

Percolate Up Economics: A theory of functional economics where wealth is generated through the collective wealth of many individuals interacting within the economy as a whole. Wealth percolates up from the activity of the bottom and middle portions of society to the wealthy, which then invests the wealth back down to the bottom and middle of the society in order to generate more wealth. The process creates cyclical wealth that bounces back and forth between the upper and lower classes, as opposed to stagnant wealth which only sits in the upper portions of the society.

Based in Keynesian thought (albeit more specifically targeted than Keynes's model) and "Prime the Pump" Economics (albeit more systematized than this concept), Perk Up Economics is a hypothesis that can be implemented, tested and tweaked to fit real world occurrences in order to achieve the maximum potential for everyone, including the elites who govern the economy, through monetary and non-monetary considerations (such as the environment and the social order that is, in fact, around them).
