An Account of Mr Sam. Brown His Second Book of East India Plants, with their Names. Vertues, Description, &c. By James Petiver, Apothecary, and Fellow of the Royal Society.

T'He following *Plants* were gathered the 27th and 28th of April 1696. at Pearmeedoor, about 16 or 17 miles from Fort St George.

The Country here is full of Trees and Bushes, the ground clay, dry and fandy.

48. Tetrapteros Madraspatana Laurustini folio. Veanaungoo Malab.

No. 48.

The Trunk of this Tree grows 5 or 6 foot high, and then shoots out many straight branches about 12 or 13 foot long: the Husky Fruit has no ill taste, but when chewed makes the Spittle yellow. Mr Sam. Brown.

Its twigs are Ash-colour, the leaves stand on short foot-stalks, are somewhat oval, especially the younger ones. The Fruit is befet with 4 membranaceous wings. near half an inch broad and I long each Fruit stands on a pedicle about an inch long. These resemble the head or feed vessel of the Crown Imperial, but are much less.

49. Soldanella Pearmeedoorica geniculis radicosis.

Cullecaucanau Malab.

an Bel-Adamboe Walli H. Malab. V. 11. T. 58 p. 119. an Bel-Adamboe Walli H. The Root of this is a Finger thick, the Bark of Malab. V.11. which grownd with a cup of water, will purge very T. 58. p. 119. well without Gripes. Two Drams is enough for a strong man. It grows in dry ground. S. B.

This is a ground-creeping Bindweed, putting forth fibrous Roots at each joynt, from whence proceeds one round and sometimes cuspidated leaf, on a foot-stalk

Rrrrr

near two inches long: at the fetting on of these leaves comes out 3 or 4 Flowers, which are succeeded with smooth round capsules, terminating in a thredly point, each, generally containing 4 yellowish triangular Imooth Seed.

50. Apocynum arboreum, Lauri folio, Dulcamara flore.

H. Mal. V. 9. Addeweepaula Gent. Bupaulemaraum Malab. an? Tab. 3.&4.p.5 Nelem-pala Hort. Malab. Vol. 9. Tab. 3 & 4 p. 5:

The Leaves of this Tree boyl'd are Pectoral.

This Tree grows 25 or 30 foot high, and as thick as an ordinary mans waste. S. B.

The Leaves grow opposite, and the veins of the younger are very transparent, if held between your eye and the light. The Flowers are very like those of Bitter sweet, growing in Tufts, and have a yellowish pointel like them, by which this Tree is easily distinguisht from its other kinds,

The Podds are near a foot long, and 3 quarters of an inch broad when expanded, these grow in pairs, and are fill'd with a white filky down, its Seed long, and

oval like a Pine Kernel.

Its younger Pods very much resemble those of the Vanillioes.

Mus. Petiver **₫**325.

51. Erembillee Malab. Coccifera Buxifoliis oblongis & subrotundis, fructu cuspidato calyce amplo, è Madraspatan. Mus. Petiver

Height:

Is about 6 or 8 foot high, the wood hard as Iron in comparison.

Vertue.

The Root and Leaves boyl'd in water and drank, cures Scald heads. S. B.

Description.

These Leaves grow inordinately on very short or no foot-stalks, they resemble Box, but are stiffer and very often longer, especially those branches which have no Fruit on them, each Berry contains 2 blackish Kernels feparated by a thin skin... $\mathbf{D}_{\mathbf{r}}$

(701)

Dr Plukenet hath very erroneously Figured the Fruit of this, he fetting a Crown on it, it having none, but terminates in a point.

52. Carvaut-lackeree Mal.

Spergulæ affinis Pearmeedorica, foliis rotundis pubescentibus.

It lies on the ground in branches a foot or a foot and half long.

The Decoction of this and Porapatree is good for Fevers in Children. Boyl'd with Fish gives a very pleasant taste. S. B.

These Leaves are like the Alsine Amer. Nummula- Defendence riæ folio Pat. Bar. prodr. but are hoary, especially whillt young.

The Flowers commonly grow at every joynt, 3, 4, or more together, the hoary pentapetalos calyces wholly cover the feed Vessels, which when ripe, contain many very small black seed,

52. Chengunnee Malab.

Cassia Pearmeedorica, solio Senæ obtuso, subtùs pubescente.

These Flowers exactly resemble those of Cassia Fisher la, the leaves somewhat like Sena, but are hoary underneath, and end blunt, with a little Spinula in the middle.

This rifes 16 or 18 foot high, and the trunk as thick as a man's Leg.

The Decoction of the Leaves and Flowers taken inwardly, and the Root ground with Water and a little Lime Juice, cures the Itch and Scab. E. B.

54. Chaipoondoo Malab.

Knawel Pearmeedooricum Gallii lutei foliis, flor. comosis.

Roasted and boyl'd in Water, and the Decoction given to those sick of Vomiting, Looseness, and Rrrrr 2 want ۲2.

530

54.

want of Appetite, or Indigestion, cures them. When fresh 'tis Bitter. S. B.

This Herb has a long sticky root, shooting out, espe-

cially towards the bottom many stiff Fibres.

55. Wellia Tagera Hort. Malab. Vol. 6. Tab. 9. &

10. p. 17.

55.

Sarpouli Bram. Tagera Lust. groot Glid thouwt Belg. Flort. Malae. Vol. 6. Tab.9. Chamæcridæ Pavonis affinis Indica, Cassiæ folio, siliquis & Io. p. 17. Breyn, Pr. 2.p. compressis latissimis propendentibus, floribus amplissimis in summo ramorum spicatis. Breyn. Pr. 2. 30. Pl. 2. Ray H. Pl.

Siliquosa Malabarica fl. pentapetalo, siliquis longis 1746. cap. 7. planis, diaphragmatis semina secludentibus interceptis.

Ray. Hist. Plant. 1746: cap. 7.

The Flowers are in divers parts of India call'd Fula cle Coupang, because the Fruit resembles a Gold Coin so call d. in use with them. Comel. in Hort. Malab. Vol. 6. p. 18.

It Flowers in August, and the Pods are ripe in No-

vember and December.

It grows naturally in fandy places, but for its Flowers fake, and being ever green, it's esteemed in their Gardens.

I suspect the Label of this Plant is transposed, it being given under the Malabar Title of Caut-Mandaree. of which Tree Mr Sam. Brown fays, there are four forts, viz. this, the Mandaree, Cookcoo-Mandaree, and Vela-Mandaree, the same Number the Hortus Malab. I find describes and figures in the First Volume Tab. 22. & by the name of Mandaru, these are Trees with peculiar Leaves, and very different from the abovemention'd Wellia Tagera, which is the Plant before us. Ash-coloured Nicker Tree.

Bonduch cinerea fol. longioribus.

Ray Hipligates

This grows about two or three foot high, the Powder of the Root and Leaves, or those ground in water or boyl'd in Gingelee Oyl, (which I believe is Sefamum) and taken inwardly cures the frequent eruption of Bovla and Impostumes.

These Leaves are very like the Bladder Sena, and have generally 13 on a Stalk, viz. 6 pair and the top Leaf, these are glaucous, especially underneatly.

The Flowers purplish, small, and grow in spikes like our Melilot, which are succeeded by very slender pendulous crooked pods.

It grows in fandy, rocky, dry, barren places, in both

the East and West Indies.

The *Indigo* figured and described by *Hernandez*, p. 108. and *Nierembergius* 339. cap. 11. seems to differ from this Plant, the Leaves being longer and sharp pointed, and what more confirms me in it, is, a draught which that Learned *Jesuit* and most accurate *Botanist*, George Joseph *Camel* hath lately sent to Mr Ray and me, whose pointed Leaves agree with the *Icon* of *Hernandez*, and like that, his has generally but 9 Leaves, whereas ours has seldom fewer than 13, its pods also (according to *Father Camel*'s design) are very different.

58. Vanamairaum Malab.

Baccifera Peermeadoorica Laurocerasi fol. fructu sul-

cato, dispermo.

38.

Of this there are four forts, viz. Vednaingu, Vaccanne and Velvaccaunne. These are all large Trees as thick as a man's waste, and about 30 foot high; all these, or this alone, the Natives boyl in Butter, and give it for Coughs, &c.

These Berries grow in Clusters, are black, somewhat bigger than Pepper, each ends in a point, and is sulcated as if double, some (the more ripe) are cleft or crack towards the tip, in each half is contained one small Kernel, a little less than its Case, these stick to the middle of the Berry, which is parted by a double skin.

59. Causha or Causha-chedde. Malab.

Mus Petiv. 38. Baccifera Madrasp. Visci arborei foliis latioribus Muss.

H. M. 10. T. Petiv. 38. au ? Kanelli itti Canni Hort. Malab. Vol. 10.

Tab. 5. p. 9.

This

(705)

This is a Shrub about 4 foot high; here are two forts, the other is call'd Perrecaulha-cheddee, the Root, Bark and Leaves boyl'd and drank, cures pains in the Bones proceeding from Cold, S. B.

60. Mudde-maer Mooddee Malab.

Is about 5 or 6 foot high, the Root, Bark, Leaves, Flower and Seed, the Natives bruise or grind with Milk, and drink it for the Running of the Reins, others boyl the same in Butter for that use, and some take it in hot water for the same. This is one of their Panacea's in that Distemper, S. B.

61. Patchurcha Malab.

This rifes in branches 6 or 8 foot high, they do not use it inwardly, but boyl it in water, and then put red hot Stones in the said water, then covering themselves and Pot, the hot Vapours of which procures a plentiful sweat, which cures Colds, Pains, &c.

This and the last seems to be both of the Caper kind, but the specimens being much impaired, we dare not

be positive.

62. Clachedde Malab.

Lycium Madraspat. fol: Alaterni plano, Jasmini flore

This is about 2 or 3 foot high, it bears a sweetish Fruit as big as a Pea.

There is another fort call'd Pedde-cla-chedde, or

the great Cla-chedde, which is 5 or 6 foot high.

The Bark of both, or either of the Roots ground with water, and drank, cures Buboes by diffolving them, (which the Natives think the best way of cure) the same ground with Lime-juice, cures Sores or Biles.

These Leaves grow opposite on scarce discernable soot-stalks, they are thick, stiff, and veiny, very like

the common Alaternus, but are not serrated.

53. Va-

60.

311

Ris.

690

63. Vacaunnee Malab.

Coccifera Madraspat. calyce magno Staphylodendr

Mul. Peter Africani folio Mus. Petiver 276.

376

The Fruit of this is of an Ash colour, round, hard, and shining, about the bigness of a large Pea, it stands in a large velvetty calyx, seemingly tetrapetalose, its Kernel black, and divides in the middle like a Bay berry, the Leaves at first putting forth are very hoary, but when full grown, are very like the Cape Bladder Nut, and only hoary on the under side.

From some of these bruised or crackt berries, I have

observed to flow a shining hard black Gum.

64. Caut-Yellendae Malab.

64.

Toddali Madraspat. spinosus, folio rigido lobato subtus incano.

Of this here are 3 forts; Yelleneseda-chedde and this are large Trees, the Fruit of the first is smaller and reddish.

The other larger, and of a greenish yellow, and is Parkinson's Bor and Ber of Acosta. The third sort is a low shrub and bears no Fruit, it's called by the Malabars here Callaree-Yellendee.

The tender top Leaves and Flowers of either, or all 3 masht small and mixt with sowre Milk, cures Gripes and Bloody Fluxes, and is good in all Loosenesses, as also for Gonorrhea's; the Fruit is also binding. S. B.

This Tree is of the Toddali kind, in the 4th Volume AI. p. 85. Ray of the Hortus Malab. Tab. 40 & 41, and comes next to the Perin-Toddali, Tab. 41. p. 85. which is faid to

be the Jujuba Indica, CB. 446.

CB. 446, pl.

I have two or three of these species, and shall therefore refer the nice distinction of them, (they being hitherto consounded) until an opportunity offers of treating of them together. 65. Oatepemarutte Malab.

Prasiium Madraspatan. folio latissimo. Mus. Petiv. Mus. Priv. 671. an? Tsjadaen H. Mal. V. 10. Tab. 89 p. 175. H. Mal. V. 10.

Here is another fort of this, call'd Rettepemarettee. T.88, p. 175 they are both about 4 foot high, and finell strong, the Natives moisten both or either of them over the steams of boyling Water, then press out the Juice, which they drink for Asthma, Wind and cold Pains. This they take in the morning, but at a night they drink the Decoction for the same, S. B.

The lower Leaves of this Plant are very broad, and resemble our Ballote, or stinking Horehound, but are larger, the stalk is 4 square and carinated, the spike is fometimes above a span long, the Whirls are thick set, and nearer the top the closer together, each guarded with 2 leaves, the Husks are stellated and hoary, as is the whole Plant.

66. Paul-pronee Malab.

Capparis Madraspatan. Balaustii folio Mus. Petiv. 624. Mus. Petiver This rifes 5 or 6 foot high, and is 2 or 3 fingers 624; thick.

The Natives drink the Decoction of this bruifed for

a Gonorrhea and Dropsie, S. B.

These Leaves are very stiff, and full of fine Veins. some are broad, others narrow, but all terminate in a harp point, they grow inordinately on very short foot-stalks.

67. Muurlachedde Malab.

Vitis Pearmeedooriea foliis ternis subrotundis serratis. The Roots of this ground with Water, disfolves Buboes, the same cures pains in the Joynts.

Here is a leffer fort of this Climer, called Cern-Mu-

urlee. S. B.

These Flowers grow racemose like the common Vinc. or rather our Virginia Creeper, of which it feems to be a species, but differs in having only a leaves, and those much lets and round.

68. Terrane Malab.

Tekka Laurocerafi folio baccis coronatis.

An & Katu Tekka Hort. Malab. Vol. 4. Tab. 28. p.59 This grows 2 or 4 foot high, of the Fruit they make Aichar by pickling them.

The Decoction of the whole Plant is good for Pal-

hes. &c. S. B.

The same Account with the Plant I have lately received from my ingenious Friend Mr Edward Bulkley,

Surgeon at Fort St George.

This Shrub is known by its elegant coronated Berries, each having a large stellated pentapetalous crown, these are in colour, shape, and bigness like black Perper, but infipid; the Husk bitter, and Seed small and tender; they stand on short pedicles, and grow in Clusters fomewhat Umbell-like, but especially the Flowers

69. Chaddache Malab.

Angola Pearmeedoorica Toddali folio rotundo ferrato. The whole Plant grownd with Milk or hot Water, cures the most desperate Itch or Scab.

It rifes 18 or 20 foot high, and is as thick as ones

Leg. S. B.

These Leaves are hoary, round and finely serrared, like the Toddali at No. 64. but the foot-stalks are shorter: The Flowers grow in clusters, and whilst in bud are velvetty, which are the exterior petala, the middle of the Flower is full of fine Threads, crown'd with small apices like all the rest of this kind.

70. Codeseru-paulado Malab.

Anil Pearmeedoorica Coluteæ foliis pubescentibus

fere pentaphyllis.

:0

This trails on the ground, there is another fort call'd Cherupaulada, which is leffer, both these or either, ground, in hot water, cures childrens Gripes and

Fluxes

Fluxes, the same mixt with Turmerick, cures Sores. S. B.

These Leaves are like the bastard Sena, but smaller and hoary; they are winged, and commonly grow 5 together; and rarely 3; at setting on they are guarded with 2 narrow Leaves or Auricles, the like also at each Branch; its pods are very slender, being not thicker than a large pin, are strait, and when at full bigness near an inch long, ending in a spinula; these grow in naked (i.e. leastess) Spikes, being seldom more than 4 or 5, and they about a quarter of an inch distant from one another; each spike about one inch and a half long.

71. Davadarree Malab.

Berberidis facie, arbor Madraspat. foliis non serratis. Mus. Paiv. Mus. Petiver 623. an & Tsjerou-Canelli Hort. Malab. H. Mil. V. 5. Vol. 5. Tab. 50. p. 99. Ray H. Plant. 1499.

T. 50. p. 99.

This is a Tree about 30 or 35 foot bigh, thick as ones RayH.Pi. 1499. Leg. The Decoction of the Leaves drank kills Worms, the like of the Bark cures Fevers, Cholick, &c. and pains occasioned by wind. S. B.

A Decoction of the Wood purifies the blood, corrects

Choler, and expels wind. S. B.

The Natives call this wood Black Sandal; they also sometimes call it Wild Aggaly (i.e Agallochum) as my very ingenious Friend Mr Edward Buckley, Surgeon at Fort St George, informs me; and moreover, that they have in their Bazars, (or Markeis) a more fragrant sort, which comes from Cape Comerin.

72. Cheendee Malab.

Coccifer Peermeadoorica Convolvulaceus, fol. corda

to, tuberosa radice.

The Natives make an extract of the Leaves and Stalks, which cures harpness of Urine, and running of the Reins, it does not purge. S. B.

Sfiff 2

This

730

This Climer has a tuberose round thick Root; its dry Fruit is a little bigger than Pepper, its covering brittle, and seems to divide into two partitions.

73. Punne Maraum Malab;

Ponna Malabarica major, folio pulchre venoso, fructu globolo.

Prunifera seu Nucifera Malab. foliis Nymphea, fructu,

Ray H. Pl. rotundo cortice pulvinato Ray H. pl. 1525.

H. Maleb.V. 4 Ponna Hort. Malab. Vol. 4. Tab. 38, p. 79. Octiv

Tab. 38. p.79. Bram. Geele gom-Appels Belg.

The trunk of this Tree is from 7 to 12 inches Diameter, and about 20 foot high; the Fruit as big as a Damson.

A Decoction of the Root is good against wind. The Oyl of the Fruit is good in Pains, and to anoint the

running Gout. S. B.

This grows in many places in Malabar, and about

Fort St George, especially in a sandy Soil.

Its Fruit ripens twice a year, viz. in March and September, and its said in the Hort. Malab. oftentimes to continue Fruit-bearing for 300 years.

74. Punga-Maraum Malab.

Minari Malabarica, fl. Roseo-albicante, siliqua ovale compressa.

Arbor siliquosa flore papilionaceo, fabis longis & latis, plana parte sibi invicem incumbentibus Ray H.

Ray H. Pl. 1913, plana parte 1733 cap. 20. Pr. 1733 cap. 20.

Dr Plukenet hath not only made two plants of this, but also given 2 indifferent Figures of it, altho the Hortus Malab. had before better done it in one, viz. Vol.
6. Tab. 2: the first he calls

Arbuscula *India Orientalis* hexaphylla, flosculis exiguis in spicam positis, folio teneriori *Pluk*. Phyt. Tab. 148. Fig. 3. & Alm. Batan. 46. pl. 9.

The Figure of this being taken from a specimen only in bud, he either forgets or disdains to own it again, when in full Flower and Fruit, viz. in his 310th Table Fig. 3: there styling it

Piuk, Tabigio.

Phaseolis accedens Malabarica, alatis foliis glabris. monospermos, siliqua latiore brevi Alm. Bot. 294, pl. 1. Alm. Bot. 294.

The trunk of this is 6 or 8 inches Diameter, and pl. 1.

eighteen or twenty foothigh.

The Natives rasp the fresh roots of this, and press a milky Liquor from it, with which they cure Ulcers and Fistula's.

The Oyl of the Fruit expels wind. The Fruit hung about Childrens Necks cures the Hooping or Chincough,

S, B.

In the Phil. Trans. No. 244. p. 324. pl. 24. I have there already given you its Place, Time, Duration, Use and Vertue, with references to the Hortus Malab. and other Authors, which, with some additions I here in short recapitulate, viz. Hort. Malab. Vol. 6. Tab. 3. p. 5. Ray Hist plant. 1732. cap. 20. Pluk. Tab. 148. Fig. 4. Alm. Bot 46. pl. penult. & 294. pl. 1. Breyn prodr. 2. p. 39. pl. 3. Flor. Malab. p. 95. pl. 2. id. Fol. p. pl. 75. Cungee Malab.

Baccifera Madraspat. Myrti Laurea foliis perforatis, MacPer26:

sed vix conspicuis. Mus. Petiver 361.

Of this there are four forts, this is a Shrub about 4 foot high, Cadal-Cungee, is three foot high, Mala-Cungee, is something less, viz. two foot and a half high, and Sheva Cungee, is not above one foot and a half high.

The Fruit of the first the Natives eat, but n no of the other 3, the whole plant of either, or all these 4 boyled and drank cures the Pox, or Rheumuism from Venereal Cause, as also contractures from the same Ori-

ginal. $S_{i}B_{i}$

76. Ereweta-Maraum Malab.

Waga Pearmeedoorica Tamarindi folio, floribus co-moss, siliquà undulatà scabrà.

The Trunk of this Tree is 8 or 10 inches diameter,

and about 20 foot high.

The Powder of the Branches, Leaves, Fruit and Flowers, drank in Water cures Ring-worms, the same must also be applied outwardly.

Dr Plukenet hath given so many imperfect Figures of this Tribe, that it's very hard to judge whether this

be one amongst them.

These Leaves resemble those of Tamarinds or Abrus, their middle rib inclining to the upper part of each Leaf, these grow in pairs without any pedicle, have commonly 8, and rarely exceed ten leaves, the upper pair always largest. The Flowers are composed only of very fine Threads about half an inch in length, and make altogether a very regular Plume or Tust, they coming all from one base on a naked foot-stalk, somewhat more than an inch long. The Pods are blackish, and as it were covered with a Pitcht Coat, full of small cracks or wrinkles, each pod is divided into several partitions like a Neck-lace, each near one inch long and 3 quarters broad, flattish, but elevated in the middle.

Mus. Petiver.

78

Taxi fructu arbor Madraspatana Lauri folio Musei Petiver 682

This shurb grows about 6 foot high. Its Leaves and

Fruit the Natives boyl for food, S. B.

The Fruit of this is about the bigness of that of Yew, and as the Stone of that is almost wholly covered with a moist pulp, so is this with a large calyx leaving only the top of a pointed gland in view.

78. Poordele Malab.

Creeps on the ground, and seem to be a species of Verbena repens nodistora. The

The whole Plant bruised with a little long Pepper. and the quantity of a Nutmeg, taken night and morning, cures Coughs in old people and Children, the quantity being lessened, as also for Fluxes and Gripes, and then they mix it with Butter and so take it, S. B.

I have already taken notice of this Plant in the Mr. Phil. No. Phil. Trans. No. 2444 p. 329. No. 33. and of all the No. 13. plants in the Hortus Malab. none feems to come near-H. Mal. V. er it than the Ana-Coluppa Vol. 10. Tab. 47. p. 93.

19, Tab. 47, p. 93. 791 Mits Fet. 628,

Chabr. 124 Fig.

79. Aumauna dundoo Malab. Chrysanthemum Madraspat. folio trisido Mus. Petiver. 628. This grows about two foot high. The Rook is thick, which being ground with Water and Honey, and drank, cures the Piles. S. B.

80. Mura-cootan Malab.

Ulinga Hort. Malab. Vol. 8. Tab. 28. p. 53: Iffong. H. Mal. V. 8. Tab. 28.p. 33. Guineenstbus Ad. Phil. No. 232. p. 683. pl. 29. Act. Phil. No. Halicacabum peregrinum multis five Cor. Indum IB. 232. p.683.pl. 13. p. 174. c. 41. Fig. H. per. s. Cor Indum Chabr. 20. 1B.1.15.p.174.

Halicacabus peregrinus Dod. Pempt. 445. Fig. opt. c. Tab.4. Fig. 9. 2. H. Ox. 19.1. 25. H. per. Vesicarius scandens IB prodr. 39. pl. 6. Dod. Pempt.

The Natives fry this in Butter, and eat it to stop 445 C. 27. Fig. opt. IB. prodr. Fludding, or the immoderate flowing of the Courfes, 239. pl. 6. and give the Powder or Decoction for the Swelling of the Womb, which in some Women feels like a great stone in their Bellies, as also to cure the pain that some have when their Courses flow, S. B.

I have received this Plant from both the Indies. Guivea, and also from China, and cannot perceive any difference in Leaf, Flower or Seed, which I have also had from all the afore-mentioned parts, except Guinea, (whose plants I observe are generally the same with those of Malabar, and Fort St George) and the largest of

all

(714)

these Seed have not been bigger than a Pepper Corn. That accurate Botanist, the Reverend Father Camel, also assures us that this old fort grows with them in the Philippine Isles, where by the Natives it's called Apalla Nibun.

I likewise find the same amongst my Chinese Paintings of Plants, under the name of Teng. Lang-cham, and they there use it as a Discusser and Cleanser. vid. Herbar.

Tab. 40. Fig. 13. nost. Chinese illuminat. Tab. 40. Fig. 13.

I therefore think Dr Plukenet had no reason here to multiply species in making this Malabar sort to have greater Seed, when the Figure in the Hortus Malab. Not only shews the contrary, but the Commentator on that Noble Herbal, also positively says it's the very same with Casper Baubine, and other Authors.

81, Chetamucan Malab.

Anil Pearmeedooricum trifoliatum, glaucum, siliquis rigidis.

The whole Plant ground with Water and drank, eures the bites of Serpents and venomous Insects. S. B.

This at first sight resembles the true Indico, (of which it is a species) especially as to its Flowers and Pods, its chief difference is, its having but 3 leaves, and the whole plant more glaucous or silvery, particularly its staks.

The time of Flowering in its Native Soil is about

January.

E. rb. Chin.

.31.

. \$ 2

82. Toule-cutte Malab.

Arbor Pearmeedoorica Inglandis tolio, fructu racemofo, villofo, trinucleato.

This Tree is 6 or 8 inches diameter, and about 20 foot high. The Decoction of the Bark, Leaves and Fruit, cures Wind and Cholick pains. S. B.

These Leaves grow opposite without an odd one at the end, they stand on very short foot-stalks, are

very

very full of veins, elated on both fides, and foft underneath, except in the full grown branches. The Flowers are very numerous, growing in Ctusters, each composed of 5 very little woolly petala, these whilst in bud are covered with as many small hoary greenish husk-leaves, which divide to the bottom. These continue to the base of the Fruit, which are about the bigness of Hazel-nuts, and pointed, and are of a bust colour and as soft, each containing 3 Kernels.

This Flowers in November, and the Fruit ripens a-

bout April.

83. Poon-nasai Malab.

Angola Malabarica Ulmi folio.

An? Pai-Paroea sen Couradi H Mal. Vol. 5. Tab. H. Mat. V. 3 46. p. 91. Ray Hist. Plant. 1624. cap. 7. Tab. 46.9 91

Grows about 6 or 7 foot high, as thick as a mans Arm, the whole *Plant* made into *Powder*, is given by the *Natives* in Butter and Honey against *Impotency*, it

being a strong provoker to Venery, S. B.

I have lately received this from Mr Edward Bulkley at Fort St George, who adds, that a drink of the Bark and Leaves, is good in all windy pains of the Body, H Mal.V.5.T which feems to agree with what the Hortus Malab. fays +6. p. 91. of Couradi, Vol. 5. p. 92. viz. that a Decoction of its Leaves, Roots and Berries, is very efficacious in Gonty pains.

84. Coolauvalle Malab.

Colinil Hort. Malab. Vol. 1. Tab. 55. p. 103. Shera-Punca Bram.

Astragalus Malabaricus Viciæ foliis, siliqua falcata

lanuginosa.

Nil sive Indigo spuria Ray Hist. Plant. 1734. cap. 21. Polygala Indica minor siliquis recurvis Syen in H. Malab. V. 1. p. 104. Flor. Malab. p. 218. pl. 12. id. Fol. pl.

Dr

3.5

Dr Plukenet in his Almagest. pag. 112. pl. 5. does there affert he has this plant, which furely if he really had, or had but known, he would not in the same Book p. 272, given it again as a Non-descript with a worse Figure of it. Phytograph. Tab 52. fig. 1.

Mr Sam. Brown fays, that its Decoction helps indi-

gestion.

I cannot omit here taking notice of a peculiarity in this Plant, which the more convinces me that it is the Colinil of the H. Malab. viz. Having received feveral Specimens of this Plant, particularly from the Fall Indies, I did observe thereon a fort of Excrescence, like a Fruit ot dry Capsule, which upon examination, I found to be a fort of Gall, having a large perforation into it. This the Hortus Malab. takes particular notice of, Vol. 1. pag. 104. in these words, viz. Præter Siliquas, Fructus nothi virides, tenuiter pilosi ac durioli, surculis sæpe insidere conspiciuntur, qui in vertice funt foramine pertusi & intus cavi. The Indicious Mr Ray when he translated this into his Excellent Hi-RayHel. 1734. story of Plants, p. 1734. cap. 21. taking particular no-

tice of this passage, adds, these words. Hi nihil aliud sunt quam Gallæ quædam seu Excrescentiæ tumoresve a puncturis Insectorum ortæ.

85. Veraulle Malab.

& lant. Jam. 138. pl. 2.

Triopteris India utriusq; Salicis folio.

Aceri vel Paliuro affinis, angusto oblongo Ligustri folio, flore tetrapetalo herbaceo cat. pl. Jam. 138.

The Leaves of this boyl'd a little, so as to be made foft, and applied, heals Sores, eases Pains, and allays Swellings.

This grows 6 or 7 foot high, and as thick as ones Wrift, S. B.

Its Fruit very much resembles those of our Elm. which are called Samara, but these have generally a Fans or Wings.

Dr Stoane observes this shrub in Jamaica very much to vary in its outward appearance, the like I find in Specimens I have received from the East Indies, viz. fome with Leaves an inch broad and somewhat long, others not above a quarter broad and very short. The fame I have from China, with very long slender Leaves. and not half an inch broad, and yet the texture of all these the same.

This Variation may in some measure attone for Di Plukenet's Errour, in making no less than 3 differing Plants, if not four of this one. For, First of all he discovers only its Leaves, and these alone he Figures Phys. T. 145. in his Phytogr. Tab. 141. Fig. 1. After this, seeing Fig. 1. it with me in Fruit from the East Indies, and receiving it himself, I suppose from Jamaica, he now makes both these two different Plants, and distinguishes them from the first under the Title of Triopteris in his Almagest. Botan. p. 277. Fourthly in his said Book, p 7. he there afferts, contrary to the opinion of some Marce, 76.18 in. Authors, the Frutex innominatus instar Salicis pumilæ in arenosis locis nascens Marcgrav Hist. Nat. Brasil: p. 76. to be a different Plant from the afore going, which if he can, and will be pleased to shew to be so, will soon clear that doubt.

86. Perrepan-chedde Malab.

Rottang Malabar. minor. Act. Phil, No. 244. p. act. Phil. No. 326. pl. 27. 244. p. 326.

The lesser Rattan or Cane-chair Reed:

This Cane is very accurately described, and designed in a Figure lately sent to Mr Ray and me, from the Learned Jesuit George Joseph Camel, wherein the hairy Spinulæ (which no other Icon has yet taken notice of) on the back, rib and edges of the Leaf are here well exprest, as also the short crooked ones on the sheaths only of the Fruit Branches, and which are also seen on the stalks between the Leaves. Ttttt 2

(710)

This he stiles Arundo farcta seu Juneus marinus vimineus, magis ordinarius, and says, the Spaniards at the Phillipines call it Bexuco, and Rotta, and the Indians there Vaj or Ovaj, and the Fruit Paquiti.

Mr Sam. Brown says this Rattan rises 7 or 8 foot high, and spreads very much. The Root cures the Pox and Rheumatism from Venereal Cause. The Fruit

is fowre, but pleasant and good to eat.

87. Tanne mutanea-tunga Malab. Corruda Zeylanica Pæoniæ radicibus.

This is a very beautiful Climer, but I have not yet observed any Flower, Seed or Fruit that it bears, the Natives say it has none: The Roots are very numerous, some a foot and half long, others shorter, (as you may see by the sample annext,) They are about a Finger thick, like Eringo or Scorzonera, the Portagueze make Sweet-meats of it as of those, they are very good in Hectick Fevers and Consumptions. S. B.

This I have lately received, both with Flower and Berry, from Mr Edward Bulkley, by the name of E-

ringo.

87.

The first that I find takes notice of this Plant is Dr Herman, late Botanick Professor of the Leydon Physick-Heyd. 63 Fig. Garden, who in his Catalogue thereof, describes and figures this pag. 63. and its roots p. 650. under the title of Asparagus aculeatus maximus sarmentosus Zeylanicus, and says the Roots are sweet and pleasant, like our Scorzonera, and therefore so called by the Europeans in Ceylon, and by the Natives Hatawarija, he adds, that the Inhabitants boyl these Roots in Milk or Broath, or else pickle them with Salt, Vineger, and Pepper, and esteem them amongst their Dainties.

H. Mal. V. 10. I take this also to be the Schada-veli Kelangu Hort.

T. 10. p. 19 Malab. Vol. 10. Tab. 10. p. 19.

The

The Malabar word Kelangu or Kelengu is, I generally observe, put to such Plants, whose Roots are large or Edible as the Potatoes, Yams, &c. as may more particularly be feen in the 7th Volume of the Hort. Malab. Tab. 24. 5, 6, &c. tho in the 12th Volume p. 23. the Anthor there afferts the word Kelangn to fignify a Root only.

This Plant has very different Faces, according to its age, and therefore I believe Dr Plukenet had no reafon in his Almagest, p. 54. pl. 5. to part it from that of pl. 5. Madraspatan, in his Phytograph Tab. 15. Fig. 4.

Plak. Tab. 15. Fig. 4.

88. Vusshe-cau-Chedde Malab. Sinapiferum Pearmeedooricum, triphillum fol. tenuic-

fimis.

Its pods are near one inch and a half long, and very flender like the rest of this kind. Its Roots white, fibrous and sticky.

The Powder or Decoction of this is good for a

Cough, S. B.

89. Perrain-chedde Malab.

Convolvuli capsula Frutex Madraspat, Ulmi mino-Mus Per 634

ris folio Mus. Petiver, 634.

Grows 6 or 8, and sometimes 12 foot high thick as a mans Leg, the whole Plant made into powder, hinders the too great Flux of Urine. The Milk of this cures pains in the joynts. There is another fort of this not milky, called Solo-peraia good for the same ule. S_{\bullet} B.

The Leaves of this shrub has very much the face and texture of our common Elm, they grow inordinately on very short foot stalks, from the bosom of these Leaves come one or two Capfules, terminating in a thread, like those of our Bindweed, but in these are contained but one Kernel. Each Capfule stands on a short foot-stalk, not exceeding half an Inch, covered with a calyx, composed of 4 roundish leaves. 90,

00. Prunisera Madraspatana, fructu mucilaginoso

calyce magno.

This seems very much to resemble the Vidimaram Hort. Malab. V. 4. Tab. 37. p. 77. in the shape and Lab. 57. p.77. clammines of its Fruit, and the large calyx it stands in, but whither it be (as Dr Plukenet affirms) the Sebestena Sylvest. CB 446, which Prosper Alpinus de Plant. Ægypti Figures in his 8th Chapter, I dare not vet determine.

> Tho the Label to this Plant be loft, I find a reference to it (amongst some of Mr Sam. Brown's Papers to me) by the Malabar Name of Caut-Mogula-Maraum, and fays its Flowers are very fragrant, which the Hort Malab. afferts also of the Vidimarum. Dr Plukenet also takes notice of this in his Mantissa, p. 21. without ever referring it to his Phytographia, Tab. 217, Fig. 3. where he has diminutively recut the Vidimaram; but having by this time forgot it, he now supposes it to be the Elengi Hort. Malab. Vol. 1. Tab. 20. which I can affure him is a different Tree, as I shall prove in the next Book of Mr Brown's Plants.

91. Neer-Chaddai Malab.

Ereyn. Cent. Mimosa non Spinosa major Zeylanica Breyn: Cent. p. 52. Fig. opt. H. Lugd. Bat. 52. Fig. Opt. p. 458. pl.3.

Onobreyhis annua Zeylanica Mimosæ foliis, siliqus ar-

J. 46. pl. ult. tic ulatis asperis major H. Ludg. Bat. 458 pl. 3

Securidica clypeata, fl. luteo, Lentis folio, Zeilanica

Breyn. Pr. 1. p. 46. pl ult.

Breyn Prodr.

I wonder Dr Plukenet should give this in his Mantissa as a Plant new to him, after that acurate Botanist Jacobus Breynius had so well Figured and described it. which he himself owns in his Almagest. 269.

The Natives of Ceylon call this Plant Dia-Hibala, i. e Water Tamarinds, because the Leaves have some resemblance to Tamarinds, and it delights in watry

places,

places. Dya in the Ceilon Language fignifying Water, as Neer or Nir I find does in the Malabar, as Nir-H. Mal. V.O. Schulli H. Mal. Vol. 2. p. 89. Nir-Carambu in the Table of the Nir added to fuch Plants as grow in or near the water.

The Reverend Father Camel seems also to Figure and Describe this under the Title of Lupinus Luzonis 1. centum folius. Indis Sambasamba, and says it grows plentifully in Taytay, in watry places amongst Rice.

Mr Sam. Brown says the Natives eat the Leaves of this, and with the Wood, which is very light and spongy, they build their Huts to live in. It is only one strait stick, without branches, save some very small ones near the top, in the middle it's as thick as ones wrist, and tapers away at both ends, and grows 6 or 7 foot high. The Portugueze call it Pau (pao) levi or light-wood.

92. Cheru murree Malab.

Baccifera dispermos Madraspatana, lanosa folio, py-Mus Por 6206 ramidali Mus. Petiver 620.

The Decoction of the whole Plant helps the Dropsie.

This grows 2 or 3 foot high, S. B. The Leaves stand at uncertain distances on quarter inch foot-stalks are broadest towards the base, viz. one inch, and run tapering near 3 long. Each Fruit stands on half inch pedicles, not very unlike the Tilia, or Lime-tree, but grow in sparst Clusters, small, woolly, oft testiculated, and sometimes 3 together, these have a remarkable black Circle immediately below each Fruit.
