Flower-Garden Displayed :

I N W H I C H

The most Ornamental FOREIGN PLANTS, cultivated in the Open Ground, the Green-House, and the Stove, are accurately represented in their natural Colours.

T O W H I C H A R E A D D E D,

Their Names, Class, Order, Generic and Specific Characters, according to the celebrated LINNÆUS ; their Places of Growth, and Times of Flowering :

T O G E T H E R W I T H

THE MOST APPROVED METHODS OF CULTURE.

A W O R K

Intended for the Use of such LADIES, GENTLEMEN, and GARDENERS, as wish to become scientifically acquainted with the Plants they cultivate.

By *WILLIAM CURTIS*,
Author of the *FLORA LONDINENSIS*.

V O L . III. 7 - 4

“ The spleen is seldom felt where Flora reigns ;
“ The low’ring eye, the petulance, the frown,
“ And fullen sadness, that o’ershade, distort,
“ And mar the face of beauty, when no cause
“ For such immeasurable woe appears ;
“ These Flora banishes, and gives the fair
“ Sweet smiles and bloom, less transient than her own.”

MONSONIA SPECIOSA. LARGE-FLOWER'D
MONSONIA.

Class and Order.

POLYADELPHIA DODÉCANDRIA.

Generic Character.

Cal. 5-phyllus. *Cor.* 5-petala. *Stam.* 15. connata in 5 fila-
menta. *Stylus* 5-fidus. *Caps.* 5-cocca.

Specific Character and Synonyms.

MONSONIA *speciosa* foliis quinatis: foliolis bipinnatis,
Lin. Syst. Vegetab. p. 697.
MONSONIA *grandiflora.* *Burm. prodr.* 23.

The genus of which this charming plant is the most distinguished species, has been named in honour of *Lady Anne Monson*. The whole family are natives of the Cape, and in their habit and fructification bear great affinity to the *Geranium*. The present species was introduced into this country in 1774, by Mr. MASSON.

We received this elegant plant just as it was coming into flower, from Mr. COLVILL, Nurseryman, King's-Road, Chelsea, who was so obliging as to inform me that he had succeeded best in propagating it by planting cuttings of the root in pots of mould, and plunging them in a tan-pit, watering them as occasion may require; in due time buds appear on the tops of the cuttings left out of the ground.

It rarely or never ripens its seed with us.

Should be treated as a hardy green-house plant; may be sheltered even under a frame, in the winter.

Pub^d as the Act directs Feb^r 1769. by W Currie, Botanic Garden, Lambeth Marsh.

ANTIRRHINUM TRISTE. MELANCHOLY OR
BLACK-FLOWER'D TOAD-FLAX.

Class and Order.

DIDYNAMIA ANGIOSPERMIA.

Generic Character.

Cal. 5-phyllus. *Cor.* basis deorsum prominens, nectarifera;
Capsf. 2. locularis.

Specific Character and Synonyms.

ANTIRRHINUM *triste* foliis linearibus sparsis inferioribus
oppositis nectariis subulatis, floribus sub-
sessilibus. *Lin. Syst. Vegetab.* p. 555.

LINARIA *tristis hispanica.* *Dill. Elth.* 201. t. 164. f. 199.

Receives its name of *triste* from the sombre appearance of its flowers; but this must be understood when placed at some little distance, for, on a near view, the principal colour of the blossoms is a fine rich brown, inclined to purple.

Is a native of Spain, and of course a green-house plant with us, but it must not be too tenderly treated, as it loses much of its beauty when drawn up, it should therefore be kept out of doors when the season will admit, as it only requires shelter from severe frost, and that a common hot-bed frame will in general sufficiently afford it.

It flowers during most of the summer months; as it rarely or never ripens its seeds with us, the usual mode of propagating it, is by cuttings, which strike readily enough in the common way.

MILLER relates that it was first introduced into this country by Sir CHARLES WAGER, from Gibraltar seeds.

Pub^d as the Act directs, Feb^r. 1789, by W. Curtis, Botanic Garden, Lambeth.

POTENTILLA GRANDIFLORA. LARGE-
FLOWER'D POTENTILLA.

Class and Order.

ICOSANDRIA POLYGYNIA.

Generic Character.

Cal. 10-fidus. *Petala* 5. *Sem.* subrotunda, nuda, receptaculo parvo exsucco affixa.

Specific Character and Synonyms.

POTENTILLA *grandiflora* foliis ternatis dentatis utrinque subpilosis, caule decumbente foliis longiore, *Lin. Syst. Vegetab. p. 715.*

FRAGARIA *sterilis*, amplissimo folio et flore petalis cordatis, *Vaill. Paris. 55. t. 10. f. 1.*

Culture is well known to produce great alterations in the appearance of most plants, but particularly in those which grow spontaneously on dry mountainous situations, and this is strikingly exemplified in the present instance, this species of *Potentilla*, becoming in every respect much larger, as well as much smoother than in its natural state. *Vid. VAILL.* above quoted.

It is a hardy herbaceous plant, a native of Switzerland, Siberia, and other parts of Europe, and flowers in July.

LINNÆUS considers it as an annual; MILLER, as a biennial; we suspect it to be, indeed have little doubt of its being a perennial; having propagated it by parting its roots, but it may be raised more successfully from seed.

EPILOBIUM ANGUSTISSIMUM. NARROWEST-
LEAV'D WILLOW-HERB.

Class and Order.

OCTANDRIA MONOGYNIA,

Generic Character.

Cal. 4-fidus. *Petala* 4. *Capsf.* oblonga, infera. *Sem.* papposa.

Specific Character and Synonyms.

EPILOBIUM *angustissimum*, foliis sparsis linearibus obsolete denticulatis aveniis, petalis æqualibus integerrimis. *Ait. Hort. Kew.* 2. p. 5.

EPILOBIUM *angustifolium*, var. *Lin. Sp. Pl.*

EPILOBIUM flore difformi, foliis linearibus. *Hall. Hist. Helv.* p. 427. n. 1001.

Though the *Epilobium* here figured has not been many years introduced into this country, it is a plant which has long been well known, and described.

LINNÆUS makes it a variety only of the *Epilobium angustifolium*; HALLER, a distinct species, and in our opinion, most justly.

Those who have cultivated the *Epilobium angustifolium* have cause to know that it increases prodigiously by its creeping roots. The present plant, so far as we have been able to determine from cultivating it several years in our Garden, Lambeth-Marsh, has not shewn the least disposition to increase in the same way, nor have any seedlings arisen from the seeds which it has spontaneously scattered: we have, indeed, found it a plant rather difficult to propagate, yet it is highly probable that at a greater distance from London, and in a more favourable soil, its roots, though not of the creeping kind, may admit of a greater increase, and its seeds be more prolific.

It is a native of the Alps of Switzerland, from whence it is frequently dislodged, and carried into the plains by the impetuosity of torrents.

It flowers with us in July and August, and being a hardy perennial, and perhaps the most elegant species of the genus, appears to us highly deserving a place in the gardens of the curious.

CENTAUREA MONTANA. GREATER BLUE BOTTLE.

Class and Order.

SYNGENESIA POLYGAMIA FRUSTRANEA.

Generic Character.

Receptaculum fetosum. *Pappus* simplex. *Corollæ* radii infundibuliformes, longiores, irregulares.

Specific Character and Synonyms.

CENTAUREA *montana* calycibus ferratis, foliis lanceolatis decurrentibus, caule simplicissimo. *Linn. Syst. Vegetab. p. 785.*

CYANUS *montanus* latifolius S. Verbasculum cyanoides. *Bauh. Pin. 273.*

CYANUS *major.* *Lobel. icon. 548.*

It has been suggested by some of our readers, that too many common plants, like the present, are figured in this work. We wish it to be understood, that the professed design of the Botanical Magazine is to exhibit representations of such. We are desirous of putting it in the power of all who cultivate or amuse themselves with plants, to become scientifically acquainted with them, as far as our labours extend; and we deem it of more consequence, that they should be able to ascertain such as are to be found in every garden, than such as they may never have an opportunity of seeing. On viewing the representations of objects of this sort, a desire of seeing the original is naturally excited, and the pleasure is greatly enhanced by having it in our power to possess it. But, while we are desirous of thus creating Botanists, we are no less anxious to gratify the wishes of those already such; and we believe, from a perusal of the Magazine, it will appear that one third of the plants figured, have some pretensions to novelty.

The *Centaurea montana* is a native of the German Alps, flowers during the greatest part of the summer, is a hardy perennial, and will grow in any soil or situation, some will think too readily.

Pub^d as the Act directs. March 11780. by W. Curtis Botanic Garden Lambeth Marsh.

NARCISSUS ODORUS. SWEET-SCENTED, OR
GREAT JONQUIL.

Class and Order.

HEXANDRIA MONOGYNIA.

Generic Character.

Petala 6, æqualia. *Nectario* infundibuliformi, 1-phylo. *Stamina* intra nectarium.

Specific Character and Synonyms.

NARCISSUS *odorus* spatha sub-biflora, nectario campanulato sexfido lævi dimidio petalis brevior, foliis femicylindricis. *Linn. Syst. Vegetab. p. 317.*

NARCISSUS *angustifolius*, five *juncifolius maximus* amplo calice.

The Great Jonquilla with the large flower or cup. *Park. Parad. p. 89. fig. 5.*

We shall be thought, perhaps, too partial to this tribe of plants, this being the fifth species now figured; but it should be remembered, that as the spring does not afford that variety of flowers which the summer does, we are more limited in our choice; the flowers of this delightful season have also greater claims to our notice, they present themselves with double charms.

This species, which, as its name implies, possesses more fragrance than many of the others, is a native of the South of Europe, flowers in the open border in April, is a hardy perennial, thriving in almost any soil or situation, but succeeds best in a loamy soil and eastern exposure. Varies with double flowers, in which state it is often used for forcing.

No notice is taken of this species by MILLER, except as a variety of the *N. Jonquilla*, from which it differs *tota celo*.

Pub^d as the Act directs, March 11789. by W. Curtis, Botanic Garden, Lambeth Marsh.

LOTUS JACOBÆUS. BLACK-FLOWER'D
LOTUS.

Class and Order.

DIADELPHIA DECANDRIA.

Generic Character.

*Legumen cylindricum strictum. Alæ sursum longitudinaliter
conniventes. Cal. tubulosus.*

Specific Character and Synonyms.

LOTUS *Jacobæus*. leguminibus subternatis, caule herbaceo
erecto, foliolis linearibus. *Linn. Syst. Veg.* 691.

LOTUS *angustifolia*, flore luteo purpurascente, insulæ S.
Jacobi. *Comm. hort.* 2. p. 165. t. 83.

This species of *Lotus* has been called black-flower'd, not that the flowers are absolutely black, for they are of a very rich brown inclined to purple, but because they appear so at a little distance; the light colour of the foliage contributes not a little to this appearance.

“ It grows naturally in the Island of St. James; is too
“ tender to live abroad in England, so the plants must be
“ kept in pots, and in the winter placed in a warm airy glass
“ case, but in the summer they should be placed abroad in a
“ sheltered situation. It may be easily propagated by cuttings
“ during the summer season, and also by seeds, but the plants
“ which have been two or three times propagated by cuttings,
“ seldom are fruitful.” *Miller's Gard. Dict.*

It continues to flower during the whole of the summer; as it is very apt to die off without any apparent cause, care should be taken to have a succession of plants from seeds, if possible.

SPIGELIA MARILANDICA. MARYLAND SPI-
GELIA, OR WORM-GRASS.

Class and Order.

PENTANDRIA MONOGYNIA.

Generic Character.

Corolla infundibuliformis. *Capsula* didyma. 2-locularis, poly-
sperma.

Specific Character and Synonyms.

SPIGELIA *Marilandica* caule tetragono, foliis omnibus oppo-
sitis. *Linn. Syst. Veg. p. 197. Mant. 2. p. 338.*

LONICERA *Marilandica. Spec. Pl. ed. 3. p. 249.*

PERICLYMENI virginiani flore coccineo planta marilandica
spicata erecta foliis conjugatis. *D. Sher-
rard Raii Suppl. p. 32. Catesb. Carol. 11.
t. 78.*

ANTHELMIA Indian pink. *Dr. Lining. Essays Physical
and Literary, Vol. 1. and Vol. 3.*

This plant, not less celebrated for its superior efficacy in destroying worms*, than admired for its beauty, is a native of the warmer parts of North-America; the older Botanists, and even LINNÆUS, at one time considered it as a *honeysuckle*, but he has now made a new genus of it, which he has named in honour of SPIGELIUS, a Botanist of considerable note, author of the *Isagog. in rem herbar.* published at *Leyden* in 1633.

“ This plant is not easily propagated in England, for the
“ roots make but slow increase, so that the plant is not very
“ common in the English Gardens at present; for although
“ it is so hardy as to endure the cold of our ordinary winters
“ in the open air, yet as it does not ripen seeds, the only
“ way of propagating it is by parting of the roots; and as
“ these do not make much increase by offsets, so the plants
“ are scarce; it delights in a moist soil, and must not be often
“ transplanted.” *Miller's Dict.*

The scarcity of this plant, even now, is a proof of the just-
ness of Mr. MILLER's observation; it is, in fact, very difficult
of culture, and scarcely to be kept in this country but by
frequent importation.

It flowers in June and July.

* *Vid. Lewis's Mater. Medica.*

Pub.^d as the Act directs April 11789. by W. Curtis. Botanic Garden, Lambeth Marsh.

COLUTEA ARBORESCENS. TREE COLUTEA,
OR BLADDER SENNA.

Class and Order.

DIADELPHIA DECANDRIA.

Generic Character.

Calyx 5-fidus. *Legumen* inflatum, basi superiore dehiscens.

Specific Character and Synonyms.

COLUTEA *arborescens* arborea foliolis obcordatis. *Linn. Syst. Vegetab.* p. 668.

COLUTEA *vesicaria*. *Bauh. Pin.* 396.

The greater Bastard Senna with bladders. *Park. Par.* 440.

The Bladder Senna, a native of the South of France and Italy, produces a profusion of bloom from June to August, when its inflated pods please from the singularity of their appearance; on these accounts, it is one of the most common flowering shrubs cultivated in gardens and plantations.

“ It is propagated by sowing its seeds any time in the spring
“ in a bed of common earth; and when the plants are come
“ up, they must be kept clear from weeds, and the Michaelmas
“ following they should be transplanted either into nursery-
“ rows, or in the places where they are designed to remain;
“ for if they are let grow in the seed-bed too long, they are
“ very subject to have tap roots, which render them unfit for
“ transplanting; nor should these trees be suffered to remain
“ too long in the nursery before they are transplanted, for the
“ same reason.” *Miller's Gard. Dict.*

We have learned by experience, that a very wet soil will prove fatal to these shrubs.

Pub. as the Act directs, April 11789 by W. Curtis, Botanic Garden, Lambeth Marsh.

LACHENALIA TRICOLOR. THREE-COLOURED LACHENALIA.

Class and Order.

HEXANDRIA MONOGYNIA.

Generic Character.

Calyx subtriphyllus, inferus, coloratus. *Corolla* 3-petala, receptaculo inserta. *Jacquin jun. in act. helv. vol. 9.*

Specific Character and Synonyms.

LACHENALIA *tricolor.* Linn. *Syst. Vegetab. ed. 14. p. 314.*
Jacq. Icon. pl. rarior, t. 3.

PHORMIUM *Aloides.* Linn. *Syst. Vegetab. ed. 14. p. 336.*
Suppl. 205.

To Mr. LEE, of the Vineyard, Hammersmith, the first, and as we understand, the only Nurseryman as yet in possession of this plant, which has but lately been introduced into this country from the Cape, we are indebted for the present specimen.

Mr. JACQUIN, jun. who has figured and described it in the *Acta Helvetica*, gives it the name of *Lachenalia*, in honour of WARNERUS DE LA CHENAL, a very eminent Swiss Botanist, and the particular friend of the late illustrious HALLER. Our readers should be informed, that it had before been called by two other different names, viz. *Hyacinthus orchinoides*, and *Phormium aloides*, under the latter of which it now stands in the 14th edition of the *Systema Vegetabilium*, as well as that of *Lachenalia*.

Its trivial name of *tricolor*, it receives from the three colours observable in the flowers; but it must be noticed, that it is only at the middle period of its flowering, that these three colours are highly distinguishable; as it advances, the brilliant orange of the top flowers dies away; the spots on the leaves also, which when the plant is young, give it the appearance of an orchis, as it advances into bloom become less and less conspicuous.

Like most of the Cape plants, the *Lachenalia* requires to be sheltered in the winter; during that season it must therefore be kept in a green-house, or hot-bed frame, well secured.

It flowers in the spring, but its blowing may be accelerated by the warmth of the stove, for it bears forcing well enough.

It is increased by offsets from the bulbs.

Pub^d as the Act directs May 1789 by Wüirtz Botanic Garden Lambeth Marsh

HIBISCUS SYRIACUS. SYRIAN HIBISCUS;
commonly called ALTHÆA FRUTEX.

Class and Order.

MONADELPHIA POLYANDRIA.

Generic Character.

Calyx duplex, exterior polyphyllus. Capsula 5-locularis, polysperma.

Specific Character and Synonyms.

HIBISCUS *syriacus* foliis cuneiformi ovatis superne incisoferratis, caule arboreo. *Linn. Syst. Veg. p. 630.*

ALCEA arborefcens syriaca. *Baub. Pin. p. 316.*

ALTHÆA frutex flore albo vel purpureo. *Park. Par. p. 369.*

The *Hibiscus syriacus*, known generally by the name of *Althæa frutex*, is a native of Syria, and forms one of the chief ornaments of our gardens in autumn; we view it, however, with less delight, as it is a sure indication of approaching winter.

There are many varieties of it mentioned by authors, as the *purple, red-flowered, white-flowered, variegated red and white flowered*, and the *striped-flowered*, to which may be added, another variety, lately introduced, with double flowers: it varies also in its foliage, which is sometimes marked with white, sometimes with yellow.

As from the lateness of its flowering, and the want of sufficient warmth, it rarely ripens its seeds with us; the usual mode of increasing it is by layers, and sometimes by cuttings; but the best plants are raised from seeds. MILLER observes, that the scarce varieties may be propagated by grafting them on each other, which is the common method of propagating the sorts with striped leaves.

In the time of PARKINSON it was not looked on as a hardy shrub: he thus writes,—“they are somewhat tender, and would not be suffered to be uncovered in the winter time, or yet abroad in the garden, but kept in a large pot or tubbe, in the house or in a warme cellar, if you would have them to thrive.” *Park. Parad.*

TUSSILAGO ALPINA. ALPINE COLTSFOOT.

Class and Order.

SYNGENESIA POLYGAMIA.

*Generic Character.**Receptaculum nudum. Pappus simplex. Cal. squamæ æquales, discum æquantés, submembranacæ.**Specific Character and Synonyms.*TUSSILAGO *alpina* scapo unifloro subnudo, foliis cordato orbiculatis crenatis utrinque virentibus. *Linn. Syst. Vegetab. p. 755.*TUSSILAGO *alpina rotundifolia* glabra. *Baub. Pin. 197.*

This species, a native of the Alps, of Switzerland, and Austria, is frequently kept in gardens for the sake of variety; like the rest of the genus, it flowers early in the spring, in March and April; is a very hardy perennial, increases most readily in a moist shady situation, is usually kept in pots for the convenience of sheltering it in very severe seasons; but it will grow readily enough in the open border. All plants that flower early, though ever so hardy, require some kind of shelter, previous to, and during their flowering.

Is propagated by parting its roots in autumn.

Pub^l as the Act direct. May. 11789 by W. Curtis, Botanic Garden, Lambeth Marsh.

SPARTIUM JUNCEUM. SPANISH BROOM.

Class and Order.

DIADELPHIA DECANDRIA.

Generic Character.

Stigma longitudinale, supra villosum. *Filamenta* germini ad-
hærentia. *Calyx* deorsum productus.

Specific Character and Synonyms.

SPARTIUM *junceum* ramis oppositis teretibus apice floriferis,
foliis lanceolatis. *Linn. Syst. Vegetab. p. 643.*

SPARTIUM *arborescens*, feminibus lenti similibus. *Baub.*
Pin. 396.

Spanish Broom. *Park. Parad. p. 442. t. 443. fig. 4.*

Grows naturally in France, Spain, Italy, and Turkey; bears our climate extremely well; is a common shrub in our nurseries and plantations, which it much enlivens by its yellow blossoms: flowers from June to August, or longer in cool seasons.

Is raised by seeds, which generally come up plentifully under the shrubs.

MILLER mentions a variety of it, which, as inferior to the common sort, does not appear to be worth cultivating.

GLADIOLUS COMMUNIS. COMMON CORN-
FLAG.

Class and Order.

TRIANDRIA MONOCYNIA.

Generic Character.

Corolla sexpartita ringens. Stamina adscendentia.

Specific Character and Synonyms.

GLADIOLUS *communis* foliis ensiformibus, floribus distan-
tibus. *Linn. Syst. Vegetab. p. 86.*

GLADIOLUS *utrinque floridus?* *Baub. Pin. 41.*

The French Corn-Flag. *Park. Parad. p. 189. t. 191. f. 1.*

Grows wild in the corn-fields of most of the warmer parts of Europe, varies with white and flesh-coloured blossoms, increases so fast, both by offsets and seeds, as to become troublesome to the cultivator; hence, having been supplanted by the Greater Corn-Flag, the *Byzantinus* of MILLER, whose blossoms are larger, and more showy, it is not so generally found in gardens as formerly.

It flowers in June.

HYOSCYAMUS AUREUS. GOLDEN-FLOWERED HENBANE.

Class and Order.

PENTANDRIA DIGYNIA.

Generic Character.

Corolla infundibuliformis, obtusa. *Stamina* inclinata. *Capsula* operculata 2-locularis.

Specific Character and Synonyms.

HYOSCYAMUS *aureus* foliis petiolatis dentatis acutis floribus pedunculatis, fructibus pendulis.
Linn. Syst. Vegetab. p. 220.

HYOSCYAMUS *creticus luteus major.*, *Baub. Pin. 169.*

A native of Crete, and other parts of the East.

“ Flowers most part of the summer, but seldom ripens seeds
“ in England; will continue for several years, if kept in pots
“ and sheltered in winter, for it will not live in the open air
“ during that season; if placed under a common hot-bed
“ frame, where it may enjoy as much free air as possible in
“ mild weather, it will thrive better than when more tenderly
“ treated.

“ It may be easily propagated by cuttings, which if planted
“ in a shady border and covered with hand-glasses, in any of
“ the summer months, they will take root in a month or six
“ weeks, and may be afterwards planted in pots and treated
“ like the old plants.” *MILLER'S Gard. Dict.*

It is, however, a more common practice to keep this plant in the stove in the winter; one advantage, at least, attends this method, we secure it with certainty.

Pub^d as the Act directs June 1. 1789. by W. Curtis, Botanic Garden Lambeth Marsh.

NARCISSUS BULBOCODIUM. HOOP-PETTI-
COAT NARCISSUS.

Class and Order.

HEXANDRIA MONOGYNIA.

Generic Character.

Petala 6, æqualia: *Nectario* infundibuliformi, 1-phyllo.
Stamina intra nectarium.

Specific Character and Synonyms.

NARCISSUS *Bulbocodium* spatha uniflora, nectario turbinato
petalis majore, staminibus pistilloque declinatis.
Linn. Syst. Veg. p. 317.

NARCISSUS *montanus* juncifolius, calyce aureo. *Baubin.*
p. 53.

The greater yellow Junquilia, or bastard Daffodil. *Park.*
Parad. p. 106. t. 107. fig. 6. var. min. fig. 7.

Grows spontaneously in Portugal; flowers in the open border about the middle of May. Is an old inhabitant of our gardens, but, like the *triandrus*, is now become scarce, at least in the nurseries about London; in some gardens in Hampshire we have seen it grow abundantly: MILLER calls it the *Hoop-Petticoat Narcissus*, the nectary, as he observes, being formed like the ladies hoop petticoats,

It certainly is one of the neatest and most elegant of the genus, is propagated by offsets, and should be planted in a loamy soil, with an eastern exposure.

VIOLA PEDATA. CUT-LEAVED VIOLET.

Class and Order.

SYNGENESIA MONOGAMIA.

Generic Character.

Calyx 5-phyllus. *Cor.* 5-petala, irregularis, postice cornuta.
Capsula supera, 3-valvis, 1-locularis.

Specific Character and Synonyms.

VIOLA *pedata* acaulis, foliis pedatis septempartitis. *Linn. Syst. Veget. ed. 14. Murr. p. 802. Spec. Pl. p. 1323. Gronov. Fl. Virg. ed. 2. p. 135.*

VIOLA *tricolor* caule nudo, foliis tenuius dissectis. *Banist. Virg.*

VIOLA *inodora* flore purpurascente specioso, foliis ad modum digitorum incis. *Clayt. n. 254.*

This species of Violet, a native of Virginia, is very rarely met with in our gardens; the figure we have given, was drawn from a plant which flowered this spring in the garden of THOMAS SIKES, Esq. at Hackney, who possesses a very fine collection of plants, and of American ones in particular.

It is more remarkable for the singularity of its foliage than the beauty of its blossoms; the former exhibit a very good example of the *folium pedatum* of LINNÆUS, whence its name.

MILLER, who calls it *multifida* from a former edition of LINNÆUS's *Species Plantarum*, says, that the flowers are not succeeded by seeds here, hence it can only be propagated by parting its roots.

The best mode of treating it, will be to place the roots in a pot of loam and bog earth mixed, and plunge the pot into a north border, where it must be sheltered in the winter, or taken up and kept in a common hot-bed frame.

GORTERIA RIGENS. RIGID-LEAVED
GORTERIA.

Class and Order.

SYNGENESIA POLYGAMIA. FRUSTRANEA.

Generic Character.

*Receptaculum nudum. Pappus lanatus. Corollæ radii ligulatæ.
Calyx imbricatus, squamis spinosis.*

Specific Character and Synonyms.

GORTERIA *rigens* foliis lanceolatis pinnatifidis, caule depresso, scapis unifloris. *Linn. Syst. Vegetab. ed. 14. Murr. 783. Sp. Pl. ed. 3. p. 1284.*

ARCTOTIS ramis decumbentibus, foliis lineari-lanceolatis rigidis, subtus argenteis. *Mill. Dict. et. Icon. t. 49.*

ARCTOTHECA foliis rigidis leniter dissectis. *Vaill. act. 1728. n. 9.*

The GORTERIA, of which there are several species, and most of them, like the present, natives of the Cape, has been named in honour of DAVID DE GORTER, author of the *Flora Zutphanica* and *Ingrica*; the trivial name of *rigens* is given to this species from the rigidity of its leaves, a term which it is sometimes apt to exchange for the more common botanic name of *ringens*; an instance of such mistake occurs in the 6th edition of MILLER'S *Gard. Dict.*

The green-house, to which it properly belongs, can scarcely boast a more shewy plant; its blossoms, when expanded by the heat of the sun, and it is only when the sun shines on them that they are fully expanded, exhibit an unrivalled brilliancy of appearance.

It flowers in June, but rarely brings its seeds to perfection in this country, which is of the less consequence, as the plant is readily enough increased by cuttings.

It requires the common treatment of a green-house plant.

Pal. ex the Act direct, July 13789. by W. Curtis, Botanic Garden, Lambeth Marsh.

IRIS SUSIANA. CHALCEDONIAN IRIS.

Class and Order.

TRIANDRIA MONOGYNIA.

Generic Character.

Cor. 6-petala, inæqualis, petalis alternis geniculato-patentibus. *Stigmata* petaliformia, cucullato-bilabiata.

Specific Character and Synonyms.

IRIS *susiana* barbata foliis ensiformibus glabris, scapo unifloro, petalis rotundatis. *Linn. Syst. Vegetab. ed. 14. p. 88.*

IRIS *susiana* flore maximo et albo nigricante. *Bauh. Pin. 31.*

The great Turkey Flower-de-luce. *Park. Parad. 179.*

This species, by far the most magnificent of the Iris tribe, is a native of Persia, from a chief city of which it takes the name of *Susiana*: LINNÆUS informs us, that it was imported into Holland from Constantinople in 1573.

Though an inhabitant of a much warmer climate than our own, it thrives readily in the open borders of our gardens; and, in certain favourable situations, flowers freely about the latter end of May or beginning of June. It succeeds best in a loamy soil and sunny exposure, with a pure air: moisture, which favours the growth of most of the genus, is injurious and sometimes even fatal to this species.

As it rarely ripens its seeds with us, it is generally propagated by parting its roots in autumn. These are also usually imported from Holland, and may be had of the importers of bulbs at a reasonable rate.

Being liable to be destroyed by seasons unusually severe, it will be prudent to place a few roots of it in pots, either in the greenhouse or in a hot-bed frame during the winter.

It bears forcing well.

Pub. by the Act direct. Aug^o 1. 1789 by W. Curtis Botanic Garden Lambeth Marsh.

SAXIFRAGA SARMENTOSA. STRAWBERRY
SAXIFRAGE.

Class and Order.

DECANDRIA DIGYNIA.

Generic Character.

Calyx 5-partitus. *Cor.* 5-petala. *Caps.* 2-rostris, 1-locularis, poly sperma.

Specific Character and Synonyms.

SAXIFRAGA *sarmentosa* foliis radicalibus subrotundis cordatis crenatis, sarmentis axillaribus radican-
tibus, corolla irregulari, racemo composito.
Linn. Syst. Veg. ed. 14. p. 412. Suppl. p. 240.

This species of Saxifrage differing so widely from the others, both in its habit and fructification, as to create a doubt in the minds of some, whether it ought not to be considered as a distinct genus, is a native of China, and one of the many plants which have been introduced into our gardens since the time of MILLER.

Its round variegated leaves, and strawberry-like runners, the uncommon magnitude of the two lowermost pendant petals, joined to the very conspicuous glandular nectary in the centre of the flower, half surrounding the germen, render this species strikingly distinct.

It is properly a greenhouse plant; in mild winters indeed it will bear the open air, especially if placed at the foot of a wall, or among rock-work; but, in such situations, it is frequently killed in severe seasons.

It flowers in May and June, but does not produce its blossoms so freely as some others.

No difficulty attends the propagation of it, for it increases so fast by its runners, as to be even troublesome.

Pub^d as the Aca directs Aug^r 1789 by W. Curtis Botanic Garden Lambeth Marsh

SEMPERVIVUM MONANTHES. DWARF
HOUSELEEK.

Class and Order.

DODECANDRIA DODECAGYNIA.

Generic Character.

Calyx 12-partitus. *Petala* 12. *Capsulæ* 12, polyspermæ.

Specific Character and Synonyms.

SEMPERVIVUM *monanthes* foliis teretibus clavatis confertis, pedunculis nudis subunifloris, nectariis obcordatis. *Aiton. Hort. Kew.*

It appears from the *Hortus Kewensis*, the publication of which is daily expected, that the plant here figured was first brought to this country from the Canary Islands, by Mr. FRANCIS MASSON, in the year 1777.

It is highly deserving the notice of the Botanist, not only as being by far the least species of the genus, but on account of its Nectaria; these, though not mentioned by LINNÆUS in his character of the genus, have been described by other authors, particularly JACQUIN and HALLER; and though not present in most, and but faintly visible in a few species of *Sempervivum*, in this plant form a principal part of the fructification; they are usually seven in number but vary from six to eight.

In the specimens we have examined, and which perhaps have been rendered luxuriant by culture, the number of stamina has been from twelve to sixteen; of styles, from six to eight; of flowers on the same stalk, from one to eight.

It flowers during most of the summer months, succeeds very well with the common treatment of a greenhouse plant in the summer, but does best in a dry stove in the winter.

Is readily increased by parting its roots.

Pub^d as the Act directs. An^o. 1769 by W. Curtis, Botanic Garden, Lambeth Marsh.

SISYRINCHIUM IRIDIOIDES. IRIS-LEAV'D
SISYRINCHIUM.

Class and Order.

GYNANDRIA TRIANDRIA.

Generic Character.

Monogyna. *Spatha* diphylla. *Petala* 6 plana. *Capsula* trilocularis, infera.

Specific Character and Synonyms.

SISYRINCHIUM *iridioides* foliis ensiformibus; petalis oblongo-obcordatis, venosis; germinibus pyriformibus, subhirsutis.

SISYRINCHIUM *Bermudiana*. *Lin. Syst. Vegetab.* p. 820. var. 2. *Spec. Pl.* p. 1353.

BERMUDIANA *iridis* folio, radice fibrosa. *Dill. Elth.* 48. t. 41. f. 48.

SISYRINCHIUM *Bermudiana* foliis gladiolatis amplexicaulis, pedunculis brevioribus. *Miller's Dict.* ed. 6. 4to.

On comparing the present plant with the *Bermudiana graminea flore minore caeruleo* of DILLENIIUS, both of which I have growing, and now in pots before me, the difference appears so striking, that I am induced with him and MILLER to consider them as distinct species; especially as, on a close examination, there appear characters sufficient to justify me in the opinion, which characters are not altered by culture.

It is a native of the Bermudian Islands, and flowers in the open border from May to the end of July; it is not uncommon to keep it in the greenhouse, for which, from its size, &c. it is very well adapted; but it is not necessary to treat it tenderly, as it will bear a greater degree of cold than many plants usually considered as hardy.

It may be propagated most readily by seeds, or by parting its roots in the autumn; should be planted on a border with an eastern aspect; soil the same as for bulbs.

Pub^d as the Act directs Sep^r 21 1769. by W. Curtis. Botanic Garden, Lambeth Marsh.

GERANIUM RADULA. RASP-LEAV'D
GERANIUM.

Class and Order.

MONADELPHIA DECANDRIA.

Generic Character.

Monogyna. *Stigmata* 5. *Fruetus* rostratus, 5-coccus.

Specific Character and Synonyms.

GERANIUM *revolutum* pedunculis subbifloris, foliis multifidis linearibus scabris ad oras revolutis, caule arboreo. *Jacq. ic.* 133. *collect.* 1. p. 84.

GERANIUM *Radula*. *Cavanill. Diff.* 4. p. 262. t. 101. f. 1.

This is one of the numerous tribe of *Geraniums* introduced from the Cape since the time of MILLER: it takes the name of *Radula*, which is the Latin term for a rasp or file, from the rough rasp-like surface of the leaves.

There are two varieties of it, a *major* and a *minor*, which keep pretty constantly to their characters; and as this species is readily raised from seeds, it affords also many seminal varieties.

As a Botanist, desirous of seeing plants distinct in their characters, we could almost wish it were impossible to raise these *foreign Geraniums* from seeds; for, without pretending to any extraordinary discernment, we may venture to prophecy, that in a few years, from the multiplication of seminal varieties, springing from seeds casually, or perhaps purposely impregnated with the pollen of different sorts, such a crop will be produced as will baffle all our attempts to reduce to species, or even regular varieties.

Such as are partial to this tribe, will no doubt wish to have this species in their collection; the blossoms are pretty, and the foliage is singular, but it remains but a short time in flower.

It is readily propagated by cuttings.

Pub^d as the Act directs Sep 11 1789 by W Curtis Botanic Garden, Lambeth Marsh.

LANTANA ACULEATA. PRICKLY LANTANA.

Class and Order.

DIDYNAMIA ANGIOSPERMIA.

Generic Character.

Calyx 4-dentatus obsolete. *Stigma* uncinato-refractum. *Drupa*
nucleo 2-loculari.

Specific Character and Synonyms.

LANTANA *aculeata* foliis oppositis, caule aculeato ramo
spicis hemisphæricis. *Lin. Syst. Veg. ed. 14. p.*
566.

According to MILLER, this species grows naturally in *Jamaica*, and most of the other Islands in the *West-Indies*, where it is called *wild Sage*; the flowers, which are very brilliant, are succeeded by roundish berries, which, when ripe, turn black, having a pulpy covering over a single hard seed.

It is readily propagated by cuttings.

Different plants vary greatly in the colour of their blossoms, and the prickliness of their stalks; the prickles are seldom found on the young shoots.

This plant will bear to be placed abroad in the warmest summer months, the rest of the year it requires artificial heat. It is usually placed in the dry stove, to which, as it is seldom without flowers, it imparts great brilliancy.

Pub^d as the Act directs. Sep^r 12 1789, by W. Curtis, Botanic Garden, Lambeth Marsh.

FUCHSIA COCCINEA. SCARLET FUCHSIA.

Class and Order.

OCTANDRIA MONOGYNIA.

Generic Character.

Calyx 1-phyllus, coloratus, corollifer, maximus. *Petala* 4, parva.
Bacca infera, 4-locularis, polysperma.

Specific Character and Synonyms.

FUCHSIA *coccinea* foliis oppositis ovatis denticulatis; petalis obovatis, obtusis. *Hort. Kew.*

THILCO *Feuillée* *it.* 3. p. 64. t. 47.

The present plant is a native of *Chili*, and was introduced to the royal gardens at Kew, in the year 1788, by Capt. FIRTH; it takes the name of *Fuchsia* from *Fuchs* a German Botanist of great celebrity, author of the *Historia Stirpium in folio*, published in 1542, containing five hundred and sixteen figures in wood; and which, though mere outlines, express the objects they are intended to represent, infinitely better than many laboured engravings of more modern times.

Every person who can boast a hot-house will be anxious to possess the *Fuchsia*, as it is not only a plant of peculiar beauty, but produces its rich pendant blossoms through most of the summer; the petals in the centre of the flower are particularly deserving of notice; they somewhat resemble a small roll of the richest purple-coloured ribband.

Though this plant will not succeed well in the winter, nor be easily propagated unless in a stove, it will flower very well during the summer months, in a good green-house or hot-bed frame, and though at present from its novelty it bears a high price, yet as it is readily propagated, both by layers, cuttings, and seeds, it will soon be within the purchase of every lover of plants.

Mr. LEF, of Hammer-smith, we understand first had this plant for sale.

TROPÆOLUM MINUS. SMALL TROPÆOLUM,
OR INDIAN-CRESS.

Class and Order.

OCTANDRIA MONOGYNIA.

Generic Character.

Cal. 1-phyllus, calcaratus. *Petala* 5, inæqualia. *Baccæ* tres, siccæ.

Specific Character and Synonyms.

TROPÆOLUM *minus* foliis peltatis repandis, petalis acuminato-fetaceis. *Lin. Syst. Vegetab.* p. 357.

Indian-Cresses, or yellow Larke's-heeles. *Park. Parad.* p. 280.

This species of *Tropæolum* (which like the *majus* already figured in this work, is a native of *Peru*) has long been an inhabitant of our gardens; it was the only species we had in the time of PARKINSON, by whom it is figured and described; it appears indeed to have been a great favourite with that intelligent author, for he says this plant "is of so great beauty" and sweetnesse withall, that my garden of delight cannot "bee unfurnished of it, and again the whole flower hath a fine" "small sent, very pleasing, which being placed in the middle of" "some Carnations or Gilloflowers (for they are in flower at" "the same time) make a delicate Tuffimusic, as they call it," "or Nofegay, both for sight and sent."

As the *Passiflora cærulea*, from its superior beauty and hardiness, has in a great degree supplanted the *incarnata*, so has the *Tropæolum majus* the *minus*; we have been informed indeed that it was entirely lost to our gardens till lately, when it was re-introduced by Dr. J. E. SMITH, who by distributing it to his friends, and the Nursermen near London, has again rendered it tolerably plentiful.

Like the *majus* it is an annual, though by artificial heat it may be kept in a pot through the winter, as usually is the variety of it with double flowers; but as it will grow readily in the open air, in warm sheltered situations, it should be raised on a hot-bed, like other tender annuals, if we wish to have it flower early in the summer, continue long in blossom, and produce perfect seeds.

ANTIRRHINUM PURPUREUM. PURPLE
TOAD-FLAX.

Class and Order.

DIDYNAMIA ANGIOSPERMIA.

Generic Character.

Calyx 5-phyllus. *Corollæ* basis deorsum prominens, nectarifera.
Capsula 2-locularis.

Specific Character and Synonyms.

ANTIRRHINUM *purpureum* foliis quaternis linearibus, caule
erecto spicato. *Lin. Syst. Vegetab. p. 555.*

LINARIA *purpurea major odorata.* *Baub. Pin. 213.*

LINARIA *altera purpurea.* *Dod. Pempt. 183.*

Though not so beautiful as many of the genus, this species is a common inhabitant of the flower-garden, in which it continues to blossom, during most of the summer.

It is a native of Italy, and delights in a dry soil and situation; it will even flourish on walls, and hence will serve very well to decorate the more elevated parts of rock-work.

When once introduced it comes up spontaneously from seeds.

Pub^d as the Act directs, Oct. 7. 1789. by W. Curtis Botanic Garden Lambeth Marsh.

LATHYRUS TINGITANUS. TANGIER PEA.

Class and Order.

DIADELPHIA DECANDRIA,

Generic Character.

Stylus planus, supra villosus, superne latior, *Cal.* laciniaë superiores 2-breviores.

Specific Character and Synonyms.

LATHYRUS *tingitanus* pedunculis bifloris, cirrhis diphyllis, foliolis alternis lanceolatis glabris, stipulis lunatis. *Lin. Syst. Vegetab.* p. 663.

LATHYRUS *tingitanus*, filiquis orobi, flore amplo ruberrimo. *Moris. hist.* 2. p. 55.

The Tangier Pea, a native of Morocco, cannot boast the agreeable scent, or variety of colours of the sweet Pea; nor does it continue so long in flower; nevertheless there is a richness in the colour of its blossoms, which entitles it to a place in the gardens of the curious, in which it is usually sown in the spring, with other hardy annuals.

It flowers in June and July.

The best mode of propagating it, is to sow the seeds on the borders in patches, where the plants are to remain; thinning them when they come up, so as to leave only two or three together.

Pub^d as the Act directs, Nov^r 1789, by W. Curtis Botanic Garden, Lambeth Marsh.

ALYSSUM HALIMIFOLIUM. SWEET ALYSSUM.

Class and Order.

TETRADYNAMIA SILICULOSA.

Generic Character.

Filamenta quædam introrsum denticulo notata. *Silicula* emarginata.

Specific Character and Synonyms.

ALYSSUM *halimifolium* caulibus suffruticosis, diffusis, foliis lineari-lanceolatis integerrimis, villosiusculis, staminibus simplicibus, siliculis subrotundis integris. *Hort. Kew. V. 2. p. 381.*

ALYSSUM *halimifolium* caulibus procumbentibus, perennantibus, foliis lanceolato-linearibus, acutis, integerrimis. *Linn. Syst. Vegetab. p. 590.*

Thlaspi halimi folio sempervirens. *Herm. lugd. 594. t. 595.*

Grows spontaneously in dry situations, in the southernmost parts of Europe, where it is shrubby; and in similar situations it is so in some degree with us; but on our flower-borders, where it is usually sown, it grows so luxuriantly, that the stalks becoming juicy and tender, are generally destroyed by our frosts; hence it is an annual from peculiarity of circumstance; as such, it is very generally cultivated; the flowers exhibit a pretty, innocent appearance, and strongly diffuse an agreeable honey-like smell. They continue to blow through most of the summer months.

It is a very proper plant for a wall or piece of rock-work; care must be taken, however, not to sow too much of the seed in one pot, as it spreads wide, but it may easily be reduced at any period of its growth, as it does not creep at the root.

The specific description in the *Hortus Kewensis* above referred to, admirably characterizes the plant, but surely at the expence of its generic character.

Pub: as the. Act directo Nov: 2, 1789, by W. Curtis, Botanic Garden, Lambeth. Marsb.

CAMPANULA SPECULUM. VENUS'S LOOKING-GLASS.

Class and Order.

PENTANDRIA MONOGYNIA.

Generic Character.

Corolla campanulata, fundo clauso valvis staminiferis. *Stigma* trifidum. *Capsula* infera, poris lateralibus dehiscens.

Specific Character and Synonyms.

CAMPANULA *Speculum* caule ramosissimo, diffuso; foliis oblongis subcrenatis, floribus solitariis, capsulis prismaticis. *Linn. Syst. Vegetab. p. 209.*

ONOBRYCHIS *arvensis* f. *Campanula arvensis erecta.* *Bauh. Pin. 215.*

Grows wild among the corn in the South of Europe, is an annual, and, like the *Sweet Alyssum*, generally cultivated in our gardens, and most deservedly so indeed, for when a large assemblage of its blossoms are expanded by the rays of the sun, their brilliancy is such as almost to dazzle the eyes of the beholder.

Those annuals which bear our winter's frosts without injury, are advantageously sown in the autumn; for by that means they flower more early, and their seeds ripen with more certainty; the present plant is one of those: it usually sows itself, and is therefore raised without any trouble.

It begins to flower in May and June, and continues to enliven the garden till August or September.

Pub.^d as the Act directs Nov^r. 1789 by W. Curtis Botanic Garden Lambeth Marsh.

PELARGONIUM ACETOSUM. SORREL
 CRANE'S-BILL.

Class and Order.

MONADELPHIA HEPTANDRIA.

Generic Character.

Calyx 5-partitus: lacinia suprema desinente in tubulum capillarem, nectariferum, secus pedunculum decurrentem.

Cor. 5-petala, irregularis. *Filam.* 10. in æqualia: quorum 3 (raro 5) castrata. *Fruetus*, 5-coccus, rostratus: rostra spiralia, introrsum barbata. *L'Herit. Geran.*

Specific Character and Synonyms.

PELARGONIUM *acetosum* umbellis paucifloris, foliis obovatis crenatis glabris carnosiss, petalis linearibus. *L'Herit. Monogr. de Geran. n. 97.*

GERANIUM *acetosum* calycibus monophyllis, foliis glabris obovatis carnosiss crenatis, caule fruticoso laxo. *Linn. Syst. Vegetab. ed. 14. Murr. p. 613. Sp. Pl. p. 947.*

GERANIUM *Africanum* frutescens, folio crasso et glaucos acetosæ sapore. *Comm. præl. 51. t. 1.*

Monf. L'HERITIER, the celebrated French Botanist, who, in the number, elegance, and accuracy of his engravings, appears ambitious of excelling all his cotemporaries, in a work now executing on the family of *Geranium*, has thought it necessary to divide that numerous genus into three, viz. *Erodium*, *Pelargonium*, and *Geranium*.

The *Erodium* includes those which LINNEUS (who noticing the great difference in their appearance, had made three divisions of them) describes with five fertile stamina, and calls *Myrrhina*; the *Pelargonium* those with seven fertile stamina, his *Africana*; the *Geranium* those with ten fertile stamina, his *Batrachia*.

They

They are continued under the class *Monadelphica*, in which they now form three different orders, according to the number of their stamina, viz. *Pentandria*, *Heptandria*, and *Decandria*. If the principles of the Linnean system had been strictly adhered to, they should perhaps have been separated into different classes; for though the *Pelargonium* is Monadelphous, the *Geranium* is not so; in consequence of this alteration, the *Geranium peltatum* and *radula*, figured in a former part of this work, must now be called *Pelargonium peltatum*, and *radula*, and the *Geranium Reichardi* be an *Erodium*.

The leaves of this plant have somewhat the taste of sorrel, whence its name, it flowers during most of the summer, and is readily propagated by cuttings. MILLER mentions a variety of it with scarlet flowers.

It is a native of the Cape, and known to have been cultivated in Chelsea Garden, in the year 1724.

Pub.^d as the Act directs, Dec. 1, 1789, by W. Curtis, Botanic Garden, Lambeth Marsh.

LYSIMACHIA BULBIFERA. BULB-BEARING
LOOSESTRIFE.

Class and Order.

PENTANDRIA MONOGYNIA.

Generic Character.

Corolla rotata. *Capsula* globosa, mucronata, 10-valvis.

Specific Character and Synonyms.

LYSIMACHIA *stricta* racemis terminalibus, petalis lanceolatis patulis, foliis lanceolatis sessilibus. *Hort. Kew.* p. 199.

In the spring of the year 1781, I received roots of this plant from Mr. ROBERT SQUIBB, then at New-York, which produced flowers the ensuing summer, since that time, I have had frequent opportunities of observing a very peculiar circumstance in its æconomy; after flowering, instead of producing seeds, it throws out *gemmæ vivaces*, or *bulbs* of an unusual form, from the *alæ* of the leaves, which falling off in the month of October, when the plant decays, produce young plants the ensuing spring.

As it is distinguished from all the known species of *Lysimachia* by this circumstance, we have named it *bulbifera* instead of *stricta*, under which it appears in the *Hortus Kewensis*.

Some Botanists, whose abilities we revere, are of opinion that the trivial names of plants, which are or should be a kind of abridgment of the specific character, ought very rarely or never to be changed: we are not for altering them capriciously on every trivial occasion, but in such a case as the present, where the science is manifestly advanced by the alteration, it would surely have been criminal to have preferred a name, barely expressive, to one which immediately identifies the plant.

The *Lysimachia bulbifera* is a hardy perennial, grows spontaneously in boggy or swampy ground, and hence requires a moist soil. It flowers in August.

Pub.^d as the Act directs Dec. 1, 1789, by W. Curtis, Botanic Garden, Lambeth Marsh.

TRADESCANTIA VIRGINICA. VIRGINIAN
TRADESCANTIA, OR SPIDERWORT.

Class and Order.

HEXANDRIA MONOGYNIA.

Generic Character.

Calyx triphyllus. *Petala* 3. *Filamenta* villis articulatis. *Cap-
sula* 3-locularis.

Specific Character and Synonyms.

TRADESCANTIA *Virginica* erecta lævis, floribus congestis.
*Linn. Syst. Vegetab. ed. 14. Murr. p. 314.
Sp. Pl. 411.*

ALLIUM five moly *Virginianum.* *Baub. Pin. 506.*

PHALANGIUM *Ephemerum Virginianum Joannis Tradescant.*

The soon-fading Spiderwort of Virginia, or Tradescant his
Spiderwort. *Park. Parad. 152. 5. t. 151. f. 4.*

Under the name of *Spiderwort*, the old Botanists arranged many plants of very different genera: the name is said to have arisen from the supposed efficacy of some of these plants, in curing the bite of a kind of spider, called *Phalangium*; not the *Phalangium* of LINNEUS, which is known to be perfectly harmless: under this name, PARKINSON minutely describes it; he mentions also, how he first obtained it.

“ This Spiderwort,” says our venerable author, “ is of late knowledge, and for it the Christian world is indebted unto that painful, industrious searcher, John Tradescant, who first received it of a friend that brought it out of Virginia, and hath imparted hereof, as of many other things, both to me and others.”

TOURNEFORT afterwards gave it the name of *Ephemerum*, expressive of the short duration of its flowers, which LINNEUS changed to *Tradescantia*.

Though a native of Virginia, it bears the severity of our climate uninjured, and being a beautiful, as well as hardy perennial, is found in almost every garden.

Though each blossom lasts but a day, it has such a profusion in store, that it is seldom found without flowers through the whole of the summer. There are two varieties of it, the one with white the other with pale purple flowers. The most usual way of propagating it is by parting its roots in autumn; to obtain varieties, we must sow its seeds.

Pub. as the Act directs, Dec. 1, 1789, by W. Curtis, Botanic Garden, Lambeth Marsh.

IBERIS UMBELLATA. PURPLE CANDY-TUFT.

Class and Order.

TETRADYNAMIA SILICULOSA.

Generic Character.

Corolla irregularis: *Petalis* 2 exterioribus majoribus: *Silicula* polysperma, emarginata.

Specific Character and Synonyms.

IBERIS *umbellata* herbacea, foliis lanceolatis, acuminatis, inferioribus ferratis; superioribus integerrimis.

Linn. Syst. Veg. ed. 14. Murr. p. 589. Sp. Pl. p. 906.

THLASPI *umbellatum creticum, iberidis folio. Baub. Pin. 106.*

DRABA S. Arabis S. Thlaspi *Candiæ. Dod. pempt. 713.*

THLASPI *creticum umbellatum flore albo et purpureo.*

Candy-Tufts, white and purple. *Park. Parad. p. 390.*

The Candy-Tuft is one of those annuals which contribute generally to enliven the borders of the flower-garden: its usual colour is a pale purple, there is also a white variety of it, and another with deep but very bright purple flowers, the most desirable of the three, but where a garden is large enough to admit of it, all the varieties may be sown.

For want of due discrimination, as MILLER has before observed, Nurserymen are apt to collect and mix with this species the seeds of another, viz. the *amara*, and which persons not much skilled in plants consider as the white variety; but a slight attention will discover it to be a very different plant, having smaller and longer heads, differing also in the shape of its leaves and seed vessels, too trifling a plant indeed to appear in the flower-garden.

Purple Candy-Tuft is a native of the South of Europe, and flowers in June and July: it should be sown in the spring, on the borders of the flower-garden in patches; when the plants come up, a few only should be left, as they will thereby become stronger, produce more flowers, and be of longer duration.

Pub. as the Act directs, Jan. 1. 1790. by W. Curtis. Botanic-Garden, Lambeth-Mansh.

CASSIA CHAMÆCRISTA. DWARF CASSIA.

Class and Order.

DECANDRIA MONOGYNIA.

Generic Character.

Calyx 5-phyllus. *Petala* 5. *Antherae* superne 3 steriles; inferiorum 3 rostratae. *Legumen*.

Specific Character and Synonyms.

CASSIA *Chamæcrista* foliis multijugis, glandula petiolari pedicellata, stipulis ensiformibus. *Linn. Syst. Vegetab. ed. 14. Murr. p. 394. Hort. Kew. p. 54.*

CHAMÆCRISTA pavonis major. *Comm. Hort. 1. p. 53. t. 37.*

A native of the West-Indies, and of Virginia according to LINNEUS; not common in our gardens, though cultivated as long ago as 1699, by the DUCHESS of BEAUFORT; (*vid. Hort. Kew.*) unnoticed by MILLER.

This species, superior in beauty to many of the genus, is an annual, and consequently raised only from seeds, these must be sown in the spring, on a hot-bed, and when large enough to transplant, placed separately in pots of light loamy earth, then replunged into a moderate hot-bed to bring them forward, and in the month of June removed into a warm border, where, if the season prove favourable, they will flower very well towards August; but, as such seldom ripen their seeds, it will be proper to keep a few plants in the stove or greenhouse for that purpose, otherwise the species may be lost.

Pub. as the Act directs, Jan. 1, 1790, by W. Curtis, Botanic-Garden, Lambeth-Market.

ANTHYLLIS TETRAPHYLLA. FOUR-LEAV'D
LADIES-FINGER.

Class and Order.

DIADELPHIA DECANDRIA.

Generic Character.

Calyx ventricosus. *Legumen* subrotundum, tectum.

Specific Character and Synonyms.

ANTHYLLIS *tetraphylla* herbacea, foliis quaterno-pinnatis.
Linn. Syst. Vegetab. ed. 14. Murr. p. 25. Hort.
Kerw. vol. 3. p. 25.

LOTUS pentaphyllos vesicaria. *Baub. Pin. 332.*

TRIFOLIUM halicacabum. *Cam. Hort. 171. t. 47.*

An annual; the spontaneous growth of Spain, Italy, and Sicily, flowers in the open border in July, and ripens its seeds in September.

Long since cultivated in our gardens, but more as a rare, or curious, than a beautiful plant.

Its seeds are to be sown in April, on a bed of light earth, where they are to remain; no other care is necessary than thinning them, and keeping them clear of weeds.

Pub. as the Act directs, Jan. 1. 1790. by W. Curtis. Botanic-Garden, Lambeth-Marsh.
