

The new London Crossrail system promises a new and vastly improved traveling experience, owed in large part to significant station improvements. These improvements include larger station entrances, ticketing halls, and pedestrian spaces as well as improved access to Crossrail, London Under-ground, and other elements of London's mass transit network. In addition to Crossrail track and maintenance access the tunnel network will provide extensions to London's communications network.

Each Crossrail station will have a unique yet consistent design aesthetic, using architectural components throughout the platform and tunnel to create an integrated 'Crossrail' station brand identity. Each station is designed to compliment the existing architectural character of their surrounding context while utilizing cutting edge technology to minimize environmental impacts, maximize efficiency, and provide flexibility for future expansion.
