
 - Popular tags include:
 - Text Tags Logical structure for content
 - Link Tags to links such as hyperlinks, image links
 - Style sheet tags how content is rendered
 - and many more
- See the green screenshot displayed inside of the WDz BMS Map Editor, together with with the BMS Macros that are input to generate the code – that upon execution causes the "green screen" to be displayed.
 - WDz provides similar support for HTML screens

BMS and HTML

BMS

Name and overall format of map - Includes items such as input/output, whether keyboard should be enabled, types of terminal, colors, size etc. are defined.

SAMPDB2 DFHMSD

TYPE=&SYSPARM,MODE=INOUT,LANG=COBOL,STORAGE=AUTO,

CTRL=FREEKB,EXTATT=YES,TERM=3270-2,TIOAPFX=YES,

MAPATTS=(COLOR,HILIGHT,OUTLINE,PS,SOSI),

DSATTS=(COLOR,HILIGHT,OUTLINE,PS,SOSI)

Connectivity

Web Services

- Architecture for
 - Application to application
 - Communication
 - Interoperation
- Definition:
 - Web Services are software components described via WSDL that are capable of being accessed via standard network protocols such as SOAP over HTTP
- WS-I.org (Web Services Interoperability Organization)
 - Ensure interoperability

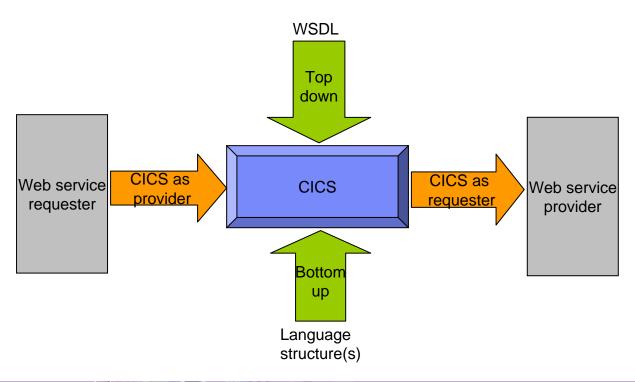

The entire industry is agreeing on one set of standards !!

RGANIZATION

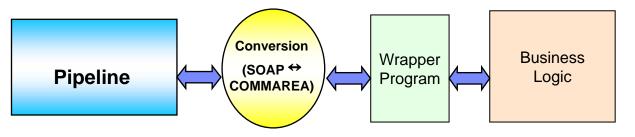

Web Services Enablement Styles

Where a wrapper program fits in

IBM

XML Terminology

- <u>SOAP</u> and <u>WSDL</u> are based on XML
- A tag / attribute based syntax
- Format of XML file described in
 - DTD Document Type Definition
 - XSD XML Schema Definition
- XML files are
 - Well-formed (syntax is ok matching tabs, etc.)
 - Valid (obeys rules in DTD or XSD) (CICS can validate)
- Namespaces
 - Avoids name collisions
 - A set of names (XML tags) that apply to a certain space in a document

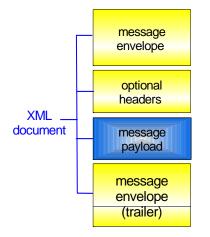

XML – Basic Parts

<?xml version="1.0" standalone="no" encoding="UTF-8" ?> A XML Declaration <! DOCTYPE shirt SYSTEM "http://shirts.com/xml/dtds/shirt.dtd"> Document <shirt> root element type <model >CLCS Tee</model > — child of root declaration <brand>Tommy Hilltop</brand> end tag start tag <price currency="USD">10.95</price> –attribute <fabric content="70%">cotton</fabric> attribute <fabric content="30%">pol yester</fabric> <on sal e/> empty element <opti ons> <col or0pti ons> <col or>red</col or> <col or>whi te</col or> </col orOpti ons> <si ze0pti ons> <!-- Medium and large are out of stock --> comment <si ze>smal | </si ze> <si ze>x-l arge</si ze> </sizeOptions> </options> <order info>Call ☎ </order info> entity reference </shirt>

Simple Object Access Protocol (SOAP)

- An XML-based protocol for exchanging of information in a decentralized, distributed environment
- An open standard whose main goal is to facilitate interoperability
- A protocol which is not tied to any operating system, transport protocol, programming language, or component technology

- XML Message Envelope
 - -service requested
 - -routing information
 - -message type
 - -date/time stamp
- XML Message Headers
 - -authentication
 - -transaction context
- XML Message Payload
 - data understood by target application
- XML Message Trailer
 - -closing tags
 - -optional message digest

application-specific message vocabulary

Soap envelope

vocabulary

SOAP spec defines how to do this!

SOAP: Request Message

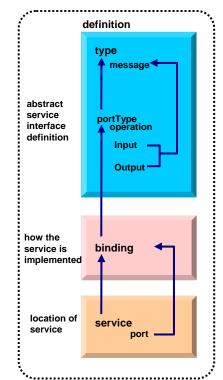

SOAP: Response Message Result returned in **Body** <SOAP-ENV:Envelope xmlns:SOAP-ENV= "http://www.w3.org/2001/06/soap-envelope" SOAP-ENV:encodingStyle= "http://www.w3.org/2001/06/soap-enc/ding"> <SOAP-ENV:Body> <m:GetLastTradePriceResponse xmlns:m="Some-URI"> app-specific <Price>134</Price> </m:GetLastTradePriceResponse>message </SOAP-ENV:Body> </SOAP-ENV:Envelope>

WSDL - Web Service Description Language

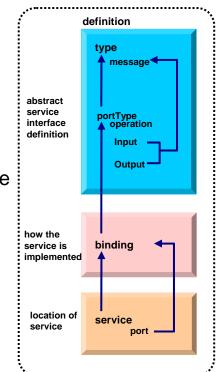

- Open Standard
- XML resume describing what a Web Service can do, where it resides, and how to invoke it
- Machine readable, generated, used by IDEs
- Similar in purpose to IDL, but in XML form
- Can be One or multiple documents
- Major sections are:
 - Service Interface (operations, input, output)
 - Service binding (protocol binding)
 - Service implementation (location of service)

WSDL: Logical Contents

- Service Interface
 - Operation (business functions)
 - Input Message (0 or 1) and Output Message (0 or 1)
 - 1 or more parts
 - Parts may be simple or complex
 - Complex parts may have multiple elements
- Service binding
 - Definition of the physical service interface implementation
- Service Implementation
 - Location of the service

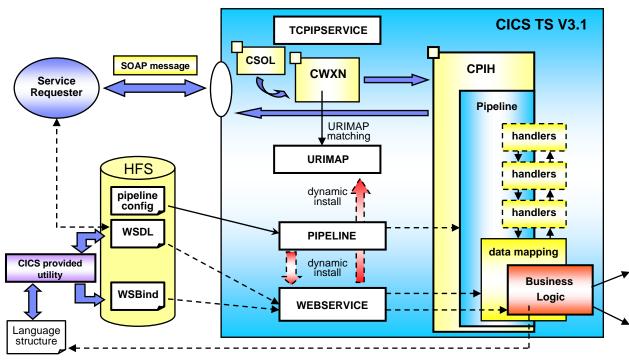

WSDL: Physical Contents

- Definitions highest level tag
 - types definition of complex parts
 - message a grouping of 1 or more parts
 - parts simple or complex (complex points to a type)
 - portType a grouping of operations
 - operation correspond to business functions
 - **input** points to input message
 - output points to output message
 - fault can be returned when stuff goes wrong
 - binding physical associations to operations
 - **operation** implementation of a portType operation
 - service grouping of ports
 - port location of associated binding

CICS as a service provider

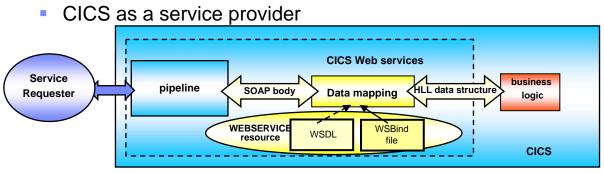

Defining the CICS Web Services Resources

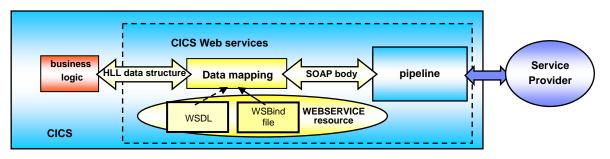

- Define a TCPIPSERVICE (or WMQ) and a PIPELINE
- Then install the PIPELINE definition and issue CEMT PERFORM PIPELINE SCAN
- CICS uses the PIPELINE definition to
 - Locate the WSBind file
 - From the WSBind file, CICS will dynamically create a WEBSERVICE resource
 - CICS will also dynamically create a URIMAP definition
- Can define everything individually if preferred

CICS usage of the WSBind file

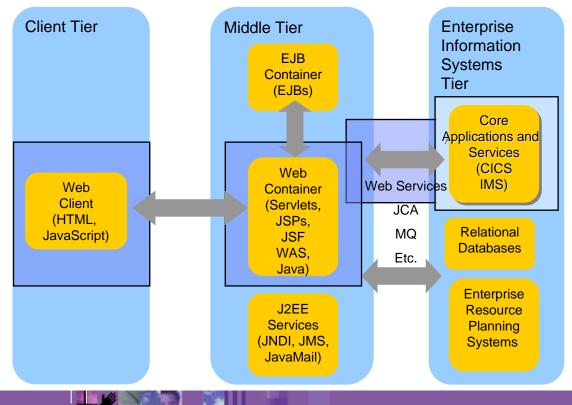

CICS as a service requester

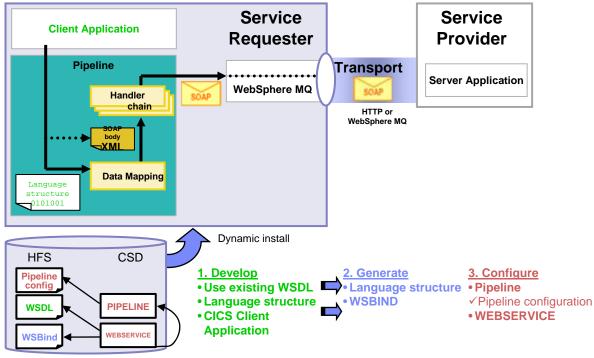

The Business Tier

CICS as a Web service requester

CICS TS V3.1

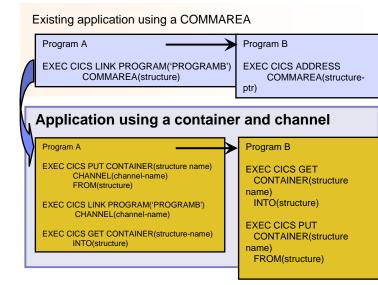

CICS API's

- Invoking a Web Service from a CICS application program
 - CICS as a service requester
 - EXEC CICS INVOKE WEBSERVICE () CHANNEL () URI () OPERATION ()
 - WEBSERVICE: name of the Web Service to be invoked
 - CHANNEL: name of the channel containing data to be passed to the Web Service (DFHWS-DATA container)
 - URI: Universal Resource Identifier of the Web Service (optional)
 - OPERATION: name of the operation to be invoked

Data Exchange between CICS programs with Containers and Channels

- Offers a more flexible and intuitive alternative to the COMMAREA
- Enables large amounts of data to be passed between CICS applications
 - Not subject to 32KB restriction
- Optimized and managed by CICS
- Requires minimal application changes required to use

IBM Enterprise COBOL CICS/IMS/Batch/DB2 COBOL

XML/

SOAP

WDz

XML

Support

- XML Language based generation from COBOL data structure
 - XMLGenerate Verb
 - WebSphere EJB support
 - DB2 V8
- High speed XML Sax based parsing
- Object Oriented Support for Java COBOL Interoperability
- Unicode support
- CICS and DB2 integrated preprocessor
- Raise 16Mb COBOL data size limit
 - Picture clause replication: 01 A PIC X(134217727).
 - OCCURS::

05 V PIC X OCCURS 134217727 TIMES.

XMLDoc-Handler Evaluate xml-action when 'START-OF-DOC'

when 'END-OF-DOC'

```
when 'START-OF-ELEMENT
```

when 'ATTRIBUTE-NAME'

when 'ATTRIBUTE-CHAR'

when 'END-ELEMENT when 'START-OF-CDATA-Section' when 'CONTENT-CHARACTER when 'PROCESSING-INSTRUCTION-TARGET' when 'PROCESSING-INSTRUCTION-DATA'

XMLGenerate Document

XML GENERATE XML-OUTPUT FROM SOURCE-REC COUNT IN XML-CHAR-COUNT ON EXCEPTION DISPLAY XML generation and CARCODE STOP RUN NOT ON EXCEPTION DISPLAY XML document was successfully generated.⁷ END-XML

COBOL is an excellent business language

Why COBOL?

- Large portfolios
- Many developers
- High performance
- Self documenting
- Proven Maintainability
- Business oriented, eases technology burden

Summary

- MVC application model provides high levels of flexibility
- CICS provides leading edge support of Web Services
 - Allows for re-use of existing business assets and new development of high QOS assets
- Developers need "complete" application skills
- CICS and WebSphere Application Server are strategic middleware products that together...
 - Interoperate Web services, JCA, Enterprise JavaBeans
 - Exploit and complement z/OS qualities of service
 - Have high qualities of service, low cost per transaction, excellent security.

Demo

- Modern Application Architecture Building and testing a JSF/COBOL process.
- Demo of WDz used to create a simple, understandable visual and business application process for deployment.
- The session shows how to build and deploy composite CICS and WebSphere applications using the IBM WebSphere tooling and the Enterprise Compilers. Composite applications are applications which are assembled from independent component parts, using Web and Web Services standards.
